TeamViewer

1E Platform on-premises 8.1 documentation

Table of Contents

1 Tachyon 15

1.1 Introducing Tachyon 15

1.1.1 Tachyon real-time features 15

1.1.2 Tachyon Inventory and Catalog features 21

1.1.3 Tachyon Features 22

1.1.4 Tachyon Architecture 40

1.2 Quick Start 55

1.2.1 Verifying Tachyon 55

1.2.2 Prepare 55

1.2.3 Install 72

1.2.4 Configure 81

1.2.5 Use 82

1.2.6 In conclusion 84

1.2.7 Next Steps 84

1.3 Planning for Tachyon 86

1.3.1 License requirements 86

1.3.2 Architectural requirements 118

1.3.3 Windows Server requirements 157

1.3.4 Certificate requirements 173

1.3.5 Directory requirements 186

1.3.6 Email and 2FA requirements 194

1.3.7 Product integration requirements 196

1.3.8 Network requirements 204

1.3.9 1E Client requirements 226

1.4 Installing Tachyon 235

1.4.1 Preparation 235

1.4.2 Tachyon Setup 282

1.4.3 Verifying 324

1.4.4 Tachyon Server post-installation tasks 355

1.4.5 Implementing a Tachyon DMZ Server 370

1.4.6 Deploying 1E Client 394

1.4.7 Uninstalling Tachyon Platform 394

1.4.8 Tachyon Product Pack Deployment Tool 399

1.5 Upgrading Tachyon Platform 403
1.5.1 Preparing for upgrade 404
1.5.2 In-place upgrade of Tachyon 405
1.5.3 Upgrading to Tachyon Platform 411
1.5.4 After upgrading to Tachyon Platform 415
1.5.5 In-place upgrade of ActiveEfficiency Server for Nomad 417
1.5.6 Side-by-side upgrade of ActiveEfficiency Server for Nomad 419
1.5.7 In-place upgrade of ActiveEfficiency Server for Shopping 422
1.5.8 Upgrading 1E Client 424
1.5.9 Role name changes 425
1.6 Using consumer applications 429
1.6.1 Included applications 430
1.6.2 Optional applications that require a license 430
1.7 Using Settings 430
1.7.1 Settings features 430
1.7.2 Configuration Menu 445
1.7.3 Monitoring Menu 692
1.7.4 Permissions Menu 715
1.7.5 Instructions Menu 787
1.8 Introducing Inventory 792
1.8.1 Inventory features 792
1.8.2 Hardware 794
1.8.3 Software Inventory 799
1.8.4 Manage associations 815
1.8.5 User Summary 825
1.8.6 The 1E Catalog 826
1.8.7 AI Powered Auto-curation 850
1.8.8 Configuring 1E Catalog connection to 1E Cloud 863
1.8.9 Rebuilding the 1E Catalog 875
1.9 Troubleshooting 880
1.9.1 1E Support contact details 880
1.9.2 The technical support process 881
1.9.3 Log files 883
1.9.4 Known issues 884
1.9.5 Server installation issues 936

1 Tachyon

Tachyon platform is a systems management tool based on the concept that a device is aware of its own current state more accurately than any centrally held repository. Also, if you can query the device directly then the need to store masses of data becomes unnecessary.

1.1 Introducing Tachyon

An overview of the Tachyon is presented; what it does and how it can benefit your organization.

1.1.1 Tachyon real-time features

1.1.1.1 Introduction

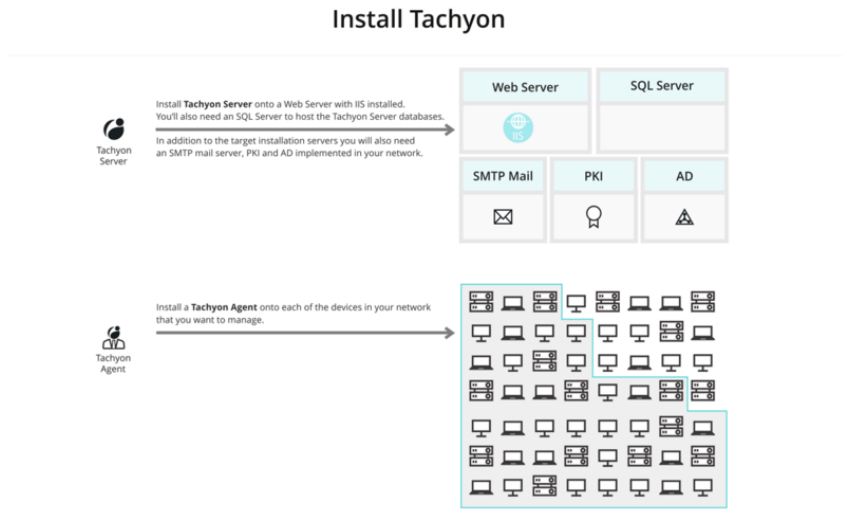
Tachyon is a systems management tool that turns the traditional systems management model on its head. It is based on the concept that a device is aware of its own current state more accurately than any centrally held repository. Also, if you can query the device directly then the need to store masses of data becomes unnecessary.

1.1.1.2 Implement Tachyon

To implement Tachyon you need to design, install and verify your installation. Full details can be found in Planning for Tachyon.

Broadly speaking, installation is done in two steps:

1. Install Tachyon onto an appropriate Windows server with IIS installed.
2. Install a 1E Client onto each of the devices you want to manage.



1.1.1.3 Add Instruction Definitions to Tachyon

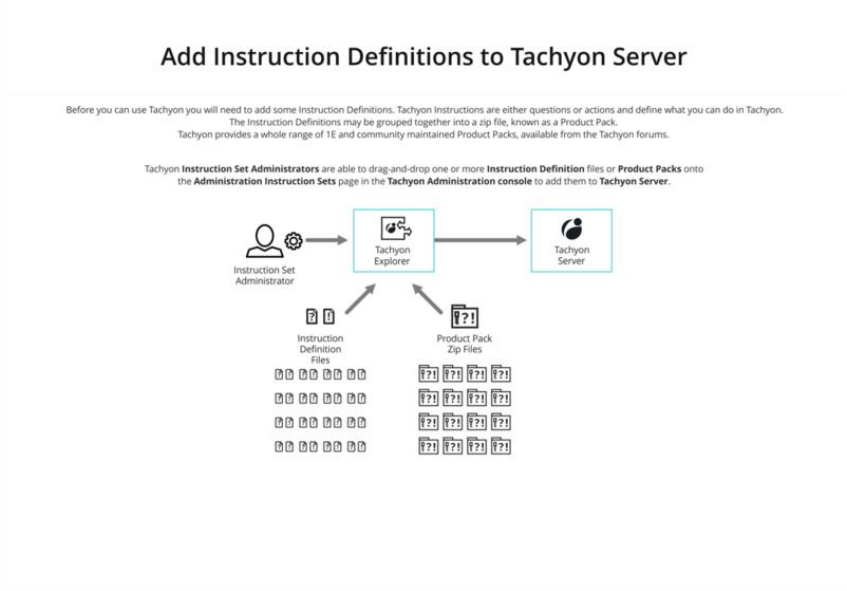
Using the Tachyon administration console, import Instruction Definitions into Tachyon. An Instruction Set Administrator can load Instructions by dragging and dropping one or more Instruction Definition files onto the interface. The Instruction Definitions may also be grouped together in a zip file, known as a Product Pack, and added in a single operation.

When uploaded, the administrator then assigns the instructions to one or more Instruction Sets. The administrator also assigns permissions to Instruction Sets to control who can ask questions, and perform and approve actions, as well as assigning Management Groups to control which devices the instructions can be sent to.

1E provides a number of Product Pack zip files available in the **Tachyon Platform Product Packs** zip (available on the 1E Support Portal) and from the Tachyon Exchange (https://exchange.1e.com/). Each Product Pack contains a related collection of Instruction Definitions.

Full details of adding Instruction Definitions can be found in Instruction sets page.

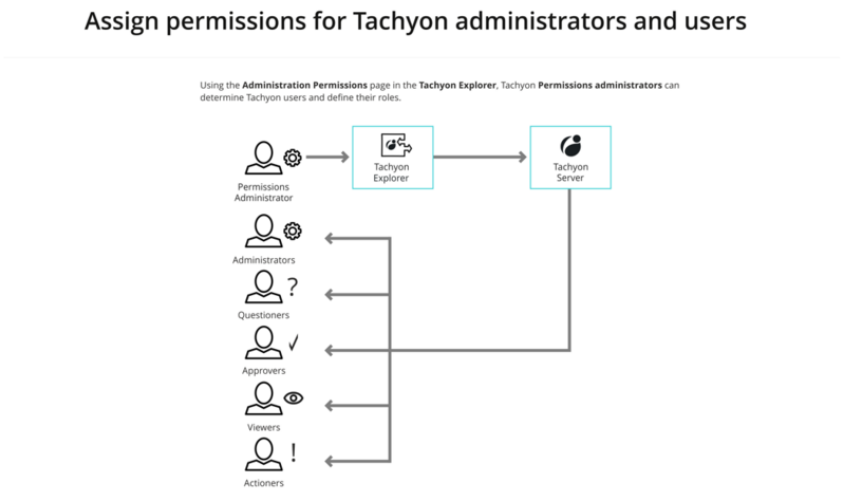
Integrated Product Packs provide ready-made policies for Guaranteed State but also include instructions. To upload these, please refer to -Uploading Integrated Product Packs.



1.1.1.4 Assign permissions for Tachyon administrators and users

Following on from installation you then assign permissions to particular users corresponding to the Tachyon administration roles and instruction set questioner, actioner, approver, and viewer roles.

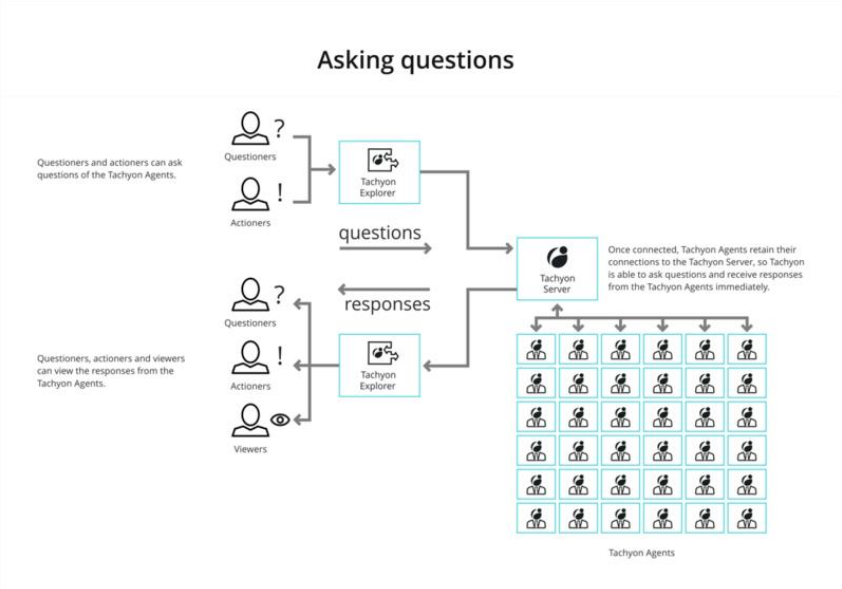
Full details of assigning permissions for Tachyon administrators and users can be found on the Users and Groups page and the Roles page.



1.1.1.5 Sending instructions - asking questions and performing actions

Using Tachyon Explorer questions can be asked of Tachyon client devices by users with the questioner or actioner roles. The responses can be viewed by viewers, questioners and actioners.

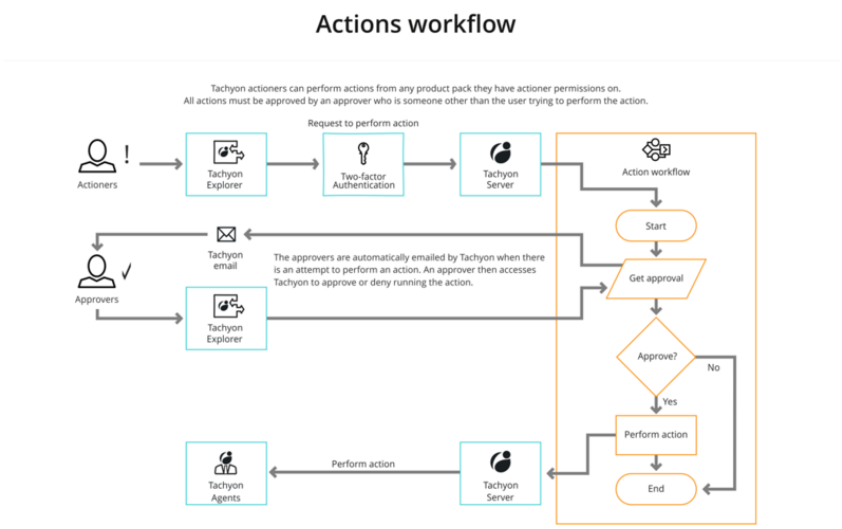
Details on asking questions can be found in [ExplorerHome page, questions and responses](#).



Using Tachyon Explorer, actions can be performed on Tachyon client devices by users with the actioner role on an instruction set, subject to the following:

- They will need to enter their password
- If the action has been configured to use two-factor authentication, they will need to enter the authentication code
- They will need the approval of someone other than themselves with an approver role.

Details on performing actions and the approval workflow can be found in The action approval workflow.

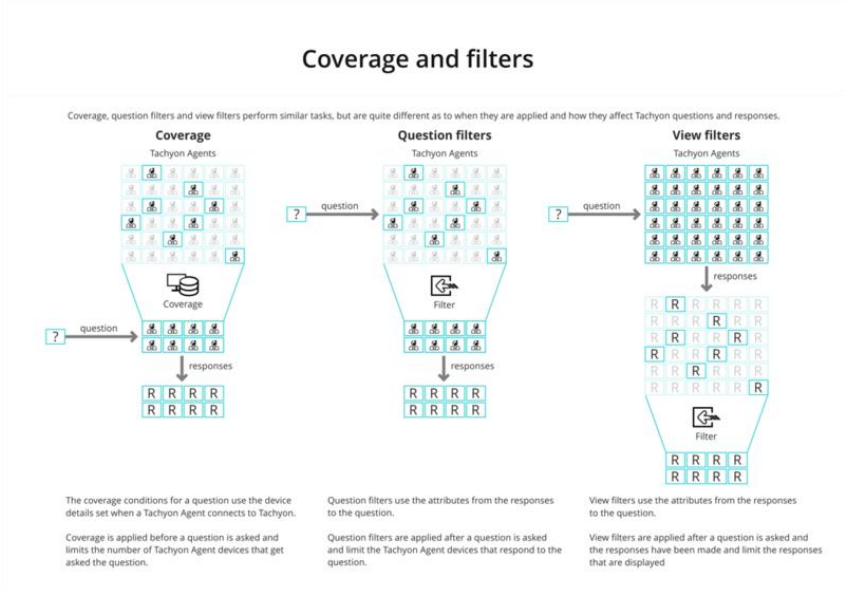


1.1.1.6 Coverage and filters

You can use coverage and filters to reduce the amount of network traffic caused by asking a question. They are also useful in reducing the amount of data that is presented to Tachyon users. Tachyon provides coverage, question filters, and view filters.

- Coverage is applied before a question is asked and reduces how many client devices get asked the question. Coverage uses the device properties that are sent by a client when it connects to Tachyon.
- Question filters are applied to the client after the question has been asked and use the attributes from the question responses to determine whether the client should send the response.
- View filters are applied in the Tachyon Explorer after the responses have been sent and reduce the responses that are displayed.

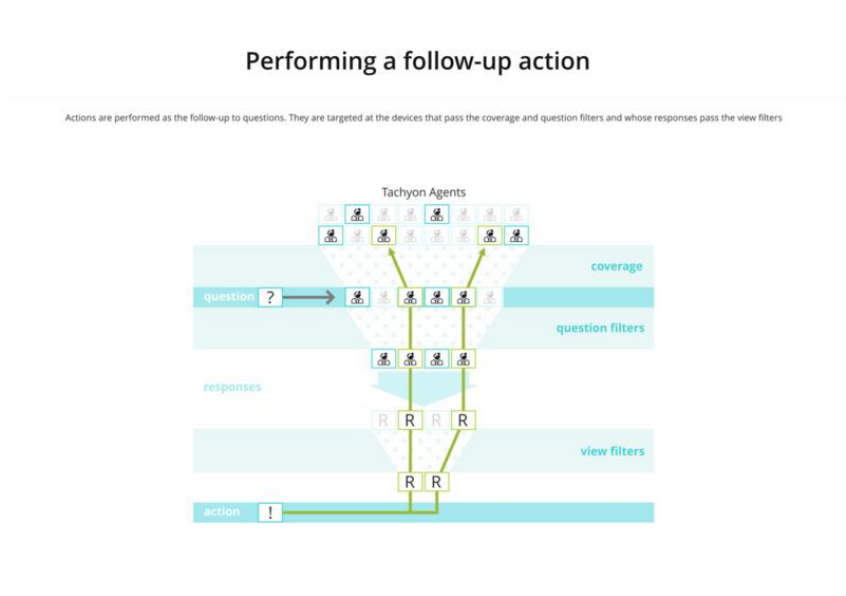
For more information see Coverage, question filters and view filters.



1.1.1.7 Performing follow-up questions and actions

You can perform a follow-up question or action after a previous question has been asked. Each follow-up causes the previous questions to be re-asked to detect any real-time changes. Any coverage, question, and view filters are applied to the responses, as shown.

For more information see Refining responses with follow-up questions and Performing an action - tutorial.

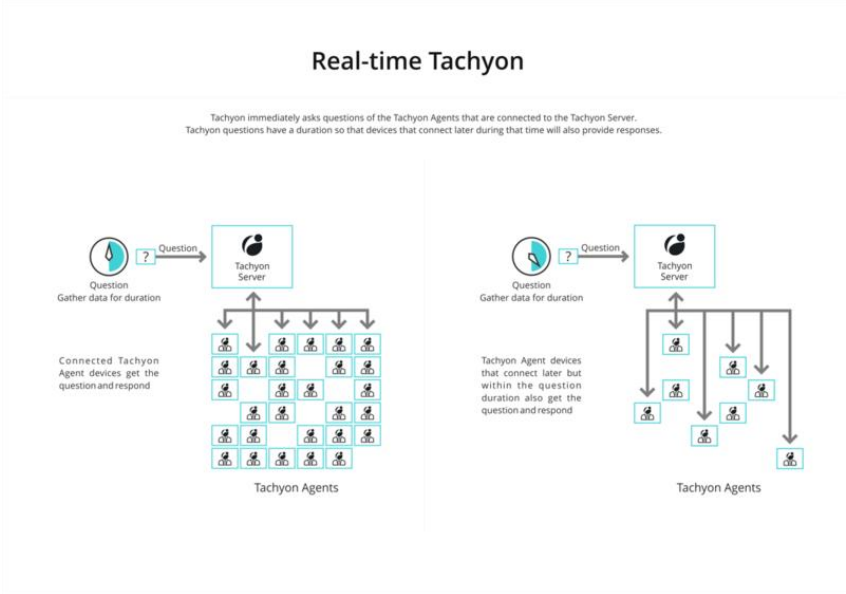


1.1.1.8 Real-time Tachyon

Tachyon works in real-time, so not all the devices may be connected at the time a question is asked. Tachyon questions have a configurable duration that they will gather data for - allowing devices that connect later, within the **gather data for** duration, to respond.

Questions also have a configurable **keep answers for** duration - given that the answers from a live network can potentially get stale quickly, and Tachyon questions are fast enough that you can simply ask again rather than relying on old answers.

Details on asking questions can be found in ExplorerHome page, questions and responses.



1.1.1.9 Basic Instruction flow

The picture shows the basic flow of Tachyon Instructions between its components. For simplicity, the workflow section, where the Instruction is authenticated and verified, has been omitted.

The basic Instruction flow is:

1. A Tachyon Consumer initiates an Instruction using a request to the Consumer API.
2. The Consumer API stores the Instruction in the Tachyon Master database.
3. The Instruction is authenticated and verified by the Workflow and becomes ready for processing by the Core.
4. The Core relays the Instruction to the Switch.
5. The Switch transmits the Instruction to the appropriate connected Tachyon clients.
6. The Tachyon clients process the Instruction on their devices and produce responses in real-time.
7. The Tachyon clients pass the responses to the Switch, intelligently minimizing bandwidth utilization.
8. The Switch relays the responses to the Core.
9. The Core stores the responses in the Responses database while intelligently minimizing the amount of data and maximizing the speed of retrieval.
10. The Consumer API fetches the responses from the Responses database and makes them available to the Consumer.

Tachyon architecture has been designed for the sending of Instructions and gathering of responses for thousands of devices in seconds.

1.1.1.10 Content delivery

To maximize the speed of Instruction delivery and gathering responses from its clients, Tachyon keeps the size of Instructions to a minimum fixed size. If you want to run an Instruction that requires a script or other sizable resource in order to carry out its functionality, this is made available using an alternative mechanism using the Background Channel.

The first step in the content delivery process actually occurs before the Instruction is used when the Instruction containing the resource is first loaded into Tachyon:

1. An Instruction Set Administrator loads an Instruction definition with an associated script, or other sizable resource, into Tachyon using Explorer.
2. The Consumer API copies the script or resource to the Background Channel.
3. The Consumer API stores the Instruction and resource in the Tachyon Master database.

After the Instruction has been loaded into Tachyon:

1. A suitably permissioned Tachyon Questioner or Actioner requests the Instruction.
2. The Instruction request flows through the Tachyon components as normal.
3. This time, when the Instruction gets to clients, they know that they need to download the Instruction's script or resource in order to process the Instruction.
4. The script or resource is downloaded from the Background Channel using HTTPS.
5. If Nomad is installed on the client device it will be used for the download, providing all its download optimization features to speed up the process.
6. Once the script or resource file has been downloaded to the client device it processes the Instruction and returns the responses made as a result of using the script or resource.
7. The responses flow back through the Tachyon components as normal.

1.1.2 Tachyon Inventory and Catalog features

1.1.2.1 Introduction

Tachyon is a systems management tool that turns the traditional systems management model on its head. It is based on the concept that a device is aware of its own current state more accurately than any centrally held repository. Also if you can query the device directly then the need to store masses of data becomes unnecessary.

Inventory features

Inventory captures data from different sources, then consolidates, normalizes, and stores it in Inventory repositories.

AI Powered Auto-curation

Describes the AI Powered Auto-curation feature that improves software inventory results.

Manage associations

Applications and Packages in Configuration Manager are identified by a name and optionally publisher and version arbitrarily determined by the Configuration Manager administrator that created them. Tachyon uses a standard Vendor, Title, Version, and Edition format to identify applications.

The **Manage Associations** section of Inventory enables an administrator to effectively normalize the Applications and Packages imported from Configuration Manager by associating them with a Vendor, Title, Version, and Edition defined in the 1E Catalog. These associations are then used to define migration rules in Introducing Application Migration and reclaim rules in Introducing AppClarity.

1E Catalog is a prerequisite for installing the SLA components of Tachyon. SLA uses 1E Catalog to normalize or match source inventory information, for example, software devices and processors.

1E Catalog allows you to:

- Have a consistent view of your estate
- Uniquely identify software deployed in your estate
- Identify device types (laptop, desktop, virtual machine), operating system, device family, device manufacturer, and maximum number of processors
- Normalize processor information like processor model, processor family, vendor name, and number of cores of processors running on your devices
- Define and apply bundling rules to identify suites and their components
- Define and apply entitlement rights, such as version upgrade/downgrade, edition downgrade, and software assurance rights which are used during license demand and compliance calculations
- Apply autofill entitlement information using software SKU.

1.1.3 Tachyon Features

An overview of Tachyon features and enhancements. The page provides a brief overview of each feature and links to other pages with more detail.

1.1.3.1 Installation

Tachyon provides a setup wizard that installs all the separate parts of the Tachyon platform using their individual installers. It is used to validate a server prior to running the installers, and supports a range of configurations as described in Tachyon configuration options.

1E Client installers are also provided for Windows and packages for supported non-Windows OS.

Introducing 1E Client Deployment Assistant is a wizard that assists Configuration Manager with deployment of 1E Client and other 1E Client agents, guiding you through common settings for clients and deployments.

1.1.3.2 Tachyon Explorer features

Explorer gives you the ability to investigate, remediate issues and manage operations across all your endpoints in real time. For more information, please refer to Using Tachyon Explorer.

Here's an overview of the features available in the Explorer application.

1.1.3.2.1 Questions, actions and their responses

Explorer lets you directly question connected devices to retrieve responses, run actions, and get real-time information from them. The Explorer front-end capabilities ensure fast querying, investigation, and remediation.

The questions, responses and actions feature includes:

- Graphical display of response information
- Instruction impact assessment
- Response history.

Note

For more information on Instructions and their responses, please refer to:

- ExplorerHome page, questions and responses
- Question parameters
- Instructions
- History.

1.1.3.2.2 Exporting data from Tachyon Explorer

Results visible in Explorer can be exported to files containing comma-separated values (CSV) or, in the case of the **Export all** option on the instruction response page, tab-separated values (TSV), and results can be marked for export at the point of asking a question to automate the process. Explorer lets you export the data on a number of pages to CSV files:

- Instruction history
- Responses - you can export a single page or all results once the Instruction has finished gathering responses - these can then be used for auditing purposes or to drive external programs
- Drill-down responses
- Device information.

Note

For more information on exporting data from Explorer, please refer to:

- Exporting data from Explorer.

1.1.3.2.3 Coverage, question filters, view filters and follow-on instructions

Questions and responses can be tailored to focus on specific ranges of devices through the use of coverage and filters:

- Coverage acts first to let you restrict the devices that will be asked a given question

- Question filters act before devices have responded to narrow the responses that are sent
- View filters act after the responses have been sent to focus the responses presented to the user and to determine the input into the follow-on instructions

The responses to initial questions can be further refined by asking follow-on questions or actions, allowing questioners and actioners to focus in on the results they want to see.

Note

For more information on coverage, question filters, view filters and follow-on instructions, please refer to:

- Coverage, question filters and view filters
- Limiting coverage using a Management group - tutorial
- Refining responses with follow-up questions.

1.1.3.2.4 Approval workflow

To enhance the safety of running actions in the Tachyon system, there is an approval workflow that ensures that every Tachyon action requires the approval of designated approvers before it can be run. To make it even safer, someone with approval permissions cannot approve their own action.

When an attempt is made to run an action, the Tachyon approval workflow sends an email and a notification to all the approvers associated with the action. Any of the approvers may approve or reject the request to run the action.

Note

For more information on the Approval workflow, please refer to:

- The action approval workflow
- Performing an action - tutorial.

1.1.3.2.5 Authentication

Users must provide their user credentials when attempting to run an action, this prevents unauthorized access by a third party attempting to make use of an unattended computer.

Actions can also be configured to require two-factor authentication. This is where the user attempting to run an action is challenged to enter a unique, one-time authorization code that has been sent to them by an alternative method such as email or a registered mobile.

Note

For more information on authentication, please refer to:

- Two-factor authentication.

1.1.3.2.6 Task-based organization for accessing and scheduling instructions

Tachyon provides a way of accessing the questions and actions that is organized around the way that network administrators typically interact with their network. This interface also lets you run the Instruction using a schedule.

The **Explorer→Instructions→Tasks** page in Explorer provides a structured view of the instructions defined in the Product Pack. It also lets you schedule the tasks so they can be run in the future or according to a particular schedule.

1.1.3.2.7 Using task groups

The benefit of using **Tasks** lies in the task group structure that is defined in the Product Pack. It is this structure that enables you to focus in on specific task areas to find the particular instruction that you want.

For example you may be interested in instructions related to particular software vendor's products. Depending on the Instructions that you have uploaded to your Tachyon system you may see the following structure:

- At the top-level there is a **Software Vendors** task group whose children are **1E** and **Microsoft**.
- Underneath the **1E** task group there is a **Tachyon** group that contains **Configuration**, **Diagnostics** and **Verification** groups as well as a couple of Instructions.
- Underneath the **Microsoft** task group is the **Configuration Manager** task group containing Instructions related to that product.

Note

For more information on using Task groups to access and schedule Instructions, please refer to:

- Tasks
- Scheduling instructions
- Scheduling instructions - a tutorial.

1.1.3.2.8 Inventory and connectivity

The **Devices** page in the Explorer shows you all the devices that have connected with Tachyon and their current connection status. There are two views provided that let you research the devices: the devices table and the devices dashboard, please refer to The Devices Table and The Devices Dashboard for more details.

Note

For more information on inventory and connectivity, please refer to:

- Investigating Devices
- Using the Devices dashboard - Tutorial.

1.1.3.3 Guaranteed State features

The Guaranteed State application gives you the ability to ensure device compliance with enterprise IT policies. For more information please refer to the Using Guaranteed State section of this documentation.

1.1.3.3.1 Policies and Rules

The Guaranteed State state of a device is enforced by the Tachyon client at the device. One or more policies are deployed to devices according to the management groups the devices belong to. Each policy consists of one or more rules that are either check rules or fix rules.

Rule	Explanation
Check	Allow you to verify that a device has a particular state, such as a registry key having a specific value. You can then view summary and detail reports which show devices that are compliant and not compliant with the check rules.
Fix	Allow you to define a desired state for the device and then enforce that state. For example, you could mandate that a registry key exists and contains a specific value. Again, you can report on the application of these fix rules to devices.

For an explanation of management groups, please refer to the Management Groups page. Management groups allow devices to be flexibly grouped, based on management group rules. This means you can easily administer devices based on, for instance, their Active Directory Organizational Unit, or their operating system version, or any other criteria supported by the management group rules.

Note

For more information on policies and rules please refer to:

- Defining your own policy
- Integrated Product Packs.

1.1.3.3.2 The Guaranteed State Overview page

The **Overview** page lets you view the current state of your enterprise in terms of the devices and policies that have been defined and applied. It consists of a number of charts that let you monitor the state in real-time.

Note

For more information on the Guaranteed State Overview page please refer to:

- Guaranteed State Overview page

1.1.3.3.3 Guaranteed State Reports

The Guaranteed State application provides three reports that let you view the details for the currently defined **Policies**, **Rules** and **Devices**. The information in these reports is consolidated into the **Guaranteed State Overview** page charts.

Note

For more information on the **Policies**, **Rules** and **Devices** reports pages please refer to:

- Guaranteed State Overview page

1.1.3.3.4 Exploring devices

Guaranteed State provides a **Devices** page where you can view the currently connected devices. On this page you can also select one or more of the devices and click an **Explore** button that launches the **Explorer** application. You can then run an instruction using the selected devices as the coverage for the instruction.

Note

For more information on exploring devices please refer to:

- Using Explorer to investigate devices in Guaranteed State.

1.1.3.3.5 Device Criticality

Device criticality is an attribute of a device that defines its importance within an organization. The default definition in Tachyon has these settings:

- Undefined (or not set)
- Non-critical
- Low
- Medium
- High
- Critical.

At present, criticality settings do not affect the primary operation of Guaranteed State. However, it is possible to use Tachyon to set device criticality and to view it within Guaranteed State.

Tachyon also supports the use of the criticality setting when defining coverage for an instruction. For example, you can target an instruction to be sent only to devices whose criticality is not **Critical**.

Note

For more information on device criticality please refer to:

- Using Device Criticality.

1.1.3.4 Settings features

The Settings application lets you configure Tachyon system and application settings. For more information please refer to Using Settings.

Here's an overview of the features available in the Settings application.

1.1.3.4.1 Instructions, product packs, Instruction sets and permissions

Tachyon lets you investigate your network using questions and actions, which are collectively known as Instructions.

You can load Instructions into Tachyon, either individually or using a Product Pack, which is essentially a zip file containing one or more Instructions. Tachyon comes with a range of pre-framed questions and actions in the form of Product Packs, providing extensive out-of-the-box capabilities that can be extended as new and updated Product Packs are made available.

Tachyon permissions for the Instructions are handled using Instruction sets. You create Instruction sets, then define roles which specify particular permissions on those sets and then assign the roles to users. Each Instruction is only allowed to reside in one Instruction Set, which associates it with a role and thereby the users that have that role and can run the Instruction. The roles have associated Management groups that determine the devices that users with the role have access to.

When Instructions are loaded into Tachyon they are placed in the default **Unassigned** Instruction Set, so you must move them into previously created Instruction sets before they can be run.

> **Note**
>
> For more information on uploading product packs into Tachyon and managing Instruction sets, please refer to:

- Instruction sets page

1.1.3.4.2 Connectors

Connectors are used to connect to other 1E and third party systems and populate repositories. When more than one connector to different data sources are used, the information from those different data sources is de-duplicated and normalized into a single cohesive view that is then stored in a repository. In this way you can use the data from different sources to augment each other and build a better picture of "what's out there?".

For example, you can sync inventory data from Configuration Manager into an inventory repository, which will fetch information about your Windows devices. You could then augment that with inventory data synced from Tachyon platform which could include information about non-Windows devices where the Tachyon client has been installed.

> **Note**
>
> For more information on connectors, please refer to:

- Connectors page

The following connectors are supported:

- BigFix connector — Connects to a BigFix Inventory database server.

- BigFixInv connector — Connects to a BigFix Inventory database.
- File Upload connector — Uploads inventory data from a folder containing tab (TSV) and comma (CSV) separated value file(s).
- Intune connector — Connects to an Intune application and collects inventory and usage data.
- Microsoft Office 365 connector — Connects to an Office 365 application in InTune and pulls in inventory and usage data.
- OpenLM connector — Connects to an OpenLM database server.
- Oracle LMS connector — Connects to Oracle LMS and queries it for inventory information.
- ServiceNow connector — Connects to a ServiceNow instance to import basic inventory data into SLA Platform.
- System Center Configuration Manager connector — Connects to a Configuration Manager database and pulls in inventory and usage data.
- Tachyon connector — Connects the Tachyon and SLA components to support Management group and Tachyon Powered Inventory features. The Tachyon Powered Inventory feature uses instructions to fetch inventory data from Tachyon clients, and is a prerequisite for Patch Success.
- vCenter connector — Connects to a vCenter server and pulls in inventory data.
- Windows Server Update Services connector — Connects to a WSUS database and pulls in patch data.

1.1.3.4.3 Repositories

Repositories are used by applications to process and store information. For example the Patch Success application uses both an inventory and a BI repository to process the information needed to report on how successful patching is in your enterprise. Normally a connector is used to connect a data source to an appropriate repository.

Tip

Repositories are also useful when you want to segregate different types of data. For example, you could have one inventory repository for Configuration Manager inventory data, and another one for BigFix data. Alternatively, you can have connectors to different inventory sources pushing data into one repository. Any Management Groups that you create will span all the repositories you have.

Note

For more information on managing repositories, please refer to:

- Repositories page

1.1.3.4.4 Device Tags

Device Tags are generally associated with Explorer and can be used when setting coverage to target Instructions to particular devices, but they can also be used to define Management Groups optionally used by all applications.

Device Tags must be defined by a **Full Administrator** before they can be used to tag devices or used to set the coverage of Instructions.

This is done from the **Settings**→**Configuration**→**Custom properties**→ **Device Tags** page, which can be viewed by users with the **Full Administrator** role.

Note

For more information on managing and using Device Tags, please refer to:

- Device Tags page
- Adding properties - tutorial
- Actions to set tags - tutorial
- Using tags to set the coverage for a question - tutorial.

1.1.3.4.5 Software Tags

Using Software Tags allows you to create custom labels and associate them with the software titles you have deployed in your estate.

You can do this from the **Settings**→**Configuration**→**Custom properties**→**Software Tags** page, which can be viewed by users with the **Full Administrator** role.

Using Software Tags allows you to create custom labels and associate them with the software titles you have deployed in your estate. An administrator with either the **Full Administrator** or **Group Administrator** role can set Software Tags in their environment, they can also create Management Groups based on the tag name and value. For details about configuring Tachyon users, Roles, and Management Groups refer to the Permissions Menu pages.

In short, you can work with Software tags by:

1. Creating your Software Tag.
2. Associating the new tag with a software title.
3. Creating a Management Group based on the Software Tag name and Tag value rules (This step can be run anytime before evaluation).
4. Evaluating the new Management Group by running a Basic Inventory Consolidation.

If an administrator adds or modifies Software Tags or associations, they will have to run the Management Group evaluation report again to see the updated devices reflected in Inventory.

1.1.3.4.6 Schedules

Schedules can be created to execute specific operations on repositories in Tachyon so that they are kept up to date with their data sources and processing. These operations include:

- Syncing data sources to repositories using connectors

- Processing the BI data cube.

Repository schedules are different to Instruction schedules that can be set in Explorer.

Note

For more information on setting schedules, please refer to:

- Schedules page.

1.1.3.4.7 Consumers, Applications, Components and Providers

There are pages in the Settings application for each of these. They are described in the following table:

Configuration objects	Description
Consumers	These can access Tachyon using the Tachyon Consumer API. To enhance the security of the Tachyon system. Only consumers that have been registered on the **Settings→Configuration→Consumers** page will be allowed to access Tachyon.
Applications	Features of that are hosted in the Tachyon Portal. Applications are generally Consumers as they need to interact with Tachyon using the Tachyon API. These are available on the **Switch App** menu.
Components	These form part of SLA and cannot be changed or altered by a user. These can be viewed using the **Settings→Configuration→Components** page.
Providers	These are components that can be configured to provide a particular operation in SLA. These can be viewed and configured using the **Settings→Configuration→Provider configuration** page.

Note

For more information on Consumers, Components and Providers, please refer to:

- Consumers page
- Components page
- Provider configuration table

1.1.3.4.8 Information pages

Information on your Tachyon license is available, as well as the ability to re-activate it following an update.

You can view information on the Tachyon system information for the Consumer, Coordinator, Background channel, Core and Switch.

Note

For more information please refer to:

- License information page
- System information page.

1.1.3.4.9 Monitoring log files

The monitoring pages let you view how Tachyon is performing its tasks. Four key log pages are provided:

Page	Description
Process log	Whenever you execute a sync or process a repository the steps are displayed here. This page is updated in real-time and shows the status of each step as it happens.
Sync log	The results of performing a sync are displayed here.
Infrastructure log	Information on the Tachyon infrastructure is displayed here, such as: license status and instruction workflow.
Audit information log	This page displays information on the Instructions that have been run in Explorer. This includes the instruction text and the user that requested it.

Note

For more information on monitoring please refer to:

- Process log page
- Sync log page
- Infrastructure log page
- Audit information log page.

1.1.3.4.10 Defining users and roles

Tachyon users or groups can be added from your IdP. They can be assigned roles that determine what aspects of Tachyon they can access. Custom roles can be created that let you associate particular permissions on particular Instruction sets for particular management groups.

Note

For more information on users and roles please refer to:

- Users and Groups page
- Roles page
- Configuring Access Rights - tutorial.

1.1.3.4.11 Management groups

Management groups use inventory-based rules to define groups of particular devices, they are implemented in SLA and then made available to Tachyon applications and other consumers. After a management group is defined, each time the inventory is updated the device membership of the groups is re-evaluated by applying the management group's rules to the new inventory.

Custom roles can be created that tie particular Instruction sets to particular management groups. This means you can not only set the permissions for users to access the Instructions in specific Instructions sets, you can also determine which devices they can target using those Instructions.

Once defined, management groups can then be used to set the coverage for Instructions in Explorer and also which devices can be targeted by particular users. Management groups are also used by other applications to determine which devices are being targeted.

> **Note**
>
> For more information on management groups, please refer to:

- Management Groups page
- Management Groups - tutorial.

1.1.3.4.12 Uploading Instructions into Tachyon and creating Instruction sets

You determine the capabilities of Explorer by uploading Instructions from Product Packs into Tachyon. Product Packs are either provided with the release or downloaded from the 1E Exchange. Once the Instructions have been uploaded into Tachyon you then need to put them into Instruction sets. The Instruction sets can then be associated with custom roles to determine the permissions applied to the Instructions. The custom roles are then applied to users to determine which Instructions each user has access to.

> **Note**
>
> For more information on uploading product packs into Tachyon and managing Instruction sets, please refer to:

- Instruction sets page

1.1.3.5 Inventoryfeatures

The Inventory app captures data from different sources, then consolidates, normalizes and stores it in Inventory repositories. The Inventory app is also used to view and export inventory, and manage associations.

Inventory uses connectors to capture software, hardware and other data from sources such as Tachyon, Configuration Manager, Big Fix and vCenter where it is consolidated, de-duplicated and normalized. Normalization uses software and hardware entries in The 1E Catalog.

An empty repository called **Default Inventory** is provided out-of-the box. You can optionally create additional inventory repositories to partition data by source, time periods, or other purpose. To populate a repository, you must use one or more inventory connectors, and either manually sync the data or schedule a sync. For more detail, please refer to Repositories page and Schedules page in Settings.

Inventory repositories are used by the following applications:

- Introducing Patch Success - reports on and ensures successful patching of your enterprise
- Introducing Application Migration - automates the migration of applications during a Configuration Manager OS deployment
- Introducing AppClarity - manages entitlements, compliance and reclaiming unused software
- Any application - if you need it to use Management Groups.

1.1.3.6 Consumer applications

Applications are categorized as follows:

- Configuration - applications required to configure Tachyon platform and required by all other applications
- Client - applications that communicate with devices in real-time
- Inventory – applications that use inventory features.

1.1.3.6.1 Applications that are included in the Tachyon Platform license

Application	Purpose	Type
Inventory Insights	View and export inventory, and manage associations. It uses the SLA databases.	Inventory, configuration
Settings	Configure and monitor platform features. It uses the Tachyon Master database.	Configuration
Endpoint Automation	Ensure endpoint compliance to enterprise IT policies. It uses the Tachyon Master and Responses database.	Client
Endpoint Troubleshooting	Investigate, remediate issues and manage operations across all your endpoints in real-time. It uses the Nomad Master and Responses database.	Client

1.1.3.6.2 Applications that require a license

Application	Purpose	Type
Appclarity	Manage software license compliance, License Demand Calculations, license entitlements, and for reclaiming unused software. It uses the SLA databases.	Inventory

Application	Purpose	Type
Application Migration	Intelligently automate the migration of applications during a Configuration Manager OS deployment. It uses the SLA databases.	Inventory
Content Distribution	Manage content distribution across your organization using a centralized dashboard. It uses the Content Distribution database. 1E Client requires Tachyon and Nomad features to be enabled on all clients. Content Distribution replaces the Nomad features of ActiveEfficiency Server, which is deprecated. Legacy Nomad clients continue to be supported by direct communication with the Content Distribution API, whereas Nomad 8.x clients communicate with the Content Distribution API via the proxy feature on Response Servers. Tachyon Setup is used to install Content Distribution, and the Nomad app, and no longer installs ActiveEfficiency. Nomad uses Content Distribution for the following features: • Nomad app provides visibility of content distribution activity • Single-site download - SSD • Single Site Peer Backup Assistant - SSPBA • High Availability PBA (HAPBA) • Get Migration Settings task sequence action used to manage computer associations • Nomad Pre-caching • Nomad Download Pause.	Client
Patch Success	Reports on and ensures successful patching of your enterprise. It uses the SLA and BI databases. Requires SLA Business Intelligence to be installed by Tachyon Setup, as described in 1E Business Intelligence above. It also needs	Inventory

Application	Purpose	Type
	connectors to get meta-data for patches from whichever of the following that you use to approve patches: • Configuration Manager (SCCM) if it is configured to manage WSUS • Windows Server Update Services (WSUS).	
Experience Analytics	Measure performance, stability and responsiveness for applications and devices to assess user experience across your enterprise. It uses the Tachyon Master and Experience databases.	Client

1.1.3.7 The 1E Client

The 1E Client provides functionality to Tachyon. On Windows devices, the 1E Client provides client features and modules for other 1E products. On non-Windows devices, the 1E Client only provides Tachyon features.

Tachyon enables rapid response to instructions using the 1E Client, which supports the retrieval of information, running actions and device tagging. The 1E Client can also be extended to support additional features. On Windows OS, the 1E Client is installed as a service, with a small footprint.

1.1.3.7.1 Supported Platforms

All 1E Client features are supported on the following Windows OS:

Windows

- Windows Server 2022
- Windows Server 2019
- Windows Server 2016
- Windows 11 CB 21H2
- Windows 10 CB 21H2
- Windows 10 CB 21H1
- Windows 10 CB 20H2

The zip for 1E Client for Windows is available for download from the 1E Support Portal, https://1e.my.site.com.

Professional and Enterprise editions are supported for Windows 10 and Windows 11.

All versions are provided with 32-bit & 64-installers, and can be installed on physical and virtual computers.

Note

This list is automatically updated to show only those OS versions in mainstream support by Microsoft, and therefore supported by 1E, and by 1E Client 8.1.

Please refer to Constraints of Legacy OS regarding the end of mainstream support.

For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.

Please refer to https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions.

The Tachyon client features of 1E Client are supported on the following non-Windows OS:

macOS

- macOS Monterey 12.0
- macOS Big Sur 11.0
- macOS Catalina 10.15
- macOS Mojave 10.14

Linux

- CentOS Stream 8
- Debian 10.4
- Fedora 34
- Red Hat Enterprise Linux 7.9
- Red Hat Enterprise Linux 8.5
- SUSE Linux Enterprise 15.2
- Ubuntu 18.04

Solaris

- Please use 1E Client 5.2

Other versions of these non-Windows OS should work but have not been tested by 1E.

1E Client packages for other Linux distributions can be requested, including Raspbian for Raspberry Pi.

The 1E Client for Linux supports the following architectures:

- Linux variations on Intel 64-bit platforms

1E Client packages for Linux are included in the non-Windows zip available for download from the 1E Support Portal, https://1e.my.site.com.

1E Client supports only Tachyon features on non-Windows devices.

1E Client 8.1 is ***not*** available for Solaris, please use 1E Client 5.2 instead.

The 1E Client 5.2 for Solaris supports for the following architectures:

- Solaris on Intel 64-bit and SPARC platforms

1E Client 5.2 package for Solaris is included in the non-Windows zip available for download from the 1E Support Portal, https://1e.my.site.com.

1E Client supports only Tachyon features on non-Windows devices.

1.1.3.7.2 Tachyon Activity Record feature

Tachyon clients capture certain types of event data in a local database (Persistent Storage) so that instructions can query later. Data is compressed and encrypted in a way that ensures a very low impact on device performance and security.

Tachyon Activity Record is similar to Windows Task Manager and Perfmon. On Windows client devices Tachyon continuously captures events, which enables all significant events to be captured as they happen. Other OS use polling, which requires the polling frequency to be regular enough to ensure brief events are captured.

1.1.3.8 System status bar and notification area

Tachyon includes a system status bar that displays the number of Tachyon instructions in progress and current and historical connectivity information for the total number of devices connected to Tachyon.

The notification area provides information on the logged on user or administrator and access to their notifications.

1.1.3.9 Certificates

Tachyon uses certificates on the Tachyon Server and client devices to maintain the security of the system. Any custom Instructions must be code-signed with a certificate that has been registered in your 1E license before they can be run in Tachyon.

The certificates feature includes:

- Support for Cryptographic Next Generation certificates
- Upgrade to the latest version of OpenSSL v1.0.2h
- Security to enforce 1E Client device certificates.

1.1.3.10 Tachyon integration

Tachyon can integrate with 3rd party products. It integrates seamlessly with Microsoft System Center Configuration Manager, it can use Content Distribution to add content download capabilities, provides a fully-featured consumer API and can even be used as a response delivery mechanism by 3rd party applications.

1.1.3.10.1 Consumer management

Tachyon provides a dedicated page where the 3rd party consumers can be enabled and managed by Tachyon Consumer Administrators, as described on the Consumers page.

1.1.3.10.2 Microsoft System Center Configuration Manager console integration

Configuration Manager users can use all the features of Tachyon from within the Configuration Manager console.

- Run questions and actions that target the devices in Configuration Manager collections.

1.1.3.10.3 1E Client integration with Content Distribution to enable efficient download of content

Tachyon can leverage the features of the industry-respected Content Distribution to enable content to be downloaded to the Tachyon client device. Using Content Distribution provides the following benefits:

- Significantly reduces the bandwidth required for delivering software
- Small offices or sites connected via poor network links can receive software updates more reliably
- Reduces the need for large numbers of Configuration Manager servers
- Faster Configuration Manager implementations because fewer servers are required
- Distribute software to home, mobile and remote office users
- Low cost – easy to deploy
- No new infrastructure or skills required
- Reduces software distribution costs

The feature is a set-and-forget option on the 1E Client . By default, it is enabled and means that Tachyon will automatically use Content Distribution to download content if it is installed on the 1E Client device (Content Distribution is currently supported on Windows devices only). The prerequisites for using Content Distribution are given on Supported Platforms. The options for configuring Content Distribution integration are NomadContentDownloadEnabled and NomadContentDownloadTimeoutSecs in the **1E Client configuration file**.

1.1.3.10.4 Tachyon consumer API

Tachyon implements a complete API for controlling the questions, answers, responses and workflows that implement the Tachyon features for third-party applications including ServiceNow.

The Tachyon API feature includes:

- Consumer API versioning
- Improved version and error reporting support in Consumer API
- Extended RBAC API extensions for consumers

1.1.3.10.5 Tachyon can offload responses directly to 3rd party applications

Tachyon can be used as the means to gather data for 3rd party applications. Using its fast response time to gather the data, it then be configured to pass the data on without storing it locally. The offloading is configured for each consumer on the Consumers page. To use this feature, the consumer must be configured to use the offloaded responses data.

1.1.3.11 Telemetry

Telemetry helps 1E to continually improve your experience with Tachyon. Only summarized statistical information is collected, which enables 1E to see how customers use features of the application. No personally identifiable data is collected. 1E use this information to:

- Understand how the product is being used to influence future development decisions
- Plan supported platforms (OS, SQL etc. versions) over time
- Deliver a smooth upgrade experience as we can focus testing on implemented scenarios
- Improve system performance
- Identify early warning signs of potential issues such as excessive growth of database tables, instruction failures etc. so we can pro-actively address them.

Server telemetry reports how the platform is used and data is compressed, encrypted and sent to 1E through email on a configurable schedule. Full details of the Server telemetry data sent to 1E is provided in Server telemetry data.

User Interface telemetry reports how the user interface is used, and data is sent directly from administrator browsers to the 1E Cloud.

Telemetry features are configurable using Tachyon Setup during installation or upgrade, and can be enabled or disabled as a post-installation task. 1E encourages customers to enable sending telemetry.

1.1.4 Tachyon Architecture

A description of Tachyon Stacks and their Tachyon components, the Tachyon clients, and how they connect to provide Tachyon features.

1.1.4.1 Tachyon deployment architecture

At the top-most level, Tachyon architecture consists of Tachyon Server components, grouped into Stacks, and clients that are deployed onto the devices that you want to manage.

1.1.4.1.1 Tachyon Server Stacks

Every Tachyon system has a single **Master Stack**, which provides web services for Tachyon applications. Master Stack components are typically all installed on a single **Master Server**.

Tachyon real-time features require **Response Stacks**, which are made up of one or more **Response Servers**. A **DMZ Server** is an example of a Response Server. Each Response Stack has at least one **Background Channel** for sharing resources and a single **Core** component that supports an associated set of up to five **Switches**.

Switches are the primary mechanism for rapidly requesting and retrieving responses from the **1E Client**. As each Switch can handle up to 50,000 devices there is a limit of 250,000 devices per Response Stack. Higher numbers can be achieved if you contact 1E for guidance. Switches may be local or remote to the other components in the Response Stack.

Databases for Tachyon, 1E Catalog, Nomad, Experience, SLA and BI, are installed on SQL Server database instance(s) that may also be local or remote to their respective Master and Response servers. It is also possible for multiple Response Stacks to share the same Responses database. The **Cube** used by Patch Success (SLA-BI) is installed on a local or remote SQL Server Analysis Services (SSAS) instance.

Please refer to the:

- Architectural requirements section for guidance on which architecture to choose
- Communication Ports reference page for connection details between components and ports necessary for firewalls.

1.1.4.1.2 Tachyon Single-Server system

In the most basic setup, there is a single server that hosts both a Master Stack and a Response Stack and this can be deployed by selecting the default settings in Tachyon Setup.

The following table shows the Tachyon platform components, including Tachyon Master and Response Stacks, and also shows the DMZ Server discussed in Tachyon architecture for Internet-facing devices.

Subsystem	Component	Web application	Master Stack	Response Stack	DMZ Server
Master Server	Tachyon Portal UI and applications	Tachyon	1		
Consumer API	Consumer	1			
Coordinator service		1			
Tachyon Master database		1 (optionally Remote)			
Experience	Experience API	Experience	1		
Experience database		1 (optionally Remote)			
Nomad	Nomad API	Nomad	1 (optional)		
Nomad database		1 (optionally Remote)			

Subsystem	Component	Web application	Master Stack	Response Stack	DMZ Server
1E Catalog	1E Catalog UI	CatalogWeb	1		
1E Catalog API	CatalogWeb				
1E Catalog Update Service					
1E Catalog database		1 (optionally Remote)			
SLA and Inventory	SLA Platform UI and SLA applications	Platform	1		
SLA Admin	Admin	1			
SLA Engine		1			
SLA Integrate services: • SLA Integrate Agent service • SLA Integrate Manager service		1			
SLA Operations Provider API	CoreExternal	1			
SLA databases (Data, Integrate, Shared)		1 (optionally remote)			
SLA Business Intelligence (BI) (for Patch Success)	MDX API (BI)		1		
SLA-BI database		1 (optionally Remote)			

Subsystem	Component	Web application	Master Stack	Response Stack	DMZ Server
SLA-BI cube (requires SSAS)		1 (optionally Remote)			
Response Server	Core	Core		1	
Background Channel	Background		1	1	
Switch(es) (also includes a single Switch Host service)			up to 5 (optionally Remote)	up to 5	
Tachyon Responses database			1 (optionally Remote)		

The picture shows a Tachyon Single-Server System with databases optionally installed locally or on remote SQL Server instance(s). Components colored green are optional in a Tachyon system.

The Response Stack can be installed on the same server as the Master Stack, and on remote servers.

The DMZ Server has only the Tachyon client-facing components of the Response Stack: the Background Channel and Switches.

1.1.4.1.3 Applications and Tools

Tachyon applications and tools are consumers, and all consumers connect to the Tachyon Consumer API.

The following consumer applications run on the Tachyon platform and are installed using Tachyon Setup. Please also refer to the License requirements page.

Applications are categorized as follows:

- Configuration - applications required to configure the Tachyon platform and required by all other applications
- Client - applications that communicate with devices in real-time
- Inventory – applications that use inventory features.

1.1.4.1.3.1 Applications that are included in the Tachyon Platform license

Application	Purpose	Type
Inventory Insights	View and export inventory, and manage associations.	Inventory, configuration

Application	Purpose	Type
	It uses the SLA databases.	
Settings	Configure and monitor platform features. It uses the Tachyon Master database.	Configuration
Endpoint Automation	Ensure endpoint compliance to enterprise IT policies. It uses the Tachyon Master and Responses database.	Client
Endpoint Troubleshooting	Investigate, remediate issues and manage operations across all your endpoints in real-time. It uses the Nomad Master and Responses database.	Client

1.1.4.1.3.2 Applications that require a license

Application	Purpose	Type
AppClarity	Manage software license compliance, License Demand Calculations, license entitlements, and for reclaiming unused software. It uses the SLA databases.	Inventory
Application Migration	Intelligently automate the migration of applications during a Configuration Manager OS deployment. It uses the SLA databases.	Inventory
#UUID39ecfb49a2e10e6f5820cc411d69d030	Manage content distribution across your organization using a centralized dashboard. It uses the Content Distribution database. 1E Client requires Tachyon and Content Distribution features to be enabled on all clients.	Client

Application	Purpose	Type
	Content Distribution replaces the Nomad features of ActiveEfficiency Server, which is deprecated. Legacy Nomad clients continue to be supported by direct communication with the Content Distribution API, whereas Nomad 8.x clients communicate with the Content Distribution API via the proxy feature on Response Servers. Tachyon Setup Setup is used to install Content Distribution, and the Nomad app, and no longer installs ActiveEfficiency. Nomad uses Content Distribution for the following features: • Nomad app provides visibility of content distribution activity • Single Site Download (SSD) • Single Site Peer Backup Assistant (SSPBA) • High Availability Peer Backup Assistant (HAPBA) • Get Migration Settings task sequence action used to manage computer associations • Nomad Pre-caching • Nomad Download Pause.	
/document/preview/763581#UUID-54875393-7855-5624-cbae-9ad5406e1c95	Reports on and ensures successful patching of your enterprise. It uses the SLA and BI databases. Tachyon Setup indstalls SLA Business Intelligence, which requires SQL Server Analysis Server.	Inventory

Application	Purpose	Type
	Patch Success also uses Inventory connectors to get meta-data for patches from whichever of the following that you use to approve patches: • Configuration Manager (SCCM) if it is configured to manage WSUS • Windows Server Update Services (WSUS).	
Introducing Tachyon Experience	Measure performance, stability and responsiveness for applications and devices to assess user experience across your enterprise. It uses the Tachyon Master and Tachyon Experience databases.	Client

The following types of application require 1E Client (with Tachyon features enabled) to be deployed to all in-scope devices.

- All Client applications
- Inventory applications if you intend using the Tachyon connector to populate your inventory.

The **AI Powered Auto-curation** feature is optionally used by Inventory applications to provide automatic curation of new products. This avoids having to manually add products to the 1E Catalog, or wait for it be updated. This optional feature requires additional memory on the Tachyon Server (Master Stack). Please refer to AI Powered Auto-curation: Memory requirements for details.

Some benefits of using AI Powered Auto-curation are that you can:

- Achieve significantly more normalized software from the first sync
- Reduce the manual effort required to normalize software
- Get an expanded SAM offering as more data is available for AppClarity
- Get additional coverage for Application Migration
- Identify more software to review for security threats.

1.1.4.1.3.3 Tachyon Tools

The following are tools included in Tachyon 8.1 platform. These tools are not installed using Tachyon Setup. They have either their own installers or are included in download zips.

- Tachyon ConfigMgr UI Extensions - installed as part of the Tachyon Toolkit, this is a right-click extension for the Configuration Manager console that provides the option to browse and run an instruction on devices in a specified Collection, refer to Preparing for the Tachyon extensions for the Configuration Manager Console. for details.
- Tachyon Run Instruction command-line tool - installed as part of the Tachyon Toolkit, it is used for sending instructions to the Tachyon server from a script or from a command prompt.
- Tachyon Product Pack Deployment Tool - included in the Tachyon platform zip ProductPacks folder.
- TIMS - used for the development of instructions using the Tachyon SDK, refer to /document/preview/736745#UUID-952f2552-fb04-d55c-6d12-fcf68313ecac for details.

A typical Tachyon license allows the use of all these tools.

1.1.4.1.4 Tachyon Multi-Stack system

The picture shows a Tachyon Multi-Stack System. Here the Tachyon Master Stack communicates with one or more Tachyon Response Stacks. A local Response Stack is not mandatory. Components colored green are optional in a Tachyon system.

As with a single-server system, the databases are optionally installed locally or on remote SQL Server instances(s).

1.1.4.2 Tachyon components

Let's take a look at each of the Tachyon components in slightly more detail.

Component	Description
IIS Components	The following components are IIS Web Applications that reside on a single-server. Other configurations - such as Response Stack and DMZ Server - have a subset of these. Under the Tachyon website: **Web Applications** • Admin (SLA Admin) • Background (Tachyon Background Channel) **Application Pools** • CatalogWeb • ContentDistribution • SLAPlatform.Admin

Component	Description
	• CatalogWeb • Consumer (Tachyon Consumer API) • ContentDistribution (Nomad) • Core (Tachyon Core) • CoreExternal (SLA Ops Provider API) • Experience (optional) • Platform (SLA Platform UI) • Tachyon (Tachyon Portal UI) • SLAPlatform.CoreExternal • SLAPlatform.Platform • Tachyon.Background • Tachyon.Consumer • Tachyon.Core • Tachyon.Experience • Tachyon.Portal
Core	The Core is a Tachyon Response Stack component which provides internal API and data processing. Core does the following: • Forwards workflow commands from the Workflow service to the Tachyon Switch • Generates and sends instrumentation data to the Instrumentation service • Forwards responses from the Switch to the Responses database.
Background Channel	The Background Channel is a Tachyon Response Stack component which provides a means for the Tachyon clients to retrieve large data items from Tachyon without loading the Tachyon Switch: • Stores Tachyon content provided by the Consumer API in the Background Channel for Tachyon clients to retrieve • Responds to Tachyon clients retrieving Tachyon content from the Background Channel.
Switch	The Switch is a Tachyon Response Stack component which provides the following: • Sends instructions to and retrieves responses from the Tachyon clients • Receives workflow commands from the Core component

Component	Description
	• Retrieves instruction definitions from the Core component • Forwards responses to the Core component • Sends instrumentation data to the Instrumentation component. The Switch Host service is responsible for starting local Switches.
Tachyon Portal UI	Tachyon users browse to the portal to access Tachyon applications. Applications that are Tachyon built-in applications: • Guaranteed State • Inventory • Settings • Explorer Applications that are optional: • AppClarity • Application Migration • Patch Success • Experience.
Tachyon Consumer API	The Tachyon Consumer API provides the following: • Processes the consumer requests from Explorer and other Consumers • Publishes Tachyon content to the Tachyon Background Channel • Forwards requests for instrumentation data from the Explorer to the Tachyon Instrumentation component • Forwards workflow commands from the Explorer to the Tachyon Workflow component.
Tachyon Coordinator	The Coordinator service is the coordinating service used by Tachyon components. It has two modules, Workflow and Instrumentation. The Workflow module provides the following:

Component	Description
	• Forwards workflow commands from the Consumer API to the Core • Stores workflow in SQL • Connects to remote SMTP to send emails used in the approval process for actions • The Workflow component contacts the Authentication component to manage the two-factor authentication process The Instrumentation module processes instrumentation data from the following components: • Core • Workflow • Switch. And responds to requests for instrumentation data from the Consumer API. Supports the two-factor authentication feature, with email.
Nomad	Content Distribution replaces the related features of ActiveEfficiency Server, which is deprecated. Legacy clients continue to be supported by direct communication with the Content Distribution API, whereas Nomad 8.x clients communicate with the Content Distribution API via the proxy feature on Response Servers. Tachyon Setup is used to install Content Distribution and the Nomad app, and no longer installs ActiveEfficiency. Nomad includes the following features: • Nomad app provides visibility of content distribution activity • Single-site download - SSD • Single Site Peer Backup Assistant - SSPBA • High Availability PBA (HAPBA) • Get Migration Settings task sequence action used to manage computer associations • Nomad Pre-caching

Component	Description
	• Nomad Download Pause.
1E Catalog UI	The website is used to view and interact with the 1E Catalog. Tachyon Setup supports the installation of 1E Catalog on the Tachyon Master Stack server. For customers that want to continue using an existing installation of 1E Catalog 2.0 then Tachyon Setup supports using a remote Catalog server as a custom setup option. Please contact 1E for details on how to use custom setup options.
Catalog Update Service	Service is used to connect to the 1E Cloud Catalog in order to download the latest catalog entries.
Catalog API	Consumer API is used to manage and update the 1E Catalog.
SLA Admin	Internal API used to manage SLA components.
SLA Platform UI	The website is used to view and interact with the Inventory.
SLA Engine	The Engine service is the coordinating service used by SLA components. This includes processing of Management Groups.
SLA Integrate Services	The SLA Integrate Agent sevice performs Connector functions by connecting to data sources and importing data into repositories. The SLA Integrate Manager service manages Agent operations including repository action schedules.
SLA Inventory	The inventory repositories. Each instance of a repository is stored in SLA-Data database, and is based on a template defined in the SLA-Data database.
SLA Operations Provider API	Consumer API and functions used by SLA clients, including Application Migration task sequence steps and AppClarity Software Reclaimer.
MDX (BI)	Internal API used by Patch Success application. Business Intelligence is an optional component installed by Tachyon Setup on the Master Stack, and requires SQL Server Analysis Services (SSAS). Business

Component	Description
	Intelligence is a prerequisite for the **Patch Success** application to support efficient presentation of visualizations on a large scale.
Consumer applications	The following Consumer applications are licensed: • AppClarity • Application Migration • Guaranteed State • Nomad • Patch Success • Experience • Explorer The following Consumer applications are included with Tachyon platform: • Inventory • Settings. Other consumers are Tachyon Configuration Manager Console extensions and other toolkit features.
SQL Server (Database Engine and Analysis Services)	Tachyon has two databases: • Tachyon Master • Tachyon Responses. Experience has one database: • TachyonExperience 1E Catalog has one database: • 1ECatalog SLA has three databases: • SLA-Data • SLA-Shared

Component	Description
	• SLA-Integrate SLA BI has two databases: • SLA-BI database • SLA-BI cube on a SQL Server Analysis Server (SSAS) instance Nomad has one database: • ContentDistribution
1E Client	1E Client includes clients for Tachyon, Nomad, PXE Everywhere Agent, Shopping/WSA, and WakeUp. All the above are supported on Windows devices, client features (excluding Experience and User Interaction) are also available on non-Windows devices. Tachyon clients communicate with the Tachyon Switches and the Background Channel to provide responses to instructions (questions and actions) and subscribe to policy events for Experience and Guaranteed State. Nomad clients use Tachyon Switches and the Background Channel as a proxy for communicating with the Content Distribution.

1.1.4.3 Tachyon architecture for Internet-facing devices

Enabling Tachyon to support devices that are external to your company network is done by slightly extending the default single-server architecture.

To enable external Tachyon client devices to interact with Tachyon, the DMZ requires at least one Background Channel and at least one Switch.

The Responses Stack handles communications between Master Stack and the platform clients. The Background Channel and Switch components handle the direct communication with the platform clients, the Core processes the information in both directions between the Master Stack and the Switches.

First, you need a working Tachyon system on the internal network, with a Response Stack that will provide the Core for the DMZ Server. The picture shows a Response Stack and Master Stack on the same server, located on the internal network. This serves clients when they are connected to the internal network.

Then configure the internal firewall to allow two-way communication between each of the following:

- The Core on the Internal Response Stack and the Switch(es) in the DMZ
- The Coordinator on the internal Response Stack and the Switch(es) in the DMZ
- The Consumer API on the internal Master Stack and the Background Channel in the DMZ.

Configure the external firewall to allow incoming connections for:

- The external platform clients and the Background Channel in the DMZ
- The external platform clients and the Switch(es) in the DMZ.

After you have provisioned a server in the DMZ, you need to make the following changes to the existing Tachyon system:

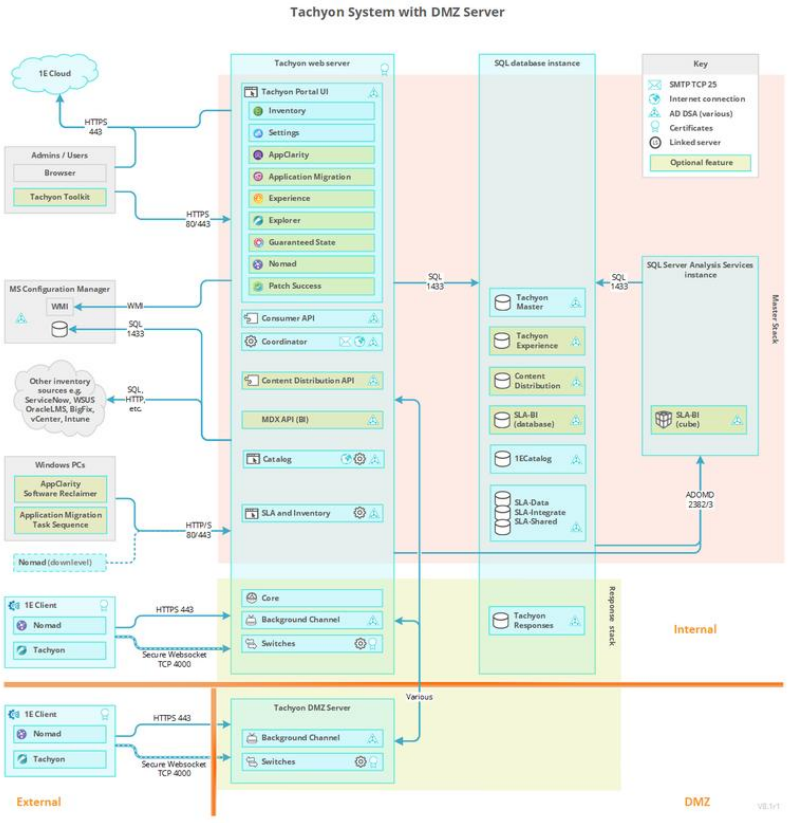
- Run Tachyon Setup on the Tachyon Response Stack to tell it about the DMZ Server, which will do the following:
  - Prepare the Master database with relevant details of the DMZ Background Channel and Switch(es)
  - Raise the security level of the Core and Switch communications
  - Produce a configuration file for the DMZ Server.
- Run Tachyon Setup on the DMZ Server using the pre-prepared configuration file, to complete the installation of DMZ Background Channel and Switch(es).

Detailed steps for the above process can be found on the Implementing a Tachyon DMZ Server page.

Tip

The DMZ picture shows a dual firewall design, but a single firewall is also supported.

In the picture, components colored green are optional in a Tachyon system.



1.2 Quick Start

How to quickly install, configure and run Tachyon for first use in a small-scale lab, evaluation, or pilot environment.

To simplify things, this quick start assumes a simple design in which you will install Tachyon components on a single web server, with SQL Server, installedTachyon components on a single web server, with SQL Server installed either locally or remotely (split). When implementing in a more complex environment you should instead follow the design, install and verify phases described in the Planning for Tachyon section.

This quick start is intended only for a fresh install. For upgrading or replacing an existing system, please see Upgrading Tachyon Platform.

There are four stages to the Tachyon quick start. Each of these stages touches upon the design, install, and verify phases described in the Planning for Tachyon section.

1.2.1 Verifying Tachyon

This quick start provides an outline for installing, configuring, and verifying a Tachyon system that is suitable for a lab-type environment. After the Prepare and Install sections, the Configure and Use sections provide steps that will verify the following aspects of Tachyon installation:

1. Configure quick start users - confirms integration with Active Directory and the basic RBAC capabilities of Tachyon.
2. Verification instructions - confirms the basic functionality for importing instruction definitions into Tachyon as well as confirming that licensing is working appropriately.
3. Viewing connected devices - confirms that Tachyon certificates have been correctly configured
4. Asking a question - confirms that Tachyon client communications are working
5. Performing an action - confirms that two-factor authentication, email connections, and the approval workflow are working. The stage 2 verification action also checks that the Tachyon client download mechanism is working and that the background channel has been correctly configured.

This run-through of basic Tachyon functionality works as a verification of Tachyon installation in a lab environment. If you see any issues when running through these steps please check the Troubleshooting section for a list of known issues. For production environments, a more formal verification process that uses the same **1E-TachyonPlatform.zip** file as used in this quick start guide is provided on the Verifying page.

1.2.2 Prepare

This quick start assumes a simple design in which you will be installing Tachyon components on a single web server, with SQL Server installed either locally or remote (split).

A summary of the preparation tasks:

1. Get a suitable license file for Tachyon, this should cover the Tachyon applications you want to use.
2. Review your Quick start infrastructure.

3. Prepare the Quick start Tachyon servers.
4. Create the DNS Name.
5. Install IIS on the Tachyon server.
6. Get and install the Tachyon Server's web server certificate - Request a Web Server certificate.
7. Get and install a certificate on the Tachyon Server with at least **Client Authentication Enhanced Key Usage**. You might find that your Tachyon Server web certificate has this already, but that will not usually be the case.
8. Get the Tachyon files that will be used to complete the quick start.
9. Prepare the Quick start Tachyon client devices.
10. Create the Quick start user accounts.

The below process assumes your quick start environment has a Microsoft Enterprise CA and you are familiar with how to:

- Configure your CA to use a CRL DP that supports HTTP or HTTPS
- Publish a Web Server certificate template or issue a PFX
- Use **certlm.msc** or the **mmc** certificates snap-in to request a web server certificate
- Deploy computer certificates to clients, optionally using auto-enrollment.

1.2.2.1 Quick start infrastructure

A Tachyon system consists of:

- Tachyon Server, which includes the Tachyon Switch component and website, hosted on an IIS web server
- SQL Server instance, which hosts the Tachyon Master and Responses databases, can be local or remote (split)
- Tachyon clients on supported devices
- Browsers used by Tachyon users and administrators to access the Explorer and Admin portal.

Your environment also requires:

- A correctly routed network environment where each device is configured with a genuine default gateway
- The server where your Tachyon Web Server will be installed also needs internet access so that the licensing will work, specifically to https://license.1e.com
- AD domain for the Tachyon Server and user accounts, but Tachyon client devices can be in workgroups or other domains
- SMTP email server - See Email and 2FA requirements for more details

- A PKI which serves the Tachyon Server and all Tachyon client devices
- Your CA(s) are able to issue certificates with a CRL DP that supports HTTP or HTTPS.

Remote SQL

If using a remote SQL Server in a test environment, and you want to configure the Tachyon Server to support more than 500 devices, then you can either ignore the warning that you should have an additional network interface used for SQL traffic, or you can install and configure an additional network interface as described in Configuring a persistent route for SQL traffic.

PKI notes

If you have an existing PKI and have just added a new CDP to support HTTP/S then you will need to re-issue certificates to your servers and devices.

Tachyon deliberately does not work with self-signed certificates for security reasons. Therefore, Tachyon Server cannot be installed on the same server as a Root CA, because its certificate is self-signed. For the same reason, client cannot be installed on a DC unless the client's Switch is configured to not require client certificates.

Tachyon uses TLSv1.2. If your PKI is using SHA512, then please ensure that your environment has relevant updates applied, as described in KB2973337. See Enabling SHA-512 to work with TLSv1.2.

If you want Tachyon to manage any legacy OS that Microsoft no longer supports, there may be issues with encrypted certificates described in Constraints of Legacy OS.

1.2.2.2 Quick start Tachyon servers

These are the servers required by Tachyon in addition to Quick start infrastructure.

Server	Software	Hardware
Tachyon Server	Windows Server 2016, 2019 or 2022 Full .NET Framework 4.8 or later	1 CPU Core, 1GB RAM if Web Server only. 2 CPU Core, 2GB RAM if using combined Web and SQL Server.
SQL Server	SQL Server 2017 or 2019, Standard or Enterprise	1 CPU Core, 1GB RAM if SQL Server only.

Server(s) can be physical or virtual, and must be domain joined.

If using any other version of Windows OS or SQL Server, or more detail is required, please refer to Windows Server requirements, and Server Provisioning.

If using a firewall on the Tachyon Server, then ensure the following incoming ports are open:

- Website HTTPS 443

- Switch Port 4000

If more detail is required, refer to Communication Ports in the Reference section.

1.2.2.3 DNS Name

Create the DNS Name for the Tachyon Server, for example **Tachyon.acme.local**

This can be a CNAME or a (A) Host record.

This DNS Name is used in the Web Server certificate (refer to Request a Web Server certificate) that needs to be installed on the TachyonServer.

1.2.2.4 Install IIS

Run the following PowerShell script on the Server. Do this even if IIS is already installed because it will ensure all the required features and roles are installed.

> **Note**
>
> If you intend to install Tachyon by running setup, then you may choose to let the setup program perform this operation for you instead of downloading and running the script manually. Just click on the **Install missing prerequisites** button after you have run the checks in the **Check prerequisites** page.

If more detail is required, refer to, Windows Server roles and features.

> **Note**
>
> View RolesInstall.ps1 ...
>
> Click here to download - RolesInstall.ps1
>
> **RolesInstall.ps1 - Configure IIS using PowerShell**

```
Import-Module ServerManager

Get-WindowsFeature | Out-file $PSScriptRoot\ServerManager-1.txt -Append
Install-WindowsFeature Web-Server,
Web-Http-Redirect,
Web-Dyn-Compression,
Web-Basic-Auth,
Web-IP-Security,
Web-Windows-Auth,
Web-Asp-Net45,
Web-Mgmt-Console,
Net-Framework-45-Core,
Net-Framework-45-ASPNET

Uninstall-WindowsFeature Web-DAV-Publishing

Get-WindowsFeature | Out-file $PSScriptRoot\ServerManager-2.txt -Append
```

> **Note**

When running the above command, if you receive an error that contains **The source files could not be downloaded** you will need to supply the source path to your Windows Server OS installation media \Sources\sxs folder.

Append **-source X:\Sources\sxs** or **-source \\Server\Path\Source\sxs** to the command line, adjusted for your drive letter or UNC path.

Note

PowerShell always uses **45** in the names of .NET Framework features, irrespective of the actual version of .NET Framework 4.X installed on the server, like:

- 4.8 in Windows Server 2022 (note: from Tachyon 8.1 onwards, any Tachyon component that requires .NET Framework, requires version 4.8)
- 4.7.2 in Windows Server 2019
- 4.6.2 in Windows Server 2016

For details of .NET Framework versions, please refer to https://docs.microsoft.com/en-us/dotnet/framework/get-started/system-requirements#supported-server-operating-systems.

Tip

Tip

If you prefer to use the Add Roles and Features Wizard to manually enable features then you can use the Display Names listed in the table Windows Server roles and features.

Note

Web-Http-Redirect is only required to support legacy Nomad clients after an In-place upgrade of ActiveEfficiency Server for Nomad.

Web-Basic-Auth is only required if you will be installing 1E ITSM Connect or 1E Core for integrating ServiceNow and Tachyon.

1.2.2.5 Request a Web Server certificate

You will need to have requested a Web Server certificate from your Certificate Authority. To get the certificate in your organization you will have either:

- Submitted a CSR and received a password protected PFX file
- Used the Certificate Enrollment wizard to request a suitable Web Server certificate.

Once the Web Server certificate has been provided it must be imported into the Tachyon Server's **local computer Personal Certificates** store.

Each server that has Tachyon Server components installed requires its own Web Server certificate (except for a remote SQL Server). This certificate is also used by the Tachyon Switch and the Tachyon Coordinator. Therefore, a single-server installation requires only one Web Server certificate. This certificate must be provided on the server prior to installation of Tachyon.

The Web Server certificate requires the minimum of the following:

1. Issued by a trusted Certificate Authority (CA)

- The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the server
- If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the server
- The above CA certificates must exist on the Tachyon Web Server and Windows client devices
- Most organizations have automated distribution of these CA certificates to servers and clients, using Group Policy for example.

2. Has at least the following Key Usage:
   - Digital signature
   - Key encipherment
3. Has at least the following Enhanced Key Usages:
   - Server Authentication
4. Revocation information is included
   - References at least one CRL Distribution point that uses HTTP - see DMZ Server note below
5. Must have a private key available

Tip

The default template **Web Server** available with a Microsoft PKI is suitable for requesting a Tachyon Web Server certificate.

DMZ Server

Please ensure you note the additional certificate requirements described below, when installing any server in a system that also contains a DMZ Server. Internal Master and Response Stack servers, and DMZ Server, each require **two** HTTPS bindings, as described in DNS Names. For even more detail, please refer Implementing a Tachyon DMZ Server.

Also note the requirement for server certificates to reference at least one CRL Distribution point that uses HTTP. These CRL DPs are likely to be in the internal network, and the firewall will need to allow the DMZ server to access these internal servers.

Web Server certificates used by a Tachyon Servers must be issued with their fields set as follows. Example **DNS Names** are discussed in DNS Names.

Fields	Example Option 3 type certificate
Subject Common Name Field (subject:commonName)	Subject (CN) can be any valid name, and is no longer mandatory as required by previous versions of Tachyon.

Fields	Example Option 3 type certificate
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The **Tachyon Server DNS Name FQDN** (DNS Alias) of the server. This is mandatory, same as required by previous versions of Tachyon. On a Master Stack - example: **DNS Name=Tachyon.ACME.LOCAL** On a Response Stack - example: **DNS Name=TachyonRS.ACME.LOCAL** On a DMZ Server - example: **DNS Name=TachyonEXT.ACME.COM**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	An **Alternate DNS Name FQDN** (DNS Alias) of the server. This is usually mandatory, for example if there is more than one server in your Tachyon system, as discussed in DNS Names. On a Master Stack, example: **DNS Name=TachyonALT.ACME.LOCAL**or**DNS Name=Tachyon.ACME.LOCAL** On a Response Stack - example: **DNS Name=TachyonALT.ACME.LOCAL** On a DMZ Server - example: **DNS Name=TachyonDMZ.ACME.LOCAL**

Fields	Example Option 3 type certificate
Example	
Note

Earlier versions of Tachyon required the certificate to have a CN and used SAN fields differently. If you are upgrading your Tachyon server from an earlier version, it may still be using this type of certificate. When upgrading Tachyon, you can issue a replacement certificate, or continue using the old style certificate (because the new-style certificate requires only a SAN DNS Name that matches the DNS Alias, which are provided by the old style certificates).

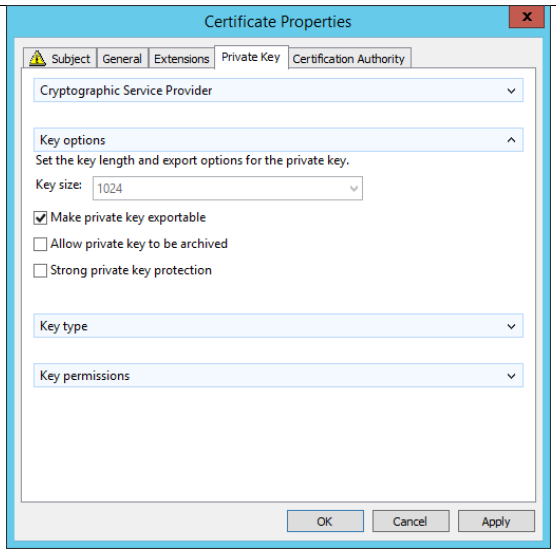
Click here to see examples of old-style certificates...

Fields	Example old Option 2 type certificate
Subject Common Name Field (subject:commonName)	The computername FQDN of the server

Fields	Example old Option 2 type certificate
	Example: **CN=ACME-TCN01.ACME.LOCAL**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The DNS Alias FQDN of the server Example: **DNS Name=Tachyon.ACME.LOCAL** **Tip** Add any additional DNS Names here.
Example certificate request	  **Note** Option 2 type certificates required the CN to be the computername FQDN, and the list of

Fields	Example old Option 2 type certificate
	Subject Alternate Names (SAN) to contain the DNS Alias. Also, prior to Tachyon 5.0 the certificate required its private key to be exportable. Tachyon 5.0 and later is able to use this type of certificate when upgrading from an earlier version of Tachyon.

Fields	Example of old Option 1 type certificate
Subject Common Name Field (subject:commonName)	The DNS Alias FQDN of the server Example: **CN=Tachyon.ACME.LOCAL**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The DNS Alias FQDN of the server Example: **DNS Name=Tachyon.ACME.LOCAL** The computername FQDN of the server Example: **DNS Name=ACME-TCN01.ACME.LOCAL**
Example certificate request	
Fields	Example of old Option 1 type certificate



Note

Option 1 type certificates required the CN to be the DNS Alias, and the list of Subject Alternate Names (SAN) to contain the computername FQDN.

Also, prior to Tachyon 5.0 the certificate required its private key to be exportable.

Tachyon 5.0 and later is able to use this type of certificate when upgrading from an earlier version of Tachyon.

1.2.2.6 Request a client certificate

You will need to have requested a client certificate from your Certificate Authority. This will be used to authenticate communications between the **Background Channel** and the **ContentDistribution** components to support Nomad features.

1.2.2.7 Get the Tachyon files

You will need to download the following to complete the quick start.

1.2.2.7.1 1E Client installers

The **1EClient zip** file can be downloaded from the 1E Support Portal https://1e.my.site.com/. The zip includes the following files used to install the 1E Client on Windows devices:

- **1E.Client-x64.msi**
- **1E.Client-x86.msi**

1.2.2.7.2 Tachyon Server installers

The **TachyonPlatform zip** file can be downloaded from the 1E Support Portal (https://1e.my.site.com/). Extracting the zip will create a folder structure containing the following, where the files highlighted in bold are required by Tachyon Setup.

- Licenses.txt
- Tachyon Release Information.html
- **Tachyon.Setup.exe**

Please refer to:

- Tachyon Setup, for detailed information about each screen in setup
- Quick Start if you want a brief overview of installing Tachyon .

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

- Installers**1ECatalog.msi**
- Installers**AppClarity.msi**
- Installers**ApplicationMigration.msi**
- Installers**ContentDistribution.msi**
- Installers**SLA.BI.Installer.msi**
- Installers**SLA.Platform.Installer.msi**
- Installers**TachyonServer.msi**
- Installers\TachyonToolkit.msi

This folder contains **msi installer files** for components and applications that will be installed by Tachyon Setup if their prerequisites are met.

- Installers\Apps\Experience**Experience.zip**
- Installers\Apps\Experience**metadata.json**

This folder contains **apps folders** for Tachyon consumer applications that will be installed by Tachyon Setup if their prerequisites are met.

- Installers\Apps\Explorer**Explorer.zip**
- Installers\Apps\Explorer**metadata.json**
- Installers\Apps\GuaranteedState**GuaranteedState.zip**
- Installers\Apps\GuaranteedState**metadata.json**
- Installers\Apps\Inventory**Inventory.zip**
- Installers\Apps\Inventory**metadata.json**
- Installers\Apps\Nomad**metadata.json**
- Installers\Apps\Nomad**Nomad.zip**
- Installers\Apps\PatchSuccess**metadata.json**
- Installers\Apps\PatchSuccess**PatchSuccess.zip**
- Installers\Apps\Settings**metadata.json**
- Installers\Apps\Settings**Platform.zip**
- ProductPacks\Newtonsoft.Json.dll
- ProductPacks\Tachyon.ProductPackDeploymentTool.exe
- ProductPacks\Tachyon.ProductPackDeploymentTool.exe.config
- ProductPacks\Tachyon.SDK.Consumer.dll
- ProductPacks\Classic\1E-ConfigMgrConsoleExtensions.zip
- ProductPacks\Classic\1E-Experience.zip

If you do not want to install a consumer application, then delete the folder before running setup.

Later, if you need to install the consumer application, then you can reinstate the folder and install the app using setup as described in Applications maintenance.

> **Note**
>
> Some consumer applications are installed using their msi instead of an apps folder, for example AppClarity and Application Migration.

These Product Pack are required to support various features, for more detail please refer to Tachyon Product Packs reference.

If your license permits, you can use additional Product Pack available from 1E Exchange (https://exchange.1e.com/) to meet specific use-cases.

Classic Product Packs	Contain instructions, for use in Explorer and other Tachyon applications. They can be uploaded using the **PPDT**, or using **Settings→Instructions→I**

- ProductPacks\Classic\1E-Explorer-TachyonAgent.zip
- ProductPacks\Classic\1E-Explorer-TachyonCore.zip
- ProductPacks\Classic\1E-Inventory.zip
- ProductPacks\Classic\1E-Nomad.zip
- ProductPacks\Classic\1E-Patch-Success.zip
- ProductPacks\Classic\1E-Tachyon-Platform.zip
- ProductPacks\Integrated\MEMCMClientHealth.zip
- ProductPacks\Integrated\NomadClientHealth.zip
- ProductPacks\Integrated\TachyonCore.zip
- ProductPacks\Integrated\WindowsClientHealth.zip

nstruction sets page in the Tachyon Portal.

Integrated Product Packs

Contain policies, rules and fragments for use by Guaranteed State , and may also include instructions.

They can only be uploaded using the **PPDT**.

Tip

The **Tachyon Product Pack Deployment Tool** can be started independently or at the end of the **Tachyon Setup** process via the Post-installation checks screen, where the screen contains a link that launches the tool. The **Tachyon Setup** method of starting the tool is recommended because Tachyon Setup ensures you have the correct permissions to upload the Product Packs.

1.2.2.8 Quick start Tachyon client devices

The Tachyon client is supported on the following Windows OS in a quick start environment.

- Windows Server 2022
- Windows Server 2019
- Windows Server 2016
- Windows 11 CB 21H2
- Windows 10 CB 21H2
- Windows 10 CB 21H1
- Windows 10 CB 20H2

If using any other OS then please refer to Supported Platforms and Tachyon client installation pages in the Reference section.

Tachyon users on client devices can connect to the Tachyon Explorer using any of the following browsers:

Latest version of:

- Google Chrome
- Microsoft Edge (Chromium)
- Mozilla Firefox.

PowerShell is used by some Tachyon Product Packs. If more detail is required, refer to Tachyon scripting requirements.

If you have configured Tachyon Server to require client certificates (Client certificates) then each device requires a certificate with the following properties, so the Tachyon client can be authenticated by the Tachyon Switch.

1. Issued by a trusted Certificate Authority (CA)
   - The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the client
   - If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the client
   - If either of these CA certificates are different to those used by the Tachyon Web Server, they will need to be exported and imported on the Tachyon Web Server
   - Most organizations have automated distribution of these CA certificates to clients and servers, using Group Policy for example.
2. Has at least the following Enhanced Key Usage
   - Client Authentication
3. Has at least the following Key Usage
   - Digital Signature
   - Key encipherment
4. Has a private key
   - For workgroup and non-Windows devices, the **private key must be exportable**
5. Revocation information is included.
   - References at least one CRL Distribution point that uses HTTP.
6. Has a Subject Name of type Common Name (**CN=<computername>**) or Subject Alternative Name (**DNS Name=<computername>**) where <computername> depends on the type of device:
   - On domain-joined Windows PCs this must be the **computername FQDN** of the computer, for example **W701.ACME.LOCAL**
   - On workgroup Windows PCs and non-Windows devices, this must be the computername of the computer - as returned by the **hostname** command, for example on Windows PC this could be **W701**, and on a Mac this could be **MAC01.local**

Note

Tachyon clients and Switches use OpenSSL and its validation process to verify certificates.

1.2.2.9 Quick start user accounts

For simplicity in the quick start guide, we use just two Tachyon user accounts, the installation account and another full administrator account.

Note

To get things up and running quickly in a lab environment, you may want to make use of the full administrator role. This will help minimize the number of users required for an evaluation and reduce the initial configuration required.

To further minimize the number of users needed, you can also enable the Windows account used to install Tachyon to assume the Tachyon full administrator role. The installation account is added as the system principal user in Tachyon by the installer, and its permissions are locked down by default. You can allow it to assume the full administrator role using the following steps:

1. Create a Tachyon user from an existing AD security group.
2. Apply the Tachyon full administrator role to the user.
3. Add the installation account to the AD security group.

In the short term it's fine to make use of full administrators in this way, but this practice is not really suitable for large-scale deployments and should be used with care for the following reasons:

- The full administrator role has permissions to do everything in Tachyon. It has across the board permissions to all Instruction Sets and therefore can be used to run actions that can have a major impact on your network.
- The full administrator accounts receive emails for all the transactions that are performed by Tachyon.

For the purposes of the quick start, which uses two-factor authentication, each account must have its AD account configured with an email address.

Note

If two-factor authentication is enabled (as it is by default) email is required for any user who intends to run an action, in this case **TCNInstaller01**.

Using just the following accounts we can perform all the installation, administration, verification questions, actions and approval tasks shown in this quick start guide.

Account	Description	Tachyon roles
TCNInstaller01	Server installation account, used to install Tachyon Server and	The roles for this account cannot be changed directly, but this account

Account	Description	Tachyon roles
	configure initial security user and roles settings. This account requires the following rights: • Full Administrator rights on the Tachyon Server • **Sysadmin** rights on the SQL Server instance • **Read-only Analyst** permissions in Configuration Manager. This account should be a member of the **TCNGAdministrators** group	may be added to AD groups with other Tachyon permissions assigned.
TCNAdmin01	A user account that will be used in combination with the **TCNInstaller01** user to enable the request and approval of actions.	No direct roles applied to this account.
TCNGAdministrators	An AD **Universal** group with two members: **TNCInstaller01** and **TCNAdmin01**.	**Global Administrators** role.

1.2.2.10 Quick start service accounts

The table below describes all the service accounts and where they are used. Where domain accounts are required, you should create separate domain user accounts for each service.

Account	Description
CATSVC	1E Catalog Update Service account. Used by the 1E Catalog Update service to connect to the 1E Cloud service via the Internet to download catalog updates and upload anonymous details about newly detected software. Used by the Catalog web application pool to connect to the 1ECatalog database on the SQL Server database instance.

Account	Description
BISSASSVC	Business Intelligence (BI) SSAS user account. Used to access the BI cube on the SSAS instance by services on the web server and the linked server on the SQL Server database instance.
SLATACHYON	A Tachyon user account that will be used by the 1E Platform Connector, which provides the Tachyon Inventory. This account will be a member of the **1E Inventory** custom role, which has questioner permissions on the **1E Inventory** instructions set. The instruction set contains four instructions. You can choose different names for this role and instruction set.
Network Service	On local servers, this is **NT AUTHORITY\Network Service**; on remote servers, this is: **ACME\computer$** where computer is the computer name of the Tachyon Server. Used by the following for connection to databases on the SQL Server database instance: • All web application pools for Tachyon and SLA, except where noted elsewhere in this table • All Windows services for Tachyon and SLA except where noted elsewhere in this table. Used by the Tachyon Coordinator service to connect to the 1E license cloud to validate and activate your license. Used by the System Center Configuration Manager (SCCM) Connector if the connector configuration has **Use Windows Authentication** enabled instead of a SQL Login.
Local System	Used by the Tachyon Switch Host service.

1.2.3 Install

1.2.3.1 Tachyon Server

After obtaining your **Tachyon.lic** file from 1E you should store it in a secure location. In our example we've placed the **Tachyon.lic** file in the installation directory where **Tachyon.Setup.exe** is located.

1. Logon to the server using the server installation account **TCNInstaller01**.

2. Install interactively using **Tachyon.Setup.exe**.

3. Launch the setup wizard by double-clicking on **Tachyon.Setup.exe**. Then fill out the screens of the wizard using the following information.

Screen	Actions
Welcome	Click **Next** to skip to the next screen.
Documentation	This page provides some links to some online information about Tachyon. Click **Next** to skip to the next screen.
License agreement	Accept the license agreement by checking the **I accept the terms of the license agreement** checkbox and click **Next**.
License File	Enter the location for your Server **Tachyon.lic** license file, or click **Browse** to locate the file using the system file browser. When the **.lic** file is selected, it will be verified with the Tachyon license server. If everything is OK, click **Next**.
Select configuration	This screen lets you select the configuration you want to install, which determines which components are installed on the server. The quick start example installs all the Tachyon Server components onto a single-server with the databases on a remote SQL instance, so ensure that the **All components on a single server** option is selected and then click **Next**.
Check prerequisites	This screen performs prerequisite checks on the local server and user account. Click **Start checking** to start the checks. If any of the checks fail, **Tachyon Setup** may be able to install the missing prerequisites. To install these, click the **Install missing prereqs.** button. Not all prerequisite checks have automated fixes. If your environment fails a check and the **Install missing prereqs.** button has not been enabled, you will need to fix the conditions for that check by hand. You can click **Check Again** to re-run the checks once any remediation steps have been made.
Server certificate	This screen displays a list of certificates from the **Local Computer\Personal** certificate store, and you select the certificate created earlier, as described in the Request a Web Server certificate heading. **Tachyon Setup** will then evaluate the suitability of the selected certificate according to how specific properties of the certificate have been configured.

Screen	Actions
	In this quick start example, we select the certificate with the friendly name of **Tachyon Web Certificate**, confirm all checks pass and click **Next** to continue.
Client certificates	On this screen, you can set whether client certificates are required to be presented by the Tachyon clients. If your clients do not have certificates, then uncheck the **Switches require client certificates to be presented by Tachyon client features of the 1E Client** checkbox. If your clients have certificates issued by different Certificate Authorities than the Tachyon Server certificate, then you must ensure clients and Switch servers each have the others CA certificates in their certificate stores. For the quick start, client certificates are required from the Tachyon clients, and as all the clients in the quick start example use the same certificate authority as the Tachyon Server, you can skip this screen by clicking **Next** to continue.
Database servers	Select the SQL server instance name for the Tachyon Master and Responses databases as well as the SQL server instance names for the 1E Catalog, SLA and BI databases. In the quick start example, these will all be installed on the **ACME-SQL01** instance. It's also a good idea to click the **Validate** button to ensure that the specified instance is valid before continuing by clicking **Next**.
SSAS servers	Here you need to set the domain account details for the BI SSAS user. This user will be used to create a linked server for the BI database to access the BI cube and enable BI services on the server to query the cube. You also enter the SQL Server Analysis Service (SSAS) instance, where the BI cube will be created. In the quick start example, the account name and password for the domain account **ACME\BISSASSVC** are used. The SSAS instance for BI is set to **ACME-SQL01**, where an SSAS instance has been set up alongside the SQL Server instance used for the main Tachyon databases.
Number of devices	Enter the number of devices to match your license key. The quick start example is limited to 15 by the **Tachyon.lic** file selected on the **License File** screen. You can change this number from the default, but it should not be set larger than your permitted licenses.

Screen	Actions
Switch configuration	The default switch configuration displayed is determined by the number of devices set on the **Number of devices** page. For the quick start, we leave this as the suggested default. In the quick start example we click **Validate** to check that the selected configuration is appropriate, all the checks pass, so we then click **Next** to continue.
Website configuration	Verify the following details for **Main website bindings**: HTTP Host Header: Hostname FQDN of the Tachyon Server. In the quick start example, this is set to **ACME-TCN01.acme.local**. HTTP Port: 80 HTTPS Host Header: DNS Name FQDN of the Tachyon Server. In the quick start example, this is set to **Tachyon.acme.local**. HTTPS Port: 443 For the quick start, the **Alternate website bindings** are not used, so you can leave these at their default settings. Verify the following service ports: Workflow port: 8081 Integrate REST port: 6002 Click **Next** to continue.
Active Directory and email	Enter the following: Active Directory: GC:// Enable email: Emails are used to inform approvers of pending notifications, and users of pending results expiry. **Note** You should only enable this if you have a working email system which supports SMTP.

Screen	Actions	
	SMTP Server	FQDN of your SMTP gateway. In the quick start example, this is **ACME-EXC01.ACME.LOCAL**.
	SMTP Port	25
	Mail From	Mail-from email address used by the Tachyon Server when it sends emails to users. In the quick start example, this is set to **Tachyon@acme.local**.
	Enable two-factor authentication	Emails are used to send authentication codes to users who submit actions. **Note** ONLY enable this if you have a working email system which supports SMTP.
	In the quick start example, we click **Validate** to check that the options are valid, and then click **Next** to continue.	
SLA and 1E Catalog	On this screen, you can enable or disable the AI Powered Auto-curation feature. This is supported by SLA but also involves downloading the AI files using 1E Catalog. In the quick start example, we leave this in the default state, where the **Enable AI-based auto-curation** checkbox is not checked, and the feature is disabled, and then click **Next**. You should only enable this feature if you have appropriate hardware. You can enable this feature later. For more information, please refer to AI Powered Auto-curation.	
Nomad	If you selected to install **Content Distribution** on the **Select Configuration** screen you will need to provide the server name for a Microsoft Endpoint Manager Configuration Manager (MEMCM, ConfigMgr) site server. In the quick start example, we enter **ACME-CM01** as the Configuration Manager Site server and leave the Nomad sync at its default value of **30**. Clicking **Validate** checks the connection to the CM Site Server. We then select the Client Authentication certificate, requested earlier under the Request a client certificate heading, that will be used to authenticate	

Screen	Actions
	communications between the Background Channel and the ContentDistribution components. The clients authentication we leave at the default of **Windows authentication**. Clicking the **Validate** button verifies the selected Client Authentication certificate. Then click **Next** to continue.
Ready to install	Having entered all the necessary values, click the **Install!** button to begin the installation.
Installation results	The **Installation results** screen displays the log messages from the installer as they occur. Confirm that the installation has succeeded by checking that the concluding log message says: **The installer exited and reported successful completion** then click **Next**.
Post-installation checks	Run the post-installation checks by clicking the **Start checking** button. Confirm that all checks pass. **Note** You can click on the **Open** link to the right of the **Tachyon Portal web application responds** check to open the Tachyon Portal. If you get green ticks all the way down, then your Tachyon Server installation has been successful, and you can now close the setup wizard by clicking the **Close** button. If any of the checks failed, you can see more information about the check in the **Info** column. Which you can then use in combination with the Troubleshooting section to help track down the cause of the issue. If you have unzipped the contents of the **TachyonProductPacks** zip file to a **ProductPacks** folder in the same folder where **Tachyon.Setup.exe** resides, a **Product Packs are available** check will be displayed with a link that launches the **Tachyon Product Pack Deployment Tool**. In this initial quick start video, we pause the setup at this point and continue with the process under the Uploading with the Tachyon Product Pack Deployment Tool heading.

Screen	Actions
Maintenance	This section of setup is used to configure Tachyon post-installation. Here you can uninstall components, configure applications and replace certificates.

For more detail on the setup wizard, read Tachyon Setup in Installing Tachyon.

> **Note**
>
> You can now choose to launch the Tachyon Portal by browsing to: **https://<TachyonDNSName>/Tachyon**, where **<TachyonDNSName>** is the DNS name you have configured for Tachyon in your environment. In our example, this is **https://tachyon.acme.local/Tachyon**.

1.2.3.2 Uploading with the Tachyon Product Pack Deployment Tool

Continuing from the previous section, we select to run the **Tachyon Product Pack Deployment Tool** using the following steps:

1. In setup click on the **Deploy** link next to the **Product Packs are available** check on the **Post-installation checks** screen.
2. The **Tachyon Product Pack Deployment Tool** appears, showing all the **Available Product Packs** that were found in the **ProductPacks** folder.
3. There are two types of Product Pack displayed, **Classic** and **Integrated**. **Classic** Product Packs contain Instruction definitions, and **Integrated** Product Packs also include Policies.
4. You can select the Product Packs you want to load by checking the box in the **Selected** column for each entry. In our example, we'll leave all the Product Packs selected to load them all.
5. To load the Product Pack, click on the **Upload selected** button.
6. When the upload has completed, the text **Done** will appear in the **Results** field.
7. At this point, you can click the **Close** button to close the **Tachyon Product Pack Deployment Tool**.
8. Then click the **Close** button in setup, and click **OK** in the confirmation dialog to exit the wizard.

Signing in to the Tachyon Portal to check the Instructions from the uploaded Product Pack:

1. Enter the URL for the Tachyon Portal into a suitable browser for example **https:\\Tachyon portal.acme.local\Tachyon**.
2. Sign in using your installation account credentials, for example **ACME\TCNInstaller01**.
3. When the Tachyon Portal has finished loading, click on **Settings** at the bottom of the list of applications.
4. When the **Settings** application has opened, click on **Instructions** and then **Instruction sets**.
5. On the **Instructions sets** page, you will be able to see Instruction sets that have been created for each Product Pack that was in the **ProductPacks** folder.

1.2.3.3 Verification instructions

By following the steps provided in Uploading with the Tachyon Product Pack Deployment Tool you will have loaded the **1E-Tachyon-Platform.zip** Product Pack into the **1E Tachyon Platform** Instruction set, containing the two verification instructions **Tachyon Platform verification stage 1** and **Tachyon Platform verification stage 2 (all platforms)**, along with a number of other instructions that are used to populate data in the Device View. The verification instructions are used later in the quick start guide to perform a quick verification of Tachyon and demonstrate how to ask questions and run actions.

1.2.3.4 Tachyon clients

When installing 1E Client (with Tachyon features enabled) the following installation settings are mandatory and must be supplied. Other client configuration settings are optional and have been assigned default values.

The following properties can be entered manually when installing from the Windows Installer wizard. Alternatively, the properties can be included as part of a Windows msiexec command-line launch.

Property	Mandatory	Setting
BACKGROUNDCHANNELURL	Yes	Set to the previously configured Tachyon DNS Name FQDN. You will also need to specify the port and the rest of the background channel URL. By default, the port is set to 443. In our example, this would be set to: `https://TACHYON.ACME.local:443/Background/`
SWITCH	Yes	Set to the previously configured Tachyon DNS Name FQDN. From version 3.1 onwards, you will also need to specify the port. By default, this is set to 4000. In our example, this would be set to: `TACHYON.ACME.local:4000`

1.2.3.4.1 Example which enables only Tachyon client

Example Windows 1E Client installer command-line with only the 1E Client features enabled, other client modules are not enabled. Tachyon uses HTTPS only.

```
msiexec /i 1E.Client-x64.msi SWITCH="tachyon.acme.local:4000" BACKGROUNDCHANNEL
URL="https://tachyon.acme.local:443/Background/" /qn /l*vx C:\Windows\temp\1ECl
ient-install.log
```

1.2.3.4.2 Example which enables only Nomad client

Example Windows 1E Client installer command-line with only **Nomad** module enabled, which also requires Tachyon client features to be enabled. Tachyon uses HTTPS only.

```
msiexec /i 1E.Client-x64.msi SWITCH="tachyon.acme.local:4000" BACKGROUNDCHANNEL
URL="https://tachyon.acme.local:443/Background/" MODULE.NOMAD.ENABLED=true MODU
LE.NOMAD.CONTENTREGISTRATION=1 MODULE.NOMAD.SSDENABLED=1 /qn /l*vx C:\Windows\t
emp\1EClient-install.log
```

1.2.3.4.3 Example which enables only PXE Everywhere Agent

Example Windows 1E Client installer command-line with only **PXE Everywhere Agent** client module enabled, and Tachyon features disabled (by setting SWITCH and BACKGROUNDCHANNELURL to none). PXE Everywhere uses only HTTP.

```
msiexec /i 1E.Client-x64.msi SWITCH=none BACKGROUNDCHANNELURL=none MODULE.PXEEV
ERYWHERE.ENABLED=true MODULE.PXEEVERYWHERE.CONFIGSERVERURL="http://pxecentral.a
cme.local/PXELite/PXELiteConfiguration.asmx" /qn /l*vx C:\Windows\temp\1EClient
-install.log
```

1.2.3.4.4 Example which enables only Shopping client

Example Windows 1E Client installer command-line with only **Shopping client** module enabled, and Tachyon features disabled (by setting SWITCH and BACKGROUNDCHANNELURL to none). Ensure you use HTTP or HTTPS as appropriate.

```
msiexec /i 1E.Client-x64.msi SWITCH=none BACKGROUNDCHANNELURL=none MODULE.SHOPP
ING.ENABLED=true MODULE.SHOPPING.SHOPPINGCENTRALURL="https://appstore.acme.loca
l/shopping" MODULE.SHOPPING.LOOPBACKEXEMPTIONENABLED=true /qn /l*vx C:\Windows\
temp\1EClient-install.log
```

1.2.3.4.5 Example which enables only WakeUp client

Example Windows 1E Client installer command-line with only **WakeUp client** module enabled, and Tachyon features disabled (by setting SWITCH and BACKGROUNDCHANNELURL to none).

```
msiexec /i 1E.Client-x64.msi SWITCH=none BACKGROUNDCHANNELURL=none MODULE.WAKEU
P.ENABLED=true MODULE.WAKEUP.REPORTINGSERVER="nwmserver.acme.local" /qn /l*vx C
:\Windows\temp\1EClient-install.log
```

Use **1E.Client-x64.msi** for 64-bit Windows and **1E.Client-x86.msi** for 32-bit Windows. For non-Windows platforms, platform specific packages for Linux, Solaris and Mac are available.

When installing interactively through the Windows installer wizard, logon using an account that has local administrator rights.

For details of step-by-step interactive and command-line installation, please see Deploying 1E Client on Windows.

For details of how to deploy the 1E Client to macOS platforms, see Deploying 1E Client on macOS.

For details of how to deploy the 1E Client to Linux platforms, see Deploying 1E Client on Linux.

1.2.3.5 Export all responses feature

This step is optional, only if you require this feature. Please refer to Tachyon Server post-installation tasks for details.

1.2.4 Configure

1.2.4.1 Set security roles

After installation you will only be able to log onto the Tachyon Explorer using the installation account. This account is purposefully restricted to just allowing the configuration of security roles. So the first step must be to add other users to access the other capabilities of Tachyon.

1.2.4.1.1 Users for administration

We suggest that you add a user or group to handle the administration tasks for your evaluation environment.

1.2.4.1.2 Users for performing actions

To perform actions you will need at least two other users. One an actioner and the other an approver, otherwise you won't be able to perform actions.

1.2.4.1.3 A Tachyon AD group tutorial

For this quick start guide we use two specific accounts and a security group to assign to the roles we need. You may want to use AD groups to define Tachyon access and we have provided a complete tutorial on adding users and roles via AD groups, on the Configuring Access Rights - tutorial page, which you may find useful.

1.2.4.2 Configure quick start users

At this point we will configure the user accounts, as listed in Quick start user accounts, to their different roles in Tachyon.

Using these accounts the user roles configuration is done using the following steps:

1. Logon to Tachyon using the installation account. The Tachyon Portal website will be available after installation using the Tachyon DNS Name FQDN, configured during the prepare phase of the quick start. In our quick start environment this is **tachyon.acme.local**. So the URL for the Tachyon Portal is:

   Note

   https://tachyon.acme.local/Tachyon

   The first time you log in the Tachyon applications will be set up.

2. Initially the installer account has purposefully limited Tachyon permissions and the permissions for this account cannot be modified directly. This means that the account cannot access any of the applications. To resolve this for the quick start guide, we need to create a new Tachyon user account for the **TCNGAdministrators** group and assign global administrator permissions to that user. To do this you need to navigate to the **Settings** application page using one of the following methods:

   a. If you're on the home page click on the **Settings** item.

   b. If you've already navigated to another application, click on the **Settings** item on the **Switch app** menu.

3. Once you're in the **Settings** application, to add the **TCNGAdministrators** group Tachyon user:

    a. Expand the **Permissions** node.

    b. Click on **Users** to display the **Users** page.

    c. Click the **Add** button to display the **Add user** popup.

    d. Enter some text in the **Select AD user or security group** field (for example, **TCNG**) that matches the required user or group name. In our example we know we will be adding a security group, so we can uncheck the **User** option so that the search only returns security groups.

    e. After clicking the search icon, a list of matching users and groups from AD will be displayed. Select **TCNGAdministrators** and click **Add**.

4. To set the full administrator role for the new **ACME\TCNGAdministrators** Tachyon user:

    a. Click on the new **ACME\TCNGAdministrators** username link to display its details.

    b. On the **Roles** tab click the **Edit** button to display the **Edit roles assigned to user** popup.

    c. Select **Full Administrator** from the list of available roles.

    d. Click the **Save** button to assign the selected roles to the user.

You can check which users belong to the group by clicking on the **Group members** tab. In our example, you can see that there are two users in the group: **TCNAdmin01** and **TCNInstaller01**. Both of these accounts should now have the **Full Administrator** role applied.

In our example, to demonstrate this for the logged on **TCNInstaller01** account all they need to do is refresh the page in the browser. They now have all the permissions related to the **Full Administrator** role and will therefore be able to see all the configuration items in the **Settings** application, and they can also now browse to Tachyon Explorer.

1.2.5 Use

1.2.5.1 Using Tachyon

Having configured the users who will access Tachyon we can now go on to demonstrate the basic functionality of Tachyon including: viewing connected devices, asking a question and seeing the responses, requesting to perform an action and the associated approval process.

1.2.5.2 Viewing connected devices

Perhaps one of the first things you should do after installing and configuring role-based access to Tachyon is to check what devices are connected. This gives you instant feedback on whether the Tachyon client devices have been installed correctly and are able to communicate back to Tachyon.

In our quick start example we were previously logged on to Tachyon as **TCNInstaller01**, and have already navigated to **Explorer**. In order to view the **Devices**->**Table** page expand the **Devices** node and select **Table**.

1.2.5.3 The quick start example

To illustrate the workflow for asking questions, filtering responses and performing follow-up actions we will use a simple example where we ask the **Tachyon Platform verification stage 1** question. We'll then run the **Tachyon Platform verification stage 2** action to complete the verification.

1.2.5.4 Asking a question

The first step in the example is to ask the question and view the responses in Tachyon Explorer. The question we want to ask is **Tachyon Platform verification stage 1**. The following steps show how to select and ask the question then view the responses. Still logged on as the **TCNInstaller01** account, the steps are:

1. The usual way to run instructions is from the **ExplorerHome** page, click on **Home** to view the **Home** page.
2. Type some letters from the name of the stage 1 question into the Explorer field, in our example we type the text **verif**. This will display a list of questions that match the text. You will see the two instructions; the stage 1 question and the stage 2 action.
3. Select the **Tachyon Platform verification stage 1** question from the list of matches.
4. The question is added to the Explorer window. Depending on the question you may need to set some attributes and for all questions you can set parameters, such as the duration, coverage and question filters. In our example this simple question has no attributes and will be asked of all the devices with no filtering, so we click on the **Ask this question** button directly.
5. The question gets asked of all Tachyon client devices. If they are currently connected they will respond immediately. If they are offline they will respond if they connect within the duration of the question.

1.2.5.5 Performing an action

From Tachyon v4.0 you no longer need to ask a question before you can run an action from the **Explorer** home page.

1. In the edit field of the **Home** page type **verif** and select the **Tachyon Platform verification stage 2** action from the list displayed.
2. Run this action with default parameters by clicking the **Perform this action** button. Doing this triggers the action approval workflow.
3. Tachyon will ask you to confirm your user name and password credentials. This is a safeguard to prevent actions from being run on unlocked devices where you are temporarily absent.
4. By default, if email has been configured, Tachyon provides two-factor authentication - so after the credentials have been set and the **Confirm and send** button is clicked, you will see that the instruction requires authentication. You will then need to check your email for the authentication code.
5. After retrieving the authentication code, return to Tachyon and enter it into the prompt. The instruction will then go into a pending approval state and a notification will be sent to the approver. As a further safeguard, Tachyon actions cannot be approved by the person requesting the action. In our

example this means that **TCNInstaller01** cannot approve their own action, approval must be done by the other user **TCNAdmin01**.

6. The approver will receive an email saying that the action is pending their approval. If the approver logs on to Tachyon using the link provided in the email, they will be directed to their **Notifications** page.

7. Scrolling to the bottom of the **Notifications** page the approver gets an opportunity to provide a comment for their approval or rejection decision. If they want to approve the action they must first check the **I understand approving my request impacts my IT environment** checkbox and then click the **Approve** button. In our example **TCNAdmin01** enters a suitable comment, checks the box and clicks **Approve** to approve the service start action.

8. The approver is then immediately notified that their decision has been implemented.

9. At the same time, Tachyon also enables the action to go ahead. In our example, the results of running the action are displayed, showing that all twelve connected devices responded and were able to run the verification of the background channel.

1.2.6 In conclusion

In this quick start guide we've shown how to configure an example environment, how to implement the Tachyon Server and Tachyon clients onto the environment, how to configure the Tachyon users and import Product Packs. Finally we've shown those users accessing the Explorer to investigate the devices that are currently connected and then asking a question and performing and approving an action.

1.2.7 Next Steps

1.2.7.1 Using applications that are installed by default

The following applications are always installed by Tachyon Setup, although you may have limited access to features depending on your license.

- **Settings** - please refer to Using Settings
- **Inventory** - please refer to Introducing Inventory
- **Explorer** - please refer to Using Tachyon Explorer
- Guaranteed State - please refer to Using Guaranteed State
- **Experience** - please refer Using Tachyon Experience.

Please refer to Using consumer applications for a summary of these and other optional applications.

Use the Connectors page in the Inventory application to configure connectors and populate the inventory repository. Introducing Inventory describes how to view the normalized inventory data, which can then be used by the following applications that depend on inventory.

- AppClarity
- Application Migration

- Patch Success.

1.2.7.2 Installing and Using AppClarity

You can use Tachyon Setup to install AppClarity during or after you install or upgrade Tachyon using setup. Please refer to Implementing AppClarity.

1.2.7.3 Installing and Using Application Migration

You can install Application Migration during or after you install or upgrade Tachyon using setup. Please refer to Introducing Application Migration.

1.2.7.4 Installing and Using Patch Success

Use must use Tachyon Setup to install and configure Patch Success when you install or upgrade Tachyon. Further configuration is then required as described in Implementing Patch Success.

1.2.7.5 Installing and Using Nomad

You can install Nomad during or after you install or upgrade Tachyon using setup. Please refer to Implementing Nomad.

1.2.7.6 Using Configuration Manager Console Extensions

If you have **Microsoft System Center Configuration Manager** (SCCM, ConfigMgr) then you can install the 1E Tachyon Toolkit on each computer that has Configuration Manager Console installed, in order to add right-click tools. Please refer to The 1E Tachyon Toolkit.

1.2.7.7 Creating your own instructions

You will need your own code signing certificate, and have it registered in your Tachyon license, if you want to develop your own custom Tachyon instructions, or modify those of other authors. Instructions that are provided in the Tachyon Platform zip or downloaded from the 1E Exchange have already been code signed using the Platform and Exchange certificates from 1E. Your license controls whether you can use these instructions.

Ideally, all of your Tachyon instruction developers should share a single **code signing certificate** between them. Each code signing certificate must be registered in your license and associated with your organization's **instruction name prefix**. When you have chosen your prefix and have your code signing certificate(s) you then need to send details of these to 1E, who will update your license. This will then automatically activate on your Tachyon Server (assuming it has a connection to the Internet).

For a getting-started guide to configuring and verifying your Tachyon system so that you can run customized Instructions, refer to /document/preview/736871#UUID-66857689-bfb0-8dbc-ae8d-1de40c66fad9.

The Tachyon SDK (refer to /document/preview/736743#UUID-33c212b3-863e-21bc-bc5d-52e41a0492b3) is where you can find comprehensive resources for using Tachyon Instruction Management Studio (TIMS) and authoring your instructions.

1.3 Planning for Tachyon

Everything you need to know about planning your implementation of Tachyon.

Below is a summary of the design decisions you need to make when planning your Tachyon implementation. Further detail is available below each topic.

1.3.1 License requirements

To be able to use a Tachyon application or tool, you must ensure it is registered as a consumer in your Tachyon licence.

If any consumer, such as Tachyon Explorer, is required to run an instruction, then the instruction's prefix must also be registered in the licence.

> **Tip**
>
> If you want to develop your own instructions in-house, or modify downloaded instructions, you will need to contact 1E to add your custom instruction prefix to your license file, along with the thumbprint of your Code signing certificates , that you must provide.

1E will provide you with a **Tachyon.lic** license file that defines the applications, tools, and features your system is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license.

- The license must be activated. Once activated, it may be used only by the system that activated it.
- Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable.
- For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk.
- For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon master server.

1.3.1.1 License requirements for consumer applications

For any application, tool or feature to use instructions, its consumer and prefix pattern must be registered in your license. The table below shows the consumers and prefix patterns that are typically included in a Tachyon license. The table also includes other applications where instructions - and therefore licensing - are not applicable. Tachyon expects to find the license file in: **%PROGRAMDATA%\1E\Licensing** on your Tachyon (Master Stack) Server.

Applications and features are included in the standard Tachyon License unless otherwise stated in the notes below as being an additional cost.

License requirements for consumer applications

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
Endpoint Troubleshooting	Explorer	You will need prefixes for any Tachyon instructions and you want to use, including custom prefixes for your own and/or third party. Included in the base license are: • 1E-Exchange-* • 1E-Explorer-* • 1E-TachyonPlatform-*	• **Tachyon Platform** zip available on the Support Portal https://support.1e.com/ includes the following classic Product Packs and instruction sets: – **Instructions** – **Instructions** – **Instructions** • 1E Exchange is an online library containing lots of other Product Packs containing instruction	**Explorer** application provides functionality to run, approve and schedule instructions, view Tachyon managed devices. Used to investigate, remediate issues and manage operations across all your endpoints in real-time. **Tip** If you want to use instructions developed by third parties, your own developers, or 1E devel

Inventory Insights	Inventory	• 1E-Inventory-*	• **Tachyon Platform** available on the Support Portalhttps://support.1e.com/ includes the following classic Product Pack and instruction set: – **Instructions** includes 1E Inventory instructions for Tachyon	**Patch Success** application is used to view and export inventory, and manage associations (new in 5.0). Inventory data can be captured from various sources using Connectors, refer to the Connectors page. Data is consolidated, normalized and stored in Repositories, refer to the Repositories page. The Tachyon connector is one method of collecting data, and this uses four inventory instructions which are available in the

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			Powered Inventory	**1E Inventory Product Pack**. This pack also includes another instruction used by Patch Success.
Settings	Platform	N/A	N/A	The **Settings** application is used to administer Tachyon. For example, permissions management, instruction set management, connector management, repository management, sync scheduling etc.
Dashboards	Dashboards	• 1E-ExecutiveDashboard-*	• The latest **Hotfix Bundle** for Tachyon platform (which you can download from the Support Portal https://support.1e.com/)	The Exec Dashboard lets you gain fresh DEX insights from 1E apps. It is the first dashboard available in the **Dashboards** application. This product pack contains a

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			is used to install the app and its product pack: – 1E ExecutiveDashboard product pack	special type of instruction called **Server question**. These questions cannot be run or scheduled in Explorer. These instructions are not sent to devices, instead they query data already held in Tachyon databases. They are run whenever the Exec Dashboard is refreshed if the previous cache of responses has expired.
Experience Analytics	Experience	N/A	• **Tachyon Platform** available on the Support Portal https://support.1e.com/ includes the following classic Product Packs and	Experience helps you visualize your end-users' experience of IT service delivery across your enterprise. It is centered around the experience score, which is based on

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			instruction sets: – Instructions	metrics that cover four categories: • **Stability** - derived from the frequency of operating system and software crashes, hangs and service failures. • **Responsiveness** - based on the speed of operating system startup, system resource creation and availability. • **Performance** - a weighted

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				indication of load and throughput for device processor, memory and disk resources. • **Sentiment** - an aggregated measurement of users feelings or opinions of their device's performance, stability and responsiveness based on user surveys.
AppClarity	AppClarity	N/A	N/A	AppClarity is a Tachyon application aimed at

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				Software Asset Management (SAM) users, helping you get to grips with software waste, take control of license compliance and manage application portfolios easily. It offers an immediate reduction in software costs by helping you manage your software assets on desktops more effectively and maintain software license compliance. The main benefits of using AppClarity are: • Software license compliance – provides at a summary on

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				whether a particular product is license compliant or not • Efficient management of entitlements and agreements for an organisation • Software waste identification – shows unused or rarely used software which are probably the two largest form of software waste and

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				enables to reclaim • License Demand based on different metrics for vendors • Efficient application management – identifies version sprawl where there are many versions of the same product in use. Now, you can financially quantify all software waste by identifying and controlling unused software across your enterprise

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				and improve your compliance status. **Note** AppClarity is an additional cost to the standard Tachyon Platform license.
Patch Insights	Patch Success	• 1E-PatchSuccess-*	• **Tachyon Platform** available on the Support Portal https://support.1e.com/ includes the following classic Product Pack and instruction sets:	Patch Success is an application that lets you maximize success of enterprise-wide patch deployment. It provides a view of patch state of your estate, as well as supplementing your existing patch deployment methods.

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			– Instructions – Instructions also includes a Patch Success instruction	Required instructions need to be licensed as well as the consumer. Three instructions are available in the **1E Patch Success Product Pack** and another one in the **1E Inventory Product Pack.** **Note** Patch Success is an additional cost to the standard Tachyon Platform license.
1E ConfigMgr UI Extensions	CmConsoleExtensions RunInstructionUI	• 1E-ConfigMgrConsoleExtensions-*	• **Tachyon Platform** available on the Support Portal	The Configuration Manager Console extensions is

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			https://support.1e.com/includes the following classic Product Pack and instruction set: – **Instructions**	installed as part of The 1E Tachyon Toolkit.
The 1E Tachyon Toolkit	TachyonRunInstruction	You will need prefixes for any Tachyon instructions you want to use, including custom prefixes for your own and/or third party.	N/A	The Tachyon Run Instruction command-line tool is installed as part of The 1E Tachyon Toolkit.
1E ITSM Connect	ServiceNowCore	You will need prefixes for any Tachyon instructions you want to use, including custom prefixes for your own and/or third party.	N/A	1E ITSM Connect (with 1E Core) provides a User Interface in ServiceNow similar to **Tachyon Explorer**, that allows ServiceNow users to use any instruction that is permissioned for the **1E ITSM Connect app user role**. **Note**

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				1E ITSM Connect is an additional cost to the standard Tachyon Platform license.
1E Service Catalog Connect	ServiceNowCore	You will need prefixes for any Tachyon instructions you want to use, including custom prefixes for your own and/or third party.	N/A	1E Service Catalog Connect (with 1E Core) provides a User Interface in ServiceNow similar to the **1E Shopping** app portal, that allows ServiceNow users to use any instruction that is permissioned for the **1E ITSM Connect app user role**. **Note**

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				1E Service Catalog Connect is an additional cost to the standard Tachyon Platform license.
Application Migration and WSS	Nomad	N/A	N/A	Application Migration intelligently automates the migration of applications during a Configuration Manager OS deployment. Using migration rules (defined by an administrator), previously installed applications can be reinstalled,

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				upgraded or replaced with an alternative during an OS deployment task sequence. These rules can include usage criteria, allowing you to choose to only install previously installed applications if they were being used, or perhaps replace a rarely used application with a less costly alternative. This functionality enables applications to be actively rationalized during an OS migration exercise, standardizing on products and versions and reclaiming unused software. **Note**

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				Application Migration is an additional cost to the standard Tachyon Platform license.
Content Distribution	Nomad	• 1E-Nomad-*	• **Tachyon Platform** available on the Support Portal https://support.1e.com/includes the following classic Product Pack: – **Instructions**	**Nomad Download Pause** requires an installation of the Content Distribution service on Tachyon platform. The feature is available as: • A right-click option in the Nomad Admin tools for the Configuration Manage

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				r Console • Instructions in Explorer. Nomad Admin tools for the Configuration Manager are installed using the **NomadBranchAdminUIExt.msi** installer. **Note** Nomad is an additional cost to the standard Tachyon Platform license.
Nomad	• 1E-GuaranteedState-Check-	• **Tachyon Platform** available on the Support Portal https://support.1e.com/ includes the following	Many businesses rely on Microsoft Endpoint Manager Configuration Manager	

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
	MEMCM* • 1E-GuaranteedState-Check-Network* • 1E-GuaranteedState-Check-Service* • 1E-GuaranteedState-Check-Software* • 1E-GuaranteedState-Check-WindowsUpdate* • 1E-GuaranteedState-	Integrated Product Pack: – MEMCM Client Health Policy	(MEMCM) to deploy software, patches and updates across their company networks. It is crucial that Configuration Manager is working effectively. The MEMCM Client Health policy monitors Configuration Manager client health and performance. It checks for cache availability, inventory cycles, service availability and Configuration Manager WMI integrity - common causes of Configuration Manager client problems on devices. The MEMCM Client Health policy replaces the previous SCCM Client Health policy and covers the following:	

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
	Check-Wmi* • 1E-GuaranteedState-Fix-MEMCM* • 1E-GuaranteedState-Fix-Service* • 1E-GuaranteedState-Fix-WindowsUpdate* • 1E-GuaranteedState-Fix-Wmi* • 1E-GuaranteedState-Precondition*		• Ensure the correct version of the CM client is installed and running and assigned to the correct site • Ensure the CM client is not stuck in provisioning mode • Ensure that heartbeat discovery, inventory and state messages are being sent regularly • Ensures the CM client cache is set to the correct size • Ensure the CM client log settings are correct	

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			• Ensure the BITS service exists, configured to start up automatically and is running • Ensure the Windows Time service exists with correct startup settings • Ensure the Windows Management Instrumentation (WMI) service exists, configured to start automatically and is running • Ensure WMI is healthy, the core CIMv2 and ccm	

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			namespaces and classes exist and that the WMI repository is consistent • Ensure the Windows Update service exists with correct startup settings, is configured to use the correct source (CM, WSUS or Microsoft Update) and that the service can connect to the source **Note** This policy is intended for deploym ent to	

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			Windows devices only.	
Nomad	• 1E-Explorer-NomadClientHealth-* • 1E-GuaranteedState-Nomad*	• **Tachyon Platform** available on the Support Portal https://support.1e.com/ includes the following Integrated Product Pack: – **Nomad Client Health Policy**	Nomad is included as part of the 1E Client, and as part of that integration, we offer a Nomad client health compliance policy in Guaranteed State. This verifies common Nomad requirements such as ACP registration, disk availability, firewall exceptions, crash notifications and cache monitoring. The Nomad client health policy replaces the client health tile in the Nomad dashboard plus additional remediation steps: • Keeps content distribution services up and running on Nomad clients, so that users	

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
			are secure and productive • Ensures Alternative Content Provider (ACP) registration configuration is set • Maintains optimal disk availability and monitors cache size for storage capacity planning • Enforces Firewall exceptions. **Note** This policy is intended for deployment to Windows devices only.	

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
Nomad	• 1E-Explorer-MSSCCMClientHealth-* • 1E-Explorer-NomadClientHealth-* • 1E-Explorer-WindowsClientHealth-* • 1E-GuaranteedState-ClientHealth* • 1E-GuaranteedState-General-Check-ServiceState* • 1E-Guaran	• Required if all the following apply: – You have a Nomad license instead of a full Tachyon license, – And you upgraded from an earlier version of Tachyon – And using legacy**Microsoft SCCM Client Health Policy** (which has been replaced by the MEMCM Client Policy, for more details please refer to:**MEMCM Client Health Policy**).

		teedState-MSSCCMClientHealth-*		
NightWatchman Online Status	NightWatchman	N/A	N/A	The NightWatchman console uses Tachyon to display traffic lights live status of its clients – indicating whether they are currently online or offline (or unknown). You can also check the status of groups within the NightWatchman client hierarchy. **Note** NightWatchman is an additional cost to the standard Tachy

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				on Platform licens e.
Shopping integration with Tachyon	Shopping	You will need prefixes for any Tachyon instructions you want to use, including custom prefixes for your own and/or third party.	N/A	Shopping integrates with Tachyon by allowing users to shop for Tachyon instructions, in the same way as they can for applications served by Configuration Manager and Intune. This is most useful to allow users to fix or reconfigure their computers for issues that users commonly understand (such as disk space or Outlook issues). However, it can also be used to quickly deploy software to users or anything else that

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				instructions can do. Shopping integration also extends the Shopping's order tracking feature, particularly for client-side notifications and status monitoring. To enable these features, please refer to Shopping 6.1 - Enabling Tachyon integration and Shopping 6.1 - Managing Order Tracking. **Note** Shopping is an additional cost to the standard Tachyon Platform

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				licens e.
Third party and custom er integra tion softwa re	See notes	N/A	N/A	You must ask 1E to add consumer names to your license if you intend to use third party or your own custom software to integrate with Tachyon and leverage its real-time client-based features, for example: • Splunk • QRadar • Rapdid7 • LogRhyt hm • EUCDas hboard You will probably also require your own custom prefixes for instructions and/or Guaranteed State fragments

Application or Feature	Consumer name	Prefix patterns	Where to obtain the Product Pack	Notes
				used by these Consumers, theefore you will need to ask 1E to add these prefixes too, as described the top of this table.

Tip

Additional consumers and tools can be developed by third parties, your developers, or 1E developers on your behalf. 1E must register their consumer names in the Tachyon license.

1.3.1.2 Developing your own instructions

You will need your own code signing certificate, and have it registered in your Tachyon license, if you want to develop your own custom instructions, or modify those of other authors. Instructions that are provided in the Tachyon platform zip, or in Product Packs you download from the 1E Exchange, have already been code signed using the Platform and Exchange certificates from 1E. Your Tachyon license controls whether you can use these instructions.

Ideally, all of your Tachyon instruction developers should share a single **code signing certificate** between them. Each code signing certificate must be registered in your Tachyon license and associated with your organization's **instruction name prefix**. When you have chosen your prefix and have your code signing certificate(s) you then need to send details of these to 1E, who will update your Tachyon license. This will then automatically activate on your Tachyon master server (assuming it has connection to the Internet).

For a detailed step-by-step process, please refer to /document/preview/736871#UUID-66857689-bfb0-8dbc-ae8d-1de40c66fad9 (in the Tachyon SDK).

/document/preview/736743#UUID-33c212b3-863e-21bc-bc5d-52e41a0492b3 is where you can find comprehensive resources for developing your instructions.

You can download Product Packs containing more instructions from the 1E Exchange, and ask questions in the support.1e.com/.

1.3.2 Architectural requirements

You need to decide which architecture your Tachyon system will use, and which configuration options. Your architectural decisions will include the types of Tachyon servers you will need, and how many, as well as how you will provide SQL services.

Tip

This documentation covers installation on-premises and on your own cloud-based servers. Alternatively, please contact your 1E Account team if you wish to use 1E's SaaS solution and avoid having to install and maintain servers.

SQL Server can be local or remote from your Tachyon servers.

Tachyon supports the following High Availability (HA) options for SQL Server:

- AlwaysOn Availability Group (AG) using an AG Listener
- Failover Cluster Instance (FCI)

Tachyon Setup is a configuration wizard which must be run on *each* server in your architecture, to install the required components. Tachyon Setup supports the following types of Tachyon server:

- **All components on a single server** - a single-server installation comprises Master Stack and Response Stack, which is the most common choice for a system of any size supporting Tachyon real-time features.
- **Master Stack** - you would install a Master Stack on its own if you do not require real-time features, or you want one or more remote Response Stacks.
- **Response Stack** - this choice allows you to install a Response Stack after you have completed a single-server installation or installed a Master Stack, and is required to support Tachyon real-time features.
- **DMZ Server** - this choice is used on when installing a DMZ Server to provide real-time features for Internet-facing clients. For design and configuration steps, please refer to the Implementing a Tachyon DMZ Server page.

The number of devices you need to support influences the number of Switches and Response Stacks you will need, and their server specifications. Each Switch can handle up to 50000 devices, and you can have up to five Switches on a single Response Stack server, handling a maximum of 250000 devices.

Multiple Response Stacks provide a degree of high availability, but are not intended for that purpose. Instead, Response Stacks are required for security, geographic or other network reasons. For example, because your organization covers multiple geographies and you do not want 1E Client traffic to go beyond the boundaries of each region, or because you have Internet-facing devices and need a Tachyon DMZ Server on-premises.

1.3.2.1 Tachyon Architecture

The pictures below show the most common architectural implementations of Tachyon that are supported by Tachyon Setup. Organizations with less than 50000 devices will typically have a single-server system with one Switch, but there may be reasons why a more complex configuration would be required. Key factors are the location of servers and how devices and users will connect to them.

Every Tachyon system has a single **Master Stack**, which provides web services for Tachyon applications. Master Stack components are typically all installed on a single **Master Server**.

Tachyon real-time features require **Response Stacks**, which are made up of one or more **Response Servers**. A **DMZ Server** is an example of a Response Server. Each Response Stack has at least one **Background Channel** for sharing resources, and a single **Core** component that supports an associated set of up to five **Switches**. Switches are the primary mechanism for rapidly requesting and retrieving responses from the **clients**. As each Switch can handle up to 50,000 devices there is a limit of 250,000 devices per Response Stack. Higher numbers can be achieved if you contact 1E for guidance. Switches may be local or remote to the other components in the Response Stack.

Databases for Tachyon, 1E Catalog, Nomad, Experience, SLA and BI, are installed on SQL Server database instance(s) that may also be local or remote to their respective Master and Response servers. It is also possible for multiple Response Stacks to share the same Responses database. The **Cube** used by Patch Success (SLA-BI) is installed on a local or remote SQL Server Analysis Services (SSAS) instance.

The pictures of the single-server and internet-facing configurations each show a system with a single Response Stack. The internet-facing system is special because the components of its Response Stack are split over two servers. Splitting a stack across multiple servers is not usually necessary except in special circumstances, for example the Switch and Background Channel on a DMZ Server is remote from its Core. The DMZ picture shows a dual firewall design, but single firewall is also supported.

The databases for Tachyon Master and Response Stacks can exist on local or remote installations of SQL Server. Local is the simplest implementation. A local Responses database offers the best performance, whereas a remote Responses database requires an additional network interface and network routing explained in Network requirements.

Tachyon can be installed on-premises on physical and virtual servers, and also on AWS and Azure cloud servers.

For an explanation of Tachyon components, please refer to Tachyon components.

> **Note**
>
> Click on a picture to enlarge. Click on a link to take you to the relevant part of the Tachyon Architecture page for more detail along with a description of the various components.
>
> Components colored green are optional when installing a Tachyon system.

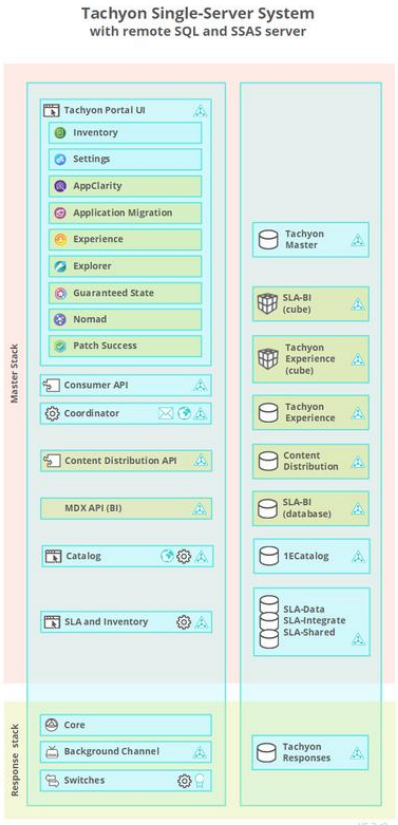
1.3.2.2 Tachyon configuration options

Tachyon Setup configuration wizard has several standard options described above. There is also a custom installation option to support different configurations to those described.

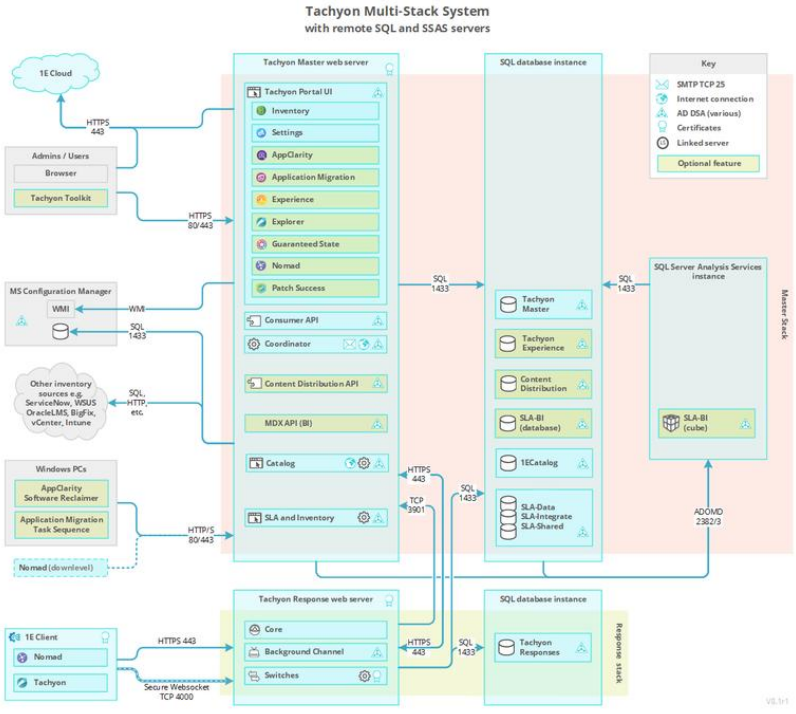
> **Note**
>
> Please contact your 1E Account Team if you need help with this.

SQL Cluster and SQL Always On are supported, but require additional steps, described in High Availability options for SQL Server.

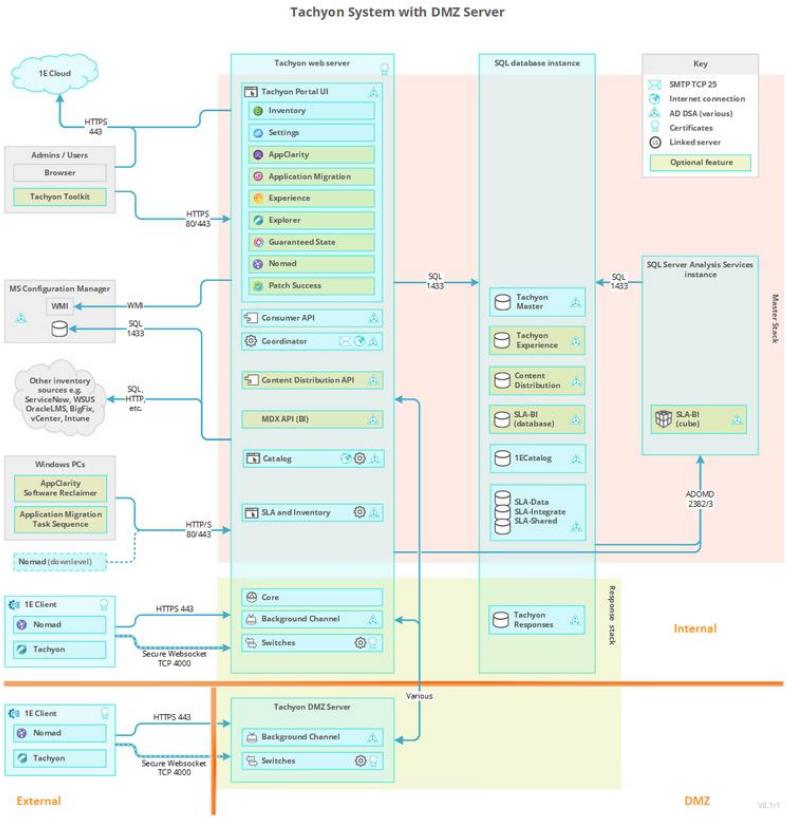
> **Note**
>
> Please contact your 1E Account Team if you need help with this.



[Tachyon Single-Server system]



[Tachyon Multi-Stack system]



Tachyon architecture for Internet-facing devices

1.3.2.2.1 1E Business Intelligence

Business Intelligence is an optional component installed by Tachyon Setup on the Master Stack, and requires SQL Server Analysis Services (SSAS). Business Intelligence is a prerequisite for the **Patch Success** application to support efficient presentation of visualizations on a large scale.

1.3.2.2.2 Applications and Tools

Tachyon applications and tools are consumers, and all consumers connect to the Tachyon Consumer API.

The following consumer applications run on Tachyon platform and are installed using Tachyon Setup. Please also refer to the License requirements page.

Applications are categorized as follows:

- Configuration - applications required to configure Tachyon platform and required by all other applications
- Client - applications that communicate with devices in real-time
- Inventory – applications that use inventory features

1.3.2.2.2.1 Applications that are included in the Tachyon Platform license

Application	Purpose	Type
Inventory	View and export inventory, and manage associations. It uses the SLA databases.	Inventory, configuration
Settings	Configure and monitor platform features. It uses the Tachyon Master database.	Configuration
Guaranteed State	Ensure endpoint compliance to enterprise IT policies. It uses the Tachyon Master and Responses database.	Client
Explorer	Investigate, remediate issues and manage operations across all your endpoints in real-time. It uses the Tachyon Master and Responses database.	Client

1.3.2.2.2.2 Applications that require a license

Application	Purpose	Type
AppClarity	Manage software license compliance, License Demand Calculations, license entitlements, and for reclaiming unused software. It uses the SLA databases.	Inventory
Application Migration	Intelligently automate the migration of applications during a Configuration Manager OS deployment. It uses the SLA databases.	Inventory
#UUID39ecfb49a2e10e6f5820cc411d69d030	Manage content distribution across your organization using a centralized dashboard. It uses the Content Distribution database.	Client

Application	Purpose	Type
	1E Client requires Tachyon and Content Distribution features to be enabled on all clients. Content Distribution replaces the Nomad features of ActiveEfficiency Server, which is deprecated. Legacy Nomad clients continue to be supported by direct communication with the Content Distribution API, whereas Nomad 8.x clients communicate with the Content Distribution API via the proxy feature on Response Servers. Tachyon Setup Setup is used to install Content Distribution, and the Nomad app, and no longer installs ActiveEfficiency. Nomad uses Content Distribution for the following features: • Nomad app provides visibility of content distribution activity • Single Site Download (SSD) • Single Site Peer Backup Assistant (SSPBA) • High Availability Peer Backup Assistant (HAPBA) • Get Migration Settings task sequence action used to manage computer associations • Nomad Pre-caching • Nomad Download Pause.	
/document/preview/763581#UUID-54875393-7855-5624-cbae-9ad5406e1c95	Reports on and ensures successful patching of your enterprise.	Inventory

Application	Purpose	Type
	It uses the SLA and BI databases. Tachyon Setup indstalls SLA Business Intelligence, which requires SQL Server Analysis Server. Patch Success also uses Inventory connectors to get meta-data for patches from whichever of the following that you use to approve patches: • Configuration Manager (SCCM) if it is configured to manage WSUS • Windows Server Update Services (WSUS).	
Introducing Tachyon Experience	Measure performance, stability and responsiveness for applications and devices to assess user experience across your enterprise. It uses the Tachyon Master and Tachyon Experience databases.	Client

The following types of application require 1E Client (with Tachyon features enabled) to be deployed to all in-scope devices.

- All Client applications
- Inventory applications if you intend using the Tachyon connector to populate your inventory.

The **AI Powered Auto-curation** feature is optionally used by Inventory applications to provide automatic curation of new products. This avoids having to manually add products to the 1E Catalog, or wait for it be updated. This optional feature requires additional memory on the Tachyon Server (Master Stack). Please refer to AI Powered Auto-curation: Memory requirements for details.

Some benefits of using AI Powered Auto-curation are that you can:

- Achieve significantly more normalized software from the first sync
- Reduce the manual effort required to normalize software
- Get an expanded SAM offering as more data is available for AppClarity
- Get additional coverage for Application Migration

- Identify more software to review for security threats.

1.3.2.2.3 Tachyon Tools

The following are tools included in Tachyon 8.1 platform. These tools are not installed using Tachyon Setup. They have either their own installers or are included in download zips.

- Tachyon ConfigMgr UI Extensions - installed as part of the Tachyon Toolkit, this is a right-click extension for the Configuration Manager console that provides the option to browse and run an instruction on devices in a specified Collection, refer to Preparing for the Tachyon extensions for the Configuration Manager Console. for details.
- Tachyon Run Instruction command-line tool - installed as part of the Tachyon Toolkit, it is used for sending instructions to the Tachyon server from a script or from a command prompt.
- Tachyon Product Pack Deployment Tool - included in the Tachyon platform zip ProductPacks folder.
- TIMS - used for the development of instructions using the Tachyon SDK, refer to /document/preview/736745#UUID-952f2552-fb04-d55c-6d12-fcf68313ecac for details.

A typical Tachyon license allows the use of all these tools.

1.3.2.3 Telemetry

Telemetry helps 1E to continually improve your experience with Tachyon. Only summarized statistical information is collected, which enables 1E to see how customers use features of the application. No personally identifiable data is collected. 1E use this information to:

- Understand how the product is being used to influence future development decisions
- Plan supported platforms (OS, SQL etc. versions) over time
- Deliver a smooth upgrade experience as we can focus testing on implemented scenarios
- Improve system performance
- Identify early warning signs of potential issues such as excessive growth of database tables, instruction failures etc. so we can pro-actively address them.

Server telemetry reports how the platform is used and data is compressed, encrypted and sent to 1E through email on a configurable schedule. Full details of the Server telemetry data sent to 1E is provided in Server telemetry data. **User Interface telemetry** reports how the user interface is used, and data is sent directly from administrator browsers to the 1E Cloud.Please refer to Whitelisting connections to 1E Cloudfor details of URL that must be whitelisted for administrator browsers.

Telemetry features are configurable using Tachyon Setup during installation or upgrade, and can be enabled or disabled as a post-installation task. 1E encourages customers to enable sending telemetry.

Please also refer to Enabling or disabling Telemetry features.

1.3.2.4 Server sizing requirements

1.3.2.4.1 Objectives

The objective of this document is to outline prescriptive guidance for Tachyoncustomers implementing the solution, either on-premises servers, or in the Amazon AWS or Microsoft Azure cloud platforms.

There are many possible hardware server configurations, or cloud instance types and storage options, that customers can choose from, but the aim of this document is to recommend prescriptive guidance, and detailed configuration of the best performant implementation that customers, of varying client count sizes, should use to implement Tachyon.

This document focuses heavily on the SQL Server implementation and required storage for Tachyon, as this is singly the most performance demanding component of the system.

The default Tachyon configuration assumes, and recommends, a single Tachyon server and a separate remote SQL Server in a standard two server setup. There are sections for additional and complex implementations for separate Switch and Background Channels servers (DMZ), plus the extreme scenario where multiple Tachyon servers in a split, Response and Master Stack server configurations could be deployed, depending on the specific requirements for larger customers, for reasons of scale and higher availability.

1.3.2.4.2 Assumptions

The key assumption in this document for sizing guidelines is that the customer is using all components of Tachyon, that is, Explorer, Guaranteed State, Experience, Patch Success, Inventory, and Content Distribution.

The sizing guidelines are based on extensive testing of all components of the Tachyon platform, at different client count scales, using representative test data to simulate typical customer environments and their administrative and reporting usage.

Therefore, the following sizing guidelines should be used as the *minimum* hardware requirements for the specific numbers of managed clients in the respective size environments.

- In terms of CPUs, the test environment used Intel Xeon E5-2687 v3 @3.1Hz, though any server-level CPU from 2016 should meet the performance needs for the cores specified in the following tables. Additional or newer and faster speed CPUs will improve performance, and the Tachyon platform will SQL Server will utilize all the CPU resources available.
- In terms of data sizing, actual customer data and individual requirements will vary greatly. The data sizing is provided only as general guidance and assumes that some amount of storage will remain as free space, most of the time, when not at peak loads.

1.3.2.4.3 Performance load modelling

To simulate 100,000s of actual 1E Clients, 1E developed a Load Generation tool (loadgen) that maintains the same number of persistent connections and can respond with the same data responses as would actual real-world clients.

In reality, loadgen generates more data and creates greater data storms at the Tachyon servers than, offline and latent 1E Client responses would generate, so can be considered as producing a more extreme and worst-case scenario performance loads on the Tachyon servers.

Assumptions used when creating the sizing guide

Component	Feature	Assumptions
Explorer	Instructions	An average of 1,000 instructions per day (including Synchronous instructions). Peak loads of 10 simultaneous small and some large instructions, targeted at both small and large device sets. Small instructions (<4K) can be received and processed from all online clients in less than 15 seconds.
Guaranteed State	Policies	Around 20 deployed policies totaling 300 active rules and remediations. An average of up to 100 rule state changes per device per day.
Experience	Events and metrics	Each device reports an average of 300 Device and Software Performance, User Interactions and Windows events per day. The Experience Dashboards and UI drill-down queries should be able to display and filter required data views, within a few minutes.
Inventory (also known as SLA)	Hardware and software inventory	At least two connectors are configured (for example SCCM or BigFix) in addition to the Tachyon connector. An average of 200 software installations and 100 patches per device and up to 50,000 distinct software products, per 50k devices. Up to 50 distinct Management Groups per 50,000 Devices.
Patch Success	Patch data	Clients process a maximum of 20 patch state changes per month for Windows and other related Microsoft Updates.
Content Distribution	Downloads	For every 50,000 clients there are 100 sites containing around 2,500 distinct subnets. At peak loads (that is, during a critical patch deployment) there could be up to 20,000 content download requests

Component	Feature	Assumptions
		(and their responses) per minute handled by the platform and content registrations.

An overall assumption is that long duration and high impact batch processing operations, such as SLA inventory sync consolidations and Experience sync processing, are run primarily out of business hours (typically overnight) when there would be little potential impact on other Tachyon traffic and administrative interactive query and analytical reporting.

1.3.2.4.3.1 Using AI Powered Auto Curation with SLA Inventory Sync

Additional RAM is required if this feature is enabled, based on the total number of distinct software titles found in a specific customer environment. Please refer to the table detailed at AI Powered Auto-curation, which explains how to calculate the memory requirements. You must then add this to the figures in the following sizing tables.

1.3.2.4.4 On-premises installation

The Tachyon platform is recommended to be installed on a dedicated server, with a separate dedicated SQL Server, and can be installed on either virtual server or physical hardware.

For every 50,000 clients, Tachyon requires a separate instance of the Tachyon Switch component, which requires a dedicated Network Interface (NIC) for each switch instance. In a virtualized environment, this should a dedicated vNIC that preferably maps to a dedicated physical NIC, on the host.

Tachyon is a high-intensity database application and so requires a highly performant Microsoft SQL Server setup, with fast storage, and this is the most important component to size correctly. Storage could be presented locally, but it is expected that the more likely scenario is that this is presented from a customer Enterprise Storage Area Network (SAN), or cloud-based managed storage.

As per Microsoft SQL Server best practice, 1E recommends to provision at least three separate disk volumes for SQL Data, Logs, and TempDB. These volumes may be made up from multiple dedicated disks, striped in a RAID Volume for both resilience and performance, for example RAID 10, depending on the standard operational configuration of the customer's on-premises storage sub-systems.

Data and log drives disk volumes should be formatted to use 64 KB allocation unit size. It is assumed the customer is using fast SSD based storage to achieve the necessary disk throughput in MB/s and IOPS, at least 6Gb/s SATA, but preferably 12Gb/s SAS or NVMe drives at higher scale.

Microsoft SQL Server should be configured according to the Microsoft best practice documentation. The default installation of SQL Server 2017 or later, will make automatic configuration settings for memory, TempDB, and processing parallelism. However, the best single index to overall Microsoft recommendations for SQL Server can be found at https://docs.microsoft.com/en-us/sql/relational-databases/performance/performance-center-for-sql-server-database-engine-and-azure-sql-database?view=sql-server-ver15.

Note

One setting to make over and above the SQL Server installation defaults is to set **Maximum SQL Server Memory** to a value that reserves some memory at the server for the Operating System itself, and any additional running processes. A reasonable rule of thumb to use, for a dedicated SQL Server configuration as defined in the following server

tables, would be to set **Maximum SQL Server Memory** to 85% of total memory of the server.

Cloud based SQL Database deployment templates, may configure most, but not all, memory optimizations automatically, but some of the key recommendations to note, are as follows.

- Server memory configuration options (https://learn.microsoft.com/en-us/sql/database-engine/configure-windows/server-memory-server-configuration-options)
- Configure the max degree of parallelism Server Configuration Option (https://learn.microsoft.com/en-us/sql/database-engine/configure-windows/configure-the-max-degree-of-parallelism-server-configuration-option)
- optimize for ad hoc workloads server configuration option (https://learn.microsoft.com/en-us/sql/database-engine/configure-windows/optimize-for-ad-hoc-workloads-server-configuration-option)

In addition, it is essential that a Backup and Maintenance strategy of SQL server must be defined, and backup and maintenance jobs configured accordingly. These must be run during low peak hours or when server is not in use (such as over-night or weekends) and should include the following.

- At least weekly full backups and then daily differentials, as required
- Daily Update statistics job and weekly Rebuild index followed by DBCC Checkdb

1.3.2.4.4.1 SQL Server Analysis Services (SSAS)

In addition to SQL Server databases, Patch Success requires a SSAS instance, in multi-dimensional mode, that can be co-located with SQL Server Database installation, using the same data and log drives. The disk space required for the SSAS cubes is typically only 10's of MBs, so can largely be ignored in terms of disk space sizing.

SSAS settings and configuration can be left at the installation defaults, but additional best practice performance optimizations for SSAS can be found in the following Microsoft guidance at http://download.microsoft.com/download/d/2/0/d20e1c5f-72ea-4505-9f26-fef9550efd44/analysis%20services%20molap%20performance%20guide%20for%20sql%20server%202012%20and%202014.docx

When SSAS is being used, set **Memory Limit Low**: 90% and **SSAS Memory Limit High**: 95%. Both of these settings can be set at the Server properties via SQL Server Management Studio.

1.3.2.4.4.2 Small server sizing (<10K clients, on-premises and cloud)

For small systems with less than 10,000 seat counts and Proof-of-Concept installations, it is allowable for simplicity for all the Tachyon server components and SQL Server to be installed onto a single server - though it should be noted that this may mean higher SQL per core licensing costs than a split two server installation.

In a single server, as per Microsoft SQL Server best practice, it is still recommended to have a minimum of 3 separate disks (OS Drive, SQL DB and Logs, and TempDB) to gain optimum disk performance.

VM and storage sizing for both on-premises and cloud platforms

Platform	On-Premises	Microsoft Azure	Amazon AWS
CPU Cores	4	4	4
RAM	32 GB	32 GB	32 GB
Tachyon Switches	1	1	1
NICs	1	1	1
Disks			
OS Drive disk size	64 GB	64 GB	64 GB
DB and Logs disk size	500 GB	500 GB	500 GB
MBs/IOPS	250/15,000	170/3,500	250/16,000
TempDB disk size	150 GB	150 GB	180 GB
MBs/IOPS	250/15,000	242/38,500	250/16,000

Note

For a combined single-server installation, **Maximum SQL Server Memory** max memory should be capped at 50% of available memory, to ensure the set of Tachyon databases has its own, dedicated pool of memory.

IOPS is calculated at standard 16k Block Size, although SQL Data volumes/disks should be formatted in Windows at 64k allocation units, according to Microsoft SQL Server best practice guidance.

For Cloud implementations, to achieve the required disk throughput, the above assumes using premium storage SSD based disks. For example, for Azure use Premium SSDs, and for AWS use EBS gp3 volumes.

1.3.2.4.4.3 Medium and large on-premises design patterns

On-premises VM and storage sizing for different customer sizes

	Medium 1	Medium 2	Large 1	Large 2	Large 3
CPU Cores	4	8	16	32	63

	Medium 1	Medium 2	Large 1	Large 2	Large 3
RAM	16 GB	32 GB	64 GB	128 GB	256 GB
Tachyon Switches	1	1	2	4	10
NICs	2	2	3	5	11
Remote SQL Server					
CPU Cores	4	8	16	24	64
RAM	32 GB	64 GB	128 GB	256 GB	512 GB
Disks					
DB Size	500 GB	1,000 GB	2,000 GB	4,000 GB	8,000 GB
MBs/IOPS	250/15,000	500/30,000	1,000/60,000	2,000/120,000	4,000/240,000
Logs Size	100 GB	200 GB	500 GB	1,000 GB	2,000 GB
MBs/IOPS	170/10,000	250/15,000	500/30,000	1,000/60,000	2,000/120,000
TempDB Size	150 GB	300 GB	600 GB	1,200 GB	2,000 GB
MBs/IOPS	250/15,000	500/30,000	1,000/60,000	2,000/120,000	4,000/240,000

Note

Customers with intervening seat counts should choose the closest higher number. For example, a 150,000-seat implementation should be treated as **Large 2** rather than **Large 1**.

IOPS is calculated at standard 16k Block Size, although SQL Volumes should have a 64k block size, and disks/volumes should be formatted in Windows at 64k allocation units, according to Microsoft best practice guidance.

1.3.2.4.4.4 Network considerations

A server hosting a Tachyon Response Stack requires a dedicated network interface for each Switch, and for the connection to the remote SQL Server, to keep incoming traffic from clients separate from the outgoing traffic to the Response and other Tachyon SQL databases. It is expected that this Server-to-Server network traffic, would be over a Data Center backbone network of 10Gb or more.

Accelerated Networking which provides enhanced NIC performance, using Receive Side Scaling (RSS) should be enabled on all NICs. Please refer to https://docs.microsoft.com/en-us/windows-hardware/drivers/network/introduction-to-receive-side-scaling.

Also, its better performant to increase the transmit (TX) and receive (RX) buffer sizes to their maximum under the Windows network adaptor advanced properties.

1.3.2.4.5 Microsoft Azure

1.3.2.4.5.1 Out of scope

This document only focuses on implementing Tachyon components and SQL Server on individual Azure VMs, and configurations using Azure Premium storage.

It doesn't consider using Microsoft SQL as part of Azure Platform as a Service (PAAS) offerings, either SQL Server Managed Instances or Native Azure SQL (https://docs.microsoft.com/en-us/azure/azure-sql/azure-sql-iaas-vs-paas-what-is-overview) as these solutions are not currently supported by 1E as a means to implement SQL Server for Tachyon.

In addition, it does not consider using Azure instances that do not rely on Azure premium storage, but have local NVMe drives, like the Lsv2-series. Although these instance types have very high performing storage and data transfer bandwidth, the NVMe disks are ephemeral or non-persistent, so only practical for single SQL Server instance for TempDB.

In the future, 1E plan to provide guidance in using non-persistent storage solutions or SQL Business Critical Managed Instances, as part of a **SQL Server Always on Availability Group** cluster, that would provide storage resilience and redundancy as described in https://docs.microsoft.com/en-us/sql/database-engine/availability-groups/windows/overview-of-always-on-availability-groups-sql-server?view=sql-server-ver15. However, since these solutions require a cluster of minimum 3 nodes, it should be noted that these solutions would be much more expensive to implement than individual VMs.

1.3.2.4.5.2 Azure VM Selection

This document should be read in conjunction with the Azure documentation, especially with the guidance on Maximizing Microsoft SQL Server Performance with on Azure VMs https://docs.microsoft.com/en-us/azure/azure-sql/virtual-machines/windows/performance-guidelines-best-practices.

Azure Premium storage recommendations for SQL Server workloads are also detailed more completely in https://docs.microsoft.com/en-us/azure/virtual-machines/premium-storage-performance#optimize-IOPS-throughput-and-latency-at-a-glance.

Based on these factors, 1E recommend using Azure Dsv4 VMs for the Tachyon server and Edsv4-series VMs for SQL Server, to achieve the optimum ratio of vCPU and memory count for the separate requirements.

Dsv4 and Edsv4-series sizes run on the Intel® Xeon® Platinum 8000 series (Cascade Lake) processors. In addition, the Edsv4 virtual machine sizes feature up to 504 GiB of RAM, in addition to fast and large local SSD storage (up to 2,400 GiB). These virtual machines are ideal for memory-intensive enterprise applications and applications that benefit from low latency, high-speed local storage in the following specifications.

Azure Dsv4 VMs for the Tachyon server

Dsv4 Series							
Standard_D2s_v4	2	8	0	4	3200/48	2	1000
Standard_D4s_v4	4	16	0	8	6400/96	2	2000
Standard_D8s_v4	8	32	0	16	12800/192	4	4000
Standard_D16s_v4	16	64	0	32	25600/384	8	8000
Standard_D32s_v4	32	128	0	32	51200/768	8	16000
Standard_D48s_v4	48	192	0	32	76800/1152	8	24000
Standard_D64s_v4	64	256	0	32	80000/1200	8	30000

1.3.2.4.5.3 Azure VM constrained core CPU options

At some VM sizes, it is possible to reduce the CPU count to therefore lower SQL license requirements, whilst maintaining the higher storage throughput of the VM. Selecting constrained core SQL VMs, specifically to get the higher required storage throughput, although with the same VM and OS license pricing, will provide half the actual presented vCPU core count, but therefore minimise SQL Server license costs.

Please refer to https://learn.microsoft.com/en-us/azure/virtual-machines/constrained-vcpu.

1.3.2.4.5.4 Azure Premium storage selection

For any solution based on Microsoft SQL Server, storage throughput is normally the major bottleneck to performance, and Tachyon is no exception to this.

The maximum storage throughput in terms of MB/s and IOPS for specific Azure EdsV4 VMs is detailed in the table below, and this will determine the maximum equivalent MBs/IOPS for the selected Azure Premium storage volumes.

For example, if you attach a two P30 disks volume (200MB/s provisioned throughput each) to an E16ds_v4 VM, you reach the instance limit of 384 MB/s before you reach the volume limit of 400 MB/s total throughput.

Azure EdsV4 VMs for the Tachyon SQL Server

Edsv4 Series				
Standard_E2ds_v4	75	4	19000/120(50)	3200/48
Standard_E4ds_v4	150	8	38500/242(100)	6400/96

Edsv4 Series

Standard_E8ds_v4	300	16	77000/485(200)	12800/192
Standard_E16ds_v4	600	32	154000/968(400)	25600/384
Standard_E20ds_v4	750	32	193000/1211(500)	32000/480
Standard_E32ds_v4	1200	32	308000/1936(800)	51200/768
Standard_E48ds_v4	1800	32	462000/2904(1200)	76800/1152
Standard_E64ds_v4 [1]	2400	32	615000/3872(1600)	80000/1200

The recommended Azure Premium storage type are Premium SSDs as these deliver the best high-performance and low-latency disk support for virtual machines at the lowest storage cost. Please refer to https://learn.microsoft.com/en-us/azure/virtual-machines/disks-types.

Another option would be to use Azure Ultra disks, but these are much more expensive and do not benefit from read caching. Though, some additional benefits of Ultra disks include the ability to dynamically change the performance of the disk, without the need to restart the VM.

As per Microsoft SQL Server best practice, 1E recommends to provision at least three separate Azure disk volumes for SQL Data, Logs and TempDB. In the Azure Edsv4 virtual machine, it is possible to use the fast and large local SSD storage for TempDB, as this does not need to be persistent and is re-created automatically every time SQL Server starts.

The Data volumes may be made up from multiple Premium disks (in the higher spec Configurations), striped in a Basic Array using Windows Storage Spaces. This configuration allows for the local NVMe SSDs to act as a read-ahead cache for these striped volumes and gain better read performance. Please refer to https://learn.microsoft.com/en-us/azure/azure-sql/virtual-machines/windows/performance-guidelines-best-practices-storage.

> **Note**
>
> If the VM is created using the Azure SQL VM template, then the relevant disks will be automatically created as Windows Storage space volumes, with read-ahead caching enabled.
>
> Overall, these storage volumes should have the combined MBs throughput, equal to or above the total MBs supported by the given VM size, to gain maximum storage performance.

1.3.2.4.5.5 Increasing Azure SQL Server Performance

The latest Azure Ev5 series VMs provides up to three times an increase in remote storage performance compared with previous generations: https://azure.microsoft.com/en-us/blog/increase-remote-storage-performance-with-azure-ebsv5-vms-now-generally-available/.

For larger scale Tachyon environments, achieving the best storage throughput provides the best performance for long running data consolidation operations.

In addition, the latest Ev5 Series VMs support disk busting which provides the ability to boost disk storage IOPS and MB/s performance: https://learn.microsoft.com/en-us/azure/virtual-machines/disk-bursting

On-demand disk bursting in Azure is only available for premium disks of 1TB in size or greater (P30), but by enabling this on SQL data disk(s), allows you to achieve the maximum storage throughput available to the VM on high-intensity operations: https://learn.microsoft.com/en-us/azure/virtual-machines/disks-enable-bursting.

1.3.2.4.5.6 Azure prescriptive design patterns

Azure VM and storage sizing for different customer sizes

	Medium 1	**Medium 2**	**Large 1**	**Large 2**	**Large 3**
CPU Cores	4	8	16	32	64
RAM	16 GB	32 GB	64 GB	128 GB	256 GB
Tachyon Switches	1	1	2	4	10
NICs	2	2	3	5	11*
Remote SQL Server					
VM Type	**Std E4ds v4**	**Std_E8ds v4**	**Std E16ds v4**	**Std_E20ds_v4**	**Std_E64ds_v4**
CPU Cores	4	8	16	20	64
RAM	32 GB	64 GB	128 GB	160 GB	504 GB
Max MB/s	96	192	384	480	1,200
Max IOPS	6,400	12,800	25,600	32,000	80,00
DB Size	500 GB	1,000 GB	2,000 GB	4,000 GB	8,000 GB
MBs/IOPS	170/3,500	340/7,000	400/10,000	800/20,000	1,600/40,000
Logs Size	128 GB	256 GB	500 GB	1,000 GB	2,000 GB
MBs/IOPS	170/3,500	170/3,500	170/3,500	200/5,000	250/7,500

	Medium 1	Medium 2	Large 1	Large 2	Large 3
TempDB Size	150 GB	300 GB	600 GB	750 GB	2,000 GB
MBs/IOPS	242/38,500	485/77,000	968/154,000	1,211/193,000	3,872/615,000

Note

For customers with inter-meaning seats count, they should choose the closest higher number. For example, a 150,000-seat implementation should be treated as **Large 2** rather than **Large 1**.

As noted above, to reach the required throughput in MBs, for the data drive especially, multiple P20, P30 or P40 Premium disks should be used and these disks, striped using Windows Storage space to present a single volume.

The high MBs/IOPS for the TempDB drives is because they are using the built-in high throughput of the fast, local SSD based (non-persistent) storage that the Edsv4-series provides.

1.3.2.4.5.7 Azure network considerations

A server hosting a Tachyon Response Stack requires a dedicated network interface for each of its Switches, and for the connection to the remote SQL Server instance used for the Responses database to keep incoming traffic from clients separate from the outgoing traffic to the Response database.

Accelerated Networking which provides enhanced NIC performance using SR-IOV should be enabled on the SQL VM Network Interface and Platform VM Network Interface that communicates with it. Detailed steps on how to configure this are given here https://docs.microsoft.com/en-us/azure/virtual-network/create-vm-accelerated-networking-powershell.

Also increase the transmit (TX) and receive (RX) buffer sizes to their maximum under the network adaptor advanced properties.

If connecting to an Azure based Tachyon Switch via external public Azure IP addresses or Azure Load Balancers you will need to extend the default TCP timeout from 4 minutes to 15 minutes. Detailed steps on how to do this can be found here https://azure.microsoft.com/en-us/blog/new-configurable-idle-timeout-for-azure-load-balancer.

1.3.2.4.6 Amazon AWS

1.3.2.4.6.1 Out of scope

This document only focuses on AWS elastic cloud (EC2) instances and configurations using AWS Elastic Block Storage (EBS).

It does not consider using Microsoft SQL as part of AWS Platform as a Service (PAAS) offerings such as Amazon Relational Database Service (RDS) (https://aws.amazon.com/rds/) as this not currently supported by 1E as a means to implement SQL Server for Tachyon.

In addition, it does not consider using AWS instances that do not use the EBS platform but have local NVMe based storage such as I3en and R5d instance types.

Although these instance Types have very high performing storage and data transfer bandwidth, the NVMe disks are ephemeral or non-persistent, so only practical for SQL Server use for TempDB.

In the future, 1E plan to provide guidance in using non-persistent storage solutions as part of a **SQL Server Always on Availability Group** cluster, that provides storage resilience and redundancy as described in https://learn.microsoft.com/en-us/sql/database-engine/availability-groups/windows/overview-of-always-on-availability-groups-sql-server. However, since these solutions require a cluster of minimum 3 nodes, it should be noted these solutions would be much more expensive to implement.

1.3.2.4.6.2 AWS instance selection

This document should be read in conjunction with the AWS documentation, especially with guidance on Maximizing Microsoft SQL Server Performance with Amazon EBS https://aws.amazon.com/blogs/storage/maximizing-microsoft-sql-server-performance-with-amazon-ebs.

In recommending the desired AWS instance type and size 1E, has followed the following guidance.

- Instances are based on the latest AWS Nitro Systems https://aws.amazon.com/ec2/nitro
- Amazon EBS Optimized systems were selected, so that these can have the best possible storage throughput performance in terms of MB/s and IOPS https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ebs-optimized.

Based on these factors 1E recommend using the EC2 M5 instances for the Tachyon server and R5 instances for the SQL server, to get the optimum ratio of vCPU and memory count.

EC2 M5/R5 instances have 3.1 GHz Intel Xeon® Platinum 8000 series processors with new Intel Advanced Vector Extension (AVX-512) instruction set and following specifications.

AWS EC2 M5 instances for the Tachyon server

Instance Size	vCPU	Memory (GiB)	Instance Storage(GiB)	Network Bandwidth (Gbps)	EBS Bandwidth (Mbps)
m5.xlarge	4	16	EBS-Only	Up to 10	Up to 4,750
m5.2xlarge	8	32	EBS-Only	Up to 10	Up to 4,750
m5.4xlarge	16	64	EBS-Only	Up to 10	4,750
m5.8xlarge	32	128	EBS Only	10	6,800
m5.12xlarge	48	192	EBS-Only	12	9,500

Instance Size	vCPU	Memory (GiB)	Instance Storage(GiB)	Network Bandwidth (Gbps)	EBS Bandwidth (Mbps)
m5.16xlarge	64	256	EBS Only	20	13,600
m5.24xlarge	96	384	EBS-Only	25	19,000

1.3.2.4.6.3 AWS instance CPU options

The above table shows the default number of vCPUs provisioned for a specific AWS instance type at creation time.

Amazon EC2 instances support multi-threading, which enables multiple threads to run concurrently on a single CPU core. By disabling hyper-threading, it is possible to get less vCPUs (and therefore lower SQL license requirements) whilst maintaining the higher storage throughput. Please refer to https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-optimize-cpu.

1.3.2.4.6.4 AWS EBS storage selection

For any solution based on Microsoft SQL Server, storage throughput is normally the major bottleneck to performance, and Tachyon is no exception to this.

The maximum storage throughput in terms of MB/s and IOPS for specific AWS M5 instances is detailed in the table below and this will determine the maximum equivalent IOPS for the selected AWS storage volumes.

For example, if you attach a single 20,000-IOPS volume to an r5.4xlarge instance, you reach the instance limit of 18,750 IOPS before you reach the volume limit of 20,000 IOPS.

AWS EC2 R5 instances for the Tachyon SQL Server

Instance size	Maximum storage bandwidth (Mbps)	Maximum throughput (MB/s, 128 KiB I/O)	Maximum IOPS (16 KiB I/O)
r5.xlarge	4,750	593.75	18,750
r5.2xlarge	4,750	593.75	18,750
r5.4xlarge	4,750	593.75	18,750
r5.8xlarge	6,800	850	30,000

Instance size	Maximum storage bandwidth (Mbps)	Maximum throughput (MB/s, 128 KiB I/O)	Maximum IOPS (16 KiB I/O)
r5.12xlarge	9,500	1,187.5	40,000
r5.16xlarge	13,600	1,700	60,000
r5.24xlarge	19,000	2,375	80,000

The recommended AWS EBS storage type is Provisioned IOPS SSD (io1 and io2) volumes. These (io1 and io2) SSD volumes are designed to meet the needs of I/O-intensive workloads, particularly database workloads, that are sensitive to storage performance and consistency.

Unlike General Purpose EBS Storage (gp2), which uses a bucket and credit model to calculate performance, io1 and io2 volumes allow you to specify a consistent IOPS rate when you create volumes, and Amazon EBS delivers the provisioned performance 99.9 percent of the time. For more details see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ebs-volume-types.html.

As per Microsoft SQL Server best practice, 1E recommends to provision at least three separate AWS disk volumes for SQL Data, Logs and TempDB. These volumes may be made up from multiple Io1 disks, striped in a Basic Array using Windows Storage Spaces to create a single higher performance volume, with the combined IOPS of all individual disks in the Storage Pool. For an example of this, see https://d1.awsstatic.com/whitepapers/maximizing-microsoft-sql-using-ec2-nvme-instance-store.pdf.

The configured volumes should have the combined MBs/IOPS throughput, equal to or above, the total MBs/IOPS supported by the given instance type, to gain maximum storage throughput performance possible for the given instance type.

1.3.2.4.6.5 Increasing AWS SQL Server Performance

The latest AWS R5b EC2 instances are specifically designed for larger SQL Server deployments that require higher EBS performance per instance. R5b instances deliver up to 60 Gbps bandwidth and 260K IOPS of EBS performance, the fastest block storage performance on EC2: https://aws.amazon.com/blogs/compute/sql-server-runs-better-on-aws/.

For larger scale Tachyon environments, achieving the best storage throughput provides the best performance for long running data consolidation operations.

In addition, the latest Amazon EC2 R5b Instances benefit from the highest block storage performance with a single storage volume using io2 Block Express: https://aws.amazon.com/ebs/provisioned-iops/.

AWS R5b instances and block express EBS storage allows you to achieve the maximum storage throughput available to the VM for high-intensity SQL Server operations.

1.3.2.4.6.6 AWS EC2 prescriptive design patterns

AWS Instance and storage sizing for different customer sizes

	Medium 1	Medium 2	Large 1	Large 2	Large 3
AWS Instance	M5.xLarge	M5.2xlarge	M5.4xlarge	M5.8xlarge	M5.16xLarge
CPU Cores	4	8	16	32	64
RAM	16 GB	32 GB	64 GB	128 GB	256 GB
Switches	1	1	2	4	10
NICs	2	2	3	5	11
Remote SQL Server					
AWS Instance	R5.xlarge	R5.2xlarge	R5.4xlarge	R5.12xlarge	R5.16xLarge
CPU Cores	4	8	16	24*	64
RAM	32 GB	64 GB	128 GB	384 GB	512 GB
Max MB/s	593.75	593.75	593.75	1,187.5	1,700
Max IOPS	18,750	18,750	18,750	40,000	60,000
DB Disk Size	500 GB	1,000 GB	2,000 GB	4,000 GB	8,000 GB
DB Disk IOPS	10,000	10,000	12,000	24,000	48,000
Logs Disk Size	150 GB	300 GB	600 GB	1,200 GB	2,000 GB
Log Disk IOPS	5,000	5,000	6,000	8,000	16,000
TempDB Size	150 GB	300 GB	600 GB	1,200 GB	2,000 GB
TempDB IOPS	6,000	6,000	8,000	10,000	20,000

Note

Customers with intervening seats count, should choose the closest higher number. For example, a 150,000-seat implementation should be treated as **Large 2** rather than **Large 1**.

The **Large 2** sizing (*) uses a larger Instance size to get the necessary storage throughput but assumes disabling hyper-threading in the instance to reduce the vCPU count, and therefore, SQL license costs.

1.3.2.4.6.7 AWS network considerations

A server hosting a Tachyon Response Stack requires a dedicated network interface for each of its Switches, and for the connection to the remote SQL Server instance used for the Responses database to keep incoming traffic from clients separate from the outgoing traffic to the Response database.

Enhanced networking (SR-IOV) must be enabled on both NICs which should be the default. Also increase the transmit (TX) and receive (RX) buffer sizes to their maximum under the network adaptor advanced properties. Detailed steps on how to verify this are detailed here https://docs.aws.amazon.com/AWSEC2/latest/WindowsGuide/sriov-networking.

1.3.2.4.7 Additional and complex configurations

1.3.2.4.7.1 Tachyon Switch and Background Channel servers (DMZ)

In some customer environments, with network segmentation, it may be beneficial to separate the Switch infrastructure servers from other Tachyon component servers so that clients connect to a more network local server, whilst the platform and SQL Servers reside in a more central datacenter subnet.

This same model is true for a DMZ environment, where remote clients only connect to **Switch** and **Background Channel** components in an intentionally separated DMZ environment and subnet.

Tachyon Setup (DMZ installation) can be used to install Tachyon components for required for client connectivity only, that is, the **Switch** and **Background Channel** (BGC).

Servers with only Switch and BGC components will have lesser memory, CPU core and storage requirements than a full Tachyon server, but the following requirements should be noted:

- As stated above, a new instance of the Switch is required for every 50k clients with a dedicated NIC of at least 1GBps speed. This network IP may be shared with the BGC.
- To support additional client connection count numbers, for every 50k clients, a separate dedicated NIC and additional instance of the Switch and separate IP address will be required.
- An additional internal facing interface is required for outgoing response traffic from Switch(s) on the Switch/DMZ Server to the internal Response Stack. This also should have a minimum speed of 1Gbps, or higher if hosting multiple switch instances.

On-premises and cloud specifications for a Switch and BGC (DMZ) server

Platform	On-premises	Microsoft Azure	Amazon AWS
CPU Cores	4	4	4
RAM	16 GB	16 GB	16 GB

Platform	On-premises	Microsoft Azure	Amazon AWS
Switches	1	1	1
NICs	2	2	2
Devices	**Up to 100,000**	**Up to 100,000**	**Up to 100,000**
Server Type	Physical or Virtual	Std_D8s_v4	M5.2xlarge
CPU Cores	8	8	8
RAM	32 GB	32 GB	32 GB
Switches	2	2	2
NICs	3	3	3
Devices	**Up to 200,000**	**Up to 200,000**	**Up to 200,000**
Server Type	Physical or Virtual	Std_D16s_v4	M5.4xlarge
CPU Cores	16	16	16
RAM	64 GB	64 GB	64 GB
Tachyon Switches	4	4	4
NICs	5	5	5

1.3.2.4.7.2 Separate Master and Response Stacks

The standard Tachyon installation assumes all components are installed on a single server, with databases hosted on a remote dedicated SQL Server.

However, it is also supported to split some of Tachyon components between multiple servers - in this configuration creating a **Tachyon Master Stack** server (Coordinator Service, Consumer API, Experience and SLA Inventory components) and one or more **Tachyon Response Stack** servers (Switch, Background Channel and Core components).

Tachyon Setup has different configuration options, to support these installation types, installing first a **Master Stack** and then separate **Response Stack** servers.

A split-server configuration would only really be practical in large scale environments, but does have a couple of advantages over installing all components on a single server:

- **Spread the H/W requirements into multiple, smaller servers:** If the required VM sizes (CPU and Memory or of NICs) is greater than the capabilities of the virtual host, then multiple smaller sized VMs may be more practical in some environments.
- **Provide some Resilience and fault-tolerance for the Platform:** Multiple and redundant Response Stack servers, would allow for the failure of a single Response Server VM, where all clients fall over to the remaining server and it's Switch instances in single VM failure.

Multiple Response Stacks can provide higher performance throughput than a single server, but at the cost of increased total vCPU and Ram for the platform, across multiple VMs.

To achieve resilience, it would assume the number of Switches configured and total capacity of a single Response server, is matched to the total load of all required client connections. This may mean at least three response server installations are required, so that two remaining response servers can handle all the required number of active connections, if one VM fails.

In terms of resilience, it should be noted that multiple redundant Response Servers only provide resilience in the failure of one of the redundant Response server VMs – if the separate and single Master Stack VM (or SQL Server) fails, then the entire Tachyon solution would be unavailable.

Overall resilience and high-availability would best be enabled using the standard high-availability features built-in to the chosen virtualization platform and at the storage system level (on-premises), or if in the cloud, through their specific high-availability and disaster recovery options.

The rule that for every 50,000 clients, Tachyon requires a separate instance of the Switch component, which requires a dedicated Network Interface (NIC), still applies for Response Servers, as they will host switch instance(s) alongside the Tachyon Core component.

If deploying separate Response and Master Stack servers, it is still recommended installing all Tachyon databases on a separate and dedicated SQL Server, so as not to mix a SQL Server installation with IIS other and web server components, as per Microsoft best practice. Therefore, the VM sizing guidelines, disk throughput and storage requirements for SQL Server VM will be identical, if either a single or split platform server configuration. Please refer to the above sections for SQL Server sizing, using specific total client counts required for the environment.

1.3.2.4.7.2.1 Response Stack server design patterns

With Response Stack servers, there are various configuration sizes that could be used to support the required maximum number of active clients, depending on required resilience or redundancy.

The basic formula for sizing a separate Response server is to allocate at least 8x vCPU cores and 16GB of memory for a maximum of 50,000 active clients reporting to that server.

Response Stack server sizing for different customer sizes

Response Servers				
CPU Cores	4	8	16	32
RAM	12 GB	24 GB	48 GB	96 GB
Switches	1	1	2	4

Response Servers				
NICs	2	2	3	5

Note

When planning for resiliency, there should be enough capacity in the individual Response Stack servers to allow for at least 1 VM server to fail, but the remaining VMs to have the capacity to support the total number of required connections.

1.3.2.4.7.2.2 Master Stack server design patterns

The basic formula for sizing a separate Master Stack server is to allocate at least 2x vCPU cores and 16GB of memory for every 50,000 active clients in the environment.

The following table details the VM CPU, Memory and NIC requirements for example individual Response servers, supporting a max total number of active clients in the environment.

Master Stack server sizing for different customer sizes

Master Stack Servers				
CPU Cores	2	4	8	16
RAM	16 GB	32 GB	64 GB	128 GB
NICs	1	1	1	1

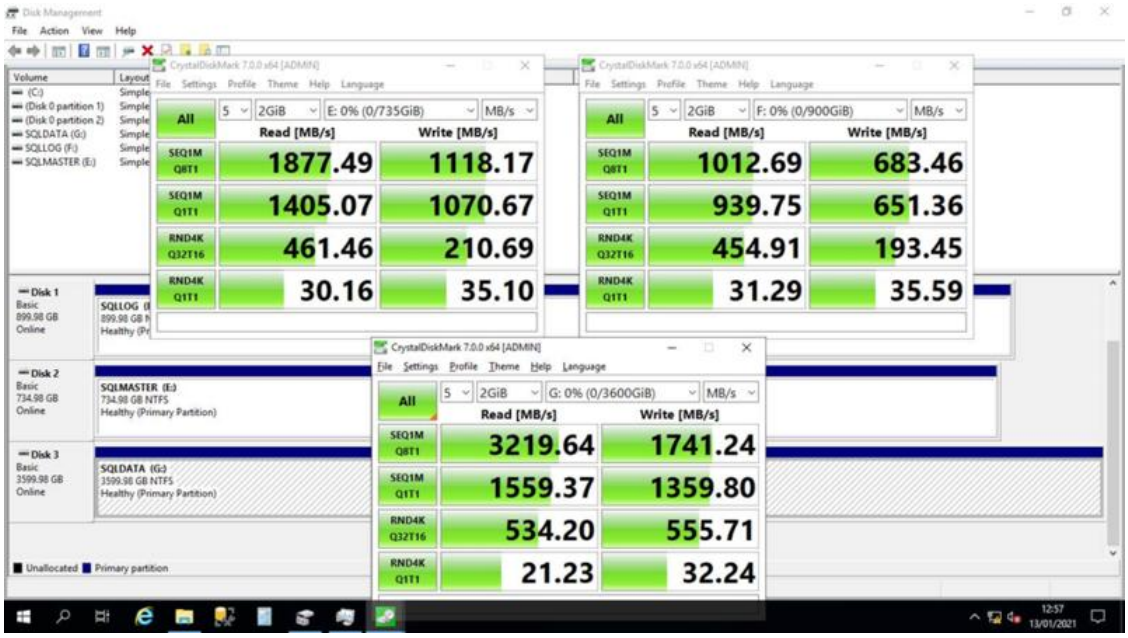
Note

Although the multiple (and potentially redundant) Response Stack servers can support more clients, the total number of active clients across all the Response Stack servers will always stay the same.

1.3.2.4.8 How we measure disk performance

There are a number of third party tools to measure disk and storage performance but the most commonly used and referenced by various hardware providers, is CrystalDiskMark (https://crystalmark.info/en/software/crystaldiskmark).

An example of the output from CrystalDiskMark is shown below, where the drives consist of an array of Samsung Pro 850, 6 Gb/s SATA SSDs.

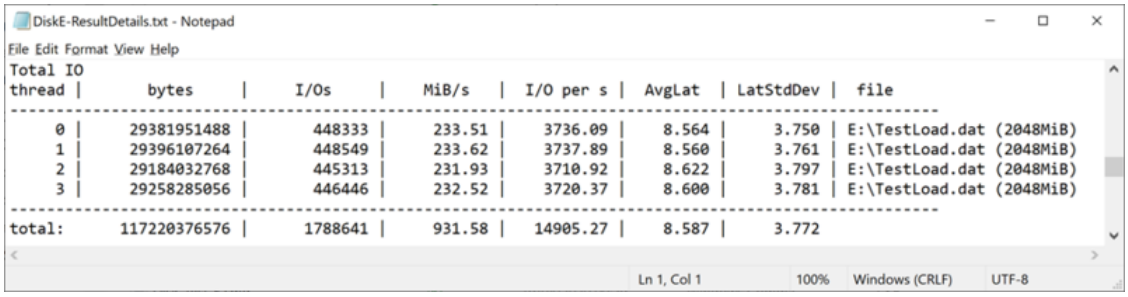


Under the hood, CrystalDiskMark uses the Microsoft tool **Diskspd** (https://github.com/microsoft/diskspd/releases) which can be useful to run on its own to get a simple and reproducible way to measure different server and VM disk subsystem performance.

Use the following command line to test each of the relevant SQL volumes, by drive letter, in turn.

Diskspd -b64k –d120 –o32 –t4 –h –r –w25 –L –c2G G:\TestLoad.dat > GDisk_resultdetails.txt

Once complete, review the output in the created results file **GDisk_resultdetails.txt** for the Total IO thread section. In the following example, the total throughput in MiB/s is measured at **931.58.**



Tachyon is more akin to a Data Warehouse type SQL Application (large sequential Writes and Reads) and not an OLTP type system (millions of small random IO requests). Therefore, overall throughput (MB/s) is more important than just IO alone. Also, when comparing IOPS in the sizing tables above (16k), and Diskspd at 64K block size, x4 to equate the values.

1.3.2.5 SQL Server requirements

1.3.2.5.1 Local or remote SQL Server

You will need to decide if Tachyon databases are installed locally or on remote SQL Server instance(s).

Databases that are remote from their Tachyon Servers increase the complexity of design and installation in the following ways:

- Tachyon Server installation depends on the server installation account having appropriate rights on the SQL Server instance. Remote SQL Servers are typically run on farms managed by other teams who may not want to grant permissions to your installation account.
- If a Response Stack serves over 500 devices then you will require an additional network interface, which requires network routing as described in Network interfacesbelow.

Microsoft SQL Server Express is not supported for either Master or Responses databases, due to its limitations.

You will also require **SQL Server Analysis Services** if you are using Business Intelligence (as required by the Patch Success application).

Below is a list of SQL Server requirements covered in other sections on this page:

- SQL Server editions and configuration - see Server software section:
  - SQL Server database instance is required for databases
  - SQL Server Analysis Server (SSAS) instance for the SLA-BI cube (required by Patch Success).
- Network interface for remote SQL Server - see Network interfaces section
- Directory requirements: SQL Login for the Network Service account
- Directory requirements: SQL Logins for the server installation account
- Microsoft Bulk Copy Program (BCP) s installed on the Response Stack server(s) where the Tachyon Core component is installed, as described in Export all feature below.

Please refer to the /document/preview/791302#UUID-aa1c2691-97ed-e134-ac7d-62b2ea04fe4a page for details of SQL Server hardware and database sizing.

Please refer to High Availability options for SQL Server for HA options and their requirements.

1.3.2.5.2 Backup and recovery

You will need to regularly backup the following databases. The Tachyon server can be re-installed from scratch using the existing databases or a restored backup.

- 1E Catalog
- ContentDistribution (optional, required by Nomad)
- SLA-Data
- SLA-Shared
- SLA-Integrate
- SLA-BI (optional, required for Patch Success)
- TachyonMaster
- TachyonExperience (optional, required for Experience).

There is no requirement to backup the Tachyon Responses database because it only contains transient data. You can backup and restore the Responses database if that is your organization's preference for recovery.

There are no requirements to backup the ActiveEfficiency database, which you can delete. ActiveEfficiency is no longer supported.

For more detail about upgrading, please refer to Upgrading Tachyon Platform.

1.3.2.5.3 Export all feature

The **Export all** feature is available on the Explorer responses page, when an instruction has finished retrieving all its responses. To enable Tachyon users with the appropriate permissions to use this feature, you must ensure that the **Microsoft Bulk Copy Program** (BCP) is installed on the same Response Stack server(s) where the Tachyon Core component has been installed.

Please refer to Configure Tachyon to support the Export all responses feature for more details on configuring SQL BCP and setting up a suitable share.

1.3.2.6 High Availability options for SQL Server

1.3.2.6.1 High Availability options

Overview of High Availability (HA) options for SQL Server databases used by Tachyon and its applications. Includes steps before upgrading Tachyon, and post-installation steps required when using certain HA options.

The options described here provide resilience, they are not for increasing load and performance.

Tachyon supports the following High Availability (HA) options for SQL Server:

- AlwaysOn Availability Group (AG) using an AG Listener
- Failover Cluster Instance (FCI)

Tachyon does not support the following HA options for SQL Server:

- AlwaysOn Availability Group without an AG Listener
- AlwaysOn Availability Group on FCI
- AlwaysOn Basic Availability Group (provided by SQL Server Standard Edition)
- Older HA methods such as Log Shipping and Transactional Replication
- SQL Server Analysis Server (SSAS) databases.

This page does not describe HA options for application servers, that is servers with Tachyon Master and Response stack components, including DMZ Servers. SQL Server(s) must be remote from application servers, that is, not local. HA for Response stack components (Switches and Background Channel) is possible using multiple response servers and Network Load Balancing (NLB) as discussed in Network requirements.

> **Note**
>
> Please contact your 1E Account Team if you need help with HA for Tachyon Master stack components.

1.3.2.6.2 Failover Cluster Instance (FCI)

Installation, upgrade, and patching of Tachyon on a Failover Cluster Instance, are all supported by using Tachyon Setup.

The FCI Cluster has a **Virtual Network Name** (VNN). When you run Tachyon Setup, you must specify the **VNN** for each database in the Database servers screen.

When patching, you must use Tachyon Setup and 1E Hotfix bundles, as described in Tachyon Server post-installation tasks.

1.3.2.6.3 AlwaysOn Availability Group (AG)

Installation, upgrade, and patching of Tachyon servers in a AlwaysOn Availability Group, are all supported by using Tachyon Setup, provided your AG has an **AG Listener**.

This page does not support converting an existing installation without an AG, to one using an AG, because the re-configuration is too complex. However, you can convert as part of an upgrade, or re-installation, because Tachyon Setup will handle the configuration changes.

When installing Tachyon, you must specify the **AG Listener** name in Tachyon Setup. After installation, you can then add the databases to the AG, and manually copy SQL Logins and linked servers to secondary nodes.

When upgrading, you must temporarily remove Tachyon databases from the AG, and add them back after upgrading your Tachyon system.

> **Note**
>
> This page does not cover Basic Availability Groups (provided SQL Server Standard Edition). They are created and managed much like normal Availability Groups, but each AG only supports one database.

1.3.2.6.3.1 Prerequisites

In addition to all the requirements listed in SQL Server requirements, your AlwaysOn Availability Group (AG) must have an **AG Listener**.

> **Note**
>
> If the AG Listener is using a non-default port, then this must be included in the steps below. The Browser service does not help.

> **Note**
>
> The AG Listener name must have a **Service Principle Name (SPN)** registered for the SQL Server service account used by each SQL instance in the AG. Typically, all instances in an AG will use the same service account.

```
setspn -L domain\sqlserviceaccount

setspn -S MSSQLSvc/AGListenerName:port domain\sqlserviceaccount
setspn -S MSSQLSvc/AGListenerName.FQDN:port domain\sqlserviceaccount
```

The requirements include an **installation account** that must have a SQL Login with sysadmin or relevant rights on the primary node. If you have previously installed Tachyon, then you may already have this. Please refer to SQL Logins in Directory requirements.

You also require a user account that has sysadmin or relevant rights on all AG node instances, in order to manage the AG, replicate databases, create SQL Logins and linked servers. This can be the **installation account**.

1.3.2.6.3.2 Installing Tachyon

This scenario is for a new installation of Tachyon, and you have already prepared the Availability Group with an AG Listener.

> **Note**
>
> If you want to pre-create databases before a new installation, do *not* put them in the AG. SQL Server will find the empty databases in the primary node when you specify the AG Listener name in Tachyon Setup.

1. When you run Tachyon Setup to do the installation
   - you must specify the **AG Listener** name for each database in the **Database servers** screen
   - do not specify the **AG Listener** name in the **SSAS servers** screen
2. After installation, you can verify Tachyon functions
3. Manually add databases to the Availability Group
4. Manually copy SQL Logins to each secondary node
5. Manually copy linked servers to each secondary node
6. Verify the failover.

1.3.2.6.3.3 Upgrade Tachyon with an existing Availability Group

This scenario is for an existing installation that is already running in an AlwaysOn Availability Group.

You must use the following steps:

1. Remove all the Tachyon databases from their AG - keep the databases as full recovery model, do not change the AG, its replica(s), or the AG listener
2. Use Tachyon Setup to do the upgrade
   - you must specify the **AG Listener** name for each database in the **Database servers** screen
   - do not specify the **AG Listener** name in the **SSAS servers** screen
3. Manually add databases to the Availability Group.

You must use these steps to temporarily remove databases from the AG, because of a known issue with installers switching databases into single-user mode, which is not supported within an AG.

1.3.2.6.3.4 Upgrade Tachyon with a new Availability Group

This scenario is for an existing installation that you want to add to a new AlwaysOn Availability Group. The process is similar to a new installation.

You must use the following steps:

1. When you create the new Availability Group, ensure its primary node is the same as the SQL instance that hosts the existing Tachyon databases. Do not add the databases to the Availability Group yet.
2. When you run Tachyon Setup to do the upgrade
   - you must specify the **AG Listener** name for each database in the **Database servers** screen
   - do not specify the **AG Listener** name in the **SSAS servers** screen

   Note

   The Database servers screen will show the name of the original SQL instance (the primary node) but you must change these to the name of the AG Listener.
3. After the upgrade, you can verify Tachyon functions
4. Manually add databases to the Availability Group
5. Manually copy SQL Logins to each secondary node
6. Manually copy linked servers to each secondary node
7. Verify the failover.

1.3.2.6.3.5 Patching Tachyon

You must use Tachyon Setup and 1E Hotfix bundles, as described in Tachyon Server post-installation tasks.

1.3.2.6.3.6 Manually add databases to the Availability Group

You must manually add all databases to the AG after installing or upgrading Tachyon.

1.3.2.6.3.6.1 Tachyon databases

Tachyon uses the following SQL Server databases:

- 1ECatalog
- ContentDistribution (if using Content Distribution)
- SLA-Data
- SLA-Shared
- SLA-Integrate
- TachyonExperience (if using Experience)
- TachyonMaster
- TachyonResponses (if using a Response Stack)

1.3.2.6.3.6.2 Database recovery model

Before you add a Tachyon database to an Availability Group for the first time, you must change its recovery model from simple to full. You must do this for each Tachyon database.

> **Note**
>
> By default, Tachyon Setup installs its SQL databases with simple recovery model on the primary node of the Availability group. You must change each database to full recovery model before adding it to an Availability Group.
>
> With full recovery model, you must ensure you have a SQL maintenance plan to truncate logs, otherwise transaction logs will grow and cause performance and other issues.

1.3.2.6.3.6.3 Replicating databases to secondary nodes

When you add a database to an Availability Group, the SQL Server wizard provides two options for replicating the databases to the other AG nodes. Your choice depends on how quickly you need to complete the replication. You must do this for each Tachyon database.

- **Copy** - use this for new or small installations
- **Backup and restore** - use this for existing large installations - you can use the steps below, or whatever process your organization prefers

  1. Make a full backup of each database on the primary replica
  2. Make a tlog backup of each database on the primary replica
  3. Copy the database backups to the secondary replica

4. Restore the full backup (with no recovery) of each database on the secondary replica

5. Restore the tlog backup (with no recovery) of each database on the secondary replica.

1.3.2.6.3.7 Manually copy SQL Logins to each secondary node

When you install Tachyon, with application and SQL server in separate servers, Tachyon Setup creates a SQL Login on the primary node for the Tachyon application server's computer$ account. This is the remote representation of its **Network Service** account. For more information about this account, please refer to Directory requirements.

If you are installing SLA Business Intelligence (required by Patch Success) then Tachyon Setup will create a SQL Login for the **BI SSAS User** account.

The above SQL Logins must be manually copied to each secondary node. You can use the following steps to copy each SQL Login, or use whatever process your organization prefers. In summary, you will create a script for the SQL Login, which you then run on each of the secondary nodes.

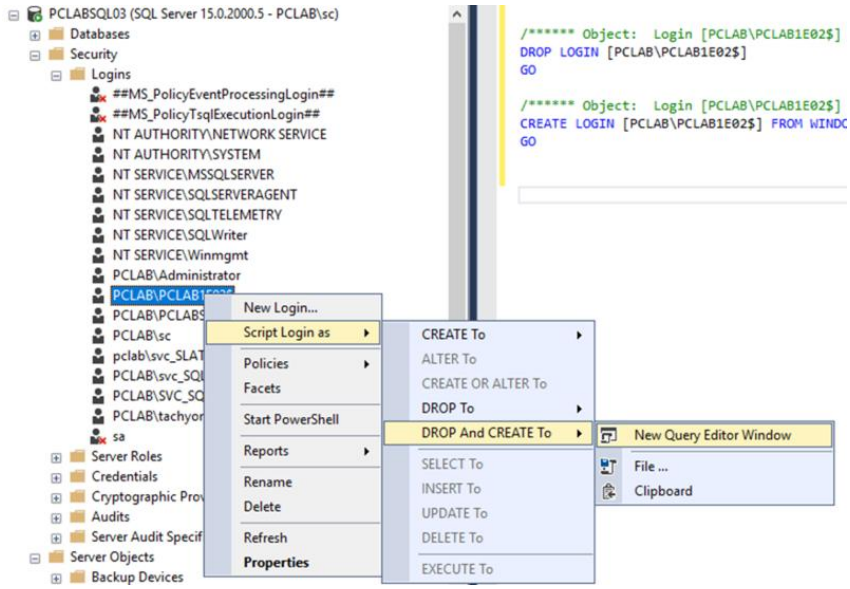
1. Using SQL Server Management Studio, connect to the primary node (the SQL instance where you originally installed Tachyon)

2. For each SQL Login

    a. Right-click on SQL Login, and select **Script Login as** → DROP And CREATE To → New Query Editor Window

    b. Save the new script

3. Connect to each secondary node, open the saved script as a new query, and execute it.



1.3.2.6.3.8 Manually copy linked servers to each secondary node

When you install Tachyon, it will create the following linked servers on the primary node. These must be manually copied to all the other nodes in the AG.

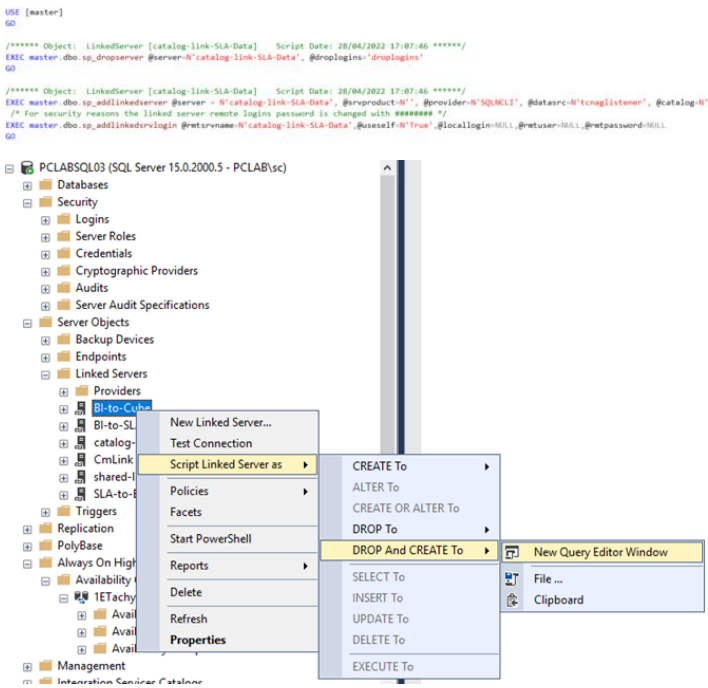
- catalog-link-SLA-Data

- shared-link-SLA-Data

You can use the following steps to manually copy each linked server, or use whatever process your organization prefers. In summary, you will create a script for each linked server, which you then run on each of the secondary nodes.

1. Using SQL Server Management Studio, connect to the primary node (the SQL instance where you originally installed Tachyon)
2. For each linked server
    a. Right-click on the linked server, and select **Script Linked Server as** → DROP And CREATE To → New Query Editor Window
    b. Save the new script
3. Connect to each secondary node, and for each linked server, open the saved script as a new query, and execute it
4. Repeat for each linked server on each of other nodes.

Below is an extract of an example script used to create the linked server **catalog-link-SLA-Data**. Note its **@datasrc** is the **AG Listener**, which you do not need to edit.



1.3.3 Windows Server requirements

You will need to provision one or more servers using the guidance provided here as the minimum specification.

For comprehensive guidance for CPU, RAM, disk volumes, and network connections, please refer to the /document/preview/791302#UUID-aa1c2691-97ed-e134-ac7d-62b2ea04fe4a page.

You will install each Tachyon Server using a wizard called Tachyon Setup. To make the process easier for installing Tachyon platform and its applications, the Tachyon Setup wizard aims to help you:

- Prepare for a successful deployment of Tachyon platform and applications
- Find online resources for Tachyon platform and applications
- Check and configure prerequisites
- Create the Tachyon Server certificate for use with the Tachyon Server website and the Tachyon Switch
- Deploy selected components
- Perform post-installation tasks, including configuring the components for interaction with each other
- Running validation tests on the completed installation.

The correct choice of DNS Name(s) for your Tachyon Servers is perhaps the most fundamental decision you will make.

1.3.3.1 Server software

Category	Product	Notes
Server OS	• Windows Server 2022 • Windows Server 2019 • Windows Server 2016	For more detail about configuration of servers, please refer to Windows Server requirements. Only 64-bit server OS are supported. The server must be domain-joined. This version of Tachyon requires the server OS to be **English** because of a Known issues with certain regional settings. If TLS 1.0 is disabled, then please ensure you follow the steps in If TLS1.0 is disabled to add registry entries, for the 1E Catalog Update Service to successfully connect to the 1E Cloud Catalog. **Note** This list shows only those OS versions in mainstream support by Microsoft, and therefore

Category	Product	Notes
		supported by Tachyon, and by 1E Client 8.1. Please refer to Constraints of Legacy OS regarding the end of mainstream support. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Refer to Support for Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions.
SQL Server and SQL Server Analysis Services (SSAS)	• SQL Server 2019 • SQL Server 2017 • SQL Server 2016 SP3	For more detail, please refer to SQL Server requirements. Standard and Enterprise editions of these versions of SQL Server and SQL Server Analysis Services (SSAS) are supported. SQL Server 2016 RTM is not supported due to some issues, which are resolved by SP3. **Note** Tachyon only supports AlwaysOn Availability Groups on **SQL Server Enterprise Edition**. Please refer to High Availability options for SQL

Category	Product	Notes
		Server for HA options and their requirements. **Note** If you intend to integrate with third-party business intelligence products such as Power BI, you must install the **Enterprise edition of SSAS** as per their requirements. A SQL Server database instance is required for the following databases: • **1ECatalog** • **ContentDistribution** (optional - required for Nomad) • **SLA-BI** (optional - required for Patch Success) • **SLA-Data** • **SLA-Integrate** • **SLA-Shared** • **TachyonExperience** (optional - required for Tachyon Experience) • **TachyonMaster** • **TachyonResponses** **SLA Inventory databases** Tachyon Setup can install the above databases on separate SQL Server instances, however SLA-Data, SLA-Integrate, and

Category	Product	Notes
		SLA-Shared must exist on the same instance. A SQL Server Analysis Services (SSAS) instance installed in **Multidimensional** mode is required for SLA Business Intelligence. **SLA Business Intelligence** SLA Business Intelligence (BI) is only required for the Patch Success application. Together, the SLA Platform and BI installers create the following: • A database called **SLA-BI** on the SQL Server database instance. • A MOLAP cube called **SLA-BI** on the SSAS instance. • A linked server for the SLA databases to get data from the SLA-BI database and then from the SLA-BI cube. • A linked server for the SLA-BI database to get data from the SLA databases. • A datasource definition used by the SLA-BI cube to connect to the BI database. If the SLA databases, BI database, or SSAS instance for BI, are on *different* SQL Servers then the BI installer enforces

Category	Product	Notes
		the use of a SQL login on each instance. If they are on the *same* SQL Server then the installer gives you a choice of using integrated security (domain user account) or a SQL login. However, if you are installing all the components using Tachyon Setup instead of their individual installers, then you are not given the choice. Tachyon Setup always uses integrated security. Contact your 1E Account Team if your scenario requires the above-mentioned databases to be on *different* SQL Servers. This affects different servers, not different instances. All SQL Server instances *must* be configured with the following: • A case-insensitive, accent-sensitive collation which is **SQL_Latin1_General_CP1_CI_AS** by default, • **Allow remote connections to this server** enabled. All SQL Servers should be configured with the **SQL Server Browser service** running in order for the BI installer to select from a list of instances. **SQL Server Management Studio** is required to review the

Category	Product	Notes
		configuration and edit settings in 1E database tables. If installing SQL Server locally, note: • SQL Server 2016 and 2017 require .NET Framework 4.6 or later • SQL Server setup requires PowerShell 2.0. For the latest information about SQL Server prerequisites, please refer to http://go.microsoft.com/fwlink/?LinkId=622999.
Microsoft Endpoint Configuration Manager	• MECM CB 2303 • MECM CB 2211 • MECM CB 2207 • MECM CB 2203 • MECM CB 2111 • MECM CB 2107	Tachyon uses Configuration Manager for the following optional apps and features: • Reclaiming a product using SCCM Uninstall • Introducing Application Migration • Introducing Inventory captures data using the System Center Configuration Manager connector • Tachyon extensions for the Configuration Manager Console. - installed on Configuration Manager consoles using the 1E Tachyon Toolkit installer • Introducing Nomad requires 1E Client with Nomad client features enabled.

Category	Product	Notes
		Nomad provides the following Content Distribution features for Configuration Manager: • Nomad app overview provides visibility of content distribution activity • Single Site Download (SSD) (SSD). • Task sequence actions to augment OS Deployment: – Peer Backup Assistant - PBA – High Availability PBA (HAPBA) – Get Migration Settings to manage computer associations. • Nomad Pre-caching • Nomad Download Pause. Nomad requires the Content Distribution web service to synchronize with the Configuration Manager database. For standalone primary site environments, permissions are automatically assigned to the service account of Content Distribution's web application pool service (by default Network Service) using the **ConfigMgr_DViewAccess** localgroup native to Configuration Manager. For a CAS, this group is not created natively therefore additional steps are required to allow access. Please refer to Preparation: Microsoft

Category	Product	Notes
		Endpoint Configuration Manager preparation.
Web Server	• IIS 10	See Windows Server roles and features for details about required Web Server roles and features.
Runtime libraries	• Visual C++ 2013 Redistributable • Visual C++ 2015-2019 Redistributable • ASP.NET Core Framework 3.1 • .NET Framework 4.8	See Windows Server roles and features for details about required .NET Framework roles and features. To know supported combinations of OS and .NET Framework, please refer to: https://docs.microsoft.com/en-us/dotnet/framework/migration-guide/versions-and-dependencies. • Windows Server 2022 has .NET Framework 4.8 installed by default. • Windows Server 2019 has .NET Framework 4.7.2 installed by default. • Windows Server 2016 has .NET Framework 4.6.2 installed by default. **ASP.NET Core Hosting Bundle** is required only for the Nomad. It is not included with the Operating System, and must be downloaded and installed separately. If it not already installed, Tachyon Setup will attempt to automatically download version **3.1.11** and install it. Alternatively you can download it, or a later version, and install it yourself. For more detail please refer to ASP.NET Core Hosting Bundle. Installers include and automatically installs the redistributable packages

Category	Product	Notes
		for **Visual C++ 2013** and **Visual C++ 2015-2019**. The Coordinator (licensing module on the Master Stack), and Switch (on Response Stack) are written in C++ using Visual Studio 2013 and 2019, therefore require the **runtime (x64)** versions of these packages. Other server components use .NET Framework. **SQL BCP** is required by the **Export All** feature described in Exporting data from Explorer, and must be installed on each Tachyon Response Stack server (specifically the servers which have the Tachyon Core installed). BCP uses ODBC, which requires **Microsoft ODBC Driver versions 13.1 and 17** and **Visual C++ 2017 Redistributable** to be installed first. Please refer toP SQL BCP for more detail.
Other software	• PowerShell	PowerShell is required by Tachyon installer during installation.
Browsers	Latest version of: • Google Chrome • Microsoft Edge (Chromium) • Mozilla Firefox	A browser is not a prerequisite for installation of Tachyon servers but is required to use and administer the Tachyon platform. The administration is performed via the Tachyon portal and can be on a remote computer. These browsers are supported on all OS platforms which the browser vendor supports. The Portal and any API should be added as a trusted site. This is especially important when running

Category	Product	Notes
		scripts that may produce unexpected errors. Please review Known Issues Using Tachyon. **Note** **Microsoft legacy browsers** Support has been withdrawn for **Internet Explorer 11** and **legacy Microsoft Edge** (non-Chromium version) because Microsoft no longer supported them since 2021. We recommend you use Google Chrome, Firefox, or Microsoft Edge Chromium browser.

1.3.3.2 Naming

1.3.3.2.1 Computername

The computername of a Tachyon Server must comply with Microsoft NetBIOS naming standards, which includes having a length of 15 characters or less.

Microsoft's guidance can be found here: https://docs.microsoft.com/en-us/windows/desktop/SysInfo/computer-names.

1.3.3.2.2 DNS Names and SPNs

Please refer to the following sections on the Network requirements page:

- Network interfaces
- DNS Names
- Service Principal Names

1.3.3.3 Windows Server roles and features

Items in **bold** are included in the PowerShell script available for download from Windows Server roles and features.

Note

Tachyon Setup will create a website with the necessary bindings, therefore please do not pre-create a website of the same name.

The following roles, role services and features must be **installed/enabled** as a minimum. The **Name** column is the reference used in PowerShell commands.

In the case of .NET Framework features we refer to 4.X in the **Display Name**, as X may be different depending on the server OS. The PowerShell **Name** always uses 45 instead of the actual version.

Role or Feature	Display Name	Name	Notes
Web Server	**Web Server (IIS)**	**Web-Server**	
Web Server Common HTTP Features	Default Document	Web-Default-Doc	Included in Web-Server.
Directory Browsing	Web-Dir-Browsing	Included in Web-Server.	
HTTP Errors	Web-Http-Errors	Included in Web-Server.	
Static Content	Web-Static-Content	Included in Web-Server.	
HTTP Redirection	**Web-Http-Redirect**	Only required to support **legacy Nomad clients** after upgrading ActiveEfficiency.	
Web Server Health and Diagnostics	HTTP Logging	Web-Http-Logging	Included in Web-Server.
Web Server Performance	Static Content Compression	Web-Stat-Compression	Included in Web-Server.

Role or Feature	Display Name	Name	Notes
Dynamic Content Compression	**Web-Dyn-Compression**		
Web Server Security	Request Filtering	Web-Filtering	Included in Web-Server.
Basic Authentication	**Web-Basic-Auth**	Only required if using 1E ITSM Connect or 1E Core for integrating ServiceNow and Tachyon.	
IP Address and Domain Restrictions	**Web-IP-Security**	See note below.	
Windows Authentication	**Web-Windows-Auth**		
Web Server Application Development	.NET Extensibility 4.X	Web-Net-Ext45	Included in Web-Asp-Net45.
ASP.NET 4.X	**Web-Asp-Net45**		
ISAPI Extensions	Web-ISAPI-Ext	Included in Web-Asp-Net45.	
ISAPI Filters	Web-ISAPI-Filter	Included in Web-Asp-Net45.	
Web Server Management Tools	**IIS Management Console**	**Web-Mgmt-Console**	
.NET Framework 4.X Features	**.NET Framework 4.X**	**Net-Framework-45-Core**	

Role or Feature	Display Name	Name	Notes
ASP.NET 4.X	**Net-Framework-45-ASPNET**		

The following roles, role services and features must be removed/disabled.

Parent	Display Name	Name
Web Server Common HTTP Features	WebDAV Publishing	Web-DAV-Publishing

IIS Features Configuration

Core web applications use **IP and Domain Restrictions** so that only specific servers can access it. Other web applications cannot be accessed using HTTP because their **SSL Settings** are configured with **Require SSL**.

The web applications for the Consumer API and Explorer use Tachyon role-based security and therefore have **Windows Authentication** enabled. The other web applications have **Anonymous Authentication** enabled.

HTTP Redirection (Web-Http-Redirect) is only required to support legacy Nomad clients after an In-place upgrade of ActiveEfficiency Server for Nomad

Basic Authentication (Web-Basic-Auth) is required only if you will be installing 1E ITSM Connect or 1E Core for integrating ServiceNow and Tachyon.

Note

Web-Http-Redirect is only required to support legacy Nomad clients after an In-place upgrade of ActiveEfficiency Server for Nomad.

Web-Basic-Auth is only required if you will be installing 1E ITSM Connect or 1E Core for integrating ServiceNow and Tachyon.

1.3.3.4 Anti-Virus and Malware

The following should be excluded from scans to prevent file locking and resource deletion.

- 1E log files. See Log files for details of Tachyon Server and 1E Client logs
- The Background channel virtual directories (Agent, Content, Installers, PolicyDocuments, and Updates, which by default are in **%programdata%\1E\Tachyon**)

1.3.3.5 Constraints of Legacy OS

In this documentation, the following are referred to as legacy OS. Below are described some known issues for these OS.

1E does not provide support for 1E products on the following OS unless the OS is explicitly listed as being supported for a specific 1E product or product feature. This is because Microsoft has ended mainstream support for these OS or they are not significantly used by business organizations.

- **Windows XP ***
- **Windows Vista**
- **Windows 7**
- **Windows 8.0**
- **Windows 8.1**
- **Windows Server 2003 ***
- **Windows Server 2008**
- **Windows Server 2008 R2**
- **Windows Server 2012**
- **Windows Server 2012 R2**

Note

1E Client 8.1 and later will not install on Windows XP and Windows Server 2003. Please contact 1E if you intend to continue using any of the other legacy OS. If you experience an issue, then please try replicating the issue on a supported OS.

For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.

1.3.3.5.1 Microsoft legacy browsers

Support has been withdrawn for **Internet Explorer 11** and **legacy Microsoft Edge** (non-Chromium version). 1E has taken this decision for new releases that are expected to remain in support by 1E beyond March 2021 when **Microsoft Edge** goes end of life and August 2021 when **Internet Explorer 11** goes end of life. We recommend you use Google Chrome, Firefox or Microsoft Edge Chromium browser.

1.3.3.5.2 Certificate limitations - SHA2

Like most software vendors, 1E software requires the OS to support SHA2. If your organization has a PKI configured to use SHA2 256 or higher encryption, then your legacy OS may have already been updated to support it.

- Windows XP and Server 2003 require an update as described in **KB968730.** Microsoft no longer provides this hotfix as a download. You must contact Microsoft Support if you need it
- Windows 7 and Server 2008 R2 require an update as described in **KB3033929**. This update is not available for Vista and Server 2008
- Windows 8, 8.1, Server 2012, Server 2012 R2 and later OS already support SHA2.

1.3.3.5.3 Certificate limitations - encrypted certificate requests

Windows XP and Server 2003 are unable to encrypt certificate requests, whereas later OS are able to support higher more secure RPC authentication levels. If you are using a Microsoft CA and expect these clients to request (enrol) certificates then the CA must have its IF_ENFORCEENCRYPTICERTREQUEST flag disabled. It is disabled by default on Windows 2003 and 2008 CA, but is enabled by default on Windows 2012 CA.

To determine which InterfaceFlags are set, execute the following command on the CA server:

```
certutil -getreg CA\InterfaceFlags
```

If the following is specified then it means the flag is enabled.

```
IF_ENFORCEENCRYPTICERTREQUEST -- 200 (512)
```

To disable the encrypt certificate requests flag, execute the following commands on the CA server:

```
certutil -setreg CA\InterfaceFlags -IF_ENFORCEENCRYPTICERTREQUEST
sc stop certsvc
  sc start certsvc
```

1.3.3.5.4 Certificate limitations - signing certificates missing

On Windows computers, the installation MSI files, and binary executable and DLL files of 1E software are digitally signed. The 1E code signing certificate uses a timestamping certificate as its countersignature. 1E occasionally changes its code signing certificate, and uses it for new releases and patches for older versions, as shown in the table(s) below.

Root Certificate Authorities are implicitly trusted to validate certificates, and their certificates must be correctly installed to do this. Your computers should already have the necessary **root CA** certificates installed, however this may have been prevented by your organization's security policies, or inability to connect to the Internet, or they are legacy OS. In general this is not an issue because by default Windows allows software to be installed and run without validation, although you may see a warning or experience a delay. However, you *must* have relevant CA certificates installed if you are using 1E Client (which self-validates its own files), or your organization has applied more secure polices (for example UAC, AppLocker or SmartScreen).

Typical reasons for issues with signing certificate are:

- If your organization has disabled **Automatic Root Certificates Update** then you must ensure the relevant **root CA** certificates are correctly installed on each computer
- If computers do not have access to the Internet then you must ensure the relevant **root and issuing CA** certificates are correctly installed on each computer, numbered in the table(s) below.

The signature algorithm of the 1E code signing certificate is SHA256RSA. In most cases, the file digest algorithm of an authenticode signature is SHA256, and the countersignature is a RFC3161 compliant timestamp. The exception is on legacy OS (Windows XP, Vista, Server 2003 and Server 2008) which require the file digest algorithm of an authenticode signature to be SHA1, and a legacy countersignature.

The table below applies to software and hotfixes released in 2020.

2020	Signing certificate	Timestamping certificates
Certificate	1E Limited	TIMESTAMP-SHA256-2019-10-15 ***and*** DigiCert Timestamp Responder

2020	Signing certificate	Timestamping certificates

1.3.3.5.5 Certificate limitations - expired root certificates

Ensure that your Root CA Certificates are up-to-date on clients and servers. The **Automatic Root Certificates Update** feature is enabled by default, but its configuration may have been changed or restricted by Group Policy **Turn off Automatic Root Certificates Update**.

If this GPO is enabled, then you will see *DisableRootAutoUpdate = 1 (dword)* in *HKLM\Software\Policies\Microsoft\SystemCertificates\AuthRoot.*

1.3.3.5.6 PowerShell limitations

PowerShell version 3.0 (required by some Tachyon instructions) is not supported on Windows XP, Vista and Server 2003. However, PowerShell 2.0 is supported on the following OS versions:

- Windows XP SP3
- Vista SP1 & SP2
- Windows Server 2003 R2 & SP2.

1.3.4 Certificate requirements

You need to have a PKI in your environment with at least one Issuing CA. Each server that has Tachyon Server components installed requires its own Web Server certificate (except for a remote SQL Server). By default, every client requires a client authentication certificate.

Client-Switch communication uses **WebSocket Secure** protocol, whereby each client establishes a secure link to the Switch, which is then used by the Switch to send instructions to the client. This is shown as a dotted line in the pictures on the Communication Ports page.

All other communications from external devices use **HTTPS**, including client connecting to the Background Channel in order to download resources that may be required by instructions, and using the Tachyon Portal to administer and use the system.

All communication is encrypted, which requires a **Public Key Infrastructure** (PKI).

1.3.4.1 PKI certificates

PKI is required for:

- **Web Server certificate** - prerequisite for each Tachyon server website, must contain all the DNS Names used for the server
- **Tachyon server's client authentication certificate** - only on Tachyon servers hosting a Background Channel, and only if using Content Distribution
- **Client authentication certificates** - each 1E Client uses the device's client certificate to authenticate itself to Tachyon Switches
- **Certificate Revocation Lists (CRLs)** - 1E Clients and Switches use HTTP-based CRL Distribution Points to validate certificates
- **Code signing certificates** - used for signing custom and modified instructions, so they can be imported into Tachyon and then run
- **Digital signing certificates** - used for signing 1E software.

1.3.4.2 Public Key Infrastructure

You need to have a PKI in your environment with at least one Issuing CA.

Tachyon requires each Issuing CA has:

- A **Certificate Revocation List** (CRL) **Distribution Point** (CDP) that uses HTTP/S.
- This HTTP/S CDP information included in certificates issued to Tachyon Server and client devices.

PKI notes

If you have an existing PKI and have just added a new CDP to support HTTP/S then you will need to re-issue certificates to your servers and devices.

Tachyon web server deliberately does not work with self-signed certificates for security reasons. Therefore, Tachyonservers cannot be installed on the same server as a Root CA, because its certificate is self-signed. For the same reason, 1E Client cannot be installed on a DC unless the client's Switch is configured to not require client certificates.

Tachyon supports TLSv1.2 and TLSv1.3. If your PKI is using SHA512, then please ensure that your environment has relevant updates applied, as described in KB2973337. See Enabling SHA-512 to work with TLSv1.2.

If you want Tachyon to manage legacy OSs that Microsoft no longer supports, there may be issues with encrypted certificates described in Constraints of Legacy OS.

Note

1E Client and Tachyon Switches use OpenSSL and its validation process to verify certificates. Websites use Microsoft IIS validation methods.

1.3.4.3 Web Server certificate

Each server that has Tachyon server components installed requires its own Web Server certificate (except for a remote SQL Server). This certificate is also used by the Switch and the Coordinator. Therefore, a single-server installation requires only one Web Server certificate. This certificate must be provided on the server prior to installation of Tachyon.

The Web Server certificate requires the minimum of the following:

1. Issued by a trusted Certificate Authority (CA)
   - The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the server
   - If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the server
   - The above CA certificates must exist on the Tachyon Web Server and Windows client devices
   - Most organizations have automated distribution of these CA certificates to servers and clients, using Group Policy for example.
2. Has at least the following Key Usage:
   - Digital signature
   - Key encipherment.
3. Has at least the following Enhanced Key Usages:
   - Server Authentication.
4. Revocation information is included
   - References at least one CRL Distribution point that uses HTTP - see DMZ Server note below.
5. Must have a private key available.

Tip

The default template **Web Server** available with a Microsoft PKI is suitable for requesting a Tachyon Web Server certificate.

DMZ Server

Please ensure you note the additional certificate requirements described below, when installing any server in a system that also contains a DMZ Server. Internal Master and

Response Stack servers, and DMZ Server, each require **two** HTTPS bindings, as described in DNS Names. For even more detail, please refer Implementing a Tachyon DMZ Server.

Also note the requirement for server certificates to reference at least one CRL Distribution point that uses HTTP. These CRL DPs are likely to be in the internal network, and the firewall will need to allow the DMZ server to access these internal servers.

Web Server certificates used by a Tachyon servers must be issued with their fields set as follows. Example **DNS Names** are discussed in DNS Names.

Fields	Example Option 3 type certificate
Subject Common Name Field (subject:commonName)	Subject (CN) can be any valid name, and is no longer mandatory as required by previous versions of Tachyon.
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The **Tachyon server DNS Name FQDN** (DNS Alias) of the server. This is mandatory, same as required by previous versions of Tachyon. On a Master Stack - example: **DNS Name=TACHYON.ACME.LOCAL** On a Response Stack - example: **DNS Name=TACHYONRS.ACME.LOCAL** On a DMZ Server - example: **DNS Name=TACHYONEXT.ACME.COM**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	An **Alternate DNS Name FQDN** (DNS Alias) of the server. This is usually mandatory, for example if there is more than one server in your Tachyon system, as discussed in DNS Names. On a Master Stack, example: **DNS Name=TACHYONALT.ACME.LOCAL**or**DNS Name=TACHYON.ACME.LOCAL** On a Response Stack - example: **DNS Name=TACHYONALT.ACME.LOCAL** On a DMZ Server - example: **DNS Name=TACHYONDMZ.ACME.LOCAL**

Fields	Example Option 3 type certificate
Example	
Note

Earlier versions of Tachyon required the certificate to have a CN and used SAN fields differently. If you are upgrading your Tachyon server from an earlier version, it may still be using this type of certificate. When upgrading Tachyon, you can issue a replacement certificate, or continue using the old style certificate (because the new-style certificate requires only a SAN DNS Name that matches the DNS Alias, which are provided by the old style certificates).

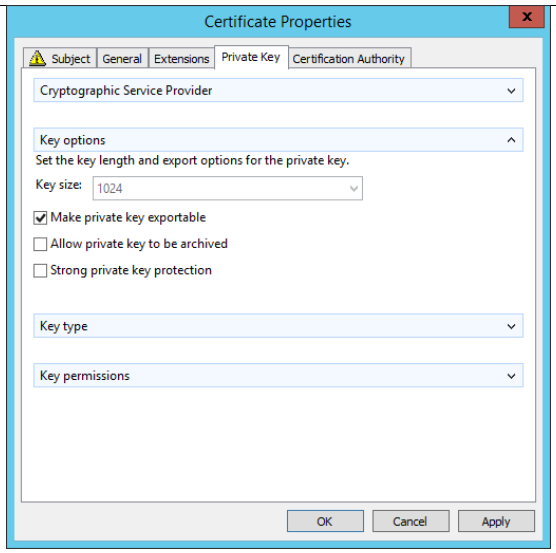
Examples of old-style certificates:

Fields	Example old Option 2 type certificate
Subject Common Name Field (subject:commonName)	The computername FQDN of the server

Fields	Example old Option 2 type certificate
	Example: **CN=ACME-TCN01.ACME.LOCAL**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The DNS Alias FQDN of the server Example: **DNS Name=TACHYON.ACME.LOCAL** **Tip** Add any additional DNS Names here.
Example certificate request	  **Note** Option 2 type certificates required the CN to be the computername FQDN, and the list of

Fields	Example old Option 2 type certificate
	Subject Alternate Names (SAN) to contain the DNS Alias. Also, prior to Tachyon 5.0 the certificate required its private key to be exportable. Tachyon 5.0 and later is able to use this type of certificate when upgrading from an earlier version of Tachyon.

Fields	Example of old Option 1 type certificate
Subject Common Name Field (subject:commonName)	The DNS Alias FQDN of the server Example: **CN=TACHYON.ACME.LOCAL**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The DNS Alias FQDN of the server Example: **DNS Name=TACHYON.ACME.LOCAL** The computername FQDN of the server Example: **DNS Name=ACME-TCN01.ACME.LOCAL**
Example certificate request	
Fields	Example of old Option 1 type certificate



Note

Option 1 type certificates required the CN to be the DNS Alias, and the list of Subject Alternate Names (SAN) to contain the computername FQDN.

Also, prior to Tachyon 5.0 the certificate required its private key to be exportable.

Tachyon 5.0 and later is able to use this type of certificate when upgrading from an earlier version of Tachyon.

The following need to be considered when requesting this type of certificate.

- The certificate can be used only on the server it was intended, that has the correct computername FQDN and DNS Alias FQDN.
- It is not possible to use the **Create Certificate Request** method in IIS Manager Server Certificates, because it does not support all the above requirements.
- If you have a Microsoft CA, and a suitable **Web Server** template has been issued and enabled in the **Directory Enrollment Policy**, then it is possible to **Request New Certificate** in the **Certificates (Local Computer)** mmc snap-in and use the **Certificate Enrollment wizard**.
- Many organizations have their own process for submitting a Certificate Signing Request (CSR). Please ensure all the above requirements are specified. Security administrators sometimes have difficulty providing a certificate with one or more Subject Alternative Names (SAN), and it helps to explain these are type DNS.

If you have a Microsoft CA then it is simplest to use the Certificate Enrollment wizard available in the mmc certificates snap-in, to request a Web Server certificate and fill in the details.

1.3.4.4 Tachyon server's client authentication certificate

When Content Distribution is installed, any server hosting a Background Channel must have a Client Authentication certificate. This can be the same certificate as a Client authentication certificates if you have 1E Client installed, or it can be the same certificate as the Web Server certificate if your organization security policy allows your Web Server certificates to be used for both **Server Authentication** and **Client Authentication**.

The Background Channel proxy uses this certificate to be authenticated by the Content Distribution Web API, and must be available on the server so that it can be selected on the Tachyon Setup Nomad screen during installation.

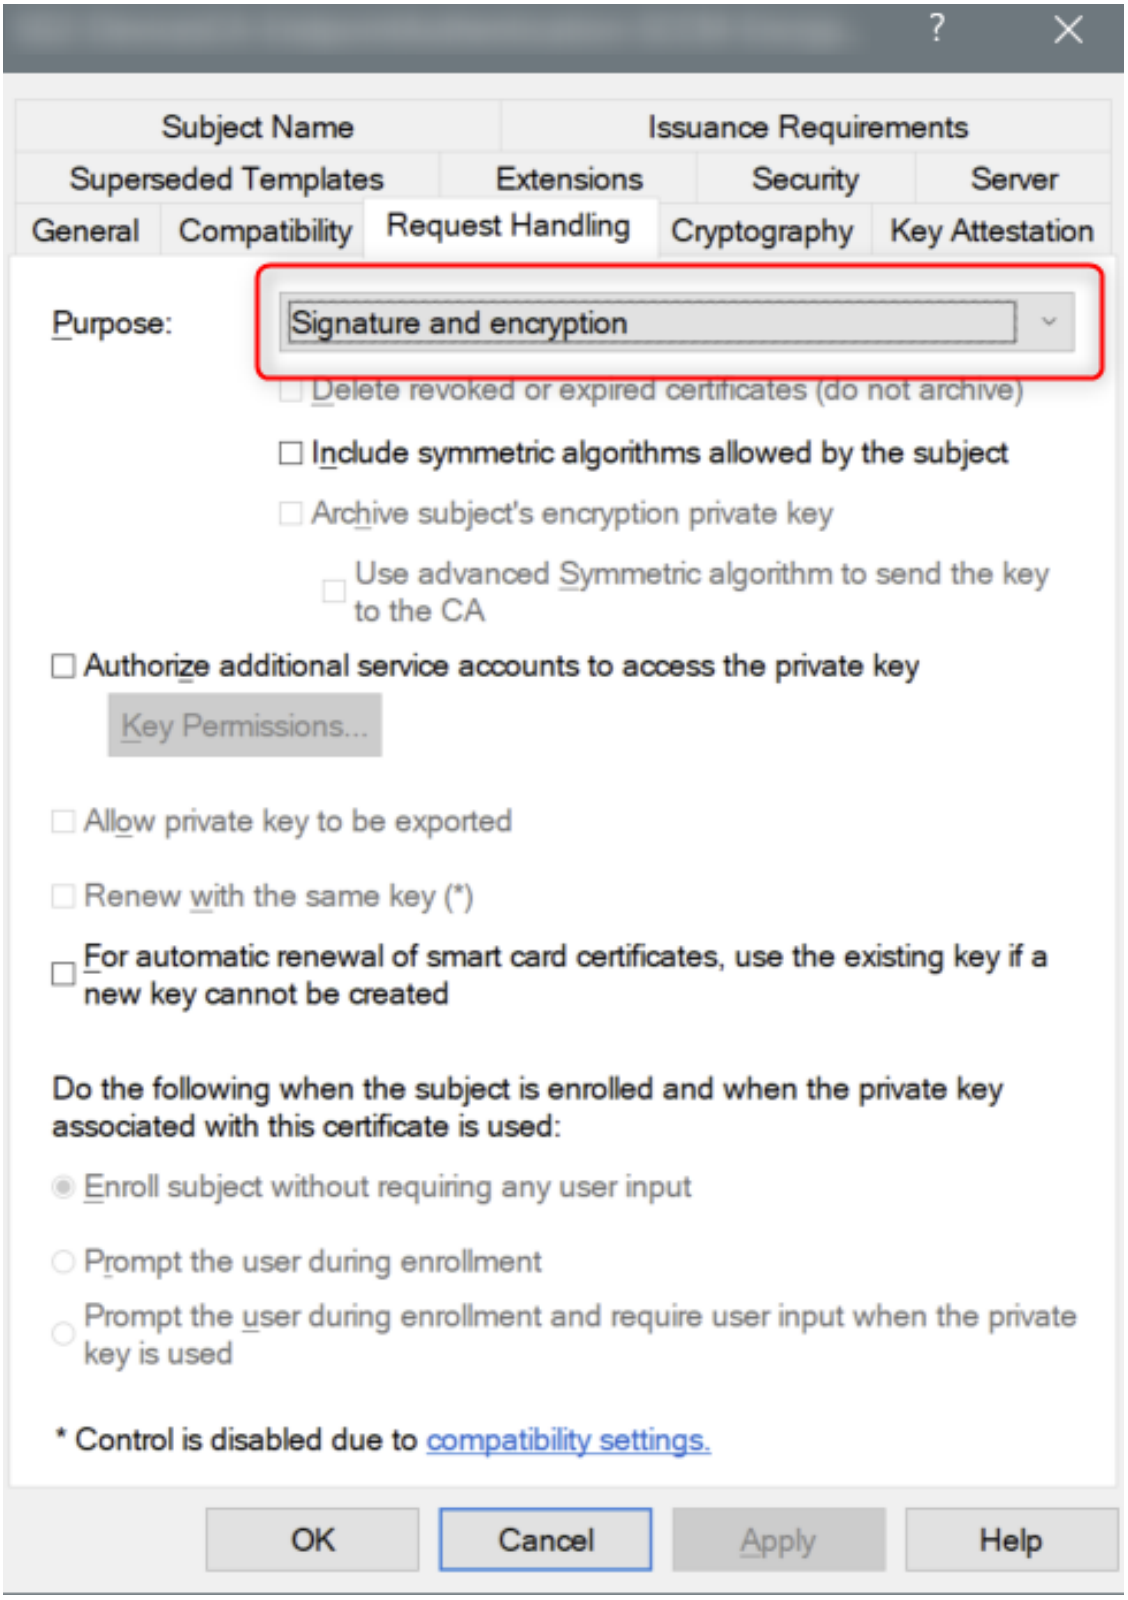
1.3.4.5 Client authentication certificates

Note

You can use Tachyon Setup to install Tachyon so it does not require 1E Clients to present certificates to the Tachyon Switch. Tachyon can be reconfigured later to re-enable use of client certificates when your environment is ready. Each Tachyon server requires a Web Server certificate. Please contact your 1E Account Team if you need help with this.

Note

The 1E Client requires that the client certificate it presents to the platform has both the **Signature** and **Encryption** request handling options. These options are the defaults if provisioning using a Computer Certificate template from a Microsoft Windows Certificate Authority. If you are using a custom template, or an alternative certificate authority, you should confirm that both these options are enabled.



If you have configured Tachyon to require client certificates (Client certificates) then each device requires a certificate with the following properties, so the 1E Client can be authenticated by the Tachyon Switch.

1. Issued by a trusted Certificate Authority (CA):
    - The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the client.
    - If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the client.
    - If either of these CA certificates are different to those used by the Tachyon Web Server, they will need to be exported and imported on the TachyonTachyon Web Server.
    - Most organizations have automated distribution of these CA certificates to clients and servers, using Group Policy for example.
2. Has at least the following Enhanced Key Usage:
    - Client Authentication.
3. Has at least the following Key Usage:
    - Digital Signature.
    - Key encipherment.
4. Has a private key:
    - For workgroup and non-Windows devices, the **private key must be exportable**.
5. Revocation information is included:
    - References at least one CRL Distribution point that uses HTTP.
6. Has a Subject Name of type Common Name (**CN=<computername>**) or Subject Alternative Name (**DNS Name=<computername>**) where <computername> depends on the type of device:
    - On domain-joined Windows PCs this must be the **computername FQDN** of the computer, for example **W701.ACME.LOCAL**.
    - On workgroup Windows PCs and non-Windows devices, this must be the computername of the computer - as returned by the **hostname** command, for example on Windows PC this could be **W701**, and on a Mac this could be **MAC01.local**.

Note

Tachyon clients and Switches use OpenSSL and its validation process to verify certificates.

The client device's certificate is stored differently depending on the type of OS:

- For Windows devices, the certificate is stored in the Windows Local Computer personal certificates store.
- For non-Windows devices, except for the Mac, the Tachyon client does not use proprietary certificate stores. Instead, the client requires the certificate exists as a **.pfx** file in the client installation folder structure. For more information, please refer to Client certificates.

- For macOS, you have a choice of storing the client certificate in the macOS Key Store or using the **.pfx** file approach required by other non-Windows devices. Please refer to Client certificates.

If using a Microsoft Enterprise CA then the following should be considered.

- For domain joined Windows computers:
  - Use the Computer template or a duplicate.
  - Enable auto-enrollment - so that devices enroll automatically.
- For workgroup Windows and non-Windows devices:
  - Use a duplicate or equivalent of the Computer or Workstation template.
  - The template's Subject Name uses **supply in the request** - so the hostname can be entered when requesting a certificate.
  - The template must **Allow private key to be exported** - so a certificate can be requested on a domain joined Windows computer, exported as a **.pfx** file and then imported on the target device (see non-Windows Device Certificate).

If using a standalone CA, then certificates must be deployed by other means.

1.3.4.6 Code signing certificates

You will need your own code signing certificate, and have it registered in your Tachyon license, if you want to develop your own custom Tachyon instructions, or modify those of other authors. Instructions that are provided in the Tachyon Platform zip or downloaded from the 1E Exchange have already been code signed using the Platform and 1E Exchange certificates from 1E. Your Tachyon license controls whether you can use these instructions.

Ideally, all of your Tachyon instruction developers should share a single **code signing certificate** between them. Each code signing certificate must be registered in your Tachyon license and associated with your organization's **instruction name prefix**. When you have chosen your prefix and have your code signing certificate(s) you then need to send details of these to 1E, who will update your Tachyon license. This will then automatically activate on your Tachyon server (assuming it has connection to the Internet).

The following applies to the importing and running of custom Tachyon instructions:

- Tachyon platform will only allow instructions to be imported if they have been signed and the code-signing certificate exists in the Tachyon server's Trusted Publishers certificate store.
- Tachyon platform will only allow instructions to be run if their prefix and code-signing certificate have been registered in the Tachyon server's license file (even if the instruction has been successfully imported, it will be flagged as unlicensed if the license information is not there).

Custom Instructions must be signed by TIMS using a code-signing certificate present in the Personal certificate store where TIMS is installed (either local user or machine store). The TIMS user signing the Instruction also needs to have access to the certificate's private key.

For a getting started guide to configuring and verifying your Tachyon system so that you can run customized Tachyon instructions, refer to /document/preview/736871#UUID-66857689-bfb0-8dbc-ae8d-1de40c66fad9.

1.3.4.7 Digital signing certificates

On Windows computers, the installation MSI files, and binary executable and DLL files of 1E software are digitally signed. The 1E code signing certificate uses a timestamping certificate as its countersignature. 1E occasionally changes its code signing certificate, as shown in the table below, and uses it for new releases and hotfixes for older versions, as shown in the table below.

The signature algorithm of the 1E code signing certificate is SHA256RSA. In most cases, the file digest algorithm of an authenticode signature is SHA256, and the countersignature is a RFC3161 compliant timestamp. The exception is on legacy OS (Windows XP, Vista, Server 2003 and Server 2008) which require the file digest algorithm of an authenticode signature to be SHA1, and a legacy countersignature.

The root CA certificates (for signing and countersigning) must exist in the **Third-Party Root Certification Authorities** store (which is replicated in the Trusted Root Certification Authorities store). These root CA certificates are normally automatically provided by Microsoft's Update Root Certificates feature, however, this may not be true for legacy OS computers in a lab environment that are not connected to the Internet.

The table below applies to software and hotfixes released in 2020.

2020	Signing certificate	Timestamping certificates
Certificate	1E Limited	TIMESTAMP-SHA256-2019-10-15 ***and*** DigiCert Timestamp Responder
Issuing CA	**DigiCert EV Code Signing CA (SHA2)** Thumbprint: 60ee3fc53d4bdfd1697ae5beae1cab1c0f3ad4e3	**DigiCert SHA2 Assured ID Timestamping CA** Thumbprint: 3ba63a6e4841355772debef9cdcf4d5af353a297 ***and*** **DigiCert Assured ID CA-1** Thumbprint: 19a09b5a36f4dd99727df783c17a51231a56c117
Root CA	**DigiCert High Assurance EV Root CA** Thumbprint: 5fb7ee0633e259dbad0c4c9ae6d38f1a61c7dc25	**DigiCert Assured ID Root CA** Thumbprint: 0563b8630d62d75abbc8ab1e4bdfb5a899b24d43

1.3.4.8 PKI in the cloud

Tachyon relies on both client (device) and server side certificates to ensure secure communication. In order for these certificates to work the computers need to trust the PKI implementation (issuing

Certification Authority and chain of trust). In a standard on-premises environment, devices can be enrolled with certificates using Directory Group Policy.

It is possible to use a non-Windows based PKI, but it is then left as an exercise for the user as to how to distribute and enrol device certificates to all end-points.

Given the supported Directory configuration above, the PKI requirements described above still apply to a cloud based implementation.

1.3.4.8.1 Tachyon Web Server certificate

Since clients must be able to access the Tachyon Switch and Background Channel from both the internal corporate network and the Internet, there are some additional considerations when creating the Tachyon web server certificate.

1. The server must have a consistent external FQDN.

   In AWS, a standard EC2 instance has an external FQDN based upon its externally accessible IP address. However, this IP address will change each time the server restarts, and since the Tachyon Switch relies on an HTTPS certificate that utilizes the FQDN to authenticate the server, this would cause the Switch to stop working. In order to work around this, any AWS implementation MUST use an Elastic IP address associated with the network interface of the Switch to ensure that the IP address never changes, and therefore the external FQDN is always the same. Alternatively, you can create a CNAME entry in your external DNS to point to the external FQDN of the AWS instance and use the CNAME as the subject name of the server certificate.

2. The web server certificate must incorporate all DNS Names that will be used to access the server in the certificate SAN.

   Clients can be configured to connect to multiple Switches for resilience and geographic load balancing. In many cases a cloud based virtual machine may be able to be accessed through both an internal VPN network, and an external Internet connection. These connections can be made using the same DNS name (via a CNAME entry as specified in the main documentation) or by different DNS names (where there are separate internal and external DNS domains in use).

   The certificate crafted for the Tachyon Switch ***must contain all*** DNS Names that will be used to contact the server in the Subject Alternate Name (SAN) entry within the certificate.

1.3.4.8.2 Client certificates

Any devices that will connect to the Tachyon implementation must have a client certificate from a PKI infrastructure trusted by the Tachyon server. In a Windows domain environment, this is usually provided through an Enterprise Certificate Authority and the use of Group Policy. It is also possible to provide certificates through SCEP, which 1E has tested and support the use of the Microsoft Device Enrollment Service (MDES) for this purpose. Use of other SCEP solutions will be supported on a best-efforts basis.

1.3.5 Directory requirements

Please note the following considerations:

- Tachyon Servers must be domain-joined. The exception is a Tachyon DMZ Server where domain-joined is optional.

- Tachyon is supported in multi-domain, multi-forest environments.
- Each Tachyon user requires an account in Azure Active Directory. Azure Active Directory accounts must have their userPrincipalName (UPN) attribute populated, which is normal but may be missing if user accounts have been created using scripts.
- Users and approvers should have email addresses to support approval workflow and notifications. Email addresses are mandatory if Two-Factor Authentication (2FA) is enabled.
- Azure Active Directory groups are recommended for role-based access control (RBAC) but are not mandatory. Azure Active Directory groups can be assigned to Tachyon roles after installation, they are not required during installation. Groups are not mandatory because users can be assigned to roles and managed within Tachyon instead of Azure Active Directory.
- Tachyon Setup assigns a limited set of permissions to the Setup user account (specified during installation/updates), as described on the Roles page which cannot be edited. It is possible to increase this user account to have Full Administrator access during installation/upgrade, 1E recommends that this user account is viewed as a service account and kept with the minimum permission.
- An Azure Active Directory group is useful to configure access to the CatalogWeb Admin page, as described in Rebuilding the 1E Catalog .

Note

AD *distribution* groups are not supported.

If AD *security* groups are nested (groups within groups), they can slow down the performance of the Tachyon Portal for administrators. Therefore, we recommend nesting is not used, and each administrator and approver account is a member of a group used in Tachyon . You can improve performance further by disabling the recursive search used by Tachyon , bearing in mind this will not support nested groups. Please refer to the Post Installation page.

Domain Local security groups are not supported.

1.3.5.1 Server installation account

This is the account used to run Tachyon Setup (and the MSI installer) when installing or upgrading a Tachyon Server. The account is automatically defined as a Tachyon admin user with limited rights which cannot be edited (called a system principal).

1.3.5.1.1 Local admin rights

The server installation account has the following requirements on the server.

- **Local admin rights on the Tachyon Server**. It must be an Azure Active Directory domain user account that is a direct or indirect member of the Administrators local group on the server where Tachyon Server will be installed.
- Can be disabled (not deleted) in Azure Active Directory after additional admin users have been created in Tachyon, and installation has been verified.

1.3.5.1.2 Tachyon user permissions

The installation account only has sufficient rights to add other Tachyon users, assign them to Tachyon roles, and install Tachyon applications. The users and roles created by the installation account are then used for ongoing use and management of Tachyon.

If you need the installation account to have additional roles or be a **Full Administrator**, then the recommended approach is:

- First create a role-based AD Security group, and add the installation and other accounts to this group
- Then, the installation account:
  - Logs into Tachyon and navigates to Settings→Permissions→Users and Groups
  - Creates a new Tachyon user for the role-based AD Security Group
  - Assigns the relevant system role(s) to the new Tachyon user - this can be Full Administrator.

Tip

You can disable the installation account in AD after the system is operational and other Tachyon users have been set up. You can then re-enable it whenever required for ongoing configuration changes and upgrades.

Note

Do not delete the server installation account from Tachyon after installation.

The server installation account is granted the following permissions as a Tachyon user, configured during installation of the Tachyon Server.

- It is the first Tachyon user account and is a **System Principal**, which means it cannot be deleted or assigned any other rights
- It is assigned to the Tachyon system role of Installer
- It should be used to add additional Tachyon users and administrators, assign them to Tachyon roles, which should then be used for ongoing use and management of Tachyon.
- It may be included in any AD security group assigned to a Tachyon system or custom role.

Refer to Roles and Securables for a complete reference of Tachyon system roles, custom roles, securables and operations.

1.3.5.1.3 SQL Logins for the server installation account

The server installation account requires SQL permissions during installation and upgrade, which can be temporary or permanent. The level of SQL permissions required by the installation account depends on which Tachyon components it is installing.

1.3.5.1.3.1 Master Stacks

For master stacks **sysadmin** is required as follows, to:

- Install **1E Catalog**
- Create Linked Servers for **SLA,** which requires **sysadmin** for the SQL database instances for both SLA and 1E Catalog databases
- Create Linked Servers for **BI**, which requires **sysadmin** for the SQL database instances for both SLA and BI databases, and the SSAS instance for the BI cube (required only by Patch Success).

1.3.5.1.3.2 Response Stacks

<table>
<tr><th>Sysadmin availability on SQL instance(s)</th><th>SQL Login permissions</th></tr>
<tr><td>sysadmin SQL Server role is permitted</td><td>The server installation account requires the sysadmin SQL Server role on the SQL Server instance(s) that host the TachyonMaster and/or TachyonResponses database(s).

This can be used for a new installation, or for an upgrade.</td></tr>
<tr><td>sysadmin SQL Server role is not permitted</td><td>The SQL Login permissions required by the server installation account vary depending on which choice is implemented, as described in the following table:

<table>
<tr><th>Choice implemented</th><th>Role required for the installation account's SQL Login</th></tr>
<tr><td>Database(s) created by the Tachyon Server installer during installation.</td><td>dbcreator SQL Server role on the SQL instance</td></tr>
<tr><td>Database(s) created before installation - a common scenario if you want to select database location and size.

Also required when upgrading Tachyon.</td><td>db_owner database role on the pre-created databases:

• TachyonResponses</td></tr>
</table>

Note
In addition to the permissions given in the table above, the server installation account also needs to ALTER ANY LOGIN Securables permission in order to allow the creation of the Example SQL scripts for creating a SQL Login and granting roles, used by the Tachyon Server web applications and services.

Example scripts are provided below to create a SQL Login and grant roles.</td></tr>
</table>

Sysadmin availability on SQL instance(s)	SQL Login permissions
	During installation, the Tachyon Server installer will **always** attempt to grant **db_owner** permission to the server installation account on each of the Tachyon databases. **Note** Databases must be configured in multi-user mode.

Please refer to Preparation for example SQL scripts.

1.3.5.2 Service accounts

All Tachyon web applications and services use network service account, **NT AUTHORITY\NETWORK SERVICE**, except for the **BI SSAS User** account which must be a domain user account.

The **BI SSAS User** account has the following requirements:

- The account name and its password will be specified in the Tachyon Setup screen.
- Must be a **domain user account**
  - Configured with **Password never expires**
  - Although this user might be referred to as a service account, it does not require **Logon as a service** on the server.
- During installation, the SLA BI installer (used by Tachyon Setup) does the following with the user account:
  - Stores its credentials encrypted in the following places:
    - A linked server connection for the BI database to access the BI cube
    - In the configuration file used by the MDX API to query the BI cube.
  - Creates a SQL Login, with rights on the SLA-BI database.

1.3.5.2.1 SQL Login for the Network Service account

The SQL Login that is used by the Tachyon Server web applications and services depends on whether the SQL Server is remote from the Tachyon Server or is local, as described in the following table:

Installation scenario	Service account SQL Login
Tachyon Server is remote from SQL	The computer account of the remote Tachyon Server. For example **ACME\ACME-TCN01$**
Tachyon Server and SQL are local	The local network service account, **NT AUTHORITY\NETWORK SERVICE**

Note

Before upgrading Tachyon, or installing or upgrading Consumer applications like Application Migration or AppClarity, the SQL Login must be granted the following rights to support Database Snapshot of the 1E Catalog and SLA databases, to restore them if an error occurs:

- **dbcreator** rights on the SQL database instance hosting the 1E Catalog database.
- **dbcreator** rights on the SQL database instance hosting the SLA databases.

During installation, the Tachyon Setup will **always**:

- Attempt to create the SQL Login
- Grant it **db_owner** permission on each of the Tachyon databases
- Remove the **db_owner** permissions when installation is completed.

1.3.5.3 User accounts

Please note the following:

- Each Tachyon user requires an account in Azure Active Directory. AAD accounts must have their userPrincipalName (UPN) attribute populated, which is normal, but may be missing if users accounts have been created using scripts.
- Tachyon users and approvers should have email addresses to support approval workflow and notifications. Email addresses are mandatory if Two-factor Authentication is enabled.
- Users are added to the Tachyon system and assigned roles by any Tachyon user assigned to the **Full Administrator** system role. A Full administrator manages Tachyon users and roles using the Permissions Menu in the Tachyon Portal Settings application.
- Tachyon is supported in multi-domain, multi-forest environments. You have a choice of how Tachyon queries Azure Active Directory, specified during installation.
- Tachyon services locate users and computers and membership of security groups by querying a semi-colon delimited list of Azure Active Directory GC and/or LDAP URLs.

GC URL	This is the quickest and simplest method of resolving users and group membership. A single GC URL will normally resolve all users and groups within a single **forest**.

	Supports only Universal security groups.
LDAP URL	A single LDAP URL will normally resolve all users and groups within a single **domain**. Supports Universal and Global security groups. Required if a Global Catalog (GC) server does not exist in a trusted forest, or if Global security groups must be used.

Any domain which contains Tachyon servers, users or groups must:

- Be resolvable from the Tachyon Server using DNS - that is, the server must be able to resolve domain names using DNS
- Have a two-way trust with the domain in which the Tachyon (Master Stack) Server exists - so that users trust the server, and the server trusts users
- Allow the Tachyon Server to read computer, user and security group objects in each domain.

The default **GC://** is sufficient for a Tachyon Server in a simple Active Directory environment of one forest which has a Global Catalog. You can include, but it is not required, the name of the server's local domain or root domain, for example: **GC://acme.local**

To add support for a remote forest which has its own GC, you would for example have **GC://acme.local;GC://nadir.local** and so forth adding the root domain of any other forests to the list of GC URLs.

If you prefer to use LDAP, or there are difficulties with trusts between forest domains, then you would create a list of LDAP URLs including *all* domains that have Tachyon users and groups, as well as domains in which a Tachyon server resides. For example:

LDAP://acme.local;LDAP://pop.acme.local;LDAP://rock.acme.local;LDAP://country.acme.local;LDAP://nadir.local;LDAP://disco.nadir.local

You can mix GC and LDAP URLs, but you should avoid mixing LDAP URLs that are also resolved by a GC URL. For example: **GC://;LDAP://nadir.local;LDAP://disco.nadir.local**

1.3.5.3.1 Active Directory Security Groups

Active Directory security groups are strongly recommended for role-based access control (RBAC) but are not mandatory. AD security groups can be assigned to Tachyon roles after installation, they are not required during installation. They are added as Tachyon users and configured in the same way as AD user accounts. A Tachyon user can therefore be a domain user account or a security group. Groups are not mandatory because users can be assigned to roles and managed within Tachyon instead of AD, or a combination.

Tachyon Setup assigns a limited set of permissions to the server installation account, as described in Tachyon user permissions, which cannot be edited. However, the installation account's permissions can be extended if the account is a member of one or more AD Groups configured as Tachyon users.

An AD security group is also useful to configure access to the CatalogWeb Admin page, as described in Rebuilding the 1E Catalog.

Note

AD *distribution* groups are not supported.

If AD *security* groups are nested (groups within groups), they can slow down the performance of the Tachyon Portal for administrators. Therefore, we recommend nesting is not used, and each administrator and approver account is a member of a group used in Tachyon . You can improve performance further by disabling the recursive search used by Tachyon , bearing in mind this will not support nested groups. Please refer to the Post Installation page.

Domain Local security groups are not supported.

Tachyon sends emails to users and approvers of Tachyon instructions, which requires user AD accounts to be email-enabled. However, Tachyon allows you to permission instruction sets with AD users or groups, roles that Permissions are assigned to instruction sets, and AD security groups can be assigned permissions. Tachyon will use the email address of an AD security group if it has been configured, and relies on the Mail system to forward emails to the members of the AD security group. If the AD security group is not configured with an email address, then Tachyon sends an email to each member that has an email address. AD distribution groups are not supported.

1.3.5.4 Active Directory in the cloud

The Tachyon software must be installed on a Windows Server that is part of an Active Directory domain. Companies do not always have their on-premises Active Directory extended into their cloud environment - there are security concerns that must be taken into account and there must be some mechanism for either a secure network connection between the customer's on-premises systems and the cloud environment (usually via VPN connection) or a way of synchronizing the cloud based Active Directory implementation with the on-premises one (through a directory synchronization of some sort).

Both AWS and Azure provide the following 'cloud' based versions of Active Directory:

1. **AWS Directory Service for Microsoft Active Directory (Enterprise Edition)** - This is a full implementation of Active Directory, but it requires a VPN and a trust relationship set up with any existing on-premises Active Directory to be able to use on-premises based accounts. This makes it quite a complex solution to implement and maintain.

   Note

   1E have not yet tested any Tachyon platform implementation using this solution, and as such it is only supported by 1E on a best-efforts basis.

   Also known as AWS Managed Microsoft Active Directory (AD).

2. **AWS AD Connector** - This is a mechanism for redirecting domain queries from the local network to an on-premises Domain Controller using a VPN instead of needing a domain controller in the cloud.

   Note

   1E have not yet tested any Tachyon platform implementation using this solution, and as such it is only supported by 1E on a best-efforts basis.

3. **AWS Simple AD** - This is an implementation of Active Directory based upon Samba 4 and provides a limited subset of a full Active Directory.

   Warning

   1E do not support the Tachyon platform running in this environment.

4. **Azure Active Directory** - Although this provides cloud based identity, it cannot be used for direct directory connectivity from an Azure virtual machine, for that you need Azure Active Directory Services (see next).

5. **Azure Active Directory Services** - This provides the ability to domain join Azure Virtual Machines to your Azure Active Directory, however, it is not a full AD as you cannot have domain admin or enterprise admin privileges.

   Warning

   1E do not support the Tachyon platform running in this environment.

The following is the only cloud solution that is fully supported by 1E, and is what we call **Extended AD**. It doesn't use any of the above, but has the following requirements, which provide an Active Directory presence in the cloud and brings the full capabilities of Active Directory to bear.

- Virtual machines located in the customer's cloud network installed with Windows Server as hosts for:
  - Domain Controller(s) in the existing enterprise domain, which can be Read-Only domain controllers (RODC).
  - Other member server(s) which host the Tachyon Server components, including Microsoft SQL Server, must be joined to the same enterprise domain.
- A permanent site-to-site VPN connection from cloud to the corporate on-premises network.

Note

1E fully support the **Extended AD** solution for AWS and Azure, which do not change any of the Active Directory requirements described above.

1.3.6 Email and 2FA requirements

You will need to decide if you want to use the Email and two-factor authentication features.

1.3.6.1 SMTP server

The Tachyon SMTP feature can optionally be enabled to send the following types of emails to Tachyon users.

- Approval request emails to approvers about pending action requests
- Notification emails to users about responses that will expire shortly
- One-time authentication code emails if the two-factor authentication feature is enabled.

Emails are HTML format, without any attachments, and have a typical size of approximately 70KBytes. You can choose to modify the email banner header.

Emails are sent by the Coordinator service (workflow module) which by default uses the built-in Network Service (NT AUTHORITY\NETWORK SERVICE).

If the Tachyon SMTP feature is enabled, your SMTP relay/gateway may require the following to be configured.

- Add the Tachyon Server name or IP address to a new or existing white-list policy
- Disable require SMTP authentication (allow anonymous) - see note below
- Assign the "mail-from" address to an AD account - see Mail-From address below - if it has a **SPF (Sender Policy Framework)** or **Sender ID** policy.

Note

In this version of Tachyon, **SMTP Authentication** is not configurable using the Server installer. The default is anonymous authentication. However, it can be changed post-installation. For details of changing the SMTP configuration and disabling email notifications, please refer to Tachyon Server post-installation tasks.

1.3.6.2 Mail-From address

If the Tachyon SMTP feature is enabled, then a Mail-From address is required as the Sender of Tachyon emails.

Tachyon does not require the Mail-From address to belong to a real AD account or have a real mailbox, however, your SMTP relay/gateway might have these requirements, therefore you may need to create an additional AD account.

Choose a suitable email address, especially if there is no mailbox, for example no_reply@acme.local.

1.3.6.3 Email for Users and Approvers

Each Tachyon user and approver should have an email address, otherwise they will not receive emails when actions require authentication or approval. Email addresses are mandatory if two-factor authentication is enabled.

If a Group is assigned rights in Tachyon to approve actions, and the Group has an email address, then Tachyon will use that. However, a group member will receive emails only if your organization's mail system supports group emails and the member has an email address. If the Group does not have an email address, then Tachyon will look up group members and send emails to any member that has an email address. Irrespective of whether the Group has an email address, members must have emails addresses in order to receive emails.

Note

If your organization uses separate accounts for user and administration tasks, then you should consider the impact of using admin accounts for Tachyon if they do not have associated email addresses.

1.3.6.4 Two-factor Authentication requirements

If the 2FA feature is enabled, Tachyon users are prompted to enter a one-time authentication code in addition to their password in order to confirm they want to submit an **action** instruction.

The one-time authentication code is sent to the user by email. The two-factor authentication feature requires email.

Please refer to Tachyon Server post-installation tasks.

1.3.7 Product integration requirements

An overview of how Tachyon connects to third-party systems, and how it integrates with its companion 1E products.

More detailed information about how to configure Tachyon is provided in Using Settings.

1.3.7.1 1E companion products

The following tables show the 1E products that combine to support particular features.

Supported versions of 1E companion products with features that depend on Tachyon 8.1.

(For products that depend on the 1E Client, please refer to urn:resource:component:647597)

Products and features that depend on Tachyon platform	Supported versions of companion products	
AppClarity	AppClarity is a consumer application of the Tachyon platform and requires a full Tachyon infrastructure.	• AppClarity 8.1
Application Migration	Application Migration is a consumer application of the Tachyon platform and requires a full Tachyon infrastructure.	• Application Migration 8.1
Guaranteed State	Guaranteed State is a consumer application of the Tachyon platform and requires a full Tachyon infrastructure.	• Guaranteed State 8.1
NightWatchman	Console live status of NightWatchman clients is an optional feature of NightWatchman and requires a full Tachyon infrastructure. NightWatchman is not a Tachyon platform application and requires its own server(s).	• NightWatchman Enterprise 7.3

Products and features that depend on Tachyon platform	Supported versions of companion products	
Nomad	Nomad is a consumer application of the Tachyon platform and requires a full Tachyon infrastructure. It includes the Content Distribution feature that replaces the legacy ActiveEfficiency Server and its features.	• Nomad 8.1 (app) and Nomad 8.1 (tools)
Patch Success	Patch Success is a consumer application of the Tachyon platform and requires a full Tachyon infrastructure. It also requires 1E SLA Platform Business Intelligence to be installed and a SQL Server Analysis Server (SSAS) instance.	• Patch Success 8.1
Shopping	Shopping uses Tachyon platform and 1E Client for its client-side order notifications, and to allow end-users to shop for Tachyon instructions. Shopping is not a Tachyon platform application, and requires its own server(s).	• Shopping 6.1
Experience	Experience is a consumer application of the Tachyon platform and requires a full Tachyon infrastructure.	• Experience 8.1
Explorer	Explorer is a consumer application of the Tachyon platform and requires a full Tachyon infrastructure.	• Explorer 8.1

Note

In addition to the consumer applications listed above, Tachyon Setup is also used to install the Inventory and Settings applications.

Supported versions of 1E companion products that Tachyon 8.1 platform features depend on.

Products and features that Tachyon platform depends on	Supported versions of companion products	

1E Client	Tachyon requires the 1E Client to be installed on all client computers.
	
	Client features:
	
	• Real-time response to instructions, which supports the retrieval of information using questions, and running actions
	• Tags (freeform and device/coverage)
	• Criticality and Location
	• 1E Client UI to support the Real-Time Control Center, Announcements, Surveys, and Sentiment features of Experience #
	• Inventory, including process usage, to support the:
	  – Tachyon Activity Record feature
	  – Inventory and other consumer applications.
	• Performance metrics features to support the Experience application #
	• Policy feature to support consumer applications: Guaranteed State ##, Experience #, and Nomad #
	• Modules to support:
	  – Patch Success #
	  – Command and script execution
	  – Content distribution
	  – Device criticality
	  – Manipulation of files and processes
		• 1E Client 8.1
		• 1E Client 8.0
		• 1E Client 5.2
		• 1E Client 5.1

Products and features that Tachyon platform depends on	Supported versions of companion products	
	– Manipulation of registry and WMI # – Security # – Software uninstallation – User sessions, including Primary User. # not supported on non-Windows, ## partially supported on non-Windows Platform clients can optionally use the Nomad client module of 1E Client to more efficiently download content.	
Nomad	Clients can optionally use Nomad (1E Client with Nomad client features enabled) to provide more efficient downloading of content.	• 1E Client 8.1 (with Nomad enabled) • 1E Client 8.0 (with Nomad enabled) • 1E Client 5.2 (with Nomad enabled) • 1E Client 5.1 (with Nomad enabled).

1.3.7.2 Connectors

Connectors are used to connect to other 1E and third party systems, retrieve their data and populate repositories. Tachyon provides the following inventory connectors to populate the Inventory repositories, for details refer to Repositories page:

- BigFix connector — Connects to a BigFix Inventory database server.
- BigFixInv connector — Connects to a BigFix Inventory database.

- File Upload connector — Uploads inventory data from a folder containing tab (TSV) and comma (CSV) separated value file(s).
- Intune connector — Connects to an Intune application and collects inventory and usage data.
- Microsoft Office 365 connector — Connects to an Office 365 application in InTune and pulls in inventory and usage data.
- OpenLM connector — Connects to an OpenLM database server.
- Oracle LMS connector — Connects to Oracle LMS and queries it for inventory information.
- ServiceNow connector — Connects to a ServiceNow instance to import basic inventory data into SLA Platform.
- System Center Configuration Manager connector — Connects to a Configuration Manager database and pulls in inventory and usage data.
- Tachyon connector — Connects the Tachyon and SLA components to support Management group and Tachyon Powered Inventory features. The Tachyon Powered Inventory feature uses instructions to fetch inventory data from clients, and is a prerequisite for 1E Patch Success.
- vCenter connector — Connects to a vCenter server and pulls in inventory data.
- Windows Server Update Services connector — Connects to a WSUS database and pulls in patch data.

Use the links above to find more information about each type of connector. Please refer to Introducing Inventory for more information about viewing and exporting inventory repositories.

Additional connectors may exist for add-on Consumer applications that have been installed. For example, Connectors page has the following connectors to populate its entitlement repository:

- AppClarity v5.2 connector — Exports entitlements from an AppClarity 5.2 database into a TSV file, which can then be reviewed and imported into.
- Entitlement .tsv connector — Uploads entitlements from a folder containing one or more tab or comma-separated value file(s).

Please refer to the relevant connector page to identify security and other requirements for a specific connector.

Patch Success needs to get meta-data for patches. Ensure you add a connector for whichever one of the following sources that you use to approve patches:

- Configuration Manager (SCCM) if it is configured to manage WSUS
- Windows Server Update Services (WSUS).

If you are using Configuration Manager then you must add a System Center Configuration Manager connector.

If you are using WSUS then you must add a Windows Server Update Services connector.

Patch Success also requires a Tachyon connector.

The following table shows the supported versions of software used by the Tachyon out-of-box connectors.

Connector	Product	Notes
BigFix	• BigFix	Please refer to the BigFix connector for prerequisites.
Intune	• Intune	Please refer to the Intune connector page for prerequisites.
Microsoft Office 365	• Azure	Please refer to the Microsoft Office 365 connector page for prerequisites.
OpenLM	• OpenLM Server version 21.12	Please refer to the OpenLM connector page for prerequisites.
Oracle LMS	• Oracle LMS	Please refer to the Oracle LMS connector page for prerequisites.
ServiceNow	• ServiceNow Jakarta release	Please refer to the ServiceNow connector page for prerequisites.
System Center Configuration Manager (SCCM)	• SCCM CB 2203 • SCCM CB 2111 • SCCM	Please refer to the System Center Configuration Manager connector page for prerequisites.

Connector	Product	Notes
	CB 2107 • SCCM CB 2103 • SCCM CB 2010	
Tachyon	• Tachyon 8.1	Please refer to the Tachyon connector page for prerequisites.
vCenter	• VMware PowerCLI 11.1.0	VMware PowerCLI 11.1.0 (code.vmware.com/web/dp/tool/vmware-powercli/11.1.0) must be installed on the Tachyon Master server (where the SLA Integrate Services Agent service is hosted) before you can configure and use the vCenter connector. Earlier or later versions of PowerCLI are not supported and may cause errors. VMware PowerCLI is freeware and was previously known as vSphere PowerCLI. VMware PowerCLI supports multiple versions of VMware vCenter Server. For details, please refer to the VMware compatibility matrix using the following link: https://www.vmware.com/resources/compatibility/sim/interop_matrix.php#interop&2=&106= Please refer to the vCenter connector page for configuration details.
WSUS (Windows Server Update Services)	• WSUS	Please refer to the Windows Server Update Services connector page for configuration details.

1.3.7.3 Product Pack and Security Roles

Classic Product Packs:

- Include instructions
- Are uploaded using either of the following methods:
  - Tachyon Product Pack Deployment Tool as described in Tachyon Product Pack Deployment Tool
  - **Upload** button on the **Settings - Instructions sets** page, as described in Instruction sets page
- Once the instructions are uploaded you must organize them manually into Instruction Sets, although the Tool will use the name of the zip file as the basis for the Instruction set name
- Instruction Sets are the basis for assigning custom roles that determine who can do what with the instructions in each Set.

Integrated Product Packs:

- Include policies and/or instructions
- Are uploaded using the Tachyon Product Pack Deployment Tool as described in Uploading Integrated Product Packs
- If the pack contains instructions, each one is automatically uploaded into an Instruction Set using the folder name as the basis for the Instruction set name
- Policies are uploaded into Guaranteed State.

The Integrated Product Packs provided by 1E include ready-made Policies, and any instructions included in the packs are intended to augment the policies, but can be used independently.

You may want to create AD security groups to use custom roles to control access to:

- **Instructions Sets** - you should think about groups of people who will need to view, question, action, and approve instructions
- **Policies** - you must decide who needs access to Guaranteed State - in this version, you cannot grant access to individual Policies.

1.3.7.4 Nomad integration

Nomad integration is available on Windows PC devices and is enabled by default (NomadContentDownloadEnabled=true), and can be disabled during or after installation of the 1E Client.

With the integration feature enabled, Tachyon will detect if the Nomad client module of the 1E Client is enabled, or if Nomad v6.0.100 or later version is running on the device. Nomad then automatically downloads content from Tachyon Background Channel servers, and any other HTTP/S content source that the client may use.

Tachyon use of Nomad works irrespective of whether Nomad is integrated with Configuration Manager or using advanced Nomad features that use ContentDistribution.

Configuration Manager is not a prerequisite for Nomad integration with Tachyon, but you will need to consider the following:

1.3.7.4.1 Configuration Manager present

You do not need to make any configuration changes to Nomad for it to integrate with Tachyon. Please refer Introducing Nomad for guidance on designing and deploying Nomad.

1.3.7.4.2 Configuration Manager not present

You can deploy Nomad to Windows devices where the Configuration Manager client is not present. You will need to enable the following bits in relevant installer properties:

- CompatibilityFlags bit 1 - enable long hashes
- SpecialNetShare bit 13 - enable HTTP(S)

These are enabled by default in the Nomad client module of the 1E Client.

1.3.7.5 Configuration Manager integration

Tachyon is able to integrate into the Configuration Manager console to provide a right-click context menu that can be invoked from Configuration Manager computer collections. Tachyon can then use the members of the computer collections as the coverage for any instruction selected from the menu. The Configuration Manager extensions are part of the 1E PowerShell Toolkit. For more details, please refer to Preparing for the Tachyon extensions for the Configuration Manager Console..

1.3.8 Network requirements

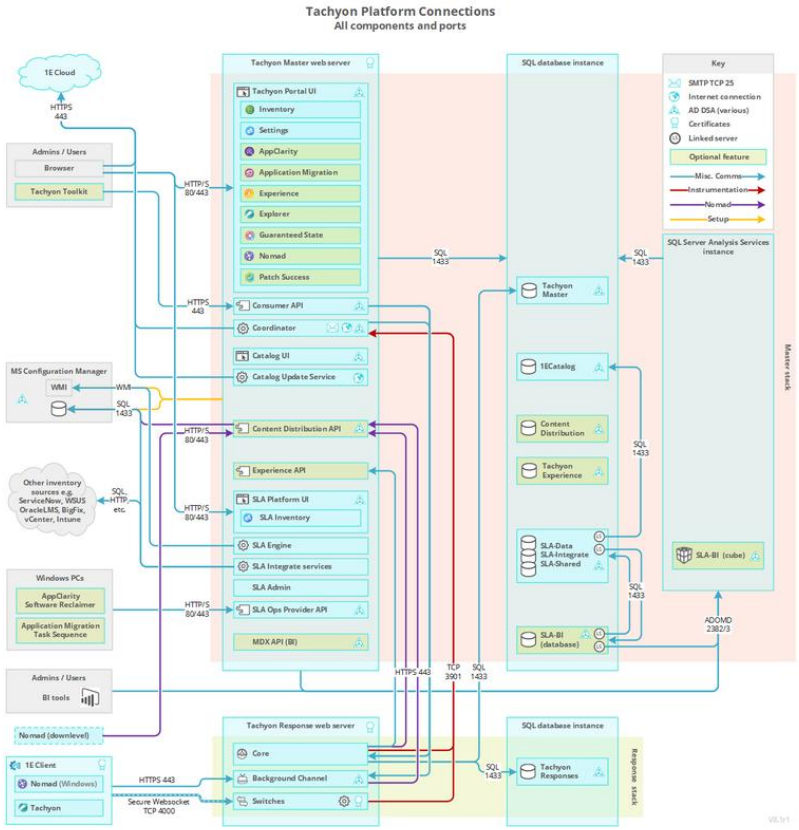
The correct choice of DNS Names for your Tachyon Servers is perhaps the most fundamental decision you will make.

You must ensure the firewalls on your client, servers, and network are configured correctly, and your Internet connections to the 1E Cloud are whitelisted.

For a remote SQL Server, please refer to Configuring a persistent route for SQL traffic. However, please ensure you also consult your server, firewall and networking teams.

1.3.8.1 Firewall Ports

The following are extracts from the Communication Ports reference page.



The following table lists firewall requirements for a **single-server** where **Tachyon Master Stack** and **Response Stack** are installed on the same server. The table assumes a remote SQL Server hosting TachyonMaster and TachyonResponses databases. Each Tachyon component described in the table has at least one output and/or input. For each Tachyon component with an output, there is a matching input.

Firewalls normally protect against incoming traffic from remote devices, however, the table below also includes outgoing connections. The table does not include internal communications within the Server.

In addition to but not included in the table are various ports that Tachyon uses to communicate with Microsoft services, including Certificate Services and Active Directory. The Coordinator **Workflow service** queries AD for email details; the **Consumer API** queries AD for security details.

Port requirements are not provided here for the Content Distribution, Shopping, and WakeUp modules of the **1E Client**. Only the ports used by the 1E Client feature of the **1E Client** are listed.

If the 1E Nomad module is being used by the 1E Client on Windows computers, it has additional port requirements of its own, which are not changed by Tachyon.

Additional ports may be required if Tachyon instructions need to connect to non-Tachyon content sources.

Additional requirements may exist if the environment has changed default security settings.

1.3.8.2 Tachyon Servers

Device	Port	Protocol	Direction	Usage	Configurable
Tachyon Server (Master Stack)	TCP 443	HTTPS	Incoming	• Console browser connections to **Tachyon Portal UI** • Console browser connections to **SLA Platform UI** • Console browser connections to **1E Catalog UI** • Consumer connections to**Catalog API**	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesHTTPSIISPORTHTTPSIISPORT. Setup installs other components using the same settings as Tachyon Server.

Device	Port	Protocol	Direction	Usage	Configurable
				• Consumer connections to **Consumer API** • Consumer connections to **SLA Operations Provider API**	
Tachyon Server (Master Stack)	TCP 80	HTTP	Incoming	• Console browser connections to **SLA Platform UI** • Console browser connections to **1E Catalog UI**	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesHTTPSIISPORTHTTPSIISPORT. Tachyon Setup installs other components using the same settings as Tachyon Server.

Device	Port	Protocol	Direction	Usage	Configurable
				• Consumer connections to **Catalog API**	
				• Consumer connections to **SLA Operations Provider API**	
Tachyon Server (Response Stack)	TCP 443	HTTPS	Incoming	• Client retrieving content from the **Background Channel**.	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesHTTPSIISPORTHTTPSIISPORT.
Tachyon Server (Master Stack)	TCP 443	HTTPS	Outgoing	• Tachyon **Coordinator service** contacting the **1E Cloud License Se**	The port used to connect to the **1E Cloud Services** is not configurable.

Device	Port	Protocol	Direction	Usage	Configurable
				rvice via an Internet connection. • **1E Catalog Update service** contacting the **1E Cloud Catalog Service** via an Internet connection.	
Tachyon Server (Master Stack)	TCP 6002	WebSocket (ws)	Incoming Outgoing	• **Integrate Agent** service connecting to the **Integrate Manager Web API** to get connector jobs	Yes, configurable after installation. **Note** **Integrate Agent** component is not shown on the diagram, and installation on remote systems is not supported.

Device	Port	Protocol	Direction	Usage	Configurable
Tachyon Server (Response Stack)	TCP 4000	WebSocketSecure (wss)	Incoming	• Client receiving instructions from and sending compressed responses to the Tachyon Switch.	Switch ports are not configurable using the Server installer. A Switch port can be changed post-installation, by configuring the value in the **Port** column for the relevant Switch in the **SwitchConfiguration** table in the Tachyon Master database. If the Switch port is changed after deploying 1E Client (with Tachyon features enabled) then the corresponding Switch port must be updated in each Client's configuration file. Clients initiate and maintain a WebSocket Secure connection to a Switch, which the Switch uses to communicate back to the clients.
Tachyon Server (Master Stack)	TCP 25	SMTP	Outgoing	• Tachyon **Coordinator service** sending two-factor authentication emails. • Tachyon **Coordinator service** sending workfl	Yes. In this version of Tachyon, **SMTP Authentication** is not configurable using the Server installer. The default is anonymous authentication. However, it can be changed post-installation. For details of changing the SMTP configuration and disabling email notifications, please refer to Changing the SMTP Host configuration.

Device	Port	Protocol	Direction	Usage	Configurable
				ow emails.	
Tachyon Server (Master Stack)	TCP 1433	TDS	Outgoing	• Tachyon Web Site application pools (**Portal**, **Consumer API**) communicating with SQL Server. • SLA Platform Web Site application pools (**Admin**, **CoreExternal**, **Platform**) communicating with SQL Server.	Not configurable from Setup. In the **Database Servers** panel in Tachyon Setup you can select a SQL Server instance. The instance can be installed using a non-standard port. However, selecting an instance that uses a non-standard port will not change the port used by the Tachyon Installer, and installation will fail. If you require the use of a non-standard port on a Default SQL Server instance, contact 1E for guidance on a manual workaround. If using a Named Instance that is set to its default configuration where the server automatically chooses a random port (or if you manually configured the instance to use a fixed port), then the **SQL Browser** service needs to be enabled to let the Tachyon Server determine the port in use. You will need to open UDP port 1434 used by the SQL Browser. See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesSQLSERVER_MASTERSQLSERVER_MASTER.

Device	Port	Protocol	Direction	Usage	Configurable
				• Tachyon **Coordinator service** communicating with SQL Server. • Catalog services and application pool communicating with SQL Server. • **1E Catalog Update service** communicating with SQL Server.	

Device	Port	Protocol	Direction	Usage	Configurable
Tachyon Server (Master Stack)	TCP 1433	TDS	Outgoing	• Inventory connectors fetching data from sources that use SQL Server.	Configurable in various Connectors, please refer to Connectors page.
Tachyon Server (Master Stack)	TCP 135 and 445 (initially)	WMI (DCOM)	Outgoing	• SCCM WMI Server provider connection to Configuration Manager. • Nomad connection to Configuration Manager used by the Nomad Sync	Not configurable. Please refer to Provider configuration page and Nomad.

Device	Port	Protocol	Direction	Usage	Configurable
				feature.	
Tachyon Server (Response Stack)	TCP 1433	TDS	Outgoing	• Tachyon Web Site application pools (**Core** and **Core Internal**) communicating with SQL Server (mainly uncompressed responses).	Not configurable from Setup. See the comments above for the Tachyon Server (Master Stack). See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesSQLSERVER_RESPONSESSQLSERVER_RESPONSES.
SQL Server (TachyonMaster database)	TCP 1433	TDS	Incoming	• Tachyon Web Site application pools (**Consumer API**, **Portal**) communicating	Not configurable from Setup. See the comments above for the Tachyon Server (Master Stack). See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesSQLSERVER_MASTERSQLSERVER_MASTER.

Device	Port	Protocol	Direction	Usage	Configurable
				with SQL Server. • Tachyon **Coordinator service** communicating with SQL Server. • Tachyon Web Site application pools (**Core**) communicating with SQL Server.	
SQL Server (TachyonResponses database)	TCP 1433	TDS	Incoming	• Tachyon Web Site application pools (**Core** and **Core Internal**)	Not configurable from Setup. See the comments above for the Tachyon Server (Master Stack). See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesSQLSERVER_RESPONSESSQLSERVER_RESPONSES.

Device	Port	Protocol	Direction	Usage	Configurable
				communicating with SQL Server (mainly uncompressed responses).	

1.3.8.3 Whitelisting connections to 1E Cloud

The simplest method is to whitelist ***.1e.com**

The following sections briefly describe Tachyon features which connect to the 1E Cloud.

For guidance on whitelisting and configuring Internet Explorer proxy settings, please refer to Preparation.

1.3.8.3.1 1E license service URL

Ensure the following URL is whitelisted:

- https://license-v1.1e.com

This URL must be accessible from the Tachyon server during setup and running of Tachyon.

The Tachyon license must be validated on a regular basis via internet contact with the 1E license service. The regular validation period is set when the license is requested.

For whitelisting purposes, the Tachyon server (specifically the Coordinator Workflow module in the Master Stack) requires an Internet connection to the 1E license service, as defined in the license file itself. If activation fails, then the system will install but not be usable until activation is completed.

Upgrading

When upgrading, you are recommended to get a new license file and update your whitelist with the new URL. The old URL (https://license.1e.com) is suitable only for 8.0 and earlier. However, if you are upgrading and your license file has the old URL then you should also whitelist the old URL.

Tachyon setup will report a warning in the Tachyon Setup screen if it is unable to connect to the 1E license service. This is important only on the Tachyon Master Stack Server, not on other types of Tachyon server. You can test the connection using Tachyon setup or using Internet Explorer.

> **Tip**
>
> If you are whitelisting an IP address and your server has multiple network interfaces, then you can configure a persistent route using a similar process described in Configuring a persistent route for SQL traffic.

Your Tachyon server may not be able to connect to the 1E license service if your environment is using web proxy servers. Contact your 1E Account Team for advice in case you have this type of setup.

1.3.8.3.2 1E Catalog service URL

Ensure the following URL is whitelisted:

- https://catalog.1e.com

This URL must be accessible from the Tachyon Server during setup and running of 1E Catalog. This enables the Catalog Update service to connect to the 1E Cloud Catalog and download the latest catalog entries.

> **Note**
>
> 1E Catalog may need additional configuration to support proxy servers, but this depends on the configuration you have in your current environment. Please contact 1E Support if you need help doing this.

1.3.8.3.3 1E Analytics URL

Ensure the following URL are whitelisted for clients and Tachyon servers:

- https://analytics.1e.com
- https://data.analytics.1e.com
- https://content.analytics.1e.com
- https://_460897a4cf2c02443c6af6aed8761f7b.content.analytics.1e.com

Or simply ***.analytics.1e.com** or ***.1e.com**

User Interface telemetry reports how the user interface is used, and data is sent directly from administrator browsers to the 1E Cloud.

Telemetry features are configurable using Tachyon Setup during installation or upgrade, and can be enabled or disabled as a post-installation task. 1E encourages customers to enable sending telemetry.

For more information, please refer to Telemetry.

1.3.8.4 Network interfaces

The following conditions apply to network interfaces, which must be configured before installing Tachyon on a server. Each network interface must be assigned a static IP Address.

Switches	Each Switch supports up to 50,000 devices and requires its own network interface, with a minimum speed of 1Gbps. Switch interfaces can be on the same or different subnets. Each interface can have its own DNS Name or share the same DNS Name as explained in DNS Names below. If necessary, these interfaces can be shared with a Background Channel or other Tachyon services, which may share the same DNS Name or have their own names.
Response Stack with a Core component using a remote SQL Server instance and more than 500 devices	In addition to the Switch interfaces, another interface is required for outgoing response traffic from the Response Stack Core to its remote SQL Server. This should have a minimum speed of 1Gbps, or 10Gbps if the Response Stack has 3 or more Switches. This is required to ensure optimum performance when SQL Server is remote. Network routing on the Response Stack server must be configured so that SQL traffic is routed over this interface. The simplest method is to route all outgoing traffic. The interface used for SQL traffic should not register its IP Address in DNS to avoid unnecessary incoming traffic and accidentally becoming part of a round-robin DNS Name used for Switches.
DMZ Server	An additional internal facing interface is required for outgoing response traffic from Switches on the DMZ Server to the Core on the internal Tachyon Response Stack. This should have a minimum speed of 1Gbps. As stated above, each Switch must have it own external facing interface, used for incoming response traffic from clients to Switches. The external facing interface(s) can also be used for clients to the Background Channel. The simplest way to ensure the internal interface is used for outgoing traffic is for it to be on a different subnet to the external interface(s) with no routing between them - this is normal in a DMZ.

Administration traffic for a Tachyon Master Stack does not have any additional network requirements.

> **Tip**
>
> Tachyon Setup supports installation using IPv4. If you have a working IPv6 environment, then please contact 1E for advice on using that.

For the remote SQL Server requirement, please refer to Configuring a persistent route for SQL traffic. However, please ensure you also consult your server, firewall and networking teams.

1.3.8.4.1 Network impact

Most of the network traffic experienced by a Tachyon system is compressed responses from clients to Switches. Responses to Tachyon instructions are returned by online clients in a matter of a few seconds. Tachyon is designed for speed without impacting your network.

The Response Stack's Core then processes and stores uncompressed responses in the Tachyon Responses database. If the database is remote then this will create significant network traffic when saving responses, but normally this will be within a datacenter. Even so, a dedicated interface is recommended on each Response Stack for connection to a remote SQL Server in order to prevent network contention between incoming and outgoing response traffic.

Other network traffic generated by Tachyon is low by comparison. Explorer is a single page application which uses paging to view responses.

Tachyon clients also download content from a Background Channel, which is a website hosted on the same server as Switches. They deliberately stagger the delay of their download for up to 5 minutes (configurable). By using Nomad, you can avoid the staggered delay on Windows PCs without impacting your network. For further information about Nomad please refer to Downloading client content and Nomad integration below.

1.3.8.4.2 WAN caching

Communications between Tachyon platform clients and Switches should not be cached or delayed, which can be prevented by excluding the Switch port(s) or the IP Addresses of Switch interfaces on caching devices.

Communications between clients and the Background Channel can be cached, however, please refer to Downloading client content and Nomad integration as an alternative to WAN caching.

1.3.8.4.3 Isolated Networks

Tachyon can operate in a multi-domain, multi-forest environment with client devices on internal and external networks, supporting internal and external Certificate Authorities.

Each client device must have a network connection to a Switch and Background Channel, with the necessary network firewall ports open. If clients are unable to connect to the Tachyon server on the corporate network, then it is necessary to install additional Tachyon servers.

1.3.8.5 DNS Names

Each server that has Tachyon platform components installed requires its own DNS Name. A DNS Name can be a DNS alias, CNAME or Host (A) record.

Master Stack	The Master Stack is used by the following, therefore it helps users if it has a recognizable and convenient DNS Name such as **tachyon** - this is specified during installation of the Tachyon server using Tachyon Setup. • Tachyon users, approvers and administrators connecting to the Tachyon Portal and Consumer API • Remote tools and Consumer applications connecting to the Consumer API • Remote Response Stacks and DMZ Server connecting to the Coordinator service. Platform services also reside on the Master Stack, which non-Tachyon clients connect to, for example: • Application Migration, used by Windows Self-Service task sequences • AppClarity, used by AppClarity Software Reclaimer.
DMZ Server	The DMZ Server is a type of Response Stack used to provide Tachyon Real-time and Inventory services to Internet-based clients. It requires an external DNS Name - for example **tachyonext** - this is specified during installation of the DMZ Server using Tachyon Setup. The DNS Name is shared between the Switch network interfaces and Background Channel on the DMZ Server, and specified during installation of Tachyon platform clients, and stored in their configuration file.
Response Stack	A Response Stack is used to provide Tachyon Real-time and Inventory services to clients on the internal (corporate) network. The choice of DNS Name is discussed in the table below. The DNS Name is shared between the Switch network interfaces and Background Channel on the Response Stack, and specified during installation of Tachyon platform clients, and stored in their configuration file.

The number of DNS Names used by a system depend on the location of Tachyon and other Platform services. The table below describes options.

Single DNS Name	A Tachyon system can have a single DNS Name if all components are installed on the same server, for example **tachyon** - this is specified during installation of the Tachyon server using Tachyon Setup. If the server has multiple Switches, and therefore multiple network interfaces, then the same DNS Name can be shared by all Switches, the Background Channel and Master Stack.

Multiple client-facing DNS Names

The following client-facing components can each have their own DNS Name:

- Tachyon Switch and Background Channel on Response Stack servers, including DMZ Server
- Tachyon platform services on the Master Stack, used by clients of Application Migration and/or AppClarity software reclaim
- Tachyon Portal, and Consumer API, on the Master Stack, used by administrators.

Note

Master and Response Stacks must have different DNS Names if they exist on different servers:

- The Master Stack has its own DNS Name, for example, **tachyon**
- Each Response Stack can have its own client-facing DNS Name, or they can share a common client-facing DNS Name, for example **tachyonrs**.

When a Response Stack is installed on the same server as Master Stack, it will normally share the same DNS Name as Master Stack as described under #UUIDba4ce843708df87c3577ca1f7920f3d8_id_PreparationSingleDNSName. However, if you have multiple Response Stacks and want them to share the *same* DNS Name, then the Master Stack must use a *different* DNS Name. This approach of all Response Stacks sharing the same DNS Name simplifies adding further Response Stacks at a later date.

During installation - using Tachyon Setup - you need to consider the following:

HTTP binding	Required for installation, but can be manually removed later - please refer to Tachyon Server post-installation tasks. This binding is not used by Tachyon platform clients or administrators, but can optionally be used for Application Migration and/or AppClarity reclaim clients. Example name **acme-tcn01**.
HTTPS binding	Required. This is the main binding. On a Master Stack server (that has no Response Stack components) it is used by administrators to connect to the Tachyon Portal. It can optionally be used for Application Migration and/or AppClarity reclaim clients. Example name **tachyon** .

On a Response Stack server, it is used by clients to connect to Switches and/or Background Channel. Example name **tachyon** or **tachyonrs**. See panel above about making the right choice.

On a DMZ Server, it is used by Internet-based clients to connect to Switches and/or Background Channel. Example name **tachyonext**. See below.

Alternate HTTPS binding

Required, except in the simplest (single server) configurations, described above.

It is typically used by other Tachyon platform servers to connect to each other, but there are other scenarios.

- Required on a Response Stack server if it will have a DMZ Server connected to it. Example name **tachyonalt**.
- Required on a DMZ Server - used by internal servers to connect to the DMZ Server - see below. Example name **tachyondmz**. See below.
- Required on a Master Stack if you have local and remote Response Stack(s) - used for inter-server communications. Example name **tachyonalt**.
- Required on a Master Stack if the main HTTPS binding is used by client-facing components, and you want a different name for the Portal. Used by administrators to connect to the Tachyon Portal. Example name **tachyon**.
- Required on a Master Stack if you need a different **HTTPS port** for Application Migration and/or AppClarity reclaim clients. This can be by choice, or if you have upgraded from an original SLA Platform installation that used different ports.

Manual bindings

You can manually add further HTTP and HTTPS bindings after installation, to help differentiate the services which client devices and administrators connect to.

If you are upgrading ActiveEfficiency to Tachyon platform then you might have had a HTTPS binding described as **aeserver** in previous documentation.

If Master and Response Stacks are on the same server and you want them to have different DNS Names, then use the main binding for client connections to the Response Stack (because it is client-facing) and use the Alternate binding for other connections to the Master Stack. A simpler option is to put the Response Stack on its own server. Remote Response Stacks are recommended if the Master Stack is also hosting services AppClarity Software Reclaimer or Application Migration.

If you want to configure Switches on the same server to use multiple DNS Names, you will need to seek guidance from 1E. In most cases this is not required or recommended.

Internal DNS Names

A DMZ Server is a special example of a Response Stack. The DMZ Server itself requires two DNS Names:

- A client (external) facing DNS Name - for example **tachyonext** - which is shared between the Switch network interfaces and Background Channel on the DMZ Server - this is specified during Tachyon Setup as the main HTTPS binding
- An internal facing DNS Name for the internal network - for example **tachyondmz** - this is specified during Tachyon Setup as the alternate main HTTPS binding.

Note

Both DNS Names must be included in the web server certificate. You can manually replace the external/client facing certificate after installation, to comply with best practice not to expose internal names in an external facing certificate.

The internal Response Stack also requires an additional DNS Name - for example **tachyonalt** - for internal communications with the DMZ Server.

Please refer to Implementing a Tachyon DMZ Server for more detail about DMZ Servers.

Note

Note

Tachyon Setup supports installation of one HTTP and up to two HTTPS bindings, but you can manually add more bindings after installation.

Tachyon Setup currently supports only one Web server certificate, which must contain all the DNS Names used by the HTTPS bindings on that server. Each DNS Name must be

included as a DNS Name in the **Subject Alternate Name (SAN)** entry of the web server certificate.

You can manually add more certificates, and change bindings. Please refer to Certificate requirements . Please note that Tachyon Setup helps maintain the main and alternate HTTPS bindings using one certificate.

1.3.8.6 Service Principal Names

Tachyon platform and applications use underlying IIS and SQL Server technology, and only require HTTP or MSSQLSvc class SPNs if your company security policy has configured IIS or SQL Server to use Kerberos authentication.

If your IIS server is using Kerberos, then each DNS Name used to access a Tachyon Web Server requires an HTTP class **Service Principal Name (SPN)** to be registered against the relevant service account in Directory, which is **computer$** by default. This allows Tachyon web applications to authenticate clients using Windows Authentication where Kerberos is an authentication provider (primary, fallback or negotiated).

Note

If your IIS server is using Kerberos then HTTP SPNs are required for web applications that use Windows Authentication, and are created using:

- The web application pool's service account, which is Network Service for all Tachyon application pools, and therefore is the computer$ account
- Each (A) Host record used to access the web application. If the server is accessed using a CNAME record, then you need to register an SPN for each (A) Host record used by the CNAME. A CNAME will have multiple (A) Host records when using round-robin or NLB to access the web server.

SPNs are not required for DNS Names used to connect to Switches or Background Channel, because they do not use Windows Authentication. However, bear in mind the same DNS Name might be used to access other web applications.

1.3.8.7 Downloading client content and Nomad integration

1E Client downloads content from the Tachyon Background Channel. Content is mainly scripts and other files required by instructions. It also includes client resources such as extensible modules, providers, and other dependencies to maintain the 1E Client. In most cases, client resources are version controlled to prevent repeated downloads. Tachyon instructions always request a download even if they have run an instruction before, unless the content for that instruction has been cached in memory.

You may need to consider the impact on the network if there is a large amount of content included in an instruction. This is more of an operational consideration instead of a design consideration.

Nomad is an optionally licensed component of the 1E Client. It makes software deployment, patching and downloading content more efficient and reduces the impact on the network. It removes the need for remote Distribution Point servers in Microsoft System Center Configuration Manager systems. When Nomad is installed on computers, it automatically elects a peer to download content from a server over the WAN and

then peer-shares the content with other PCs at the same location. The downloaded content is cached locally on each PC in case it is needed again.

Tachyon can optionally use Nomad to download content from servers irrespective of whether Nomad is integrated with Configuration Manager or not, and also uses advanced Nomad features.

1.3.8.7.1 Tachyon client integration with Nomad disabled

If Nomad integration is not used, the following apply:

- Tachyon platform client waits a randomized stagger period defined by its DefaultStaggerRangeSeconds setting, and then downloads content from the specified **Background Channel**.
- Tachyon platform client retains modules and extensibles that it has downloaded, but does not retain instruction scripts after they have been run. Any instruction that requires a script or other file will download the latest version each time the instruction is run.

1.3.8.7.2 1E Client integration with Content Distributionenabled

Content Distribution integration is available on Windows PC devices and is enabled by default, but can be disabled during installation of the 1E Client.

With the Content Distribution integration feature enabled, 1E Client will detect if a supported version of Content Distribution is running on the device.

- 1E Client immediately requests Content Distribution to download content from the specified HTTP source, such as the **Background Channel**. Content Distribution behaves in the same way as it does with Configuration Manager by ensuring the latest version of content is obtained and electing a master to perform the actual download.
- Content Distribution maintains its own cache of downloaded content which avoids the need for repeat downloads over the WAN, and provides content to peers that require the same resources which avoids peer devices having to download over the WAN.
- If the Content Distribution integration feature is enabled, and requested content is not provided within the timeout period, the 1E Client will fall back to downloading directly from the HTTP source. The most likely reason for a timeout is if Content Distribution is busy downloading other content.

To use Content Distribution, there is no special configuration of Tachyon Servers unless you want to use server-based features provided by the Content Distribution and Content Distribution, which requires the reverse proxy feature to be configured on Background Channels.

The Background Channel is a web application on the Tachyon Server which uses HTTPS and default port is 443. The URL for the Background Channel is defined in the 1E Client configuration file and is specified during installation of the 1E Client if Tachyon features are enabled. The 1E Client passes this URL to Content Distribution when it requests content to be downloaded. Instructions can also specify other HTTP sources.

Content Distribution does not need to be configured to use certificates in order to communicate with the Background Channel (the Content Distribution CertIssuer and CertSubject settings are used only with Configuration Manager Distribution Points that are configured to validate device certificates).

The **Nomad Single-Site Download (SSD)** feature, which uses **Content Distribution**, further reduces the impact of downloading content over the WAN.

1.3.9 1E Client requirements

You will need to plan the deployment of 1E Client using whichever software deployment tools you have.

The 1E Client Deployment Assistant provides a wizard that simplifies deployment of 1E Client for Windows. It also integrates with Configuration Manager to create deployments, for more details refer to Introducing 1E Client Deployment Assistant.

1.3.9.1 Deployment

You must decide how you will configure the 1E Client and deploy to devices.

> **Note**
>
> For more information about configuring the 1E Client properties during and after installation, please refer to 1E Client configuration settings and installer properties.

For details of interactive and command-line installation, please refer to Deploying 1E Client.

Tachyon, Nomad, and Shopping require client certificates. For more detail, please refer to Certificate requirements.

1.3.9.2 Installation accounts

1.3.9.2.1 1E Client Windows installation account

The 1E Client installer installs a service as local system, therefore the installation account for Windows clients must be capable of being elevated in order to run the installer. The simplest way of achieving this is for the account to have full local administrator rights (as a member of the localgroup administrators, either directly or indirectly).

1.3.9.2.2 1E Client non-Windows installation account

To install the 1E Client on a non-Windows client the installation account must have privileges to run the **sudo** command.

1.3.9.3 Supported device platforms

Below are lists of supported OS Platforms. Please also refer to Constraints of Legacy OS, which applies to server and client OS.

1.3.9.3.1 Windows client

Category	Product	Notes
Operating System	• Windows Server 2022 • Windows Server 2019	The zip for 1E Client for Windows is available for download from the support.1e.com/. Professional and Enterprise editions are supported for Windows 10 and Windows 11.

Category	Product	Notes
	• Windows Server 2016 • Windows 11 CB 22H2 • Windows 11 CB 21H2 • Windows 10 CB 22H2 • Windows 10 CB 21H2	All versions are provided with 32-bit & 64-installers, and can be installed on physical and virtual computers. **Note** This list shows only those OS versions in mainstream support by Microsoft, and therefore supported by Tachyon, and by 1E Client 8.1. Please refer to Constraints of Legacy OS regarding the end of mainstream support. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Refer to Support for Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions. For installation guidance on Windows, please refer to Deploying 1E Client on Windows. The following 1E Client features and modules are supported on Windows OS: • Real-time features (for example instructions, experience, interaction) • Nomad client • PXE Everywhere Agent client • Shopping client • Windows Servicing Assistant (WSA) client (workstation OS only, not server OS) • WakeUp client
Runtime libraries	• .NET Framework 4.8	.NET Framework is required only for the following features of 1E Client:

Category	Product	Notes
	• Visual C++ 2015-2019 Redistributable	• The Real-Time Control Center feature of the 1E Client (also known as 1E Client UI and Interaction module) supports Experience Engagements (Announcements and Surveys), and ITSM Support Tickets • Windows Servicing Assistant (WSA) is a feature of the Shopping/WSA client module, which supports OS deployment, upgrades and migrations. **Note** This list shows only those .NET Framework versions in mainstream support by Microsoft, and therefore supported by 1E, and by 1E Client 8.1. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. 1E Client installer includes the Visual C++ 2015-2019 Redistributable package.
Other Windows Software	• Nomad 8.0 (or later) • PowerShell 3.0 (or later)	1E Client provides real-time client features. It also includes the Nomad client module. Real-time client features can optionally use Nomad to download content (feature enabled by default) if the Nomad client module in 1E Client is enabled (module disabled by default) or Nomad 7.0 or later is running. For more details please refer to Nomad client requirements. PowerShell is not a prerequisite for installation of the 1E Client. PowerShell is used by some Tachyon instructions (that have PowerShell commands embedded or scripts that are downloaded) and some of these require PowerShell 3.0 or later.

Category	Product	Notes
Microsoft Endpoint Configuration Manager Client	• MECM CB 2211 • MECM CB 2207 • MECM CB 2203 • MECM CB 2111 • MECM CB 2107	The following client features work with these versions of Configuration Manager on Windows computers: • Real-time client - instructions used by Tachyon Configuration Manager Console extensions • Nomad client • PXE Everywhere Agent • Shopping/WSA client • WakeUp client - including Policy Refresh and REFRESHONSUBNETCHANGE features Configuration Manager is not a prerequisite for installation of the 1E Client, and except for above features, the 1E Client, its features and modules, have no dependency on Configuration Manager. Tachyon, Nomad, WakeUp, and Application Migration have Configuration Manager Console extensions which are available separately. **Note** This list shows only those Configuration Manager versions in mainstream support by Microsoft, and therefore supported by 1E, and by 1E Client 8.1. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Please refer to the Support for the Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions. (Microsoft Endpoint Configuration Manager - MECM - is also known as Configuration Manager,

Category	Product	Notes
		ConfigMgr, Config Man, CM, and SCCM among other names. Version names include 2012 and Current Branch or CB.)

1.3.9.3.2 macOS clients

Category	Product	Notes

Operating System	• macOS Monterey 12.0
	• macOS Big Sur 11.6
	• macOS Big Sur 11.0
	• macOS Catalina 10.15
	• macOS Mojave 10.14
		Other versions of these non-Windows OS should work but have not been tested by 1E.
		
		1E Client package for macOS is included in the non-Windows zip available for download from the support.1e.com/.
		
		Note
		1E Client for macOS is written for Intel and supported on Apple devices using Intel processors. It is also supported on Apple devices using the M1 chip, provided you have installed Rosetta 2, which is included with Big Sur. 1E Client is a daemon (not an app), therefore, during installation or running it will *not* prompt for Rosetta 2, which does not get installed on-demand.
		You only need to install Rosetta 2 once, using one of the following commands, but repeating the command will safely reinstall it. The second version of the command requires root permission. Attempting to install on an Intel device will issue a harmless "unrecognized option" usage message.
		`/usr/sbin/softwareupdate --install-rosetta`
		`/usr/sbin/softwareupdate --install-rosetta --agree-to-license`
		
		For installation guidance, please refer to Deploying 1E Client on macOS.

Other Software	• Bash • Perl • Rosetta 2 (on non-Intel)	Bash and perl are required for installation of 1E Client on all non-Windows OS. Tachyon instructions support the use of Bash scripts on all supported non-Windows OS.

Category	Product	Notes
		To see if an Instruction requires a Bash script, look in its Instruction Definition XML file for Bash script resources defined under the <Resources> tag. Bash is the preferred choice when developing custom instructions for non-Windows OS. There are slight differences between OS implementations of Bash, particularly on the Mac. Therefore, 1E recommends testing custom Bash scripts on each supported OS. Rosetta 2 must be installed before installing 1E Client for macOS on an Apple device using a non-Intel processor such as M1 chip. Please see note above about installing Rosetta 2.

1.3.9.3.3 Linux clients

Category	Product	Notes
Operating System	• CentOS Stream 8 • Debian 10.4 • Fedora 34 • openSUSE Leap 15.2 • Red Hat Enterprise Linux 7.9 • Red Hat Enterprise Linux 8.5 • SUSE Linux Enterprise 15.2 • Ubuntu 18.04	Other versions of these non-Windows OS should work but have not been tested by 1E. • 1E Client packages for other Linux distributions can be requested, including Raspberry Pi. • 1E Client for Linux supports Linux variations on Intel 64-bit platforms. • 1E Client packages for Linux are included in the non-Windows zip available for download from support.1e.com/. • 1E Client supports features on non-Windows devices. For installation guidance on the following OS, please refer to Deploying 1E Client on Linux.
Other Software	• Bash • Perl	Bash and perl are required for installation of 1E Client on all non-Windows OS.

Category	Product	Notes
		Tachyon instructions support the use of Bash scripts on all supported non-Windows OS. To see if an Instruction requires a Bash script, look in its Instruction Definition XML file for Bash script resources defined under the <Resources> tag. Bash is the preferred choice when developing custom instructions for non-Windows OS. There are slight differences between OS implementations of Bash, particularly on the Mac. Therefore, 1E recommends testing custom Bash scripts on each supported OS.

1.3.9.3.4 Solaris clients

Category	Product	Notes
Operating System	• Withdrawn	**Note** 1E Client is no longer available for Solaris, but 1E may reintroduce it, if there is sufficient demand.

1.3.9.4 Tachyon scripting requirements

You must ensure the appropriate scripting environment is present on client devices. SCALE supports running native **PowerShell** on Windows and **bash** on non-Windows devices, which can be script files downloaded when an instruction runs, or command text.

- Windows Tachyon clients can use **PowerShell** scripts. Ensure your client devices have an appropriate version of PowerShell installed to support any custom scripts you may develop. PowerShell on Windows OS.
- Non-Windows clients use **bash** as their scripting medium. This should be present on all non-Windows 1E Client devices. See Bash on non-Windows OS.

1.3.9.4.1 PowerShell on Windows OS

PowerShell is used by some Tachyon instructions (that have PowerShell commands embedded or scripts that are downloaded) and some of these require PowerShell 3.0 or later, although some scripts will support PowerShell 2.0. PowerShell scripts are supported only on Windows OS.

If installing or upgrading PowerShell, it is best to install the latest version available. However, do not expect full forward or backward compatibility between PowerShell versions.

Tip

To determine the version of PowerShell on a computer, start PowerShell (command prompt or ISE) and enter one of the following commands: **$PSVersionTable.PSVersion** or **$PSVersionTable** for more detail.

The table below shows which versions of PowerShell are supported on each OS version and Service Pack, and if it is built-in or needs to be installed.

OS Version	PowerShell Version	Notes					
Windows Server 2022						RTM (Notes 12, 13)	Note 4
Windows 11						RTM (built-in)	
Windows Server 2016, 2019, 2022					RTM (Note 9)	RTM (Notes 12, 13)	Note 4
Windows 10					RTM (built-in)	Anniversary Update (built-in)	
Windows Server 2012 R2 *				RTM (built-in)	RTM (Note 9)	RTM (Note 12)	Note 4
Windows 8.1 *				RTM (built-in)	RTM (Note 9)	RTM (Note 12)	
Windows Server 2012 *			RTM (built-in)	RTM (Note 7)	RTM (Note 9)	RTM (Note 12)	Note 4
Windows 8 *			RTM (built-in)				
Windows Server 2008 R2 *		RTM (built-in)	SP1 (Note 6)	SP1 (Note 7)	SP1 (Note 8)	SP1 (Note 10)	Note 4

OS Version	PowerShell Version	Notes					
Windows 7		RTM (built-in)	SP1 (Note 6)	SP1 (Note 7)	SP1 (Note 8)	SP1 (Note 10)	
Windows Server 2008 *	RTM (built-in)		SP1 & SP2 (Note 2)				
Windows Server 2003 *	RTM & SP1	R2 & SP2					Notes 1, 2
Windows Vista *	RTM	SP1 & SP2					Notes 1, 2
Windows XP *	RTM, SP1 & SP2	SP3					Notes 1, 2

* These OS are regarded as legacy OS:

1. PowerShell is not built-in for these OS. These OS do not support 3.0 or later. See Constraints of Legacy OS
2. If PowerShell 1.0 is installed it must be removed in order to install a later version.
3. Support for PowerShell 2.0 is included in PowerShell 3.0 and later.
4. PowerShell is not installed by default on these OS but is an optional feature that should be enabled using Server Manager.
5. PowerShell 2.0 is part of WMF Core package (KB968930) with prerequisite of .NET Framework 3.51 (which includes .NET 2.0 SP1).
6. PowerShell 3.0 is part of WMF 3.0 with prerequisite of .NET Framework 4.0 or later. Refer https://www.microsoft.com/en-us/download/details.aspx?id=34595
7. PowerShell 4.0 is part of WMF 4.0 with prerequisite of .NET Framework 4.5 or later. Refer https://www.microsoft.com/en-us/download/details.aspx?id=40855
8. PowerShell 5.0 is part of WMF 5.0 with prerequisites of .NET Framework 4.5 or later and WMF 4.0. Refer https://www.microsoft.com/en-us/download/details.aspx?id=50395
9. PowerShell 5.0 is part of WMF 5.0 without any other prerequisites. Refer https://www.microsoft.com/en-us/download/details.aspx?id=50395
10. PowerShell 5.1 is part of WMF 5.1 with prerequisites of .NET Framework 4.6 or later, WMF 4.0 and SHA-2 Code Signing. Refer https://msdn.microsoft.com/en-us/powershell/wmf/5.1/install-configure

11. PowerShell 5.1 is part of WMF 5.1 with prerequisites of .NET Framework 4.6 or later and WMF 4.0. Refer https://msdn.microsoft.com/en-us/powershell/wmf/5.1/install-configure

12. PowerShell 5.1 is part of WMF 5.1 with prerequisite of .NET Framework 4.6 or later. Refer https://msdn.microsoft.com/en-us/powershell/wmf/5.1/install-configure

13. In these Server OS, PowerShell 5.1 is referred to as the Desktop Experience. You can use the PowerShell Core version if you prefer.

Please refer tohttps://support.microsoft.com/en-gb/help/17455/lifecycle-faq-net-framework for details of Microsoft support for .NET Framework.

- Support for 4, 4.5, and 4.5.1 ended on January 12, 2016
- Support for 4.5.2, 4.6 and 4.6.1 ended on April 26, 2022

1.3.9.4.2 Bash on non-Windows OS

Bash and perl are required for installation of all non-Windows 1E Client.

Tachyon instructions support the use of Bash scripts on all supported non-Windows OS.

To see if an Instruction requires a Bash script, look in its Instruction Definition XML file for the Scripting.Run method. Bash is the preferred choice when developing custom Instructions for non-Windows OS.

There are slight differences between OS implementations of Bash, particularly on the Mac. Therefore, 1E recommends testing custom Bash scripts on each supported OS.

1.4 Installing Tachyon

How to set up Tachyon servers.

Once you have reviewed relevant requirements, you will know how many Tachyon servers you will need, and where they will be installed. After Preparation of each server, you will use this documentation section to help you install each server.

1.4.1 Preparation

What you will need to prepare in advance of implementing a Tachyon server in your network. Typically, these are tasks that may take some time to organize, depending on how your organization works.

1.4.1.1 Implementation Overview

Please review all tasks to decide how you wish to proceed, and record all configuration details.

Implementation of Tachyon can be extremely quick if all necessary preparations have taken place, and is typically performed in this order:

1. Obtain the Tachyon License file - ensure it includes entries for the consumer applications you have purchased.

2. Provision the Tachyon Web and SQL server hardware refer to Server Provisioning.

- Install the Windows Server OS
- Configure Network interfaces
- Create the server's DNS Names (see note) and Service Principal Names
- Obtain and install the server's Web Server Certificate, for which you will need to know the server's DNS Name
- Install IIS roles, role services and features, refer to Windows Server roles and features.

3. Optionally pre-create the Tachyon databases, refer to Tachyon databases (you can allow the Tachyon server installer to create the databases using default settings).
4. Prepare the Mail Server.
5. Identify and create AD Accounts and Groups, refer to Active Directory.
6. Review each of the requirements pages under Planning for Tachyon.
7. Run Tachyon Setup.
8. Manually install clients on a few test devices, refer to Deploying 1E Client.
9. Use the Tachyon Verification Product Pack to verify the installation, refer to Verifying.
10. To install other Instruction Definitions refer to Instruction sets page - from the Tachyon Platform zip, and from https://exchange.1e.com/
11. Add the Instruction Definitions to Instruction Sets to determine their permissions, refer to the Instruction sets page.
12. Install Tachyon Consumers (documentation not provided here).
13. Package the Tachyon client as required by your software deployment tool (see note).
14. Deploy the client to more pilot devices.
15. Pilot testing.
16. Start rollout of clients.
17. Use the SDK to begin developing your own instructions and testing your use cases.

Note

If your organization requires the client to be packaged, then you can do this once you know the **DNS Name(s)**. Then you can prepare for deploying the client in parallel to preparing and installing the server.

1.4.1.2 Details required when using Tachyon Setup to install a Tachyon server

The table below lists details required on each of the Tachyon Setup screens. You can review screens in the Tachyon Setup page. Items marked * can wait until after installation.

Tachyon Setup	Documentation Reference	All components installed on a single server	Master Stack	Response Stack	DMZ Server
Configuration		Decide which applications you want to install from the following list: • Experience • Nomad • Business Intelligence (required for Patch Success) • AppClarity • Application Migration. Other requirements:

- Server Installation Account, refer to Installation Accounts
- Server sizing for on-premises, refer to On-premises installation
- Server sizing for AWS and Azure, refer to On-premises installation

Post-installation requirements:

- Tachyon user permissions
- Product integration requirements
- Verifying
- Client devices preparation, refer to License file.

1.4.1.3 License file

You will need to obtain a valid license file from 1E. For more details, please refer to License requirements.

1.4.1.3.1 Whitelisting for license activation and validation

Ensure the following URL is whitelisted:

- https://license-v1.1e.com

This URL must be accessible from the Tachyon Server during the setup and running of Tachyon.

The Tachyon license must be validated on a regular basis via internet contact with the 1E license service. The regular validation period is set when the license is requested.

For whitelisting purposes, the Tachyon Server (specifically the Coordinator Workflow module in Master Stack) requires an Internet connection to the 1E license service, as defined in the license file itself. If activation fails, then the system will install but not be usable until the activation is completed.

Upgrading

When upgrading, you are recommended to get a new license file and update your whitelist with the new URL. The old URL (https://license.1e.com) is suitable only for 8.0 and earlier. However, if you are upgrading and your license file has the old URL then you should also whitelist the old URL.

Note

Other URL must also be whitelisted, please refer to Whitelisting connections to 1E Cloud.

1.4.1.3.2 Code Signing Certificates

You will need your own code signing certificate, and have it registered in your Tachyon license, if you want to develop your own custom Tachyon instructions, or modify those of other authors. Instructions that are provided in the Tachyon Platform or downloaded from the 1E Exchange have already been code signed using the Platform and Exchange certificates from 1E. Your license controls whether you can use these instructions.

Ideally, all of your instruction developers should share a single **code signing certificate** between them. Each code signing certificate must be registered in your license and associated with your organization's **instruction name prefix**. When you have chosen your prefix and have your code signing certificate(s) you then need to send details of these to 1E, who will update your license. This will then automatically activate on your Tachyon Server (assuming it has connection to the Internet).

1.4.1.4 Server Provisioning

An IIS Web Server should be provisioned. SQL Server can be installed on the same server or the databases can be hosted on remote SQL Server instance(s). Please refer to /document/preview/791302#UUID-aa1c2691-97ed-e134-ac7d-62b2ea04fe4a regarding hardware and software specifications for on-premises and cloud servers.

In addition, the Tachyon Server requires the following, which requires more thought and preparation:

- Network interfaces
- DNS Names and their Service Principal Names
- Web Server Certificate
- Install and configure IIS, refer to Windows Server roles and features
- Services and NTFS Security.

1.4.1.4.1 Network interfaces

For the remote SQL Server requirement, please refer to Configuring a persistent route for SQL traffic. However, please ensure you also consult your server, firewall, and networking teams.

Cloud implementations have special configuration requirements for SQL Server and network interfaces described in Server sizing requirements.

1.4.1.4.1.1 Configuring a persistent route for SQL traffic

The following example steps can be used to configure IPv4 network routing so that a specific network interface is used for all traffic going to the specified SQL Server. The example is for a Response Stack and SQL Server on different subnets, but also works if both servers are on the same subnet.

> **Note**
>
> If you add a new interface for SQL traffic after installing Tachyon, then ensure the interface is not registered in DNS using the same DNS Name that devices use to connect to Switches or Background Channel. If you intend to use the new interface to support inbound HTTP traffic from remote Response Stacks then you will also need to configure the Tachyon website to include the IP Address of the new interface as described in Server installation issues.
>
> In our example below we would add **10.0.10.31**. Installation and upgrades will automatically configure IP Address and Domain restrictions.

1. On the Tachyon Server (single-server or Response Stack) open a **PowerShell command prompt**
2. The following command should resolve the name and IP Address of the SQL Server, and show the existing network route. In our example the **10.0.20.20**.

   ```
   pathping ACME-SQL02
   ```

3. If not already installed on the server, add a new interface. Configure its properties as follows:
   - Disable IPv6
   - Configure IPv4 properties and assign a static IP Address and subnet mask. In our example, these are **10.0.10.31** and **255.255.255.0**.
   - You do not need to configure a default gateway. You can if required, but you will receive a warning later about multiple default gateways and redundancy. However, you do need to know the default gateway for the route to the SQL Server, in our example, this is **10.0.10.1**.
   - Click Advanced... and click on the DNS tab. Uncheck **Register this connection's addresses in DNS** so that the interface IP Address is NOT registered in DNS.
   - Click OK twice to save, and then Close
   - You can give the interface a name to help distinguish it from Switch interfaces. In our example, this is **Interface used for SQL**

Warning

This interface must not be registered in DNS if the DNS Name of the server is a CNAME Alias for (A) Host records registered by Switch interfaces because clients need to use the DNS Name to connect to Switches. If you need this interface to be registered in DNS, then do this with a (A) Host record.

4. Enter the following PowerShell command, which provides all the details you need to confirm interfaces have been configured correctly.

```
Get-NetIPConfiguration
```

5. This provides output similar to the following and tells us the interface index for the new interface. In our example, this is **7**.

```
InterfaceAlias       : Interface used for SQL
InterfaceIndex       : 7
InterfaceDescription : Microsoft Hyper-V Network Adapter #4
NetProfile.Name      : ACME.local
IPv4Address          : 10.0.10.31
IPv4DefaultGateway   : 10.0.10.1
DNSServer            : 10.0.1.2
                       10.0.1.3

InterfaceAlias       : Interface used for Switch 1
InterfaceIndex       : 5
InterfaceDescription : Microsoft Hyper-V Network Adapter #3
NetProfile.Name      : ACME.local
IPv4Address          : 10.0.10.32
IPv4DefaultGateway   : 10.0.10.1
DNSServer            : 10.0.1.2
                       10.0.1.3
```

6. Use the **route** command to add a persistent route. The mask must be **255.255.255.255** and NOT the same as the interface mask configured earlier because the persistent route to the SQL Server is for its IP Address and not its subnet.

```
route -p add <SQL Server IP Address> mask 255.255.255.255 <Interface used for SQL IPv4DefaultGateway> metric 1 if <Interface used for SQL Interface Index>
```

In our example:

```
route -p add 10.0.20.20 mask 255.255.255.255 10.0.10.1 metric 1 if 7
```

Note

For networks with no routing, such as a lab, the default gateway is 0.0.0.0. Therefore, <**Interface used for SQL IPv4DefaultGateway**> must be specified as **0.0.0.0**. In our example:

```
route -p add 10.0.20.20 mask 255.255.255.255 0.0.0.0 metric 1 if 7
```

If your lab has no routing then you should ensure other means for your Tachyon Server to connect to the 1E license service via the Internet.

7. Enter the following command to confirm that the **<SQL Server IP Address>** has a persistent route with the details specified. In our example, this is **10.0.20.20**.

   ```
   route print
   ```

8. Enter the following command to verify the route works and uses the correct interface.

   ```
   pathping ACME-SQL02
   ```

   The first line (hop 0) must show the name of the Tachyon Server and the IP Address of the interface. This IP Address will then be selected as **used for SQL** in the Switch configuration screen of Tachyon Setup. In our example this would be:

   ```
   0  ACME-TCN01.ACME.local [10.0.10.31]
   ```

1.4.1.4.2 Computername

The computername of a Tachyon Server must comply with Microsoft NetBIOS naming standards, which includes having a length of 15 characters or less.

Microsoft's guidance can be found here: https://docs.microsoft.com/en-us/windows/desktop/SysInfo/computer-names.

1.4.1.4.3 DNS Names

Each server that has Tachyon platform components installed requires its own DNS Name. A DNS Name can be a DNS alias, CNAME or Host (A) record.

Master Stack

The Master Stack is used by the following, therefore it helps users if it has a recognizable and convenient DNS Name such as **Tachyon** - this is specified during installation of the Tachyon Server using Tachyon Setup.

- Tachyon users, approvers and administrators connecting to the Tachyon portal and Consumer API
- Remote tools and Consumer applications connecting to the Consumer API
- Remote Response Stacks and DMZ Server connecting to the Coordinator service

Platform services also reside on Master Stack, which non-Tachyon platform clients connect to, for example:

- Application Migration, used by Windows Self-Service task sequences
- AppClarity, used by AppClarity Software Reclaimer.

DMZ Server	The DMZ Server is a type of Response Stack used to provide Tachyon Real-time and Inventory services to Internet-based clients. It requires an external DNS Name - for example, **tachyonext** - this is specified during installation of the DMZ Server using Tachyon Setup. The DNS Name is shared between the Switch network interfaces and Background Channel on the DMZ Server, and specified during installation of Tachyon clients, and stored in their configuration file.
Response Stack	A Response Stack is used to provide Tachyon Real-time and Inventory services to clients on the internal (corporate) network. The choice of DNS Name is discussed in the table below. The DNS Name is shared between the Switch network interfaces and Background Channel on the Response Stack, specified during installation of Tachyon platform clients, and stored in their configuration file.

The number of DNS Names used by a system depends on the location of Tachyon and other Platform services. The table below describes the options.

Single DNS Name	A Tachyon system can have a single DNS Name if all components are installed on the same server, for example, **tachyon** - this is specified during installation of the Tachyon Server using Tachyon Setup. If the server has multiple Switches, and therefore multiple network interfaces, then the same DNS Name can be shared by all Switches, the Background Channel, and Master Stack.
Multiple client-facing DNS Names	The following client-facing components can each have their own DNS Name: • Tachyon Switch and Background Channel on Response Stack servers, including DMZ Server • Tachyon platform services on Master Stack, used by clients of Application Migration and/or AppClarity software reclaim • Tachyon, and Consumer API, on the Master Stack, are used by administrators. **Note** Master and Response Stacks must have different DNS Names if they exist on different servers: • The Master Stack has its own DNS Name, for example, **tachyon** • Each Response Stack can have its own client-facing DNS Name, or they can share a common client-facing DNS Name, for example **tachyonrs**.

When a Response Stack is installed on the same server as Master Stack, it will normally share the same DNS Name as Master Stack as described under #UUIDba4ce843708df87c3577ca1f7920f3d8_id_PreparationSingleDNSName. However, if you have multiple Response Stacks and want them to share the *same* DNS Name, then the Master Stack must use a *different* DNS Name. This approach of all Response Stacks sharing the same DNS Name simplifies adding further Response Stacks at a later date.

During installation - using Website configuration - you need to consider the following:

HTTP binding	Required for installation, but can be manually removed later - please refer to Removing the HTTP binding from the Tachyon website. This binding is not used by clients or administrators, but can optionally be used for Application Migration and/or AppClarity reclaim clients. Example name **acme-tcn01**.
HTTPS binding	Required. This is the main binding. On a Master Stack server (that has no Response Stack components) it is used by administrators to connect to the Tachyon portal. It can optionally be used for Application Migration and/or AppClarity reclaim clients. Example name **tachyon** . On a Response Stack server, it is used by clients to connect to Switches and/or Background Channel. Example name **tachyon** or **tachyonrs**. See the panel above about making the right choice. On a DMZ Server, it is used by Internet-based clients to connect to Switches and/or Background Channel. Example name **tachyonext**. See below.
Alternate HTTPS binding	Required, except in the simplest (single server) configurations, described above. It is typically used by other Tachyon platform servers to connect to each other, but there are other scenarios. • Required on a Response Stack server if it will have a DMZ Server connected to it. Example name **tachyonalt**.

- Required on a DMZ Server - used by internal servers to connect to the DMZ Server - see below. Example name **tachyondmz**. See below.
- Required on a Master Stack if you have local and remote Response Stack(s) - used for inter-server communications. Example name **tachyonalt**.
- Required on a Master Stack if the main HTTPS binding is used by client-facing components, and you want a different name for the Portal. Used by administrators to connect to the Tachyon portal. Example name **tachyon**.
- Required on a Master Stack if you need a different **HTTPS port** for Application Migration and/or AppClarity reclaim clients. This can be by choice, or if you have upgraded from an original SLA Platform installation that used different ports.

Manual bindings

You can manually add further HTTP and HTTPS bindings after installation, to help differentiate the services which client devices and administrators connect to.

If you are upgrading ActiveEfficiency to Tachyon platform then you might have had an HTTPS binding described as **aeserver** in previous documentation.

If Master and Response Stacks are on the same server and you want them to have different DNS Names, then use the main binding for client connections to the Response Stack (because it is client-facing) and use the Alternate binding for other connections to Master Stack. A simpler option is to put the Response Stack on its own server. Remote Response Stacks are recommended if Master Stack is also hosting services AppClarity Software Reclaimer or Application Migration.

If you want to configure Switches on the same server to use multiple DNS Names, you will need to seek guidance from 1E. In most cases, this is not required or recommended.

Internal DNS Names

A DMZ Server is a special example of a Response Stack. The DMZ Server itself requires two DNS Names:

- A client (external) facing DNS Name - for example, **tachyonext** - which is shared between the Switch network interfaces and Background Channel on

the DMZ Server - is specified during Tachyon Setup as the main HTTPS binding

- An internal facing DNS Name for the internal network - for example, **tachyondmz** - this is specified during Tachyon Setup as the alternate main HTTPS binding.

Note

Both DNS Names must be included in the web server certificate. You can manually replace the external/client facing certificate after installation, to comply with best practice not to expose internal names in an external facing certificate.

The internal Response Stack also requires an additional DNS Name - for example **tachyonalt** - for internal communications with the DMZ Server.

Please refer to Implementing a Tachyon DMZ Server for more detail about DMZ Servers.

Note

Note

Tachyon Setup supports installation of one HTTP and up to two HTTPS bindings, but you can manually add more bindings after installation.

Tachyon Setup currently supports only one Web server certificate, which must contain all the DNS Names used by the HTTPS bindings on that server. Each DNS Name must be included as a DNS Name in the **Subject Alternate Name (SAN)** entry of the web server certificate.

You can manually add more certificates, and change bindings. Please refer to Certificate requirements . Please note that Tachyon Setup helps maintain the main and alternate HTTPS bindings using one certificate.

Where possible the Tachyon Server DNS Name should be a **CNAME Alias** which references the **(A) Host** records for each of the Switch network interfaces registered in DNS.

Warning

Ensure network interfaces used for anything other than Switches, for example, the SQL interface, are not registered in DNS. If they are registered ensure the DNS Name used by Switches only has Switch IP Addresses assigned.

For multiple Switches to share the same DNS Name, the load balancing options include:

- **DNS round-robin.** Create a CNAME record which references the (A) Host records for each of the Switch network interfaces registered in DNS.
- **Network Load Balance (NLB)** and register the Tachyon Server's DNS Name as the NLB Name, and configure the NLB to forward to each of the Switch IP Addresses.

Note

DNS round-robin provides reasonable load balancing so that devices should be evenly spread across all Switches. Each device will cache the IP Address given to it by DNS and keep using that, even if the Switch using that IP Address is not available until the TTL expires or the DNS cache is flushed.

A Network Load Balancer (NLB) allows all the Switches to share the same DNS Name which is actually the IP Address of the NLB Cluster, which can then intelligently route the connection to a Switch interface.

1.4.1.4.4 Service Principal Names

Tachyon platform and applications use underlying IIS and SQL Server technology, and only require HTTP or MSSQLSvc class SPNs if your company security policy has configured IIS or SQL Server to use Kerberos authentication.

If your IIS server is using Kerberos, then each DNS Name used to access a Tachyon Web Server requires an HTTP class **Service Principal Name (SPN)** to be registered against the relevant service account in Directory, which is **computer$** by default. This allows Tachyon web applications to authenticate clients using Windows Authentication where Kerberos is an authentication provider (primary, fallback, or negotiated).

Note

If your IIS server is using Kerberos then HTTP SPNs are required for web applications that use Windows Authentication, and are created using:

- The web application pool's service account, which is Network Service for all Tachyon application pools, and therefore is the computer$ account
- Each (A) Host record used to access the web application. If the server is accessed using a CNAME record, then you need to register an SPN for each (A) Host record used by the CNAME. A CNAME will have multiple (A) Host records when using round-robin or NLB to access the web server.

SPNs are not required for DNS Names used to connect to Switches or Background Channel, because they do not use Windows Authentication. However, bear in mind the same DNS Name might be used to access other web applications.

If an SPN is not created, then you will see "401 Not authenticated" errors in the browser and/or log files.

Service Principal Names (SPN) are attributes of AD accounts. A domain administrator will need to create an HTTP class SPN for the Tachyon web server service account, by using one of the following methods:

- By editing the ServicePrincipalName attribute of the web server's computer account
- Using the following SETSPN commands, substituting your DNS Name, server and service account:

```
setspn -l ACME\ACME-TCN01$
setspn -s http/acme-tcn01.acme.local ACME\ACME-TCN01$
setspn -s http/tachyon.acme.local ACME\ACME-TCN01$
```

Use each command as follows:

1. List existing SPNs for the service account. Run this to record details before you request for any new SPN(s) to be created. Re-run this after creation, ensuring you wait sufficient time for AD replication to occur.
2. Use this if **tachyon.acme.local** is a CNAME record and its (A) Host record is **acme-tcn01.acme.local**.
3. Use this if **tachyon.acme.local** is a (A) Host record.

The above example assumes:

- The service account for all Tachyon web application pools is Network Service
- The Tachyon server name is **ACME-TCN01** with a computer account in the **ACME** domain, which means the service account is **ACME\ACME-TCN01$**
- The DNS Name for the server is **tachyon.acme.local**.

Tip

If in doubt, it does no harm to create an SPN for each DNS Name used to access the Tachyon Server, including its CNAMEs and (A) Host records using: *setspn -s http/<DNS Name> ACME\ACME-TCN01$*

To determine which type of record a DNS Name is, run the following command:

```
nslookup tachyon.acme.local
```

- If the command returns Name: **acme-tcn01.acme.local** and alias **tachyon.acme.local** then tachyon.acme.local is a CNAME record
- If the command returns Name: **tachyon.acme.local** and no aliases then tachyon.acme.local is a (A) Host record.

More complex scenarios can be configured which requires in-depth knowledge of IIS, SPN and DNS configuration and are beyond the scope of this documentation.

1.4.1.4.5 Web Server Certificate

1.4.1.4.5.1 What do I need to begin?

You will need to have requested a Web Server certificate from your Certificate Authority, using the specification below.

To get the certificate in your organization you will have either:

- Submitted a CSR and received a password protected **.pfx** file
- Used the Certificate Enrollment wizard to request a suitable Web Server certificate.

Note

In earlier versions of Tachyon the private key had to be exportable to create certificate files for Tachyon Switches, but this is no longer required for Tachyon 5.0 onwards.

1.4.1.4.5.2 Import the Web Server certificate

Once the Web Server certificate has been provided it must be imported into the Tachyon Server's local computer Personal Certificates store.

After importing, you should give the certificate a Friendly Name, so that you can easily identify it for the post-installation task Tachyon Server post-installation tasks.

1. On the Tachyon Server, start **certlm.msc** (or start mmc and add the certificates snap-in for the local machine).
2. Navigate to the **Personal Certificates** store.
3. Locate the Web Server certificate you have just imported.
4. Right-click on the certificate and select **Properties**.
5. In the **General** tab enter a Friendly name, for example, **1E platform**.
6. Click **OK** to save.

1.4.1.4.5.3 Web Server certificate specification

Each server that has Tachyon Server components installed requires its own Web Server certificate (except for a remote SQL Server). This certificate is also used by the Tachyon Switch and the Tachyon Coordinator. Therefore, a single-server installation requires only one Web Server certificate. This certificate must be provided on the server prior to the installation of Tachyon.

The Web Server certificate requires the minimum of the following:

1. Issued by a trusted Certificate Authority (CA)
   - The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the server
   - If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the server
   - The above CA certificates must exist on the Tachyon Web Server and Windows client devices
   - Most organizations have automated distribution of these CA certificates to servers and clients, using Group Policy for example.
2. Has at least the following Key Usage:
   - Digital signature
   - Key encipherment
3. Has at least the following Enhanced Key Usages:
   - Server Authentication
4. Revocation information is included
   - References at least one CRL Distribution point that uses HTTP - see DMZ Server note below

5. Must have a private key available

Tip

The default template **Web Server** available with a Microsoft PKI is suitable for requesting a Tachyon Web Server certificate.

DMZ Server

Please ensure you note the additional certificate requirements described below, when installing any server in a system that also contains a DMZ Server. Internal Master and Response Stack servers, and DMZ Server, each requires **two** HTTPS bindings, as described in DNS Names. For details, please refer Implementing a Tachyon DMZ Server.

Also, note the requirement for server certificates to reference at least one CRL Distribution point that uses HTTP. These CRL DPs are likely to be in the internal network, and the firewall will need to allow the DMZ server to access these internal servers.

Web Server certificates used by Tachyon Servers must be issued with their fields set as follows. Example **DNS Names** are discussed in DNS Names.

Fields	Example Option 3 type certificate
Subject Common Name Field (subject:commonName)	Subject (CN) can be any valid name and is no longer mandatory as required by previous versions of Tachyon.
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The **Tachyon Server DNS Name FQDN** (DNS Alias) of the server. This is mandatory, the same as required by previous versions of Tachyon. On a Master Stack - example: **DNS Name=TACHYON.ACME.LOCAL** On a Response Stack - example: **DNS Name=TACHYONRS.ACME.LOCAL** On a DMZ Server - example: **DNS Name=TACHYONEXT.ACME.COM**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	An **Alternate DNS Name FQDN** (DNS Alias) of the server. This is usually mandatory, for example if there is more than one server in your Tachyon system, as discussed in DNS Names. On a Master Stack, example: **DNS Name=TACHYONALT.ACME.LOCAL**or**DNS Name=TACHYON.ACME.LOCAL** On a Response Stack - example: **DNS Name=TACHYONALT.ACME.LOCAL**

Fields	Example Option 3 type certificate
Example	On a DMZ Server - example: **DNS Name=TACHYONDMZ.ACME.LOCAL** 
Note

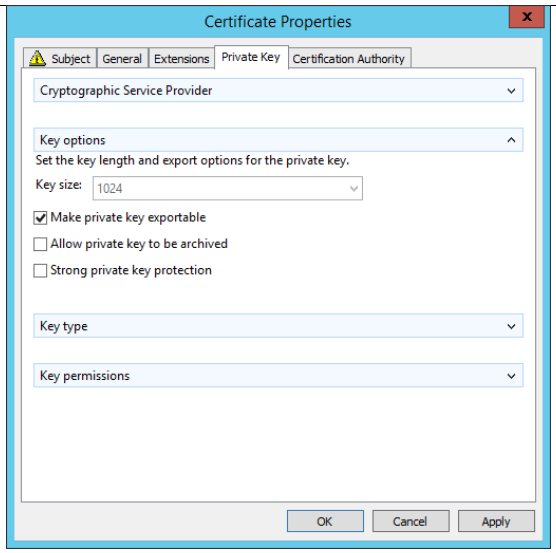
Earlier versions of Tachyon required the certificate to have a CN and used SAN fields differently. If you are upgrading your Tachyon server from an earlier version, it may still be using this type of certificate. When upgrading Tachyon, you can issue a replacement certificate, or continue using the old style certificate (because the new-style certificate requires only a SAN DNS Name that matches the DNS Alias, which are provided by the old style certificates).

Examples of old-style certificates.

Fields	Example of old Option 1 type certificate
Subject Common Name Field (subject:commonName)	The DNS Alias FQDN of the server Example: **CN=TACHYON.ACME.LOCAL**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The DNS Alias FQDN of the server Example: **DNS Name=TACHYON.ACME.LOCAL** The computername FQDN of the server Example: **DNS Name=ACME-TCN01.ACME.LOCAL**
Example certificate request	 
Note

Fields	Example of old Option 1 type certificate
	Option 1 type certificates required the CN to be the DNS Alias, and the list of Subject Alternate Names (SAN) to contain the computername FQDN. Also, prior to Tachyon 5.0 the certificate required its private key to be exportable. Tachyon 5.0 and later is able to use this type of certificate when upgrading from an earlier version of Tachyon.

Fields	Example old Option 2 type certificate
Subject Common Name Field (subject:commonName)	The computername FQDN of the server Example: **CN=ACME-TCN01.ACME.LOCAL**
Subject Alternative Name Extension (extensions:subjectAltName), type dnsName	The DNS Alias FQDN of the server Example: **DNS Name=TACHYON.ACME.LOCAL** **Tip** Add any additional DNS Names here.
Example certificate request	
Fields	Example old Option 2 type certificate



Note

Option 2 type certificates required the CN to be the computername FQDN, and the list of Subject Alternate Names (SAN) to contain the DNS Alias.

Also, prior to Tachyon 5.0 the certificate required its private key to be exportable.

Tachyon 5.0 and later is able to use this type of certificate when upgrading from an earlier version of Tachyon.

1.4.1.4.5.4 Switch certificate files

Tachyon Switches use certificates in the Windows Certificate Store. From version 5.0 onwards they no longer use Switch Certificate files.

1.4.1.4.6 Windows Server roles and features

Note

Tachyon Setup will create a website with the necessary bindings, therefore please do not pre-create a website of the same name.

The following PowerShell commands can be used to install relevant IIS roles and features and record the server configuration in a file.

Note

When you run Tachyon Setup, you may choose to let the Setup perform this operation for you instead of downloading and running the script manually. Just click on the

Install missing prerequisites button after you have run the checks in the **Check prerequisites** page.

Click here to download - RolesInstall.ps1

RolesInstall.ps1 - Configure IIS using PowerShell

```
Import-Module ServerManager

Get-WindowsFeature | Out-file $PSScriptRoot\ServerManager-1.txt -Append
Install-WindowsFeature Web-Server,
Web-Http-Redirect,
Web-Dyn-Compression,
Web-Basic-Auth,
Web-IP-Security,
Web-Windows-Auth,
Web-Asp-Net45,
Web-Mgmt-Console,
Net-Framework-45-Core,
Net-Framework-45-ASPNET

Uninstall-WindowsFeature Web-DAV-Publishing

Get-WindowsFeature | Out-file $PSScriptRoot\ServerManager-2.txt -Append
```

Note

When running the above command, if you receive an error that contains **The source files could not be downloaded** you will need to supply the source path to your Windows Server OS installation media \Sources\sxs folder.

Append **-source X:\Sources\sxs** or **-source \\Server\Path\Source\sxs** to the command line, adjusted for your drive letter or UNC path.

Note

PowerShell always uses **45** in the names of .NET Framework features, irrespective of the actual version of .NET Framework 4.X installed on the server, like:

- 4.8 in Windows Server 2022 (note: from Tachyon 8.1 onwards, any Tachyon component that requires .NET Framework, requires version 4.8)
- 4.7.2 in Windows Server 2019
- 4.6.2 in Windows Server 2016

For details of .NET Framework versions, please refer to https://docs.microsoft.com/en-us/dotnet/framework/get-started/system-requirements#supported-server-operating-systems.

Tip

If you prefer to use the Add Roles and Features Wizard to manually enable features then you can use the Display Names listed in the table Windows Server roles and features.

Note

Web-Http-Redirect is only required to support legacy Nomad clients after an In-place upgrade of ActiveEfficiency Server for Nomad.

Web-Basic-Auth is only required if you will be installing 1E ITSM Connect or 1E Core for integrating ServiceNow and Tachyon.

1.4.1.4.7 ASP.NET Core Hosting Bundle

This is required on the Tachyon Master Stack server if you are installing Content Distribution features.

If it is not already installed, Tachyon Setup will attempt to automatically download and install version **3.1.1**. However, this supposes your installation account and the server is whitelisted to allow download from https://download.visualstudio.microsoft.com/download/pr/d8b046b7-c812-4200-905d-d2e0242be9d5/53d5698d79013be0232152ae1b43c86b/dotnet-hosting-3.1.11-win.exe.

If you want to download it yourself, or a later version, then go to https://dotnet.microsoft.com/download/dotnet and then install it using a command similar to the following:

dotnet-hosting-3.1.11-win.exe OPT_NO_X86=1 /install

The parameter ***OPT_NO_X86=1*** causes the installer to only install the 64-bit version, which is what Tachyon requires.

You may experience an error if some bundle components are already installed. If this happens, then re-run using ***/repair*** instead of ***/install*** .

Note

You can run the following command to list the installed versions of .NET

%ProgramFiles%\dotnet\dotnet.exe --list-runtimes

1.4.1.4.8 If TLS1.0 is disabled

1.4.1.4.8.1 Web server registry settings

If TLS 1.0 is disabled on the Web server, you must add the following two registry entries, for the 1E Catalog Update Service to successfully connect to the 1E Cloud Catalog.

Import registry entries

```
Windows Registry Editor Version 5.00

[HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions"=dword:00000001

[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v4.0.30319]
"SystemDefaultTlsVersions"=dword:00000001
```

1.4.1.4.9 SQL BCP

The **Export all** feature is described in Exporting data from Explorer. To enable Tachyon users with the appropriate permissions to use the **Export all** feature you must ensure that **Microsoft Bulk Copy Program (BCP)** is installed on each **Tachyon Response Stack**, specifically the Response server where the Core component is hosted.

- If Microsoft SQL Server is installed on the same server as the Tachyon Response Stack, then BCP will normally be present.
- If the TachyonResponses database is remote to the Tachyon Response Stack and there is no local copy of Microsoft SQL Server, then you will need to install BCP.

You can confirm BCP is installed by starting a command prompt and typing **bcp** and usage information is displayed. The command **bcp -v** displays the version.

> **Note**
>
> The information here applies regardless of which version of SQL Server is being used. This does not imply that Tachyon itself is supported under every possible version of SQL Server that falls within those ranges. See Windows Server requirements for the supported versions and required Service Packs.

Install the following components to get BCP working:

Installer file name	Product Name	Where to get it from
vc_redist.x64.exe	Visual C++ 2017 Redistributable	https://support.microsoft.com/en-gb/help/2977003/the-latest-supported-visual-c-downloads
msodbcsql.msi	Microsoft® ODBC Driver 13.1 for SQL Server®	https://www.microsoft.com/en-us/download/details.aspx?id=53339 This needs to be installed because of a known issue in the Microsoft Command Line Utilities 15 for SQL Server.
msodbcsql.msi	Microsoft® ODBC Driver 17 for SQL Server®	https://docs.microsoft.com/en-us/sql/connect/odbc/download-odbc-driver-for-sql-server Use version 17 (x64).
MsSqlCmdLnUtils.msi	Microsoft Command Line Utilities 15 for SQL Server	https://docs.microsoft.com/en-us/sql/tools/bcp-utility The msi includes **BCP** and **SQLCMD**.

To verify the components have been installed, you can use **AppWiz.cpl** and check for the **Product Name**.

1.4.1.4.10 Services and NTFS Security

Tachyon and SLA Platform services, including web application pools, use built-in accounts Local System (SYSTEM) and Network Service (NETWORK SERVICE) by default, and 1E recommends this configuration.

You must ensure these built-in accounts have the necessary NTFS security permissions on the Tachyon and SLA Platform installation and log folders.

If you are using default installation settings for the Tachyon server on a default configuration of Windows Server, then **Local System** has the necessary permissions by default, but **Network Service** requires some additional steps. The simplest method is to add **Network Service** to the **Administrators** localgroup, which allows the default installation and logs folders to be created during installation.

However, adding Network Service to the **Administrators** localgroup is not considered best practice, therefore alternative methods are described below.

The table below lists the Tachyon services and their default service accounts.

Tachyon service	Service account name	Description	SID
Tachyon Switch Host service	NT AUTHORITY\SYSTEM	Local System	S-1-5-18
1E Catalog Update Service 1E SLA Platform services (3) 1E Tachyon Coordinator service Web application pools: • Catalog (1) • SLAPlatform (3) • Tachyon (5)	NT AUTHORITY\NETWORK SERVICE	Network Service	S-1-5-20

The table below lists the default folder locations which must have NTFS security permissions configured for all service accounts.

The Tachyon installation process does not modify permissions, except for the %ProgramData%\1E\Licensing\ folder which *does* receive full permissions for Network Service.

Folder	Default location	Service account	NTFS security
Installation folders	%ProgramFiles%\1E\Catalog\ %ProgramFiles%\1E\SLA Platform\ %ProgramFiles%\1E\Tachyon\	Network Service SYSTEM	Minimum of **read & execute** permission (**folder, subfolders and files**).

Folder	Default location	Service account	NTFS security
Logs folders	%ProgramData%\1E\Catalog\ %ProgramData%\1E\DatabaseUpgrade\ %ProgramData%\1E\Licensing\ %ProgramData%\1E\Platform Consumer\ %ProgramData%\1E\SLA Platform\ %ProgramData%\1E\Tachyon\	Network Service SYSTEM	Minimum of **Full Control** permission (**folder, subfolders and files**).

For a default installation of Tachyon on a default configuration of Windows Server, **Local System (SYSTEM)** has the necessary permissions by default, but **Network Service** requires some additional steps.

You have a choice of how to configure NTFS security for **Network Service**, using one of the following options, according to your organization's policies.

You can pre-create the Tachyon installation and logs folders prior to installation and apply NTFS permissions on these instead of their parent folders.

Choice	Method
Administrators localgroup	Add NETWORK SERVICE to the **Administrators** localgroup (this is the simplest method but not best practice).
Users localgroup	Add NETWORK SERVICE to the **Users** localgroup, and grant this group permissions on the folders. • Default **INSTALLDIR** does not need to be modified because **Users** localgroup has inherited **read & execute** permission • Default **LOGPATH** requires the inherited **Users** localgroup to be modified to give **Full Control** permission
Direct permissions	As above, but grant NETWORK SERVICE direct rights on the folders

Note

The Tachyon Server Installation Account should be a member of the **Administrators** localgroup, so that it has full rights on the server.

1.4.1.4.10.1 Using a non-default location for the Installation Folder

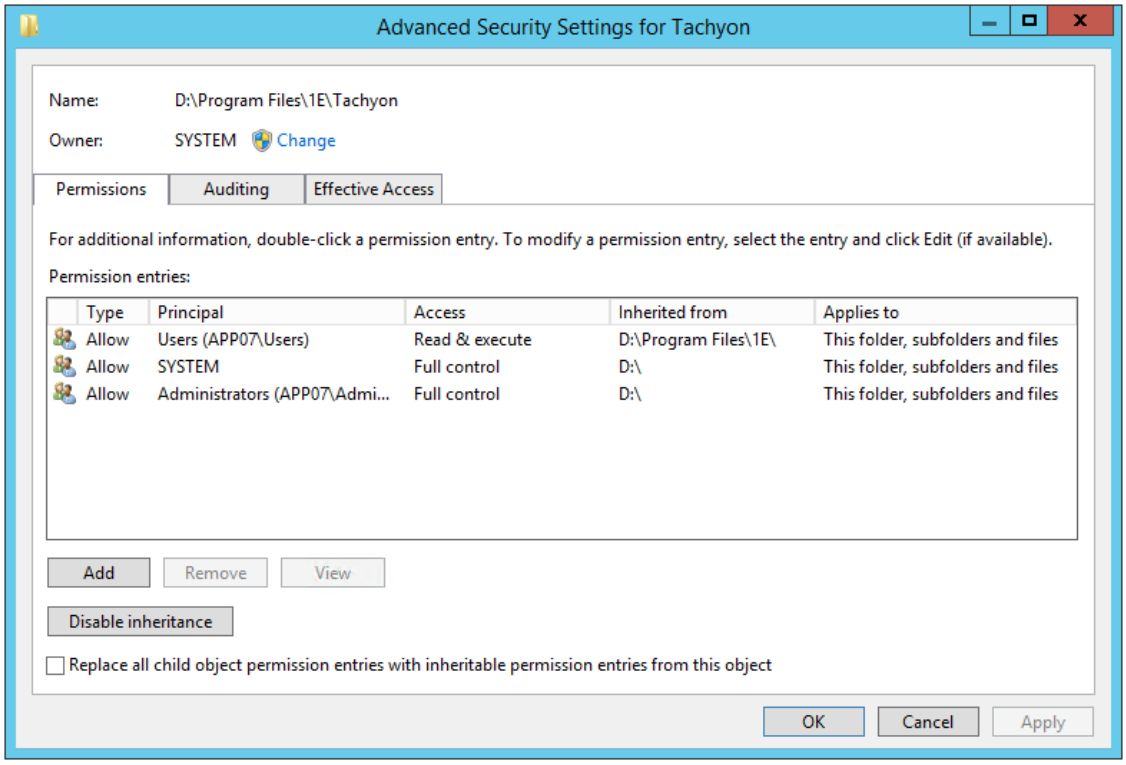
If you are installing in a non-default installation folder, or the default installation folder has non-standard NTFS security, then before installation, you must ensure the installation folder is pre-created with suitable NTFS security applied. If this is not done, some services will fail to start, or users will not be able to access the website.

The NTFS security for the service accounts described above must be explicitly applied.

In addition, the **Users** or **Authenticated Users** localgroup must have a minimum of **read & execute** permission on each of the Web application folders (**folder, subfolders and files**). This is simplest to achieve by granting permission on the INSTALLDIR folder.

The example screenshot shows:

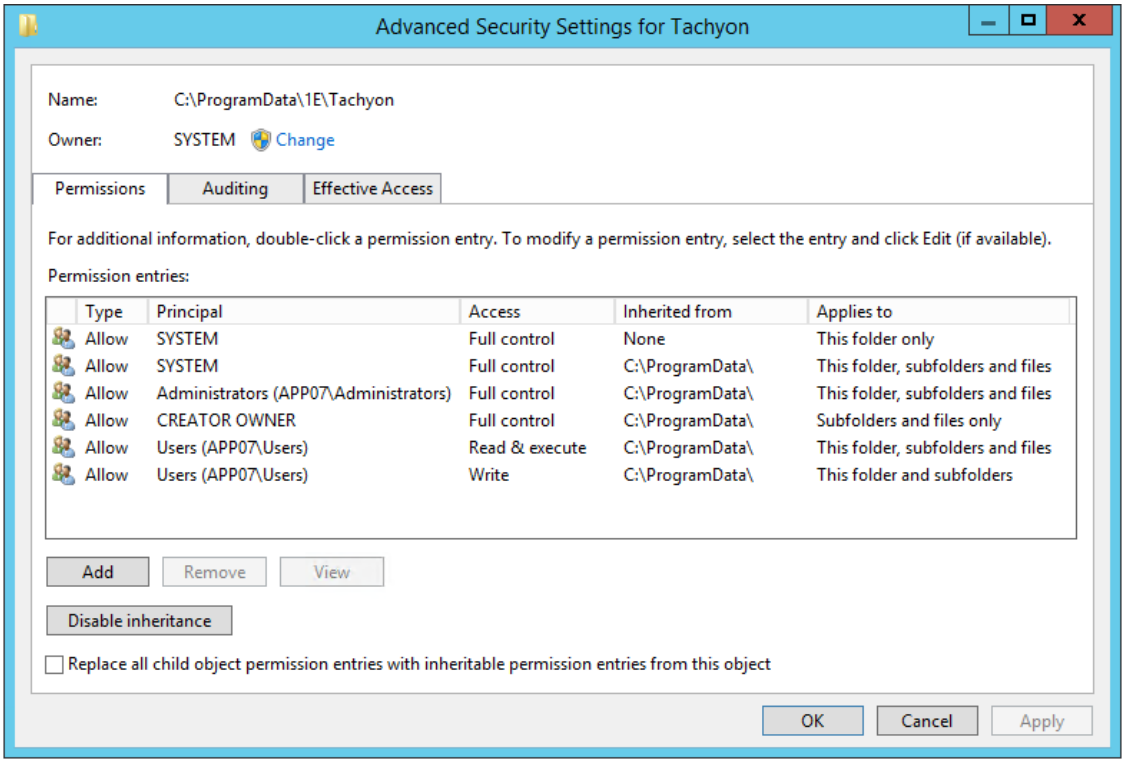
- A non-default installation INSTALLDIR=D:\Program Files\1E\Tachyon\
- RX permissions for the Users group is applied to the 1E folder
- Other permissions are inherited from the root of the D: drive
- INSTALLDIR permissions are inherited from the 1E folder
- NETWORK SERVICE is a member of the **Users** localgroup



1.4.1.4.10.2 Using a non-default location for the Logs Folder

The accounts used by Tachyon services and application pools must have a minimum of **Full Control** permission on the logs folder (**folder, subfolders and files**.

The example screenshot shows a default installation. For a default installation, the only permissions necessary are SYSTEM and Administrators, both Full Control.



1.4.1.5 SQL Databases

Tachyon platform databases can be installed on one or more SQL Server database instances. These SQL Server instances can be on the Tachyon application server (local) or remote. You can allow the Tachyon Setup to create the databases in their default locations, or you can pre-create them with appropriate permissions before installation if you want to select the location and sizes of the databases. For a new installation, and for upgrades, the Installation Accounts requires a SQL Login with appropriate permissions.

Please refer to High Availability options for SQL Server.

Tachyon platform supports the following High Availability (HA) options for SQL Server:

- AlwaysOn Availability Group (AG) using an AG Listener
- Failover Cluster Instance (FCI).

The following is a list of databases used by Tachyon platform. In the Database servers screen, you can select the name of the SQL Server instance, but it does not let you change the database names.

- 1ECatalog
- SLA databases must be installed on the same instance:
  - SLA-Data

  - SLA-Shared
  - SLA-Integrate.

- ContentDistribution (required for Nomad)
- SLA-BI (this is the Business Intelligence database required for Patch Success)
- TachyonMaster
- TachyonResponses (required for a Response Stack)
- TachyonExperience (required for Experience).

The following is a list of database cubes used by Tachyon platform. In the SSAS servers screen, you can select the name of the SQL Server instance, but it does not let you change the database names.

- SLA-BI (this is the Business Intelligence cube required for Patch Success).

1.4.1.5.1 Default configuration of databases

If you allow the installer to create new databases, they each have the following default settings. Databases will grow automatically to the sizes estimated in /document/preview/791302#UUID-aa1c2691-97ed-e134-ac7d-62b2ea04fe4a.

Property	Value
Owner	If the Installer is used to create the databases, this will be the Tachyon Server Installation Account . The best practice is to change the owner to 'sa' as shown in, Example SQL scripts for creating a SQL Login and granting roles.
Collation	SQL_Latin1_General_CP1_CI_AS
Path	Default SQL location
Initial Size MDF	128MB
Autogrowth MDF	By 128MB
Initial Size LDF	128MB
Autogrowth LDF	10%

Property	Value
Recovery Model	Simple

Note

If the **model** system database has been changed to have a larger size than the values specified in the table above, then the Tachyon Server installer may report an error executing 'Bootstrap.sql' on MasterDatabase. Rebooting the SQL Server may cure the error.

1.4.1.5.2 Creating your own databases

You may be required to create databases by hand before installation. This is also known as pre-creating databases. Below are some of the reasons why your SQL administrator may require you to do this:

- Tachyon Server Installation Account is only allowed rights on existing databases and not allowed rights to create them
- Locations of the database files need to be different from the defaults used on the SQL Server instance(s)
- The initial size of the database files needs to be set to their estimated full size given in /document/preview/791302#UUID-aa1c2691-97ed-e134-ac7d-62b2ea04fe4a.

1.4.1.5.3 SQL Login for the server installation account

The server installation account requires SQL permissions during installation and upgrade, which can be temporary or permanent. The level of SQL permissions required by the installation account depends on which Tachyon components it is installing.

1.4.1.5.3.1 Master Stacks

For master stacks **sysadmin** is required as follows, to:

- Install **1E Catalog**
- Create Linked Servers for **SLA,** which requires **sysadmin** for the SQL database instances for both SLA and 1E Catalog databases
- Create Linked Servers for **BI**, which requires **sysadmin** for the SQL database instances for both SLA and BI databases, and the SSAS instance for the BI cube (required only by Patch Success).

1.4.1.5.3.2 Response Stacks

Sysadmin availability on SQL instance(s)	SQL Login permissions
sysadmin SQL Server role is permitted	The server installation account requires the **sysadmin** SQL Server role on the SQL Server instance(s) that host the TachyonMaster and/or TachyonResponses database(s). This can be used for a new installation, or for an upgrade.
sysadmin SQL Server role is not permitted	The SQL Login permissions required by the server installation account vary depending on which choice is implemented, as described in the following table:

Choice implemented	Role required for the installation account's SQL Login
Database(s) created by the Tachyon Server installer *during* installation.	**dbcreator** SQL Server role on the SQL instance
Database(s) created *before* installation - a common scenario if you want to select database location and size. Also required when upgrading Tachyon.	**db_owner** database role on the pre-created databases: • **TachyonResponses**

Note

In addition to the permissions given in the table above, the server installation account also needs to **ALTER ANY LOGIN** Securables permission in order to allow the creation of the Example SQL scripts for creating a SQL Login and granting roles, used by the Tachyon Server web applications and services.

Example scripts are provided below to create a SQL Login and grant roles.

During installation, the Tachyon Server installer will **always** attempt to grant **db_owner** permission to the server installation account on each of the Tachyon databases.

Note

Databases must be configured in multi-user mode.

1.4.1.5.4 Example SQL scripts for creating a SQL Login and granting roles

The following examples assume **ACME\TCNinstaller01** is the Tachyon Server Installation Account.

When the account is not permitted to have the **sysadmin** SQL Server role, then a sysadmin can use the following script to create a SQL Login and grant it rights.

Create SQL Login and grant ALTER ANY LOGIN Expand source

```
USE [master]
GO
CREATE LOGIN [ACME\TCNinstaller01] FROM WINDOWS
GO
GRANT ALTER ANY LOGIN TO [ACME\TCNinstaller01]
GO
```

If the Tachyon Server Installation Account is permitted to create the databases, then a sysadmin can use the following script to add the SQL Login to the **dbcreator** role.

Grant dbcreator Expand source

```
USE [master]
GO
ALTER SERVER ROLE [dbcreator] ADD MEMBER [ACME\TCNinstaller01]
GO
```

If the databases have been pre-created, then a sysadmin can use the following script to add the SQL Login to the **db_owner** role on each pre-created database.

Grant db_owner Expand source

```
USE [TachyonMaster]
GO
CREATE USER [ACME\TCNinstaller01] FOR LOGIN [ACME\TCNinstaller01];
ALTER ROLE [db_owner] ADD member [ACME\TCNinstaller01];
GO
USE [TachyonResponses]
GO
CREATE USER [ACME\TCNinstaller01] FOR LOGIN [ACME\TCNinstaller01];
ALTER ROLE [db_owner] ADD member [ACME\TCNinstaller01];
GO
```

After the databases have been created, best practice is to change the **owner** of each database to **sa**, to avoid issues if the owner's Windows account is deleted in future.

The following script can be used to change the **owner** of each Tachyon database to **sa**. This will work even if the **sa** login has been disabled, which is also best practice.

Change owner to 'sa' Expand source.

```
ALTER AUTHORIZATION ON DATABASE::TachyonMaster To "sa"
GO
ALTER AUTHORIZATION ON DATABASE::TachyonResponses To "sa"
GO
```

Note

Ensure the Tachyon Server Installation Account retains the **db_owner** role on the database to support re-configuration and upgrades. If the account is removed from being **owner**, then it will also be removed from the **db_owner** role and will need to be re-assigned, for example by using the **Grant db_owner** SQL script.

The **owner** user and **db_owner** role are both mapped to the database **dbo** user. It is preferable for the account to be a member of the **db_owner** role, instead of being the **owner** user.

1.4.1.5.5 SQL Login for the Tachyon service account

The SQL Login that is used by the Tachyon Server web applications and services depends on whether the SQL Server is remote from the Tachyon Server or is local, as described in the following table:

Installation scenario	Service account SQL Login
Tachyon Server is remote from SQL	The computer account of the remote Tachyon Server. For example **ACME\ACME-TCN01$**
Tachyon Server and SQL are local	The local network service account, **NT AUTHORITY\NETWORK SERVICE**

Note

Before upgrading Tachyon, or installing or upgrading Consumer applications like Application Migration or AppClarity, the SQL Login must be granted the following rights to support Database Snapshot of the 1E Catalog and SLA databases, to restore them if an error occurs:

- **dbcreator** rights on the SQL database instance hosting the 1E Catalog database.
- **dbcreator** rights on the SQL database instance hosting the SLA databases.

During installation, the Tachyon Setup will **always**:

- Attempt to create the SQL Login
- Grant it **db_owner** permission on each of the Tachyon databases
- Remove the **db_owner** permissions when installation is completed.

1.4.1.5.6 Keeping databases during re-installation and upgrade

If re-installing or upgrading Tachyon, you need to decide if you will keep the existing databases or create new ones.

Note

Before doing a re-installation or upgrade of the Tachyon Platform, make a backup of the following (but first see the note below about automatic backups):

- Tachyon Master database

  Note

  Backing up the Tachyon Responses database is **not** usually needed, unless there are instruction responses that you need to keep. Tachyon responses are not permanently held data and will naturally expire according to the settings specified when an instruction was run, typically in hours or possibly days. If in doubt, there is no harm in backing up the Tachyon Responses database as well.

- Tachyon Server installation directory.
  - including the config files, which may have been manually updated in the previous installation.
  - Switch certificate files.
- Earlier versions of Product Packs that have been modified.

Note

Tachyon Setup will automatically perform a backup of the following items:

- Tachyon Server installation directory. This is backed up to a subfolder named Tachyon.bak under the root installation folder for Tachyon . All files, including the .config files and certificate files, will be copied.
- IIS configuration. This is done by taking a copy of the applicationhost.config file from the Windows system folders. The backup file is placed at the same location and is named like the original file with a suffix that indicates the date and time when the copy was taken.
- The following databases are backed up to the default location for backups that is configured in the database server. By default, this points to a subfolder named "Backups" under the folder where the executable for SQL Server is installed. Unless you are installing a small lab or proof-of-concept, this is usually *not* a good location for the backups, so make sure that you configure the backup location in SQL Server to an adequate folder before starting the Tachyon upgrade:
  - 1ECatalog
  - ContentDistribution (optional, required by Nomad)
  - SLA-Data
  - SLA-Shared
  - SLA-Integrate
  - TachyonMaster
  - TachyonResponses
  - TachyonExperience (optional, required for Experience).

The Product packs are not copied by themselves, but they are kept in a table within the TachyonMaster database, which *is* backed up.

1.4.1.6 SSAS Databases

If Business Intelligence is selected for installation, then you will need to provide an instance of SQL Server Analysis Services (SSAS) configured in Multidimensional (*not* Tabular) mode.

Make sure that the SSAS instance is enabled, reachable, configured in Multidimensional mode, and the Server installation account has sufficient permissions. The Setup program is not able to perform a full validation of the SSAS server, so you need to ensure a proper configuration during the preparation phase.

Business Intelligence is a component required by Patch Success and requires a **BI SSAS user**.

The **BI SSAS User** account has the following requirements:

- The account name and its password will be specified in the SSAS servers screen.
- Must be a **domain user account**
  - Configured with **Password never expires**
  - Although this user might be referred to as a service account, it does not require **Logon as a service** on the server.
- During installation, the SLA BI installer (used by Tachyon Setup) does the following with the user account:
  - Stores its credentials encrypted in the following places:
    - A linked server connection for the BI database to access the BI cube
    - In the configuration file used by the MDX API to query the BI cube.
  - Creates a SQL Login, with rights on the SLA-BI database.

Note

Prior to Tachyon 8.1, Experience required its own SSAS database.

This is no longer necessary. If you are upgrading to Tachyon 8.1 or later, then you can delete the Experience SSAS database after the upgrade is completed.

1.4.1.7 Email

Tachyon users and approvers require AD accounts with email addresses to support approval workflow and notifications.

1.4.1.7.1 Mail Server

For details about mail server requirements, please refer to SMTP server.

1.4.1.8 Active Directory

Tachyon Server must be installed on a domain-joined server, except for a DMZ Server, where this is optional. Clients do not have to be installed on domain-joined devices but must have a certificate.

1.4.1.8.1 Installation Accounts

1.4.1.8.1.1 Tachyon Server Installation Account

The server installation account has the following requirements on the server.

- **Local admin rights on the Tachyon Server**. It must be an Active Directory domain user account that is a direct or indirect member of the Administrators local group on the server where Tachyon Server will be installed.
- Can be disabled (not deleted) in Active Directory after additional Tachyon admin users have been created in Tachyon , and installation has been verified.

In addition, the server installation account requires SQL rights as described in SQL Databases above.

1.4.1.8.1.2 Tachyon client Windows Installation Account

The 1E Client installer installs a service as local system, therefore the installation account for Windows clients must be capable of being elevated in order to run the installer. The simplest way of achieving this is for the account to have full local administrator rights (as a member of the localgroup administrators, either directly or indirectly).

1.4.1.8.1.3 Tachyon client Non-Windows Installation Account

To install the 1E Client on a non-Windows client the installation account must have privileges to run the **sudo** command.

1.4.1.8.2 Tachyon Users Accounts

Each Tachyon user requires an account in the Identity Provider used. All accounts must have their userPrincipalName (UPN) attribute populated, which is normal, but may be missing if users accounts have been created using scripts.

Tachyon users and approvers should have email addresses to support approval workflow and notifications. Email addresses are mandatory if Two-factor Authentication is enabled.

Groups that are setup in the Identity Provider are recommended for role-based access control (RBAC) within Tachyon but are not mandatory. Groups can be assigned to Tachyon roles after installation, they are not required during installation. They are added as Tachyon groups and configured in the same way as user accounts. A Tachyon user can therefore be a user account or in a group within the Identity Provider. Groups are not mandatory because users can be assigned to roles and managed within Tachyon instead of the Identity Provider, or a combination.

Tachyon Setup assigns a limited set of permissions to the Setup user account (specified during installation/updates), as described on the Roles page which cannot be edited. It is possible to increase this user account to have Full Administrator access during installation/upgrade, 1E recommend that this user account is viewed as a service account and kept with the minimum permission.

A group is also useful to configure access to the CatalogWeb Admin page, as described in Rebuilding the 1E Catalog .

Note

AD *distribution* groups are not supported.

If AD *security* groups are nested (groups within groups), they can slow down the performance of the Tachyon Portal for administrators. Therefore, we recommend nesting is not used, and each administrator and approver account is a member of a group used in Tachyon . You can improve performance further by disabling the recursive search used by Tachyon , bearing in mind this will not support nested groups. Please refer to the Post Installation page.

Domain Local security groups are not supported.

1.4.1.8.3 Service accounts

Tachyon platform uses either **Network Service** or **Local system** for all its services and web application pools.

Please refer to the following sections regarding any rights these accounts may require:

- Service Principal Names
- Services and NTFS Security
- SQL Login for the server installation account
- SQL Login for the Tachyon service account
- Microsoft Endpoint Configuration Manager preparation.

1.4.1.9 Microsoft Endpoint Configuration Manager preparation

Tachyon platform requires permission to access various features of Configuration Manager when you implement any of the following optional features:

- Nomad
- System Center Configuration Manager connector.

1.4.1.9.1 Configuring SQL rights in the Configuration Manager database

The Network Service account of the Tachyon Master Stack server requires a SQL Login, with **all** the following rights in the Configuration Manager site database.

- **db_datareader** database role
- Explicit *Execute* permissions to the scalar value function **fn_GetAppState**
- Explicit *Execute* permissions to the scalar value function **fnGetSiteNumber**.

1. If the connector is using **Windows Authentication**, then you can use **one** of the following:

a. Create a SQL Login for the **Tachyon server's computer$ account**, and explicitly grant it the above rights.

b. Add the **Tachyon server's computer$ account** to the **ConfigMgr_DViewAccess** localgroup on the Configuration Manager database server - this is the preferred method.

Note

You may already be familiar with configuring **ConfigMgr_DViewAccess** if you have previously set up Configuration Manager access for older versions of Nomad Dashboard which used **ActiveEfficiency Server**, or the **ActiveEfficiency Scout**, as used for AppClarity 5.x or Shopping 5.x and 6.0

The existence of the **ConfigMgr_DViewAccess** localgroup depends on the version of Configuration Manager. It should exist for a Primary Site, but may not exist for a CAS. If it does not already exist, it is safe for you to manually create the localgroup on the SQL Server used by the Configuration Manager database. If it already exists, you will need to confirm it has a SQL Login and all the necessary rights, as the Configuration Manager setup does not always configure this group correctly.

The following SQL script can be used to create a SQL Login for **ConfigMgr_DViewAccess** and grant it permissions on the Configuration Manager database. Before you run the SQL script, you must first:

- Manually create the localgroup on the SQL Server
- Add the **Tachyon server's computer$ account** to the localgroup.

Click here to download - ConfigMgr_DViewAccess_permissions.SQL

```
-- Connect to the SQL instance using an account that has sysadmin r
ights.
-- Execute this SQL script on the Configuration Manager database.
-- The script creates a SQL Login on the instance for [hostname\Con
figMgr_DViewAccess]
-- and grants it the following rights on the Configuration Manager
database:
-- [db_datareader]
-- EXECUTE on [dbo].[fn_GetAppState]
-- EXECUTE on [dbo].[fnGetSiteNumber]

DECLARE @SqlLogin nvarchar(2000)
DECLARE @SqlString nvarchar(max)

SET @SqlLogin = CAST(host_name() AS varchar(512)) + '\ConfigMgr_DVi
ewAccess'
PRINT 'Granting permissions for ''' + @SqlLogin + ''' on database '
+ DB_NAME() + ' ...'

SET @SqlString = '
IF NOT EXISTS ( SELECT schema_name FROM information_schema.schemata
WHERE schema_name = '''+@SqlLogin +''' )
```

```
EXEC (''CREATE SCHEMA [' + @SqlLogin + ']'')
'
EXEC sp_executesql @SqlString

SET @SqlString = '
IF NOT EXISTS (SELECT * FROM sys.server_principals WHERE name = '''
+ @SqlLogin +''')
CREATE LOGIN [' + @SqlLogin + '] FROM WINDOWS WITH DEFAULT_DATABASE
=[master]
'
EXEC sp_executesql @SqlString

SET @SqlString = '
IF NOT EXISTS (SELECT * FROM sys.database_principals WHERE name = '
''+ @SqlLogin +''')
CREATE USER [' + @SqlLogin + '] FOR LOGIN [' + @SqlLogin + '] WITH
DEFAULT_SCHEMA=[' + @SqlLogin + ']
'
EXEC sp_executesql @SqlString
PRINT 'SQL Login created.'

SET @SqlString = '
ALTER ROLE [db_datareader] ADD MEMBER [' + @SqlLogin + ']
GRANT EXECUTE ON [dbo].[fn_GetAppState] TO [' + @SqlLogin + '] AS [
dbo]
GRANT EXECUTE ON [dbo].[fnGetSiteNumber] TO [' + @SqlLogin + '] AS
[dbo]
'
EXEC sp_executesql @SqlString
PRINT 'Permissions granted.'
```

When you run Tachyon Setup, the Nomad screen will attempt to validate the existence of the **ConfigMgr_DViewAccess** localgroup and membership of the Nomad server's computer$ account. The validation test will fail if the installation account does not have sysadmin rights on the SQL Server instance used by Configuration Manager. This is not a fatal error as long as you are sure the computer$ account is a member of the **ConfigMgr_DViewAccess** localgroup.

If you opt to use a specific SQL Login:

1. If the connector is using a **SQL Login**, then create the login on the Configuration Manager database and grant it the above rights.

To install Nomad features, Tachyon Setup requires your **server installation account** to have the following rights. Please refer to Tachyon Setup.

- **Read-only Analyst** rights in Configuration Manager Console - so that Setup can query the Site Server for details of the Configuration Manager database.

- SQL Login (with public role) on the SQL database instance that hosts the Configuration Manager database - so that Setup can run a SQL query to validate that the machine account is a member of the **ConfigMgr_DViewAccess** localgroup on the SQL Server.

Note

If either of the above rights are not provided then Setup will issue a warning to say it was not possible to verify the machine account is a member of the **ConfigMgr_DViewAccess** localgroup.

1.4.1.9.2 Configuring Site Settings in Configuration Manager

You must enable certain Configuration Manager site settings if you plan to use the System Center Configuration Manager connector to populate Inventory.

The following **Client Settings** must be configured to gather inventory and usage data from clients, and applied to relevant Collections containing in-scope devices:

- Software metering (metering rules are not necessary)
- Software inventory
- Hardware inventory

The following **Discovery Methods** must be configured to gather Active Directory data about clients, and applied to relevant Domains and OUs containing in-scope devices:

- Active Directory System Group Discovery (default attributes are sufficient)

1.4.1.10 Tachyon client devices preparation

Please ensure devices that will be used to validate and test the Tachyon installation has the following.

- Be a supported device platform, (refer to 1E Client requirements), capable of having the installed
- Have appropriate scripting support - please refer to Tachyon scripting requirements
- Have a computer certificate (refer to Tachyon client certificate requirements) suitable for use by the Tachyon platform client features of 1E Client.

1.4.1.10.1 Tachyon integration with Nomad on Windows devices

1.4.1.10.1.1 Configuration Manager present

You do not need to make any configuration changes to Nomad for it to integrate with Tachyon. Please refer Introducing Nomad for guidance on designing and deploying Nomad.

1.4.1.10.1.2 Configuration Manager not present

You can deploy Nomad to Windows devices where the Configuration Manager client is not present. You will need to enable the following bits in relevant installer properties:

- CompatibilityFlags bit 1 - enable long hashes

- SpecialNetShare bit 13 - enable HTTP(S)

These are enabled by default in the Nomad client module of the 1E Client.

1.4.1.10.2 Tachyon client certificate requirements

If you have configured Tachyon Server to require client certificates (Client certificates) then each device requires a certificate with the following properties, so the client can be authenticated by the Tachyon Switch.

1. Issued by a trusted Certificate Authority (CA)
   - The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the client.
   - If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the client.
   - If either of these CA certificates is different from those used by the Tachyon Web Server, they will need to be exported and imported on the Tachyon Web Server.
   - Most organizations have automated distribution of these CA certificates to clients and servers, using Group Policy for example.
2. Has at least the following Enhanced Key Usage.
   - Client Authentication.
3. Has at least the following Key Usage.
   - Digital Signature
   - Key encipherment.
4. Has a private key.
   - For workgroup and non-Windows devices, the **private key must be exportable**.
5. Revocation information is included.
   - References at least one CRL Distribution point that uses HTTP.
6. Has a Subject Name of type Common Name (**CN=<computername>**) or Subject Alternative Name (**DNS Name=<computername>**) where <computername> depends on the type of device:
   - On domain-joined Windows PCs this must be the **computername FQDN** of the computer, for example **W701.ACME.LOCAL**.
   - On workgroup Windows PCs and non-Windows devices, this must be the computername of the computer - as returned by the **hostname** command, for example on Windows PC this could be **W701**, and on a Mac this could be **MAC01.local**.

Note

Tachyon clients and Switches use OpenSSL and its validation process to verify certificates.

In organizations that have an established PKI, the client devices will probably have a suitable certificate already, along with relevant Trusted Root CA certificates.

For non-Windows devices, the certificate files must be included in the 1E Client installation folder structure, as described below in Configuring the Non-Windows Tachyon certificate using OpenSSL.

1.4.1.10.2.1 Certificate Authority (CA) public keys

Tachyon clients need to authenticate Switches and Switches need to authenticate Tachyon clients. In each case, one end of a secure connection requires the public key for each CA in the other end's certificate certification path (trust chain).

The Tachyon client needs the public key of each CA in the Switch's certification path. These public keys are stored differently on the client device depending on the type of OS.

- For Windows devices, CA public keys are normally stored in the Windows Trusted Root Certification Authorities store.
- For non-Windows devices, CA public keys are stored in a **cacert.pem** located in the 1E Client installation folder.
- For macOS devices, you have a choice of storing CA public keys in the macOS KeyStore or using the cacert.pem file approach required by other non-Windows devices.

The following points should be noted for Windows devices:

- If each client device has an identical certification path as the Switch, then its CA certificates (public keys) will probably already exist in the Windows Trusted Root Certification Authorities store. This is a typical situation in a small-scale lab with a simple PKI.
- If any client device has a different certification path then the certificates (public keys) of the different CAs will need to be added to the corresponding certificate store on Windows devices, either Trusted Root Certification Authorities or Intermediate Certification Authorities.
- In each of the above cases, the CA certificates (public keys) may have been deployed by Group Policy.

Note

If any of these CAs has its certificate renewed or re-issued then:

- The appropriate Certification Authorities store will need to be updated on the Tachyon Server and Windows devices. Most organizations have automated processes for this task.
- An updated **cacert.pem** file must be distributed to non-Windows devices. This should include old and new keys to aid with the transition.

1.4.1.10.2.2 Configuring the Non-Windows Tachyon certificate using OpenSSL

Each non-Windows device requires its own certificate. Below is a guide for using a Microsoft CA to issue a certificate (which is the same for Windows computers), then exporting it and using OpenSSL to prepare it before installing it on a non-Windows device.

First, you will need to have created a new Certificate template on your Certificate Authority by making a duplicate of either the Computer or Workstation template and configuring it with at least the following properties:

- **General** - use a suitable name such as Tachyon **Devices** and validity period
- **Request Handling** - Allow private keys to be exported
- **Subject Name** - Allow information to be supplied in the certificate request, rather than being built from Active Directory information
- **Extensions** - Application Policies should contain only Client Authentication
- **Security** - ensure relevant users and computers will be able to request certificates.

Once the new template is created on the CA, issue it.

Using the issued template, request a certificate for a target device, export it in **.pfx** form and remember the password.

The target device requires a copy of the basic **cacert.pem** and the **.pfx** file with its password removed. You can do this using the following steps. Use the relevant OpenSSL version for the OS. OpenSSL is normally available by default on Linux and Mac devices. If you want to follow these steps on Windows, you will need to download the open-source version appropriate to your OS.

1. First, extract the certificate:

   ```
   openssl pkcs12 -clcerts -nokeys -in <YourPKCSFile>.pfx -out certificate.c
   rt
   ```

2. Second, the CA key:

   ```
   openssl pkcs12 -cacerts -nokeys -in <YourPKCSFile>.pfx -out ca-cert.ca
   ```

3. Now, the private key:

   ```
   openssl pkcs12 -nocerts -in <YourPKCSFile>.pfx -out private.key -passout
   pass:TemporaryPassword
   ```

4. Remove the passphrase:

   ```
   openssl rsa -in private.key -out new.key -passin pass:TemporaryPassword
   ```

5. Put things together for the new PKCS-File (on Windows, **type** can be used instead of **cat**):

   ```
   cat new.key > PEM.pem
   cat certificate.crt >> PEM.pem
   cat ca-cert.ca >> PEM.pem
   ```

6. And create the new **.pfx** file, when prompted for a password ensure that you enter an empty password (that is press enter when prompted for the password and confirmation without entering any text):

```
openssl pkcs12 -export -nodes -CAfile ca-cert.ca -in PEM.pem -out Tachyon
.pfx
```

Now you have a new PKCS12 key file without a passphrase on the private key part. This **Tachyon.pfx** file and the **cacert.pem** file, must be placed in one of the following locations - depending on the OS. These are hidden folders.

On Linux and Solaris:

```
/etc/1E/Client/.sslcerts
```

On Mac:

```
/Library/Application Support/1E/Client/.sslcerts
```

1.4.1.10.2.3 Configuring the Tachyon certificate for macOS

The 1E Client for macOS devices supports the Configuring the Non-Windows Tachyon certificate using OpenSSL approach described above. Alternatively, the 1E Client for macOS also supports certificates stored within the macOS Key Store.

1.4.1.11 1E Catalog

Tachyon Setup will install 1E Catalog on the Tachyon server and ensure the server meets the requirements for installation.

Ensure the following URL is whitelisted:

- https://catalog.1e.com

This URL must be accessible from the Tachyon Server during the setup and running of 1E 1E Catalog. This enables the Catalog Update service to connect to the 1E Cloud Catalog and download the latest catalog entries.

> **Note**
>
> 1E Catalog may need additional configuration to support proxy servers, but this depends on the configuration you have in your current environment. Please contact 1E Support if you need help doing this.

1.4.2 Tachyon Setup

Use the Tachyon Setup wizard to check and configure prerequisites, install and verify each Tachyon server that makes up your Tachyon platform. It installs the applications you are licensed for and does various maintenance and configuration tasks.

1.4.2.1 Required installation files

You can download the installer from https://support.1e.com/. Extracting the zip will create a folder structure containing the following, where the files highlighted in bold are required by Tachyon Setup.

- Licenses.txt
- TachyonRelease Information
- **Tachyon.Setup.exe**

Please refer to:

- Tachyon Setup, for detailed information about each screen.
- Quick Startif you want a brief overview of installing Tachyon.

- Installers**1ECatalog.msi**
- Installers**AppClarity.msi**
- Installers**ApplicationMigration.msi**
- Installers**ContentDistribution.msi**
- Installers**SLA.BI.Installer.msi**
- Installers**SLA.Platform.Installer.msi**
- Installers**TachyonServer.msi**
- Installers\TachyonToolkit.msi

This folder contains **msi installer files** for components and applications that will be installed by setup if their prerequisites are met.

- Installers\Apps\Experience**Experience.zip**
- Installers\Apps\Experience**metadata.json**
- Installers\Apps\Explorer**Explorer.zip**
- Installers\Apps\Explorer**metadata.json**
- Installers\Apps\GuaranteedState**GuaranteedState.zip**
- Installers\Apps\GuaranteedState**metadata.json**
- Installers\Apps\Inventory**Inventory.zip**

This folder contains **apps folders** for consumer applications that will be installed by setup if their prerequisites are met.

If you do not want to install a consumer application, then delete the folder before running setup.

Later, if you need to install the consumer application, then you can reinstate the folder and install the app using setup as described in Applications maintenance.

- Installers\Apps\Inventory**metadata.json**
- Installers\Apps\Nomad**metadata.json**
- Installers\Apps\Nomad**Nomad.zip**
- Installers\Apps\PatchSuccess**metadata.json**
- Installers\Apps\PatchSuccess**PatchSuccess.zip**
- Installers\Apps\Settings**metadata.json**
- Installers\Apps\Settings**Platform.zip**
- ProductPacks\Newtonsoft.Json.dll
- ProductPacks\Tachyon.ProductPackDeploymentTool.exe
- ProductPacks\Tachyon.ProductPackDeploymentTool.exe.config
- ProductPacks\Tachyon.SDK.Consumer.dll
- ProductPacks\Classic\1E-ConfigMgrConsoleExtensions.zip
- ProductPacks\Classic\1E-Experience.zip
- ProductPacks\Classic\1E-Explorer-TachyonAgent.zip
- ProductPacks\Classic\1E-Explorer-TachyonCore.zip
- ProductPacks\Classic\1E-Inventory.zip
- ProductPacks\Classic\1E-Nomad.zip
- ProductPacks\Classic\1E-Patch-Success.zip

These Product Packs are required to support various Tachyonfeatures, for more detail please refer to Tachyon Product Packs reference.

If your license permits, you can use additional Product Packs available from 1E Exchange to meet specific use cases.

Classic Product Packs	Contain instructions, for use in Explorerand other Tachyonapplications. They can be uploaded using the Tachyon Product Pack Deployment Tool, or using **Settings→Instructions→Instruction sets** page in the Tachyon portal.
Integrated Product Packs	Contain policies, rules, and fragments for use by Guaranteed State, and may also include instructions. They can only be uploaded using

- ProductPacks\Classic\1E-Tachyon-Platform.zip
- ProductPacks\Integrated\MEMCMClientHealth.zip
- ProductPacks\Integrated\NomadClientHealth.zip
- ProductPacks\Integrated\TachyonCore.zip
- ProductPacks\Integrated\WindowsClientHealth.zip

the Tachyon Product Pack Deployment Tool.

Note

You should also have access to the location of the **Tachyon.lic** file provided with your purchase or evaluation.

1.4.2.2 Running Setup

Logon to the server using the Server installation account.

To start the setup wizard, double-click on **Tachyon.Setup.exe**. It will then display the following screens, you may go directly to any screen by clicking on the list on the left side of the wizard, but for best results, we recommend that you follow these in the order they are presented.

Note

Parts of each Setup screen will be greyed out if they are not applicable for the selected configuration type.

Warning

If you are installing a DMZ Server, please refer to Implementing a Tachyon DMZ Server before running Tachyon Setup.

The setup provides a two-stage process to install a new DMZ Server:

1. Run Setup Maintenance on the Response Stack server (specifically the server that hosts the Core which the DMZ Server will connect to) to prepare the Response server and its database, and store details in an **ini** file.
2. Run Setup to install the DMZ Server using the prepared **ini** file.

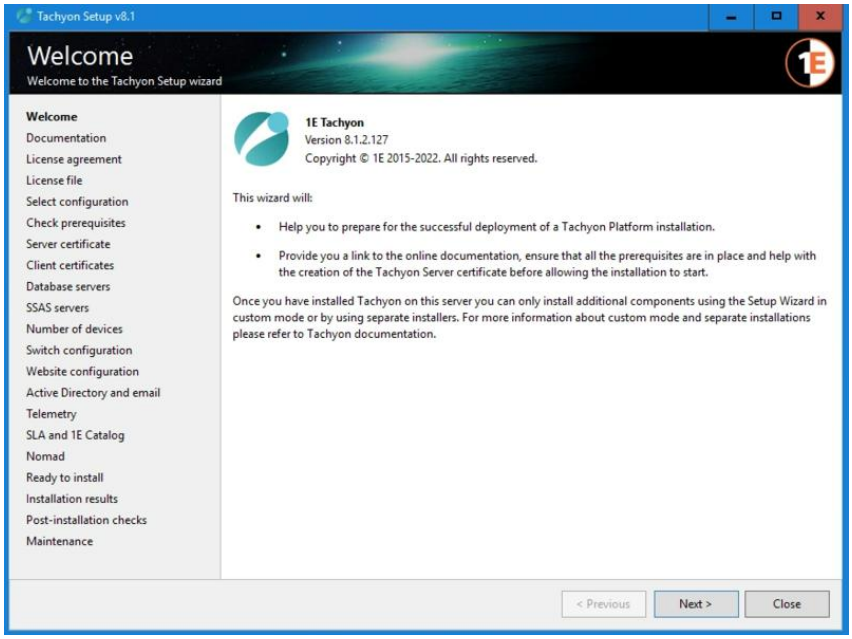
The two-stage process and its **ini** file are required because setup is unable to communicate through the DMZ firewall. In previous versions of Tachyon, the first stage required complex manual configuration.

To upgrade a DMZ Server, you only need to run setup on the DMZ Server, you do not require the **ini** file.

1.4.2.2.1 Welcome

This screen provides the version number for Tachyon platform and outlines what the wizard will do. It also examines the system for installed versions of the components and displays warning messages in case any of them cannot be upgraded to the versions that you are currently installing.

Click **Next** to go to the next screen.

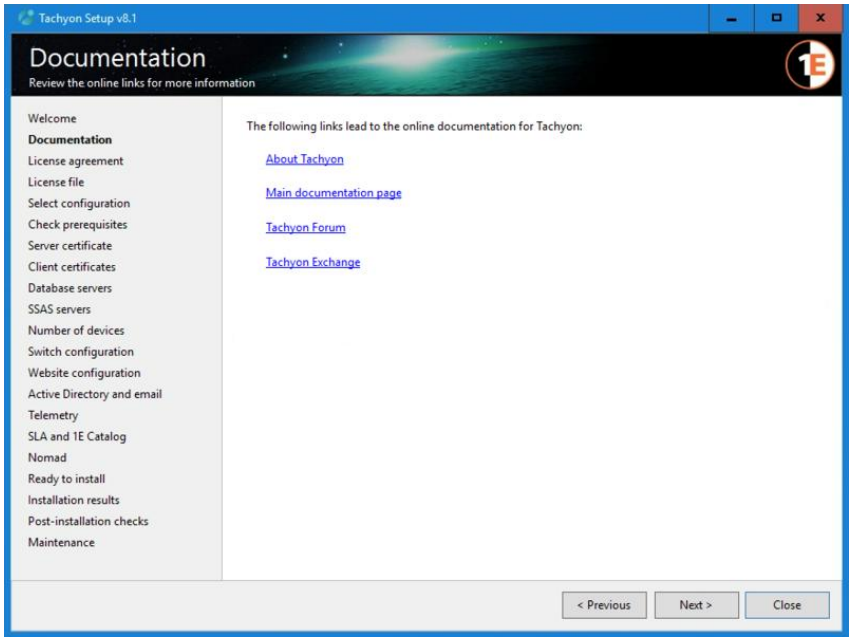


1.4.2.2.2 Documentation

This screen provides links to several online resources that provide additional information about how to use and configure Tachyon.

Link	Description
About 1E	Links to the Tachyon platform page on the 1E website.
Main documentation page	Links to the Welcome page for this documentation are on the help.1e.com website.
1E Forum	Links to the Tachyon Forum where you can find technical resources, such as troubleshooting and FAQs.
1E Exchange	Links to the 1E Exchange where you can find 1E and community-supported product packs to supplement the product packs included in the Tachyon Platform.

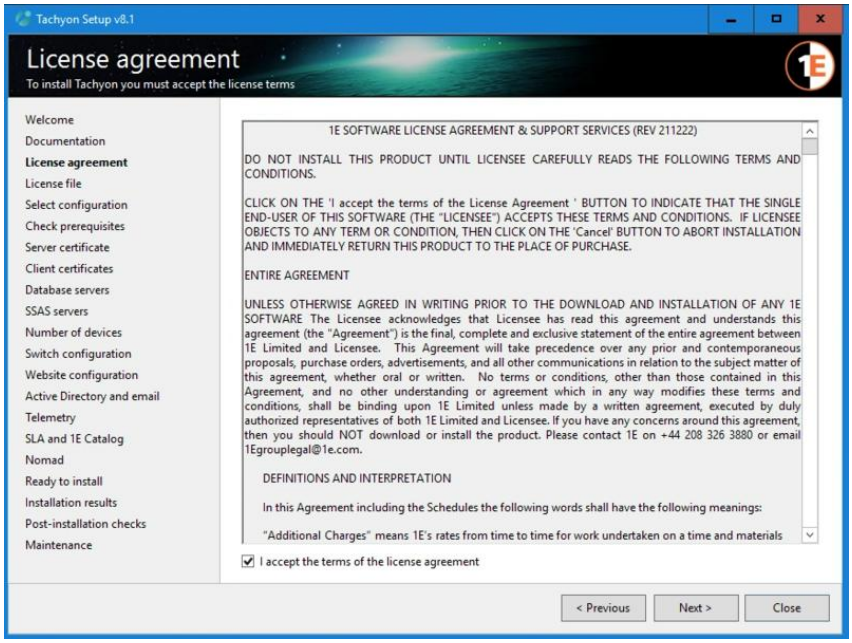
Once you've finished investigating the online resources, click **Next** to go to the next screen.



1.4.2.2.3 License agreement

You must read and then accept this license information by checking the **I accept the terms in the license agreement** checkbox. If you continue with the setup without checking the link to this screen will be highlighted in red and you won't be able to install it until it is checked.

Click **Next** to go to the next screen.



1.4.2.2.4 License File

On the **License File** field screen, you must enter the path to a valid 1E license file. You can also click **Browse** to locate the file using a standard file browser.

1E will provide you with a **Tachyon.lic** license file that defines the applications, tools, and features your system is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license.

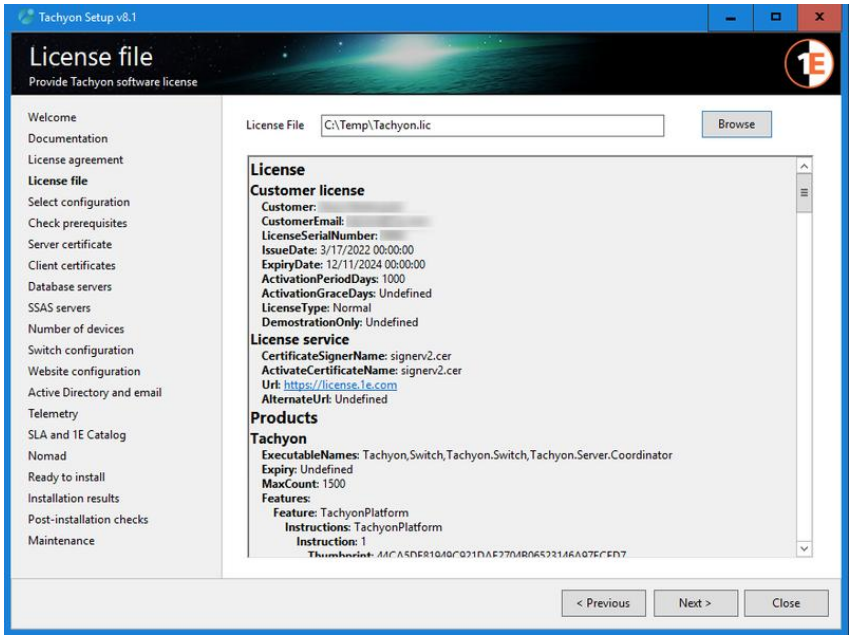
- The license must be activated. Once activated, it may be used only by the system that activated it.
- Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable.
- For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk.
- For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server.

Setup will attempt to connect to the 1E license service in the 1E cloud, and warn you if a connection cannot be established. The product will still install successfully and you will be able to connect to the Tachyon portal but you won't be able to fully use the system until you enable communications with the 1E license service.

For more details please refer to the License requirements page.

Note

This screen displays the message "A DMZ Server installation does not require a license file" when installing a DMZ Server, and you have provided an **ini** file in the Setup folder that has the same name as the server hostname.



1.4.2.2.5 Select configuration

This screen lets you choose between installing all the Tachyon Server components onto a single server or selecting the components you want to install individually.

The options in the **Select configuration** list are:

- **All components on a single server** (default) - all components required for Tachyon Master and Response Stacks
- **Tachyon Master Stack** - all Tachyon systems require one Master Stack
- **Tachyon Response Stack** - this is required for Real-time features of Tachyon
- **DMZ Server** - this is required to provide Real-time features to Internet-facing clients

Note

This screen automatically selects "DMZ Server" when installing a DMZ Server, and you have provided an **ini** file in the Setup folder that has the same name as the server hostname. For more detail, please refer to Implementing a Tachyon DMZ Server.

Optional components

When you select **All components on a single server** or **Tachyon Master Stack**, you can also select optional components:

- **Tachyon Experience** - if you want to use the Experience application from 1E
- **Nomad** - if you want to monitor Nomad in your environment, and features such as Single-Site Download and Pre-cache
- **AppClarity**
- **Application Migration**.

A component is included in this list because its installer **.msi** file has been detected by Setup in its **Installers** folder. A component is automatically enabled if its feature is enabled in the License File.

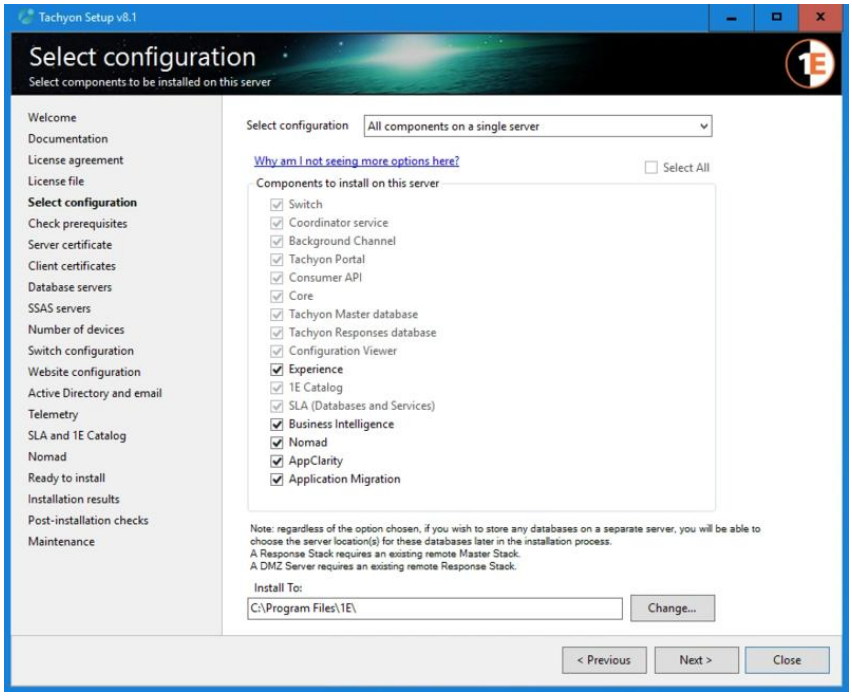
Setup will also automatically install additional applications it detects in its **Installers\Apps** folder, which includes apps that do not have their own installers, such as Explorer , Guaranteed State , Inventory , and Patch Success . After installation, these apps are visible in the Tachyon portal if their consumer is enabled in the License File. The Settings app is always available.

Custom configuration

A **custom configuration** can be made available where you can select the components you wish to install on the server. For guidance please contact 1E.

You can also change the folder you wish to install to.

After selecting the installation options you want, click **Next**.



1.4.2.2.6 Check prerequisites

This screen performs prerequisite checks on the local server and user account. The list varies depending on which components you selected on the Select configuration screen.

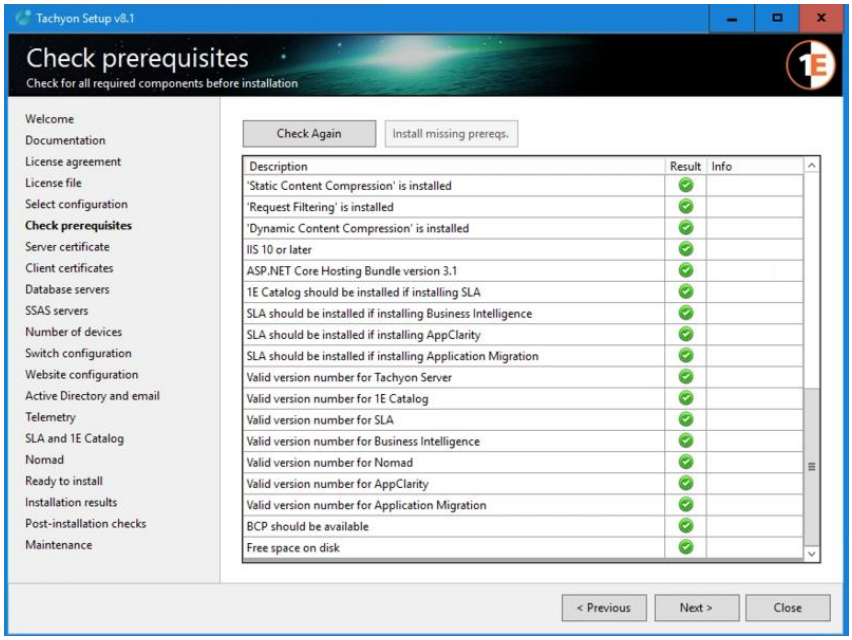
Click **Start Checking** to start the checks.

If any of the checks fail, **Tachyon Setup** may be able to install the missing prerequisites. To install these, click the **Install missing prereqs.** button.

> **Note**
>
> If .NET Framework 4.8 is missing, the checker will stop at this point, for you to select **Get & Install**. You must reboot after you have installed .NET Framework, and then start Tachyon Setup again.

> **Note**
>
> If there are missing prerequisites that **Tachyon Setup** is able to install, then the **Install missing prereqs.** button is enabled. If you click this button, the missing prerequisites will start the installation immediately.
>
> Not all prerequisite checks have automated fixes. If your environment fails a check and the **Install missing prereqs.** button has not been enabled then you will need to install or configure the missing prerequisites by hand.

You can click **Check Again** to re-run the checks once any remediation steps have been made.



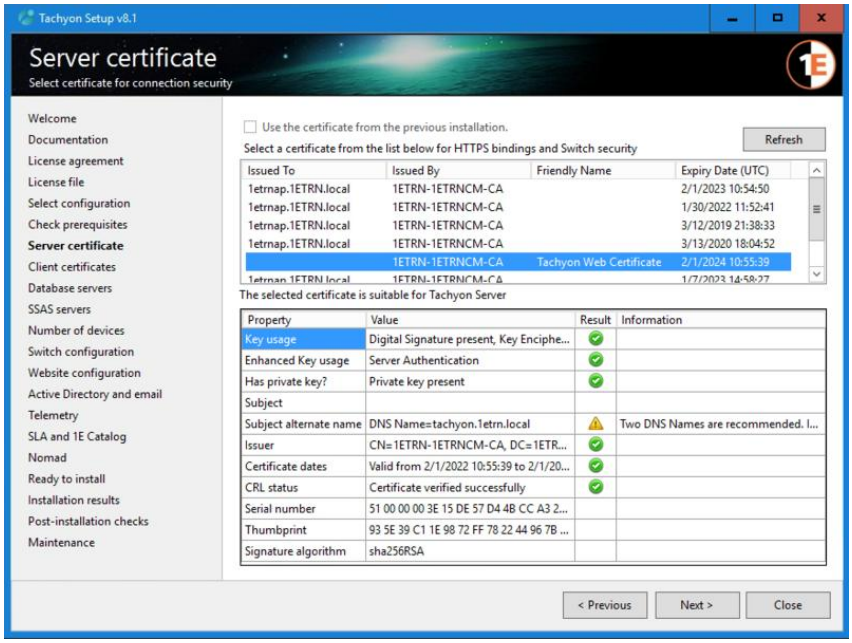
1.4.2.2.7 Server certificate

This screen displays a list of certificates from the Local Computer\Personal certificate store, letting you select a specific certificate you want to use for the Tachyon Server website and Tachyon Switches. Tachyon Setup will then evaluate the suitability of the selected certificate.

> **Note**
>
> You may notice a warning for the **Subject alternate name** indicating that **Two DNS Names are recommended**. This is a requirement when performing a Tachyon Setup in a DMZ scenario. In all other scenarios, although recommended this warning can be ignored and still result in a successful setup.

The option to **Use the Switch certificate from a previous installation** can be used if you are upgrading, or you can choose a different certificate.

If there are issues with the certificate after installation, they may be resolved using the steps in Server installation issues.



1.4.2.2.8 Client certificates

This screen lets you manage the trust(s) between the Tachyon Server and clients.

If your clients do not have certificates or you do not want to use them, then uncheck **Switches require client certificates to be presented by Tachyon client features of the 1E Client**. This option configures Switch(es) to not require client certificates. Clients will effectively use anonymous authentication.

Note

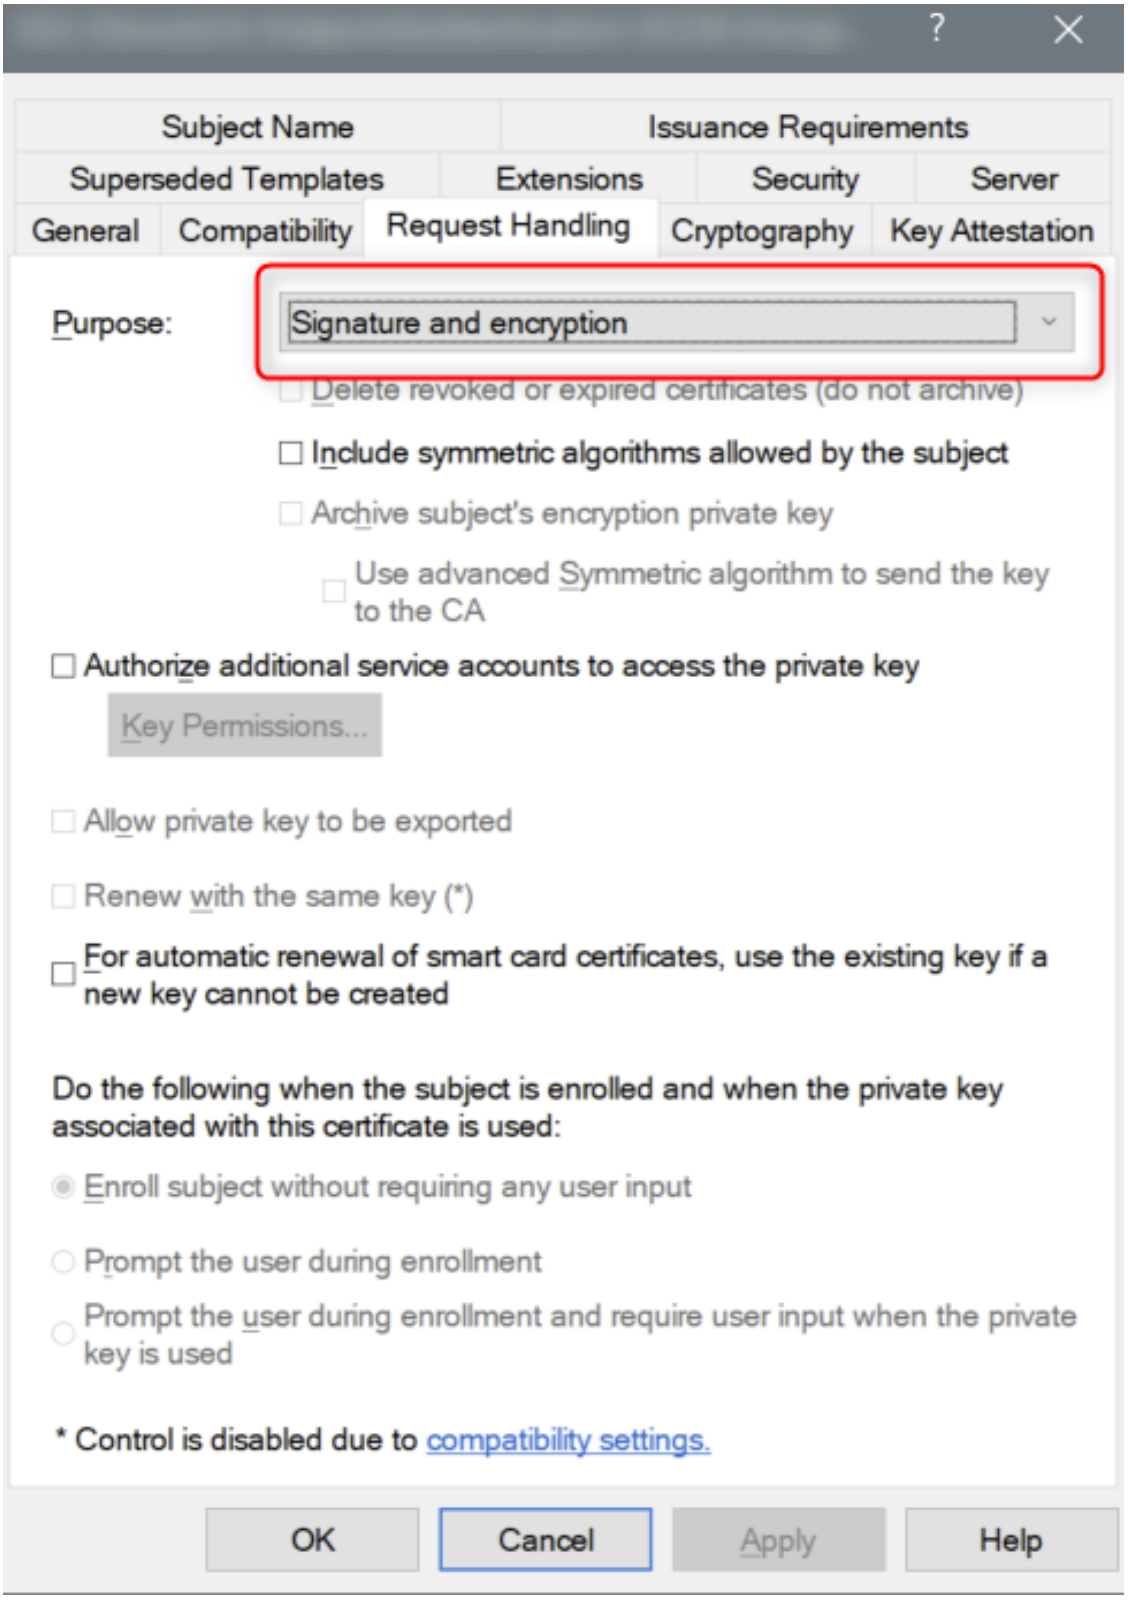
For a new installation, this setting is checked by default.

For an upgrade, this setting is determined by the current configuration of the Switch(es). If any Switch is configured to require client certificates, then this setting will be checked and re-applied to all Switches.

Please refer to Switch Command Lines if you want to reconfigure switches post-installation.

Note

The 1E Client requires that the client certificate it presents to the platform has both the **Signature** and **Encryption** request handling options. These options are the defaults if provisioning using a Computer Certificate template from a Microsoft Windows Certificate Authority. If you are using a custom template, or an alternative certificate authority, you should confirm that both these options are enabled.



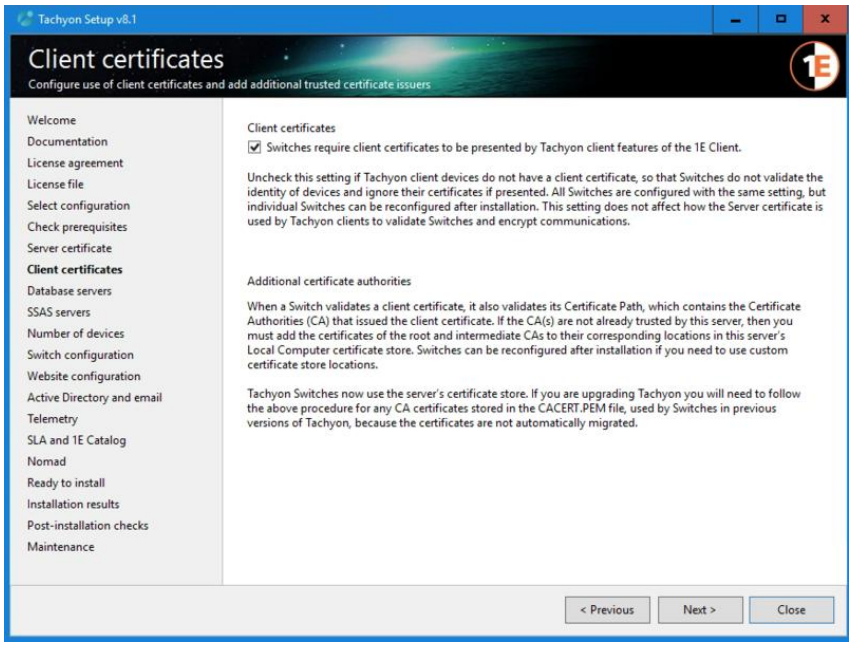
Using certificates issued by a differant CA

If you want clients to present certificates, that were issued by a different Certificate Authority than the certificate used by Switch(es), then the process described below must be used for each *different* Certificate Authority:

1. Create **.cer** or **.pfx** files containing the public key of the issuing CA, its root CA, and any intermediate CA in the trust path of the client certificate.

2. Import the CA files into the corresponding CA stores on the Tachyon server.

For more detail about client certificates, please refer to Tachyon client certificate requirements.



1.4.2.2.9 Database servers

On this screen, you select the SQL Server instances where you want to install each of the databases that will be deployed:

- Master
- Responses
- 1E Catalog
- SLA databases (SLA-Data, SLA-Shared, and SLA-Integrate databases must be installed on the same instance)
- Content Distribution
- Experience .

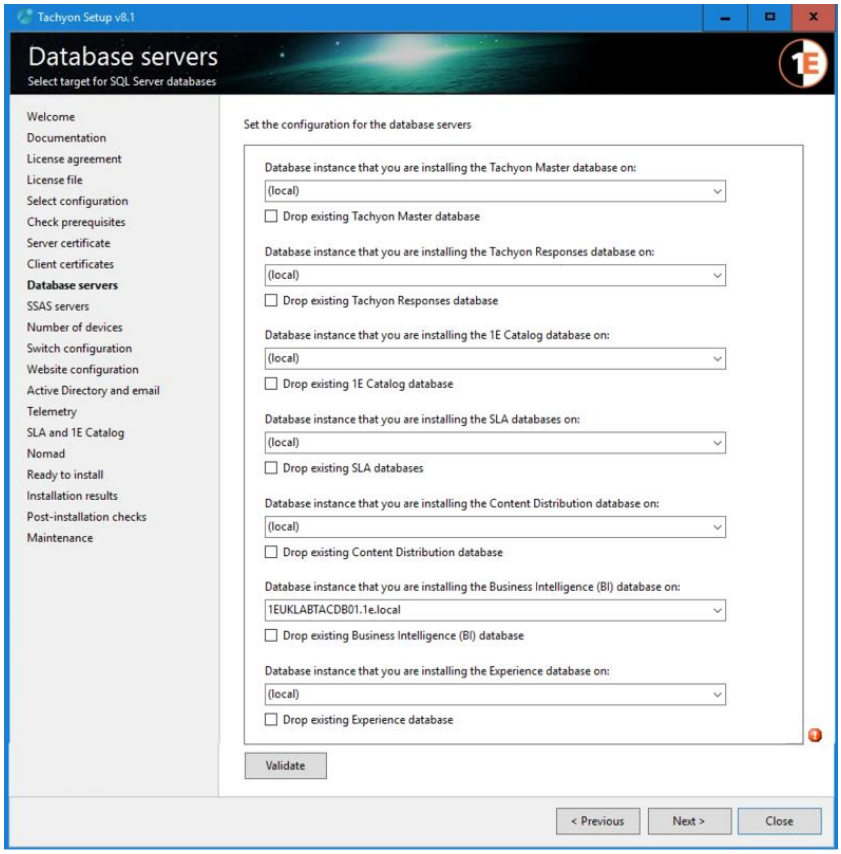
For each database, a combo box containing a list of available SQL Server instances is displayed. This list of instances is generated as a background task, so it may take a few seconds to populate. It may also return instances that are accessible but not necessarily on the local network. You may

select one from the list or type in your own. 1E recommends all databases are installed on the same SQL Server instance.

For each database, there is a **Drop existing <title> database** checkbox, which if you are upgrading you can check to remove any existing data from that database on the specified database server. You should be careful when checking these checkboxes and sure that you want to continue, as data will be deleted if they are checked and the installation is started.

A **Validate** button is provided that performs some basic tests to check that the selected SQL instances can be accessed using the current user account.

Once the SQL Server instances have been selected and validated, click **Next** to continue.



1.4.2.2.10 SSAS servers

This screen is only relevant if you selected the option to install **Business Intelligence** on the **Select Configuration** screen.

On this screen:

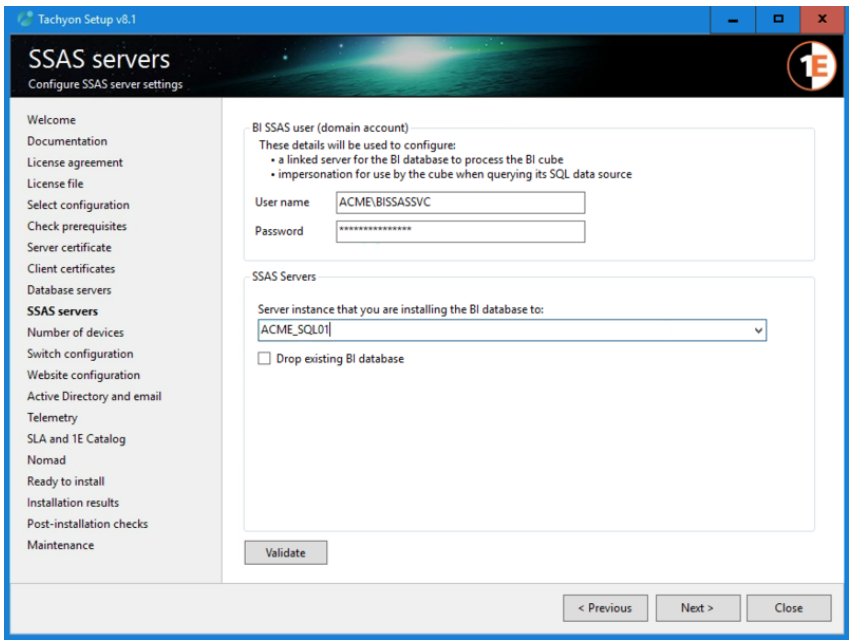
- Enter the credentials for the **BI SSAS User** account, that will be used to connect to the SSAS server (Patch Success)
- Select the server instance for the SQL Server Analysis Service where you want to deploy the Business Intelligence cube (Patch Success).

The **Validate** button lets you performs some basic tests (but not a full validation of permissions and functionality on the SSAS server).

Once you have entered and validated the settings, click **Next** to continue.

Note

For more information about the **BI SSAS User** account, please refer to Service accounts.



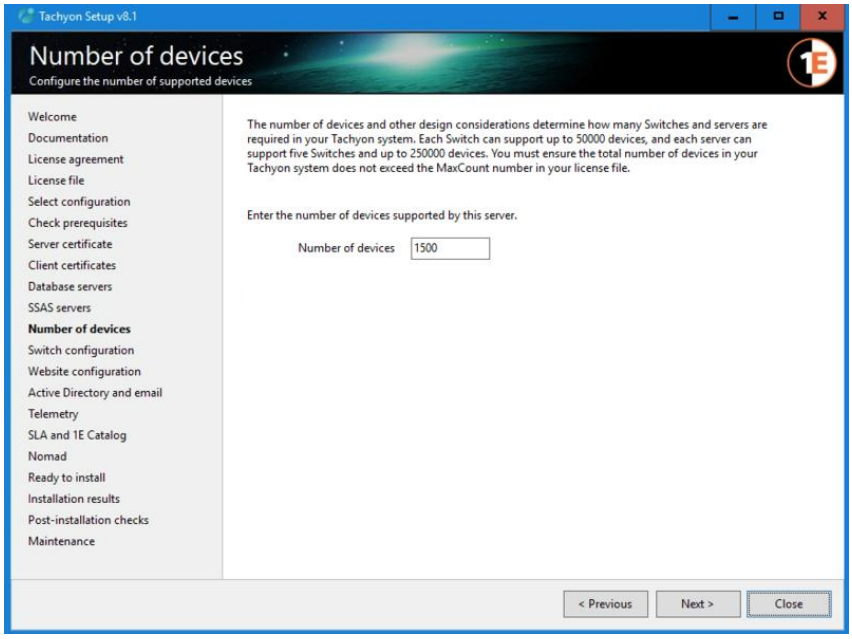
1.4.2.2.11 Number of devices

Enter the number of devices supported by this server.

The number of devices supported by a Tachyon Server determines the number of Switches configured on the server.

The range is 1 to 250,000; default is 1,000.

A single server with suitable resources can support up to five Switches and up to 250,000 devices, with each Switch supporting up to 50,000 devices. Additional servers or configurations may be required according to the design of the system. The total number of devices supported across the system must not exceed the license file allocation.



1.4.2.2.12 Switch configuration

This screen is only relevant if you selected one of the following configuration options:

- All components on a single server
- Tachyon Response Stack
- DMZ Server.

This screen displays a list of IP Addresses that can be assigned to each Switch in your configuration. Tachyon Setup will estimate how many Switches are required for the number of devices selected in the earlier setup screen and try to assign an IP Address for each. You will need to confirm or change which IP Address is used by each Switch.

IPv6

The screen only displays a list of IPv4 IP Addresses available on the server. If you need to use IPv6 and have a functioning IPv6 network infrastructure then please contact 1E for further advice on how to use this screen.

Ideally, to maximize the performance of Tachyon you should have the following configuration:

- You have enough Switches configured to support the selected number of devices - you can add additional Switches by clicking extra checkboxes if you have enough IP Addresses configured
- One interface per Switch - interfaces may have more than one associated IP Address, so you'll need to check the MAC Addresses to make sure that the IP Addresses are on different interfaces
- An additional interface if you have a remote SQL Server, is necessary to separate incoming and outgoing response traffic, using a persistent route as described in Configuring a persistent route for SQL traffic.

However, in a lab or other environment which has less than 500 devices, you can have all components using a single IP Address.

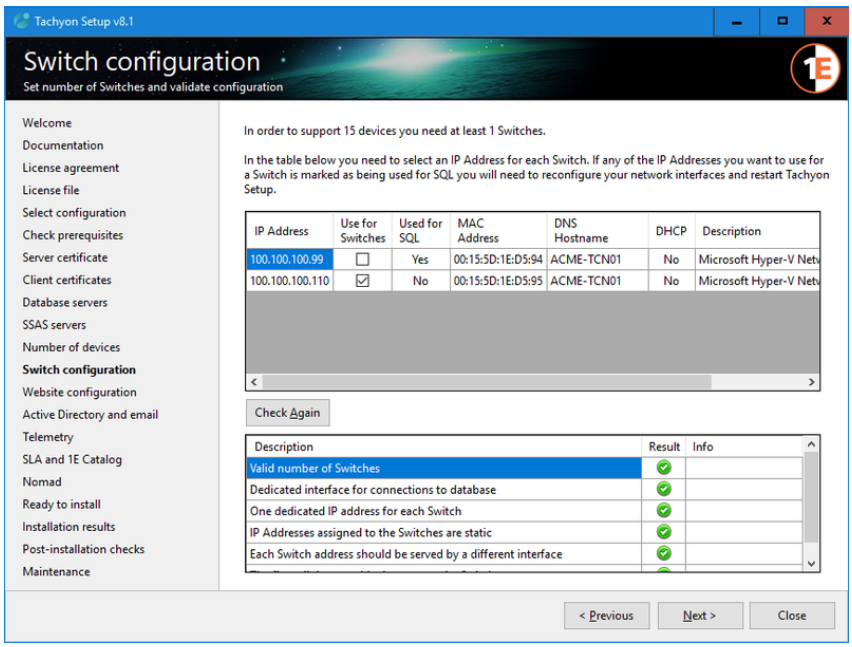
If you have a local installation of SQL Server, then **Used for SQL** will show **No** for all IP Addresses, and you can select whichever IP Address you wish to for each Switch.

If you are using a remote SQL Server, then **Used for SQL** will show **Yes** for the IP Address, which is the validation process used in the Database servers screen to validate the connection to the SQL Server you selected for the Responses database. If this is not the same interface you prepared a persistent route for, then you will need to configure the persistent route and restart Tachyon Setup. The validation checks do not test if the route is persistent.

For an installation with multiple Switches, aside from each selected IP Address, all Switches will have an identical configuration.

Click **Validate** to check that your selection conforms to the best practice rules for configuring switches.

Once the selection has been validated, click **Next** to continue.



1.4.2.2.13 Website configuration

Confirm that the details are correct on this screen. If the defaults are changed, then ensure you use the **Validate** button.

> **Note**
>
> Many of the fields on his screen are pre-populated with default ports (the Main website binding ports should not be changed), and DNS Names found in the certificate selected in the Server certificate screen.
>
> When installing a DMZ Server, and you have provided an **ini** file in the Setup folder that has the same name as the server hostname, the fields are pre-populated using values from the **ini** file. You should not change these.
>
> For more detail, please refer to Implementing a Tachyon DMZ Server.

Parameter	Description
HTTP Host Header (Main binding)	Sets the **host header** used by the **main HTTP binding** for the website. The default value is set to the FQDN for the local computer, and should not need to be changed. **Note** If you are upgrading from SLA Platform 3.3 and SLA Platform had a custom host header defined for HTTP, you should change the host header to the host header used for the SLA Platform website. If the Tachyon website uses a different host header port than was previously used by SLA Platform and you are using Application Migration, the Application Migration Task sequence step and Shopping integration will stop working until these URLs are updated.
HTTP Port (Main binding)	Sets the **port** used by the **main HTTP binding** for the website. Together with the Host Header and IP Address, these bindings uniquely identify the website which Tachyon Switches use to connect to the Tachyon Core. The default value is set to 80, and should not need to be changed. **Note** If you are upgrading from SLA Platform 3.3, you should change this port to the **HTTP port** previously used for the SLA Platform website (default **8080**). If the Tachyon website uses a different port than was previously used by SLA Platform and you are using Application Migration, the Application Migration Task sequence step and Shopping integration will stop working until these URLs are updated.
HTTPS Host Header (Main binding)	Sets the **host header** used by the **main HTTPS binding** used by the website. This is used by: • Tachyon administrators to communicate with the Tachyon portal and apps • Tachyon clients connecting to the background channel, if installed. **Note** The FQDN used for the host header must be included as a Subject Alternate Name (SAN) in the Web certificate. The default value is set to Tachyon .<domainFQDN>
HTTPS Port	Sets the **port** used by the **main HTTPS binding** used by the website. The default value is set to 443, and should not need to be changed.

Parameter	Description
(Main binding)	
HTTPS Host Header (Alternate binding)	Sets the **host header** used by the **alternate HTTPS binding** used by the website. This is mandatory when installing on a DMZ Server, and used for the internal-facing network. Optionally used by the following if you do not want the main HTTPS binding, for example if you want to use a different HTTPS port: • Tachyon clients connecting to the background channel • Application Migration clients running task sequences and connecting to the SLA Provider API • AppClarity software reclaimer connecting to the SLA Provider API. **Note** If used, the FQDN used for the host header must be included as a Subject Alternate Name (SAN) in the Web certificate. **Note** If you are upgrading from SLA Platform 3.3 and SLA Platform had a custom host header defined, you should change the host header to the host header used for the SLA Platform website. If the Tachyon website uses a different host header port than was previously used by SLA Platform and you are using Application Migration, the Application Migration Task sequence step and Shopping integration will stop working until these URLs are updated.
HTTPS Port (Alternate binding)	Sets the **port** used by the **alternate HTTPS binding** used by the Tachyon portal website. This is used by clients to communicate with the Tachyon server using the background channel. The default value is set to 443. **Note** If you are upgrading from SLA Platform 3.3, you should change this port to the **HTTPS port** previously used for the SLA Platform website (default **8443**). If the Tachyon website uses a different port than was previously used by SLA Platform and you are using Application Migration, the Application Migration Task sequence step and Shopping integration will stop working until these URLs are updated.

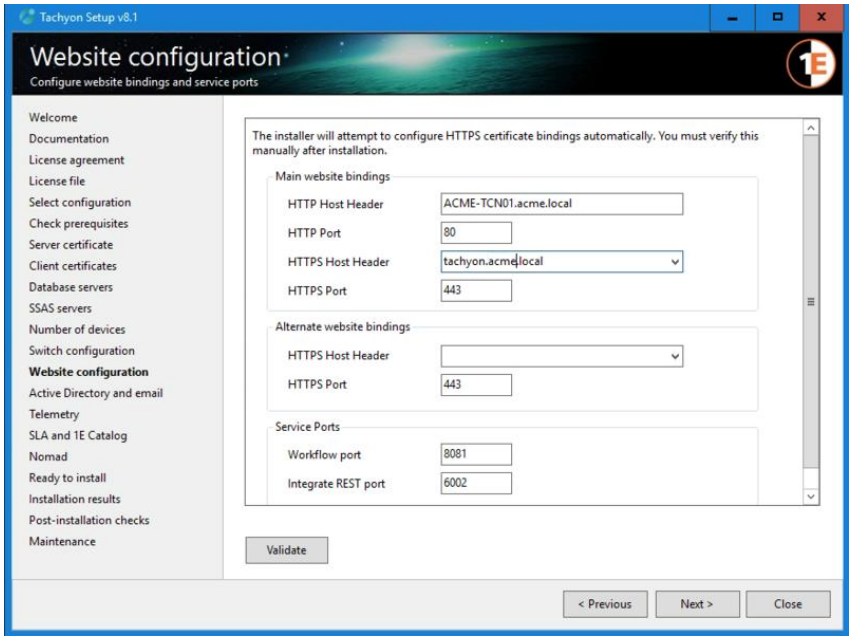
Parameter	Description
Workflow port	Sets the port used by HTTPS binding of the Coordinator Workflow module. This is separate from the Tachyon website. **Tachyon Setup** suggests **8081** by default, and should not need to be changed.
Integrate REST port	This is used internally by the SLA Integrate services. You will normally not need to change it unless it conflicts with any other service that is already using the same port.

After installation, you will need to manually verify the certificate bindings, as described in Tachyon Server post-installation tasks.

A **Validate** button is provided that performs some basic tests to check that the selected HTTP/HTTPS Host Header and ports as well as the service ports do not conflict with each other and that the addresses are resolvable from DNS.

When all the settings have been made and validated, click **Next** to continue.

> **Note**
>
> Versions of Tachyon Setup before 5.2 had the option to change the IP Address used by the Main website bindings for HTTPS and HTTP. By default, this is * for both bindings. You can manually edit the bindings later using IIS Manager if you need to change the IP Address for any binding.



1.4.2.2.14 Active Directory and email

On this screen you enter the details for the Active Directory search method. You can choose to enable email and enter the SMTP server details. When email is enabled you can also select if you want two-factor authentication to be enabled.

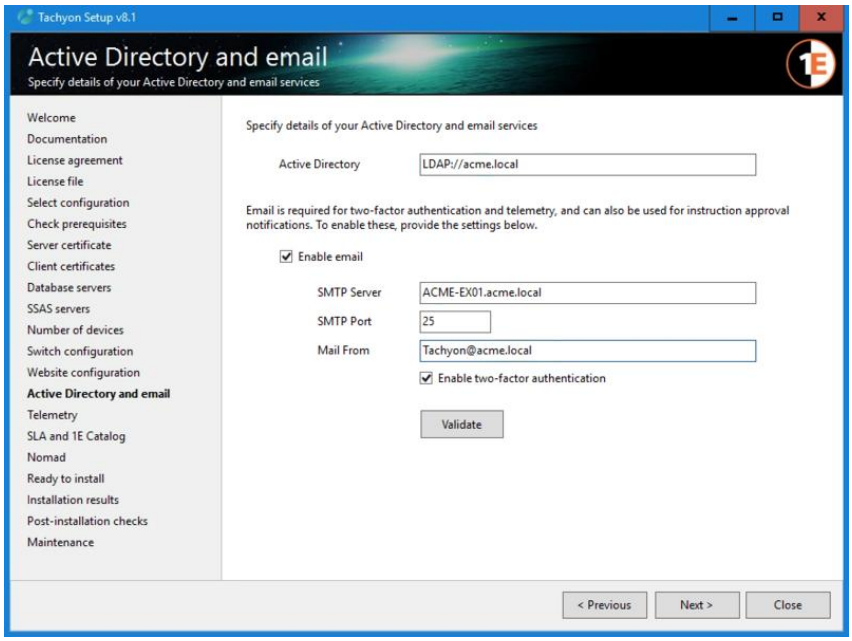
Parameter	Description
Active Directory	A list of Active Directory URLs. Tachyon services locate users and computers and membership of security groups by querying a semi-colon delimited list of Active Directory GC and/or LDAP URLs. **GC URL** This is the quickest and simplest method of resolving users and group membership. A single GC URL will normally resolve all users and groups within a single **forest**. Supports only Universal security groups. **LDAP URL** A single LDAP URL will normally resolve all users and groups within a single **domain**. Supports Universal and Global security groups. Required if a Global Catalog (GC) server does not exist in a trusted forest, or if Global security groups must be used. Any domain which contains Tachyon servers, users or groups must: • Be resolvable from the Tachyon Server using DNS - that is, the server must be able to resolve domain names using DNS • Have a two-way trust with the domain in which the Tachyon (Master Stack) Server exists - so that users trust the server, and the server trusts users • Allow the Tachyon Server to read computer, user, and security group objects in each domain. The default **GC://** is sufficient for a Tachyon Server in a simple Active Directory environment of one forest which has a Global Catalog. You can include, but it is not required, the name of the server's local domain or root domain, for example: **GC://acme.local**

Parameter	Description
	To add support for a remote forest which has its own GC, you would for example have **GC://acme.local;GC://nadir.local** and so forth adding the root domain of any other forests to the list of GC URLs. If you prefer to use LDAP, or there are difficulties with trusts between forest domains, then you would create a list of LDAP URLs including *all* domains that have Tachyon users and groups, as well as domains in which a Tachyon server resides. For example: **LDAP://acme.local;LDAP://pop.acme.local;LDAP://rock.acme.local;LDAP://country.acme.local;LDAP://nadir.local;LDAP://disco.nadir.local** You can mix GC and LDAP URLs, but you should avoid mixing LDAP URLs that are also resolved by a GC URL. For example: **GC://;LDAP://nadir.local;LDAP://disco.nadir.local** The Coordinator Workflow module queries AD for email details of Tachyon users, and the Consumer API queries AD for security details of Tachyon users to support Role-Based Access Control.
Enable Email	Determines whether email features are available. Tachyon uses email for: • Notifications • Two-factor authentication • Sending Telemetry data to 1E. For guidance about using non-default SMTP settings, see Email and 2FA requirements. If email notifications need to be disabled after installation, then see Changing the SMTP Host configuration. To configure Telemetry after installation, please refer to Enabling or disabling Telemetry features.
SMTP Server	Sets the FQDN of the SMTP relay/gateway. If the FQDN needs to be changed after installation, then see Changing the SMTP Host configuration.
SMTP Port	Sets the port used to connect to the SMTP relay/gateway. Default is 25.

Parameter	Description
	If the port needs to be changed after installation, then see Changing the SMTP Host configuration.
Mail from	Sets the mail-from email address used by the Tachyon Server when it sends emails. For guidance about the Mail-From address see Mail-From address.
Enable two-factor authentication	Determines whether Tachyon uses two-factor authentication. If email is disabled then so is two-factor authentication which relies on email. See Email and 2FA requirements.

A **Validate** button is provided that performs some basic tests to check that the selected SMTP server and port can be contacted.

Click **Next** to continue.



1.4.2.2.15 Telemetry

On this screen, you choose whether to enable or disable the Tachyon telemetry features.

The Default setting of **Server telemetry** feature is enabled

The Default setting of **User Interface telemetry** feature Is Full

Click **Next** to continue.

Note

Server telemetry

Tachyon will periodically send summarized, statistical information about the usage of the product to 1E. This enables 1E to improve your experience as it helps us understand how features are being used, focus future development, ensure we continue to support the Operating Systems you currently use, spot early warning signs of potential issues, and identify instructions that may be causing issues or could be improved. No personally identifiable data is collected. The data is compressed, encrypted, and sent to 1E through email.

Full details of what data is collected are provided here: Server telemetry data.

How to configure the frequency with this data sent to 1E is described here: Enabling or disabling Telemetry features.

The **Server Telemetry** feature is only available if the following dependencies are enabled:

- Coordinator service - this component is enabled when installing a Tachyon Master Stack, visible in the Select configuration
- Email - this is an optional feature in Active Directory and email screen.

1E Cloud connection from the server must also be whitelisted, as described in Whitelisting connections to 1E Cloud.

You can change the configuration after installation, as described in Enabling or disabling Telemetry features.

Note

User Interface telemetry

User Interface telemetry reports how the user interface is used, and data is sent directly from administrator browsers to the 1E Cloud.

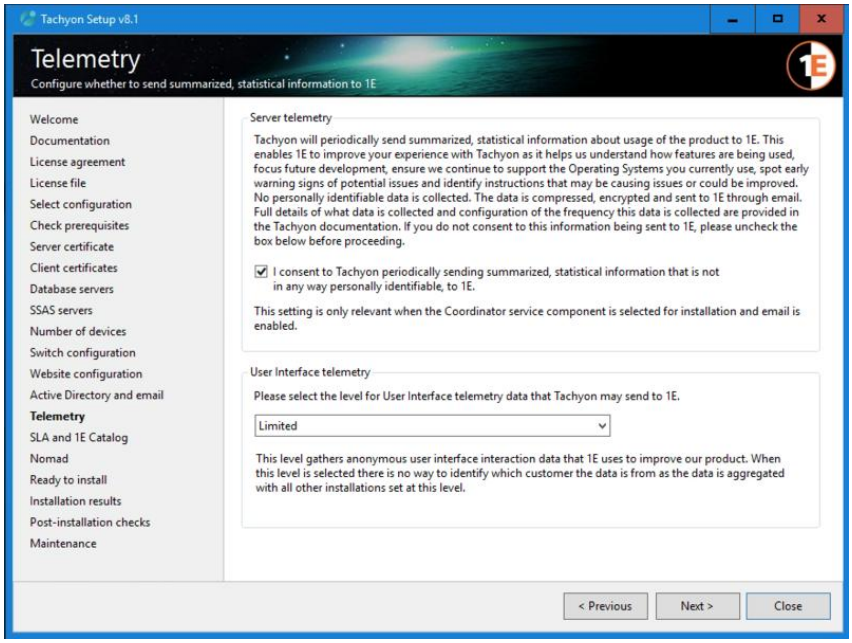
1E Cloud connection from administrator browsers must also be whitelisted, as described in Whitelisting connections to 1E Cloud.

You can change the configuration after installation, as described in Enabling or disabling Telemetry features.

There are three options available, they all gather user interaction data that 1E uses to improve Tachyon platform and its associated applications. They are described in the following table:

Option	Description
Limited	When this option is selected the data is aggregated and anonymized so there is no way to identify the customer the data is being collected from.
Basic	The data collected for this option is the same as the **Limited** option, except that it is associated with the name used in the

Option	Description
	license file. The 1E customer success team can use this information to help improve the experience for our customers.
Full	The data collected for this option is the same as the **Basic** option, except that it also records a unique identifier for each user. The user's name is not captured. The 1E product team can use this information to see how users are interacting with our products and understand their user journeys.



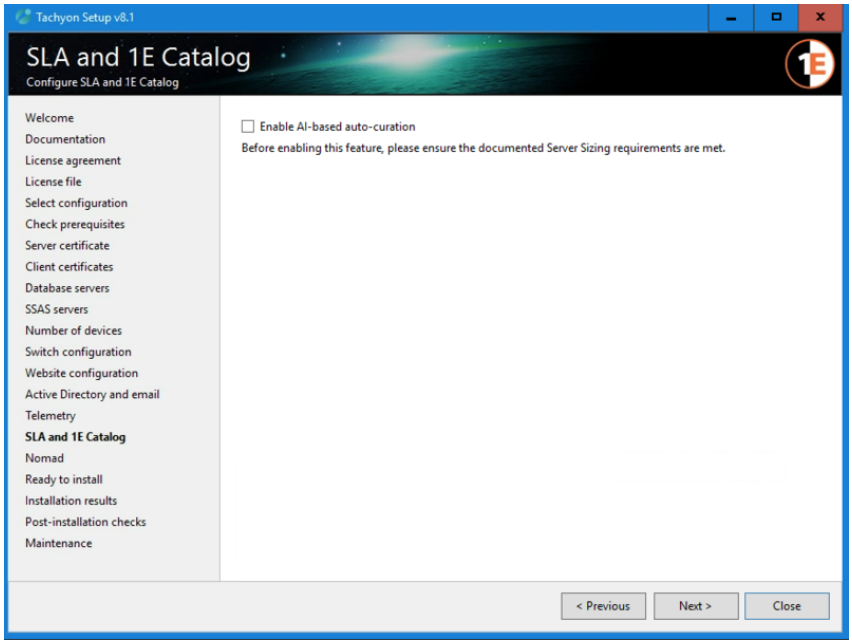
1.4.2.2.16 SLA and 1E Catalog

Tachyon AI Powered Auto-curation feature automatically recognizes software without the need to first create mapping rules in the 1E Catalog . This means you can have greater visibility of software installed across your organization. Please refer to AI Powered Auto-curation for more details, this also includes information on how to enable the feature post setup.

On this screen, you can configure whether the AI Powered Auto-curation feature is enabled or not. If you are installing or upgrading 1E Catalog using Tachyon Setup , enabling this will also configure 1E Catalog to download the files needed by SLA to support this feature.

To enable the feature, check the **Enable AI-based auto-curation** checkbox.

Click **Next** to continue.



1.4.2.2.17 Nomad

If you have selected the option to install Nomad on the **Select Configuration** screen, then you need to set the following options.

Name for the Configuration Manager Site server

Provide the name for the Configuration Manager Site server.

Doing this allows the Configuration Manager database to be located using a WMI query - for this to work the installation account must have Read-only Analyst permissions in Configuration Manager.

Use the **Validate** button to verify the specified Configuration Manager Site server can be located, and that the installation account has the required permissions in Configuration Manager.

> **Note**
>
> If your installation account does not have sysadmin rights on the SQL instance that hosts the Configuration Manager database, then you will see a popup warning you that Setup could not validate the membership of the Tachyon

	server's computer$ account in the **ConfigMgr_DViewAccess** localgroup. This is not a fatal error as long as you are sure the account is a member of the localgroup. If you proceed without this, then you will need to add it later to ensure Nomad functions correctly. For more information about the **ConfigMgr_DViewAccess** localgroup, please refer to Microsoft Endpoint Configuration Manager preparation.
Synchronization interval	Select a synchronization interval in minutes that governs how often the Nomad app and Pre-cache feature synchronizations will happen. This is set to 30 minutes by default.

You must also configure the following authentication options. If you do not configure these settings now, then you will have to manually configure them later if you decide to use Nomad .

Authentication from Background Channel Proxy to Content Distribution	Determines how the Background Channel Proxy communications with the Nomad application. You have the following options: **Windows authentication** — Windows authentication will be used to authenticate communications between the Background Channel and Content Distribution. **Certificate** — On choosing this option, you then need to select a valid **Client Authentication certificate** on the

	local server, that will be used to authenticate communications from the Background Channel by the Content Distribution component. Use the **Validate** button to verify the selected certificate.
Authentication used by Nomad clients connecting to the Background Channel Proxy	Determine how the Nomad clients will authenticate with the Background Channel Proxy. This is separate from the Nomad client configuration for Peer-to-Peer communication features. You have the following choices:
Client certificates	This option is the natural choice if you have also chosen, in the Client certificates screen above, for clients to their present client authentication certificates to Switches on the same server as the local Background Channel. Use this if either of the following is true:

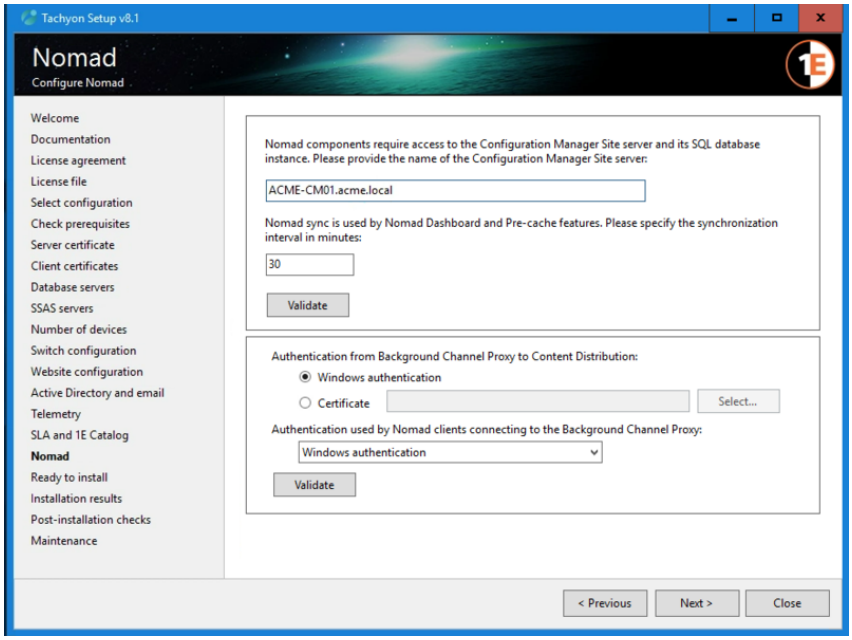
	• You are installing the Background Channel on a DMZ Server that is not domain-joined • Any of your 1E Clients are non-Windows or not domain-joined (workgroup) computers.
Windows authentication	Use this if you do not wish to use client certificates. This option is only possible if the local server is domain-joined, which is not typical for a DMZ Server. All your 1E Client must be domain-joined computers in domains trusted by the

	domain of the Response server.
None	If neither of the above options is possible. This means any clients will connect Anonymously.

Note

The Background Channel provides a reverse proxy feature that forwards communications from Nomad clients (internal and external) to the Content Distribution API, devices that are external to the organisation will communicate via the 1E DMZ server.

Click **Next** to continue.



1.4.2.2.18 Ready to Install

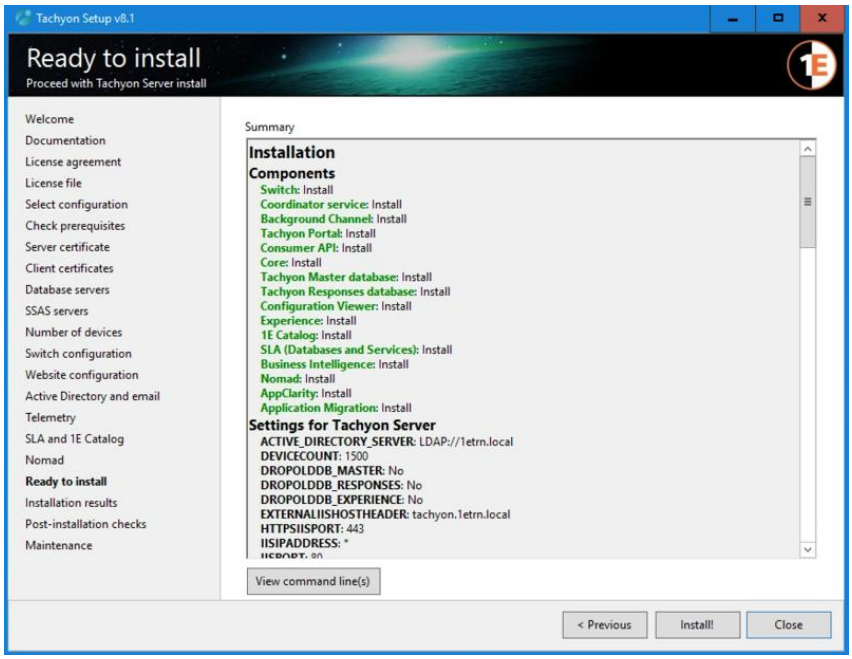
To start the Tachyon Server installation with the information you have provided, click the **Install!** button at the bottom of the **Ready to Install** screen.

Note

Because you can click on this screen at any point, the **Install!** button is only enabled when enough information and responses have been provided on the other screens to enable installation to start.

For example, one of the conditions is that until you respond by checking the **I accept the terms in the license agreement** checkbox on the **License Agreement** screen the **Install!** button will not be enabled. Other items such as selecting a valid Tachyon Server website certificate are also requirements.

Once you have reached this stage and no errors are displayed, a file named Tachyon.Setup.ini is written to disk in the same folder that contains Tachyon.setup.exe. This .ini file contains the selections that you made up to this point, and can be used to re-launch the installer without having to re-enter all the settings.



When you've configured the installation properties you can click the **View command line** button to view the command lines used to run the various **.msi** installers to install Tachyon Server along with the bundled components with the settings you have entered.

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

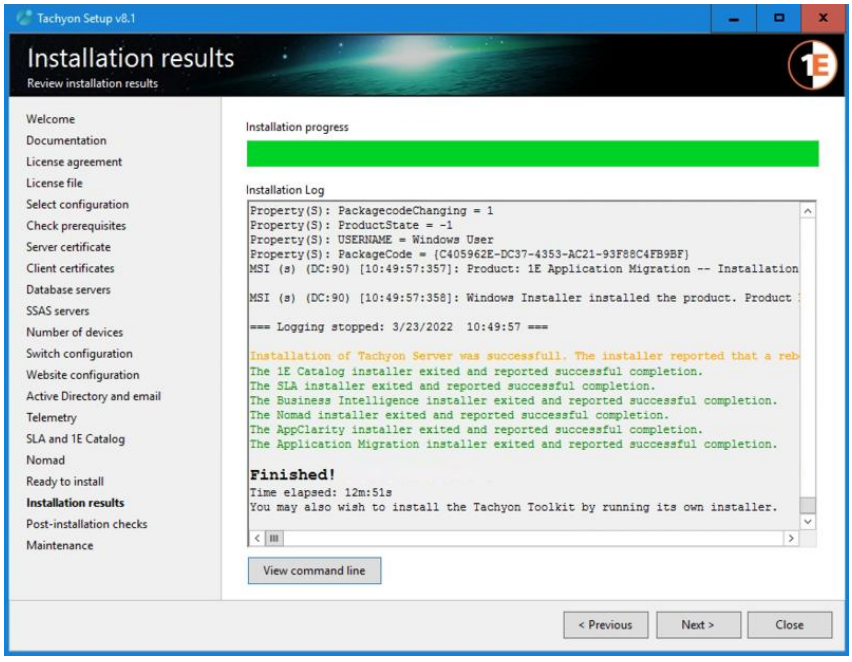
Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

1.4.2.2.19 Installation results

This screen displays the current progress of the installer. The installer log information is displayed as it occurs in the Installation Log window.

Once the installation has finished successfully the message:
The installer exited and reported successful completion, will be displayed in the **Installation Log** window.

You can find the installation logs on disk (*.log) in the same folder from where Tachyon.Setup.exe was launched.

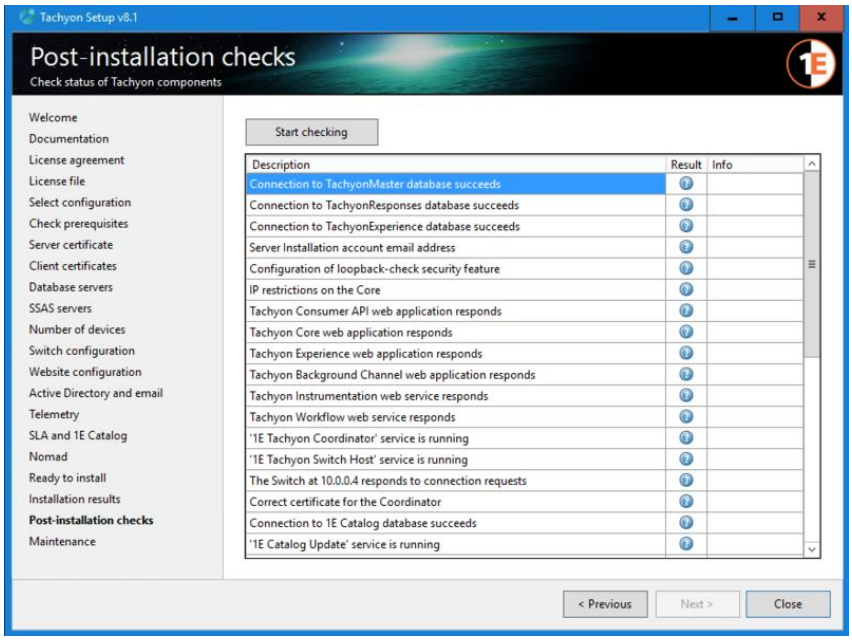


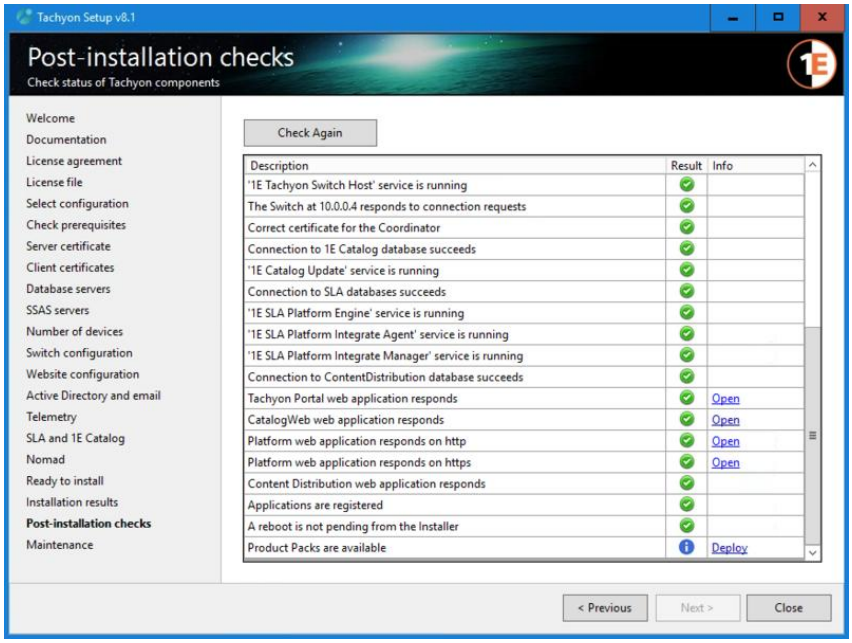
1.4.2.2.20 Post-installation checks

After an installation, you can opt to run the **Post-installation checks** by clicking on the **Start checking** button.

The aim is to achieve 100% check success results in the **Result** column. If any of the checks fail, look for additional information in the **Info** column. You can use this information to help troubleshoot the issue in combination with the Troubleshooting section and/or share with 1E Support.

One of the post-installation checks is: **Tachyon Portal web application responds**. When this check passes, it will display a link **Open** which can be used to start the default browser and connect to the **Tachyon Portal**.





1.4.2.3 Maintenance

You can start **Tachyon.Setup** and click directly on the **Maintenance** link in the left-hand menu.

1.4.2.3.1 Maintenance

From this screen, you can:

- **Uninstall...** all or part of the components deployed from Tachyon Setup
- Install, re-install or update any **Applications...**
- Change the **Server certificate...** used by the Tachyon website, switches, and services - or fix their bindings
- Upload and apply a 1E Hotfix bundle by clicking on **Hotfixing...**.

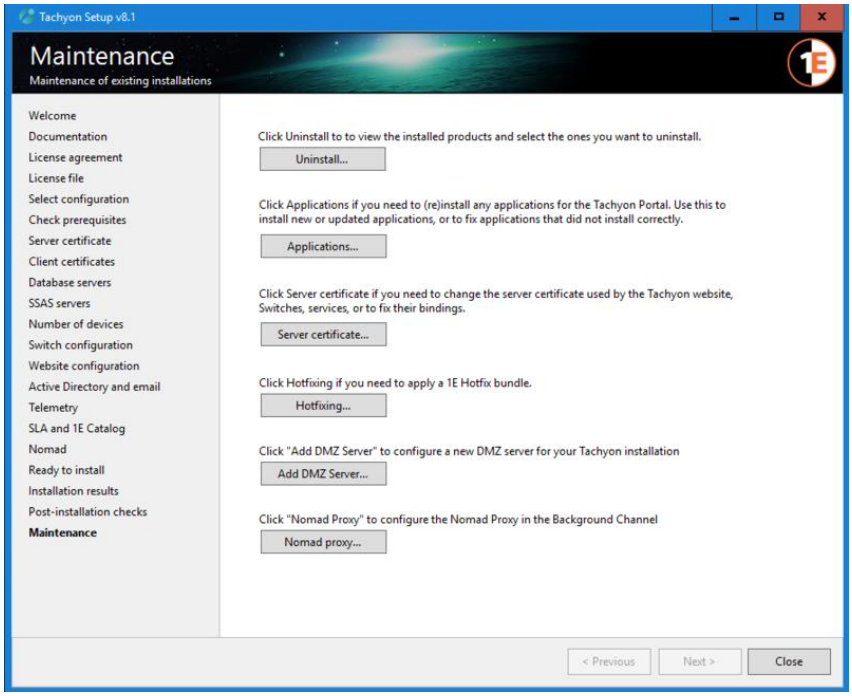
Note

A 1E Hotfix bundle contains the latest hotfixes for a specific version of Tachyon. It consists of a manifest XML file containing commands, and files which can include scripts as well as MSP files, to patch one or more components on the local server.

If you need to apply a 1E Hotfix bundle, then you must run Tachyon Setup on all of your Tachyon servers, according to the instructions provided with the bundle.

See screens below:

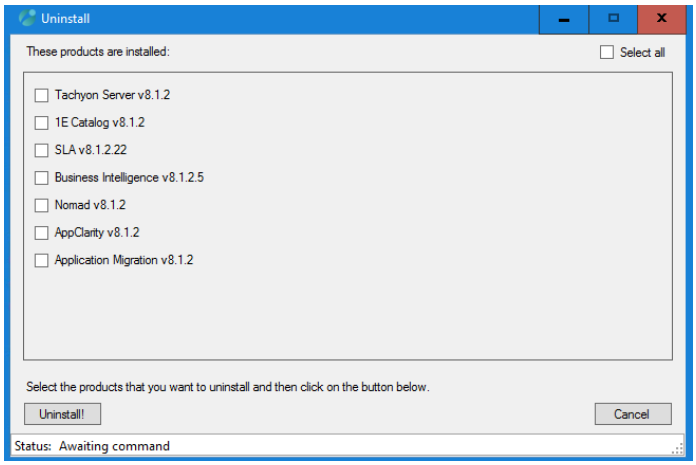
- Uninstall
- Applications maintenance
- Certificate Bindings
- Upload and apply a 1E Hotfix bundle
- Add DMZ Server
- Nomad Proxy.



1.4.2.3.2 Uninstall

From this screen, you can **uninstall** all or some of the components deployed from **Tachyon Setup**.

> **Note**
>
> **Tachyon Setup** is the recommended method of uninstalling all or individual components instead of using the Windows Control Panel.
>
> This is because Tachyon Setup can undo any changes that were done after deploying the components, which would not be undone by the standard application uninstaller. For an example of why this is important, see the information box below.



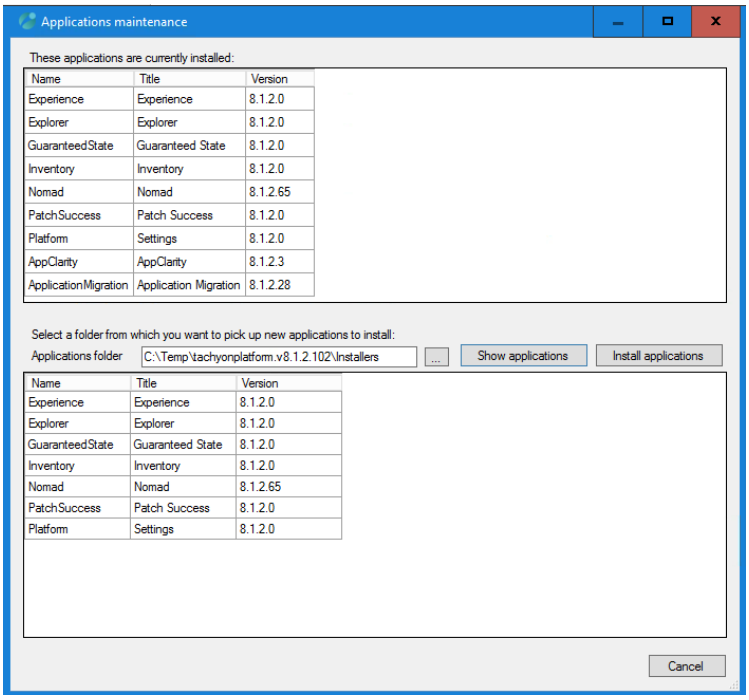
1.4.2.3.3 Applications maintenance

In this dialog, you can select to install or re-install any Applications used by the Portal.

The top grid displays the Applications that are already installed and their versions.

To install or re-install applications:

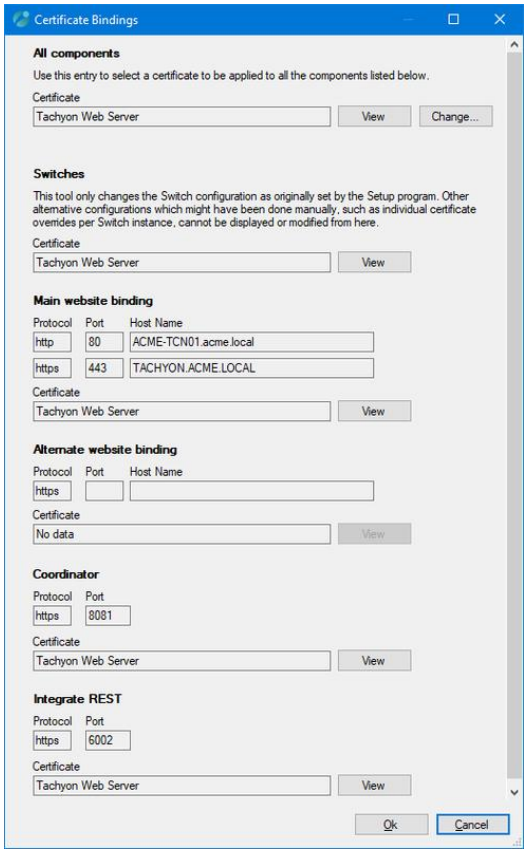
1. Type or select a folder in the **Applications folder** field.
2. Click on **Show Applications**. Doing this displays all applications found under the selected folder. The Applications are displayed using the **Name**, **Title** , and **Version**.
3. Click on **Install Applications**. This will upload the Applications into the server:
   - Any newly uploaded Applications are added to the server
   - Any uploaded Applications with a newer version number will replace the older versions
   - If any uploaded Application has a version number prior to an existing Application, an error message will be generated and the version will not be downgraded.



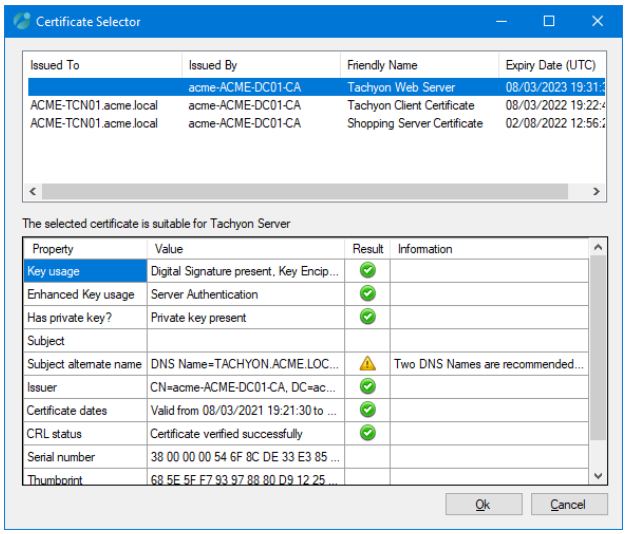
1.4.2.3.4 Certificate Bindings

In this dialog, you can change the certificate bindings used by the Switches, Website, Coordinator, and Integrate REST components. Currently, you can apply one certificate across all the components.

To view the certificate that is being used, click on any of the View buttons.



To change the certificate, click the **Change...** button and select the new certificate from the **Certificate Selector** dialog subsequently displayed. This dialog behaves in a similar way to the Server certificate screen displayed earlier in Tachyon Setup. When you've finished making the selection in the **Certificate Selector**, click **Ok**.



The certificate displayed for the Switches, Website, Coordinator, and Integrate REST components will then change to the selected certificate. Click **Ok** in the **Certificate Bindings** dialog to apply the changes.

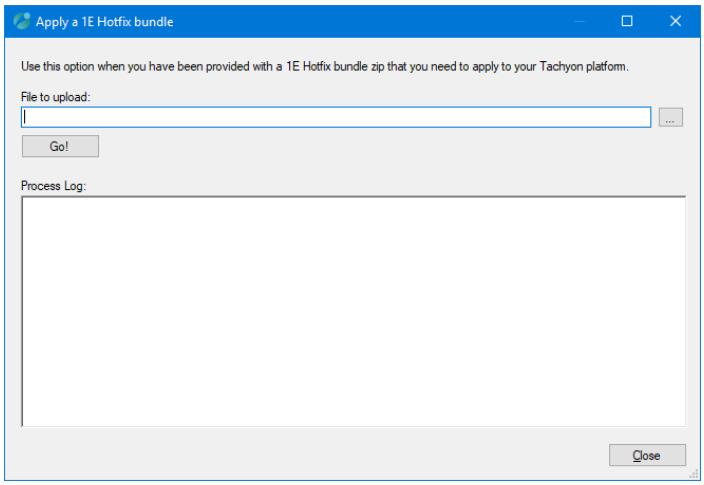
1.4.2.3.5 Upload and apply a 1E Hotfix bundle

In this dialog, you can locate and upload a 1E Hotfix file, using the **...** button at the end of the **File to upload:** field.

After locating the file, you click on the **Go!** button.

The **Process Log** will show the result of attempting to upload the Hotfix.

> **Note**
>
> A 1E Hotfix bundle contains the latest hotfixes for a specific version of Tachyon. It consists of a manifest XML file containing commands, and files which can include scripts as well as MSP files, to patch one or more components on the local server.
>
> If you need to apply a 1E Hotfix bundle, then you must run Tachyon Setup on all of your Tachyon servers, according to the instructions provided with the bundle.



1.4.2.3.6 Add DMZ Server

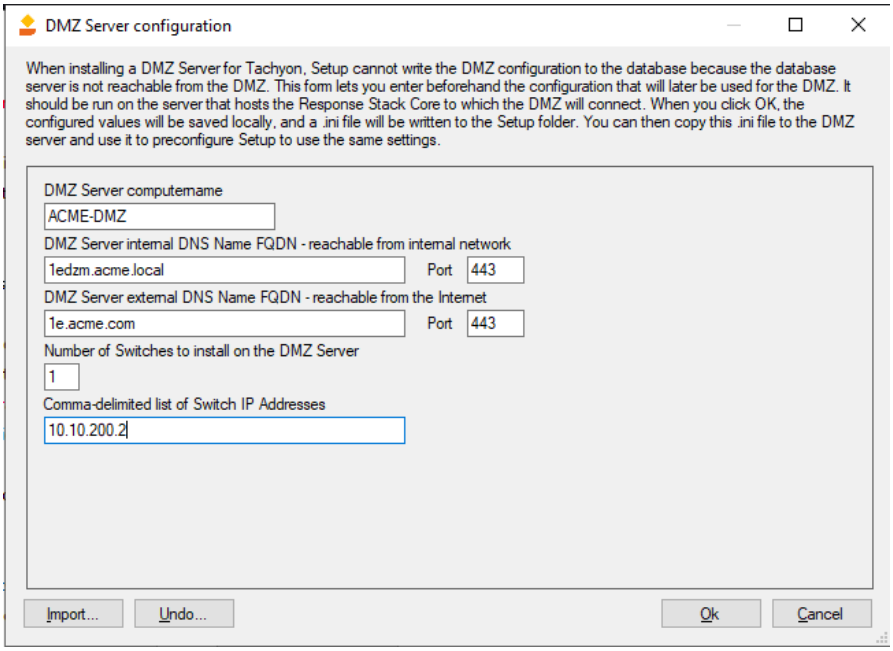
> **Note**
>
> Tachyon Setup provides a two-stage process to install a new DMZ Server:
>
> 1. Run Setup Maintenance on the Response Stack server (specifically the server that hosts the Core which the DMZ Server will connect to) to prepare the Response server and its database, and store details in an **ini** file
> 2. Run Setup to install the DMZ Server using the prepared **ini** file.
>
> The two-stage process and its **ini** file are required because the setup is unable to communicate through the DMZ firewall. In previous versions of Tachyon , the first stage required complex manual configuration.
>
> To upgrade a DMZ Server, you only need to run setup on the DMZ Server, you do not require the **ini** file.

Stage 1 of a two-stage process for installing the DMZ Server. Please refer to Implementing a Tachyon DMZ Server for full details on how to use this screen and install a 1E on a DMZ Server.

The **Import...** button allows you to read an existing or prepared **ini** file.

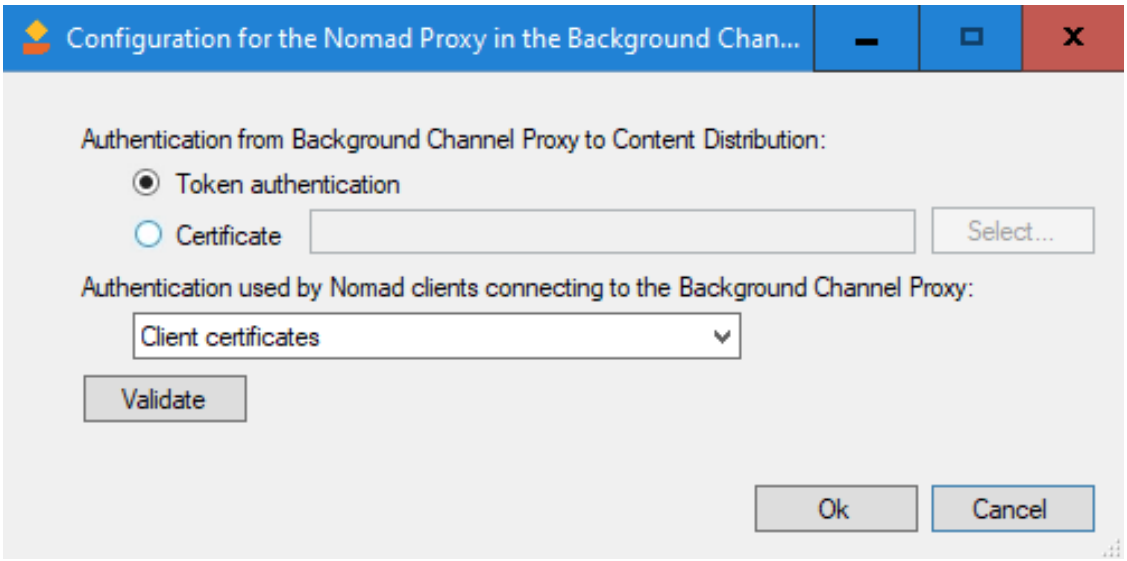
The **Undo...** button allows you to undo the changes written to the database so that your server will not think anymore that you have a DMZ Switch and Background Channel. This can be useful if you find an error in your configuration or if you need to revert the changes to avoid the errors mentioned above, or if you wish to uninstall your DMZ server.

If you need to do this after you have already closed the form, you can re-open it and reload the information by means of the **Import...** button.



1.4.2.3.7 Nomad Proxy

Selecting the proxy option lets you configure the communications and certification options for the Background Channel Proxy.



Authentication from Background Channel Proxy to Content Distribution	Determines how the Background Channel Proxy communicates with the Content Distribution application. You have the following options: **Windows authentication** — Windows authentication will be used to authenticate communications between the Background Channel and Content Distribution. **Certificate** — On choosing this option, you then need to select a valid **Client Authentication certificate** on the local server, that will be used to authenticate communications from the Background Channel by the Content Distribution component. Use the **Validate** button to verify the selected certificate.
Authentication used by Nomad clients connecting to the Background Channel Proxy	Determine how the Nomad clients will authenticate with the Background Channel Proxy. This is separate from the Nomad client configuration for Peer-to-Peer communication features. You have the following choices:

Client certificates	This option is the natural choice if you have also chosen, in the Client certificates screen above, for clients to their present client authentication certificates to Switches on the same server as the local Background Channel. Use this if either of the following is true: • You are installing the Background Channel on a DMZ Server that is not domain-joined • Any of your 1E Clients are non-Windows or not domain-joined

	(workgroup) computers.
Windows authentication	Use this if you do not wish to use client certificates. This option is only possible if the local server is domain-joined, which is not typical for a DMZ Server. All your 1E Clients must be domain-joined computers in domains trusted by the domain of the Response server.
None	If neither of the above options is possible. This means any clients will connect Anonymously.

Note

The Background Channel provides a reverse proxy feature that forwards communications from Nomad clients (internal and external) to the Content Distribution API, devices that are external to the organisation will communicate via the 1E DMZ server.

1.4.2.4 Next Steps

After installation, you should do the following:

- Tachyon Server post-installation tasks
- Deploying 1E Client
- Verifying.

1.4.3 Verifying

Basic verification tests that cover a single-server installation of the Tachyon Server. These tests only cover Tachyon and do not verify the configuration of 1E client modules with other 1E products. These tests should be run in series. They start with basic server checks, then testing 1E Clients, and finally, use the verification instructions from the **Tachyon platform** Product Pack to do end-to-end tests that confirm all components are working. Depending on the decisions you have made during the design phase of your implementation you may need additional tests to verify your implementation.

> **Note**
>
> Please ensure you complete all verification tests. They not only confirm your system is operational, but they also introduce you to concepts and tasks that you will use later when using Tachyon.

To run these tests you need:

1. Tachyon Server installed.
2. Remote workstation with a Supported Platforms.
3. The name and password for the **server installation account**.
    a. The AD account must be enabled.
    b. The account may already be assigned to other Tachyon roles either directly or via membership of an AD group role.
4. Two AD User accounts, **Test User 1** and **2**.
    a. Must not be existing Tachyon users because they will be assigned specific roles for the purpose of these tests.
    b. Must have email addresses and be able to read emails.
5. The **1E Tachyon Platform** instruction set with two Verification instructions.
    a. The verification steps describe how to create this instruction set by uploading the 1E Tachyon Platform Product Pack.
    b. You may have already uploaded this Product Pack using the Tachyon Product Pack Deployment Tool, either during setup or after.
    c. The 1E Tachyon Platform Product Pack is included in the **TachyonPlatform zip** file that you can download from the 1E Support Portal (https://1e.my.site.com/s).
6. At least one test device on which the 1E Client will be installed.

7. 1E Client installation source files and configuration details required by your implementation.

1.4.3.1 Verify Tachyon Server installation

To run the following tests you need:

1. Tachyon Server installed.
2. The name and password for the **server installation account**, account must also be enabled.

Ref	Test	Expected	Remediation
TCNI01	• Logon to the Tachyon Server using the **server installation account** • Confirm Tachyon Server is listed in Apps/Programs and Features • Confirm Windows services are running.	Programs and Features (appwiz.cpl) displays **Tachyon Server** with the correct version number. If an MSP update has been installed, the Installed Updates displays **1E Tachyon Server Update (Qnnnnn)**. The following Windows services exist and are running. • **1E Catalog Update Service** (Automatic) (Network Service) • **1E SLA Platform Engine** (Automatic Delayed start) (Network Service) • **1E SLA Platform Integrate Agent** (Automatic Delayed start) (Network Service) • **1E SLA Platform Integrate Manager** (Automatic Delayed start) (Network Service) • **1E Tachyon Coordinator** (Automatic Delayed start) (Network Service) • **1E Tachyon Switch Host** (Automatic Delayed start) (Local System)	If any of the services are not running, then check the corresponding log(s). The **Switch Host** service will stop after several seconds if it is unable to start any Switches. The **ConsumerAPI** log is not created until a user (the **server installation account**) successfully connects to the Tachyon portal. The **Background**

<table>
<tr><th>Ref</th><th>Test</th><th>Expected</th><th>Remediation</th></tr>
<tr><td></td><td></td><td></td><td>API log is not created until a 1E Client attempts to download content. The 1E Tachyon Platform Product Pack can be used to trigger this.

The Coordinator service will stop after several seconds if it is unable to activate the license.</td></tr>
<tr><td>TCNI02</td><td>• Check the Tachyon Server logs.</td><td>The default location for all logs is the folder %ALLUSERSPROFILE%\1E

Please refer to Services and NTFS Security if changing the location of log files.

In this version of Tachyon Server, some installers do not support the LOGPATH property and the logs folder is not configurable during installation.

Each component has a configuration file in the Tachyon Server installation folder structure, which contains log configuration details. Defaults are:

Ref	Test	Expected	Remediation

- Filepath *%ALLUSERSPROFILE%\1E\<product>* where product is Tachyon, SLA Platform, and Catalog
- Filename as shown in the table above.
- Maximum size 10MB (2MB for Switch logs).
- 2 rollover files numbered 1 to 2 with the rollover number included as n.log (5 rollover files for Switch logs).
- Date and timestamps are UTC to help troubleshooters synchronize logs on systems in different time zones.

Switch logs have the following names:

- The first Switch installed will typically have a log filename **Tachyon.Switch.4000.SW1.log** (where 4000 is the port it is listening on and SW1 is the **config name** in the SwitchConfiguration table in the TachyonMaster database).
- Other Switches on the same server will have different config names appended.
- The log filename will be unique on a server, but there may be the same named log on a different server.
- A Switch will continue to use the same log unless the SwitchConfiguration table is modified so that a different ID is used.
- If you see a Tachyon.Switch.log without a config name appended, this is a special case where a Switch cannot find its correct configuration and has fallen back to using the template * row which has ID=1. In which case you will need to troubleshoot how that happened.

Ref	Test	Expected	Remediation
		• Rollover logs have numbers appended, for example, Tachyon.Switch_A.1.log, up to a default maximum of 5. Tachyon server components use the **log4net RollingFileAppender** class. Details can be found in http://logging.apache.org/log4net.	

1.4.3.2 Verify IIS security of the Tachyon website

The following are basic verification tests. If you want a detailed check of IIS configuration, please refer to Server installation issues.

To run the following tests, you need:

1. Tachyon Server installed.
2. The name and password for the **server installation account**, account must also be enabled.
3. Remote workstation with a Supported Platforms - using a remote workstation is important because you will get different results if using a local browser.

Ref	Test	Expected	Remediation
TCNI03	• Start a Supported Platforms on a workstation (not the Tachyon Server) • Connect to the portal using: – **server installation account** – URL for example https://tachyon.acme.local/Tachyon	Successful connection to the **Tachyon portal** showing the following applications, if licensed: • **AppClarity** • **Application Migration** • **Experience** • **Explorer** (included with all licenses) • **Guaranteed State** • **Inventory** (included with all licenses)	Ensure the **server installation account** is enabled to do this test. It has the necessary rights to access Tachyon, as well as NTFS rights on the Tachyon Server. **401 'Unauthorized'** Typically, the website also prompts you to provide an account and password. This may occur if you are using invalid credentials or an account in a domain that is not trusted by the Tachyon Server.

- **Nomad**
- **Patch Success**
- **Settings** (included with all licenses).

The ability to open applications and navigate around them will depend on which roles have been assigned to the logged-on account.

For a new installation, the**server installation account**is only able to open the**Settings**application and view the following pages, because it is only assigned to the **Installer** role:

- Configuration
  - Custom properties
    - Device Tags (view)
    - Software Tags (view).
  - Consumers (view, add)
  - License information (view, reactivate)

403 'Access denied'

When you use a browser to open an application in the Tachyon portal, you will see **Server Error 403 - Forbidden: 'Access denied'** if the internal account used by the Application Pool does not have read access to the Tachyon web application folders. This can happen if Tachyon is installed in a non-default location and the NTFS permissions on the installation folder are not correct. To remedy the issue, you should review and correct NTFS permissions as described in Services and NTFS Security.

404 'File or directory not found'

Is the URL you entered correct, and have the correct spelling?

Is the corresponding web application installed? For example, the Consumer application may not be installed.

Contact system administrator to get access

– System information (view, export telemetry) – Branding (view, edit, reset). • Monitoring – Infrastructure log (view) – Audit information log (view) – System health (view) – Audit information log (view). • Permissions – Users and Groups (view, add) – Roles (view all roles - add, edit, and delete custom roles) – Management groups (view)	When you use a browser to open an application in the Tachyon portal and you see the message **Unauthorized access**, it means your AD account is not a Tachyon user. Try using an AD account that you know is a Tachyon user that is assigned to a Tachyon system role or custom role. For example, use the **server installation account** which is automatically installed as a Tachyon user. For a new installation, the **server installation account** must be used to add other users before their AD accounts can be used to access Tachyon applications. This process is described in the Users and Groups page and the Roles page. It is used in the following TCNU verification tests, refer to Verify user rights assignment for details.

		– Assignments (view, edit). • Instructions – Instruction sets (view, add, move, delete, upload, download).
TCNI04	• Change the web browser URL from /Tachyon to **/Consumer**	The web browser will respond with the version number of the **Tachyon platform** (IE will download as a JSON file, and other browsers will display a response in XML format). Confirm the Version number is as expected.
TCNI05	• Change the web browser URL from /Tachyon to **/**Admin	The web browser will respond with the version number of the **SLA Platform** (IE will download as a JSON file, and other browsers will display a response in XML format). Confirm the Version number is as expected.
TCNI06	• Change the web browser URL from /Tachyon to **/**Background	The web browser will respond with **You have reached Tachyon background API.** (IE will download as a JSON file, other browsers will display a response in XML format).

TCN I07	• Change the web browser URL from /Tachyon to **/Core**	The expected response is **Server Error 403 - Forbidden: Access is denied**. For security reasons, access to these web applications is allowed for local users and services only and denied to remote devices. If the response is **You have reached Tachyon Core API** then there is an issue with IIS configuration. Or, you are using a browser on the actual Tachyon Server, and should do the test on a remote workstation.	**Access Allowed** It should not be possible for a remote web browser to have access to the **Core** web application. If access is possible, then it is probable that the IIS role feature **IP Address and Domain Restrictions** is not installed on the Tachyon Server. You must ensure this IIS feature is installed, as described in the Server installation issues page. The setup installer verifies this prerequisite and optionally deploys the feature if it is missing.
TCN I08	Deleted test		
TCN I09	• Change the web browser URL from /Tachyon to **/Platform**	The web browser will take you to the SLA Inventory web application.	
TCN I10	• Change the web browser URL from /Tachyon to **/CatalogWeb** • Change the web browser URL from **https** to **http** and also change the server name so	In both cases, the web browser will take you to the **1E Catalog** website. If you use **http** while leaving the same server address used for **https**, the expected response is	To access the **Admins** tab in the CatalogWeb, you must manually add one or more administrator accounts or groups to the website configuration. Please refer to Rebuilding the 1E Catalog.

that it matches the value that you specified during installation for the *HTTP host header*. For example: http://ACME-TCN01.acme.local/CatalogWeb	**HTTP Error 404 - Not Found**. The 1E Catalog can use both **http** and **https** provided that you specify the correct server name for each protocol. For interactive use, you are recommended to use https. Http is provided for internal compatibility with existing consumers. **Note** An HTTP connection will fail if the HTTP binding has been deliberately removed (Tachyon Server post-installation tasks).

1.4.3.3 Verify user rights assignment

To run the following tests, you need:

1. Tachyon Server installed and above TCNI verification tests passed, refer to Verify Tachyon Server installation for details.
2. The name and password for the **server installation account**, account must also be enabled.
3. Two AD User accounts, **Test User 1** and **2**.
    a. Must not be existing Tachyon users because they will be assigned specific roles for the purpose of these tests.
    b. Must have email addresses and be able to read emails.
4. The **1E Tachyon Platform** Product Pack, if not already installed.

Note

1E is often asked why the **1E Tachyon Platform** Product Pack is not built into the product. The reason is that uploading a known Product Pack is part of the verification process and ensures the user is able to upload at least one pack and carry out all the other necessary tasks at least once before exploring other aspects of Tachyon.

Ref	Test	Expected Response	Remediation
TCN U01	• Download the **TachyonPlatform.zip** file from the https://support.1e.com/. • Extract the **1E-Tachyon-Platform.zip** from the ProductPacks\Classic folder • Start a Supported Platforms on a workstation • Connect to the Tachyon portal as the **server installation account** • Open the **Settings** application and go to the **Settings→Instructions→Instruction sets** page • Click on the **Upload** button • In the Open dialog navigate to the location of the **1E-Tachyon-Platform.zip** file • Select the **1E-Tachyon-Platform.zip** file and click **Open**. All the instructions contained in the zip file will initially be added to the default **Unassigned** instruction set. Instructions in the **Unassigned** instruction set cannot be used, so you will need to add the instructions to a new instruction set:	You will upload the **1E Tachyon Platform** Product Pack and assign them to a new instruction set called **1E Tachyon Platform**. For a new installation, the **Instruction sets** page will not contain any instruction definitions. After uploading the **1E Tachyon Platform** Product Pack, the two instructions contained in the Product Pack will be displayed on the **Product packs** page. After creating the **1E Tachyon Platform** instruction set, this will appear in the Instruction sets list. After moving the verification instructions from **Unassigned** to the **1E Tachyon Platform** instruction set, the instruction count for the **1E Tachyon Platfor**	If the **server installation account** is not able to add instructions from a Product Pack, then the installation account is not assigned to the **Full Administrator** role. You can confirm if this is the case by viewing the rights of the **server installation account** in the **Settings→Permissions→Users** page. You may have upgraded from a previous version where the **server installation account** was not automatically assigned to this role. Contact 1E for advice on how to fix this.

	• Select the 2 verification instructions to the new set, by clicking the checkbox at the start of each instruction row in the list. • Click the **Add new set** button in the button panel to the right of the page • In the **Add new instruction set** popup subsequently displayed, and type **1E Tachyon Platform** as the name • Ensure that the **Include 2 selected instructions** checkbox is checked • Click the **Add** button to add the new instruction set, with the selected instructions.	**m** instruction set will go up by **2**. **Note** Unlike some earlier versions of Tachyon, this version does not support the drag+drop method of uploading Product Packs. **Tip** You can use the Tachyon Product Pack Deployment Tool tool instead.	
TCN U02	• Connect to the Tachyon portal as the **server installation account** • Open the **Settings** application and go to the **Settings→Permissions→ Users and Groups** page	Entering one or more characters and clicking the search icon returns a list of matching user accounts and security groups. Selecting a group and viewing its members shows the	The purpose of this step is to confirm the system is capable of searching Active Directory. You do not need to add the group; you will add users in the next step. The ability to search and find different types of AD security groups depends on the search method selected during the installation of the Tachyon

	• Click **Add** and search for an AD Universal security group • Select one of the AD security groups and click **Add** • Click on the name of the AD group just added • In the **Group:** details page, view the group members • Navigate back to the **Users and Groups** page • Check the checkbox for the group just added and click **Remove** and then click **Yes, remove group**.	Name and Email of each member.	Server, as described in Directory requirements.
TCN U03	• Connect to the Tachyon portal as the **server installation account** • Open the **Settings** application and go to **Permissions→Users and Groups** page • In the **Users and Groups** page click on **Add**. • In the **Add User** prompt under **Select AD user or security group** type in the search box **Test User 1** and click on the search icon	The following custom role exists: • **1E Tachyon Platform** The following users are included in the list of Users. • **Server installation account** - assigned to the **Installer** role • **Test User 1** - assigned to roles: – •	

- Select **Test User 1** from the search results and click on **Add**.
- Repeat the same steps to add **Test User 2**.
- Go to the **Permissions→Roles** pag e
- Add a custom role named **1E Tachyon Platform**.
- Click on the name of the role that you just added. This will take you to the Permissions tab. Add permission with the following properties:
  - Type: **Instruction Set**
  - Name (of the Instruction Set): **1ETachyonPlatfo rm**
  - Permissions: **Actioner, Approv er, Questioner, V iewer**
- Click on **Add**
- Assign Management Group: **All Devices**
- Go to the **Members** tab and add **Test User 1**
- Role: **1E Tachyon Platform**
- Repeat for **Test User 2**.

- **Test User 2** - assigned to roles:
  - –
    -

Note

You will also see some system and machine accounts in the list of users.

			These are used internally for interaction with other components and should not concern you at this time.
TCN U04	• Connect to the Tachyon portal as **Test User 1** and confirm access to **Explorer** pages • Repeat for **Test User 2**	Each Test User is able to view the following menu pages in the **Explorer** application: • Home • Instructions – History – Tasks – Scheduled • Devices – Table – Dashboard • Notifications	**Contact system administrator to get access** When you use a browser to open an application in the Tachyon portal and you see the message **Unauthorized access**, it means your AD account is not a Tachyon user. Try using an AD account that you know is a Tachyon user that is assigned to a Tachyon system role or custom role. For example, use the **server installation account** which is automatically installed as a Tachyon user. For a new installation, the **server installation account** must be used to

add other Tachyon users before their AD accounts can be used to access Explorer. This process is described on the Users and Groups page and the Roles page.

403 'Access denied'

When you use a browser to open an application in the Tachyon portal, you will see **Server Error 403 - For bidden: 'Access denie d'** if the internal account used by the Application Pool does not have read access to the Tachyon web application folders. This can happen if Tachyon is installed in a non-default location and the NTFS permissions on the installation folder are not correct. To remedy the issue, you should review and correct NTFS permissions as described in Services and NTFS Security.

1.4.3.4 Verify 1E Client installation

To run the following tests you need:

1. Tachyon Server installed and TCNI verification tests passed, refer to Verify Tachyon Server installation for details.
2. Two user accounts, **Test User 1** and **2** , and above TCNU verification tests passed, refer to Verify user rights assignment for details.

3. At least one test device on which the 1E Client will be installed.
4. 1E Client installation source files and configuration details required by your Tachyon implementation.

Ref	Test	Expected Response	Remediation
TCNA01	• Install the 1E Client on the test device using the configuration settings required for your implementation – DNS Alias of Tachyon Server	1E Client installed. Programs and Features display **1E Client**. • Correct platform x86 or x64 • Correct version number. If an MSP update has been installed, the Installed Updates displays **1E Client Update (Qnnnnn)**.	The first clients can be installed manually or using a script. You should repeat this set of tests when you have deployed a few clients using your organization's preferred deployment method. You may need to edit the 1E Client configuration file after installation, to suit the requirements of your implementation, and restart the 1E Client service.

- Portusedbythe Tachyon Switch
- Portusedbythe Tach

	y o n B a c k g r o u n d C h a n n e l. • Include optional MSP update • Confirm Programs and Features.		
TCN A02	• Confirm Windows services are running	The following Windows services exist and are running. • **1E Client** • **1E Nomad Branch** - only if Module.Nomad.Enabled=true	If the **1E Client** service is not running, then check the Client log.
TCN A03	• Check the 1E Client log.	No errors.	Check the **Switch** setting in the Client configuration file is using the correct DNS Alias for the

		To view LOG file locations for each OS platform, click to expand... **1E Client logs on Windows** %ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client) %ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log **1E Client logs on macOS** /Library/Logs/1E.Client.Daemon.log (shows any service start errors) /Library/Logs/1E.Client.log (shows the current operation of the 1E Client) **1E Client logs on other non-Windows platforms** /var/log/1E/Client/1E.Client.log	Tachyon Server, and the correct port for the Switch. If errors in the Client log relate to certificates, then see Client issues.
TCN A04	• Start a supported browser on a workstation, refer to Supported Platforms for details. • Connect to the Tachyon	Each **Test Device** is listed on the Tachyon **Devices Table** page. The device details show information about the device's system, activity, certificate, and configuration settings.	If you cannot use the **Test User 1** or **2** accounts, then use another Tachyon user account. All Tachyon users are able to view the **Devices Table** page. Check the configuration of the client and review the Tachyon client settings in the 1E Client configuration file. To view CONF file locations for each platform, click to expand... The 1E Client is controlled via the 1E Client configuration file **1E.Client.conf** which resides in the

portal as **Test User 1**

- Open the **Explorer** application and go to the **Devices →Table** page
- For each **Test Device** that has had the 1E Client installed, confirm the device is listed in the **Table** page.
- Click on each device and view the device properties.

installation folder along with the 1E Client executable.

The default installation location used for the different OS supported by the 1E Client are given in the following table:

OS	Default install location
Windows	**%ProgramFiles%\1E\Client**
Linux and Solaris	**/etc/1E/Client**
Mac	**'/Library/Application Support/1E/Client'**

Note

The configuration file uses ASCII encoding.

A comment line starts with the # symbol.

1.4.3.5 Verify Tachyon client-server communications (stage 1 and 2 instructions)

To run the following tests you need:

- Tachyon Server installed and above TCNI verification tests passed, refer to Verify Tachyon Server installation.
- At least one test device has 1E Client installed and above TCNA verification tests passed, refer to Verify 1E Client installation.
- Two AD user accounts configured as Tachyon users and above TCNU verification tests passed, refer to Verify user rights assignment.

To run the following tests you need to logon to a workstation with a user account that is assigned to at least one of the Tachyon administration roles. 1E Tachyon Platform Product Pack describes the purpose of each of its verification instructions.

Ref	Test	Expected Response	Remediation
TCNA01	See TCNA01 above.	Each **Test Device** is listed on the Explorer Devices page.	
TCNA05	• Connect to the Tachyon portal as **Test User 1** • Open the **Explorer** application and go to the **Home** page • Type **verification** • Select **Tachyon Platform verification stage 1** • Click **Ask this question**	When the **Tachyon Platform verification stage 1** question is asked, the Explorer view changes to the **Instruction History Responses** page. The **Instruction History Responses** page lists the software products installed on each Test Device. Contents are shown for online Devices that have the 1E Client installed and running. If you view other Explorer pages and want to get back to the **Instruction History Responses** page, then you should select	You may need to refresh the **Instruction History Responses** page. Verification stage 1 tests communication between the 1E Client and Switch. Any issues will appear in the Client log. Check each test device has the 1E Client running and is online.

		Instruction History from the navigation menu on the left side, and you should see a list of the instructions that have been run. You may then click on the name of the instruction to view its responses. The Client log indicates: • Running instruction • Successfully processed instruction.	
TCN A06	• Connect to the Tachyon portal as **Test User 1** • Open the **Explorer** application and go to the **Instructions→History** page • Click on the **Tachyon Platform verification stage 1** instruction to view the response details • Click on the **Actions** tab • Type **verification** • Select **Tachyon Platform verification stage 2 (all platforms)** • Click **Perform this action** • Enter the password for the **Test User 1** account • If 2FA is enabled, enter the **authentication code**	If Two-Factor authentication (2FA) is enabled, then Explorer will prompt for an authentication code, and **Test User 1** should receive an authentication code by email. The Explorer view changes to **Instruction pending approval**. **Test User 2** should receive an email asking for approval.	This stage of the Verification tests communication between the Tachyon Server and the SMTP relay/gateway. If 2FA is enabled and **Test User 1** does not receive an email with the authentication code, then: • Check the Coordinator log and confirm it is using the correct configuration for the SMTP server

				If **Test User 2** does not receive an email, then: • Check the user is assigned to the **1E Tachyon Platform** role • The **1E Tachyon Platform** role has access rights which include **Approver** • Check the Coordinator log and confirm it is using the correct configuration for the SMTP server.
TCN A07	• Either connect to the Tachyon portal as **Test User 2** and click on the **notification icon** • Or click on the link in an email received in the previous step and wait for a browser to connect you to the Tachyon portal • View the **Request for action approval** for the	When clicking on the link in the request for approval email, a browser should open automatically and take you to the Notifications page. You can view notifications and approval requests at any time by clicking on the notification icon. The icon will show the number of actions pending		If **Test User 2** is unable to approve the request, then: • check the user is assigned to the **1E Tachyon Platform** role • the **1E Tachyon Platform**

	Tachyon Platform verification stage 2 (all platforms) action • Tick the box **I understand approving my request impacts my IT environment** • Click **Approve**.	approval by the logged-on user. When the request is approved by **Test User 2**: • The Explorer view changes to **Approval has been processed successfully** • **Test User 1** should receive an email saying the action has been approved.	role has access rights which include **Approver**.
TCNA08	• Connect to the Tachyon portal as either **Test User 1** or **2** • Open the **Explorer** application and go to the **Instructions→History** page • Click on the **Tachyon Platform verification stage 2** instruction to view the response details.	Response details show a list of devices and their Client configuration details. You may need to refresh the Details page. This stage of the Verification tests the Client's connection to the Background Channel. Successful execution of the action will cause the following to appear in the Client log: • Duplicate log entries showing a repeat run of the previous question • A series of log entries showing a connection to the Background Channel, then a script is	Repeat test TCNIO5 using a browser on the test device to confirm the Background Channel has been configured correctly. A common error is an incorrect value for the **BackgroundChannelUrl** setting in a 1E Client configuration file. If you deployed the client using a software deployment tool like Microsoft's ConfigMgr then look to see if similar devices have the same issue. Check the 1E Client configuration file on problem devices to see if the setting has

	downloaded and run: – Windows - **getConfig.ps1** PowerShell file – Linux and MacOS - **parseconfigStarter.sh** bash and **parseconfig.pl** perl files • Successfully processed instruction. You may have to wait up to 5 minutes for the action to complete on each device. This is because the default 1E Client setting for DefaultStaggerRangeSeconds=300.		the correct URL for the Background Channel. Check to see if the Background Channel has the scripts used by the Stage 2 instruction. Review the contents of **C:\ProgramData\1E\Tachyon\Content** folder on the server hosting your Background Channel. The Content folder should contain at a folder named **1E Tachyon Platform-VerificationStage2** which contains a sub-folders with a PowerShell file, and another subfolder containing a bash and a perl files.

1.4.3.6 Verify extended features

To run the following tests you need:

- All the above tests completed
- To logon to a workstation with a user account that is assigned to at least one of the Tachyon administration roles that allows you to run some instructions, which can include a Verification instruction already used above.

Ref	Test	Expected Response	Remediation
TCNX01	**Export All feature** • To confirm the **Export All** share is accessible, use	This test verifies BCP has been installed on the Tachyon Server,	If you see a popup error initiating an export operation

Windows Explorer to **browse to the share name** specified when the Export all feature was configured

- Connect to the Tachyon portal, open the **Explorer** application and **ask a question**
- After at least one device has responded with content, **stop** the question and **keep** the responses
- In the **Content** or **Status** tab on the **Responses** page, click on **Export all results**
- Enter the **share name** and click **Save**
- Use Windows Explorer to **browse to the share name** and observe a TSV file has been created
- Use Microsoft Excel or Notepad to view the contents of the TSV file.

and an Export share is correctly configured, as described in Tachyon Server post-installation tasks.

When you stop the question or wait for the question to complete its gather duration, then the Export all results button will be enabled.

TSV is a tab-delimited text file.

after clicking on the Export All results button, then:

- Ensure you specify the hostname or hostname FQDN of the Windows computer where the share has been created; do not use a DNS Alias
- Check the share permissions
- Check the share NTFS security.

1.4.3.7 1E Tachyon Platform Product Pack

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Tachyon Platform verification stage 1	Question	Stage 1 of the verification will return all software installed on each 1E Client endpoint. Verification stage 1 is a simple question-type instruction used to verify the:	**1E-TachyonPlatform-VerificationStage1**	19

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		• Authenticated user is able to access and use Tachyon Explorer • End-to-end communication between the Tachyon system, the **Switch** and the platform client.		
Tachyon Platform verification stage 2 (all platforms)	Action	Stage 2 of the verification will run a PowerShell script to return a subset of the current configuration of the platform client features of 1E Client. Verification Stage 2 is normally expected to be run as a follow-up action for Verification Stage 1. Verification stage 2 is a simple action-type instruction used to verify: • Two-factor authentication (if enabled) and approval workflow, which tests email (if enabled) - necessary for action-type instructions • End-to-end communication between the Tachyon system, the **Background Channel** and platform client • The client is able to run PowerShell scripts on Windows OS - many Tachyon instructions and	**1E-TachyonPlatform-VerificationStage2**	21

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		Guaranteed State rules use PowerShell version 3.0 and later • The client is able to run Bash script on non-Windows OS. For details about PowerShell and Bash support please refer to Tachyon scripting requirements. The rate at which Responses are returned to the Tachyon system via the Switch is affected by the 1E Client setting **DefaultStaggerRangeSeconds**. This setting governs a random delay before the instruction downloads the script from the Background Channel. This stagger setting is ignored on Windows OS if Nomad client is enabled - instead only one client per subnet (or site if Nomad SSD is used) will act as master and download the script from the Background Channel, and peer clients will download the script from the master.		

1.4.4 Tachyon Server post-installation tasks

Post-installation tasks, which include verification checks and mandatory and optional configuration tasks.

1.4.4.1 Required tasks

The following tasks must be performed post-installation. You may have already performed some of these tasks as part of following the instructions on the Quick Start.

The Tachyon portal website will be available after installation using the Tachyon DNS Alias FQDN. For example:

Note

https://1e.acme.local/Tachyon/app

1.4.4.1.1 Verify installation

Note

You must perform the verification tests provided on the Verifying page.

1.4.4.1.2 Confirming the Tachyon website HTTPS binding

If you have implemented Tachyon Server on an IIS server that has previously been or is currently used by other applications then there may be other Web Server certificates in the **Local Computer's Personal Certificates store** in addition to the Tachyon Web Server certificate. In earlier versions of Tachyon, it was possible under these circumstances for the Tachyon Server installer to bind to the wrong certificate. The current version contains improved logic for avoiding this problem, but it is still good practice to verify that the configuration is indeed as expected.

To select the correct certificate for the HTTPS binding see the troubleshooting steps for Server installation issues.

If you want to optionally remove the HTTP binding, please refer below to the optional task Removing the HTTP binding from the Tachyon website.

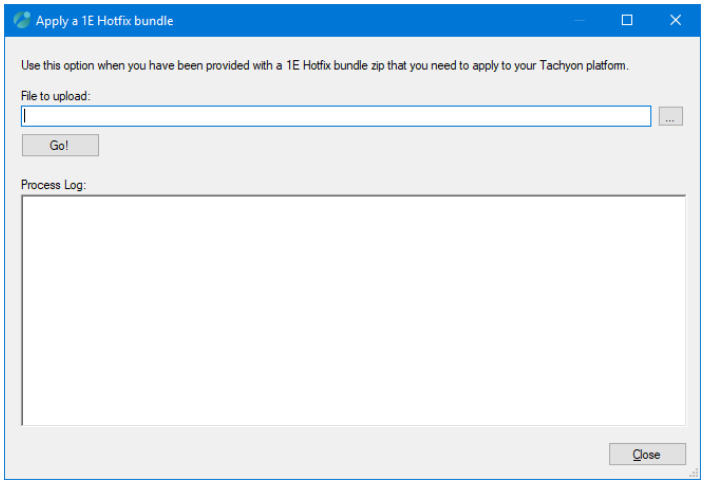
1.4.4.1.3 Apply a 1E Hotfix bundle

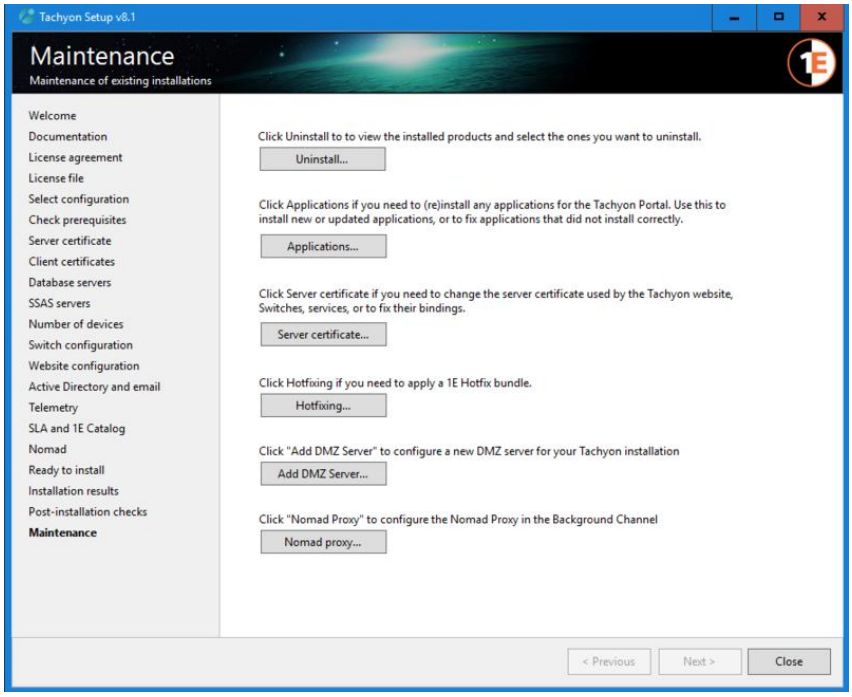
Note

A 1E Hotfix bundle contains the latest hotfixes for a specific version of Tachyon. It consists of a manifest XML file containing commands, and files which can include scripts as well as MSP files, to patch one or more components on the local server.

If you need to apply a 1E Hotfix bundle, then you must run Tachyon Setup on all of your Tachyon servers, according to the instructions provided with the bundle.

1. Start **Tachyon.Setup**
2. Click directly on the **Maintenance** link in the left-hand menu
3. In the **Maintenance** screen, click the **Hotfixing...** button
4. In the **Apply a 1E Hotfix bundle** dialog, click the **...** button to browse for the **File to upload**
5. After locating the file you click on the **Go!** button
6. The **Process Log** shows the result of attempting to upload and apply the 1E Hotfix bundle
7. Click **Close**





1.4.4.1.4 Configure permissions

Immediately after installation, you can only access the **Tachyon portal** and the **Settings** application using the server installation account, until additional users have been added and assigned to their roles.

The installation account is assigned the **Installer** role and cannot be modified because it is a System Principal.

This means that one of your first steps after the installation is to connect to the Portal using the installation account and add other Tachyon users with necessary roles as described in the Users and Groups page and the Roles page.

> **Tip**
>
> After the initial configuration of Tachyon users and groups have been performed, we recommend that the **Installer** role is assigned to one or more other Tachyon users, and

that your server installation account is disabled. It can be enabled later for the installation of updates and upgrades.

This approach of having a dedicated installation account ensures the same account is used for all installation activities and has relevant rights on the Tachyon server and in SQL Server. Disabling it makes it more secure than a normal user account. If an ordinary user account is used for installation tasks, there is a risk the account may be deleted, causing difficulties for future upgrades or re-installation.

1.4.4.1.5 Add Product Packs and configure Instruction Sets

Tachyon functionality is based on Instructions, until these are added to the system you will not be able to ask questions or perform actions. 1E provides instructions in zip files called Product Packs. A collection of Product Packs necessary for zip files is available in the **Tachyon Setup** zip (available on the https://support.1e.com/ and from the 1E Exchange. Each Product Pack contains a related collection of Instruction Definitions. Product Packs and Instruction Definitions can be added by a **Full Administrator**.

When added, Instructions are immediately allocated to the built-in **Unassigned** Instruction set. Instruction sets provide a way of determining the permissions for the Instructions they contain, but the **Unsassigned** Instruction set is only intended as a staging area for newly loaded Instructions - and Instructions in this set cannot be used directly. An Instruction can only belong to a single Instruction set, so after loading it, and before it can be used, it must be moved to another Instruction set - one created by a **Full Administrator**.

Instruction sets created by a **Full Administrator** can be used as the basis for custom roles created by a **Full Administrator** or **Group Administrator**. These custom roles determine the permissions for the Instruction sets and all the Instructions they contain. This enables the administrator to complete the assignment of specific Instruction set roles to users and determine which Instructions they can action, approve, question, or view.

You can either load instructions and create Instruction Sets for them automatically from Tachyon Setup by using the **Tachyon Product Pack Deployment Tool**, as described in Uploading with the Tachyon Product Pack Deployment Tool. Or, you can load the Product Packs and create their associated instruction sets by hand.

The tool is included in the Tachyon Platform zip file under the **ProductPacks** folder.

- **Tachyon.ProductPackDeploymentTool.exe** (and its supporting files) is used to upload Product Packs
- The tool creates a log file called **Tachyon.ProductPackDeploymentTool.log** in the same folder.

The **ProductPacks** folder contains two directories, **Classic** and **Integrated**.

- The **Classic** directory holds a number of Classic Product Packs that contain Instructions.
- The **Integrated** directory holds a number of Integrated Product Packs that contain definitions for some Guaranteed State Policies, associated Fragments, and Instructions. In addition, a core utility pack has been provided with common Fragments that you can use to build your own Policies.

Tachyon Product Packs reference provides full details of all the product packs included in the Tachyon Platform zip.

The account used to run the **Tachyon.ProductPackDeploymentTool.exe** must:

- Have local administrator rights on the computer it is running on

- Exist as a Tachyon user assigned to either **Installer** or **Full Administrator** role.

1.4.4.1.6 Deploy Tachyon clients

You will need to deploy the 1E Client (with Tachyon enabled) to at least one device in order to use any instructions. You will need to do this in order to fully verify the installation of your Tachyon Platform.

Please refer to Deploying Tachyon clients for guidance on deploying clients to Windows and non-Windows devices.

1.4.4.1.7 Configure Tachyon to support the Export all responses feature

The **Export all** feature is displayed on the responses page for a question once it has finished retrieving all its responses. To enable this to work you need to configure the following:

1. **Configure BCP**:

   The **Export all** feature is described in Exporting data from Explorer. To enable Tachyon users with the appropriate permissions to use the **Export all** feature you must ensure that **Microsoft Bulk Copy Program (BCP)** is installed on each **Response Stack**, specifically the Response server where the Core component is hosted.

   - If Microsoft SQL Server is installed on the same server as the Response Stack, then BCP will normally be present.
   - If the TachyonResponses database is remote to the Response Stack and there is no local copy of Microsoft SQL Server, then you will need to install BCP.

   You can confirm BCP is installed by starting a command prompt and typing **bcp** and usage information is displayed. The command **bcp -v** displays the version.

   Note

   The information here applies regardless of which version of SQL Server is being used. This does not imply that Tachyon itself is supported under every possible version of SQL Server that falls within those ranges. See Windows Server requirements for the supported versions and required Service Packs.

   Install the following components to get BCP working:

Installer file name	Product Name	Where to get it from
vc_redist.x64.exe	Visual C++ 2017 Redistributable	https://support.microsoft.com/en-gb/help/2977003/the-latest-supported-visual-c-downloads
msodbcsql.msi	Microsoft® ODBC Driver 13.1 for SQL Server®	https://www.microsoft.com/en-us/download/details.aspx?id=53339 This needs to be installed because of a known issue in the

Installer file name	Product Name	Where to get it from
		Microsoft Command Line Utilities 15 for SQL Server.
msodbcsql.msi	Microsoft® ODBC Driver 17 for SQL Server®	https://docs.microsoft.com/en-us/sql/connect/odbc/download-odbc-driver-for-sql-server Use version 17 (x64).
MsSqlCmdLnUtils.msi	Microsoft Command Line Utilities 15 for SQL Server	https://docs.microsoft.com/en-us/sql/tools/bcp-utility The msi includes **BCP** and **SQLCMD**.

To verify the components have been installed, you can use **AppWiz.cpl** and check for the **Product Name**.

2. **Configure the share**:

The **Export all** feature enables the bulk copying of the entire completed responses for a Tachyon question to a specified **network share**.

Note

As this may potentially be a very large data set the **l**ocation must have sufficient disk-space to store the exported data.

To use this feature you must create one or more network shares on the Tachyon Server or other location, and configure NTFS and share permissions as follows. If desired, it can be hidden using a $ at the end of the share name.

Share permissions

Configure the share with **Everyone modify** access, or the same as the NTFS security.

NTFS Security

The share folder needs **modify** access configured for the service account(s) used by the Tachyon Core application pool on *each* Response Stack server and the service account used by the Tachyon Consumer application pool on the Master Stack server. By default, this account is NT AUTHORITY\NETWORK SERVICE (if the share folder is located on a Tachyon' all-in-one' server where both the Tachyon Consumer and Core components are installed e.g. Master Stack and Response stack). However, there is another scenario where the share folder is neither located on the same server as the Tachyon Consumer or Tachyon Core components, but on a remote fileserver (like a NAS device, DFS share, etc). In this case, the Tachyon Consumer AND Tachyon Core components will attempt to connect to the share folder as their respective computer accounts, for example <domain>\<computer$>.

Therefore, depending on where the share folder is located, you will need to configure NTFS permissions for the following:

- If the share is on the same server as the Tachyon Core application pool, the share must have NTFS **Modify** permissions added for the built-in **NT AUTHORITY\NETWORK SERVICE** account local to the server.
- If the share is remote from the server used by a Tachyon Core application pool, the share must have NTFS **Modify** permissions added for the **server$ account**. For example, if the Tachyon Core application pool is running on a server called **ACME-TCN01** the server account **ACME-TCN01$** would need to be added to the remote share with NTFS **Modify** permissions.
- If you have installed multiple Response Stacks, then repeat the preceding step, adding permissions on the share for each of the computers that are running a Tachyon Core. For instance, if you have deployed Response Stacks on two computers called **ACME-TCN01** and **ACME-TCN02**, then the server accounts **ACME-TCN01$** and **ACME-TCN02$** would need to be added to the share with NTFS **Modify** permissions.

Tip

Alternatively, you can use an AD security group that contains the computer$ account of all your Tachyon Servers.

Note

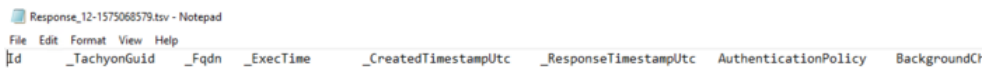
Include any user accounts or AD groups that would require access to the share.

The preceding are the *minimum* permissions required. Of course, if your share has *more* permissions, it will also work for **Export All**. For example, if your share inherits the **Modify** permission for **Authenticated Users** from its parent, then this will automatically include permission for local and remote computer$ accounts, so you will not need to explicitly grant the permissions mentioned above.

Common security issues

Error: Header-row missing in .tsv file export	Tachyon Consumer has no access to share folder

Error: Contents missing in .tsv file export	Tachyon Core(s) has no access to share folder



Successful: Both header-row and contents correctly included in .tsv file export	Tachyon Consumer and Tachyon Core(s) have access to share folder	

1.4.4.2 Optional tasks

The following tasks are not essential, but may enhance the performance and use of Tachyon in your environment. If you are carrying out a fresh installation, then you should consider implementing them. If you have upgraded from a supported version to version, then review each one and confirm that the previous configuration is still in place, and then consider whether your update requires you to implement any of these optional tasks.

1.4.4.2.1 Add an inventory connector

You can add an inventory connector to Tachyon that will sync data from a data source to an inventory repository. Typically, this connector would be to another system such as Configuration Manager or to Tachyon itself. For more details please refer to the Connectors page. At least one configured inventory connector is required to support management groups.

1.4.4.2.2 Create management groups

You can create Management groups to partition your estate into groups of devices that can be managed separately. This is done by creating a management group in the Settings application, please refer to Management Groups page and Management Groups - tutorial for more details. To synchronize the management groups with Explorer you'll need to add a Tachyon connector, please refer to Tachyon connector for more details.

1.4.4.2.3 Change Tachyon database owner to 'sa'

After the databases have been created, the best practice is to change the **owner** of each database to **sa**, to avoid issues if the owner's Windows account is deleted in the future.

The following script can be used to change the **owner** of each database to **sa**. This will work even if the **sa** login has been disabled, which is also best practice.

Change owner to 'sa' Expand source

```
ALTER AUTHORIZATION ON DATABASE::TachyonMaster To "sa"
GO
ALTER AUTHORIZATION ON DATABASE::TachyonResponses To "sa"
GO
```

Note

Ensure the Server Installation Account retains the **db_owner** role on the database to support re-configuration and upgrades. If the account is removed from being **owner**, then it will also be removed from the **db_owner** role and will need to be re-assigned, for example by using the **Grant db_owner** SQL script.

The **owner** user and **db_owner** role are both mapped to the database **dbo** user. It is preferable for the account to be a member of the **db_owner** role, instead of being the **owner** user.

Grant db_owner Expand source

```
USE [TachyonMaster]
GO
CREATE USER [ACME\TCNinstaller01] FOR LOGIN [ACME\TCNinstaller01];
ALTER ROLE [db_owner] ADD member [ACME\TCNinstaller01];
GO
USE [TachyonResponses]
GO
CREATE USER [ACME\TCNinstaller01] FOR LOGIN [ACME\TCNinstaller01];
ALTER ROLE [db_owner] ADD member [ACME\TCNinstaller01];
GO
```

1.4.4.2.4

1.4.4.2.5 Changing the SMTP Host configuration

The server installer does not support configuration of SMTP credentials, but these can be configured post-installation. By default, Tachyon assumes port 25 and anonymous authentication.

Tachyon stores its SMTP configuration in

- **<INSTALLDIR>\Tachyon\Coordinator\Tachyon.Server.Coordinator.exe.config** (workflow emails)

After any changes reboot the server or restart the **1E Tachyon Coordinator** service.

```
<configuration>
  ...
  <appSettings>
    ...
    <add key="smtpHost" value="ACME-EXC01.acme.local"/>
    <add key="TachyonEmail" value="Tachyon@acme.local"/>
    ...
    <add key="2FAEnabled" value="true" />
    ...
  </appSettings>
  ...
  </entityFramework>
  <!-- The settings in the following section can be modified to provide custom
port and authentication options for SMTP -->
  <system.net>
    <mailSettings>
```

```
      <smtp deliveryMethod="Network">
        <network
          port="25"
          defaultCredentials="true"
          userName=""
          password=""
        />
      </smtp>
    </mailSettings>
  </system.net>
</configuration>
```

Note

Microsoft's documentation for the SMTP network section can be found here: https://msdn.microsoft.com/en-us/library/ms164242(v=vs.110).aspx.

When **defaultCredentials** is set to true, the mail subsystem uses the Windows credentials from the process under which the coordinator service is running to connect to the mail server. In general, this will only work with Microsoft servers, or servers that allow anonymous connections. To use different credentials, set defaultCredentials="false" and add values for **username** and **password** (and, optionally, **clientDomain**).

To use an encrypted connection, if the server supports it, add **enableSsl**="true". Change the **port** as needed, for example, port="465" or port="587".

Microsoft supports parameters named **host** and **From**, but these are ignored by Tachyon because the **smtpHost** and **TachyonEmail** keys in the <appSettings> section take precedence.

Note

If **smtpHost** is set to empty (blank) in a config file then email is disabled for the corresponding feature.

The Email and 2FA requirements feature requires email. Therefore, if **smtpHost** is set to empty, then the 2FA feature must be disabled by setting **<add key="2FAEnabled" value="false" />** in the **<INSTALLDIR>\Tachyon\Coordinator\Tachyon.Server.Coordinator.exe.config** file.

Finally, reboot the server or restart the **1E Tachyon Coordinator** service.

1.4.4.2.6 Enabling or disabling Denial-of-Service Blocking

By default, a Switch will temporarily blacklist the IP addresses of devices that "misbehave" - that is, if an external device, browser or other endpoint, sends a message other than Online when it first connects. This is to handle denial-of-service attacks or other malicious attempts to connect to the Switch.

However, you may wish to disable this feature in some circumstances. For example, if you are using a load balancer that sends a probe which triggers the block on its IP address, potentially blocking all clients using the load balancer.

You can configure this feature by editing the **TACHYON_SWITCH_DOSBLOCK_OFF** setting in the **<INSTALLDIR>\Tachyon\Switch\Tachyon.Switch.Host.exe.config** file.

- By default, the setting is not present in the config file. If not present, empty, 1, or any value other than 0, then DoS blocking is disabled (off).
- Set to 0 to enable (turn on) DoS blocking.

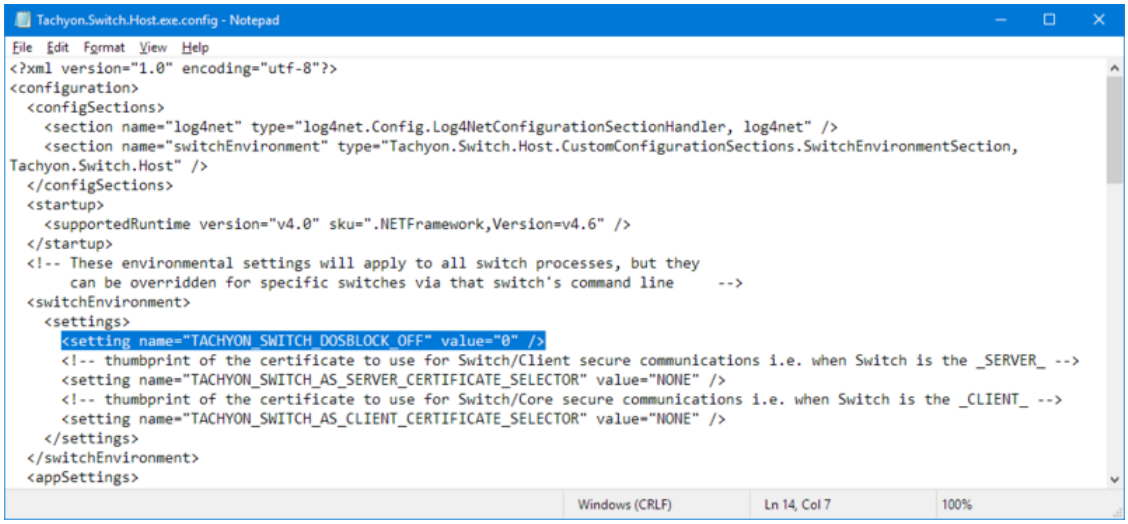
For a change of setting to take effect, restart the Switch Host service.

```
<switchEnvironment>
  <settings>
    <setting name="TACHYON_SWITCH_DOSBLOCK_OFF" value="0" />
    ...
  </settings>
</switchEnvironment>
```

You can test this by using a browser to go to:

http://tachyon.acme.local:4000

if the blocking is enabled this will be blocked for a few seconds, and if you refresh the browser you will see the connection is immediately rejected, but if the blocking is disabled you will see these are not rejected.



1.4.4.2.6.1 Blocking: On

When the blocking is on you will see **Agent blocked** warning messages in the Switch log when a device misbehaves:

1.4.4.2.6.2 Blocking: Off (default)

When the blocking is off, the first time it would have triggered you will see an INFO message saying it is disabled.

1.4.4.2.7 Enabling or disabling Device Deduplication

Please refer to the Device Deduplication page for further information about how the process works, and how to configure the settings.

> **Warning**
>
> The Device Deduplication feature is not enabled until you have modified the Coordinator configuration settings.
>
> The configuration steps describe updating the Coordinator configuration file, specify False (default) for each of the configuration arguments. You are strongly advised that all configuration arguments - except for DeviceIdentifier - are set to False (default) for the first run or for whenever a new DeviceIdentifier value is being set. Results should then be analysed to ensure that the DeviceIdentifier specified is correct for your environment.

Tachyon stores its Device Deduplication configuration in the **<INSTALLDIR>\Tachyon\Coordinator\Tachyon.Server.Coordinator.exe.config** file.

After any changes reboot the server or restart the **1E Tachyon Coordinator** service.

The time and frequency of when the Device Deduplication process runs is changed by adding and editing the **DeviceDeduplication** setting.

```
<module assemblyName="Tachyon.Server.Coordinator" providerName="Tachyon.Server.
Coordinator.Scheduling.SchedulingModule">
  <settings>
    <add key="Crontab1" value="50 23 * * * LogDevicesSeenInTheLast7Days" />
    <add key="Crontab2" value="15 * * * * MaintainPolicyRulePartitioning" />
    <add key="Telemetry" value="40 23 * * 5 SendTelemetryStats" />
    <add key="DeviceDeduplication" value="0 1 * * 0 DeviceDeduplication {Delete
Devices:'false',UpdateDeviceData:'false',DeleteOrphanedDeviceData:'false',Devic
eIdentifier:['FQDN']}" />
  </settings>
</module>
```

The numbers that you see after **value** is a crontab schedule expression. The schedule **0 1 * * 0** means "at 01:00 hours, any day of the month, any month of the year, on weekday 0 (Sunday)". In other words, this configuration runs the Device Deduplication process at 1AM UTC every Sunday night.

You can use an online tool such as https://crontab.guru/ to verify your crontab schedule expression.

Warning

Please ensure there are no spaces in the **arguments** text {within the brackets}.

Do not change the other crontab keys unless advised by 1E.

1.4.4.2.8 Enabling or disabling Telemetry features

Telemetry helps 1E to continually improve your experience. Only summarized statistical information is collected, which enables 1E to see how customers use features of the application. No personally identifiable data is collected. 1E use this information to:

- Understand how the product is being used to influence future development decisions
- Plan supported platforms (OS, SQL etc. versions) over time
- Deliver a smooth upgrade experience as we can focus testing on implemented scenarios
- Improve system performance
- Identify early warning signs of potential issues such as excessive growth of database tables, instruction failures etc. so we can pro-actively address them.

Server telemetry reports how the platform is used and data is compressed, encrypted and sent to 1E through email on a configurable schedule. Full details of the Server telemetry data sent to 1E is provided in Server telemetry data.

User Interface telemetry reports how the user interface is used, and data is sent directly from administrator browsers to the 1E Cloud.

1.4.4.2.8.1 Server telemetry

Note

By default, Tachyon collects data continuously and sends a **compressed** and **encrypted** summary by email to 1E **every Friday at 23:40 UTC**.

If you have disabled the **email feature** then Server telemetry will not be sent to 1E.

In this version of Tachyon Platform, you must edit the **Server telemetry** configuration in the **<INSTALLDIR>\Tachyon\Coordinator\Tachyon.Server.Coordinator.exe.config** file.

After any changes reboot the server or restart the **1E Tachyon Coordinator** service.

Note

Changes to the Telemetry configuration do not affect the data exported into an unencrypted CSV file by the **Export Telemetry** button on the Settings→System information page.

The time and frequency of when Telemetry is sent to 1E is changed by editing the **Telemetry** line.

```
<module assemblyName="Tachyon.Server.Coordinator" providerName="Tachyon.Server.
Coordinator.Scheduling.SchedulingModule">
  <settings>
    <add key="Crontab1" value="50 23 * * * LogDevicesSeenInTheLast7Days" />
```

```
    <add key="Crontab2" value="15 * * * * MaintainPolicyRulePartitioning" />
    <add key="Telemetry" value="40 23 * * 5 SendTelemetryStats" />
  </settings>
</module>
```

Telemetry emails can be disabled by changing the key name from *"Telemetry"* to *"DISABLED"*. To enable them, change it back to *"Telemetry"*.

The numbers that you see after **value** is a crontab schedule expression. The schedule **40 23 * * 5** means "at 23:40 hours, any day of the month, any month of the year, on the 5th day of the week (Friday)". In other words, this configuration sends the telemetry data every Friday night.

You can use an online tool such as https://crontab.guru/ to verify your crontab schedule expression.

> **Warning**
>
> Do not change the other crontab keys unless advised by 1E.

1.4.4.2.8.2 User interface telemetry

In this version of the platform, you must edit the **User interface telemetry** configuration in the Master database.

Connect to the **TachyonMaster** database and edit the **GlobalSetting** table. Locate the entry whose **Name** is **UITelemetryLevel** and change the **Value** to 0, 1, 2 or 3, to reflect the type of data that is reported to 1E.

0 - Off

1 - Anonymous

2 - License Name

3 - License Name and Unique user ID

The change takes effect for each user when they close and reopen their browser to connect to the portal.

> **Note**
>
> **License Name** is **Customer** name as it appears in the license file and License information page.
>
> **Unique user ID** is a random ID number representing an individual user.

	Name	Value	Hidden
21	PolicyDirty	false	1
22	PolicyRuleDeviceThreshold	1000	1
23	PolicyRuleStatusPartition	true	1
24	RequireReauthenticationForInstr...	true	0
25	SychronousInstructionCacheDur...	180	0
26	SychronousInstructionWaitTime...	30	0
27	UITelemetryKey	a33401cd-7dc1-4e66-4689-daa2a88d37eb	1
28	UITelemetryLevel	0	1
29	UseStartsWithMatchingForADPri...	false	0

1.4.4.2.9 Enabling or disabling Two-factor Authentication

2FA is optionally disabled (enabled by default) in the Active Directory and email screen. If you need to change this after installation, then you need to edit the setting **<add key="2FAEnabled" value="true" />** in the **<INSTALLDIR>\Tachyon\Coordinator\Tachyon.Server.Coordinator.exe.config** file.

If enabling 2FA, please refer to Email and 2FA requirements.

1.4.4.2.10 Removing the HTTP binding from the Tachyon website

You can optionally remove the HTTP binding from the Tachyon website on any Tachyon server (Master, Response, DMZ or other server). You can do this by simply deleting the HTTP binding in IIS Manager.

The table below lists 1E products and apps that may depend on the website HTTP binding, which you should consider before removing it from the Master Stack.

> **Note**
>
> In this version of platform, upgrading will re-instate the HTTP binding. Therefore, you will need to repeat the removal process described below.

App	Tachyon Master Stack	Tachyon Response server
AppClarity (Software Reclaimer)	No dependency on HTTP, although the Reclaimer uses HTTP by default. To use HTTPS, Software Reclaimer requires its Reclaimer XML to be reconfigured to use HTTPS. Please refer to Configuring Software Reclaimer to use HTTP or HTTPS.	No dependency on HTTP. Software Reclaimer does not use Response Servers.
Application Migration (Task Sequences)	No dependency on HTTP.	No dependency on HTTP. Application Migration does not use Response Servers.
Content Distribution	You will need to keep the HTTP binding only if you are still in the process of upgrading from Nomad 7.0.200 or earlier, which uses HTTP to connect to the Master Stack server. Nomad clients (in 1E Client 5.2, 8.0, 8.1, 8.1 and later) do not connect to the Master Stack.	No dependency on HTTP. Nomad clients (in 1E Client) use HTTPS by default, and connect to the Background Channel.

App	Tachyon Master Stack	Tachyon Response server
PXE Everywhere Central	Although PXE Everywhere Central is not an app, it can be installed on a Tachyon server. It requires HTTP, but this will be normally under the Default Web Site, which means you can safely remove the HTTP binding from the Tachyon website. However, there are circumstances where PXE Everywhere Central may have installed under the Tachyon website, in which case you will need to keep the HTTP binding, or remove the HTTP binding and re-install PXE Everywhere Central. PXE Everywhere Central will automatically install under the Tachyon website, or create its own website, if the Default Web Site does not exist or does not have an HTTP 80 binding. PXE Everywhere does not support HTTPS and uses/creates a HTTP 80 binding by default. You can optionally change the HTTP port after installation, but you must ensure PXE Everywhere Agents are also configured to use the same port.	See Master Stack.
ServiceNow apps	No dependency on HTTP.	No dependency on HTTP.

The following apps have no dependency on HTTP.

- Experience
- Explorer
- Guaranteed State

1.4.5 Implementing a Tachyon DMZ Server

The process for installing a Tachyon DMZ Server to support Internet-facing 1E Client devices.

Enabling Tachyon to support devices that are external to your company network is done by slightly extending the default single-server architecture.

To enable external 1E Client devices to interact with Tachyon , the DMZ requires at least one Background Channel and at least one Switch.

The Responses Stack handles communications between Master Stack and 1E Client devices. The Background Channel and Switch components handle the direct communication with clients, the Core processes the information in both directions between the Master Stack and the Switches.

Tip

Tachyon Setup provides a two-stage process to install a new DMZ Server:

1. Run Setup Maintenance on the Response Stack server (specifically the server that hosts the Core which the DMZ Server will connect to) to prepare the Response server and its database, and store details in an **ini** file
2. Run Setup to install the DMZ Server using the prepared **ini** file.

The two-stage process and its **ini** file are required because Tachyon Setup is unable to communicate through the DMZ firewall. In previous versions of Tachyon, the first stage required complex manual configuration.

To upgrade a DMZ Server, you only need to run setup on the DMZ Server, you do not require the **ini** file.

Note

You should not start Stage 1 until you are also prepared to complete Stage 2. This is because Stage 1 Tachyon reconfigures to think the DMZ Server already exists and is working before Stage 2 completes the process. This may cause the following problems:

- Tachyon will attempt to send instructions to the Switch in the DMZ, and will log an error because such Switch is not yet installed. The error is harmless and will not prevent the instruction from being sent to other existing Switches, but you should be prepared to see the error message in the Log without being alarmed.
- You will not be able to upload any new instructions which contain resources. If you try to upload an instruction definition that contains resources, the Consumer API will try to upload the resources to all Background Channels, including the one in the DMZ. This will, of course, fail, and it will cause the Consumer API to revert the changes made to all other Background Channels and return an error result.
- You will not be able to deploy a Policy, because Policies also require one or more files to be uploaded to all Background Channels, which will be reverted when the DMZ Server fails to update.

If for any reason you are unable to complete Stage 2, you can revert the Stage 1 changes by using the **Undo** button in DMZ Server form in the Tachyon Setup Maintenance screen.

1.4.5.1 Assumptions

The steps given on this page assume:

- If the Tachyon DMZ Server is domain-joined, it is either in the same domain in which the internal Tachyon Server resides or there is a two-way trust between domains
- The Tachyon DMZ Server will host only Tachyon Switch and Background Channel components and is installed in a DMZ
- Tachyon is already installed on the internal (corporate) network, with clients successfully using the internal Response Stack Switch and Background Channel, which the DMZ Server will connect to.

In our example, the DMZ Server has only one Switch, and the internal Tachyon Server is a single-server configuration with Master and Response Stacks. If your system has different requirements, please contact 1E for advice.

Client devices will be configured to swap between being on the internal network and being external to the network and therefore will communicate with the internal Tachyon Server when connected internally and the external Tachyon DMZ Server when accessing externally (for example Internet). Client devices must have the appropriate certificates installed. Please refer to Certificate requirements for more details.

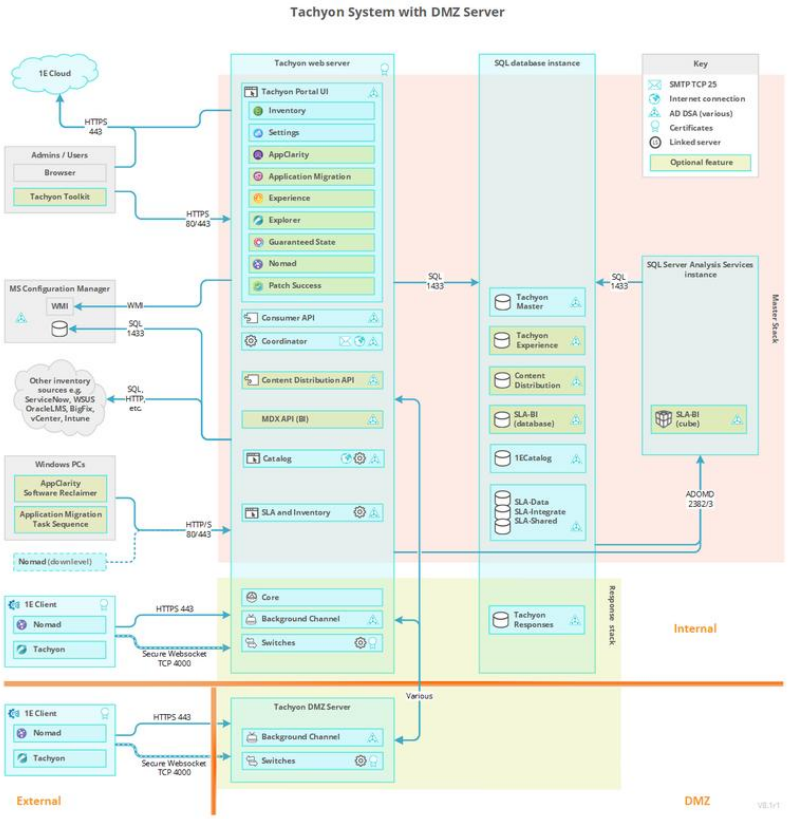
1.4.5.2 Communications ports

The Tachyon communications ports between the Tachyon Master Server and the Tachyon DMZ Server must be opened, as illustrated in the picture. Please refer to the Communication Ports page for more details.

Warning

The web server certificate on the DMZ Server needs to reference at least one CRL Distribution point that uses HTTP. These CRL DPs are likely to be in the internal network, and the firewall will need to allow the DMZ server to access these internal servers.

Tachyon Setup will warn you if the certificate does not reference a CRL Distribution point that uses HTTP, but does not tell you if it cannot connect to the CRL DP, and will allow installation to proceed.



1.4.5.3 Preparation

In the following summary and configuration steps, the following terminology is used:

- **Relevant internal servers**
  - Any internal server which hosts a Tachyon Server component that communicates with any DMZ Server
  - Typically this will include the servers which host the Coordinator, the Consumer API, and any Core bound to a DMZ switch that is registered in the dbo.SwitchToCoreApi table in the TachyonMaster database
  - The example diagrams and steps refer to only one internal server, but there may be separate servers for Master Stack (with Coordinator and Consumer API) and Response Stack (with Core).
- **DMZ Server**
  - Any server that has Tachyon Server components installed that is not on the internal network (that is, outside of the corporate network)
  - This includes a Tachyon DMZ Server (which has one or more Switches and a Background Channel).

You must ensure the following before installation of Tachyon on a DMZ Server.

- The **Master Server** is installed and verified with internal Tachyon clients.
  - Ensure the certificate(s) used on the internal server(s) already meet the additional requirements for implementing a DMZ Server. Tachyon Setup does not check these requirements.
  - The documentation below assumes this has a Master Stack and Response Stack on the same server.
  - A Response Stack is required in order to provide the Core component that will be used by the remote DMZ Server. Internal clients are not required to use the Switch and Background Channel of this Response Stack.
- The **DMZ internal and external firewall** are configured correctly. Please refer to the Communication Ports page for more details.
- The **DMZ Server** is provisioned. Although a DMZ Server does not have all Tachyon components, all prerequisites must be met in order for Tachyon Setup to run. In particular, the following must be prepared before installation. For more detail about each requirement, click on the relevant link.
  - **Network requirements** (**DNS Names**)
    - The DMZ Server requires two DNS Names, even if the DMZ Server is configured with one network interface. **Two network interfaces** are required to prevent response traffic from clients to server, and from server to Core, using the same network interface.

- A **DMZ Server internal DNS Name** so that the internal Tachyon Server can connect to the DMZ Server. The documentation below assumes this DNS Name exists, but it can alternatively be the server's computer name FQDN.
- A **DMZ Server external DNS Name** so that Internet devices can connect to the DMZ Server, which is the name included in the client configuration for Switch and Background Channel settings (1E Client configuration file). This DNS Name is not necessarily for the actual IP Address(es) of the external network interfaces if DMZ firewall, Network Address Translation (NAT), or other routing is employed.
- Both DNS Names must be included in the Web server certificate. Please see Certificate requirements below for more information on certificate DNS Name requirements.
- If the DMZ Server is domain-joined, both DNS Names require an HTTP class Service Principal Name (SPN) registered on the DMZ Server's computer$ account. Please refer to Service Principal Names for more details.

– **Network requirements (Network interfaces)**

- The DMZ Server should have an internal network interface, and an external network interface for each Switch, in order to keep Core and Switch traffic apart. This recommendation is for performance reasons when supporting over 500 devices.
- If an internal interface is *not* used, then the external interface will use both DNS Names.
- If using two interfaces...
  - The internal interface will use the internal DNS Name, and the external interface(s) will use the external DNS Name. This is the assumption made in the configuration steps below.
  - Internal and external interfaces will typically be on different subnets.
  - Ensure your network routing is configured to route outgoing traffic using the internal interface. You may need to configure a persistent route, for example using the same steps described in Configuring a persistent route for SQL traffic.

– **Certificate requirements (Web Server Certificate)**

- Each DMZ Server requires its own web server certificate. Please see Certificate requirements below for more information.

– **Windows Server roles and features**

- IIS to host the Background Channel application.
- Windows Authentication role if the server is domain joined and has a trust relationship with the domain that Master Stack is configured to use.

- **Test devices** with the client installed.
  - At least one is connected to the internal network; another is connected to the external network.

1.4.5.4 Certificate requirements

Tachyon Server certificate requirements are defined in Certificate requirements.

Implementing a Tachyon DMZ Server installation has the following additional certificate requirements for the internal server(s) as well as the Tachyon DMZ Server itself.

Relevant internal servers

Type	Additional certificate requirements	Where used
Tachyon Server certificate	The Certificate requirements require the **Tachyon Server DNS Name FQDN** and **computername FQDN** to be present in the certificate. However, it has an additional requirement to separate communications between internal and external Switches: • A **Subject Alternative Name** Extension (extensions:subjectAltName), of type **dnsName**, which must contain: – **Alternate DNS Name FQDN** - for example **Tachyonalt.acme.local**	This is the usual Tachyon website certificate. A DMZ Server installation has additional needs to allow Switches on the DMZ Server to communicate with: • Tachyon Master Stack (Coordinator) • Tachyon Response Stack (Core).
Tachyon Consumer API client certificate	The client certificate on the Tachyon Master Stack has the following requirements: 1. Issued by a trusted Certificate Authority (CA) – The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the server – If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the server – If the above CA certificates are different from those used by the DMZ Server, they	Used by the Tachyon Master Stack (Consumer API) to perform client authentication with the Background Channel on the DMZ Server. Required only if certificate authentication is used instead of domain authentication. **Note**

Type	Additional certificate requirements	Where used
	will need to be exported and then imported into the DMZ Server. 2. Has at least the following Enhanced Key Usage – Client Authentication (OID 1.3.6.1.5.5.7.3.2) 3. Has a private key 4. Revocation information is included. – References at least one CRL Distribution point that uses HTTP. 5. A **Subject Alternative Name** Extension (extensions:subjectAltName), of type **dnsName**, which must contain one of the following: – **Tachyon Server DNS Name FQDN** - in our example **Tachyon.acme.local** – **Alternate DNS Name FQDN** - as specified above - for example **Tachyonalt.acme.local** – **Tachyon Server computername FQDN** - in our example **ACME-MST.acme.local** 6. The client authentication certificate, used by the Consumer API to communicate with the DMZ Background Channel, must have a subject. **Note** You will need the thumbprint for this certificate. In our example, this is **95dfcc47c31c8bf201104da27ba8a6d792e83665**.	This certificate is only used if your DMZ Server is not domain-joined, or does not have a two-way trust between your internal domain and your DMZ domain.

1.4.5.4.1 DMZ Server

Type	Additional certificate requirements	Where used
DMZ Server certificate	The Certificate requirements are valid with regard to trust, usage, enhanced key usage, the private key, and revocation. However, as this is an externally reachable certificate, it is not recommended that the computername FQDN is present in the	Used by the Switch(es) and Background Channel to secure

Type	Additional certificate requirements	Where used
	certificate. As such, the certificate must meet the following requirements: • A **Subject Alternative Name** Extension (extensions:subjectAltName), of type **dnsName**, which must contain: – **DMZ Server external DNS Name FQDN** - in our example: **Tachyon.acme.com** – **DMZ Server internal DNS Name FQDN** - in our example **Tachyondmz.acme.local** Optionally, it may also contain a Subject Common Name Field (subject:commonName) that is unique within the organization that identifies the certificate (https://cabforum.org/wp-content/uploads/CA-Browser-Forum-BR-1.6.5.pdf#page=54).	communication to clients.
DMZ Server client certificate	The client certificate on the Tachyon DMZ Server has the following requirements: 1. Issued by a trusted Certificate Authority (CA) – The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store. – If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store. – If the above CA certificates are different to those used by the Tachyon Master Stack server, they will need to be exported and then imported on the Tachyon Web Server. 2. Has at least the following Enhanced Key Usage. – Client Authentication (OID 1.3.6.1.5.5.7.3.2). 3. Has a private key. 4. Revocation information is included.	Used by Switch(es) to perform client certificate authentication with its assigned Response Stack (Core).

Type	Additional certificate requirements	Where used

– References at least one CRL Distribution point that uses HTTP.

5. A **Subject Alternative Name** Extension (extensions:subjectAltName), of type **dnsName**, which must contain:

   – **DMZ Server internal DNS Name FQDN** - in our example **Tachyondmz.acme.local**.

1.4.5.4.2 Certificate trust

For each of the following scenarios, ensure you import the CA certificate(s) of the trust chain into the server's Local Machine's Trusted Root Certification Authority or Intermediate Certification Authorities stores (as appropriate).

- Relevant internal servers must trust the DMZ Server certificate therefore you must import the CA certificates used by the DMZ Server into the CA stores on the relevant internal servers.
- DMZ Server must trust the relevant internal server certificate(s), therefore you must import the CA certificates used by the relevant internal server(s) into the CA stores on the DMZ Server.
- The DMZ Server must also trust client certificates, therefore you import the CA certificates used by clients into the CA stores on the DMZ Server.

Note

The HTTP CDP referenced in any certificate, including imported CA certificates, must be reachable by the DMZ Server.

Note

If the certificates on the DMZ Server and the internal Tachyon servers are from different issuing CAs, then:

- Obtain the certificates (public keys only) for all the intermediate CAs, up to and including the Root CA of the internal Tachyon Server's Web Server Certificate, and add them to the corresponding CA stores on the DMZ Server. If you do not do this, the Switch on the DMZ Server will not be able to start because it won't be able to trust the Core API on the relevant internal server.

Similarly, if the certificates on the DMZ Server and client authentication certificates on external clients are from different issuing CAs, then:

- Obtain the device's intermediate and root CA certificates, and add them to the corresponding CA stores on the DMZ Server.
- Windows devices will need the Tachyon DMZ Server's intermediate and root CA certificates to be added to their CA stores

- Non-windows devices will need the Tachyon DMZ Server's intermediate and root CA certificates to be added to their certificate store (that is either KeyStore or cacert.pem file, depending on the method used to store certificates).

1.4.5.5 The installation process for a Tachyon DMZ Server

1.4.5.5.1 Overview

Tachyon Setup provides a two-stage process to install a new DMZ Server:

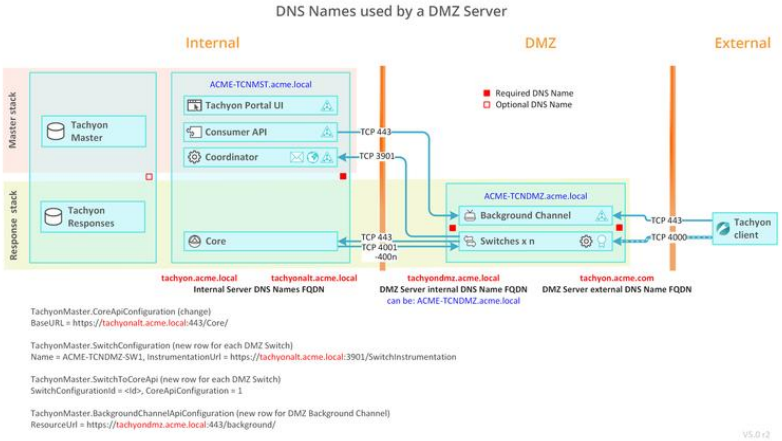
1. Run Setup Maintenance on the Response Stack server (specifically the server that hosts the Core which the DMZ Server will connect to) to prepare the Response server and its database, and store details in an **ini** file.

2. Run Setup to install the DMZ Server using the prepared **ini** file.

The two-stage process and its **ini** file are required because setup is unable to communicate through the DMZ firewall. In previous versions of Tachyon , the first stage required complex manual configuration.

To upgrade a DMZ Server, you only need to run setup on the DMZ Server, you do not require the **ini** file.

To illustrate the following detailed steps we use the ACME network with two servers.



1.4.5.5.2 DNS Names

Use the following table to help map the DNS Names used in your environment with the name used in the steps below.

Server	DNS Name references	DNS Name examples	DNS Names used in your environment
The internal Tachyon Server	Tachyon Server computername FQDN	**ACME-TCNMST.acme.local**	

Server	DNS Name references	DNS Name examples	DNS Names used in your environment
The diagram shows only relevant components of Master Stack and Response Stack			
Tachyon Server DNS Name FQDN	**Tachyon.acme.local**		
Tachyon Server Alternate DNS Name FQDN	**Tachyonalt.acme.local**		
The external Tachyon DMZ Server	DMZ Server computername FQDN	**ACME-TCNDMZ**	
DMZ Server internal DNS Name FQDN	**Tachyondmz.acme.local**		
DMZ Server external DNS Name FQDN (Internet)	**Tachyon.acme.com**		

1.4.5.5.3 Detailed steps

	Location	Detailed steps
1	Internal Tachyon Server (Master and Response Stacks) and internal	Install the internal Tachyon Server, with Master and Response Stacks, and ensure it works by running the tests described in Verifying.

	Location	Detailed steps
	Tachyon client(s).	
2	DMZ Server.	Ensure Preparation steps are complete for the Tachyon DMZ Server. **Note** You must ensure the following before installation of Tachyon on a DMZ Server. • The **Tachyon Master Server** is installed and verified with internal clients. – Ensure the certificate(s) used on the internal server(s) already meet the additional requirements for implementing a DMZ Server. Tachyon Setup does not check these requirements. – The documentation below assumes this has a Master Stack and Response Stack on the same server. – A Response Stack is required in order to provide the Core component that will be used by the remote DMZ Server. Internal clients are not required to use the Switch and Background Channel of this Response Stack. • The **DMZ internal and external firewall** are configured correctly. Please refer to the Communication Ports page for more details. • The **DMZ Server** is provisioned. Although a DMZ Server does not have all Tachyon components, all prerequisites must be met in order for Tachyon Setup to run. In particular, the following must be prepared before installation. For more detail about each requirement, click on the relevant link. – **DNS Names** • The DMZ Server requires two DNS Names, even if the DMZ Server is configured with one network interface. **Two network interfaces** are required to prevent response traffic from clients to server, and from server to Core, using the same network interface. • A **DMZ Server internal DNS Name** so that the internal Tachyon Server can connect to the DMZ Server. The documentation below assumes this DNS Name exists,

but it can alternatively be the server's computer name FQDN.

- A **DMZ Server external DNS Name** so that Internet devices can connect to the DMZ Server, which is the name included in the client configuration for Switch and Background Channel settings (1E Client configuration file). This DNS Name is not necessarily for the actual IP Address(es) of the external network interfaces if DMZ firewall, Network Address Translation (NAT), or other routing is employed.
- Both DNS Names must be included in the Web server certificate. Please see Certificate requirements for more information on certificate DNS Name requirements.
- If DMZ Server is domain-joined, both DNS Names require an HTTP class Service Principal Name (SPN) registered on the DMZ Server's computer$ account. Please refer to Service Principal Names for more details.

– **Network interfaces**

- The DMZ Server should have an internal network interface, and an external network interface for each Switch, in order to keep Core and Switch traffic apart. This recommendation is for performance reasons when supporting over 500 devices.
- If an internal interface is *not* used, then the external interface will use both DNS Names.
- If using two interfaces...
  - The internal interface will use the internal DNS Name, and the external interface(s) will use the external DNS Name. This is the assumption made in the configuration steps below.
  - Internal and external interfaces will typically be on different subnets.
  - Ensure your network routing is configured to route outgoing traffic using the internal interface. You may need to configure a persistent route, for example using the same steps described in Configuring a persistent route for SQL traffic.

Location	Detailed steps

- **Web Server certificate**
  - Each DMZ Server requires its own web server certificate. Please see Certificate requirements below for more information.
- **Windows Server roles and features**
  - IIS to host the Background Channel application.
  - Windows Authentication role if the server is domain joined and has a trust relationship with the domain that Master Stack is configured to use.

- **Test devices** with the client installed.
  - At least one is connected to the internal network; another is connected to the external network.

Expand to see guidance when DMZ Server is using different CA certificates to the internal Tachyon server or clients...

Note

If the certificates on the DMZ Server and the internal Tachyon servers are from different issuing CAs, then:

- Obtain the certificates (public keys only) for all the intermediate CAs, up to and including the Root CA of the internal Tachyon Server's Web Server Certificate, and add them to the corresponding CA stores on the DMZ Server. If you do not do this, the Switch on the DMZ Server will not be able to start because it won't be able to trust the Core API on the relevant internal server.

Similarly, if the certificates on the DMZ Server and client authentication certificates on external clients are from different issuing CAs, then:

- Obtain the device's intermediate and root CA certificates, and add them to the corresponding CA stores on the DMZ Server.
- Windows devices will need the Tachyon DMZ Server's intermediate and root CA certificates to be added to their CA stores
- Non-windows devices will need the Tachyon DMZ Server's intermediate and root CA certificates to be added to their certificate store (that is either KeyStore or cacert.pem file, depending on the method used to store certificates).

3	Internal Tachy	***On the internal Tachyon Server (Response Stack)***

	Location	Detailed steps
	on Server (Response Stack).	Add an alternate HTTPS binding to the Tachyon website. In our example this is **https://Tachyonalt.acme.local:443** You may have already created an alternate HTTPS binding when installing the Response Stack server. The Response Stack server is the server you have already installed that hosts the Core component. This will have been installed when installing a Single-Server with all components, or a dedicated Response Stack server. If you need to add the binding, then use the manual steps below. **Tip** Remember this binding for steps 5, 8 and 21. 1. On the internal Tachyon Server, open **IIS Management Console**. 2. Expand **Sites** and right-click on the **Tachyon** website. 3. Under the Edit Site actions, click on **Bindings...**. 4. Click **Add...**. 5. Select type **https**. 6. Set the **Host name** to the **Tachyon Server Alternate DNS Name** - see table above. 7. Enable **Require Server Name Indication**. 8. Select the **SSL certificate** to be the *same* certificate as the existing HTTPS binding, ensuring it is the certificate with SAN entries for **Tachyon Server DNS Name FQDN** and **Tachyon Server Alternate DNS Name FQDN**. 9. Click **OK** to save, and **Close**.
4	Internal Tachyon Server (Response Stack).	***On the internal Tachyon Server (Response Stack)*** On the server that hosts the Core component - which the DMZ Server will connect to - run Tachyon Setup and go to the **Maintenance** screen, and click on **Add DMZ Server...** This is the first stage of using Tachyon Setup to install a DMZ Server. It prepares the Response server and its database, and stores configuration details in a **<DMZ Server computername>.ini** file in the Setup folder. You will need to copy this file to the DMZ Server.

Location	Detailed steps

When you click on **Ok**, Setup validates the configuration details. Any serious errors will prevent Setup from going ahead, and any warnings will cause a dialog to be presented to ask for confirmation about whether you want to continue. The **ini** file is only saved or updated after a successful validation, or warnings have been accepted.

Note

After this moment, Tachyon will "think" that you have a DMZ Server, even though you have not yet installed it, this means:

- Tachyon will attempt to send instructions to the Switch in the DMZ and will log an error because such Switch is not yet installed. The error is harmless and will not prevent the instruction from being sent to other existing Switches, but you should be prepared to see the error message in the Log without being alarmed.
- You will not be able to upload any new instructions which contain resources. If you try to upload an instruction definition that contains resources, the Consumer API will try to upload the resources to all Background Channels, including the one in the DMZ. This will, of course, fail, and it will cause the Consumer API to revert the changes made to all other Background Channels and return an error result.
- You will not be able to deploy a Policy, because Policies also require one or more files to be uploaded to all Background Channels, which will be reverted when the DMZ Server fails to update.

The **Undo** button will allow you to undo the changes written to the database so that your server will not think anymore that you have a DMZ Switch and Background Channel. This can be useful if you find an error in your configuration or if you need to revert the changes to avoid the errors mentioned above or if you wish to uninstall your DMZ Server. If you need to do this after you have already closed the form, you can re-open it and reload the information by using the **Import** button.

Parameter	Description
DMZ Server computername.	The computername of the DMZ Server. It is used to ensure you are preparing the correct DMZ Server, and prepare the Switch configuration in the TachyonMaster database.

Tip

Location	Detailed steps
	The computername is the value returned when you run the command **cmd /k hostname** on the DMZ Server.
DMZ Server internal DNS Name FQDN - reachable from internal network.	The DNS Name FQDN and port that the internal Tachyon servers will use to connect to the DMZ Server through the DMZ firewall. In our example this is **Tachyondmz.acme.local** and default port **443**. **Tip** In most cases, your DMZ Server will have dual network connections, one for your intranet and another for the Internet. Here, you need to provide a DNS Name that resolves to the IP address of the internal network connection. It will be used by the Consumer API for posting information to the Background Channel in the DMZ, and the Core connecting to the DMZ Switch(es). When you install the DMZ Server, this DNS Name FQDN will be used for the alternate HTTPS binding and exist as a SAN in the binding certificate.
DMZ Server external DNS Name FQDN - reachable from the Internet.	The DNS Name FQDN and port that clients will use to connect to the DMZ Server, and the port used by the Background Channel. In our example this is **Tachyon.acme.com** and default port **443**. This DNS Name FQDN should be the one that the clients on the Internet use for connecting to the DMZ server. The DMZ Tool will save it to the .ini file; when the file is read by Setup in the DMZ, it will be used for pre-configuring the corresponding entry in the Web configuration page. **Note** The Tachyon installer only configures a single address in IIS. If your DMZ server is dual-ported, meaning that it uses a different address for the internal network and the external network, only the latter will be

Location	Detailed steps
	automatically configured in IIS during installation in the DMZ. You will need to manually add the internal address in the IIS configuration. **Tip** In most cases, your DMZ Server will have dual network connections, one for your intranet and another for the Internet. Here, you need to provide a DNS Name FQDN that clients use to connect to the Background Channel using the external network connection. When you install the DMZ Server, this DNS Name FQDN will be used for the main HTTPS binding, and exist as a SAN in the binding certificate.
Number of Switches to install in the DMZ.	The number of Switches you will install on the DMZ Server. By default it will be **1**, but you need to increase the value if you expect to have more than 50,000 clients connecting to this DMZ server. Add one Switch for every 50,000 clients.
Comma-deimited list of Switch IP Addresses.	Enter as many IP Addresses as the number of Switches that you specified above. In our example we have one Switch which has an IP Address **10.10.200.2** **Tip** Each Switch listens for clients on its own network interface with its own IP Address. Each IP Address is for an external connection of the Switch to the Internet. If you are using reverse-NAT in your external router, then this is the IP Address as seen by the DMZ Server, not as seen from the Internet. By default, each Switch listens on port 4000. If you need to change the port, you must do this manually after installation - please contact 1E for guidance.

Location	Detailed steps
	Note When you later run Setup on the DMZ Server to complete Stage 2, the Switch configuration allows you to select the IP Addresses for the Switches, and you must visually verify that the addresses match the ones that you selected here, and in the same order as they appear on the screen. The order is important because each Setup stage independently assigns a numeric name to each Switch, Setup stage 1 stores names in the database, and Setup stage 2 stores the same names in the Switch Host configuration file on the DMZ Server. This information is stored in the SwitchConfiguration table of the TachyonMaster database, and is read by the Switches on the DMZ Server when they start up. Therefore, a Switch will fail to start if the DMZ Server does not actually have a network interface with the expected IP Address.
Authentication - DMZ Server is member of a domain that trust the internal Master Stack server.	Check this checkbox if your DMZ Server will be a "member of a trusted domain" - that is, it will be joined to a domain that has a two-way trust with the domain of your internal Tachyon servers. **Note** If the DMZ Server and internal servers trust each other, then Setup will configure them both to use Windows Authentication for incoming and outgoing connections. If you do not select the option, then Setup will configure the servers to authenticate to each other by means of certificates, and you will need to provide thumbprints below.
Thumbprint of client certificate sent by the Consumer API on Master to Background	This text box is enabled if you did not select "member of a trusted domain". You should enter here the thumbprint of a certificate that is installed in the Master Stack server. It should be enabled for Client Authentication, contain a private key, and be accessible

Location	Detailed steps	
	Channel on DMZ Server.	to the Consumer API. This certificate will be presented by the Consumer API to the Background Channel in the DMZ when the Consumer API sends any changes to the Background Channel. In our example, this is **95dfcc47c31c8bf201104da27ba8a6d792e83665**. **Note** The service account under which the Consumer API is running (by default, NT Authority\Network Service) will need to have read access on the private key of this certificate. The DMZ configuration tool will automatically grant this permission if you are running it on the same machine where the Consumer API is installed. If you are running it in a remote Response Stack, you will need to grant this permission manually at the Master Stack.
	Thumbprint of client certificate sent by Background Channel on DMZ Server to ContentDistribution service.	This text box will only be enabled if you did not select "Member of a trusted domain". This field is optional. You only need to enter this value if you are installing the ContentDistribution service in your internal network, and you want the Background Channel in the DMZ to act as a Proxy so that external clients can reach the internal server. In our example, this is **25fe00fce6240c9260e614eb95680fb6f3ddf06a**. If you are using this feature, then you should enter here the thumbprint of a certificate that is installed in the DMZ server. It should be enabled for Client Authentication, contain a private key, and be accessible to the Background Channel. This certificate will be presented by the Background Channel to the ContentDistribution service in the intranet when its internal Proxy needs to forward any packets to the internal server.

Location	Detailed steps
	 5 Internal Tachyon Server (Response	On the internal Tachyon Server (Response Stack), restart all Switches and confirm they are working. 1. Restart the **1E Tachyon Switch Host** service. 2. Ensure all internal Switches are running. 3. In Explorer , confirm that at least one internal client is connected.

	Location	Detailed steps
	Stack).	
6	Internal Tachyon Server (Master and Response Stacks) and internal Tachyon client(s).	Ensure that everything is still working by running the tests described in Verifying. **Note** However, remember that Tachyon thinks your DMZ Server is live, although it is not. This means: • Tachyon will attempt to send instructions to the Switch in the DMZ, and will log an error because such Switch is not yet installed. The error is harmless and will not prevent the instruction from being sent to other existing Switches, but you should be prepared to see the error message in the Log without being alarmed. • You will not be able to upload any new instructions which contain resources. If you try to upload an instruction definition that contains resources, the Consumer API will try to upload the resources to all Background Channels, including the one in the DMZ. This will, of course, fail, and it will cause the Consumer API to revert the changes made to all other Background Channels and return an error result. • You will not be able to deploy a Policy, because Policies also require one or more files to be uploaded to all Background Channels, which will be reverted when the DMZ Server fails to update.
7	DMZ Server.	***On the Tachyon DMZ Server* 3**
8	DMZ Server.	Use Services.msc to confirm **Tachyon Switch Host** service is running. If it is stopped then there is an issue with all the Switches. Check the number of Switch log files, and review their contents. There should be one log file for each Switch, plus **Switch.Host.log** Use IIS Manager to confirm the presence of the **Tachyon** website, which contains only the **Background** web application. Check the binding to confirm all the bindings exist that were specified in the Website configuration screen. **Tip** If you wish, you can manually delete the default HTTP binding.

	Location	Detailed steps
9	Internal Tachyon Server (Response Stack) and DMZ Server.	Copy existing **Background Channel** content from the internal Tachyon Server to the Tachyon DMZ Server: 1. Copy the content (minus the web.config file) from each of the following directories on the internal Tachyon Server (Response Stack) to the equivalent directory on the DMZ Server. This is the default location. – **%PROGRAMDATA%\1E\Tachyon\Content** – **%PROGRAMDATA%\1E\Tachyon\Installers** – **%PROGRAMDATA%\1E\Tachyon\PolicyDocuments** – **%PROGRAMDATA%\1E\Tachyon\Updates** **Note** Only the initial copy of the content is required. From this point on, the Consumer API will maintain the content of the Background Channel on the Tachyon DMZ Server. **PolicyDocuments** can be omitted. When you click on the **Deploy** button in Guaranteed State (in step 27), then all policies will be regenerated and automatically copied to all registered Background Channels (see step 7 for registration of DMZ Server). If any source directory is empty then it means you have not tested that feature when verifying the internal Tachyon system in Step 1. This is not critical at this stage, but you should re-check later.
10	Internal Tachyon portal, Tachyon Server (Response Stack) and DMZ	Verify that the internal Tachyon Server can upload content to the Background Channel on the Tachyon DMZ Server: 1. Connect to the Tachyon website and open the Settings application and navigate to **Instruction sets** 2. Delete the **Verification** instructions. 3. Verify that **%PROGRAMDATA%\1E\Tachyon\Content\1E-TachyonPlatform-VerificationStage2** is removed from the internal Response Stack and DMZ servers. 4. Upload the **Verification** Instructions.

	Location	Detailed steps
	Server.	5. Verify that **%PROGRAMDATA%\1E\Tachyon\Content\1E-TachyonPlatform-VerificationStage2** is recreated on the internal Response Stack and DMZ servers.
11	DMZ Server and external Tachyon client(s).	Verify an external client can connect to the Tachyon DMZ Server Switch. Change the client configuration (1E Client configuration file) to point at both the internal Tachyon Server and the Tachyon DMZ Server. This assumes you want client devices to be able to switch between internal and external access. If you prefer, you can simply enter details only for the Tachyon DMZ Server. 1. Edit the **%PROGRAMFILES%\1E\Client\1E.Client.conf** file. 2. Modify the **Switch** configuration property. – In our example this would be: **Switch=tachyon.acme.local:4000;tachyon.acme.com:4000** 3. Modify the **BackgroundChannelUrl** configuration property. – In our example this would be: **BackgroundChannelUrl=https://tachyon.acme.local:443/Background/;https://tachyon.acme.com:443/Background/** 4. Ensure the test device is connected to the external network and not the internal network, then review the **1E.Client.log** to confirm the platform client connects. 5. Browse to the Tachyon website and start the Explorer application, and confirm the external test device is online.
12	Internal Tachyon portal and external client(s).	Run verification steps (Verifying) to verify an external Tachyon client can download content from the Tachyon DMZ Server Background Channel. 1. Browse to the Tachyon website and open the Explorer application. 2. Run the verification stage 1 and 2 and confirm a successful response is received from the external client. **Note** The verification stage 2 Action confirms that content can be downloaded by the platform client.

	Location	Detailed steps
13	Internal Tachyon portal and external client(s).	Verify the external client can receive Policy updates. 1. Open the **Guaranteed State** application in a browser. 2. Click **Administration**, then click **Policies**. 3. Select an existing enabled policy that will affect the client and then click **Disable**. 4. Click **Deploy**. 5. Check the 1E Client log on the external client to verify that it has successfully received a message to fetch new policy, and that the policy download from the Background Channel has been successful. **Note** You do not need any policies defined in Guaranteed State for this step to take effect. Pressing **Deploy** will create an empty policy. This step is required if you are making use of **Tachyon**

1.4.6 Deploying 1E Client

Client features are provided by the 1E Client, which also provides client modules for Nomad, PXE Everywhere Agent, Shopping/WSA, and WakeUp.

For full details, refer to Installing 1E Client.

1.4.7 Uninstalling Tachyon Platform

How to tidy up after uninstalling Tachyon. Follow these recommendations if you want to reinstall Tachyon instead of upgrading.

1.4.7.1 Uninstalling all the Tachyon server components

Use Tachyon Setup to uninstall Tachyon 8.1 instead of Windows Programs and Features (appwiz.cpl), this should not require a reboot.

Click here to see reasons why Tachyon Setup is best for uninstalling server components...

Note

Tachyon Setup is the recommended method of uninstalling all or individual components instead of using the Windows Control Panel.

This is because Tachyon Setup can undo any changes that were done after deploying the components, which would not be undone by the standard application uninstaller. For an example of why this is important, see the information box below.

Before uninstalling, make a backup copy of the installation folder.

The BI (Business Intelligence), SLA (Software Lifecycle Automation) and Catalog components have dependencies and should be uninstalled in the following order:

1. BI
2. SLA
3. Catalog.

Note

The Tachyon Server component can be uninstalled at any point as long as SLA is not installed. SLA has a dependency on Tachyon Server.

If ActiveEfficiency Server is installed (because it was not removed when Tachyon was upgraded), it can be uninstalled at any point.

If you use Tachyon Setup for uninstalling, it will automatically enforce dependencies and uninstall components in the correct order.

1.4.7.1.1 After uninstalling the Tachyon server

Uninstalling leaves behind the following artifacts. Like other Windows installers, uninstalling will leave behind any files, folders, and registry entries created after installation.

Location	Artifacts	Recommendation
Installation folder	You may find web.config files if IIS settings were modified after the previous installation.	Delete or rename the installation folder.
Logs folder	Log files remain.	Delete or rename the logs folder. If it is not deleted, a new installation using the same logs folder will continue to use the old log files.
Registry	Encrypted license details remain in HKLM\SOFTWARE\1E\Tachyon\LicData	The Tachyon registry key can be deleted or left. It is overwritten by the next installation.
SQL Server	TachyonMaster and TachyonResponses databases, as well as any databases used by additional	The databases can be deleted. If not deleted, the

Location	Artifacts	Recommendation
	installed components (Catalog, SLA), will remain at their corresponding SQL instances.	Tachyon Server installer provides an option to drop old databases or use them.

1.4.7.2 Uninstalling 1E Client for Windows

1.4.7.2.1 Manual uninstallation

1E Client can be uninstalled manually by using Windows Apps and Features (appwiz.cpl). A reboot is not normally required.

1.4.7.2.2 Disabling a feature or client module

Please refer to Reconfiguring 1E Client for examples of how to use the **-reconfigure** command-line to reconfigure the 1E Client.

1.4.7.2.3 Uninstallation using the Windows Installer

1E Client can be uninstalled automatically by using a Windows Installer command line, where the {product code} is dependent on the version of the 1E Client. The example below also includes switches that prevent prompting and restart and creates a log file.

```
msiexec /x {BF6F5FA9-64C8-4B72-A6B6-14A582BF96B8} /qn /norestart /l*vx C:\Windo
ws\temp\1EClient-uninstall.log
```

1.4.7.2.4 Tidy up after uninstallation

After uninstallation of 1E Client, the following is left behind. As with other Windows installers, uninstallation will leave behind any files, folders, and registry entries that were created after installation.

Location	Artifacts	Recommendation
Installation folder	None.	
Logs folder	Log files remain. Please refer to Log files for log file locations of 1E Client and its client modules.	The log files can be deleted or renamed. If not deleted, then a new installation that uses the same logs folder will continue to use the old log file.

Location	Artifacts	Recommendation
Client\Persist folder remains.	Leave this folder which contains status information about current instructions. The Persist folder should be deleted only if you do not intend re-installing the 1E Client with Tachyon enabled, or when preparing Sysprep and OS images.	
Tachyon client registry	HKLM\SOFTWARE\1E\Client\Persist	This registry exists if the client feature of the 1E Client is enabled. It is used to keep a record of hash values for its persistent storage files, which includes status information about current instructions. This registry key should be deleted only if you do not intend re-installing the 1E Client with Tachyon enabled, or when preparing Sysprep and OS images.
Nomad Cache	%ALLUSERSPROFILE%\1E\NomadBranch	The folder should be deleted only if you do not intend re-installing the 1E Client with Nomad enabled. Downloaded content is retained so that if Nomad client is re-enabled it will be scanned and re-registered, to make available for peer sharing with other Nomad clients.

Note

HKLM\SOFTWARE\1E\Common and HKLM\SOFTWARE\1E\NightWatchman are used by the 1E NightWatchman Agent, previously part of the 1E Agent.

1.4.7.3 Uninstalling 1E Client for non-Windows

1.4.7.3.1 macOS uninstallation

To uninstall the 1E Client from a macOS device invoke the *uninstall.sh* script from within a sudo bash script. *uninstall.sh* is available within the scripts directory of the Apple Disk Image (dmg) file of the macOS 1E Client.

Alternatively, enter the following commands inside a sudo bash shell:

```
bash$ cd /Library
bash$ pkgutil --only-files --files com.1e.pkg.1E.Client | tr '\n' '\0' | xargs
-n 1 -0 rm
bash$ pkgutil --forget com.1e.pkg.1E.Client
```

1.4.7.3.2 Linux uninstallation

The following command line can be used to uninstall the 1E Client on Linux:

```
sudo rpm -e 1e.client
```

Uninstallation will leave behind files, folders, and registry entries that were created after installation:

Location	Artifacts	Recommendation
Installation folder	None.	
Logs folder	Log files remain.	The log files can be deleted or renamed. If not deleted, then a new installation that uses the same logs folder will continue to use the old log file.
Client\Persist folder remains.	You should keep the **Persist** folder, which contains status information about current instructions, only if you intend to re-install the 1E Client.	

1.4.7.3.3 Solaris uninstallation

Note

1E Client is no longer available for Solaris, but 1E may reintroduce it, if there is sufficient demand.

1.4.8 Tachyon Product Pack Deployment Tool

The Tachyon Product Pack Deployment Tool (PPDT) can be used to upload multiple Classic and Integrated Product Packs into Tachyon.

The PPDT is found in the ProductPacks folder of the Tachyon Platform zip, and with appropriate permissions. Once the zip has been extracted, the tool can be used to upload any Classic and Integrated Product Packs found in its folder structure. Ensure you use the same version of the tool to match the version of Tachyon.

Classic Product Packs

Classic Product Packs contain instructions, for use in Tachyon Explorer and other Tachyon applications.

Classic Product Packs can also be uploaded using the Tachyon portal Settings app→ Instructions → Instruction Sets, described in Instructions Menu, this method does not assign instructions to any instruction set. Settings can also be used to export instructions.

Hyphens

The tool creates an instruction set with the same name as its zip. When creating or updating an instruction set, the tool converts hyphens to spaces. Hyphens can be included in the names of Instruction sets, but they are converted by the tool.

The Settings application keeps hyphens and spaces in the zip name when downloading (exporting) an instruction set. If the tool is then used to re-upload the same pack, the hyphens are lost, creating a new instruction set with a different name from the original.

Individual Product Packs are not versioned, however, each instruction has its version stored in the instruction definition.

Integrated Product Packs

Integrated Product Packs contain policies, rules, and fragments for use by Guaranteed State, and may also include instructions.

If the Product Pack contains instructions associated with the policies, the tool creates an instruction set using the name in its manifest file.

Note

When the tool is used to upload new versions of instructions, then the updated instructions remain in their current instruction set, they are not moved to the new set created by the tool.

Tachyon Product Packs reference provides full details of all the product packs included in the Tachyon Platform zip.

1.4.8.1 Getting started

To run the tool, you need the following:

1.4.8.1.1 Account permissions

The account used to run the **Tachyon.ProductPackDeploymentTool.exe** must:

- Have local administrator rights on the computer it is running on
- Exist as a Tachyon user assigned to either **Installer** or **Full Administrator** role.

1.4.8.1.2 The account used to run the Tachyon.ProductPackDeploymentTool.exe must:

- Have local administrator rights on the computer it is running on
- Exist as a Tachyon user assigned to either **Installer** or **Full Administrator** role.
  - Guaranteed State administrator
  - Instruction Set administrator.

1.4.8.1.3 Locating the Tachyon Product Pack Deployment Tool

The tool is included in the Tachyon Platform zip file under the **ProductPacks** folder.

- **Tachyon.ProductPackDeploymentTool.exe** (and its supporting files) is used to upload Product Packs into Tachyon.
- The tool creates a log file called **Tachyon.ProductPackDeploymentTool.log** in the same folder.

The **ProductPacks** folder contains two directories, **Classic** and **Integrated**.

- The **Classic** directory holds a number of classic Product Packs that contain Tachyon Instructions.
- The **Integrated** directory holds a number of integratedProduct Packs that contain definitions for some Guaranteed State Policies, associated Fragments, and Instructions. In addition, a core utility pack has been provided with common Fragments that you can use to build your own Policies.

Tachyon Product Packs reference provides full details of all the Product Packs included in the Tachyon Platform zip.

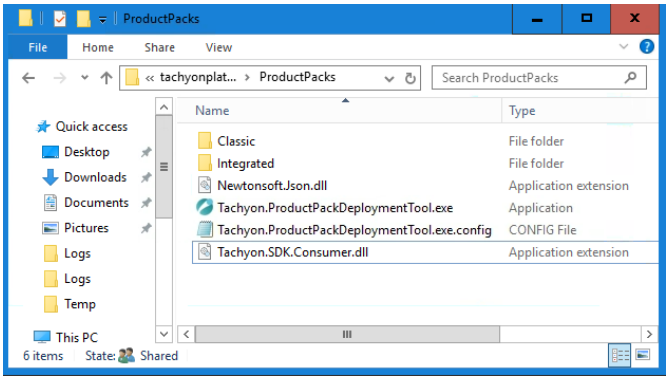
1.4.8.2 Running the Tachyon Product Pack Deployment Tool

Here are the steps for running the tool:

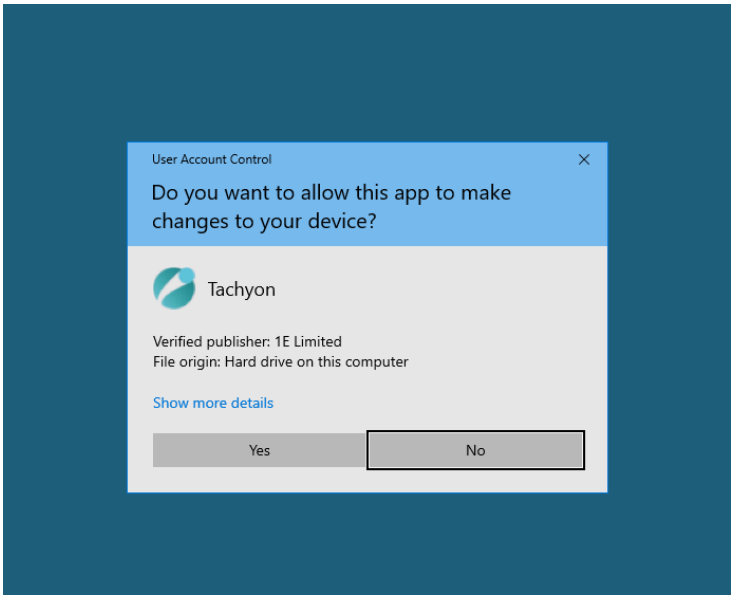
1. Navigate to the directory where the **tachyonproductpacks.<version>.zip** file has been unzipped.
2. You will see two directories: **Classic** and **Integrated** within which are actual Product Pack zips.
3. In this directory you can also see the **Tachyon Product Pack Deployment Tool** files:
   - Newtonsoft.Json.dll
   - Tachyon.ProductPackDeploymentTool.exe

- Tachyon.ProductPackDeploymentTool.exe.config
- Tachyon.SDK.Consumer.dll

4. Double-click on **Tachyon.ProductPackDeploymentTool.exe**.



5. Click on **Yes** if any UAC dialog is displayed.



6. The **Tachyon Product Pack Deployment Tool** dialog will appear.

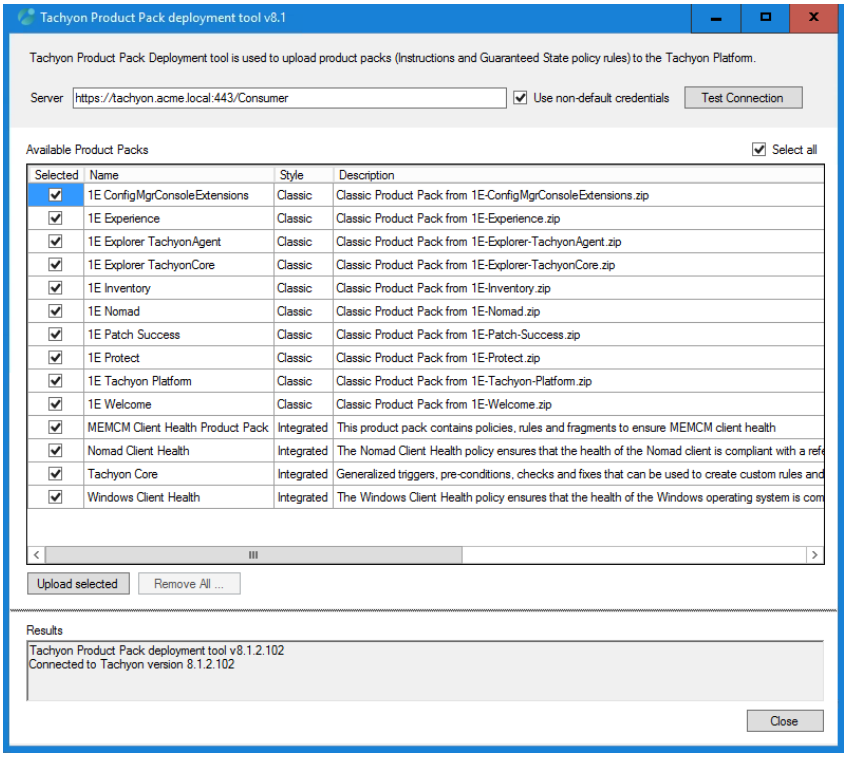
   You must specify the URL of the Tachyon Consumer API in the **Server** field and then click on **Test Connection** to verify that you have entered the correct value.

   Alternatively, you can specify the parameter *-url "<ConsumerAPI>"* on the command line, for example: *-url "https://tachyon.acme.local/Consumer"*. If you run the tool on the Tachyon Server, the tool will automatically prefill the URL.

   The **Style** column of the **Available Product Packs** table indicates whether each **Product Pack** is **Classic** or **Integrated**. The **Available Product Packs** table will be populated with all the zip files encountered in the directory the tool was launched from and all its sub-directories.

   The **Select all** box can be used to select or deselect all the items in the **Available Product Packs** table.

Click **Use non-default credentials** if you need to use alternative credentials. Domain is not required if connecting to a non-domain joined server, or server in an untrusted domain.



1.4.8.2.1 Uploading Product Packs

When you have selected and checked the Tachyon Consumer API location you will then be able to upload the selected **Available Product Packs** by clicking on the **Upload selected** button. The content of the selected packs will then be uploaded to the Tachyon Server. The **Results** field displays the progress of the operation.

> **Warning**
>
> Updating Policies, Rules, Fragments, and Triggers that already exist in the Tachyon database is supported, but you need to be careful to ensure that the new artifacts uploaded are compatible with the existing ones. In particular, any new fragments and trigger templates uploaded need to have the same parameters that are used by the version of the same artifact that already exists in the database. Otherwise, any rules that are passing the previous set of parameters to the fragments will be broken when the new fragments start requiring a different set of parameters to be passed to them.

1.4.8.3 Log files

The log file is called **Tachyon.ProductPackDeploymentTool.log**. It is created in the same folder where the tool executable is located.

The logging level can be changed by adding the parameter **-log <level>** on the command line, for example, **-log DEBUG**. Supported values available:

- TRACE
- DEBUG
- INFO (default)
- WARN
- ERROR

1.4.8.4 Command-line options

-server or -url: Specifies the url for the Consumer API.

-log: Sets the logging level. Supported values available: **Trace**, **Debug**, **Info**, **Warn**, **Error**

-domain, **-user** and **-password**: These options allow you to override the default behavior of using the currently logged-in Windows user. A domain is not required if connecting to a non-domain joined server. This option is useful when you need to upload Product Packs to a Tachyon platform running in the cloud, or from a computer that is not joined to the same domain.

Example

```
Tachyon.ProductPackDeploymentTool -server https://tachyon.acme.local/Consumer -log debug -user administrator -password notasecret
```

1.5 Upgrading Tachyon Platform

Guidance for upgrading Tachyon, SLA, and ActiveEfficiency platforms to Tachyon Platform.

Before you attempt an upgrade, please ensure you thoroughly read all sections that apply to you. Combine the steps if your system matches multiple upgrade scenarios. If you cannot find a complete match, please contact 1E.

- In-place upgrade of Tachyon
- In-place upgrade of ActiveEfficiency Server for Nomad
- Side-by-side upgrade of ActiveEfficiency Server for Nomad
- In-place upgrade of ActiveEfficiency Server for Shopping

Tachyon Setup will upgrade ActiveEfficiency Server to Content Distribution if it detects the ActiveEfficiency website is installed on the server.

- ActiveEfficiency Server is now deprecated, and is not required by the latest versions of products that previously used it: Nomad 7.1 & 8.x, AppClarity 7.0, 7.1 & 8.x, nor Shopping 6.1
- ActiveEfficiency Version 1.10.100 was released on March 2020 and is used by Nomad 7.0 and Shopping 6.0 which are still in support
- ActiveEfficiency Version 1.10 was released in November 2018 and was required by older versions of Nomad, Shopping, and AppClarity which are now out of support.

Tachyon Setup does not upgrade the following 1E server products:

- PXE Everywhere Central - please refer to Upgrading PXE Everywhere
- Shopping (Central or Receiver) - please refer to Shopping - Upgrading to Shopping
- NightWatchman Management Center - please refer to NightWatchman Enterprise - Upgrading NightWatchman Enterprise
- WakeUp Server - please refer to NightWatchman Enterprise - Upgrading NightWatchman Enterprise
- ActiveEfficiency Scout.

For upgrading clients, please read below first, then refer to Upgrading 1E Client.

Note

When upgrading to Tachyon Platform 8.1, you will need a new license. Please contact your 1E Sales account manager for license inquiries.

If you are upgrading from SLA Platform 3.3, Tachyon 3.3, or Tachyon 4.x, you must first upgrade to Tachyon 5.2.

1.5.1 Preparing for upgrade

1.5.1.1 SQL Server AlwaysOn Availability Group

If you are using an Availability Group (AG) then you must temporarily remove the Tachyon databases from the AG during the upgrade.

Please refer to high availability options for SQL Server:

- Upgrade Tachyon with an existing Availability Group.
- Upgrade Tachyon with a new Availability Group.

1.5.1.2 Backup first

Note

Before doing a re-installation or upgrade of the Tachyon Platform, make a backup of the following (but first see the note below about automatic backups):

- Tachyon Master database

  Note

  Backing up the Tachyon Responses database is **not** usually needed, unless there are instruction responses that you need to keep. Tachyon responses are not permanently held data and will naturally expire according to the settings specified when an instruction was run, typically in hours or possibly days. If in doubt, there is no harm in backing up the Tachyon Responses database as well.

- Tachyon Server installation directory.
  - including the config files, which may have been manually updated in the previous installation.

  - Switch certificate files.
- Earlier versions of Product Packs that have been modified.

Note

Tachyon Setup will automatically perform a backup of the following items:

- Tachyon Server installation directory. This is backed up to a subfolder named Tachyon.bak under the root installation folder for Tachyon . All files, including the .config files and certificate files, will be copied.
- IIS configuration. This is done by taking a copy of the applicationhost.config file from the Windows system folders. The backup file is placed at the same location and is named like the original file with a suffix that indicates the date and time when the copy was taken.
- The following databases are backed up to the default location for backups that is configured in the database server. By default, this points to a subfolder named "Backups" under the folder where the executable for SQL Server is installed. Unless you are installing a small lab or proof-of-concept, this is usually *not* a good location for the backups, so make sure that you configure the backup location in SQL Server to an adequate folder before starting the Tachyon upgrade:
  - 1ECatalog
  - ContentDistribution (optional, required by Nomad)
  - SLA-Data
  - SLA-Shared
  - SLA-Integrate
  - TachyonMaster
  - TachyonResponses
  - TachyonExperience (optional, required for Experience).

  The Product packs are not copied by themselves, but they are kept in a table within the TachyonMaster database, which *is* backed up.

1.5.2 In-place upgrade of Tachyon

This scenario is for upgrading from an older version of Tachyon.

If your current Tachyon server already has ActiveEfficiency Server installed then please also read the following according to what it is currently used for.

- In-place upgrade of ActiveEfficiency Server for Nomad
- In-place upgrade of ActiveEfficiency Server for Shopping

Tachyon Setup is used to upgrade the following versions of Tachyon and its applications.

Version	Features
Tachyon Platform 5.2, 8.0	Real-time and inventory features. Applications: Explorer, Guaranteed State, Patch Success, Application Migration, AppClarity, Experience, and Nomad.
Tachyon Platform 5.0, 5.1	Real-time and inventory features. Applications: Explorer, Guaranteed State, Patch Success, Application Migration, AppClarity, Experience, and ActiveEfficiency.

Tachyon 8.1 includes real-time and inventory features. Applications: Guaranteed State, Patch Success, Application Migration, AppClarity, Experience, and Nomad.

Tachyon Setup assumes you will keep existing applications when upgrading and optionally install additional applications. However, your Tachyon license ultimately determines which applications you can install and what you are able to use when you connect to the portal.

Upgrading from older versions

When upgrading to Tachyon Platform 8.1, you will need a new license. Please contact your 1E Sales account manager for license inquiries.

If you are upgrading from SLA Platform 3.3, Tachyon 3.3, or 4.x, you must first upgrade to Tachyon Platform 5.2. There are additional notes, which can be found in the Tachyon Platform 5.2 - Upgrading to Tachyon Platform pages.

1.5.2.1 Steps for in-place upgrade of Tachyon Platform

1. Upgrade server hardware as required - please refer to urn:resource:component:614830.
2. Run Tachyon Setup on the Tachyon Master Stack server to upgrade to Tachyon Platform.
3. Run Tachyon Setup on remote Tachyon Response Stack servers (if used).
4. Verify existing clients.
5. Run Tachyon Setup on remote Tachyon DMZ Server (if used).
6. Verify existing Internet based clients.
7. Upgrade existing Product Packs, and install new ones.
8. Deploy new 1E Client to devices (with Tachyon enabled) and verify.
9. Review Role name changes and rationalize your existing roles if necessary.

1.5.2.2 Changing the Platform configuration when reinstalling or upgrading

1.5.2.2.1 Keep the DNS Names

Each server that has Tachyon platform components installed requires its own DNS Name. A DNS Name can be a DNS alias, CNAME or Host (A) record.

Master Stack	The Master Stack is used by the following, therefore it helps users if it has a recognizable and convenient DNS Name such as **tachyon** - this is specified during installation of the Tachyon Server using Tachyon Setup. • Tachyon users, approvers and administrators connecting to the Tachyon Portal and Consumer API • Remote tools and Consumer applications connecting to the Consumer API • Remote Response Stacks and DMZ Server connecting to the Coordinator service Platform services also reside on the Master Stack, which non-Tachyon clients connect to, for example: • Application Migration, used by Windows Self-Service task sequences • AppClarity, used by AppClarity Software Reclaimer
DMZ Server	The DMZ Server is a type of Response Stack used to provide Tachyon Real-time and Inventory services to Internet-based clients. It requires an external DNS Name - for example **tachyonext** - this is specified during installation of the DMZ Server using Tachyon Setup. The DNS Name is shared between the Switch network interfaces and Background Channel on the DMZ Server, and specified during installation of Tachyon clients, and stored in their configuration file.
Response Stack	A Response Stack is used to provide Tachyon Real-time and Inventory services to clients on the internal (corporate) network. The choice of DNS Name is discussed in the table below. The DNS Name is shared between the Switch network interfaces and Background Channel on the Response Stack, and specified during installation of Tachyon clients, and stored in their configuration file.

The number of DNS Names used by a system depend on the location of Tachyon and other Platform services. The table below describes options.

Single DNS Name	A Tachyon system can have a single DNS Name if all components are installed on the same server, for example **tachyon** - this is specified during installation of the Tachyon Server using Tachyon Setup. If the server has multiple Switches, and therefore multiple network interfaces, then the same DNS Name can be shared by all Switches, the Background Channel and Master Stack.

Multiple client-facing DNS Names

The following client-facing components can each have their own DNS Name:

- Tachyon Switch and Background Channel on Response Stack servers, including DMZ Server
- Tachyon Platform services on the Master Stack, used by clients of A pplication Migration and/or AppClarity software reclaim
- Tachyon Portal, and Consumer API, on the Master Stack, used by administrators.

Note

Master and Response Stacks must have different DNS Names if they exist on different servers:

- The Master Stack has its own DNS Name, for example, **tachyon**
- Each Response Stack can have its own client-facing DNS Name, or they can share a common client-facing DNS Name, for example **tachyonrs**.

When a Response Stack is installed on the same server as Master Stack, it will normally share the same DNS Name as Master Stack as described under #UUIDba4ce843708df87c3577ca1f7920f3d8_id_PreparationSingleDNSName. However, if you have multiple Response Stacks and want them to share the *same* DNS Name, then the Master Stack must use a *different* DNS Name. This approach of all Response Stacks sharing the same DNS Name simplifies adding further Response Stacks at a later date.

During installation - using Website configuration - you need to consider the following:

HTTP binding	Required for installation, but can be manually removed later - please refer to Removing the HTTP binding from the Tachyon website. This binding is not used by Tachyon clients or administrators, but can optionally be used for Application Migration and/or AppClarity reclaim clients. Example name **acme-tcn01**.
HTTPS binding	Required. This is the main binding. On a Master Stack server (that has no Response Stack components) it is used by administrators to connect to the Tachyon Portal. It can optionally be used for Application Migration and/or AppClarity reclaim clients. Example name **tachyon** .

	On a Response Stack server, it is used by clients to connect to Switches and/or Background Channel. Example name **tachyon** or **tachyonrs**. See panel above about making the right choice. On a DMZ Server, it is used by Internet-based clients to connect to Switches and/or Background Channel. Example name **tachyonext**. See below.
Alternate HTTPS binding	Required, except in the simplest (single server) configurations, described above. It is typically used by other Tachyon Platform servers to connect to each other, but there are other scenarios. • Required on a Response Stack server if it will have a DMZ Server connected to it. Example name **tachyonalt**. • Required on a DMZ Server - used by internal servers to connect to the DMZ Server - see below. Example name **tachyondmz**. See below. • Required on a Master Stack if you have local and remote Response Stack(s) - used for inter-server communications. Example name **tachyonalt**. • Required on a Master Stack if the main HTTPS binding is used by client-facing components, and you want a different name for the Portal. Used by administrators to connect to the Tachyon Portal. Example name **tachyon**. • Required on a Master Stack if you need a different **HTTPS port** for Application Migration and/or AppClarity reclaim clients. This can be by choice, or if you have upgraded from an original SLA Platform installation that used different ports.
Manual bindings	You can manually add further HTTP and HTTPS bindings after installation, to help differentiate the services which client devices and administrators connect to.

If you are upgrading ActiveEfficiency to Tachyon Platform then you might have had a HTTPS binding described as **aeserver** in previous documentation.

If Master and Response Stacks are on the same server and you want them to have different DNS Names, then use the main binding for client connections to the Response Stack (because it is client-facing) and use the Alternate binding for other connections to the Master Stack. A simpler option is to put the Response Stack on its own server. Remote Response Stacks are recommended if the Master Stack is also hosting services AppClarity Software Reclaimer or Application Migration.

If you want to configure Switches on the same server to use multiple DNS Names, you will need to seek guidance from 1E. In most cases this is not required or recommended.

Internal DNS Names

A DMZ Server is a special example of a Response Stack. The DMZ Server itself requires two DNS Names:

- A client (external) facing DNS Name - for example **tachyonext** - which is shared between the Switch network interfaces and Background Channel on the DMZ Server - this is specified during Tachyon Setup as the main HTTPS binding
- An internal facing DNS Name for the internal network - for example **tachyondmz** - this is specified during Tachyon Setup as the alternate main HTTPS binding.

Note

Both DNS Names must be included in the web server certificate. You can manually replace the external/client facing certificate after installation, to comply with best practice not to expose internal names in an external facing certificate.

The internal Response Stack also requires an additional DNS Name - for example **tachyonalt** - for internal communications with the DMZ Server.

Please refer to Implementing a Tachyon DMZ Server for more detail about DMZ Servers.

Note

Tachyon Setup supports installation of one HTTP and up to two HTTPS bindings, but you can manually add more bindings after installation.

Tachyon Setup currently supports only one Web server certificate, which must contain all the DNS Names used by the HTTPS bindings on that server. Each DNS Name must be included as a DNS Name in the **Subject Alternate Name (SAN)** entry of the web server certificate.

You can manually add more certificates, and change bindings. Please refer to Certificate requirements . Please note that Tachyon Setup helps maintain the main and alternate HTTPS bindings using one certificate.

1.5.2.2.2 Moving Server

Agents use the DNS Name FQDN to connect to the Switch and Background Channel. Provided the DNS Name FQDN remains the same, the server can be renamed or moved without having to re-configure clients.

If the server hosting a Tachyon Server is renamed or moved, then it will need a new certificate and Tachyon Server must be re-installed. The database can be kept. There is also a known issue where new website URLs do not get updated in the database tables.

Please contact 1E for advice if a new configuration is required when re-installing or upgrading a server.

1.5.3 Upgrading to Tachyon Platform

Note

Partial Upgrades

You may still be asked at some intermediate steps about configuration information for the components that will not be installed. You should still provide it, because it may be relevant for Tachyon Setup at the time of configuring other components that *are* being installed so that they can interact with the components that are *not* being installed but are already present in the system.

Use the following process when upgrading Tachyon to Tachyon Platform, and keep the same configuration and the TachyonMaster database. Keeping the same configuration means using the same installer properties as the previous installation.

If changing the configuration, please refer to Changing the Platform configuration when reinstalling or upgrading.

Ref	Step	Notes
1	Ensure you have prerequisites ready for installation of the new version. • Tachyon Server installer properties • Server installation account • Backup the Switch certificate files, these	Preparation for an in-place upgrade is not as complex compared to a new installation, provided the configuration remains the same. If changing the configuration, please refer below to Changing the Platform configuration when reinstalling or upgrading . Determine if you will re-use the existing Web certificate or a new one. If re-using the certificate and upgrading from a version of prior to 5.0 then ensure you make a copy of the certificate files in the Switch SSL folder. If using a new certificate, then follow the guidance in Server Provisioning. If you are upgrading from Tachyon 5.x, the certificates will

Ref	Step	Notes
	are required during the upgrade • License file for new version of Tachyon Review Known issues.	already be in the local Windows Computer Certificate Store so there is no need to backup. If in doubt about your configuration, review each of the configurations in the Tachyon installation folder. A later step in this process asks you to make a backup copy of the installation folder. This allows you to review configuration settings and also retain a backup of the Switch certificate files. 1E recommends using the same server installation account as the original installation, but this is not mandatory provided the account is an existing Tachyon administrator user. You can check which is the original installation account by looking in the Permissions page and finding the user which does not have an edit or delete icon. **Note** When upgrading to Tachyon Platform 8.1, you will need a new license. Please contact your 1E Sales account manager for license inquiries. If you are upgrading from SLA Platform 3.3, Tachyon 3.3, or Tachyon 4.x, you must first upgrade to Tachyon 5.2.
2	Inform Tachyon users when you plan to upgrade the system.	You should notify Tachyon users about the impending upgrade. This includes users of external consumers such as the extension described in Using Tachyon in Configuration Manager. To help identify the users of the Tachyon system, you can review the Tachyon Permissions. You can also review the Tachyon Consumers in order to remind yourself of any 3rd party systems that will be affected by the upgrade. Any instructions that are running or pending approval prior to the Platform and Agent upgrade will not be affected, other than be delayed by services being temporarily down.
3	Shutdown the existing Tachyon system.	If you want to keep any instruction responses, review the notes in the next step before shutting down the system.

Ref	Step	Notes
	1. Stop or uninstall external or third-party Consumers (if any) 2. Stop the Tachyon services – 1E Tachyon Switch Host – 1E Tachyon Coordinator	Shutting down the system gracefully ensures there are no instructions in process and prevents access. The installer will internally shut down the services if you do not stop them manually. Stopping them manually gives you greater control over when they are stopped. The services will be restarted automatically after the upgrade. **Note** Both the Tachyon Switch Host and the Coordinator can take some time to stop their services. No other services for the applications associated with Tachyon need to be stopped. **Warning** Do not stop or disable the Tachyon website or application pools. The installer needs them to be active in order to complete all installation tasks.

4	Close all active connections to the Tachyon databases.	To avoid Known issues when upgrading, you must ensure there are no active connections to the databases.
		You can use the following SQL script to identify which programs have active connections to the Tachyon databases.
		`SELECT DB_NAME(dbid) as [database], loginame, hostname, program_name`
		`FROM sys.sysprocesses`
		`WHERE DB_NAME(dbid) LIKE 'Tachyon%' AND program_name LIKE 'Tachyon%'`
		`ORDER BY DB_NAME(dbid), loginame, hostname, program_name;`
		With the Tachyon services stopped, any open connections to the database, such as Tachyon Consumer and Tachyon Portal, should not cause the upgrade to fail and can be safely ignored.

5	Backup the databases.	If you use Tachyon Setup to perform the upgrade, it backs up the following databases: • TachyonMaster.

Ref	Step	Notes
		• TachyonExperience (if installed). • SLA-Data. • SLA-Shared. • SLA-Integrate. • ContentDistribution (if installed). • 1ECatalog. The following notes apply to the Responses database and whether you would need to create a backup of that database too: **Note** Backing up the Tachyon Responses database is **not** usually needed, unless there are instruction responses that you need to keep. Tachyon responses are not permanently held data and will naturally expire according to the settings specified when an instruction was run, typically in hours or possibly days. If in doubt, there is no harm in backing up the Tachyon Responses database as well.
6	Make a copy of the Tachyon Server installation folder.	The installation folder contains the following non-default files: • Switch certificate files in the SSL folder, these are required during the upgrade and should be copied to the directory with the TachyonServer.msi. • Configuration files for the website, web applications, services and Switch (*.config files). • Other customizations. • Content in the Background folders (these are the **Content** and **Updates** folder in %ALLUSERSPROFILE%\1E\Tachyon).
7	Install Tachyon Server.	Install Tachyon Server using the same configuration as before. Do not drop the databases.

Ref	Step	Notes
		Please refer to Tachyon Setup for more details.
8	Post-install tasks.	Repeat any Tachyon Server post-installation tasks that are relevant for an upgrade installation and are not performed automatically by Tachyon Setup.
9	Customizations.	Re-instate non-default settings. • Configuration files for the website, web applications, services and Switch (*.config files) **Note** Tachyon Setup will automatically backup and restore any entries in the .config files that it modifies during installation. Do not simply replace config files. Instead, compare the old and new versions and consider which changes can or need to be re-instated. In some cases, new versions may contain fixes for workarounds included in the old files. Please contact 1E if you have any difficulties. • Other customizations **Note** The Tachyon Setup installer will backup and restore customized mail headers. • Content in the Background folders (these are the **Content** and **Updates** folder in %ALLUSERSPROFILE%\1E\Tachyon)
10	Verify.	See Verifying page.

1.5.4 After upgrading to Tachyon Platform

1.5.4.1 All versions

- Verify the installation - see Verifying page.
- Upgrading and updating Instructions.
- After upgrading, you should perform a sync for all configured Connectors, followed by the Basic Inventory Consolidation report.

1.5.4.2 After upgrading from Tachyon Platform 8.0 or earlier

Tachyon Platform 8.1 (and later) no longer requires SQL Analysis Services (SSAS) for Tachyon Experience.

The following points should be considered if you have upgraded from Tachyon 8.0 or earlier version, and you previously used Tachyon Experience.

- You can delete the **TachyonExperience** database from your SSAS instance
- If you are not using Patch Success, you can decommission your SSAS instance - Patch Success uses the **SLA-BI** database on the SSAS instance
- Please review Device Deduplication page. Deduplication is basically the same as before, but has some minor changes because the Experience Cube no longer exists.

1.5.4.3 After upgrading from Tachyon Platform 5.0 or earlier

Tachyon Platform 5.1 (and later) uses UTC for Schedules.

The following points should be considered if you have upgraded from Tachyon 5.0 or earlier version.

- If you have previously configured any Schedules for Instructions, these will be converted to using UTC time. You will need to revisit these to ensure the time you want the Schedules to run is still correctly configured
- If you have previously configured any Schedules for Tachyon or Configuration Manager Connector syncs, these will need to be deleted and re-created - as the sync process for both of these types of connector has been redefined. Please refer to Tachyon connector and System Center Configuration Manager connector for more details.

1.5.4.4 Upgrading and updating Instructions

Tachyon Instructions are designed as far as possible to be backwards compatible, but as a general rule we recommend that you update your Tachyon Product Packs to the latest version so that you can gain the benefit of newer features.

When upgrading you should be able to safely keep your existing Instructions. We recommend that newer versions of Instructions are verified in a test environment to ensure that they still behave as expected before updating in your production environment.

> **Note**
>
> An instruction is not upgraded if it is the same version, or is currently *in use*. You will be notified if any instructions are not upgraded because they are in use. You can upload the product pack again later, after the instruction has completed, or cancelled.

Your license should retain any code signing certificates you may have registered. This means your custom instructions should continue to be licensed as normal following an upgrade of Tachyon. You may want to check the /document/preview/736743#UUID-33c212b3-863e-21bc-bc5d-52e41a0492b3 in the TachyonSDK pages to check for any changes to the SCALE language.

1.5.5 In-place upgrade of ActiveEfficiency Server for Nomad

This scenario is for upgrading a server that has ActiveEfficiency Server installed and used by Nomad. If ActiveEfficiency is also being used for Shopping then please also read In-place upgrade of ActiveEfficiency Server for Shopping.

Tachyon Setup will do the following automatically, but only if your Tachyon license includes Nomad, *and* you choose to install Nomad, *and* a local installation of ActiveEfficiency Server is detected.

- replace ActiveEfficiency Server with Content Distribution to support to new Nomad clients
- create a virtual directory in the Tachyon website and use **HTTP redirection** to support legacy Nomad clients
- rename the ActiveEfficiency database as ContentDistribution if it exists on the SQL Server instance you selected for the ContentDistribution database (the database is renamed, but the database mdf and ldf filenames are not changed)

The last point means ActiveEfficiency data will be retained in the ContentDistribution database, to provide the following:

- Existing pre-cache jobs, and paused collections, are migrated so they are shared by old and new Nomad clients, and can be managed by upgraded installations of the Nomad Configuration Manager Console Extensions
- Locations and Single-site content registrations are not migrated, but retained in legacy database tables so they continue to be used by legacy Nomad clients - content registrations for new Nomad clients are created in new database tables, so that legacy and new clients function independently.

The ActiveEfficiency database will be retained, and no data migrated, if it is on a different SQL Server instance than the one you specified for your ContentDistribution database. To automatically migrate data during upgrade, you will need to copy the ActiveEfficiency database to the new location, and reconfigure ActiveEfficiency Server to use the copied database. Alternatively, you can Manually migrate data as described in the link.

If the installation of Content Distribution fails for whatever reason, the database changes are rolled back.

Although ActiveEfficiency Server is replaced by Content Distribution, the Nomad client in 1E Client 5.2 (and later) does not connect directly to it. Instead, it connects to the same Tachyon Switch and Background Channel as the Tachyon client - the 5.2 and later versions of the Background Channel contain a reverse proxy which forwards API requests to Content Distribution. The Tachyon Switch and Background Channel may be on the same server as the Tachyon Master stack, or on a remote Response Stack. This means any remote Tachyon Response Stacks or DMZ Server (if used) must be upgraded also, before your Tachyon infrastructure can support new Nomad clients.

When upgrading Nomad clients, the new Nomad clients will no longer require an HTTP connection to the server that previously hosted ActiveEfficiency Server. However, if you are upgrading from a Tachyon or SLA server, then other 1E software (Application Migration and AppClarity Software Reclaimer) may still use HTTP to connect to SLA services on the server.

> **Note**
>
> If you are currently using Nomad with ActiveEfficiency, you must upgrade both Nomad clients *and* ActiveEfficiency. You should only upgrade to Tachyon Platform 8.1 if you are

prepared to upgrade Nomad clients to 1E Client 8.1 (with Tachyon and Nomad clients enabled) and replace ActiveEfficiency with Nomad and Content Distribution on Tachyon Platform.

1.5.5.1 Steps for in-place upgrade of ActiveEfficiency

1. Review your requirements to determine which features you need of 1E Client and Tachyon Platform, please refer to Planning for Tachyon Platform pages
2. Upgrade your server hardware as required- please refer to Server sizing requirements
3. Reconfigure Shopping Central (if used)
4. Uninstall ActiveEfficiency Scout (if used) and disable associated Windows Task Scheduler job(s)
5. Run Tachyon Setup on the ActiveEfficiency server to upgrade it to Tachyon Platform - please refer to Tachyon Setup
6. Run Tachyon Setup on remote Tachyon Response Stack servers (if used) - please refer to Tachyon Setup
7. Verify existing clients, to confirm Tachyon continues to function as before, with Nomad clients using **HTTP redirection** as described above
8. Run Tachyon Setup on remote Tachyon DMZ Server (if used) - please refer to Implementing a Tachyon DMZ Server
9. Verify existing Internet based clients
10. Deploy new 1E Client to some test devices (with Tachyon and Nomad client enabled)
11. Verify the test devices
12. Upgrade Nomad tools - please refer to Upgrading Nomad
    a. Upgrade Nomad Admin Tools and server components
    b. Update OS Deployment Task Sequence actions to use the Tachyon Platform
    c. Review Automatically migrated data and configure Nomad Sites
13. Deploy new 1E Client to remaining devices.

Warning

Do not reinstall ActiveEfficiency on the Tachyon Platform server.

1.5.5.2 Automatically migrated data

As stated above, the upgrade of ActiveEfficiency Server to Tachyon Platform automatically migrates details of pre-cache jobs, and paused collections, so they can be managed by upgraded installations of the Nomad Configuration Manager Console Extensions. You can review these in the Nomad app.

Locations, Single-site data, and content registrations are not migrated, but are retained in legacy database tables so they continue to be used by legacy Nomad clients. This data is not shared with new clients, so that legacy and new clients function independently. New clients will re-register their content automatically up to 24 hours later, or can be forced by using the NomadBranch command-line parameter **-cdssync** as described in NomadBranch.exe command-line switches. Old and new clients will perform master elections and peer-share content if they are the same subnet, but they will only use SSD with their own set of clients.

You will continue to maintain Nomad Sites (previously known as Locations) using one of the new versions of the example PowerShell scripts provided with the Nomad Admin Tools. Alternatively, you can use the examples to modify your existing script to use Content Distribution instead of ActiveEfficiency.

1.5.6 Side-by-side upgrade of ActiveEfficiency Server for Nomad

This scenario is for an existing Nomad and ActiveEfficiency installation, where Tachyon Platform is on a different server, either newly installed or upgraded from on earlier version of SLA Platform or Tachyon. The old ActiveEfficiency Server is eventually decommissioned. There is no requirement for **HTTP redirection** on the Tachyon server, because old Nomad clients will continue to use the ActiveEfficiency server, and new Nomad clients will use Content Distribution on the upgraded Tachyon Platform. Each set of clients functions independently. Some data is manually migrated from the ActiveEfficiency server, as described below.

If your Tachyon license includes Nomad, *and* you choose to install Nomad, *and* a local installation of ActiveEfficiency Server is detected, then you are doing an In-place upgrade of ActiveEfficiency Server for Nomad.

If a local installation of ActiveEfficiency Server is not detected, the ActiveEfficiency database is retained even if it is on the same SQL instance you specified for the ContentDistribution database.

1.5.6.1 Steps for side-by-side upgrade of ActiveEfficiency

1. Review your requirements to determine which features you need of 1E Client and Tachyon Platform, please refer to Planning for Tachyon Platform pages
2. Upgrade your server hardware as required- please refer to Server sizing requirements
3. Run Tachyon Setup on the existing SLA Platform or Tachyon server to upgrade it to Tachyon Platform - please refer to Tachyon Setup
4. Run Tachyon Setup on remote Tachyon Response Stack servers (if used) - please refer to Tachyon Setup
5. Verify existing clients (if upgrading SLA Platform or Tachyon)
6. Run Tachyon Setup on remote Tachyon DMZ Server (if used) - please refer to Implementing a Tachyon DMZ Server
7. Verify existing Internet based clients (if upgrading Tachyon)
8. Deploy new 1E Client to some test devices (with Tachyon and Nomad client enabled)
9. Verify the test devices
10. Upgrade Nomad Admin Tools and server components - please refer to Upgrading Nomad

a. Upgrade Nomad Admin Tools and server components

b. Update OS Deployment Task Sequence actions to use the Tachyon Platform

c. Manually migrate data from ActiveEfficiency Server

d. Configure Nomad Sites.

11. Deploy new 1E Client to remaining devices

12. When all Nomad clients have been upgraded, then you can decommission the old ActiveEfficiency Server (unless you need to retain it for Shopping).

1.5.6.2 Manually migrate data

Use the following migration scripts to manually migrate sites, pre-cache jobs, and paused collections, from ActiveEfficiency, so they can be managed by upgraded installations of the Nomad Configuration Manager Console Extensions. After migration, you can review these in the Nomad app.

Locations, Single-site data, and content registrations are not migrated, but are copied to legacy database tables for reference only. This data is not shared with new clients, so that legacy and new clients function independently. New clients will re-register their content automatically up to 24 hours later, or can be forced by using the NomadBranch command-line parameter **-cdssync** as described in NomadBranch.exe command-line switches. Old and new clients will perform master elections and peer-share content if they are the same subnet, but they will only use SSD with their own set of clients.

You will maintain Nomad Sites (previously known as Locations) using the one of the new versions of the example PowerShell scripts provided with the Nomad Admin Tools. Alternatively, you can use the examples to modify your existing script to use Content Distribution instead of ActiveEfficiency.

You may continue to maintain Locations in ActiveEfficiency as before, to continue supporting old clients.

Click here to download - AE-CD Data Migration Scripts.zip

Note

1. **ExportData.ps1** - run on any computer that has read access to the ActiveEfficiency database
2. **CreateTables.sql** - run on the SQL Server instance that hosts the ContentDistribution database created by Tachyon Setup
3. **ImportData.ps1** - run on any computer that has write access to the ContentDistribution database.

1.5.6.2.1 Prerequisites

- The ability to run PowerShell scripts and SQL script
- A SQL Login on each SQL Server instance for the user running the scripts
- db_datareader rights on the ActiveEfficiency database
- db_datawriter rights on the ContentDistribution database

Before running the scripts you will need to prevent clients, administrators, and scheduled jobs from updating ActiveEfficiency and Nomad.

1. Stop IIS on the Tachyon Master Stack server (where Content Distribution is installed)
    a. Open command prompt in administrator mode and run **iisreset /stop**
2. Stop IIS on the server where ActiveEfficiency Server is installed
    a. Open command prompt in administrator mode and run **iisreset /stop**
3. Temporarily disable any Task Scheduler jobs related to ActiveEfficiency
    a. From the Start screen, start typing Task Scheduler then click on **Task Scheduler** in the search results
    b. Expand **Task Scheduler Library** → **ActiveEfficiency**
    c. Right-click on each job and select **Disable**
4. If you have any custom jobs to run import scripts for **Sites and Subnets** then also disable these temporarily.

1.5.6.2.2 Create Tables

Open SQL Management Studio and connect to ContentDistribution database. Execute SQL script **CreateTables.sql**. This will create all the required legacy tables in the ContentDistribution database.

> **Note**
>
> This script only needs to be executed once.

1.5.6.2.3 Export Data

Run the **ExportData.ps1** script in a PowerShell admin command prompt using a command line similar to below.

```
.\ExportData.ps1 -AEServerName "AEServer" -AEDBName "ActiveEfficiency" -CDServe
rName "CDServer" -CDDBName "ContentDistribution" -folderPath "C:\migration" -lo
gsPath "C:\migration\logs"
```

This command will create a series of CSV files that we will later import into the ContentDistribution database.

1.5.6.2.4 Import Data

Run the **ImportData.ps1** script in a PowerShell admin command prompt using a command line similar to below.

```
.\importData.ps1 -CDServerName "CDServer" -CDDBName "ContentDistribution" -fold
erPath "C:\migration" -logsPath "C:\migration\logs"
```

This command will populate the tables from the CSV files exported earlier.

1.5.6.2.5 Restart IIS

1. Restart IIS on the ActiveEfficiency Server and Tachyon Master Stack server (where Content Distribution is installed)

    a. Open command prompt in administrator mode and run **iisreset /start**

2. Enable the Task Scheduler jobs again on the ActievEfficiency Server

1.5.6.2.6 Script parameters

Parameter	Description
AEServerName	Name of the SQL Server hosting ActiveEfficiency database. If the server is not running on the default instance, enter the server name and instance name separated by backslash, for example **DBServer\DB**
AEDBName	Name of the ActiveEfficiency database.
CDServerName	Name of the server hosting ContentDistribution database. If the sever is not running on the default instance, enter the server name and instance name separated by backslash, for example **DBServer\DB**
CDDBName	Name of the ContentDistribution database.
folderPath	Folder location to save CSV files. If the path doesn't exist, it will be created by the script.
logsPath	Folder location to save log files. If the path doesn't exist, it will be created by the script.

1.5.7 In-place upgrade of ActiveEfficiency Server for Shopping

This scenario is for upgrading a server that has ActiveEfficiency Server installed and used by 1E Shopping versions prior to Shopping 6.1. If ActiveEfficiency is also being used for Nomad then please also read In-place upgrade of ActiveEfficiency Server for Nomad.

If your installation of ActiveEfficiency is being used by 1E Shopping, then before you replace ActiveEfficiency with Content Distribution, you will need to do ***one*** of the following:

- upgrade to Shopping 6.1 - this version does not use ActiveEfficiency
- reconfigure your existing Shopping 6.0 server to synchronize directly with Configuration Manager - this method of synchronization is provided out-of-the-box in Shopping 6.1 onwards - to do this, please refer to the steps below
- install another instance of ActiveEfficiency Server and Scout, and reconfigure your existing Shopping server to use that - this process is not described here

Shopping is not a Tachyon Platform application, and has no direct dependency on it, therefore it is not affected by Tachyon Setup, other than ActiveEfficiency being removed. Whilst Shopping has no direct dependency on Tachyon Platform, it can optionally integrate with Introducing Application Migration which is a Tachyon application. The Shopping/WSA client is a module of the 1E Client. If this is interesting to you please refer to Shopping - Integrating with Application Migration.

1.5.7.1 Reconfigure Shopping to synchronize directly with Configuration Manager

The process is for Shopping 6.0 only.

Execute the following SQL script on the Shopping database, then restart the Shopping Central service. A few minutes later, the Central service will perform its usual synchronization processes with AD, and also synchronize with CM. You can monitor this process in
C:\ProgramData\1E\ShoppingCentral\ShoppingCentral.log

The script changes preference settings for Shopping 6.0 - Shopping Admin Console settings: Central Service as shown in the table opposite. It changes the description of the sync interval, it does not change its value, which is 1 day by default. If you change the value later it should be set to longer than the time it takes to complete all the syncs. You should not need to change the value of the sync interval because the SCCM sync should be approximately the same as your current ActiveEfficiency Scout sync.

Click here to download - ReplaceActiveEfficiencySyncWithConfigMgrSync.sql

Note

UPDATE dbo.tb_Preference
SET
Description = 'Sets the interval for synchronizing the members in Computer Cate
gory groups held in the Shopping database with Active
Directory. Also used for the ConfigMgr, Intune Machine sync and the ConfigMgr,
Intune user sync. The value for the interval uses the units defined in the
Active Directory Sync Units parameter.'
WHERE
preferencename = 'Users and Machines, AD Sync Interval'
GO

UPDATE dbo.tb_Preference
```

```
SET
Description = 'The unit is used by the AD, ConfigMgr, Intune Machine and User S
ync Interval setting. This may be set to one of the
following values: Days, Hours or Minutes.'
WHERE
preferencename = 'Users and Machines, AD Sync Units'
GO

UPDATE dbo.tb_Preference
SET
PreferenceValue = 'False'
WHERE
preferencename = 'Sync Machines and Users From Active
Efficiency'
GO

UPDATE dbo.tb_Preference
SET
Hidden = 1
WHERE
preferencename = 'Sync Machines From Old Sccm'
GO

UPDATE dbo.tb_Preference
SET
Hidden = 1
WHERE
preferencename = 'ActiveEfficiency ServerName'
GO
```

Preference name	Change made by the SQL script
Users and Machines, AD Sync Interval	Change description
Users and Machines, AD Sync Units	Change description
Sync Machines and Users From Active Efficiency	Set to 'False' (enables sync from SCCM instead)
Sync Machines From Old Sccm	Hide as no longer required
ActiveEfficiency ServerName	Hide as no longer required

1.5.8 Upgrading 1E Client

Guidance for upgrading Tachyon and other legacy 1E agents to 1E Client. This page contains detailed steps for upgrading Tachyon Agent and a summary of considerations for upgrading other

legacy agents. The 1E Client contains clients for 1E products and solutions, and their upgrade documentation should be consulted before upgrading their clients and agents.

When upgrading a 1E product or solution, you should upgrade its server infrastructure first. For more information, please refer to the following:

- Upgrading Nomad - from 7.1 onwards you will be replacing ActiveEfficiency Server with Tachyon Platform, which includes Content Distribution
- Upgrading PXE Everywhere
- NightWatchman Enterprise - Upgrading NightWatchman Enterprise
- Shopping - Upgrading to Shopping
- Upgrading Tachyon Platform.

Note

Upgrading from earlier versions of 1E Client to 8.1 simply requires deploying the new version, using the same or different configuration settings.

Please refer to:

- Deploying 1E Client on Windows
- Deploying 1E Client on macOS
- Deploying 1E Client on Linux
- Deploying 1E Client on Solaris

If you are upgrading any legacy 1E agents then please read sections below.

Please refer to Reconfiguring 1E Client for how to reconfigure the 1E Client after it has been deployed.

1.5.9 Role name changes

Role names were changed in Tachyon Platform 8.0. You will notice these changes if you are upgrading from version 5.2 or earlier.

For a full list of role names, please refer to:

- Roles and Securables reference page, which contains a copy of the notes below, details about renamed roles, and roles that are recommended to replace the ones that have been retired
- Roles page, which contains guidance on how to configure custom roles.

The upgrade process makes the following changes:

1. New roles are created, if they do not exist already:

   New system roles

   – Group Administrator

- Guaranteed State Policy Assigner
- Installer
- Tachyon System

New Custom roles

- Experience Administrator
- Experience Engagement Assigner
- Patch Success Administrator

2. The Tachyon user doing the upgrade is automatically assigned to the **Installer** role. The user is also *unassigned* from the following roles, if assigned before the upgrade:
   - Applications Administrators
   - Consumer Administrators
   - Event Subscription Administrators
   - Instruction Set Administrators
   - Permissions Administrators
3. Tachyon users associated with the NT AUTHORITY/NETWORK SERVICE and machine accounts, are assigned to the **Tachyon System** role. These users will also be *unassigned* from the following roles, if assigned before the upgrade:
   - Applications Administrators
   - Consumer Viewers
   - Engagement Administrator
   - Management Group Sync Initiators
   - Offloaders
   - Permissions Viewers
   - Survey Administrators
4. Several old roles are renamed
   a. Some are renamed from plural to singular, for example if the **Nomad Administrators**role exists it is renamed to**Nomad Administrator**
   b. An exception is in the unlikely event that the **Nomad Admins** role exists, it is renamed to **Nomad Administrator** unless that role already exists, in which case it is renamed to **Nomad Administrators** instead

c. **Global Questioner**, **Global Actioner**, **Global Viewer**, and **Global Approver** roles have been renamed with **Global...** replaced by **All instructions...**

d. **Inventory Viewers**, **Experience Viewers**, **Patch Success Viewers**, have been renamed with **...Viewers** changed to **...User**

System roles renamed from

- Global Actioners
- Global Administrators
- Global Approvers
- Global Questioners
- Global Viewers
- Guaranteed State Administrators
- Guaranteed State Viewers
- Inventory Administrators
- Inventory Viewers
- Survey Administrators
- Survey Viewers

System roles renamed to

- All Instructions Actioner
- Full Administrator
- All Instructions Approver
- All Instructions Questioner
- All Instructions Viewer
- Guaranteed State Administrator
- Guaranteed State User
- Inventory Administrator
- Inventory User
- Experience Engagement Administrator *
- Experience Engagement Viewer *

Note

* These roles are retired, and will only be kept if a user or group is assigned to it.

Custom roles renamed from

- AppClarity Administrators
- Application Migration Administrators
- Compliance Administrators

Custom roles renamed to

- AppClarity Administrator
- Application Migration Administrator
- Compliance Administrator
- Compliance Viewer
- Entitlement Administrator

- Compliance Viewers
- Entitlement Administrators
- Experience Viewers
- Nomad Administrators
- Patch Success Viewers
- Reclaim Administrators
- Reclaim Viewers
- Experience Viewer
- Nomad Administrator
- Patch Success User
- Reclaim Administrator
- Reclaim Viewer

5. Other system and custom roles are deleted. A role is kept only if it is **(a)** on the list of roles to be kept, or **(b)** the role has a user or group assigned to it

System roles that are kept

- All Instructions Actioner
- All Instructions Approver
- All Instructions Questioner
- All Instructions Viewer
- Full Administrator
- Group Administrator
- Guaranteed State Administrator
- Guaranteed State Policy Assigner
- Guaranteed State User
- Installer
- Inventory Administrator
- Inventory User

System roles that have been retired

- 1E Client Deployment Administrators
- 1E Client Installer Administrators
- Applications Administrators
- Component Administrators
- Connector Administrators
- Consumer Administrators
- Consumer Viewers
- Custom Properties Administrators
- Event Subscription Administrators
- Event Subscription Viewers
- Infrastructure Administrators
- Instruction Set Administrators
- Log Viewers
- Management Group Administrators

- Tachyon System

Custom roles that are kept

- 1E ITSM Connect Actioner
- AppClarity Administrator
- Application Migration Administrator
- Compliance Administrator
- Compliance Viewer
- Entitlement Administrator
- Experience Administrator
- Experience Engagement Assigner
- Experience User
- Nomad Administrator
- Patch Success Administrator
- Patch Success User
- Reclaim Administrator
- Reclaim Viewer
- Management Group Sync Initiators
- Offloaders
- Permissions Administrators
- Permissions Viewers
- Policy Administrators
- Provider Configuration Administrators
- Schedule Administrators
- Survey Administrators (Experience Engagement Administrator)
- Survey Viewers (Experience Engagement Viewer)
- VDI Administrators

Custom roles that have been retired

- Any custom role created by Tachyon administrators

Tip

A retired role is kept if it has a user or group assigned to it.

Role names

Tachyon Platform 5.2 onwards no longer allows the use of dots in role names, for example Questioners.Core, and roles will no longer work after an upgrade. Therefore, please review your custom role names before upgrading.

1.6 Using consumer applications

All consumer applications can be accessed from the Tachyon portal using the following URL, and then clicking the application icon.

https://<platform DNS Name FQDN>/Tachyon

where <platform DNS Name FQDN> is the FQDN of your platform server, set up during the preparation phase, as described under the heading DNS Names.

1.6.1 Included applications

The following are applications built-into the platform:

Inventory	*https://<platform DNS Name FQDN>/Tachyon/App/#/inventory/*
Settings	*https://<platform DNS Name FQDN>/Tachyon/App/#/platform/*

1.6.2 Optional applications that require a license

AppClarity	*https://<platform DNS Name FQDN>/Tachyon/App/#/appclarity/*
Application Migration	*https://<platform DNS Name FQDN>/Tachyon/App/#/applicationmigration/*
Guaranteed State	*https://<platform DNS Name FQDN>/Tachyon/App/#/guaranteedstate/*
Content Distribution	*https://<platform DNS Name FQDN>/Tachyon/App/#/nomad/*
Patch Success	*https://<platform DNS Name FQDN>/Tachyon/App/#/patchsuccess/*
Experience	*https://<platform DNS Name FQDN>/Tachyon/App/#/experience/*
Explorer	*https://<platform DNS Name FQDN>/Tachyon/App/#/explorer/*
Dashboards	*n/a*

1.7 Using Settings

How to use the **Settings** application to configure your platform and application settings.

1.7.1 Settings features

The Settings application lets you configure the Tachyon system and application settings. For more information please refer to the Using Settings section of this documentation.

1.7.1.1 Settings features

1.7.1.1.1 Instructions, Product Packs, Instruction sets, and permissions

Tachyon lets you investigate your network using questions and actions, which are collectively known as Instructions.

You can load Instructions into Tachyon, either individually or with a Product Pack, which is essentially a zip file containing one or more Instructions. Tachyon comes with a range of pre-framed questions and actions in the form of Product Packs, providing extensive out-of-the-box capabilities that can be extended as new and updated Product Packs are made available.

Tachyon permissions for the Instructions are handled using Instruction sets. You create Instruction sets, then define roles that specify particular permissions on those sets, and then assign the roles to users. Each Instruction is only allowed to reside in one Instruction Set, which associates it with a role and thereby the users that have that role and can run the Instruction. The roles have associated Management groups that determine the devices that users with the role have access.

When Instructions are loaded into Tachyon they are placed in the default **Unassigned** Instruction Set, so you must move them into previously created Instruction sets before they can be run.

For more information on uploading product packs into Tachyon and managing Instruction sets, please refer to Instruction sets page.

1.7.1.1.2 Server software

Category	Product	Notes
Server OS	• Windows Server 2022 • Windows Server 2019 • Windows Server 2016	For more detail about configuration of servers, please refer to Windows Server requirements. Only 64-bit server OS are supported. The server must be domain-joined. This version of Tachyon requires the server OS to be **English** because of a Known issues with certain regional settings. If TLS 1.0 is disabled, then please ensure you follow the steps in If TLS1.0 is disabled to add registry entries, for the 1E Catalog Update Service to successfully connect to the 1E Cloud Catalog. **Note** This list shows only those OS versions in

Category	Product	Notes
		mainstream support by Microsoft, and therefore supported by Tachyon, and by 1E Client 8.1. Please refer to Constraints of Legacy OS regarding the end of mainstream support. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Refer to Support for Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions.
SQL Server and SQL Server Analysis Services (SSAS)	• SQL Server 2019 • SQL Server 2017 • SQL Server 2016 SP3	For more detail, please refer to SQL Server requirements. Standard and Enterprise editions of these versions of SQL Server and SQL Server Analysis Services (SSAS) are supported. SQL Server 2016 RTM is not supported due to some issues, which are resolved by SP3. **Note** Tachyon only supports AlwaysOn Availability Groups on **SQL Server Enterprise Edition**. Please refer to High

Category	Product	Notes
		Availability options for SQL Server for HA options and their requirements. **Note** If you intend to integrate with third-party business intelligence products such as Power BI, you must install the **Enterprise edition of SSAS** as per their requirements. A SQL Server database instance is required for the following databases: • **1ECatalog** • **ContentDistribution** (optional - required for Nomad) • **SLA-BI** (optional - required for Patch Success) • **SLA-Data** • **SLA-Integrate** • **SLA-Shared** • **TachyonExperience** (optional - required for Tachyon Experience) • **TachyonMaster** • **TachyonResponses** **SLA Inventory databases** Tachyon Setup can install the above databases on separate SQL Server instances, however SLA-Data, SLA-Integrate, and

Category	Product	Notes
		SLA-Shared must exist on the same instance. A SQL Server Analysis Services (SSAS) instance installed in **Multidimensional** mode is required for SLA Business Intelligence. **SLA Business Intelligence** SLA Business Intelligence (BI) is only required for the Patch Success application. Together, the SLA Platform and BI installers create the following: • A database called **SLA-BI** on the SQL Server database instance. • A MOLAP cube called **SLA-BI** on the SSAS instance. • A linked server for the SLA databases to get data from the SLA-BI database and then from the SLA-BI cube. • A linked server for the SLA-BI database to get data from the SLA databases. • A datasource definition used by the SLA-BI cube to connect to the BI database. If the SLA databases, BI database, or SSAS instance for BI, are on *different* SQL Servers then the BI installer enforces

Category	Product	Notes
		the use of a SQL login on each instance. If they are on the *same* SQL Server then the installer gives you a choice of using integrated security (domain user account) or a SQL login. However, if you are installing all the components using Tachyon Setup instead of their individual installers, then you are not given the choice. Tachyon Setup always uses integrated security. Contact your 1E Account Team if your scenario requires the above-mentioned databases to be on *different* SQL Servers. This affects different servers, not different instances. All SQL Server instances *must* be configured with the following: • A case-insensitive, accent-sensitive collation which is **SQL_Latin1_General_CP1_CI_AS** by default, • **Allow remote connections to this server** enabled. All SQL Servers should be configured with the **SQL Server Browser service** running in order for the BI installer to select from a list of instances. **SQL Server Management Studio** is required to review the

Category	Product	Notes
		configuration and edit settings in 1E database tables. If installing SQL Server locally, note: • SQL Server 2016 and 2017 require .NET Framework 4.6 or later • SQL Server setup requires PowerShell 2.0. For the latest information about SQL Server prerequisites, please refer to http://go.microsoft.com/fwlink/?LinkId=622999.
Microsoft Endpoint Configuration Manager	• MECM CB 2303 • MECM CB 2211 • MECM CB 2207 • MECM CB 2203 • MECM CB 2111 • MECM CB 2107	Tachyon uses Configuration Manager for the following optional apps and features: • Reclaiming a product using SCCM Uninstall • Introducing Application Migration • Introducing Inventory captures data using the System Center Configuration Manager connector • Tachyon extensions for the Configuration Manager Console. - installed on Configuration Manager consoles using the 1E Tachyon Toolkit installer • Introducing Nomad requires 1E Client with Nomad client features enabled.

Category	Product	Notes
		Nomad provides the following Content Distribution features for Configuration Manager: • Nomad app overview provides visibility of content distribution activity • Single Site Download (SSD) (SSD). • Task sequence actions to augment OS Deployment: – Peer Backup Assistant - PBA – High Availability PBA (HAPBA) – Get Migration Settings to manage computer associations. • Nomad Pre-caching • Nomad Download Pause. Nomad requires the Content Distribution web service to synchronize with the Configuration Manager database. For standalone primary site environments, permissions are automatically assigned to the service account of Content Distribution's web application pool service (by default Network Service) using the **ConfigMgr_DViewAccess** localgroup native to Configuration Manager. For a CAS, this group is not created natively therefore additional steps are required to allow access. Please refer to Preparation: Microsoft

Category	Product	Notes
		Endpoint Configuration Manager preparation.
Web Server	• IIS 10	See Windows Server roles and features for details about required Web Server roles and features.
Runtime libraries	• Visual C++ 2013 Redistributable • Visual C++ 2015-2019 Redistributable • ASP.NET Core Framework 3.1 • .NET Framework 4.8	See Windows Server roles and features for details about required .NET Framework roles and features. To know supported combinations of OS and .NET Framework, please refer to: https://docs.microsoft.com/en-us/dotnet/framework/migration-guide/versions-and-dependencies. • Windows Server 2022 has .NET Framework 4.8 installed by default. • Windows Server 2019 has .NET Framework 4.7.2 installed by default. • Windows Server 2016 has .NET Framework 4.6.2 installed by default. **ASP.NET Core Hosting Bundle** is required only for the Nomad. It is not included with the Operating System, and must be downloaded and installed separately. If it not already installed, Tachyon Setup will attempt to automatically download version **3.1.11** and install it. Alternatively you can download it, or a later version, and install it yourself. For more detail please refer to ASP.NET Core Hosting Bundle. Installers include and automatically installs the redistributable packages

Category	Product	Notes
		for **Visual C++ 2013** and **Visual C++ 2015-2019**. The Coordinator (licensing module on the Master Stack), and Switch (on Response Stack) are written in C++ using Visual Studio 2013 and 2019, therefore require the **runtime (x64)** versions of these packages. Other server components use .NET Framework. **SQL BCP** is required by the **Export All** feature described in Exporting data from Explorer, and must be installed on each Tachyon Response Stack server (specifically the servers which have the Tachyon Core installed). BCP uses ODBC, which requires **Microsoft ODBC Driver versions 13.1 and 17** and **Visual C++ 2017 Redistributable** to be installed first. Please refer toP SQL BCP for more detail.
Other software	• PowerShell	PowerShell is required by Tachyon installer during installation.
Browsers	Latest version of: • Google Chrome • Microsoft Edge (Chromium) • Mozilla Firefox	A browser is not a prerequisite for installation of Tachyon servers but is required to use and administer the Tachyon platform. The administration is performed via the Tachyon portal and can be on a remote computer. These browsers are supported on all OS platforms which the browser vendor supports. The Portal and any API should be added as a trusted site. This is especially important when running

Category	Product	Notes
		scripts that may produce unexpected errors. Please review Known Issues Using Tachyon. **Note** **Microsoft legacy browsers** Support has been withdrawn for **Internet Explorer 11** and **legacy Microsoft Edge** (non-Chromium version) because Microsoft no longer supported them since 2021. We recommend you use Google Chrome, Firefox, or Microsoft Edge Chromium browser.

1.7.1.1.3 Connectors

Connectors are used to connect to other 1E and third party systems and populate repositories. When more than one connector to different data sources is used, the information from those different data sources is de-duplicated and normalized into a single cohesive view that is then stored in a repository. In this way, you can use the data from different sources to augment each other and build a better picture of "what's out there?".

For example, you can sync inventory data from Configuration Manager into an inventory repository, which will fetch information about your Windows devices. You could then augment that with inventory data synced from Tachyon which could include information about non-Windows devices where the client has been installed.

Note

For more information on connectors, please refer to:

- Connectors page

The following connectors are supported:

- BigFix connector — Connects to a BigFix Inventory database server.
- BigFixInv connector — Connects to a BigFix Inventory database.
- File Upload connector — Uploads inventory data from a folder containing tab (TSV) and comma (CSV) separated value file(s).

- Intune connector — Connects to an Intune application and collects inventory and usage data.
- Microsoft Office 365 connector — Connects to an Office 365 application in InTune and pulls in inventory and usage data.
- OpenLM connector — Connects to an OpenLM database server.
- Oracle LMS connector — Connects to Oracle LMS and queries it for inventory information.
- ServiceNow connector — Connects to a ServiceNow instance to import basic inventory data into SLA Platform.
- System Center Configuration Manager connector — Connects to a Configuration Manager database and pulls in inventory and usage data.
- Tachyon connector — Connects the Tachyon and SLA components to support the Management group and Tachyon Powered Inventory features. The Tachyon Powered Inventory feature uses instructions to fetch inventory data from clients, and is a prerequisite for Patch Success.
- vCenter connector — Connects to a vCenter server and pulls in inventory data.
- Windows Server Update Services connector — Connects to a WSUS database and pulls in patch data.

1.7.1.1.4 Repositories

Repositories are used by applications to process and store information. For example, the Patch Success application uses both an inventory and a BI repository to process the information needed to report on how successful patching is in your enterprise. Normally a connector is used to connect a data source to an appropriate repository.

Tip

Repositories are also useful when you want to segregate different types of data. For example, you could have one inventory repository for Configuration Manager inventory data, and another one for BigFix data. Alternatively, you can have connectors to different inventory sources pushing data into one repository. Any Management Groups that you create will span all the repositories you have.

Note

For more information on managing repositories, please refer to:

- Repositories page.

1.7.1.1.5 Device Tags

Device Tags are generally associated with Explorer and can be used when setting coverage to target Instructions to particular devices, but they can also be used to define Management Groups optionally used by all applications.

Device Tags must be defined by a **Full Administrator** before they can be used to tag devices or used to set the coverage of Instructions.

This is done from the **Settings**→**Configuration**→**Custom properties**→ **Device Tags** page, which can be viewed by users with the **Full Administrator** role.

Note

For more information on managing and using Device Tags, please refer to:

- Device Tags page
- Adding properties - tutorial
- Actions to set tags - tutorial
- Using tags to set the coverage for a question - tutorial.

1.7.1.1.6 Software Tags

Using Software Tags allows you to create custom labels and associate them with the software titles you have deployed in your estate.

You can do this from the **Settings**→**Configuration**→**Custom properties**→**Software Tags** page, which can be viewed by users with the **Full Administrator** role.

Using Software Tags allows you to create custom labels and associate them with the software titles you have deployed in your estate. An administrator with either the **Full Administrator** or **Group Administrator** role can set Software Tags in their environment, they can also create Management Groups based on the tag name and value. For details about configuring Tachyon users, Roles, and Management Groups refer to the Permissions Menu pages.

In short, you can work with Software tags by:

1. Creating your Software Tag.
2. Associating the new tag with a software title.
3. Creating a Management Group based on the Software Tag name and Tag value rules (This step can be run anytime before evaluation).
4. Evaluating the new Management Group by running a Basic Inventory Consolidation.

If an administrator adds or modifies Software Tags or associations, they will have to run the Management Group evaluation report again to see the updated devices reflected in Inventory.

1.7.1.1.7 Schedules

Schedules can be created to execute specific operations on repositories in Tachyon so that they are kept up to date with their data sources and processing. These operations include:

- Syncing data sources to repositories using connectors
- Processing the BI data cube.

Repository schedules are different from Instruction schedules that can be set in Explorer.

Note

For more information on setting schedules, please refer to:

- Schedules page.

1.7.1.1.8 Consumers, Applications, Components, and Providers

There are pages in the Settings application for each of these. They are described in the following table:

Configuration objects	Description
Consumers	These can access Tachyon using the Tachyon Consumer API. To enhance the security of the Tachyon system, only consumers that have been registered on the **Settings→Configuration→Consumers** page will be allowed to access Tachyon.
Applications	Features of Tachyon that is hosted in the Tachyon portal. Applications are generally Consumers as they need to interact with Tachyon using the Tachyon API. These are available on the **Switch App** menu.
Components	These form part of SLA and cannot be changed or altered by a user. These can be viewed using the **Settings→Configuration→Components** page.
Providers	These are components that can be configured to provide a particular operation in SLA. These can be viewed and configured using the **Settings→Configuration→Provider configuration** page.

Note

For more information on Consumers, Components, and Providers, please refer to:

- Consumers page
- Components page
- Provider configuration page.

1.7.1.1.9 Information pages

Information on your Tachyon license is available, as well as the ability to, reactivate it following an update.

You can view information on the Tachyon system information for the Consumer, Coordinator, Background channel, Core and Switch.

Note

For more information please refer to:

- License information page

- System information page.

1.7.1.1.10 Monitoring log files

The monitoring pages let you view how Tachyon is performing its tasks. Four key log pages are provided:

Page	Description
Process log	Whenever you execute a sync or process a repository the steps are displayed here. This page is updated in real-time and shows the status of each step as it happens.
Sync log	The results of performing a sync are displayed here.
Infrastructure log	Information on the Tachyon infrastructure is displayed here, such as license status and instruction workflow.
Audit information log	This page displays information on the Instructions that have been run in Explorer. This includes the instruction text and the user that requested it.

Note

For more information on monitoring please refer to:

- Process log page
- Sync log page
- Infrastructure log page
- Audit information log page.

1.7.1.1.11 Defining users and roles

Tachyon users or groups can be added from AD. They can be assigned roles that determine what aspects of Tachyon they can access. Custom roles can be created that let you associate particular permissions on particular Instruction sets for particular management groups.

Note

For more information on users and roles please refer to:

- Users and Groups page
- Roles page
- Configuring Access Rights - tutorial.

1.7.1.1.12 Management groups

Management groups use inventory-based rules to define groups of particular devices, they are implemented in SLA and then made available to Tachyon applications and other consumers. After

a management group is defined, each time the inventory is updated the device membership of the groups is re-evaluated by applying the management group's rules to the new inventory.

Custom roles can be created that tie particular Instruction sets to particular management groups. This means you can not only set the permissions for users to access the Instructions in specific Instructions sets, but you can also determine which devices they can target using those Instructions.

Once defined, management groups can then be used to set the coverage for Instructions in Explorer and also which devices can be targeted by particular users. Management groups are also used by the Patch Success and Guaranteed State applications to determine which devices are being targeted.

Note

For more information on management groups, please refer to:

- Management Groups page
- Management Groups - tutorial.

1.7.1.1.13 Uploading Instructions into Tachyon and creating Instruction sets

You determine the capabilities of Explorer by uploading Instructions from product packs into Tachyon. Product Packs are either provided with the release or downloaded from the 1E Exchange. Once the Instructions have been uploaded into Tachyon you then need to put them into Instruction sets. The Instruction sets can then be associated with custom roles to determine the permissions applied to the Instructions. The custom roles are then applied to users to determine which Instructions each user has access to.

Note

For more information on uploading product packs into Tachyon and managing Instruction sets, please refer to:

- Instruction sets page.

1.7.2 Configuration Menu

General configuration options for Tachyon.

1.7.2.1 Connectors page

Connectors are used to connect to other 1E and third party systems, retrieve their data and populate repositories. Tachyonprovides the following inventory connectors to populate the Tachyon Repositories page:

- BigFix connector — Connects to a BigFix Inventory database server.
- BigFixInv connector — Connects to a BigFix Inventory database.
- File Upload connector — Uploads inventory data from a folder containing tab (TSV) and comma (CSV) separated value file(s).
- Intune connector — Connects to an Intune application and collects inventory and usage data.

- Microsoft Office 365 connector — Connects to an Office 365 application in InTune and pulls in inventory and usage data.
- OpenLM connector — Connects to an OpenLM database server.
- Oracle LMS connector — Connects to Oracle LMS and queries it for inventory information.
- ServiceNow connector — Connects to a ServiceNow instance to import basic inventory data into SLA Platform.
- System Center Configuration Manager connector — Connects to a Configuration Manager database and pulls in inventory and usage data.
- Tachyon connector — Connects the Tachyon and SLA components to support Management group and Tachyon Powered Inventory features. The Tachyon Powered Inventory feature uses instructions to fetch inventory data from clients, and is a prerequisite for 1E Patch Success.
- vCenter connector — Connects to a vCenter server and pulls in inventory data.
- Windows Server Update Services connector — Connects to a WSUS database and pulls in patch data.

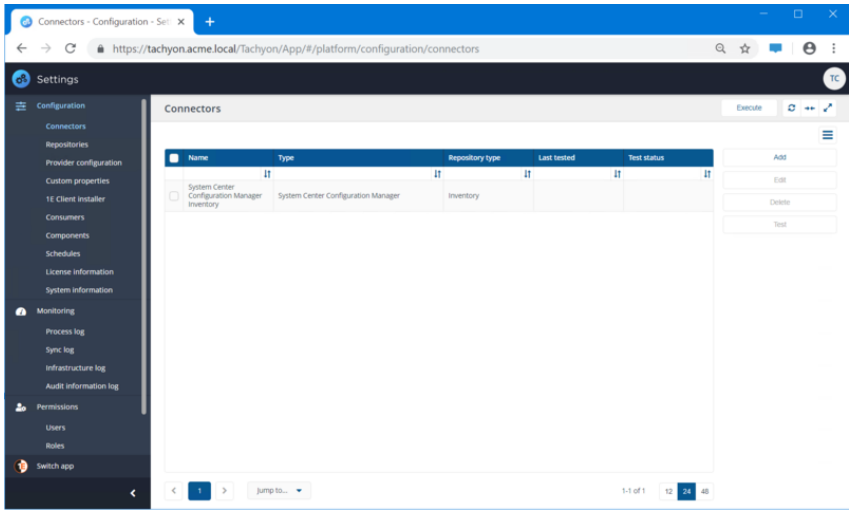
Use the links above to find more information about each type of connector. Please refer to Introducing Inventory for more information about viewing and exporting inventory repositories.

Additional connectors may exist for add-on Consumer applications that have been installed. For example, AppClarity has the following connectors to populate its entitlement repository:

- AppClarity v5.2 connector — Exports entitlements from an AppClarity 5.2 database into a TSV file, which can then be reviewed and imported into .
- Entitlement .tsv connector — Uploads entitlements from a folder containing one or more tab or comma separated value file(s).

Note

Consumer applications may add additional connectors to populate their repositories.



Please refer to Third party data sources below for supported versions of software used by these connectors, and other prerequisites.

1.7.2.1.1 Add a new connector

1. Navigate to **Settings→Configuration→Connectors**.
2. Click the **Add** button.
3. In the **Add Connector** popup select the required **Connector type** from the list of connector types.
4. Once you've made a selection the **Add connector** popup will show fields appropriate to the selected **Connector type**.
5. Enter the relevant connector configuration details including **Connector name**.

   Tip

   You should use a naming convention for connector names:

   <connector type> <scope> <RCR>

   Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

   Include **RCR** in the name if you have enabled **Run Consolidation Reports**.

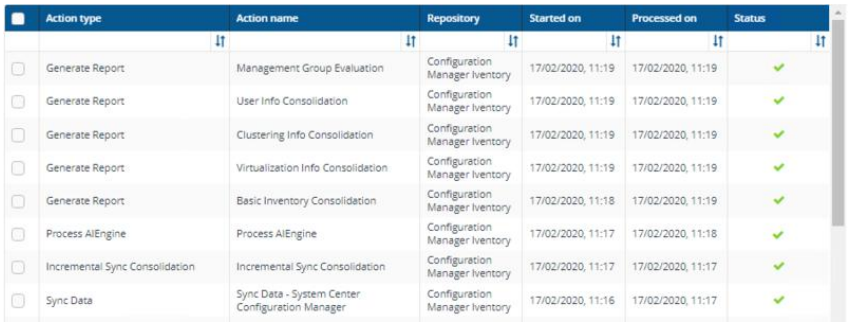
   For more information about what details are required, please refer to the corresponding documentation page for the connector type you are configuring.
6. When you have entered relevant details, click **Add**.
7. A new connector will be added with the selected details.

Note

Inventory connectors use consolidation actions to consolidate, normalize and store data in Inventory repositories.

Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.



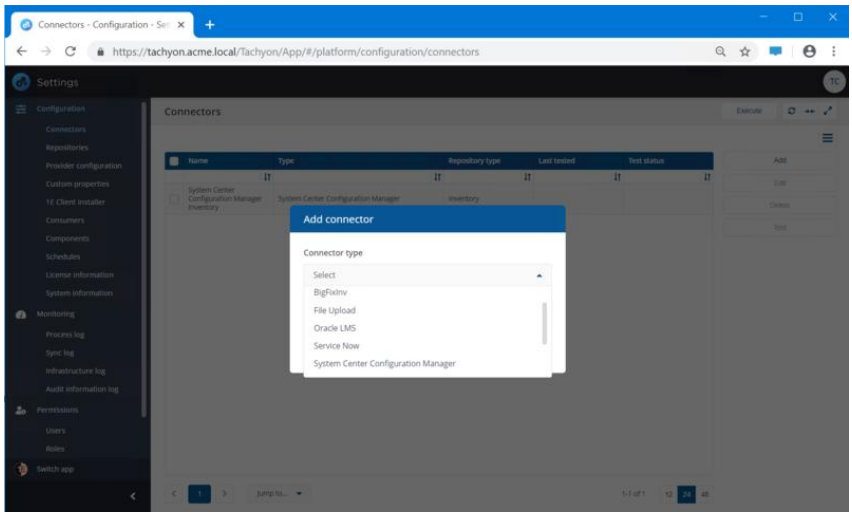
Action type	Action name	Repository	Started on	Processed on	Status
Generate Report	Management Group Evaluation	Configuration Manager Inventory	17/02/2020, 11:19	17/02/2020, 11:19	✓
Generate Report	User Info Consolidation	Configuration Manager Inventory	17/02/2020, 11:19	17/02/2020, 11:19	✓
Generate Report	Clustering Info Consolidation	Configuration Manager Inventory	17/02/2020, 11:19	17/02/2020, 11:19	✓
Generate Report	Virtualization Info Consolidation	Configuration Manager Inventory	17/02/2020, 11:19	17/02/2020, 11:19	✓
Generate Report	Basic Inventory Consolidation	Configuration Manager Inventory	17/02/2020, 11:18	17/02/2020, 11:19	✓
Process AIEngine	Process AIEngine	Configuration Manager Inventory	17/02/2020, 11:17	17/02/2020, 11:18	✓
Incremental Sync Consolidation	Incremental Sync Consolidation	Configuration Manager Inventory	17/02/2020, 11:17	17/02/2020, 11:17	✓
Sync Data	Sync Data - System Center Configuration Manager	Configuration Manager Inventory	17/02/2020, 11:16	17/02/2020, 11:17	✓

Note

When the new connector is saved then a new action is defined in Tachyon. This new action will have a name of the form: **Sync Data - <ConnectorName>**.

In order to sync the data from the connector's data source to a selected repository you will need to either:

1. To execute a manual sync action, please refer to Execute a connector sync action action below.
2. To schedule a sync action, please refer to Schedules page.



The following inventory connectors are provided by Tachyon out-of-the-box.

- BigFix connector — Connects to a BigFix Inventory database server.
- BigFixInv connector — Connects to a BigFix Inventory database.
- File Upload connector — Uploads inventory data from a folder containing tab (TSV) and comma (CSV) separated value file(s).
- Intune connector — Connects to an Intune application and collects inventory and usage data.
- Microsoft Office 365 connector — Connects to an Office 365 application in InTune and pulls in inventory and usage data.
- OpenLM connector — Connects to an OpenLM database server.
- Oracle LMS connector — Connects to Oracle LMS and queries it for inventory information.
- ServiceNow connector — Connects to a ServiceNow instance to import basic inventory data into SLA Platform.
- System Center Configuration Manager connector — Connects to a Configuration Manager database and pulls in inventory and usage data.
- Tachyon connector — Connects the Tachyon and SLA components to support Management group and Tachyon Powered Inventory features. The Tachyon Powered Inventory feature uses instructions to fetch inventory data from Tachyon clients, and is a prerequisite for Patch Success.

- vCenter connector — Connects to a vCenter server and pulls in inventory data.
- Windows Server Update Services connector — Connects to a WSUS database and pulls in patch data.

Additional connectors may exist for add-on Consumer applications that have been installed. For example, AppClarity has the following connectors to populate its entitlement repository:

- AppClarity v5.2 connector — Exports entitlements from an AppClarity 5.2 database into a TSV file, which can then be reviewed and imported into .
- Entitlement .tsv connector — Uploads entitlements from a folder containing one or more tab or comma separated value file(s).

1.7.2.1.2 Delete a connector

To delete a connector:

1. Select the connector you want to delete from the list of **Connectors** bychecking the box at the left-hand end of the connector's row.
2. Click the **Delete** button.
3. In the **Delete connector** popup you will be asked if you want to proceed and delete the selected connector.
4. To delete, click the **Yes, delete connector** button.

1.7.2.1.3 Test a connector

Once a new connector has been added the next step is normally to test that the details you have entered enable you to connect to the specified data source.

1. Select the connector you want to test from the list of **Connectors** by checking the box at the left-hand end of the connector's row.
2. Click the **Test** button.
3. The **Test status** column for the connector will display a clock icon

   indicating that the test has been queued for executing.
4. If the test succeeds **Test status** will display a check icon

   and the **Last tested** column will display the date and time the test succeeded.
5. If the test fails the **Test status** will display a failed icon

   and you'll need to check the details you entered for the connector.

Tip

If you have access to the Process log you can see an entry for the Test action.

1.7.2.1.4 Execute a connector sync action

The **Execute** button allows you to *manually* run an action. To *schedule* an action, please refer to Schedules page.

1. Click the **Execute** button.
2. In the **Execute action** popup subsequently displayed, use the **Repository** menu to select the inventory repository you want to populate.
3. Once the repository has been selected you can then select the action to run. In the case of inventory repositories the actions will be restricted to inventory related actions. For a connector you will be looking for an action with the form **Sync Data - <connector name>**.
4. For inventory syncs (where you sync a connector) you have additional options to check as shown in the example picture opposite:

   Warning

   Clean Sync causes deletion of existing data previously imported by the selected combination of **action** and **repository**. Data imported by any other connector actions is left intact and consolidated with new data. To clear all data from a repository, please refer to Repositories page.

   If **Clean Sync** checkbox is not checked then an incremental sync occurs, consolidating new data with old. An incremental sync is quicker than a clean sync.

   Clean Sync will prevent the Management Groups feature and applications such as Patch Success from working until the sync is complete and new data has been consolidated. This operation should only be performed if you need a clean sync or are experiencing problems with sync times taking too long.

   Note

   Run AI action will cause the AI action to run, this is only available if AI Powered Auto-curation has been enabled. The **Run AI action** checkbox is also available if the selected Action is **Generate Report - Basic Inventory Consolidation**. For detail on how to enable AI Powered Auto-curation the information is on the AI Powered Auto-curation page.

   Note

   Data to Sync allows you to select some or all categories of data supported by the connector.
5. Click the **Execute** button in the **Execute action** popup to start the sync.
6. A popup appears momentarily informing you that the Sync has started and you can monitor progress in the **Process log**.
7. When the sync starts a number of actions are queued to be performed on the selected repository. To check the progress of the sync actions:

a. Navigate to the **Monitoring→Process log** page.

b. Here you can see the sequence of actions that have been queued for the selected repository related to the **Sync Data** action selected.

c. When each action has finished running you'll see a check icon

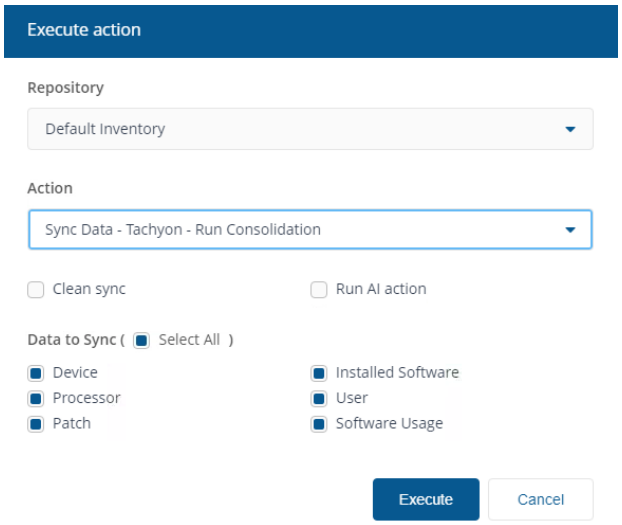
appear in the **Status** column if it succeeds or a failed icon

if it fails.

8. Once all the actions have succeeded you can check the results. To do this:

a. Navigate to the **Monitoring→Sync log** page.

b. This displays the items that have been added to the selected repository as a result of running the sync.



Note

The **Execute** button is also available on the Process log page.

1.7.2.1.5 Third party data sources

The following table shows the supported versions of software used by the Tachyon out-of-box connectors.

Connector	Product	Notes
BigFix	• BigFix	Please refer to the BigFix connector for prerequisites.

Connector	Product	Notes
Intune	• Intune	Please refer to the Intune connector page for prerequisites.
Microsoft Office 365	• Azure	Please refer to the Microsoft Office 365 connector page for prerequisites.
OpenLM	• OpenLM Server version 21.12	Please refer to the OpenLM connector page for prerequisites.
Oracle LMS	• Oracle LMS	Please refer to the Oracle LMS connector page for prerequisites.
ServiceNow	• ServiceNow Jakarta release	Please refer to the ServiceNow connector page for prerequisites.
System Center Configuration Manager (SCCM)	• SCCM CB 2203 • SCCM CB 2111 • SCCM CB	Please refer to the System Center Configuration Manager connector page for prerequisites.

Connector	Product	Notes
	2107 • SCCM CB 2103 • SCCM CB 2010	
Tachyon	• Tachyon 8.1	Please refer to the Tachyon connector page for prerequisites.
vCenter	• VMware PowerCLI 11.1.0	VMware PowerCLI 11.1.0 (code.vmware.com/web/dp/tool/vmware-powercli/11.1.0) must be installed on the Tachyon Master server (where the SLA Integrate Services Agent service is hosted) before you can configure and use the vCenter connector. Earlier or later versions of PowerCLI are not supported and may cause errors. VMware PowerCLI is freeware and was previously known as vSphere PowerCLI. VMware PowerCLI supports multiple versions of VMware vCenter Server. For details, please refer to the VMware compatibility matrix using the following link: https://www.vmware.com/resources/compatibility/sim/interop_matrix.php#interop&2=&106= Please refer to the vCenter connector page for configuration details.
WSUS (Windows Server Update Services)	• WSUS	Please refer to the Windows Server Update Services connector page for configuration details.

1.7.2.1.6 BigFix connector

Connects to a BigFix Inventory database server.

Before adding a new BigFix connector, you will need the following:

- domain user account or SQL Login to connect to the BigFix database
- access rights configured in the BigFix database.

1.7.2.1.6.1 BigFix connector configuration

To add the connector:

1. In **Connector name**, enter a logical name for this connector.

   Tip

   You should use a naming convention for connector names:

   <connector type> <scope> <RCR>

   Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

   Include **RCR** in the name if you have enabled **Run Consolidation Reports**.

2. In **BigFix Database Server**, enter the name of the server where the inventory database is hosted. If there is a database instance, then append it to the server name, for example *Server_Name\Instance*. Use the location of the inventory database server rather than the server itself. For example, if your application server is located on device A and its database is located on device B, use the location (hostname or IP address) for device B.
3. In **BigFix Database**, enter the name of the database you want to connect to.
4. If you are authenticating with Windows:
   a. Ensure **Use Windows Authentication** is checked.
   b. You do not need to populate the BigFix SQL Server User and BigFix SQL Server Password fields.
5. If you are using an SQL account:
   a. Ensure **Use Windows Authentication** is unchecked.
   b. In **BigFix SQL Server User**, enter the name for the account you want to use to connect to the database.
   c. In **BigFix SQL Server Password**, enter the password for this account.
6. Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

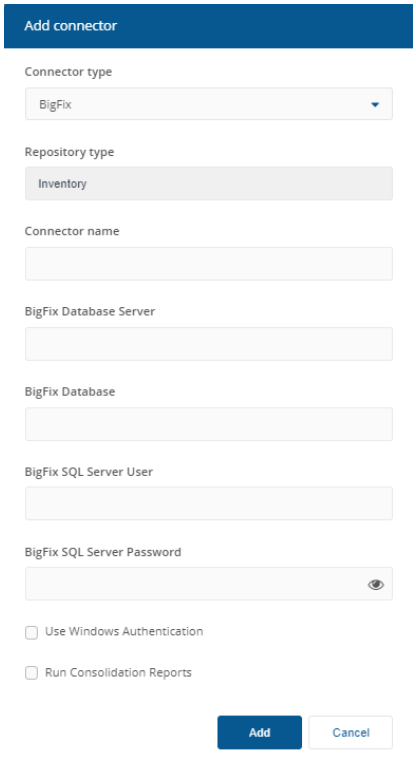
   This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the

Run Consolidation Reports checkbox on one of your connectors. You can view action processes in **Settings→Process log**.

7. Click **Add**.

After adding the connector, please refer to:

- Connectors page: Test a connector - to test the connector configuration
- Connectors page: Execute a connector sync action - to actually sync data into a repository
- Connectors page: Delete a connector



1.7.2.1.7 BigFixInv connector

Connects to a BigFix Inventory database.

Before adding a new BigFixInv connector, you will need the following:

- domain user account or SQL Login to connect to the BigFix Inventory database
- access rights configured in the BigFix Inventory database.

1.7.2.1.7.1 BigFixInv connector configuration

To add the connector:

1. In **Connector name**, enter a logical name for this connector.

   Tip

You should use a naming convention for connector names:

<connector type> <scope> <RCR>

Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

Include **RCR** in the name if you have enabled **Run Consolidation Reports**.

2. In **BigFix Inventory Database Server**, enter the name of the server where the inventory database is hosted. If there is a database instance, then append it to the server name, for example *Server_Name\Instance*. Use the location of the inventory database server rather than the server itself. For example, if your application server is located on device A and its database is located on device B, use the location (hostname or IP address) for device B.

3. In **BigFix Inventory Database**, enter the name of the database you want to connect to.

4. If you are authenticating with Windows:

    a. Ensure **Use Windows Authentication** is checked.

    b. You do not need to populate the BigFix Inventory SQL Server User or BigFix Inventory SQL Server Password fields.

5. If you are using an SQL account:

    a. Ensure **Use Windows Authentication** is unchecked.

    b. In **BigFix Inventory SQL Server User**, enter the name for the account you want to use to connect to the database.

    c. In **BigFix Inventory SQL Server Password**, enter the password for this account.

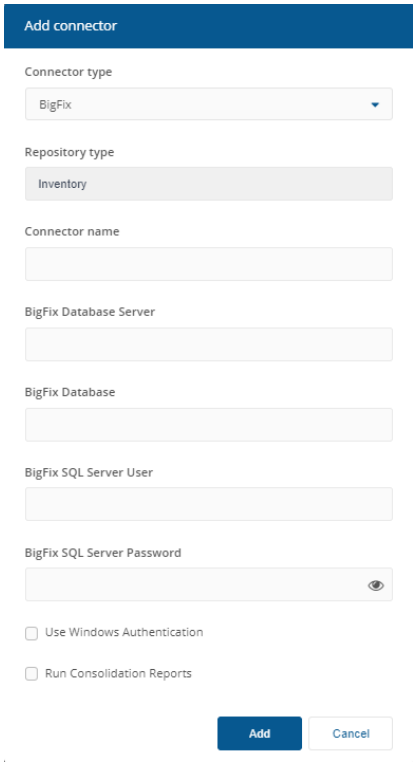
6. Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

    This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.

7. Click **Add**.

After adding the connector, please refer to:

- Connectors page: Test a connector - to test the connector configuration
- Connectors page: Execute a connector sync action - to actually sync data into a repository
- Connectors page: Delete a connector



1.7.2.1.8 File Upload connector

Uploads inventory data from a folder containing tab (TSV) and comma (CSV) separated value file(s).

Before adding a new **File Upload** connector, you will need the following:

- inventory files with the correct column structure
- folder location with at least **read access** for the **SLA Platform service account**.

1.7.2.1.8.1 File Upload connector configuration

To add the connector:

1. In **Connector name**, enter a logical name for this connector

   Tip

   You should use a naming convention for connector names:

   <connector type> <scope> <RCR>

   Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

   Include **RCR** in the name if you have enabled **Run Consolidation Reports**.

2. In **Folder Location**, enter the location for your inventory TSV/CSV file(s)
3. Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.

4. Click **Add**

Note

The **No incremental sync** checkbox is reserved for future use.

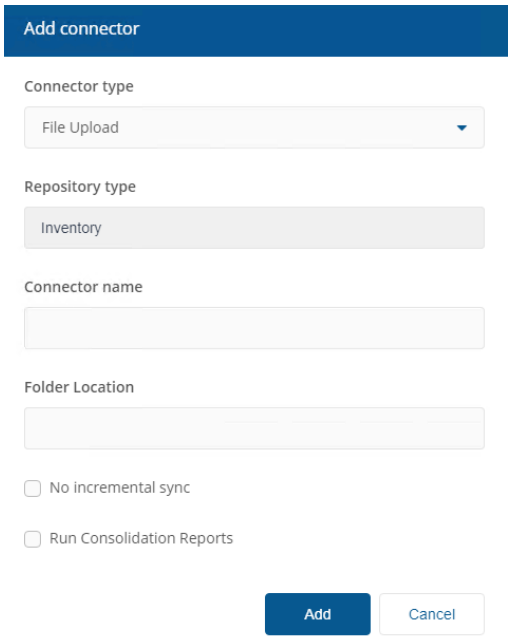
After adding the connector, please refer to:

- Connectors page: Test a connector - to test the connector configuration
- Connectors page: Execute a connector sync action - to actually sync data into a repository
- Connectors page: Delete a connector

Tip

All files in the folder location will be uploaded, including sub-directories.

Test will confirm whether the service account has read access to the folder location.



1.7.2.1.9 Intune connector

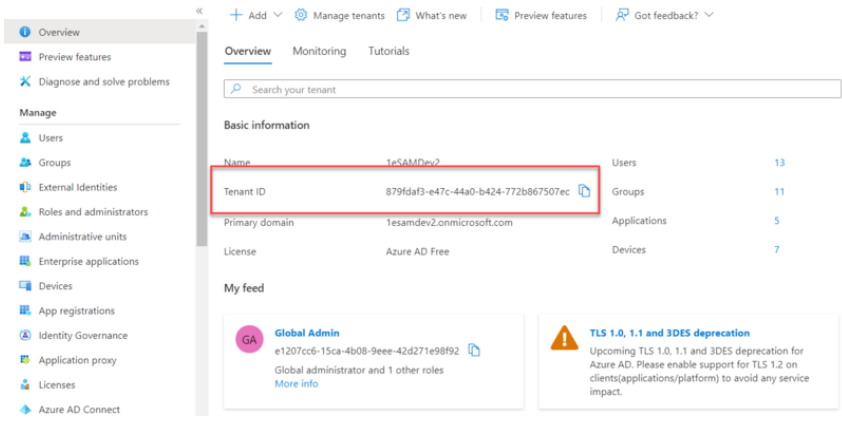
Connects to an Intune application and collects inventory and usage data. For information on the type of data collected by the Intune connector, please refer to the Intune column of the table on Management groups rules page.

The below configuration procedure assumes you already have an Intune subscription, and are able to populate the connector with information available in an Enterprise Application in your Azure Active Directory (AAD) Console.

1.7.2.1.9.1 Prerequisites

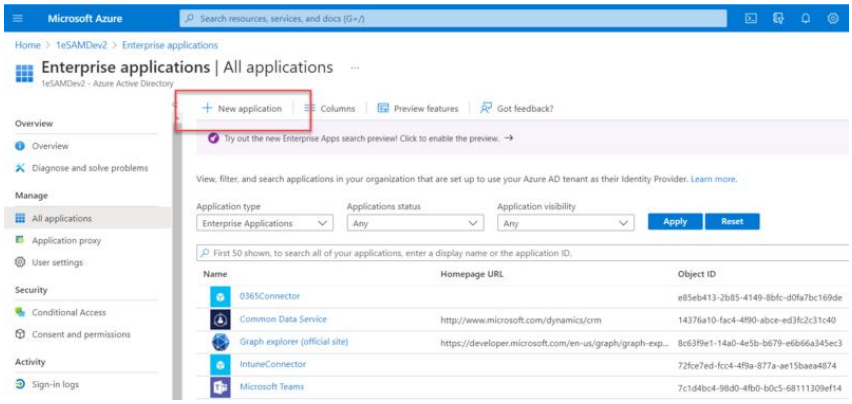
Before adding a new Intune connector, you will need the following information from an Enterprise Application created in your AAD console:

- Azure cloud instance URL (optional) if this is not supplied then **AzurePublic** is used as a default
- Azure **Tenant ID**, available in the **Overview** node of your AAD console (see opposite)
- The registered application clientID (a string representing a GUID)
- A client secret value that has been created for your chosen Enterprise Application.



1.7.2.1.9.1.1 Prepare an AAD application

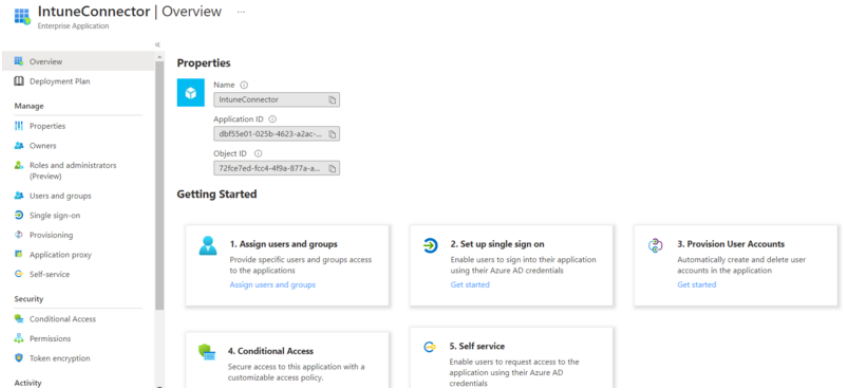
In your Azure Active Directory console, go to the **Enterprise applications** node and click **New application**.



You need to create a non-gallery application, in the version of AAD we're using this is done by clicking the **Create your own application** button.

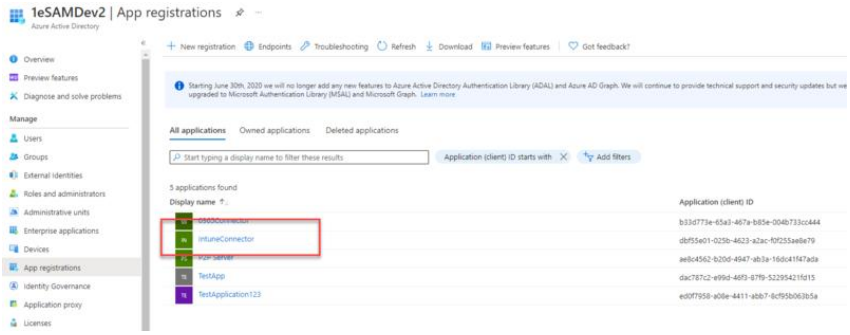
Provide a name for the application. The application name is not important but should suggest the application relates to platform connector. For example **Tachyon Intune Connector**, click **Add** in the bottom left of the screen.

In the **Overview**tab, copy the**Object ID** (called **Client Id** in Tachyon) and the **Application ID** (called **Tenant Id** in Tachyon) values as these will be required for the connector.



Click the **App registrations** node of AAD. Click on the application name for the application(s) listed, you will need to navigate back to the AAD blade.

> **Note**
>
> You may need to change the tab to **All Applications** to see the new application.



1.7.2.1.9.1.2 Add permissions

1. Click on the **API permissions** node under the **Manage** node, then click **Add a permission**.
2. Click on the **Microsoft Graph** tile, then click on **Application permissions**.
3. Scroll through the list of API permissions, and check as appropriate using the following, then click **Add permissions**.

API / Permissions name	Type	Description	Admin consent requ...	Status
Microsoft Graph (3)				
DeviceManagementApps.Read.A	Application	Read Microsoft Intune apps	Yes	Granted for
DeviceManagementManagedDe	Application	Read Microsoft Intune devices	Yes	Granted for
User.Read.All	Application	Read all users' full profiles	Yes	Granted for

4. Click **Grant admin consent for <organization>**, where <organization> is the **Organization** you set when you created your Intune instance.

   This means that as an administrator for your organization, you're consenting that the users of the application would want to use these permissions.

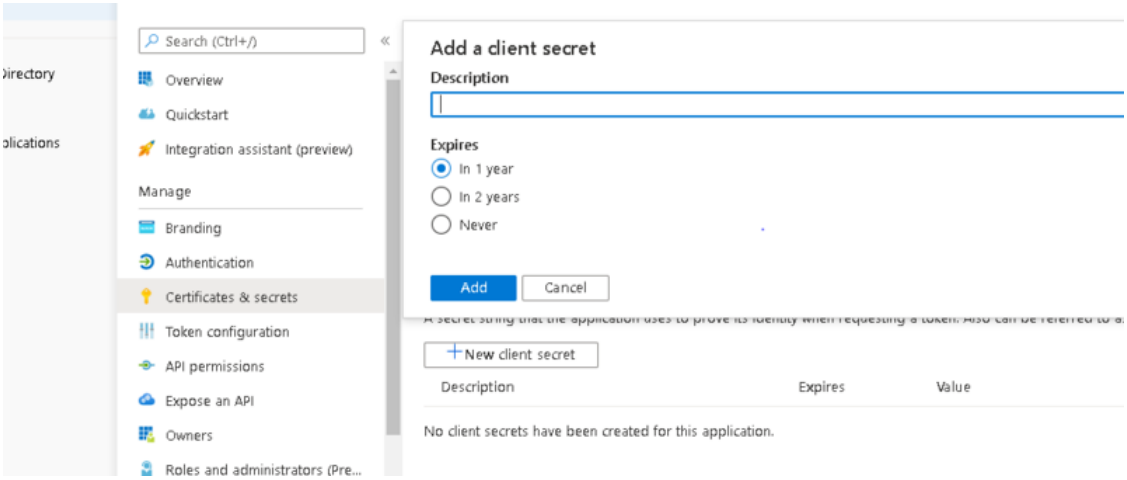
1.7.2.1.9.1.3 Add a client secret

Click on the **Certificates & secrets** node and then click on the **New client secret** button.

The **Add a client secret** form will open, add a **Description** and select an expiry from the **Expires** radio buttons and then click **Add**.

Copy the new client secret value and save it, as you won't be able to retrieve it after you perform another operation or leave this blade.

> **Warning**
>
> If you do not copy the **Value** at this point, when you navigate away from the **Certificates & secrets** screen you will be unable to copy it again. This means that you will have to delete the **Secret** and recreate it.



1.7.2.1.9.2 Configuring the Intune connector

These instructions show how to create an Intune connector in the **Settings** application.

1.7.2.1.9.2.1 Adding, testing and running an Intune connector

These are the steps to add, test and run an Intune connector.

1.7.2.1.9.2.1.1 Adding an Intune connector

1. In the Tachyon portal portal, navigate to **Settings**→**Configuration**→**Connectors**.
2. Click on the **Add** button.
3. In the **Add connector** popup, select the **Intune** type.
4. In **Connector name**, enter a logical name for this connector. In our example we choose the name **Intune Inventory**.
5. **Azure Cloud Instance** can be set to the URL for your Intune implementation. If you leave this field blank **AzurePublic** is used as a default, for the **AzureCloudInstance** reference see https://learn.microsoft.com/en-us/dotnet/api/microsoft.identity.client.azurecloudinstance?view=msal-dotnet-latest
6. In Azure **Tenant Id**, enter your Azure tenant ID, available in the **Overview**node of your AAD console.

7. **Client Id** this should be set to your registered application clientID.
8. **Client Secret** this should be set to the specific client secret value that has been created for your chosen Enterprise Application
9. **Run Consolidation Reports** - check this checkbox if you want the consolidation reports running automatically after this connector has been synchronized.
10. Click **Add**.

The new connector has now been added and a new action that can be used to run the connector has been created in the background, called **Sync Data - Intune Inventory**.

1.7.2.1.9.2.1.2 Testing an Intune connector

1. Select the Intune connector by checking the box at the left-hand end of its entry in the **Connectors** table.
2. Click the **Test** button.
    a. The **Test status** column for the connector will display a clock icon

    indicating that the test has been queued for executing.
    b. If the test succeeds, **Test status** will display a check icon

    and the **Last tested** column will display the date and time the test succeeded.
    c. If the test fails, the **Test status** will display a failed icon

    and you'll need to check the details you entered for the connector.
3. If the test succeeds, you can proceed to run the connector to populate an inventory repository.

1.7.2.1.9.2.1.3 Running an Intune connector

1. Click the **Execute** button.
2. In the **Execute action** popup subsequently displayed, use the **Repository** menu to select the inventory repository you want to populate.
3. Once the repository has been selected, you can then select the action to run. In the case of inventory repositories, the actions will be restricted to inventory related actions. For a connector, you will be looking for an action with the form **Sync Data - <connector name>**.
4. Select whether you want to clear any existing data in the repository by checking the **Clean sync** checkbox.
5. Click **Execute** button in the **Execute action** popup to start the sync.

6. When the sync starts, a number of actions are queued to be performed on the selected repository. To check the progress of the sync actions:

    a. Navigate to the **Monitoring→Process log** page.

    b. Here, you can see the sequence of actions that have been queued for the selected repository related to the **Sync Data** action selected.

    c. When each action has finished running, you'll see a check icon

    appear in the **Status** column if it succeeds or a failed icon

    if it fails.

7. Once all the actions have succeeded, you can check the results. To do this:

    a. Navigate to the **Monitoring→Sync log** page.

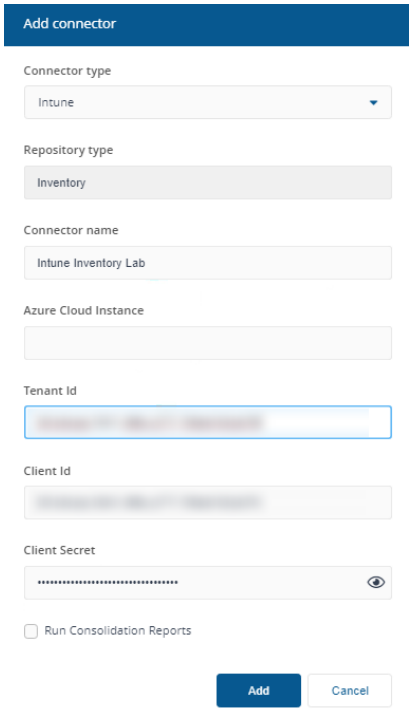
    b. This displays the items that have been added to the selected repository as a result of running the sync.

1.7.2.1.9.2.2 The Intune connector parameters

The following fields are available in the **Add connector** and **Edit connector** popups when the **Intune Connector type** is selected, as shown in the picture opposite:

Field	Description
Connector type	Shows the connector type: **Intune**.
Repository type	Shows which type of repository the connector works with. For the **Intune Connector type** this is always **Inventory**.
Connector name	Here you set the logical name for the connector. **Tip** You should use a naming convention for connector names: **<connector type> <scope> <RCR>** **Scope** describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit. Include **RCR** in the name if you have enabled **Run Consolidation Reports**.

Field	Description
Azure Cloud Instance	Azure cloud instance URL (optional) if this is not supplied the **AzurePublic** is used as a default.
Tenant Id	Azure tenant ID, available in the **Overview** node of your AAD console.
Client Id	The registered application clientID.
Client Secret	A client secret value that has been created for your chosen Enterprise Application.
Run Consolidation Reports	Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector. This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.



1.7.2.1.10 Microsoft Office 365 connector

Connects to an Office 365 application in InTune and pulls in inventory and usage data. The following steps assume you have an InTune and Microsoft Office 365 subscription, and can populate the connector with details from an Enterprise Application in your AAD Console.

1.7.2.1.10.1 Prerequisites

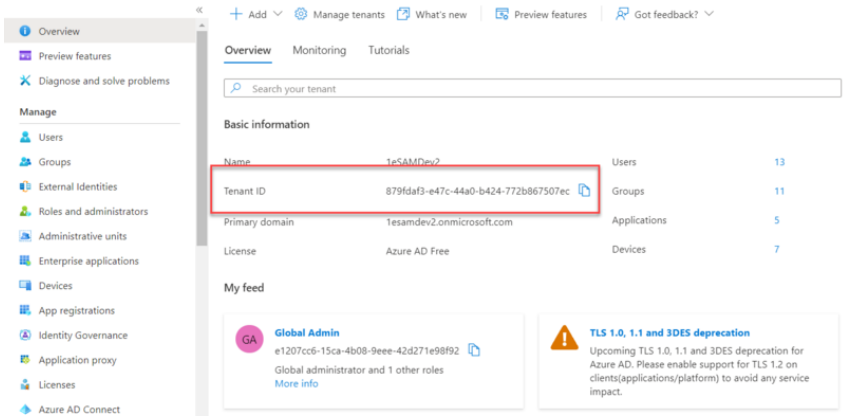
Before adding a new **Microsoft Office 365** connector, you will need to complete the following steps:

- Enable PowerShell to connect to Azure using MSOL
- Prepare an AAD application
- Add permissions
- Add a client secret
- Add a user with the necessary permissions to run the PowerShell scripts.

You will need the following information from an Enterprise Application created in your AAD console:

- Azure cloud instance URL (optional) if this is not supplied then **AzurePublic** is used as a default
- Azure **Tenant ID**, available in the **Overview** node of your AAD console
- The registered application clientID (a string representing a GUID)
- A client secret value that has been created for your chosen Enterprise Application

- SingleSignIn enabled Service Account with global reader permissions for running PowerShell cmdlets.



1.7.2.1.10.1.1 Enable PowerShell to connect to Azure using MSOL

On the Tachyon server where the **Microsoft Office 365** connector will be executed, PowerShell needs to connect to Azure using MSOL, which requires the following two modules installed:

Install-Modules for Microsoft Office 365

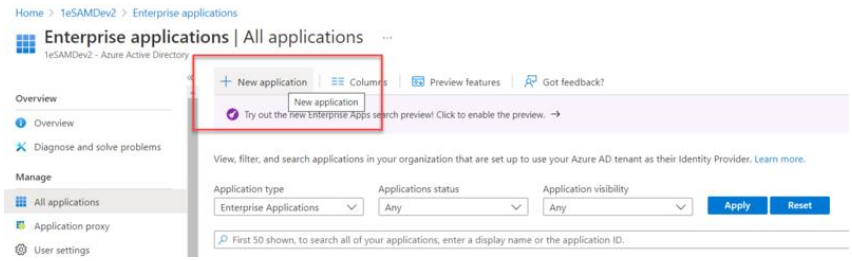
```
Install-Module -Name AzureAD
Install-Module -Name MsOnline
```

> **Note**
>
> If you see the following warnings when installing a module, you will need to run the following command first:
>
> WARNING: Unable to download from URI 'https://go.microsoft.com/fwlink/?LinkID=627338&clcid=0x409' to ''.
>
> WARNING: Unable to download the list of available providers. Check your internet connection.

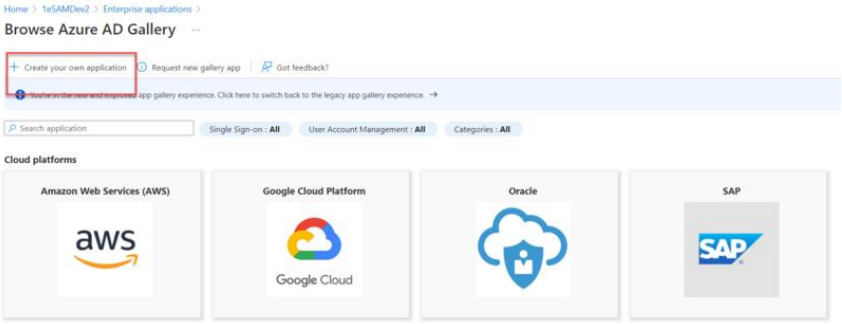
```
[Net.ServicePointManager]::SecurityProtocol = [Net.SecurityProtocolType]::Tls12
```

1.7.2.1.10.1.2 Prepare an AAD application

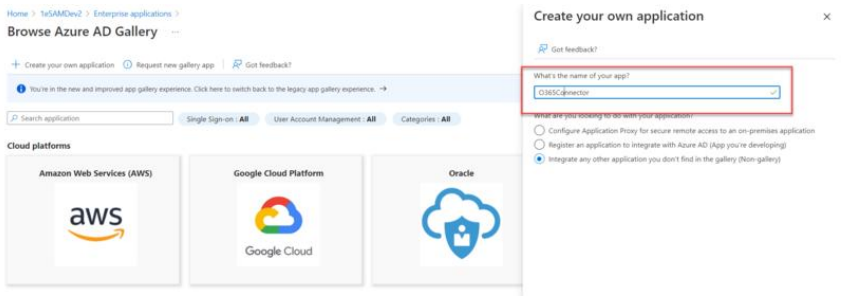
In your Azure Active Directory console, go to the **Enterprise applications** node and click **New application**.



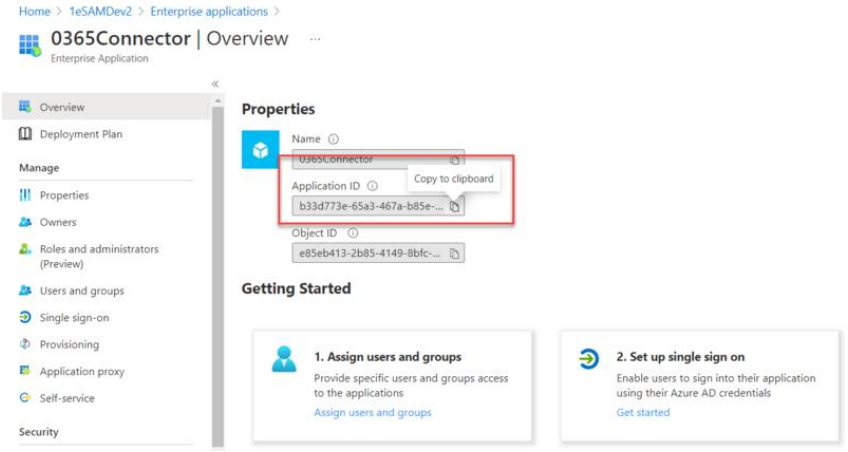
You need to create a non-gallery application, in the version of AAD we're using this is done by clicking the **Create your own application** button.



Provide a name for the application. The name of application should suggest the application is related to the Office 365 connector, for example: **Tachyon O365 Connector**. In this version of AAD we select the **Integrate any other application you don't find in the gallery (Non-gallery)** option and then click**Create**in the bottom left of the panel.



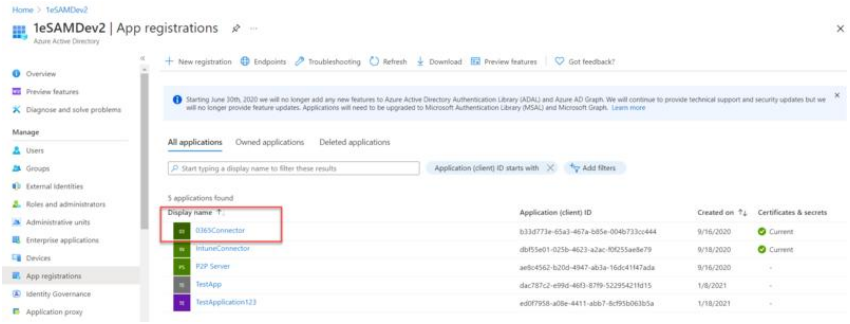
In the **Overview** tab for the new application, copy the **Application ID** value as this will be required for the connector.



Navigate back to the AAD blade and click the **App registrations** node of AAD.

> **Note**
>
> You may need to change the tab to **All applications** to see the new application.

Click on the application name for the new application.



1.7.2.1.10.1.3 Add permissions

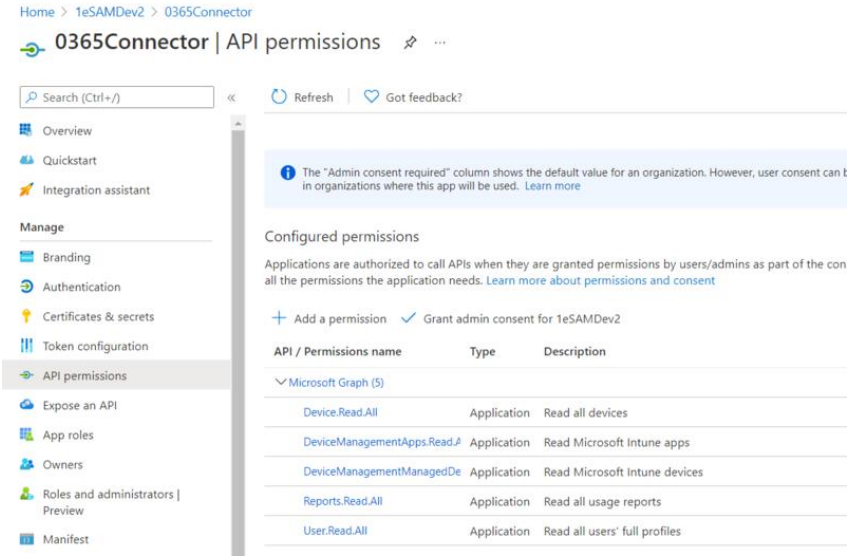
Click on the **API permissions** node under the **Manage** section, then click **Add a permission**.

Click on the **Microsoft Graph** tile and then click on **Application permissions**.

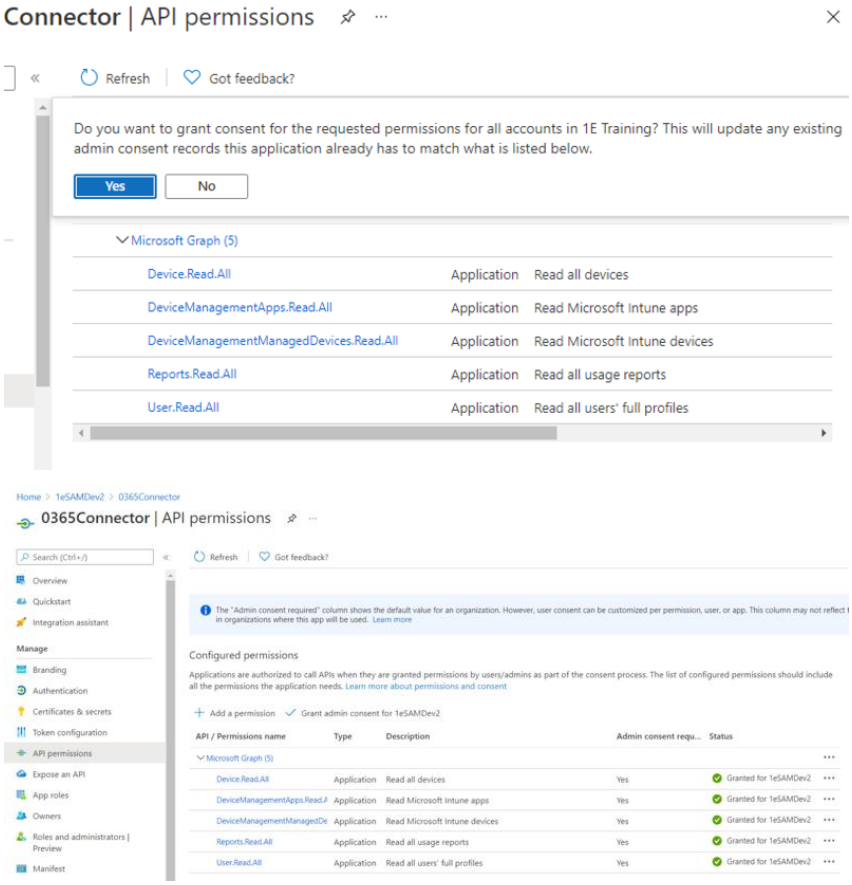
You will see a long list of API permissions, scroll through them and check as appropriate using the following table as a guide.

Group	Permission
Device	Read.All
DeviceManagementApps	Read.All
DeviceManagementManagedDevices	Read.All
Reports	Read.All
User	Read.All

When you have selected the correct permissions, click **Add permissions**. After they've been added, the permissions should like the picture shown opposite.



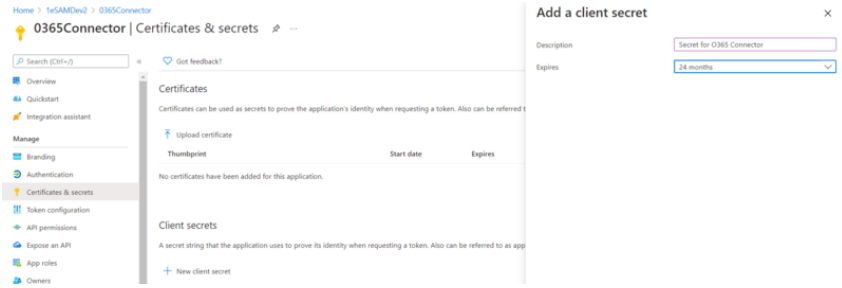
Click **Grant admin consent for <organization>**, where <organization> is the **Organization** you set when your InTune instance was created. This means that as an administrator for your organization, you're consenting that the users of the application can use these permissions. Click **Yes** to confirm.



1.7.2.1.10.1.4 Add a client secret

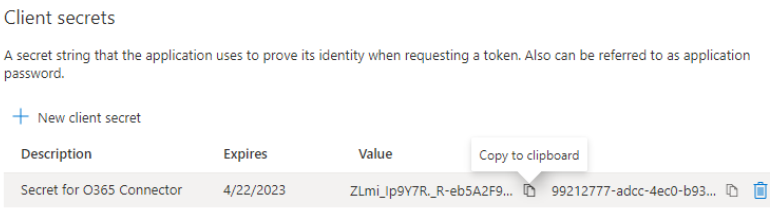
Click on the **Certificates & secrets**node, and then click on **New client secret** button

The **Add a client secret** form will open, add a **description** and select an expiry from the **Expires** options and then click **Add**.



Copy the new client secret **Value** and save it. It is important you save the client secret **Value**, as you won't be able to retrieve it after you perform another operation or leave this blade.

> **Warning**
>
> If you do not copy the **Value** at this point, when you navigate away from the **Certificates & secrets** screen you will be unable to copy it again. This means that you will have to delete the **Secret** and recreate it.



1.7.2.1.10.1.5 Add a user with the necessary permissions to run the PowerShell scripts

An AAD user with Reports Reader permissions must be made available in your organization's blade. The credentials for this user will be set in the Microsoft Office 365 connector when it is created in Tachyon.

1.7.2.1.10.2 Configuring the Microsoft Office 365 connector

These instructions show how to create a Microsoft Office 365 connector in the Settings application.

1.7.2.1.10.2.1 Adding, testing and running a Microsoft Office 365 connector

These are the steps to add, test and run a Microsoft Office 365 connector.

1.7.2.1.10.2.1.1 Adding a Microsoft Office 365 connector

1. In the Tachyon portal portal, navigate to **Settings→Configuration→Connectors**.
2. Click on the **Add** button.
3. In the **Add connector** popup select the **Microsoft Office 365** type.
4. In **Connector name**, enter a logical name for this connector. In our example we choose the name **Microsoft Office 365 Inventory**.

5. **Azure Cloud Instance** can be set to the URL for your InTune implementation. If you leave this field blank **AzurePublic** is used as a default.
6. In Azure **Tenant Id**, enter your Azure tenant ID, available in the **Overview**node of your AAD console.
7. **Client Id** this should be set to your registered application clientID.
8. **Client Secret** this should be set to the specific client secret value created for your chosen Enterprise Application.
9. **Login Email** - set this to the permissioned user.
10. **Login Password** - set this to the password for the permissioned user.
11. Click **Add**.

The new connector has now been added and a new action to run the connector has been created in the background, called:

Sync Data - Microsoft Office 365 Inventory

1.7.2.1.10.2.1.2 Testing a Microsoft Office 365 connector

1. Select the Microsoft Office 365 connector by checking the box at the left-hand end of its entry in the **Connectors** table.
2. Click the **Test** button.
    a. The **Test status** column for the connector will display a clock icon

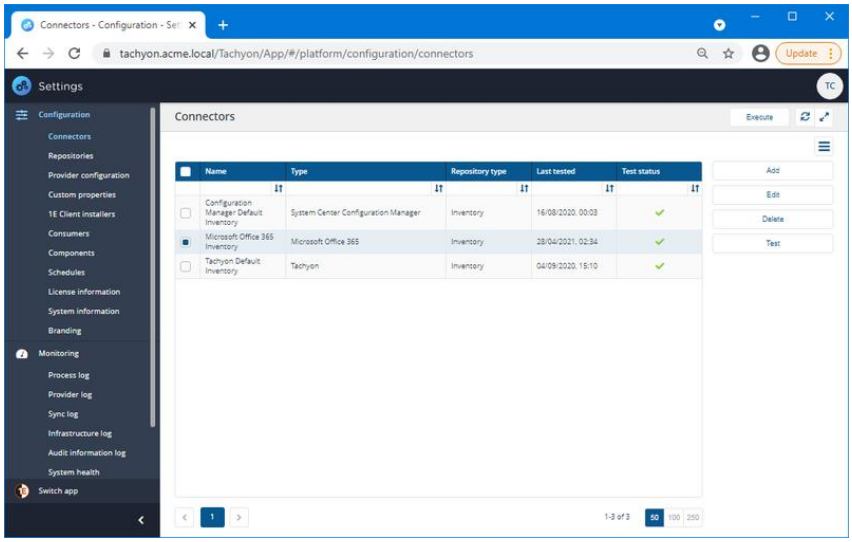
    indicating that the test has been queued for executing.

    b. If the test succeeds **Test status** will display a check icon

    , and the **Last tested** column will display the date and time the test succeeded.

    c. If the test fails the **Test status** will display a failed icon

    , and you'll need to check the details you entered for the connector.
3. If the test succeeds, you can proceed to run the connector to populate an inventory repository.

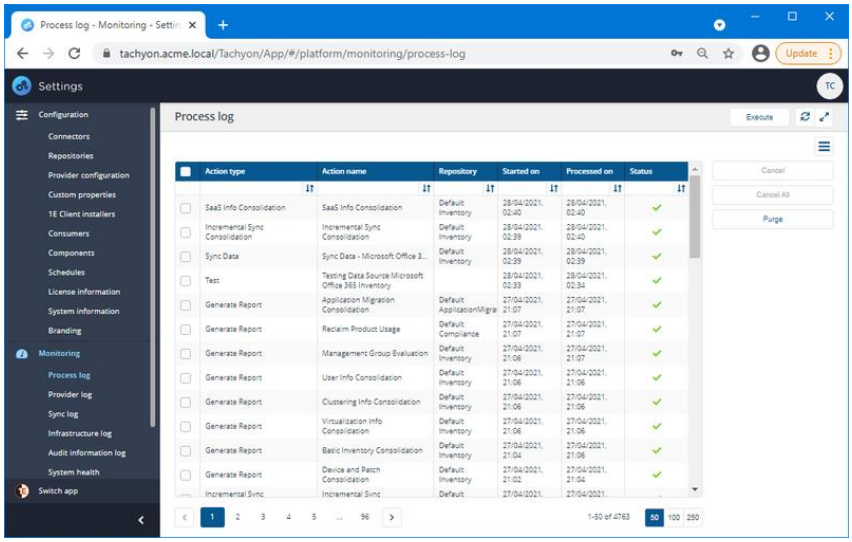


1.7.2.1.10.2.1.3 Running a Microsoft Office 365 connector

1. Click the **Execute** button.
2. In the **Execute action** popup subsequently displayed, use the **Repository** menu to select the inventory repository you want to populate.
3. Once the repository has been selected, you can then select the action to run. In the case of inventory repositories the actions will be restricted to inventory related actions. For a connector you will be looking for an action with the form **Sync Data - <connector name>**.
4. Select whether you want to clear any existing data in the repository by checking the **Clean sync** checkbox.
5. Click **Execute** button in the **Execute action** popup to start the sync.
6. When the sync starts, a number of actions are queued to be performed on the selected repository. To check the progress of the sync actions:
    a. Navigate to the **Monitoring→Process log** page.
    b. Here you can see the sequence of actions queued for the selected repository related to the **Sync Data** action selected.
    c. When each action has finished running you'll see a check icon

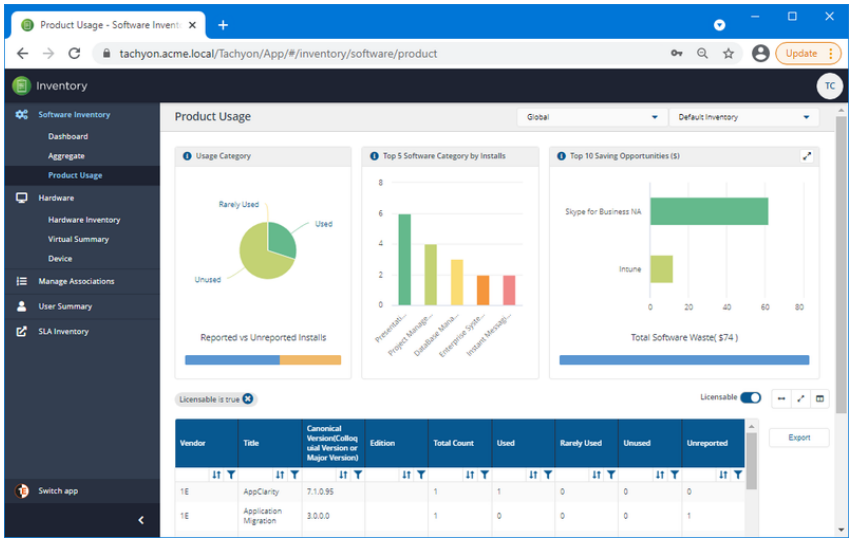
    appear in the **Status** column if it succeeds or a failed icon

    if it fails.



1.7.2.1.10.2.2 Viewing Microsoft Office 365 information in the Inventory application

1. Use the **Switch app** menu to open the **Inventory** application.
2. Navigate to **Software Inventory**→**Product Usage** page.
3. On this page you should see software items from your AAD environment.



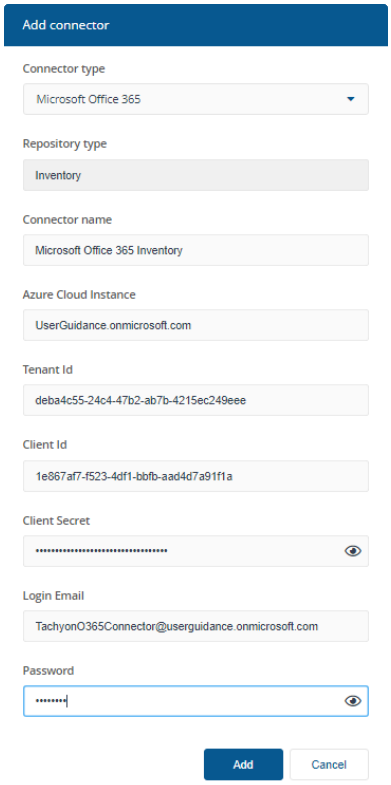
1.7.2.1.10.2.3 The Microsoft Office 365 connector parameters

The following fields are available in the **Add connector** and **Edit connector** popups when the **Microsoft Office 365 Connector type** is selected, as shown in the picture opposite:

Field	Description
Connector type	Shows the connector type: **Microsoft Office 365**.

Field	Description
Repository type	Shows which type of repository the connector works with. For the **Microsoft Office 365 Connector type** this is always **Inventory**.
Connector name	Here you set the logical name for the connector. **Tip** You should use a naming convention for connector names: **<connector type> <scope> <RCR>** **Scope** describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit. Include **RCR** in the name if you have enabled **Run Consolidation Reports**.
Azure Cloud Instance	Azure cloud instance URL (optional) if this is not supplied, the **AzurePublic** is used as a default.
Tenant Id	Azure tenant ID, available in the **Overview** node of your AAD console.
Client Id	The registered application clientID.
Client Secret	A client secret value that has been created for your chosen Enterprise Application.
Login Email	The user login name for the permissioned user.
Password	The password for the permissioned user.
Run Consolidation Reports	Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector. This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the

Field	Description
	Run Consolidation Reports checkbox on one of your connectors. You can view action processes in **Settings→Process log**.



1.7.2.1.11 OpenLM connector

Connects to an OpenLM database server.

Warning

Note

Please contact your 1E Account Team if you need more information about using this feature.

The OpenLM connector is a preview feature to demonstrate how Tachyon can collect license data from OpenLM. Currently, the collected data can be viewed only by using SQL queries, and cannot be viewed in the TachyonPortal or its Consumer applications. License data from OpenLM is not merged with entitlement data used by AppClarity.

The connector will be updated in future versions of Tachyonto support ongoing changes by OpenLM as they migrate from their XML-based API to their new REST-based API.

1.7.2.1.11.1 Prerequisites

Before adding a new OpenLM connector, you will need the following:

- OpenLM Server version 21.12
- OpenLM identity service enabled
- User name and password that provides access to OpenLM - refer to OpenLM security configuration
- Client ID and secret pair.

1.7.2.1.11.2 OpenLM connector configuration

To add the OpenLM connector:

1. In **Connector name**, enter a logical name for this connector.

   Tip

   You should use a naming convention for connector names:

   <connector type> <scope> <RCR>

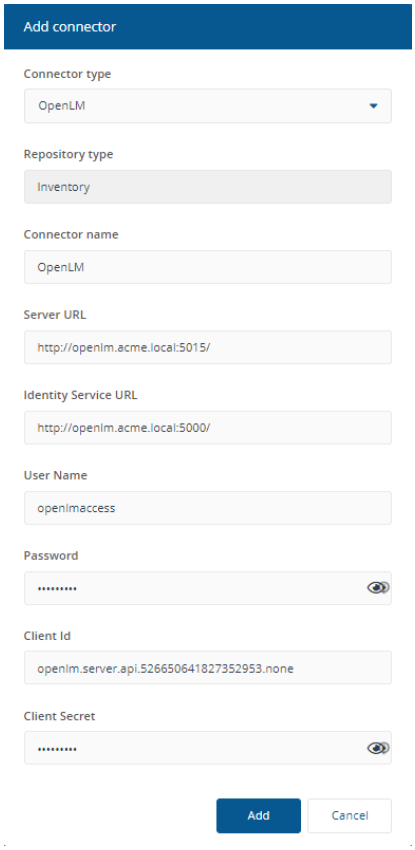
   Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

   Include **RCR** in the name if you have enabled **Run Consolidation Reports**.
2. In **Server URL**, enter the URL of the OpenLM Server, including port, for example **http://openlm.acme.local:5015/**
3. In **Identity Service URL**, enter the URL of the OpenLM Identity Service, including port, for example **http://openlm.acme.local:5000/**
4. In **User Name**, enter an OpenLM user name that already exists in your OpenLM system
5. In **Password**, enter the password for the OpenLM user
6. In **Client Id**, enter the Client Id
7. In **Client Secret**, enter the Client Secret
8. Click **Add**.

Tachyonsaves details encrypted.

After adding the connector, please refer to:

- Test a connector - to test the connector configuration
- Execute a connector sync action - to actually sync data into a repository
- Delete a connector



1.7.2.1.12 Oracle LMS connector

Connects to Oracle LMS and queries it for inventory information.

Before adding a new **Oracle LMS** connector, you will need the following:

- Location of Oracle LMS
- At least **read access** for the **SLA Platform service account**.

1.7.2.1.12.1 Oracle LMS connector configuration

To add the connector:

1. In **Connector name**, enter a logical name for this connector.

   Tip

   You should use a naming convention for connector names:

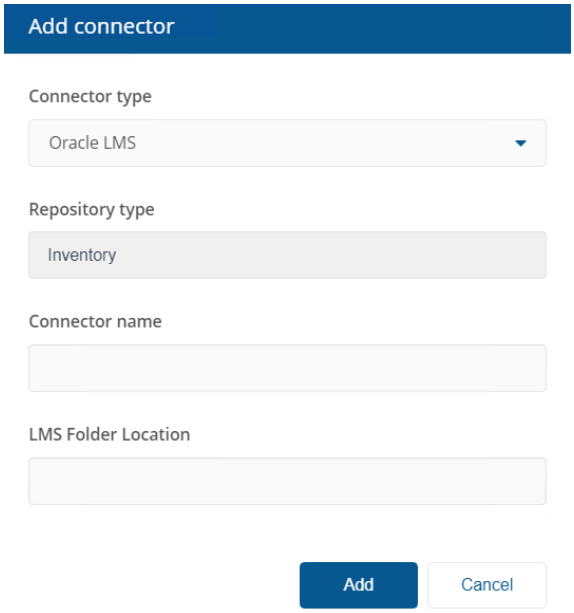
   <connector type> <scope> <RCR>

   Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

   Include **RCR** in the name if you have enabled **Run Consolidation Reports**.
2. In **LMS Folder Location** enter the location for the file.
3. Click **Add**

After adding the connector, please refer to:

- Test a connector - to test the connector configuration
- Execute a connector sync action - to actually sync data into a repository
- Delete a connector



1.7.2.1.13 ServiceNow connector

Connects to a ServiceNow instance to import basic inventory data into SLA Platform.

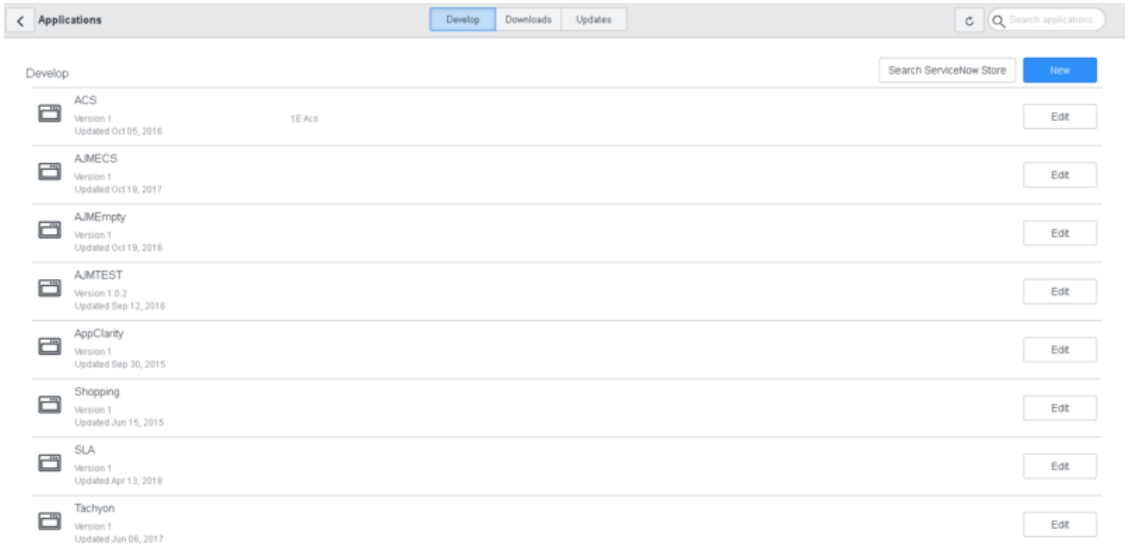
The SLA Platform ServiceNow connector is compatible with the ServiceNow Jakarta release.

Before adding a new ServiceNow connector, you will need the following:

- A ServiceNow application, with defined tables populated with data
- A ServiceNow user with read rights on application scope.

1.7.2.1.13.1 Create an application in your ServiceNow instance

1. Create a new application in ServiceNow, and configure the application scope.
2. Under the new application, create tables with fields using the schema shown below under: Table fields
3. Map / populate inventory data in these table fields.



1.7.2.1.13.2 ServiceNow connector configuration

To add the connector:

1. In **Connector name**, enter a unique name for this connector.

   Tip

   You should use a naming convention for connector names:

   <connector type> <scope> <RCR>

   Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

   Include **RCR** in the name if you have enabled **Run Consolidation Reports**.

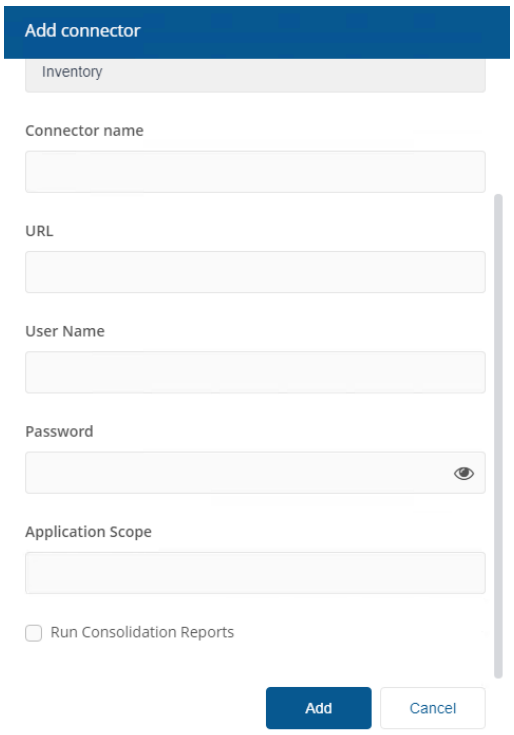
2. In **URL**, enter location of ServiceNow.
3. In **User Name**, enter the name of the account you want to use to connect to ServiceNow.
4. In **Password**, enter the password for this account.
5. In **Application Scope**, enter the scope being used in ServiceNow
6. Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

   This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.

7. Click **Add**.

After adding the connector, please refer to:

- Test a connector - to test the connector configuration
- Execute a connector sync action - to actually sync data into a repository
- Delete a connector



1.7.2.1.13.3 ServiceNow Terms Glossary

Application Scope | Application Menu | Field types | Instance | Portal

Term	Definition
Application Scope	An application scope is a logical boundary in ServiceNow which allows restricted access to services inside ServiceNow portal. Anything that you work upon must come under an application scope in ServiceNow. Every instance of ServiceNow comes with a default application scope called “Global” scope. So, any item e.g. incident, request item, variable set etc. that you create will come under the scope of “Global” application scope. For more information, please refer to: https://docs.servicenow.com/bundle/kingston-application-development/page/build/applications/concept/c_ApplicationScope.html.
Application Menu	The application menu forms the main navigational flow of the website. Every top level node in left navigation pane is an application menu e.g. Self-Service, Benchmarks, Guided Setup etc. For more information, please refer to:

Term	Definition
	https://docs.servicenow.com/bundle/kingston-platform-user-interface/page/use/navigation/concept/c_ApplicationNavigation.html.
Field types	ServiceNow database fields support a range of data types. For more information, please refer to: https://docs.servicenow.com/bundle/kingston-platform-administration/page/administer/reference-pages/reference/r_DatabaseFieldTypes.html
Instance	ServiceNow offer cloud instances to its customers, technology partners (vendors) and community developers. You can correlate it to SQL Server database instances which is the core of entire product. Vendor instance is a licensed product which is fully featured instance of ServiceNow having all the capabilities. Developer instances are trial kind of instances with few limitations e.g. they get reclaimed if the instance remains unused for 10 consecutive days.
Portal	Each instance of ServiceNow is managed, configured and controlled through a website (navigation page). The portal can also be used to create self-service requests as well.

1.7.2.1.14 System Center Configuration Manager connector

Connects to a Configuration Manager database and pulls in inventory and usage data.

Before adding a new System Center Configuration Manager (SCCM) connector, you will need the following:

- Configuration Manager client settings are enabled
- Configuration Manager database access for one of the following and given database rights as described below:
  - Tachyon Server's Network Service (computer$) account
  - a SQL Login that already exists in the Configuration Manager database

Tip

This connector supports both System Center Configuration Manager (SCCM) and Microsoft Endpoint Configuration Manager (MECM).

1.7.2.1.14.1 System Center Configuration Manager connector configuration

1.7.2.1.14.1.1 Adding, testing and running a Configuration Manager connector

To demonstrate how to add, test and run a Configuration Manager connector, we will use our example ACME environment. The following steps are also shown in the video opposite.

1.7.2.1.14.1.1.1 Adding a Configuration Manager connector

1. Navigate to **Settings**→**Configuration**→**Connectors**.
2. Click on the **Add** button.
3. In the **Add connector** popup, select the **System Center Configuration Manager Connector** type.
4. In **Connector name**, enter a logical name for this connector. In our example, we choose the name **System Center Configuration Manager Inventory** .

5. In **SCCM Database Server**, enter the name of the SQL Server instance where the Configuration Manager database is hosted, including custom port if used. In our example this is **ACME-SQL01**.

6. In **SCCM Database**, enter the name of the Configuration Manager database you want to connect to. In our example, this is called **CM_CM1**.

7. In our example, we will be using the **SLA Integrate Services Agent** service account to access the database. So we do the following:

    a. Skip the **SCCM SQL Server User** and **SCCM SQL Server Password** fields.

    b. Ensure **Use Windows Authentication** is checked.

8. Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

    This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.

9. Click **Add**.

The new connector has now been added and a new action that can be used to run the connector has been created in the background, called
Sync Data - System Center Configuration Manager Inventory.

1.7.2.1.14.1.1.2 Testing a Configuration Manager connector

1. Select the Configuration Manager connector by checking the box at the left-hand end of its entry in the **Connectors** table.

2. Click the **Test** button.

    a. The **Test status** column for the connector will display a clock icon

    indicating that the test has been queued for executing.

    b. If the test succeeds, **Test status** will display a check icon

    and the **Last tested** column will display the date and time the test succeeded.

    c. If the test fails, the **Test status** will display a failed icon

    and you'll need to check the details you entered for the connector.

3. In our example the test succeeds, so we can now continue to run the connector to populate an inventory repository.

1.7.2.1.14.1.1.3 Running a Configuration Manager connector

1. Click the **Execute** button.
2. In the **Execute action** popup subsequently displayed, use the **Repository** menu to select the inventory repository you want to populate. In our example, this is a repository called **Configuration Manager inventory**.
3. Once the repository has been selected you can then select the action to run. In the case of inventory repositories, the actions will be restricted to inventory related actions. For a connector, you will be looking for an action with the form **Sync Data - <connector name>**. In our example this is **Sync Data - System Center Configuration Manager Inventory**, which includes the name that was set earlier in the Adding a Configuration Manager connector steps.
4. In our example, we also select to clear any existing data in the repository by checking the **Clean sync** checkbox.
5. Click **Execute** button in the **Execute action** popup to start the sync.
6. When the sync starts, a number of actions are queued to be performed on the selected repository. To check the progress of the sync actions:
   a. Navigate to the **Monitoring→Process log** page.
   b. Here you can see the sequence of actions that have been queued for the selected repository related to the **Sync Data** action selected. In the video, we speed up the process of synchronizing the data.
   c. When each action has finished running you'll see a check icon

      appear in the **Status** column if it succeeds or a failed icon

      if it fails . In our example, all the actions succeed.
7. Once all the actions have succeeded, you can check the results. To do this:
   a. Navigate to the **Monitoring→Sync log** page.
   b. This displays the items that have been added to the selected repository as a result of running the sync. In our example, you can see a number of additions have been made to the **Configuration Manager inventory** repository.

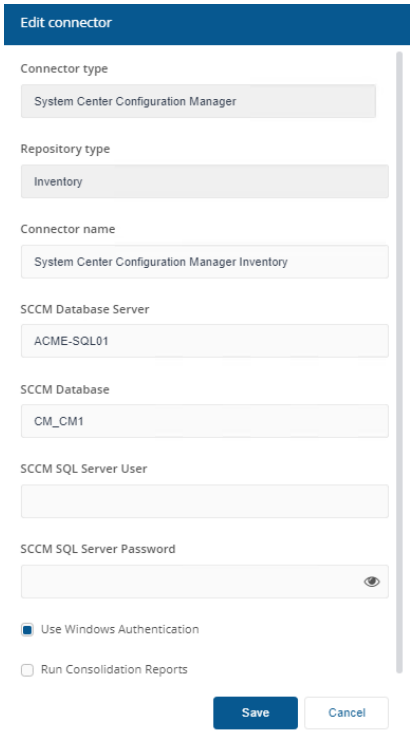
In the video we demonstrated the process of adding, testing and running a Configuration Manager connector and then monitored the progress of the sync and verified the results.

1.7.2.1.14.1.2 The Configuration Manager connector parameters

The following fields are available in the **Add connector** and **Edit connector** popups when the **System Center Configuration Manager Connector type** is selected, as shown in the picture opposite:

Field	Description
Connector type	Shows the connector type: **System Center Configuration Manager**.
Repository type	Shows which type of repository the connector works with. For the **System Center Configuration Manager Connector type** this is always **Inventory**.
Connector name	Here you set the logical name for the connector. **Tip** You should use a naming convention for connector names: **<connector type> <scope> <RCR>** **Scope** describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit. Include **RCR** in the name if you have enabled **Run Consolidation Reports**.
SCCM Database Server	The name of the SQL Server instance where the Configuration Manager database is installed. For example **ACME-SQL01**. The SQL Server instance should be specified using one of the following formats: • **<Server Name>** • **<Server Name>\<Instance>** - for a named instance • **<Server Name>\<Instance>,Port** - for a custom port
SCCM Database	The name of the Configuration Manager database. For example **CM_CM1**.
SCCM SQL Server User	The name of an SQL login account. This is ignored if the **Use Windows Authentication** checkbox is checked.
SCCM SQL Server Password	The password for the SQL login account. This is ignored if the **Use Windows Authentication** checkbox is checked.
Use Windows Authentication	Check this box if you want to use the **Tachyon server's computer$ account** instead of a SQL login specfied above. When the connector is configured to use **Windows Authentication**, the connector is actually using the **SLA Platform Integrate Agent** service account.

Field	Description
	Tachyon Setup configures this service to use **Network Service** which translates as the **Tachyon server's computer$ account** on a remote server.
Run Consolidation Reports	Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector. This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.



1.7.2.1.14.2 Configuration Manager site configuration

The following **Client Settings** must be configured to gather inventory and usage data from clients, and applied to relevant Collections containing in-scope devices:

- Software metering (metering rules are not necessary)
- Software inventory
- Hardware inventory

The following **Discovery Methods** must be configured to gather Active Directory data about clients, and applied to relevant Domains and OUs containing in-scope devices:

- Active Directory System Group Discovery (default attributes are sufficient)

1.7.2.1.15 Tachyon connector

Connects the Tachyon and SLA components to support **Management group** and **Tachyon Powered Inventory** features. The **Tachyon Powered Inventory** feature uses instructions to fetch inventory data from clients and is a prerequisite for **Patch Success**.

This configuration procedure assumes you will always use this Connector to synchronize **Management groups**, and optionally import data for the **Tachyon Powered Inventory** feature.

The following steps are always required:

- Create a Tachyon user, in our examples this user is **ACME\SLATACHYON**
- Add the **Tachyon Connector** and configure it to use the above user and password, and the correct Consumer URL
- Test the connector
- Schedule the Tachyon Connector Sync Data action to run every 24 hours using the **Default Inventory** repository.

The following steps are additionally required if intending to use the **Tachyon Powered Inventory** feature:

- Assign the above Tachyon user to the **All Instructions Questioner** role
- Create an instruction set called **1E Inventory**, and upload its instructions
- Create a custom role called **1E Inventory Questioners**, assign questioner permission on the instruction set, assign it to All Devices, and add the Tachyon user as a role member.

To understand synchronization, please refer to How Management Group Synchronization works. For information about how to configure and use Management Groups please refer to Management Groups page.

Tachyon Powered Inventory is used to populate an inventory repository with inventory and usage data by using instructions that collect data from clients. It is required by the Patch Success application. For details of how these instructions are used, please refer to How Tachyon Powered Inventory works.

1.7.2.1.15.1 Prerequisites

Before adding the Tachyon connector, you will need the following:

- A **domain user account** dedicated for use by the Tachyon connector, that will be configured as a Tachyon user
  - This is effectively like a service account. In our examples, this is **ACME\SLATACHYON**
  - The account will be assigned to the Role **All Instructions Questioner**

- A user with **Full Administrator** role permissions, to configure the connector and related tasks.

If the connector is to be used to support the **Tachyon Powered Inventory** feature then you will also need:

- The Creating the 1E Inventory instruction set for Inventory instructions used to get data from Tachyonclients
- An appropriate Tachyon License details to permit using Tachyon connector inventory instructions. This is normally included in a standard Tachyon license.

Note

The **Tachyon Powered Inventory** feature is a prerequisite for **Patch Success**.

1.7.2.1.15.2 Creating the user

These steps create the user required by the TachyonConnector and assigns it to the **All Instructions Questioner** system role.

You need a **domain user account** in Active Directory, in our example this is **ACME\SLATACHYON**.

1. Logon to the Tachyon Portal using a user account with a **Full Administrator** role.
2. Open the **Settings** application.
3. Navigate to the **Settings→Permissions→Users and Groups** page.
    a. Click on the **Add** button, doing this displays the **Add user** popup.
    b. In the **Select user** field, type the name, or part of the name, for the Active Directory user or security group that you want to add. A list of matching names will be retrieved from Active Directory and displayed as you type, these are filtered so that users or groups that have already been added do not appear.
    c. Select the Active Directory user or security group from the list of matching names displayed in the drop-down list. In our example, this is **ACME\SLATACHYON**.
    d. Click **Add**.
4. On the **Settings→Permissions→Users and Groups** page, click on the user's name link for **ACME\SLATACHYON**.
    a. On the **User: SLATACHYON** page click the **Edit** button to display the **Edit roles assigned to user** popup.
    b. Select **All Instructions Questioner**.
    c. Click the **Save** button.

1.7.2.1.15.3 Configuring the Tachyon connector

These steps add and test a Tachyon connector:

1. Navigate to **Settings→Configuration→Connectors**

2. Click on the **Add** button.
3. In the **Add connector** popup select the **Tachyon** type.
4. In **Connector name** enter a logical name for this connector.

   Tip

   You should use a naming convention for connector names:

   <connector type> <scope> <RCR>

   Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

   Include **RCR** in the name if you have enabled **Run Consolidation Reports**.
5. In **URL**, enter the URL of the Tachyon consumer, in following format

   `https://<TachyonDNSAliasFQDN>/consumer`

   Tip

   Please note that, as stated above **/consumer** must be included in the URL, in the same way that **/Tachyon** needs to be added to <TachyonDNSAliasFQDN> when a Tachyon users browses to the Tachyon Portal.

   In our example, the URL is **https://tachyon.acme.local/consumer**
6. In **User Name**, enter the name of the **user** that has permission to run the Inventory instructions. For our example, this user is **ACME\SLATACHYON**.
7. In **Password**, enter the password for this account.
8. Leave the other fields empty.
9. Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

   This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.
10. Click **Add**.

You should then test the connector:

1. Select the connector you want to test from the list of **Connectors** bychecking the box at the left-hand end of the connector's row.
2. Click the **Test** button.
3. The **Test status** column for the connector will display a clock icon

indicating that the test has been queued for executing.

4. If the test succeeds **Test status** will display a check icon

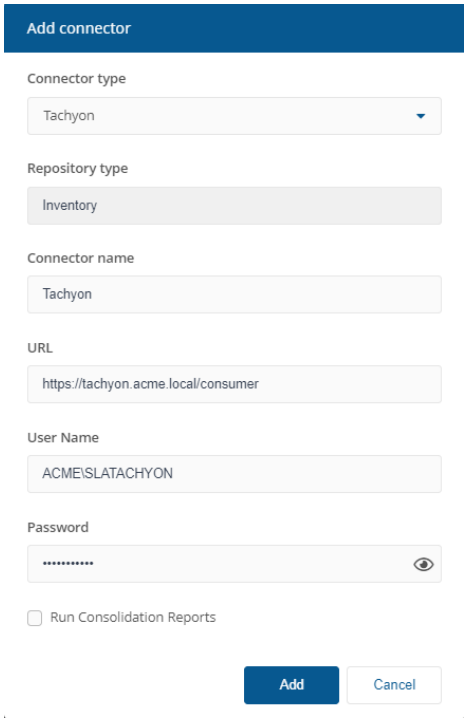
   and the **Last tested** column will display the date and time the test succeeded.

5. If the test fails the **Test status** will display a failed icon

   and you'll need to check the details you entered for the connector.

Tip

If you have access to the Process log you can see an entry for the Test action.



1.7.2.1.15.4 Creating the 1E Inventory instruction set

These steps are only required if:

- you have not already loaded the **1E Inventory** Product Pack using the Tachyon Product Pack Deployment Tool as part of the Tachyon Setup process
- you will be using **Powered Inventory**

The steps show how to create an instruction set called **1E Inventory**.

The **1E Inventory** instruction set will contain the 5 instructions listed in the following table:

<table>
<tr><th>Instruction text (ReadablePayload)</th><th>Type</th><th>Description</th><th>Data to Sync category</th><th>Instruction file name</th><th>Version</th></tr>
<tr><td>Which processors are in the device? With a stagger of <limitSecs> seconds.</td><td>Question</td><td>Processor details

Uses Device.GetProcessors method.

Note
Click here to expand details of data collected...

<table><tr><td>Method</td><td>GetProcessors</td></tr><tr><td>Library</td><td>Core</td></tr><tr><td>Action</td><td>Retrieves information about the CPUs plugged in to the motherboard of the device.</td></tr><tr><td>Parameters</td><td>(None)</td></tr><tr><td>Return values</td><td>Vendor (string): The vendor of the processor

Name (string): The vendor-defined name of this processor package

CoreCount (int): The number of cores inside this package

SpeedMhz(int): The clock speed of the processor in its current operating mode</td></tr></table></td><td>Processor</td><td>1E-Inventory-Device-GetProcessors</td><td>3</td></tr>
</table>

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
		From v5.1 onwards these columns also appear : *LogicalCoreCount* (int) : The number of logical cores inside this package *Hyperthreading* (bool): Indicates whether the cores are hyperthreaded, true for yes, false for no.			
	Example	`Device.GetProcessors();`			
	Platforms	• Windows • Linux • MacOS • Solaris Intel • Solaris Sparc			
	Notes	*Name* is the immutable string that the CPU reports to SMBIOS. This often contains the publicly marketed and sold average speed of the CPU, which usually differs to the actual speed of the processor instance. *SpeedMhz* on Windows can change over time for one particular CPU.			

Instruction text (ReadablePayload)	Type	Description		Data to Sync category	Instruction file name	Version
			Modern CPU's can adjust their clock in response to heat and power from moment to moment. This parameter cannot be relied upon for scoping future instruction executions unless some kind of range of values is in the scope to cope with natural speed variance.			
Inventory - what is the summary of file usage since <startDate>? With a stagger of <limitSecs> seconds.	Question	Process Usage data inventory for SLA Uses the **$ProcessUsage_Daily** inventory table, if **Module.Inventory.ProcessUsage.Enabled** setting is true (default) in the 1E Client configuration file. Please refer to Settings for platform features of the 1E Client. **Note** Click here to expand details of data collected... Windows only. The following table shows fields available in the **$ProcessUsage_Daily** table.		Software Usage	**1E-Inventory-FileUsageSummary**	3

		The Tachyon client captures executable usage; this is from the moment the executable is turned into a process, hence the process usage. The Process Usage data presented is grouped by executable binary, and parallel runs are accumulated in the ExecutionCount, but not in the Duration, where coverage time period is desired instead.			
Inventory - what software is installed? With a stagger of <limitSecs> seconds.	Question	Software inventory for SLA Uses a combination of: • Software.GetInstallations method • Software.GetUserInstallations method • SQL Server registry values **Note** Click here to expand details of data collected...	Installed Software	**1E-Inventory-Software**	3

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
		Method	**GetInstallations**		
		Module	Software		
		Library	Core		
		Action	Gets a list of the installed software available to all users, optionally filtered by product and/or publisher.		
		Parameters	*Product* (string; optional): If specified, search for just this product. *Publisher* (string; optional): If specified, get just this publisher's software.		
		Return values	A table of: • – *Product* (string): The product name. – *Publisher* (string): The publisher of the product. – *Version* (string): The		

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
		version of the product. – *InstallDate* (string): If available, when the product was installed. – *Architecture* (string): Platform architecture of this installation (e.g. x86, x64)			

		Example
		Get all software:
		`Software.GetInstallations();`
		Find and remove all installed instances of Calculator Plus:
		`Software.GetInstallations( Publisher : "Microsoft", Product : "Microsoft Calculator Plus");`
		`evaluate;`
		`Agent.Echo( Message: "Is installed");`
		`Software.Uninstall( Publisher : "Microsoft", Product : "Microsoft Calculator Plus");`			

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version

		To select a specific version, use a SQL WHERE clause:
		`@installs = Software.GetInstallations( Publisher : "Microsoft", Product : "Office Professional");`
		`SELECT DISTINCT * FROM @installs WHERE Version LIKE "16.0%";`			

		Platforms • Windows • Linux • MacOS • Solaris Intel • Solaris Sparc • Android			
		Notes To find additional software installed for specific users, use Software.GetUserInstallations.			
		Method **GetUserInstallations**			
		Li Core			

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
	array				
	Action	Gets a list of the software installed for specific users, optionally filtered by product and/or publisher.			
	Parameters	*Product* (string; optional): If specified, search for just this product. *Publisher* (string; optional): If specified, get just this publisher's software.			
	Returnvalues	A table of: • – *Architecture* (string): Platform architecture of this installation (e.g. x86, x64) – *InstallDate* (string): If available, when the product was installed.			

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
		– *Product* (string): The product name. – *Publisher* (string): The publisher of the product. – *Sid* (string): The user identifier for whom this software has been installed. – *Username* (string): Friendly representation of the *Sid* - this will only be resolved locally. – *Version* (string): The version of the product.			
Example		Get all user specific software: `Software.GetUserInstallations();`			
Platforms		• Windows			

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
	Notes	• *Sid* resolution may fail as this method will not go over the wire. In this case Username will be NULL. • The file modified and accessed time attributes of the NTUSER.dat directory entries under the %USERPROFILE% folder for each user and service principal might be updated to some time during the execution of this method. This is a side effect of loading and unloading the user hive and is housekeeping performed by Windows, not the 1E Client. This can cause "unused" profiles to appear to be used if the modified times are employed to determine whether a user has logged in, which is not a reliable method of establishing this fact. • This method reads user uninstall registry keys from HKU, but will not load hives. • Installs for this function are retrieved from *HKU:\<SID>\Software\Microsoft\Windows\CurrentVersion\Uninstall*

Tip

You can use the Product Pack Deployment tool to simultaneously Upload the instructions and Create the Instruction set, or use the manual steps below.

These instructions are included in the **1E Inventory** product pack, available in the **TachyonPlatform.vx.x.x.x.zip** file downloaded from the 1E Support Portal.

1.7.2.1.15.4.1 Upload the instructions

First upload the instructions:

1. Download the **TachyonPlatform.v8.x.x.x.zip** file from the 1E Support Portal
2. Extract the **1E-Inventory.zip** from the Classic folder
3. Logon to the Tachyon Portal using a user account with the **Full Administrator** role.
4. Open the **Settings** application.
5. Navigate to the **Settings→Instructions→Instruction sets** page.
6. Click on the **Upload** button.
7. In the Open dialog, navigate to the location of the **1E-Inventory.zip** file.
8. Select **1E-Inventory.zip** and click **Open**.

1.7.2.1.15.4.2 Create the Instruction set

All the instructions contained in the zip file will initially be added to the default **Unassigned** instruction set. Instructions in the **Unassigned** instruction set cannot be used, so first you will need to create a new instruction set with the verification instructions.

1. Select the **5** instructions you want to add to the new set, by clicking the checkbox at the start of each instruction row in the list.
2. Click the **Add new set** button in the button panel to the right of the page.

3. In the **Add new instruction set** popup subsequently displayed, and type:
    a. **1E Inventory** as the name.
    b. **Tachyon portalPowered Inventory** as the description.
4. Ensure that the **Include 5 selected instructions** checkbox is checked.
5. Click the **Add** button to add the new instruction set, with the selected instructions.

1.7.2.1.15.4.3 Configure the Tachyon Connector

Follow the steps in Configuring the Tachyon connector and then return to Executing the Tachyon Connector Sync Data action.

1.7.2.1.15.5 Executing the Tachyon Connector Sync Data action

When you've finished setting up the connector, you will then need to synchronize it to populate an inventory repository with the data from Tachyon.

You can execute the Connector **Sync Data** action in the same way as other connectors, manually or using a schedule, however the Tachyon connector manages its actions differently to other connectors. It uses Tachyon instructions to collect data from the client, once every 24 hours.

First, you should run the Sync Data action manually to confirm it works, in particular to test the user permissions and its ability to run the instructions.

- To manually sync data, please refer to Execute a connector sync action.
- To schedule the sync data action, please refer to Schedules page.

For our example, you will be running the **Sync Data - Tachyon** action on the default inventory repository called **Default inventory**. You can select which **Data to Sync**. The data categories displayed are dependent on the type of connector. For Tachyon, you can select from the following:

- Device
- Installed Software
- Processor
- User
- Patch
- Software Usage

Note

Each data category corresponds to one of the inventory instructions. Each instruction runs once every 24 hours, for 24 hours, collecting data if the device is online, or comes online during that period.

The exception is the **Device** category, which does not run an instruction, but instead it gets device data directly from the TachyonMaster database. To use

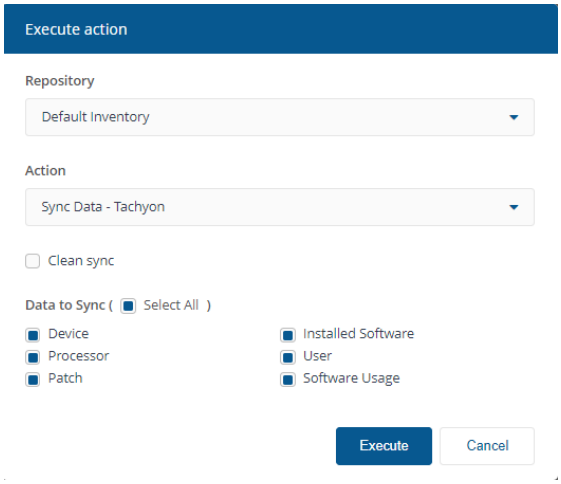
Management Groups in client-based applications (Explorer, Experience and Guaranteed State) you must use the **Default Inventory** repository, and select **Device** data.

Warning

When you schedule the **Sync Data - Tachyon** action to run automatically instead of manually, ensure you do *not* schedule it to run more frequently than the duration for the 1E Inventory instructions, that is every 24 hours. To understand why, please refer to How Tachyon Powered Inventory works.

You can review the results as they come in by reviewing the instruction history.

1. Switch to the **Explorer** application.
2. Navigate to the **Instructions→History** page.
3. Observe that all 5 instructions are running with a duration of 1440 minutes. Any devices coming online during that period will respond.
4. Click on any of the 5 instructions to review the response content and status.



If you want to review in detail the data that was imported into the **inventory repository**, navigate to the **Inventory** Application pages:

1. The **Inventory→Hardware→Hardware Inventory** page shows software details retrieved from the devices that have Tachyon clients.
2. The **Inventory→Hardware→Device** page shows hardware and OS details for devices that have Tachyon clients.
3. The **Inventory→Software Inventory→Product Usage** page shows the software product usage that has been retrieved from devices that have Tachyon clients.

The above data from Tachyonclients may be consolidated with data from other inventory sources using their inventory connectors.

1.7.2.1.15.6 How Management Group Synchronization works

The SLA components are responsible for storing information about management groups, including group definitions and membership, in the SLA databases. Tachyon maintains a synchronized copy in the TachyonMaster database. Whenever SLA Engine evaluates group membership, and it detects changes in the **Default Inventory** repository, it notifies Tachyon by initiating a sync. The Coordinator service receives the sync, fetches the changes, and updates the TachyonMaster database. To contact Tachyon, the SLA Engine uses the URL of the **Consumer** defined in the Tachyon Connector and the **Network Service** account is a member of the **Full Administrator** role.

Membership evaluations occur whenever the **Default Inventory** repository is updated by a manual or scheduled Connector **Sync Data** action, or the **Evaluate** button is pressed, as described in the Management Groups page.

1.7.2.1.15.7 How Tachyon Powered Inventory works

1.7.2.1.15.7.1 1E Inventory instructions

The Tachyon connector works differently compared with other connectors. Other connectors import data in a single operation, whereas a **Tachyon connector sync** issues a set of instructions, and then runs a two-phase process to gather the data. The default gather period behavior is controlled using settings for the inventory repository in the SLA-Data database. These must not be changed unless otherwise instructed by 1E.

When a Tachyon connector sync is actioned, either manually using **Create a new action**, or as a scheduled sync, the following happens.

1. The SLA Engine polls Tachyon to retrieve the information that is routinely sent back by the connected devices
2. The SLA Engine asks Tachyon to run each instruction
   - Each instruction runs for **1440** minutes (24 hours), known as a **gather period**
   - Tachyon sends each instruction to all devices at the same time
   - Devices respond immediately if they are online, or catch-up shortly after coming online
   - Each device will respond only once to each instruction during the **gather period**
   - Each instruction has a short random delay before the device sends its response back to the Tachyon server
   - Responses are stored in the database and only deleted at the end of the **gather period** plus a 6-hour **keep period**
3. The SLA Engine polls Tachyon
   - The poll is every **360** minutes (6 hours) after starting the instruction run for 24 hours, and fetches all the responses gathered so far
   - Data is stored in the inventory repository, and kept after the Tachyon deletes its copy of the data.

Devices only appear in the inventory repository if they respond, or if they have responded earlier to a previous sync.

Tachyon has minimal impact on the network and client devices when the instructions are run and responses are sent back to the Tachyon server. The low impact is further reduced by the random delay used by each instruction.

During each poll there is a small performance impact on the Tachyon server (master stack) and SLA components, when the initial responses are processed, and when the deltas are processed for subsequent polls, for other machines coming online.

1.7.2.1.15.7.2 How to schedule your Tachyon connector syncs

This is not a precise science, but here are some points you might want to consider when deciding what schedule you want to set for your Tachyon connector syncs:

- As we've described under 1E Inventory instructions, the instructions run for 24 hours and poll all the devices that are connected to Tachyon during that time
- Avoid creating overlapping sync schedules for an inventory repository - use only one Tachyon connector per inventory repository and sync it once every 24 hours
- Because of the 24-hour instruction TTL, the Tachyon connector sync allows time for devices in different time zones to be online and connected
- The information related to a device is updated just once during the sync period. Any updates will be captured during the next sync period.

1.7.2.1.15.7.3 Tachyon client configuration

Process and User usage capture is available only on Windows devices.

The 1E Client is required, with the following Tachyon client features enabled:

- Module.Inventory.Enabled=true (default, and this setting is visible in the 1E Client configuration file)
- Module.Inventory.ProcessUsage.Enabled=true (default - in 3.3 this was also true by default, but in 4.0 it was false by default)
- Module.Inventory.UserUsage.Enabled=true (default)

For more detail about configuring these and other settings in 1E Client, please refer to Tachyon client settings.

1.7.2.1.15.7.4 Tachyon License details

Ensure your Tachyon License file has the Inventory consumer enabled and includes the pattern for **1E-Inventory-***

You can view your Tachyon license details using either of the following methods:

- in the Settings Application, under **License info**, look in the Products section and expand Features and instruction items
- in the license file **Tachyon.LIC** found in **C:\ProgramData\1E\Licensing**

If the pattern does not exist, then the **1E-Inventory** instructions will not run. You may have an old version of Tachyon, or your license needs to be updated.

```
   <Features>
      <Feature name="TachyonPlatform">
        <Consumer name="Inventory" enable="on"></Consumer>
        <Instructions signersha="F08386A5318A8187D79B0A58253C65CB4E442570" patt
ern="1E-Inventory-*"> </Instructions>

      ...
      ...
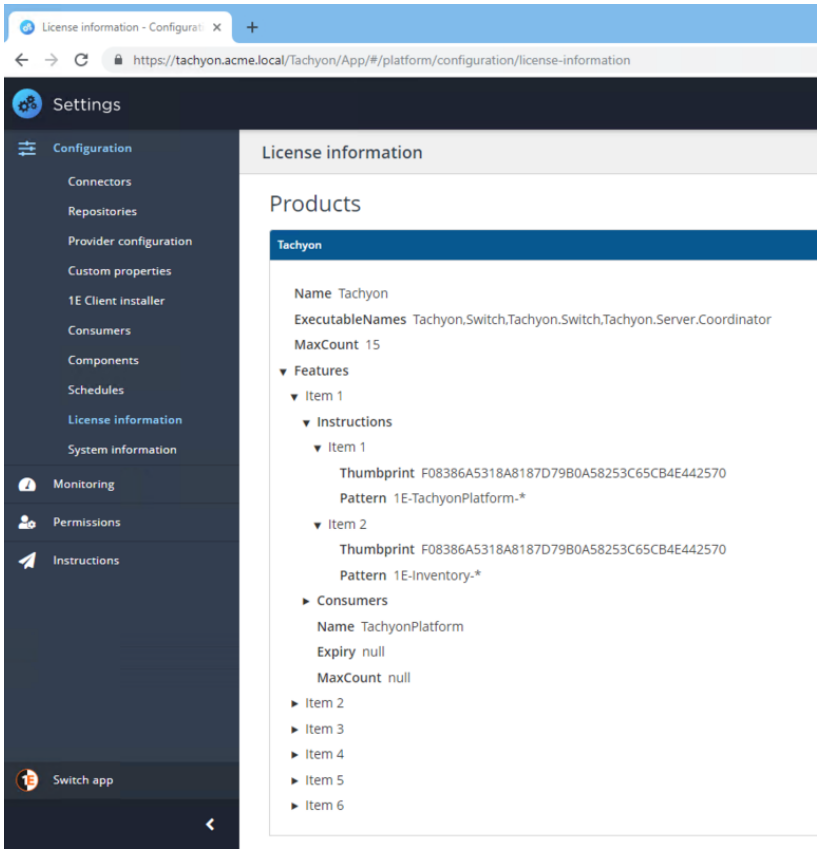
    </Features>
```



1.7.2.1.16 vCenter connector

Connects to a vCenter server and pulls in inventory data.

Before adding a new vCenter connector, you will need the following:

- Install VMware PowerCLI
- A vCenter user account and password.

1.7.2.1.16.1 vCenter connector configuration

To add the vCenter connector:

1. In **Connector name** enter a logical name for this connector.

   Tip

   You should use a naming convention for connector names:

   <connector type> <scope> <RCR>

   Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

   Include **RCR** in the name if you have enabled **Run Consolidation Reports**.

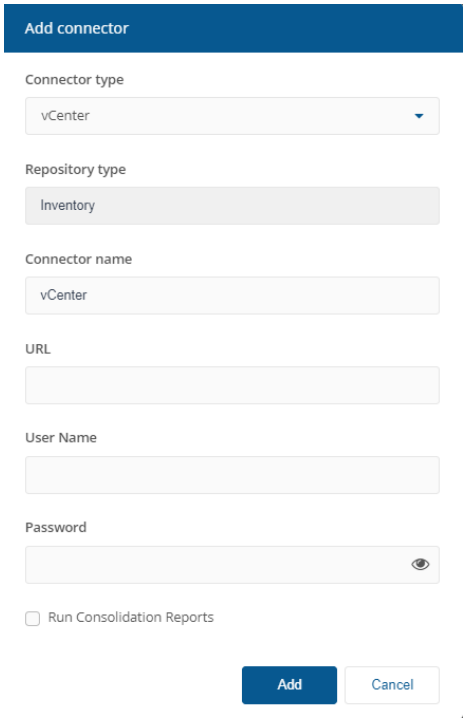
2. In **URL** enter location of vCenter server with **\sdk** appended.
3. In **User Name** enter the name of the account you want to use to connect to the database.
4. In **Password** enter the password for this account.
5. Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

   This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.

6. Click **Add**.

After adding the connector, please refer to:

- Test a connector - to test the connector configuration
- Execute a connector sync action - to actually sync data into a repository
- Delete a connector



1.7.2.1.16.2 VMware PowerCLI

VMware PowerCLI 11.1.0 (code.vmware.com/web/dp/tool/vmware-powercli/11.1.0) must be installed on the Tachyon Master server (where the SLA Integrate Services Agent service is hosted) before you can configure and use the vCenter connector. Earlier or later versions of PowerCLI are not supported and may cause errors. VMware PowerCLI is freeware and was previously known as vSphere PowerCLI.

VMware PowerCLI supports multiple versions of VMware vCenter Server. For details, please refer to the VMware compatibility matrix using the following link:
https://www.vmware.com/resources/compatibility/sim/interop_matrix.php#interop&2=&106=

1.7.2.1.17 Windows Server Update Services connector

Connects to a WSUS database and pulls in patch data.Before adding a new Windows Server Update Services connector, you will need the following:

- a SQL Login for the WSUS database, if not using Network Service (computer$).

Warning

This connector only supports WSUS that has been configured to use an external SQL database via TCP/IP protocol. Named Pipes protocol is not supported, as required by internal MSSQL$MICROSOFT##WID database instance.

1.7.2.1.17.1 Windows Server Update Services connector configuration

1. In **Name**, enter a logical name for this connector.

Tip

You should use a naming convention for connector names:

<connector type> <scope> <RCR>

Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

Include **RCR** in the name if you have enabled **Run Consolidation Reports**.

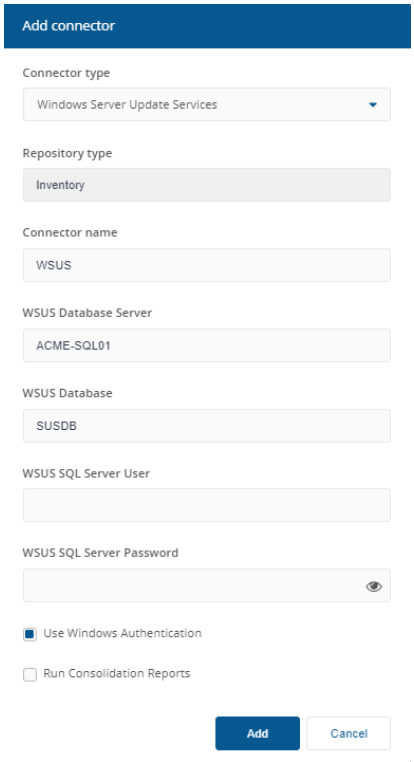
2. In **WSUS Database Server**, enter the name of the SQL Server instance where the Configuration Manager database is hosted using one of the following formats:
   - **<Server Name>**
   - **<Server Name>\<Instance>** - for a named instance
   - **<Server Name>\<Instance>,Port** - for a custom port
3. In **WSUS Database**, enter the name of the database you want to connect to.
4. If you are authenticating with Windows:
   a. Ensure **Use Windows Authentication** is checked.
   b. You do not need to populate the WSUS SQL Server User and WSUS SQL Server Password fields.
5. If you are authenticating with a SQL login:
   a. Ensure **Use Windows Authentication** is unchecked.
   b. In **WSUS SQL Server User**, enter the name for the account you want to use to connect to the database.
   c. In **WSUS SQL Server Password**, enter the password for this account.
6. Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector.

   This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.
7. Click **Add**.

The following fields are available in the **Add connector** and **Edit connector** popups when the **Windows Server Update Services Connector type** is selected, as shown in the picture opposite:

Field	Description
Connector type	Shows the connector type: **Windows Server Update Services**.

Field	Description
Repository type	Shows which type of repository the connector works with. For the **Windows Server Update Services Connector type** this is always **Inventory**.
Connector name	This lets you set the Connector name. **Tip** You should use a naming convention for connector names: **<connector type> <scope> <RCR>** **Scope** describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.
WSUS Database Server	The name of the SQL server instance where the WSUS database is installed. For example **ACME-SQL01**.
WSUS Database	The name of the WSUS database. For example **SUSDB**.
WSUS SQL Server User	The name of an SQL login account. This is ignored if the **Use Windows Authentication** checkbox is checked.
WSUS SQL Server Password	The password for the SQL login account. This is ignored if the **Use Windows Authentication** checkbox is checked.
Use Windows Authentication	Check this box if you want the **1E SLA Platform Integrate Agent** service account and not a specific SQL login account to be used to access the WSUS database. The **1E SLA Platform Integrate Agent** service account is Network Service by default.
Run Consolidation Reports	Check the **Run Consolidation Reports** checkbox if you want consolidation actions to be processed each time the **Sync Data** action is executed for the connector. This can lead to unnecessary processing if you enable this on more than one connector. The recommended method of processing consolidation actions is to schedule the action **Generate Report - Basic Inventory Consolidation** to execute after the **Sync Data** actions have run for all connectors. This will execute the remaining consolidation actions. Alternatively check the **Run Consolidation Reports** checkbox on one of your connectors. You can view action processes in **Settings→Process log**.



1.7.2.2 Repositories page

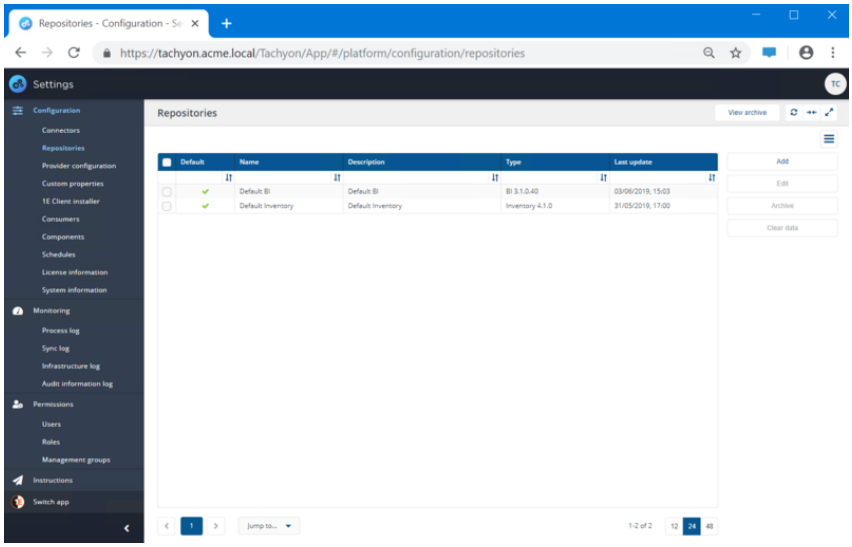
Repositories are used by applications to process and store information. Tachyon provides an Inventory repository out-of-the-box. Some consumer applications provide their own types of repositories.

Repository types	Used by	Used for
Application Migration	• Application Migration	Migration rules.
Business Intelligence	• Patch Success	Patch data for Patch Success.
Compliance	• AppClarity	Compliance data for AppClarity. Reclaim policies and history.
Entitlement	• AppClarity	Entitlements for AppClarity.
Inventory	• Inventory • AppClarity • Application Migration	Hardware and software inventory for devices. Optionally stores associations between Catalog products and Configuration Manager packages and applications.

Repository types	Used by	Used for
	• Patch Success	

A default repository is provided for each type of repository. You cannot delete a repository but you can change its details, clear its data or archive it. You can add further repositories for each type.

Repositories are populated using Connectors page which are executed either manually or on schedule, and data is then processed by applications. In some cases you can manually enter data.



1.7.2.2.1 Adding a new repository

Go to **Settings → Configuration → Repositories**

Adding a new repository

1. Click on the **Add** button.
2. In the **Add repository** popup enter the details for the new repository.
3. Enter a suitable **Name** for the repository this must not match any existing repository.
4. Select the **Repository type**.
5. Enter a suitable description for the new repository.
6. If you want the new repository to be the default for the selected **Repository type** then check the **Default repository** checkbox, otherwise leave this unchecked.
7. When all the settings have been made click **Add** to create the repository.

Tip

You should use a naming convention for repository names:

<scope> <repository type>

Naming with **scope** first makes it easier to know which repository you are using. The name of the **repository** you are currently using is visible in a drop-down list at the top of pages in the user interface.

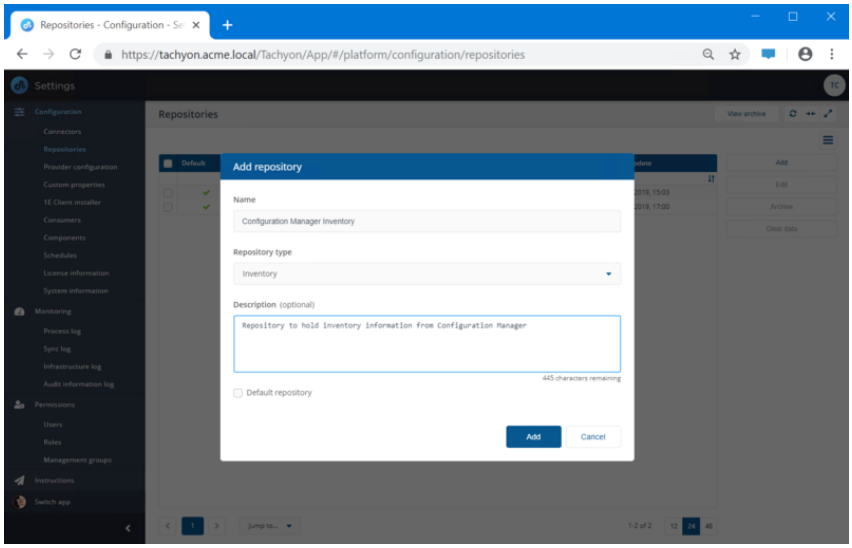
Including the **repository type** in the name helps when creating an action or schedule.

1.7.2.2.1.1 Changing the name of a repository

1. Select a repository and click **Edit**
2. In the **Edit repository** popup change the Name
3. Change the description if required.
4. If you want the repository to be the default for the selected **Repository type** then check the **Default repository** checkbox, otherwise leave this unchecked.
5. Click **Save**.

1.7.2.2.1.2 Setting the default repository

1. Select a repository, for example **Configuration Manager Inventory** and click **Edit**.
2. In the **Edit repository** popup check the **Default repository** checkbox and click **Save**.
3. Confirm the repository is listed as Default for its repository Type.
4. From this point on all pages that show information from an inventory repository would show the **Configuration Manager Inventory** by default. You can still change the repository for a particular page by clicking on the repository selector at the top-right of the page.
5. If you no longer wish a repository to be the default, then you must choose another repository instead.



Tip

Repositories are useful when you want to segregate different types of data. For example, you could have one inventory repository for Configuration Manager inventory data, and another one for BigFix data. Alternatively, you can have connectors to

different inventory sources pushing data into one repository. Any Management Groups that you create will span all the repositories you have.

Note

Once you've created a new repository you cannot delete it. You can only change its details, clear its data or archive it.

The name of a repository must be unique, but can be changed.

Setting a repository as the default repository means it is used as the default on certain screens.

1.7.2.2.2 Clearing data from a repository

This will reset all the data for a particular repository, which resets all the synced data imported by all/any of the connectors synced for that repository.

Note

We recommend you only use **Clear Data** under the following circumstances:

- If the data in a repository is no longer needed you can clear its data to free up space in the database.
- If you created connectors and associated them with the wrong repository and ran a synchronization action which returned inaccurate data
- If the data source was corrupted and the synchronization returned unreliable data
- If the synchronization failed after a partial completion

Warning

When you run **Clear Data**, scheduled or manual synchronization actions cannot take place. If there are existing background synchronization actions running, you will be notified when you attempt to reset your data.

Once you start a **Clear Data** action, do not cancel the process – when the deletion starts, existing data will lose its integrity and will no longer be reliable.

To **Clear Data**:

1. From the list of repositories, locate the active repository you want to clear the data from.
2. Check the box at the left-hand end of the repository's row.
3. Click the **Clear data** button.
4. In the **Clear data from repository** popup you will be asked if you want to proceed to clear the selected repository.

Note

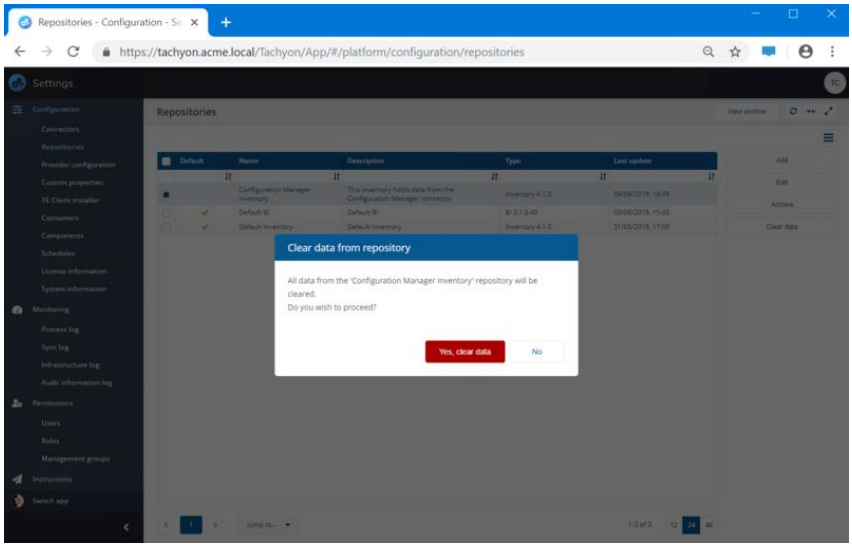
If you click the **Yes, clear data** button all the data held in the repository will be lost and cannot be retrieved.

5. Click the **Yes, clear data** button to empty the repository.
6. The repository will then be cleared.

Note

If you only want to clear data for a specific connector then use the **Clean Sync** action:

- Execute a connector sync action
- Execute an action



1.7.2.2.3 Archiving repositories

Repositories cannot be deleted. When you no longer need a repository you can archive it. It's not deleted and can still be restored for future use.

Note

When you archive a repository you should be aware that any currently defined schedules that populate or process its data will still be active. You should disable these before archiving.

1.7.2.2.3.1 Archiving an existing active repository

To archive an active repository:

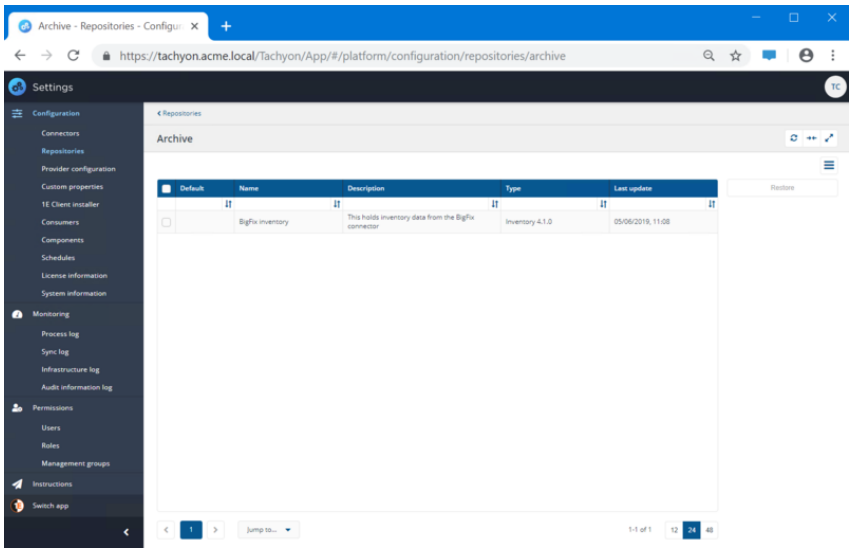
1. From the list of repositories, locate the active repository you want to archive.
2. Check the box at the left-hand end of the repository's row.
3. Click the **Archive** button.
4. In the **Archive repository** popup you will be asked if you want to proceed to archive the selected repository.
5. Click the **Yes, archive repository** button to archive it.

6. The repository will then be archived

1.7.2.2.3.2 Viewing the archived repositories

To view the archived repositories:

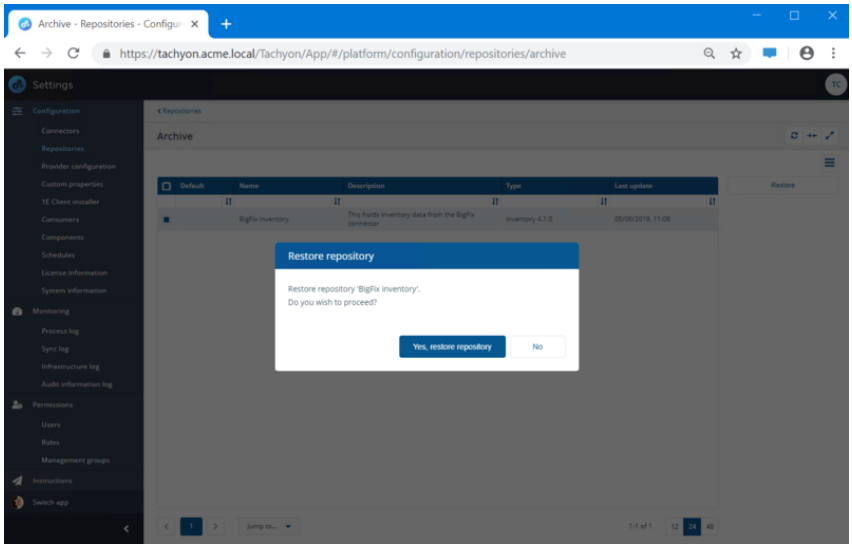
1. Click the **View archive** button.
2. The page will change to the **Archive** showing any repositories that have been archived.
3. To navigate back to the default Repositories page click on the **<Repositories** link at the top of the page.



1.7.2.2.3.3 Restoring archived repositories

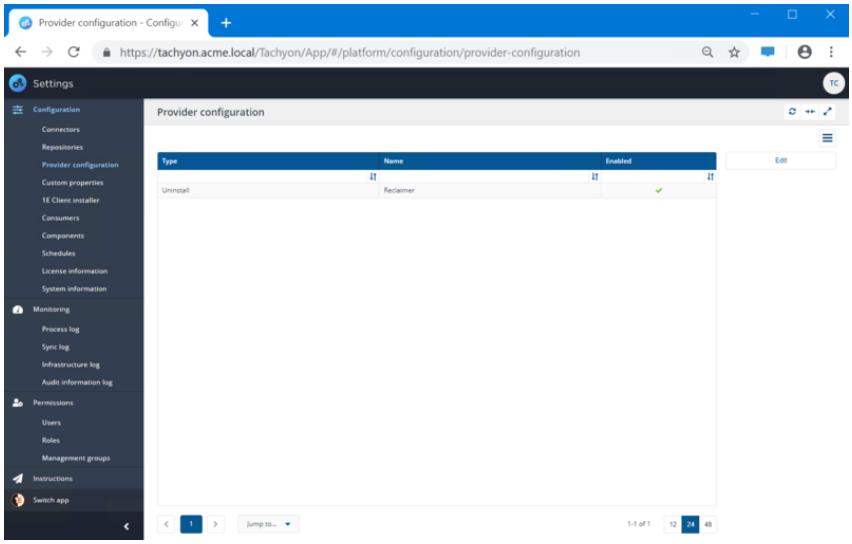
To restore a previously archived repository:

1. From the **Archive** page locate the archived repository you want to restore.
2. Check the box at the left-hand end of the repository's row.
3. Click the **Restore** button.
4. In the **Restore repository** popup you will be asked if you want to proceed to restore the selected repository.
5. Click the **Yes, restore repository** button to restore it.



1.7.2.3 Provider configuration page

Providers can be used by applications to leverage external tools to perform specific operations. For example the reclaim provider enables software to be uninstalled, thereby extending the functionality of the platform to include uninstallation.



1.7.2.3.1 Provider configuration table

The columns in the table are described below:

Column	Description
Type	This indicates the type of the provider. For example, the type of the **Reclaimer** provider is **Uninstall**.
Name	This displays the name of the provider.

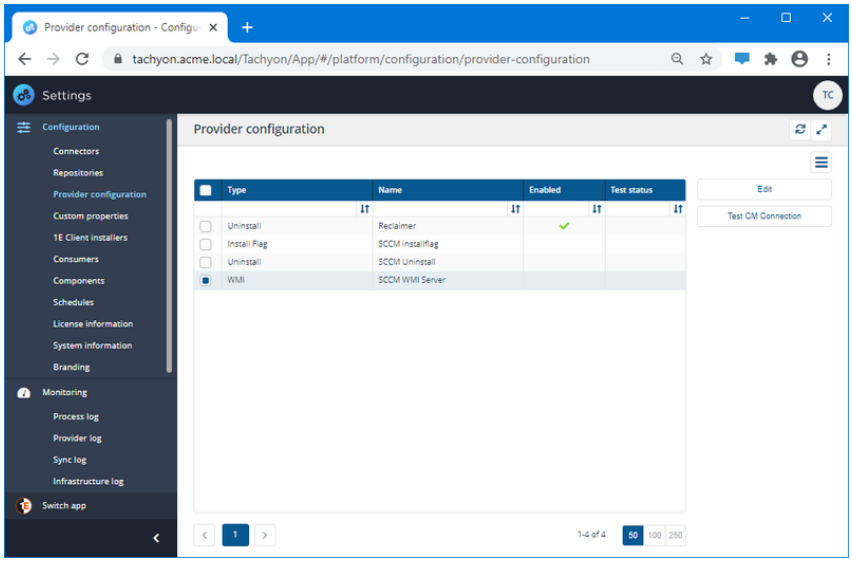
Column	Description
Enabled	This indicates whether the provider is enabled. If this cell contains a check the provider is enabled. If this cell is empty the provider is disabled.
Test status	Tells you if you have successfully tested the connection.

Providers get automatically added to the system when you install AppClarity and when you create at least one Configuration Manager (SCCM) connector.

The picture shows the **Reclaimer** provider, which lets you uninstall software using the reclaimer and is installed with AppClarity, and three providers that get created when you have added a Configuration Manager connector.

Provider	Description
Reclaimer	Used by AppClarity to connect to the Software Reclaimer, also referred to as **Traditional reclaim**. Please refer to Reclaiming a product using SCCM Uninstall for more details.
SCCM installflag	Used by Application Migration for the auto-install feature. Please refer to Enable Auto Install for Configuration Manager Applications and Packages.
SCCM Uninstall	Used by AppClarity as an alternative to the Software Reclaimer, also referred to as **SCCM custom Reclaim**. Please refer Reclaiming a product using SCCM Uninstall for more details.
SCCM WMI Server	The **SCCM WMI Server** provider lets you define credentials for accessing Configuration Manager that are subsequently used by the other two SCCM providers. You can test that the credentials are correct by selecting the SCCM WMI Server provider and then clicking the **Test CM Connection** button. In a Microsoft Endpoint Configuration Manager hierarchy, the SCCM WMI Server would be the CAS.

If you have multiple Configuration Manager connectors it's only when you have deleted the last one, that the SCCM providers are removed.



1.7.2.3.1.1 Enabling SCCM WMI Server

The WMI provider holds the connection details of the Configuration Manager server.

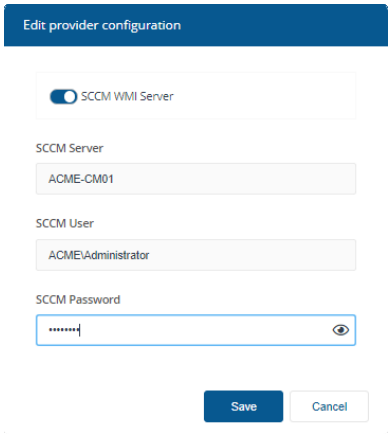
To set the provider configuration:

1. Navigate to **Settings**→**Provider configuration**.
2. Select **SCCM WMI Server** and click **Edit**.
3. In the **Edit provider configuration** popup, slide the **SCCM WMI Server** toggle to on and complete the displayed form using the following information as guidance:

Field	Description
SCCM WMI Server	Toggle this control to on (to the right) to enable the **SCCM WMI Server**.
SCCM Server	Enter the name of the Configuration Manager server. In our example this is **ACME-CM01**. In a Microsoft Endpoint Configuration Manager hierarchy, this would be the CAS.
SCCM User	The credentials for provider **SCCM WMI Server** may differ from those used for your System Center Configuration Manager (SCCM) connector. Make sure the credentials used here have SCCM administrator rights. SCCM Uninstall must be run under an account that's a member of the **dbcreator** server role on the database server where the SCCM database is hosted, in our example this would be **CM_CM1** on **ACME-SQL01**.

Field	Description
	The **SCCM User** account in our example is **ACME\Administrator**.
SCCM Password	The password for the **SCCM User** account.

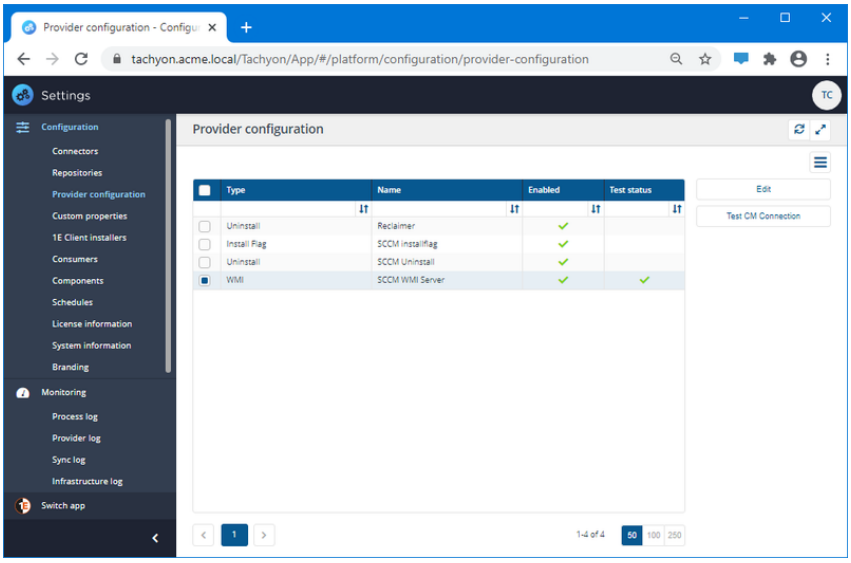
4. When you have entered the correct information, click **Save**.



1.7.2.3.1.2 Testing SCCM WMI Server

As the SCCM WMI Server provider defines how all the SCCM providers access Configuration Manager - you should test the details and credentials you have entered as soon as the provider has been saved.

1. Navigate to **Settings→Provider configuration**.
2. Select the provider with the name **SCCM WMI Server.**
3. Click on the **Test CM Connection** button, this button is enabled when only the **SCCM WMI Server** provider has been selected.
4. A test will be scheduled to run. When the test has completed successfully a green checkmark appears in the **Test status** column for the **SCCM WMI Server** row in the table, as shown in the picture opposite.
5. If the test fails you will need to recheck the details and credentials you have provided, making sure that the selected account has necessary permissions as described in Enabling SCCM WMI Server.



1.7.2.4 Custom properties

The following sections describe how you can set custom properties using Device and Software tags:

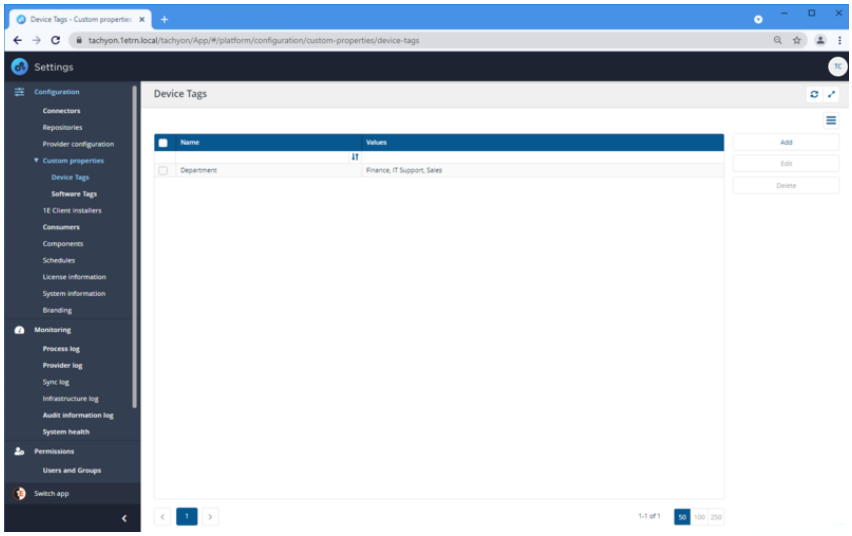
- **Device Tags** - are generally associated with Explorer and can be used when setting coverage to target Instructions to particular devices, but they can also be used to define Management Groups optionally used by all applications.
- **Software Tags** - using Software Tags allows you to create custom labels and associate them with the software titles you have deployed in your estate.

1.7.2.4.1 Device Tags page

Device Tags are generally associated with Explorer and can be used when setting coverage to target Instructions to particular devices, but they can also be used to define Management Groups optionally used by all applications.

Device Tags must be defined by a **Full Administrator** before they can be used to tag devices or used to set the coverage of Instructions.

This is done from the **Settings**→**Configuration**→**Custom properties**→**Device Tags** page, which can be viewed by users with the **Full Administrator** role.



1.7.2.4.1.1 Device Tag properties

Device Tags are used as part of the tagging workflow in Explorer, where they can be applied to devices and subsequently used to set the coverage for questions. The following table shows the constraints of the text that can be used for property names and values.

Property	Constraints
Name	Consists of a combination of alphanumeric characters, underscores, and dots - spaces are *not* allowed. Case is *not* significant, so names "*myname*" and "*MYNAME*" correspond to the same property name. The maximum length of a property name entered using the Administration console is 16 characters.
Values	Consists of a combination of alphanumeric characters, underscores, dots, and spaces. Case is preserved. The maximum length of a property value entered via the Administration console is 32 characters.

The following headings show steps to add, edit and delete properties and set property values.

1.7.2.4.1.1.1 Add a property and values

The following steps can be used to create a property name:

1. Navigate to **Settings**→**Configuration**→**Custom properties**→**Device Tags**.
2. Click the **Add** button.
3. Type in a name for the new device Tag.
4. You now need to add values to the property:
    a. In the edit field below the **Values** heading, type in a value for the property.
    b. If you want to add more values, click the **+** button beneath the **Values** heading.

5. Repeat step 4 to add as many values as you require for the selected property name.
6. When all the values have been added, click **Add**. (An error message is displayed if you exceed a maximum of 16 characters).

1.7.2.4.1.1.2 Edit a property

The following steps show how to edit the settings for an existing property:

1. Check the checkbox at the start of the row for the property you want to edit.
2. Click the **Edit** button.
3. You can change the **Name** or **Property type** and add and remove **Values**.
4. To add a value, click on the **+** icon and fill out the edit field.
5. To remove a value click on the trash can icon

   that appears when you hover the mouse to the right next to the value field you want to remove.
6. Clicking on the trash can removes the item immediately.
7. Click **Save**, when you have made all your changes.

1.7.2.4.1.1.3 Delete an entire property

The following steps show how to delete an existing property and all its values:

1. Check the checkbox at the start of the row for the property you want to delete, click **Delete**.
2. A notification will be displayed asking if you wish to proceed.
3. Click the **Yes, delete device tag** button to delete the property and all its values, or click the **No** button to abandon the deletion.

1.7.2.4.1.2 Working with Device Tags

Using Device Tags allows you to create custom labels and associate them with devices. An administrator with either the **Full Administrator** or **Group Administrator** role can set Device Tags to devices in their environment, they can also create Management Groups based on the tag name and value. For details about configuring Tachyon users, Roles, and Management Groups refer to the Permissions Menu pages.

In the following example, we create a Device Tag for use with a planned phased deployment affecting devices in our **All Managed Windows 10 Devices** Management Group. We will have values for the devices used for Testing (TestGroup), Pilot (PilotGroup), Group1 and Group2. We will, set our Windows 10 devices as a Pilot group using tags, then ask a question using the Tag as our coverage parameter.

> **Note**
>
> Management Groups are containers used to group devices and the software installed on those devices. Management Groups are defined using configurable rules that look at

various properties of the devices and their installed software, these are then evaluated to determine the group membership. This means that Management Group membership adapts to changes to the devices and software in your environment.

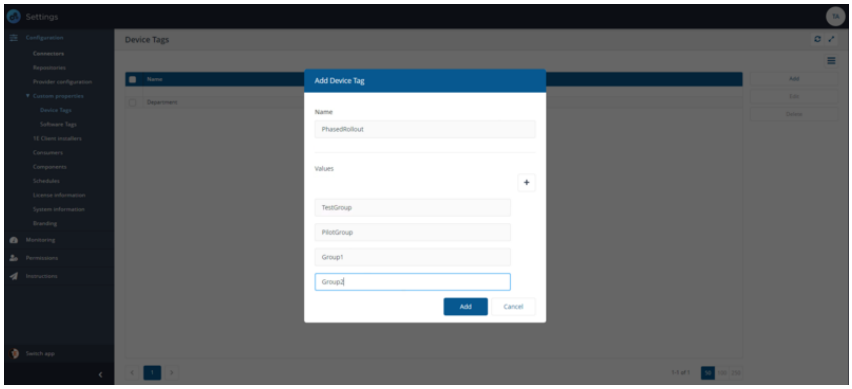
Refer to the Management Groups page and Management Groups - tutorial pages for details.

Note

For more details about using tags with client devices refer to Tagging client devices, and for more details about the system and custom Tachyon Roles, refer to the Roles page .

1.7.2.4.1.2.1 Create tags for a pilot group

1. To create our pilot group tag, our Full Administrator logs into Tachyon and switches to **Settings→Configuration→Custom Properties→Device Tags**
2. Then they click **Add**. In the **Add Device Tag** box type they type **PhasedRollout** in the Name field.
3. In the **Values** box, they add the following values by clicking the plus button, and click **Add**.
   - TestGroup
   - PilotGroup
   - Group1
   - Group2.

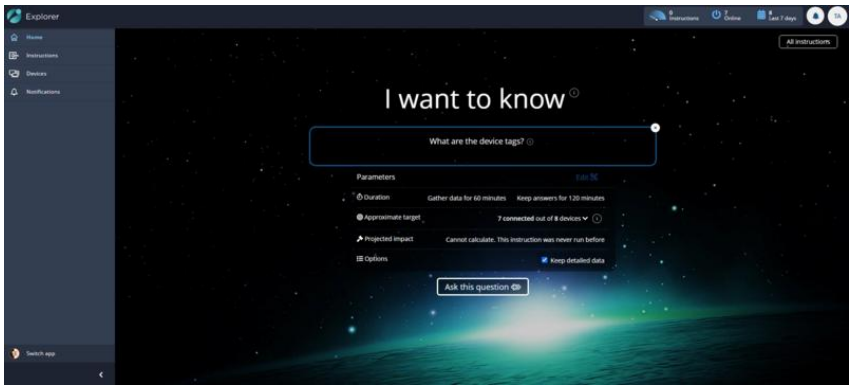


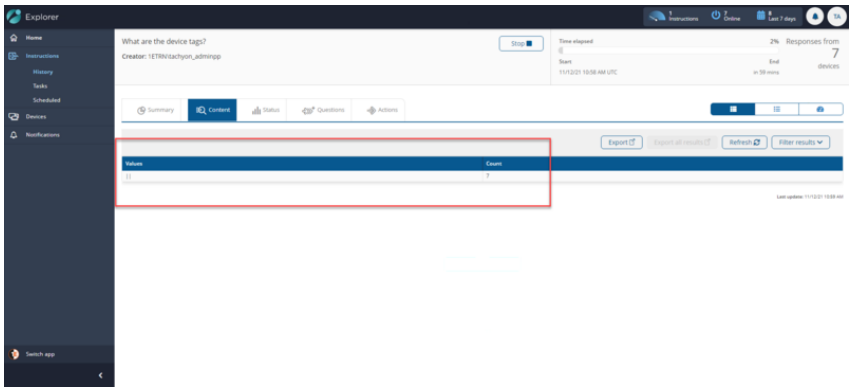
1.7.2.4.1.2.2 Apply Device Tags

Now our Full Administrator has set up the Device Tags for the planned deployment, they can assign the tags to every Windows 10 device in their environment in the **All Managed Windows 10 Devices** Management Group. Before they do this, they want to check what tags, if any, are already present in their environment.

1. Switch to the Explorer Application. Navigate to **Home** .
2. Click on **All Instructions** and searches for device tag, which brings back device tag related instructions which are in the **1E Explorer TachyonCore** instruction set.
3. They select **What are the device tags**, the leave the parameters as they are.
4. Then they click **Ask This Question**.

The administrator views the results in **Aggregated table view** , at the moment there are no tags in the environment. In the results, you can see the || delimiter which will be used for the list of tags on each device.





Next, our administrator wants to run the question on the **All Win10 Lab Workstations** Management Group and set the tags for the rollout.

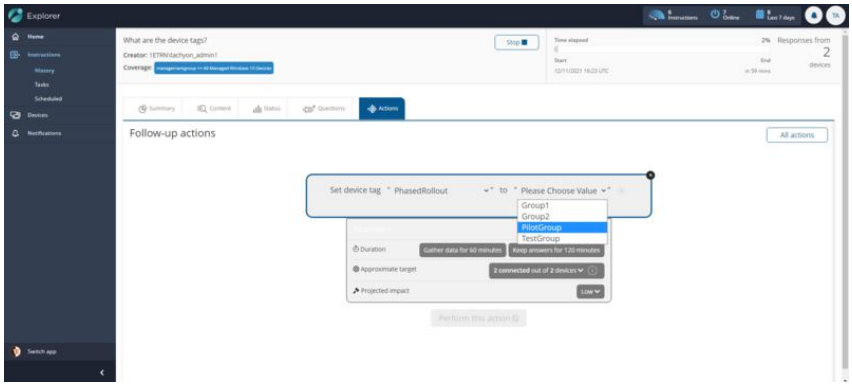
1. They ask the question again, but this time change the coverage to **All Win10 Lab Workstations** Management Group, then they click on **Ask This Question**.
2. Next, they click on **Actions** from the Question we just asked and click **All Actions**.
3. They select the **Set device tag <tagname> to <tagvalue>** action
4. They select **PhasedRollout** and **PilotGroup** and click **Perform this Action**.
5. Because this is an action, it requires approval, so prompts the administrator to confirm their password and then use an emailed confirmation code.

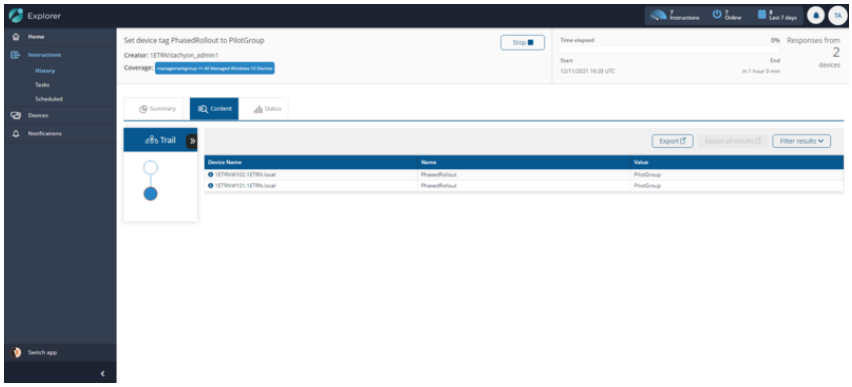
   Note

   In our environment, this requires approval from a user with the **All Instructions Approver** role. Once they have approved this action, the instruction is carried out.
6. Now, our administrator can see that they have two devices set as the **PhasedRollout - PilotGroup**.

Note

To find out more about using loading and managing Instruction sets, refer to the Instructions Menu.





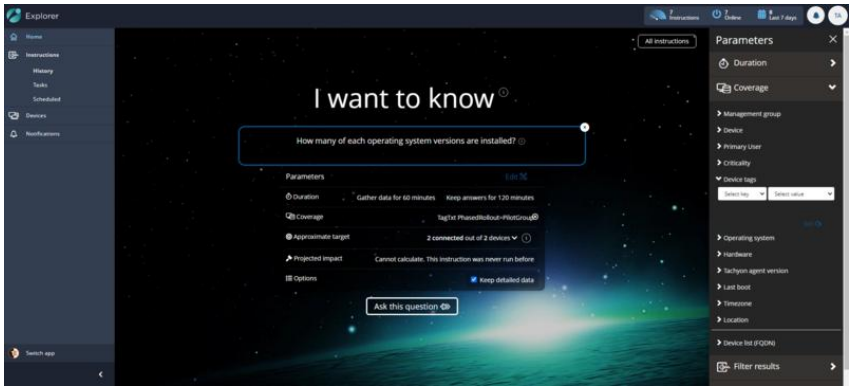
1.7.2.4.1.2.3 Ask a question using a Device Tag

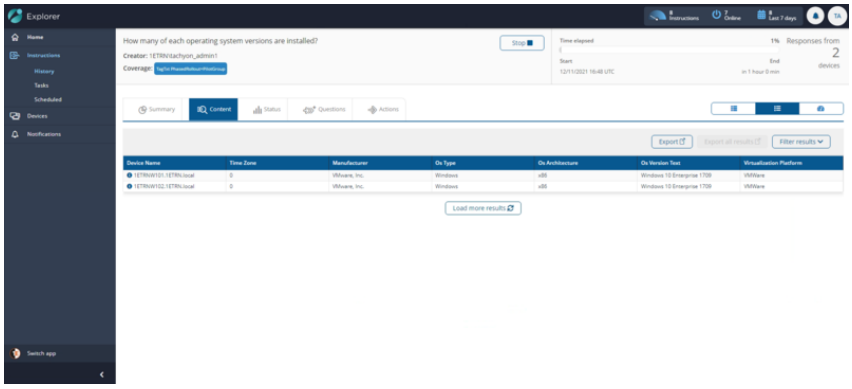
Our administrator now has Device Tags applied to the Windows 10 devices that will be in the deployment pilot group. Using these Device Tags as coverage they can ask questions using Explorer, for example to confirm how many devices have Windows 10 as an OS with the **How many of each operating system versions are installed?** Instruction from the **1E Explorer TachyonCore product pack**.

Note

The **How many of each operating system versions are installed?** Instruction returns a count of all distinct Operating Systems, version and virtual platform for each Tachyon-connected device. It is included in the Classic Product Pack used to create the **1E Explorer TachyonCore** instruction set that includes instructions for Tagging and Quarantine.

You can find a complete reference for the Product Packs included in the Tachyon Platform in the Tachyon Product Packs reference.

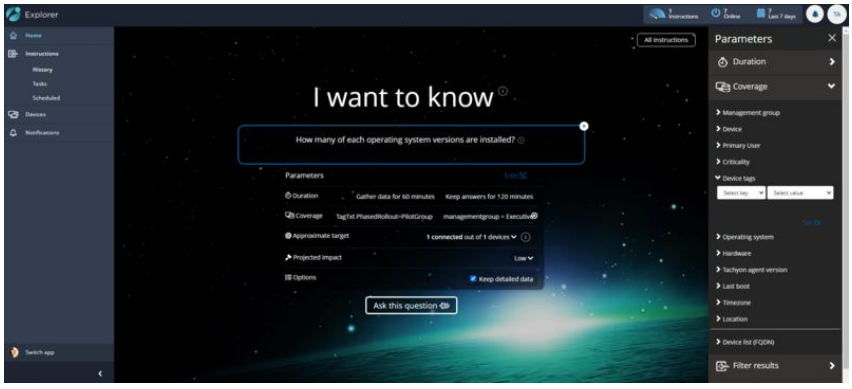


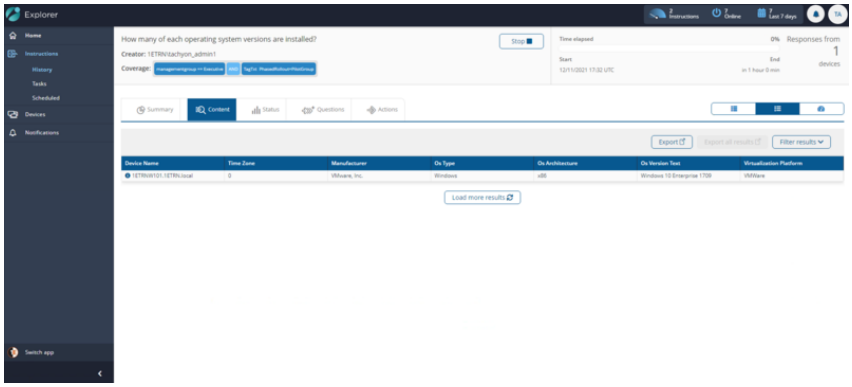


The administrator can also now cross-reference devices in the planned pilot group with any Management Groups they have created in Tachyon.

For example, our administrator wants to confirm if one of the Windows 10 devices is in the Executive Management Group, they can do this by running the
How many of each operating system versions are installed? Instruction again.

This time they include the **Executive** Management Group as a coverage parameter in addition to the Device tags, **PhasedRollout - PilotGroup**.

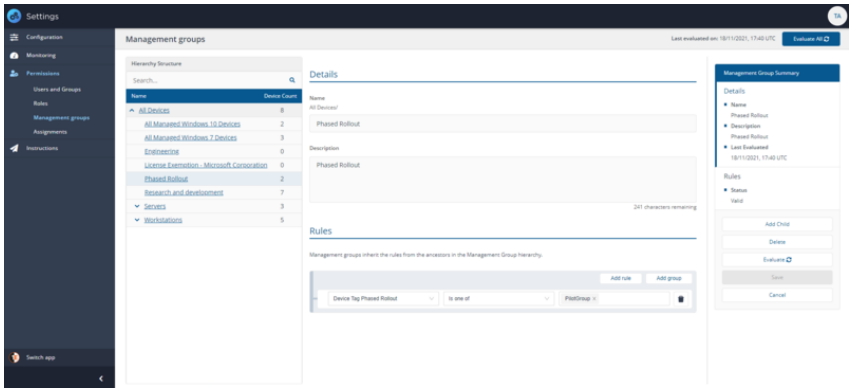




1.7.2.4.1.2.4 Management Groups based on Device Tags

In the exampleApply Device Tags our administrator checked for the presence of Device Tags in their environment and then applied those Device Tags to their Windows 10 devices. Following this, they were able to use those Device Tags as coverage parameters, so they can ask related questions using Explorer. In addition, once our administrator has created and applied their Device Tags, they could create Management Groups based on those Device Tags.

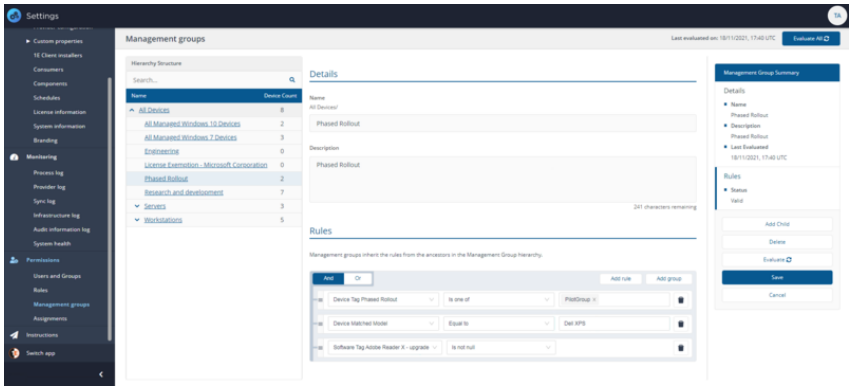
For example, now our administrator knows their Windows 10 devices have the **Phased Rollout** and **PilotGroup** Device Tag applied to them, they can create a Management Group called **Phased Rollout** based on these criteria. Using Explorer they can apply instructions focused to Windows 10 devices using the **Phased Rollout** Management Group as a coverage parameter.



Our administrator could then apply additional rules to their Management Group. For example, they could apply additional rules to narrow their focus to specific devices based on their hardware configuration . For example, they could add a Rule like **Device Matched Model Equal to Device XPS** , and then run **Evaluate**.

They could also use **Software Tags**, if they have created some, to focus group membership on devices with specific software titles if they are significant to the particular project.

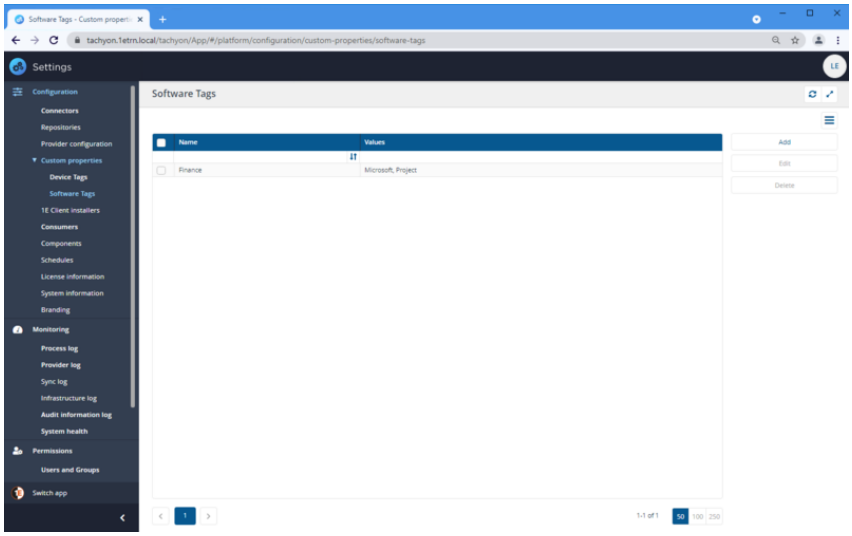
> **Note**
>
> Refer to the Software Tags page for details about using Software Tags which allow you to create custom labels and associate them with the software titles you have deployed in your estate.
>
> Refer to the Management Groups page for details about using rules and a full list of the rules used to create Management Groups, and which connectors that provide data to support the rules.



1.7.2.4.2 Software Tags page

Using Software Tags allows you to create custom labels and associate them with the software titles you have deployed in your estate.

You can do this from the **Settings→Configuration→Custom properties→Software Tags** page, which can be viewed by users with the **Full Administrator** role.



The following headings show the steps to add, edit and delete properties and set property values.

1.7.2.4.2.1 Software Tag custom properties

The following table shows the constraints of the text that can be used for property names and values.

Property	Constraints
Name	Consists of a combination of alphanumeric characters, underscores and dots - spaces are allowed. Case is *not* significant, so names "*myname*" and "*MYNAME*" correspond to the same property name.

Property	Constraints
Values	Consists of a combination of alphanumeric characters, underscores, dots and spaces. Case is preserved.

When creating your Software Tags, note that:

- You can have multiple tag values under one tag name
- A combination of one tag name and tag value is a Software Tag
- You can associate Software Tags with Software at Vendor, Title, and Edition (VTE) level
- A VTE can be associated with none or as many Software Tags as needed, there's no upper or lower bound
- A VTE can be associated with 1 tag value only under a tag name
- You can create Management Groups based on your Software Tag
- Any change in Software Tags will be reflected in Inventoryafter running Management Group evaluation.

1.7.2.4.2.1.1 Adding a property and values

The following steps can be used to create a property name:

1. Navigate to **Settings**→**Configuration**→**Custom properties**→**Software Tags**.
2. Click the **Add** button.
3. Type in a name for the property (the field warns you if you exceed a maximum of 16 characters).
4. You now need to add values to the property:
    a. In the edit field below the **Values** heading, type in a value for the property.
    b. If you want to add more values, click the **+** button beneath the **Values** heading.
5. Repeat step 5 to add as many values as you require for the selected property name.
6. When all the values have been added, click **Add**.

1.7.2.4.2.1.2 Editing a property

The following steps show how to edit the settings for an existing property:

1. Check the checkbox at the start of the row for the property you want to edit.
2. Click the **Edit** button.
3. You can change the **Name** or **Property type** and add and remove **Values**.
4. To add a value, click on the **+** icon and fill out the edit field.

5. To remove a value click on the trash can icon

   that appears when you hover the mouse to the right next to the value field you want to remove.

6. Clicking on the trash can removes the item immediately.

7. When all the required changes have been made click **Save**.

1.7.2.4.2.1.3 Deleting an entire property

The following steps show how to delete an existing property and all its values:

1. Check the checkbox at the start of the row for the property you want to delete, click **Delete**

2. A notification will be displayed asking if you want to remove the property and reminding you that the property and all of its values will be deleted

3. Click the **Yes, delete software tag** button to delete the property and all its values, or click the **No** button to abandon the deletion.

1.7.2.4.2.2 Working with Software Tags

Using Software Tags allows you to create custom labels and associate them with the software titles you have deployed in your estate. An administrator with either the **Full Administrator** or **Group Administrator** role can set Software Tags in their environment, they can also create Management Groups based on the tag name and value. For details about configuring Tachyon users, Roles, and Management Groups refer to the Permissions Menu pages.

In short, you can work with Software tags by:

1. Creating your Software Tag.

2. Associating the new tag with a software title.

3. Creating a Management Group based on the Software Tag name and Tag value rules (This step can be run anytime before evaluation).

4. Evaluating the new Management Group by running a Basic Inventory Consolidation.

If an administrator adds or modifies Software Tags or associations, they will have to run the Management Group evaluation report again to see the updated devices reflected in Inventory.

In the following example, we create a Software Tag to show how an EUC Manager who is a Full Administrator can use this feature alongside Management Groups and Experience. They want to do this, as part of an initiative to track down the causes for a recent spate of software crashes in their estate, because they want to prohibit this software from use.

> **Note**
>
> To find out about, how an EUC manager can use Experienceto track down the causes of a recent spate of software crashes, refer to Investigating software crashes and Broadcasting information via Announcements.

1.7.2.4.2.2.1 Creating tags for a software installations

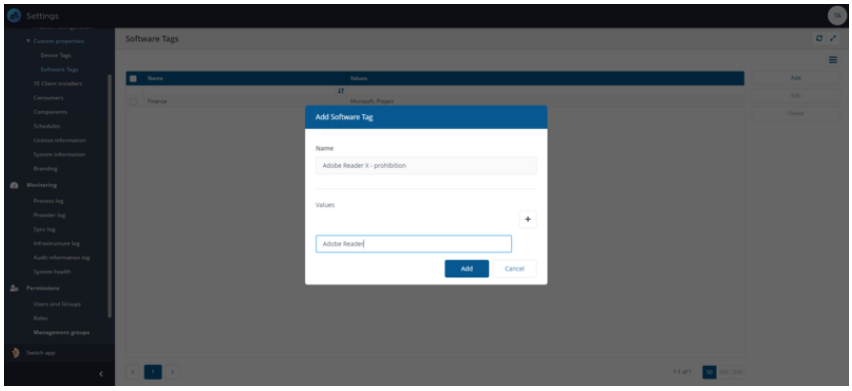
Our administrator, needs to create their Software Tag and associate the new tag with a software title.

1. To create our Software Tag, our administrator logs into Tachyon and switches to **Settings**→**Configuration**→**Custom Properties**→**Software Tags**

   There are already tags for the Finance department for Microsoft products and specifically installations for Microsoft Project. Now, they will create a new tag called **Adobe Reader X - prohibition.**

2. Then they click **Add**. In the **Add Software Tag** box, they type **Adobe Reader X - prohibition** in the Name field.

3. In the **Values** box, they add the **Adobe Reader X** values by clicking the plus button, and click **Add**.



1.7.2.4.2.2.2 Apply Software Tags

Now our administrator has set up the Software Tag for the legacy software, they can assign the tag to installations of **Adobe Reader X** software.

1. They switch to the **Inventory**→**Software Inventory**→**Aggregate** page.

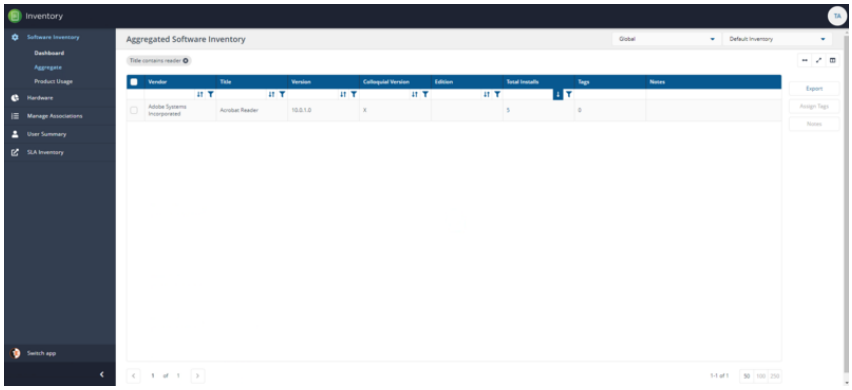
2. Then, filter on **Title contains reader** which returns five **Total Installs**.

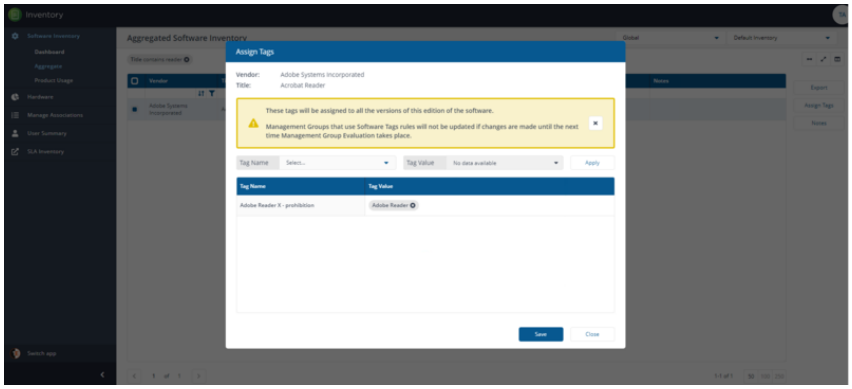
3. With the results selected, our administrator can click **Assign Tags**. In the Assign Tags pop-up, they choose **Adobe Reader X - prohibition** for the **Tag Name** and **Adobe Reader** as the **Tag Value** from the drop-down lists, and then click **Save**.

Note

Please note, Software tags will be assigned to every version of that software edition. For example, in our example we only have one version of Acrobat Reader, which is version 10.0.1.0, the one we want to prohibit.

But in a production environment, it's common to have multiple versions of a software title, Software Tags apply to all versions of a software edition not individual versions of that title.



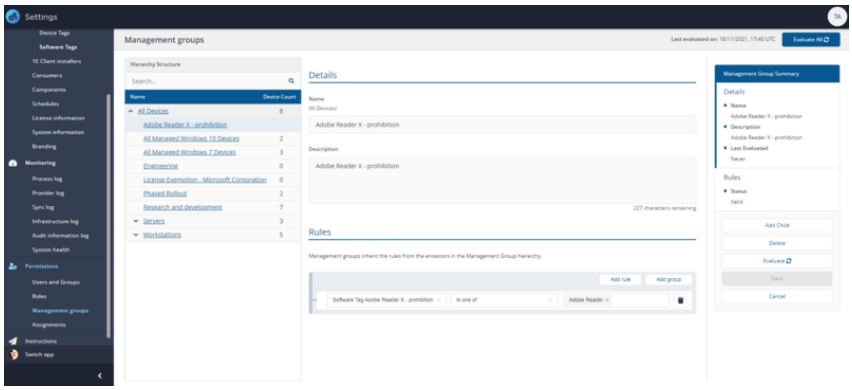


1.7.2.4.2.2.3 Create a Management Group

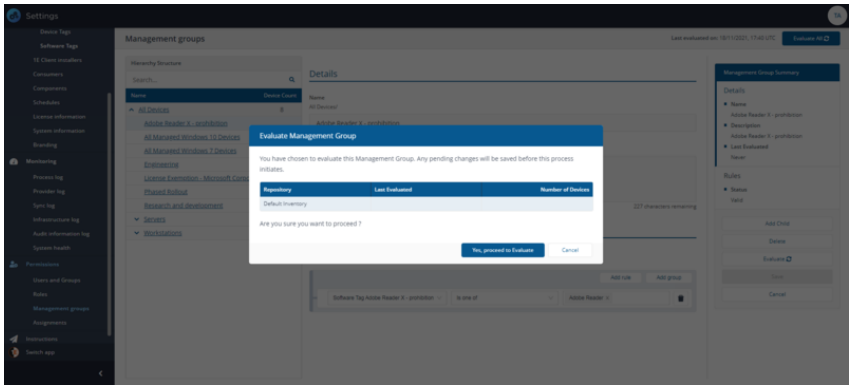
Now our administrator has created their Software Tag and associated it with a software title, they will create a Management Group based on the Software Tag name and Tag value rules. When they have completed this step, they will evaluate the new Management Group by running a Basic Inventory Consolidation.

1. To create the Management Group for Adobe Reader X, our administrator navigates to **Settings→Permissions→Management groups**. Because our administrator wants to create a group that captures every install of this legacy software, they decide to create a **Child** group under All Devices called **Adobe Reader X - prohibition**.

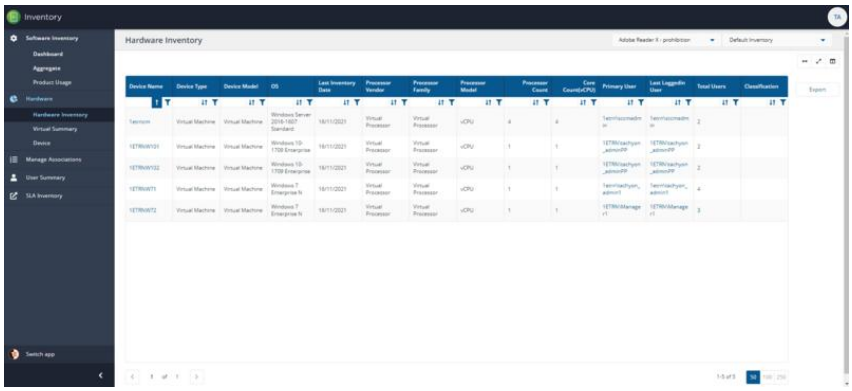
2. Next, the administrator needs to add at least one rule to the new group to define its scope. They select, **Software Tag Adobe Reader X - prohibition is one of Adobe Reader** and then click **Save**.



1. Now, they click **Evaluate**. This evaluates then new group against the default Inventory, and matching items populate the Management Group.



1. Finally, our administrator navigates to **Inventory→Hardware→Hardware Inventory** and filters the view by the newly created Management Group, **Adobe Reader X - prohibition**. Now, they can view every device where **Adobe Reader** is installed.



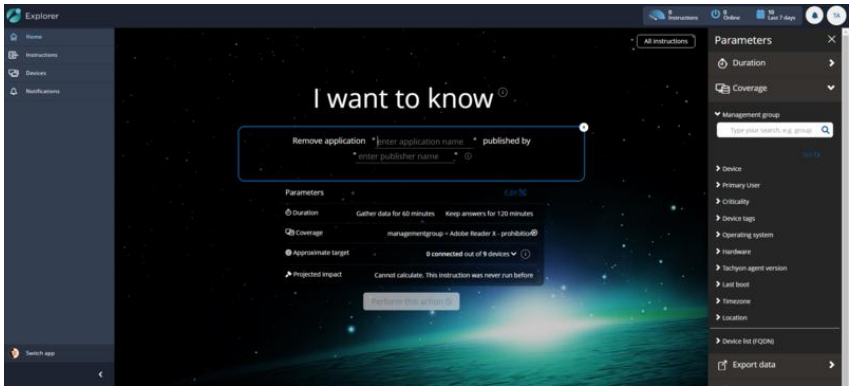
Now our administrator has identified their problematic software installations, they can use Explorer to run instructions against that Management Group. For example, they could run **Remove application <appname> published by <publisher>** using the **Adobe Reader X - prohibition** Management Group as a coverage parameter to remove all versions of the specified application published by the specified publisher, if present.

Or, they could use **Remove version <version> of application <appname> published by <publisher>** to remove the specified version of the specified application published by the specified publisher, if it is present. Our administrator could identify these details using Inventory filtered to the **Adobe Reader X - prohibition** Management Group.

Note

Both **Remove application <appname> published by <publisher>** and **Remove version <version> of application <appname> published by <publisher>** are included in the Instructions.

Refer to Tachyon Product Pack Deployment Tool to find out about the PPDT that you can use to upload multiple Classic and Integrated Product Packs into Tachyon.



1.7.2.5 1E Client installers page

Enables you to upgrade the 1E Client across your network, and allows you to select the 1E Client installer you want to use for the installation. This process will only upgrade the client on Windows 8.1 devices and above. And will keep the settings from the previous deployment, it will not allow you to enable or change any features.

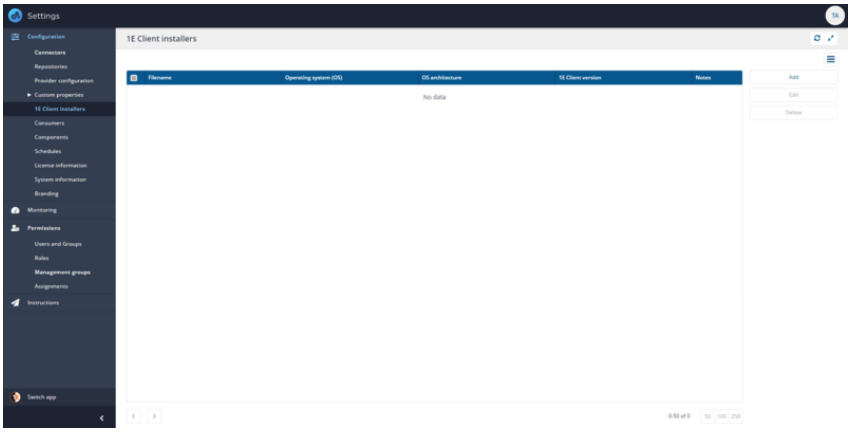
If you are deploying the 1E Client for the first time, or you need to enable new features or remove existing, then you will need to deploy the 1E Client using the Client Deployment Assistant, please refer to Deploying 1E Client.

> **Note**
>
> This feature does not support deployment of patches (accumulated hotfix).
>
> **Note**
>
> Please contact your 1E Account Team if you need help with this.

1.7.2.5.1 Preparation

First you will need to download the 1E Client Installer files from the 1E Support Portal, https://support.1e.com/ and save these to a location accessible to a user who can access Tachyon using the **Full Administrator** role.

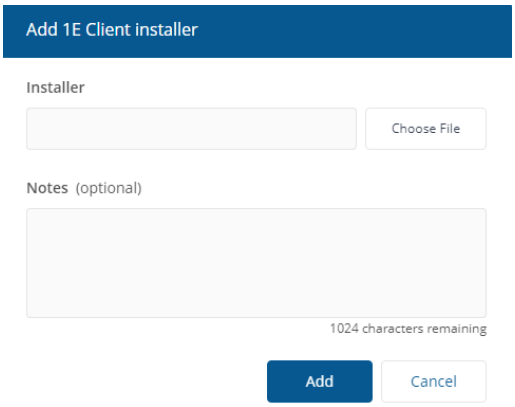
1. Open the Tachyon Portal and navigate to **Settings→Configuration→1E Client installers** page.



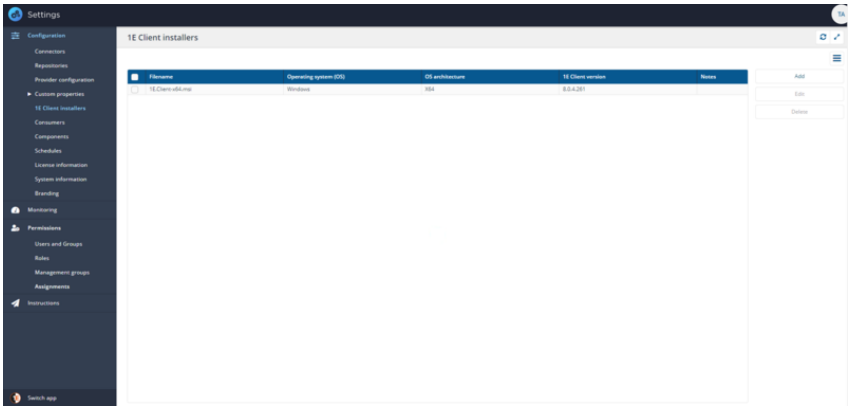
2. On the right-hand side of the screen, click **Add**.

3. From the displayed screen, select **Choose File** and browse to the location where you saved the MSI.

4. Select the **1E.Client-x64.msi** and optionally add any notes you want, click **Add**.



5. The Installer is then listed on the **1E Client installers** page, repeat the process if you have any 32 bit clients to deploy to.



1.7.2.5.2 Upgrading the clients

The upgrade runs using an Instruction called
Trigger 1E Client upgrade to <ClientVersion> for targeted devices, this is included with one of the Product Packs imported as a final task when running Tachyon Setup. You will need to have carried out the upload of new Product Packs at the end of the upgrade, before carrying out this step, refer to Upgrading Tachyon Platform for details.

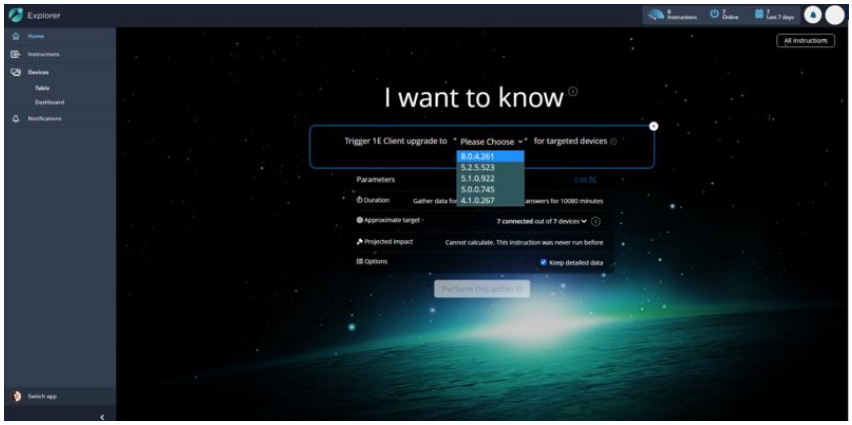
1. Choose **Switch app** and choose the **Explorer** application, the user carrying out this task will need the **All Instructions Actioner** role as a minimum, although **Full Administrator** will also be able to carry out these tasks.

2. In **I want to know**, search for and select
Trigger 1E Client upgrade to <ClientVersion> for targeted devices action, in the drop list for the Client version choose a client version, for example **8.1.2.62** as that is the Client version for this release of Tachyon.

3. Once selected, confirm the target and **Duration** are correct. We set this to be a longer gather time to ensure clients have enough time to come online, receive the instruction and run the action.

4. When you have confirmed the coverage and duration, click on **Perform this action**, and follow the 2FA process.

In a production environment, you would first target a subset of devices on your estate, to confirm the upgrade is successful, and the client correctly communicates with Tachyon. You would do this by selecting the **Edit** option next to **Parameters**, and select your target, this may be a testing management group, or a Ring 1 Device Tag.



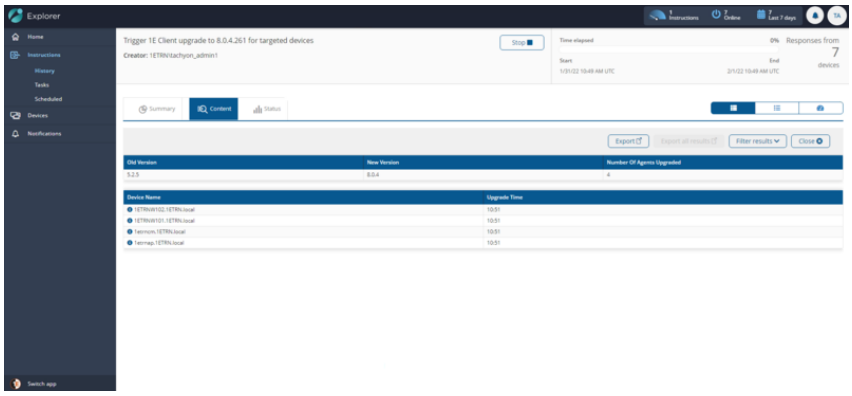
The upgrade then runs and responses are returned, and we see that the new version is now installed.

We can confirm the upgrade has been carried out and can see the old and the new version listed in the top table. This Action only upgrades devices that are Windows 8.1 or above. So, in this environment, 3 devices did not upgrade.

Tip

You can take an optional lesson contained within the Upgrade course which shows this process. You can access the lesson at https://1e.tovuti.io/1e-courses/course/tachyon-upgrade-supported-version-to-v80

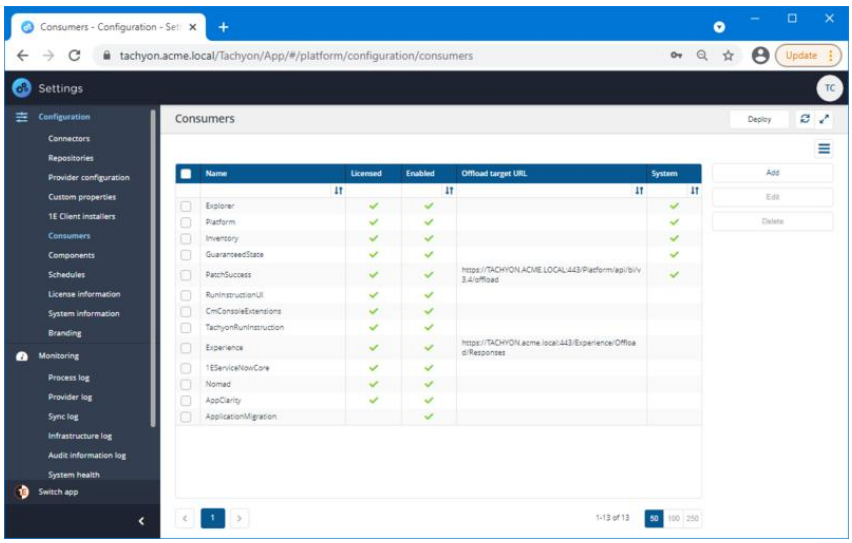
You will need to log into Tovuti to view the course, using the **Login** option at the top right of the screen. If you do not have an account, then select the **Register** option.



1.7.2.6 Consumers page

The **Consumers** page lets you register the consumers that can access Tachyon. To enhance the security of the Tachyon system, only consumers that have been registered on this page will be allowed to access Tachyon.

Tachyon can integrate with third-party applications to enable its instruction-based investigation and resolution capabilities to be leveraged by other products. Some examples include: the Content Distribution Content Pause and Configuration Manager integration features.



1.7.2.6.1 The Consumers page

Some consumers provided by 1E create their own consumer entries on the consumers page, others require that these are added by hand.

You can create a consumer entry by hand by clicking on the **Add** button. Doing this displays a form used to define how the consumer will interact with Tachyon. The parameters available on this form are described in the following table:

Parameter	Description
Name	Sets the name for the consumer. This will be determined by the third-party application and must be entered correctly to enable the consumer to work. For example the Tachyon Configuration Manager console extensions must have a consumer defined that is called **CmConsoleExtensions**.
Consumer URL (optional)	This value can be used as a placeholder for any URL that is used by the Consumer. Tachyon never makes use of this, so this is more of a reference for Tachyon Consumer Administrators if they want to look at the Consumer interface. It is also the case that not all Consumers have a URL, so this parameter can be safely left at its default.

Parameter	Description
Maximum simultaneous instructions	Determines the number of simultaneous instructions that may be made by the Consumer. Instructions in Tachyon have a **Gather data for** setting which determines how long the instruction will be in operation gathering data. The **Maximum simultaneous instructions** value sets how many instructions a Consumer can have in operation at any one time. If the value is exceeded, newly requested instructions will be delayed until one of the in operation instructions has completed.
Offload target URL (optional)	Determines the target URL when attempting to offload responses to a Consumer. The Consumer will need to have a listener at that URL waiting to receive the responses.
Offload timeout seconds (optional)	Determines the timeout for offloading responses to a Consumer. This governs the amount of time Tachyon allows for the Consumer to respond to its offloading before logging an error in the log file.
Use Windows Authentication	Determines whether Tachyon will try and use Windows Authentication when attempting to offload responses to a Consumer. For example, when Tachyon retrieves data back from a question asked by a Consumer, it can be configured to offload the responses directly to the Consumer. To do that Tachyon has to make a connection. Checking the **Use Windows Authentication** checkbox configures Tachyon to use Windows Authentication for that connection. Otherwise, if **Use Windows Authentication** is not checked, Tachyon assumes there is no authentication/anonymous authentication.
Enabled	This checkbox specifies whether the Consumer is enabled or not. In order for a Consumer to work with Tachyon, its Consumer entry on the Consumers page must be enabled.

Once the information has been set click on the **Save** button to commit the changes.

1.7.2.6.2 Deploying policies for all consumers

The **Consumers** page has a **Deploy** button at the top-right of the page, this can be used to deploy all policies, rules, events and surveys across all the consumers. When you click the button you will be notified whether there are any pending changes waiting to be deployed and reminded that this will deploy for all the consumers.

1.7.2.6.2.1 Deploying policies for consumer applications

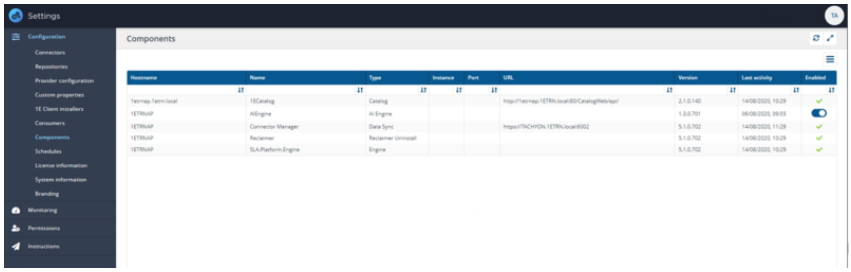
Most consumers with items that can be deployed have their own deploy buttons in their associated applications. Clicking the deploy button in any one of those applications deploys the policies, rules, events and surveys that are relevant to just that application. Content Distribution is the single exception to this as it has no deploy button in its application. The only way you can manually deploy the Content Distribution event registrations is by clicking the **Deploy** button on the **Consumers** page. Tachyon Setup performs an automatic deployment after installation but before any additional policies have been loaded. This enables the event registrations for both the Content Distribution and Experience applications without users having to do this manually.

1.7.2.6.3 Consumer example

An example of defining a consumer can be found on the Preparing for the Tachyon extensions for the Configuration Manager Console. page.

1.7.2.7 Components page

The **Components** page displays the configuration options and activity for all the components that make up the Tachyon platform.



1.7.2.7.1 The Components table

The following table provides a description of the columns in the **Components** table:

Column	Description
Hostname	The hostname of the server where the component is installed.
Name	The name of the component.
Type	The type of the component. This is entirely determined by the component. Examples are: **Catalog**, **Data Sync**, **Reclaimer Uninstall** and **Engine**.
Instance	
Port	

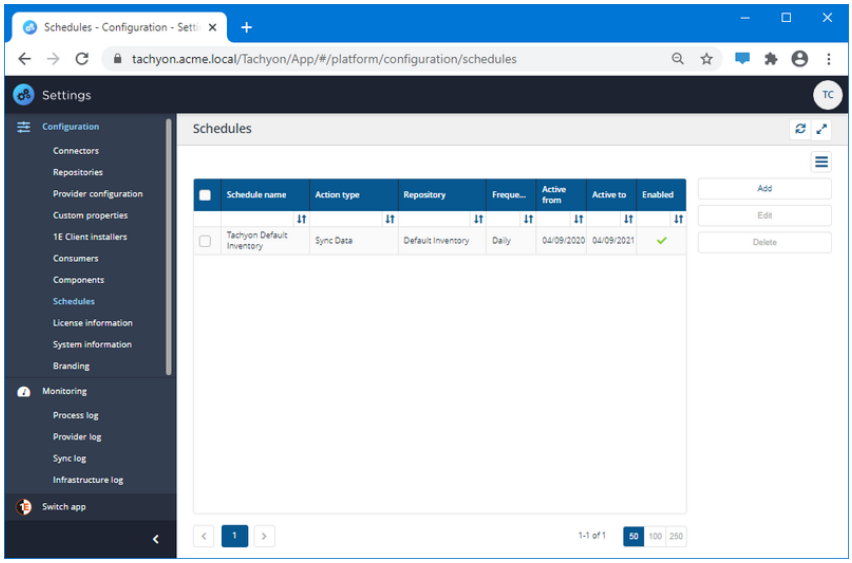
Column	Description
URL	This shows a URL that can be used to access the component. For example: **http://ACME-TCN01.ACME.LOCAL/CatalogWeb/api/** for accessing the **1ECatalog** component on a particular installation.
Version	The version number for the component. For example the **1ECatalog** component may have a version number of **2.1.0.140**.
Last activity	This shows the last date and time the component was active.
Enabled	A check in this column shows that the component is enabled. If this cell for a component is blank the component is not enabled.

Note

The **AIEngine** component can be turned on or off using the toggle control. Slide the toggle to the left to turn the AI feature off or to the right to turn the AI feature on.

1.7.2.8 Schedules page

The **Schedules** page lets you add schedules for executing actions on repositories, and select the categories of data you wish to collect.



1.7.2.8.1 Schedules table

The Schedules table lists each schedule that has been created and displays the following information:

Column	Description
Schedule name	The name set for the schedule. This can be used to identify the schedule in the **Process log**.
Action type	The type of action selected for the schedule. The available action types are dependent on the selected repository type.

Action type	Description
Sync Data	Only available for inventory repositories when one or more inventory connectors have been created. Performs a sync action where the selected connector is run to fetch data from a data source and place it into the selected inventory repository.
Generate Report	Performs a data processing action on the data in the selected repository.

Repository	The repository the action will be run on.
Frequency	The frequency for the schedule.
Active from	The date the schedule will be active from.
Active to	The date when the schedule will stop being active.
Enabled	A green tick in this cell indicates that the schedule is enabled. If the cell is empty the schedule is not enabled.

1.7.2.8.2 Adding a new Schedule

On the Schedules page you can create a new schedule by clicking the **Add** button.

> **Note**
>
> All schedules are defined in UTC time.

To add a new schedule:

1. Navigate to the **Settings**→**Configuration**→**Schedules** page.
2. Click the **Add** button.
3. In the **Add schedule** popup enter a **Schedule name**.

Tip

You should use a naming convention for schedule names:

<action type> <repository name> <schedule>

For example:

SCCM Demo Inventory 11pm *(only need to say Demo once)*

SCCM Demo Default Inventory 3am *(demo connector but default inventory)*

SCCM with RCR Default Inventory Friday 2am

4. Select the **Repository** from the drop-down list. For example, **Default Inventory**.
5. Select the **Action type** from the drop-down list. For example, **Sync Data - Tachyon** action for a Tachyon connector created previously.
6. For inventory **Sync data** actions you can perform a **Clean sync**, which deletes the data in the selected inventory repository before performing the new sync.
7. If AI Powered Auto-curation has been enabled, then inventory **Sync data** and **Basic Inventory Consolidation** actions allow you to select **Run AI action**, which performs additional processing to normalize software product names that are not in the 1E Catalog.
8. For inventory **Sync data** type actions you also get to select the categories of data that you want to sync. In the **Data to Sync** heading there is a**Select All** checkbox that lets you select or deselect all the following data categories, you can also select or deselect these individually:

   Note

   The categories displayed are dependent on the type of connector.

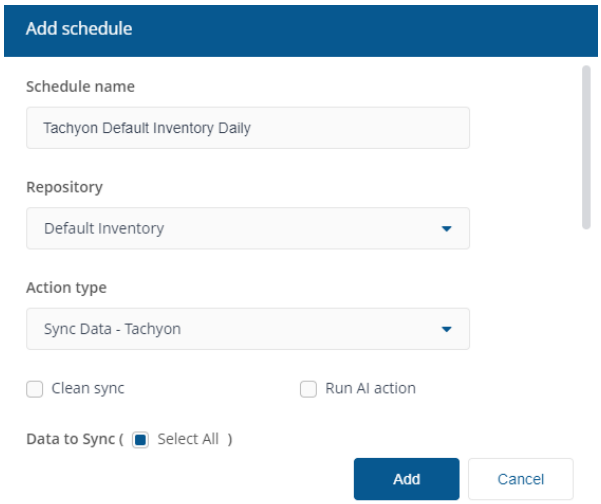
   - AD Organizational Unit
   - CM Application & Package
   - Device
   - Installed Software
   - Patch
   - Processor
   - Software Usage
   - User
9. Select a **Frequency** for the schedule. For example, you can create a **Daily** schedule. Doing this adds the relevant controls to the **Add schedule** popup.

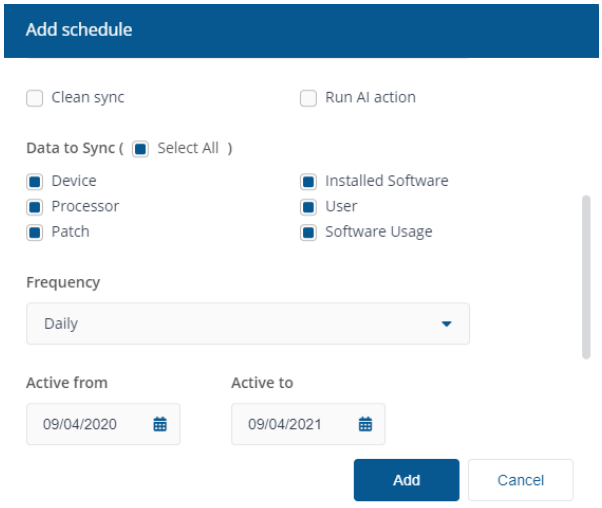
   Note

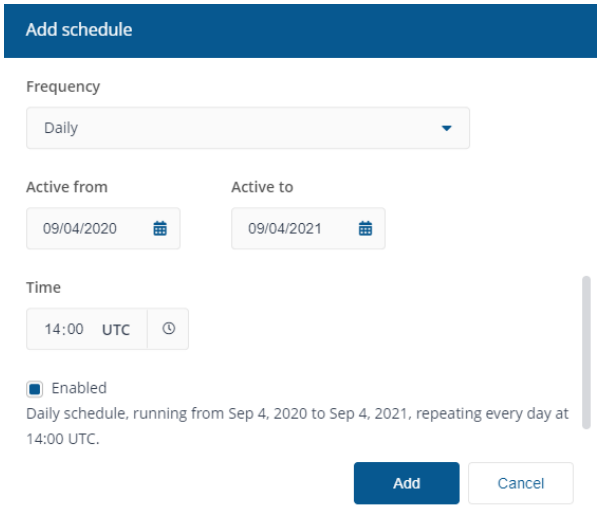
   - Repeat Minutes
   - Daily
   - Weekly
   - First week of month

- Second week of month
- Third week of month
- Last week of month
- Day of the month

10. Select the **Active from** date. For example, the current date.
11. Select the **Active to** date. For example the same day in the following year.
12. Select other settings according to the Frequency you selected. For example, you can set the **Time** to **00:01**, so that the schedule runs at 1 minute past midnight in UTC time.
13. Ensure that the **Enabled** checkbox is checked to make the schedule immediately active.
14. When all the schedule fields are set click **Add** to add the active schedule.







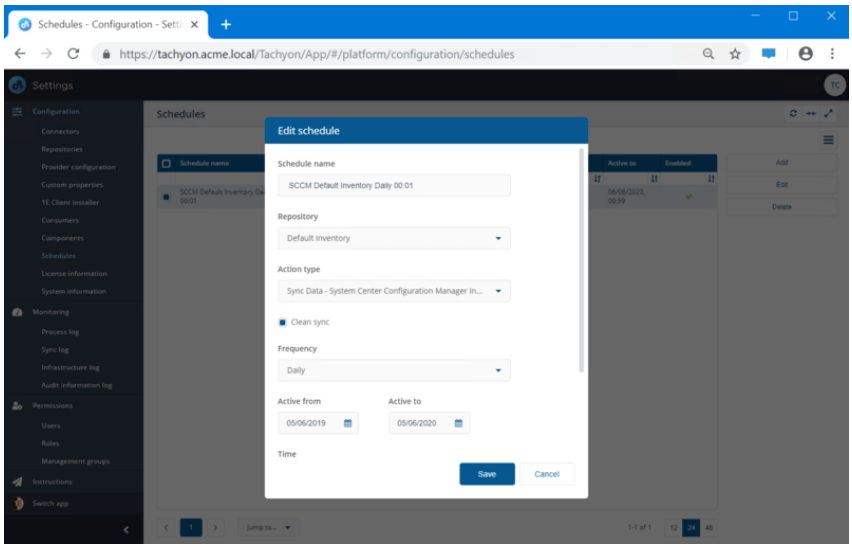
1.7.2.8.3 Editing an existing Schedule

You can edit a particular schedule to change any of its parameters. To do this:

1. Navigate to the **Settings→Configuration→Schedules** page.
2. Check the checkbox next to the one schedule you want to edit.
3. Click the **Edit** button.
4. In the **Edit schedule** popup make any changes you need to the schedule.
5. When you are finished, click **Save** to commit the changes.

1.7.2.8.3.1 Enabling and disabling a Schedule

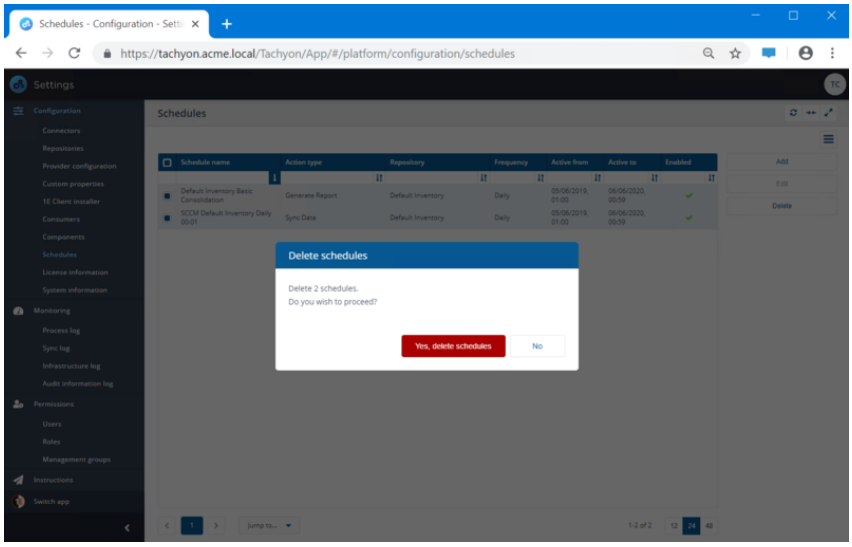
A primary reason to edit an existing schedule is to temporarily disable it so that it can be edited and re-enabled at a later date. For example if you know you have a planned maintenance task you might want to temporarily disable the schedules during the maintenance and then re-enable them once the maintenance has finished.



1.7.2.8.4 Deleting a Schedule

You can delete a particular schedule when it is no longer needed. To do this:

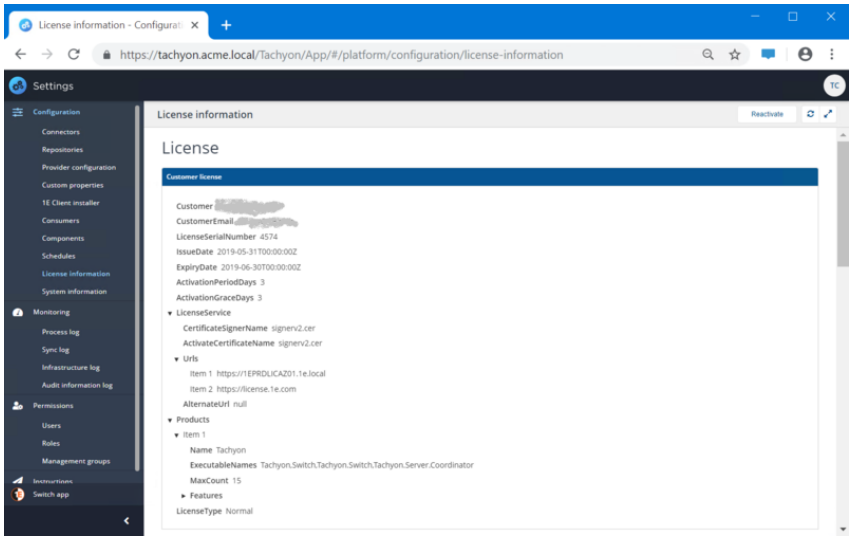
1. Navigate to the **Settings→Configuration→Schedules** page.
2. Check the checkbox next to the one schedule you want to delete (you can delete multiple schedules in a single action by checking multiple schedules).
3. Click the **Delete** button.
4. In the **Delete schedule(s)** popup you will be asked if you want to proceed.
5. To proceed and delete the selected schedule(s) click the **Yes, delete schedule(s)** button.



1.7.2.9 License information page

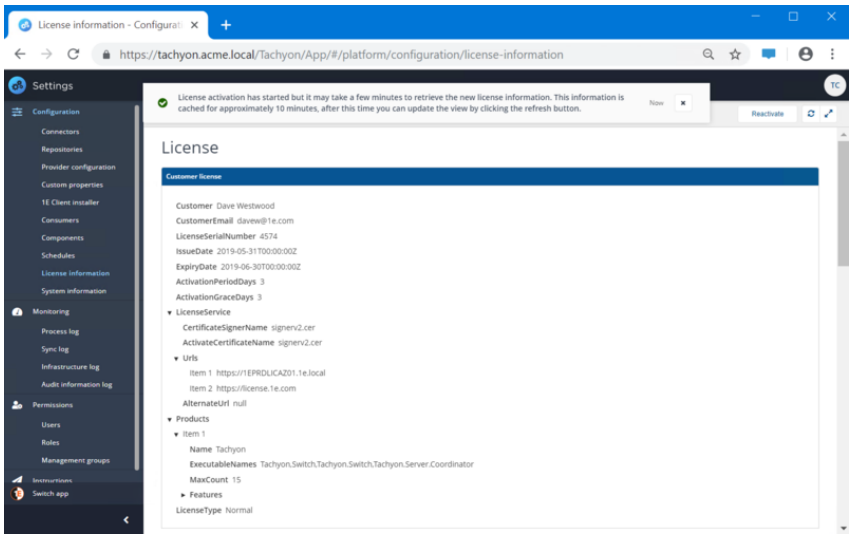
The **License information** page shows details of the current license status and lets you reactivate your license if any changes have been made.

In the Products section, under Features, you can see which consumers you are able to use, and which type of instructions you can run according to their prefix pattern. Available consumers and prefixes are listed below under License requirements for consumer applications.



1.7.2.9.1 Reactivating licenses

You can reactivate a license after it has been updated by 1E by clicking the **Reactivate** button. It takes a few minutes to retrieve the new license information and the page caches its displayed information for around 10 minutes. After this time you can update the view by clicking the **Refresh** button, which updates the information displayed on the page and in the lower right-hand corner of the browser.



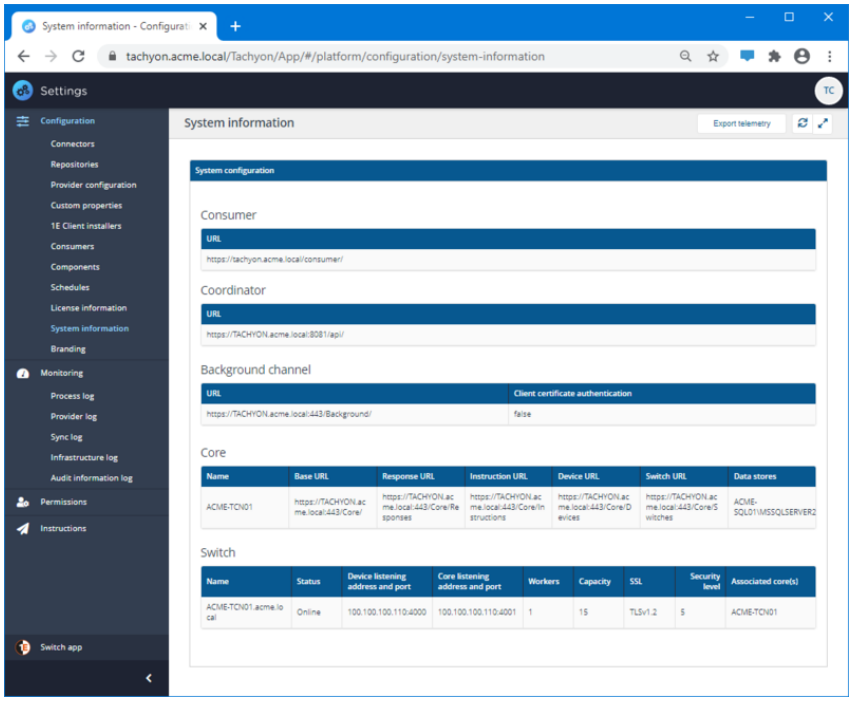
1.7.2.9.2 License requirements for consumer applications

For any application, tool or feature to use instructions, its consumer and prefix pattern must be registered in your license.

For full details about the License requirements for consumer applications, refer to License requirements.

1.7.2.10 System information page

The **System information** page lets you review the configuration of Tachyon components used for Tachyon real-time features. There are no configuration options.



1.7.2.10.1 System information

The information on this page is described in the following table:

Field	Description
Consumer	Displays the URL for the consumer API. For example: **https://TACHYON.acme.local/Consumer/**
Coordinator	Displays the URL for the coordinator API. For example: **https://TACHYON.acme.local:8080/api/**
Background Channel	Displays a list of configured background channels, showing the following information:

Field	Description

Column	Description
URL	Displays the URL for the background channel. This is set in the Tachyon clients so that they can communicate with this background channel. For example: **https://TACHYON.acme.local:443/background**
Client Certificate Authentication	Indicates whether client certificate authentication is required by the background channel. This may be **true** (client certificates are required) or **false** (client certificates are not required).

Core

Displays a list of the configured cores, showing the following information:

Column	Description
Name	The name used by the Master to identify the core. For example: **ACME-TCN01**
Base URL	The base URL for the core. For example: **http://ACME-TCN01.acme.local:80/CoreInternal/**
Response URL	The responses URL for the core. For example: **http://ACME-TCN01.acme.local:80/CoreInternal/Responses**
Instruction URL	The instructions URL for the core. For example: **http://TACHYON.acme.local:443/Core/Instructions**
Device URL	The devices URL for the core. For example: **http://ACME-TCN01.acme.local:80/CoreInternal/Devices**

Field	Description	
	Switch URL	The switches URL for the core. For example: **http://TACHYON.acme.local:443/Core/Switches**
	Data stores	The SQL instance where the core data is stored. For example: **ACME-SQL01**
Switch	Displays a list of the configured switches, showing the following information:	

Column	Description
Name	The name of the Switch Host. For example: **ACME-TCN01.acme.local**
Status	The current status for the switch. This may be one of **Online** or **Offline**
Device listening address and port The port on the IP address the switch listens on for Tachyon client connections. For example: **4000**	The address the switch listens on for Tachyon client connections. For example: **100.100.100.110:4000**
Core listening address and port The port the switch listens on for core prompts. For example: **4001**	The address the switch listens on for core prompts. For example: **100.100.100.110**

Field	Description	
	Workers	The workers the switch is configured to use. In combination with **Slots**, this value specifies the number of devices the switch can support. For example: **1**
	Capacity	The number of slots available to the switch. In combination with **Workers**, this value specifies the number of devices the switch can support. For example: **15**
	SSL	The security protocol used when communicating with this switch. This should be set to **TLSv1.2** unless advised by 1E.
	Security Layer	Shows the security level used by the switch when communicating with the Tachyon clients. By default this is set to: **5**
	Associated Core(s)	Specifies the cores this Switch is associated with by name. For example: **ACME-TCN01**

1.7.2.10.2 Export telemetry

The **Export telemetry** button triggers a collection process for Server telemetry data and exports a CSV file. The contents of the file are not encrypted.

If you have disabled automated sending of Server telemetry to 1E, and you contact 1E Support for assistance with any problems, you may be asked use the **Export telemetry** button, and then send the CSV file to 1E.

Telemetry helps 1E to continually improve your experience with Tachyon. Only summarized statistical information is collected, which enables 1E to see how customers use features of the application. No personally identifiable data is collected. 1E use this information to:

- Understand how the product is being used to influence future development decisions
- Plan supported platforms (OS, SQL etc. versions) over time
- Deliver a smooth upgrade experience as we can focus testing on implemented scenarios
- Improve system performance

- Identify early warning signs of potential issues such as excessive growth of database tables, instruction failures etc. so we can proactively address them.

Server telemetry reports how the platform is used and data is compressed, encrypted and sent to 1E through email on a configurable schedule. Full details of the Server telemetry data sent to 1E is provided in Server telemetry data.

User Interface telemetry reports how the user interface is used, and data is sent directly from administrator browsers to the 1E Cloud.

1.7.2.11 Branding page

The **Branding** page lets you customize the appearance of the portal and emails to match your corporate style.

1.7.2.11.1 Branding

To view this page and make changes to the appearance of the Tachyon Portal, you need a user with one of the following roles assigned:

- **Infrastructure Administrator**
- **Full Administrator**.

The fields on this page are described in the following table:

Field	Description
Company Name	Set this to the name for your corporation. This name is reserved for use in a future Tachyon application.
Portal Description	Set this to the description for your corporation. This text string can be up to 50 characters long. The contents of this field will appear on the Tachyon Portal landing page.
Company Logo	This field is a drop site where you can drag and drop your company logo. You can also use a local file browser dialog to locate the file by clicking on the **Browse** button in the field. The logo you provide must be .png or .jpg file at least 200 x 200 pixels and square. The maximum size is 100 kB. When uploaded, the logo will appear on the Tachyon Portal landing page and **Switch app** control menu.

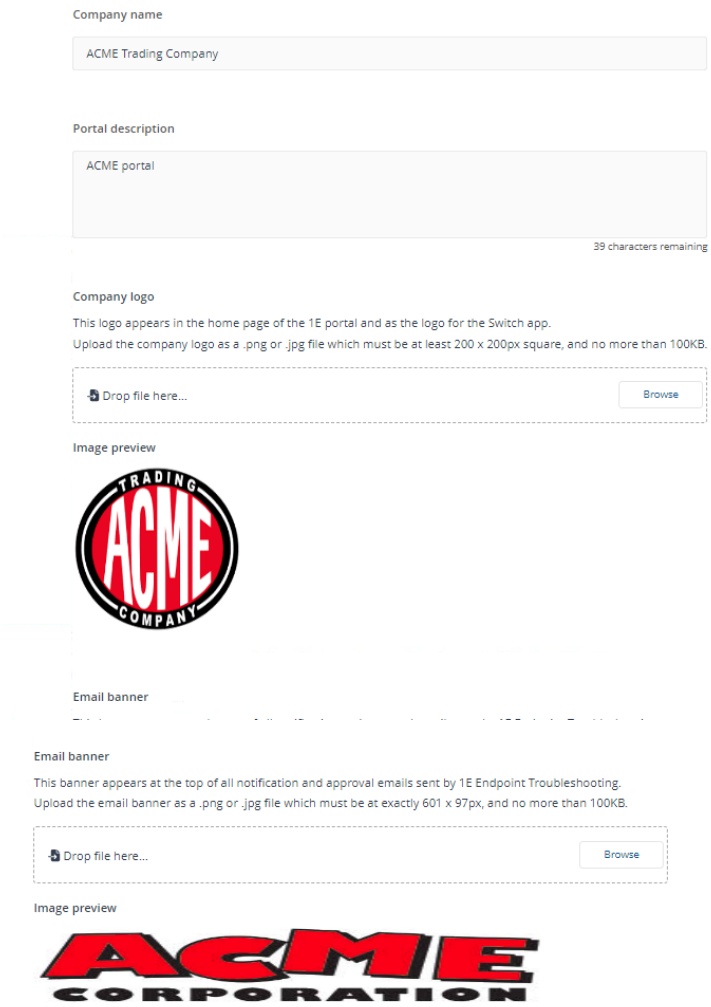
Field	Description
Email Banner	This field is a drop site where you can drag and drop your corporation email banner. You can also use a local file browser dialog to locate the file by clicking on the **Browse** button in the field. The logo you provide must be .png or .jpg ifle and exactly 601 x 97 pixels. The maximum size is 100 kB. When uploaded this banner will appear at the top of all Tachyon emails: verification, approval etc.

1.7.2.11.2 Setting the brand

The pictures show the **Branding** page filled out for the fictional ACME Trading Company Corporation with the following settings:

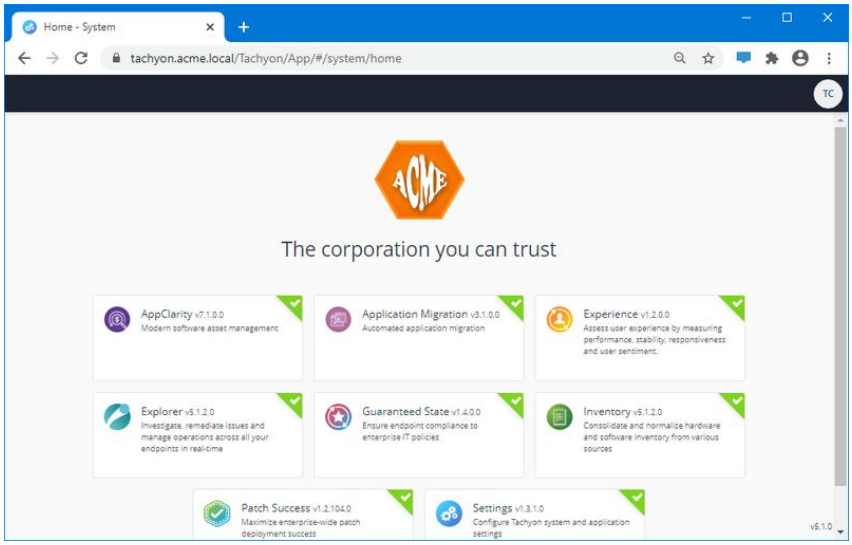
Field	Setting
Company Name	ACME Trading Company
Portal Description	ACME portal
Company Logo	ACME Logo.png
Email Banner	ACME Banner.png

After clicking **Save**, you are prompted to refresh the browser window.



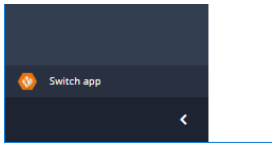
1.7.2.11.2.1 Tachyon Portal with branding

After refreshing the browser, if you navigate to the landing page you will see the new logo and description applied, as shown.



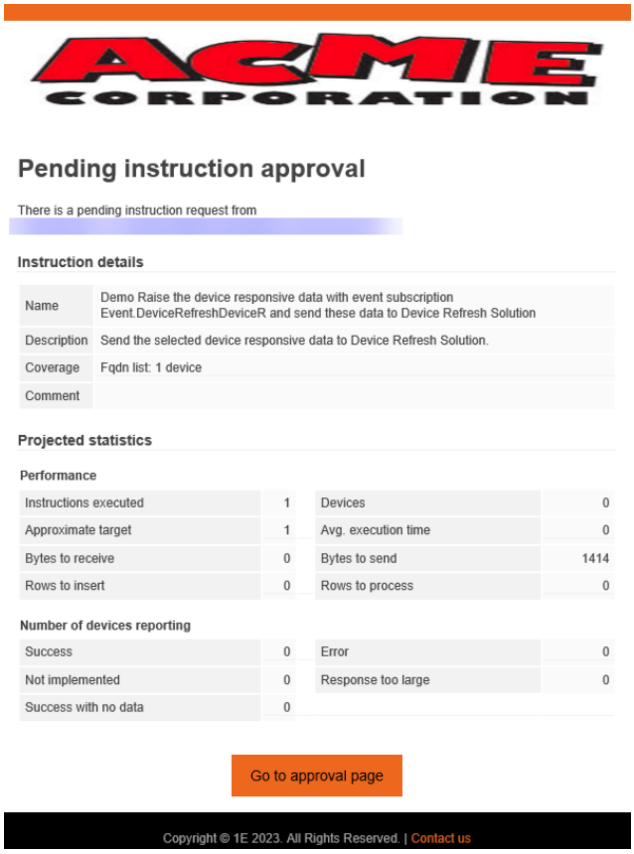
1.7.2.11.2.2 The Switch App menu with branding

The Switch App menu is displayed after you navigate to any of the installed applications. You will see your new logo appear next to the menu title. The picture shows the new logo applied.



1.7.2.11.2.3 A Tachyon email with branding

When Tachyon sends an email it will also apply the banner added and saved on the **Branding** page. The picture shows the ACME banner applied to an authentication email.



1.7.2.11.3 Resetting the branding to the default values

If at any time you want to revert Tachyon to using the default logos and text:

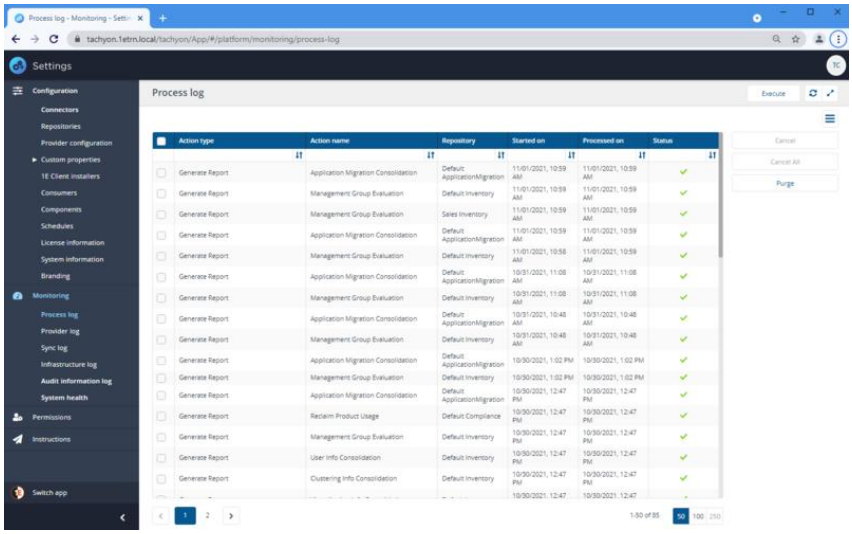
1. Navigate to the **Settings→Configuration→Branding** page.
2. Click on the **Reset** button to display the **Update - Branding** popup.
3. Here you are asked if you want to proceed? To reset the branding click **Yes, Reset & Save**, otherwise click **No**.
4. Clicking on **Yes, Reset & Save** resets the fields of the **Branding** page to their default values.
5. To view the reset you will need to refresh the browser again.

1.7.3 Monitoring Menu

Viewing Tachyon logs.

1.7.3.1 Process log page

The **Process log** page lets you view the progress of queued actions, cancel actions that are pending and purge process log history.



1.7.3.1.1 The Process log table

Column	Description
Action type	The type of action queued. For example **CleanSync** and **Sync Data** might be two actions executed when executing an overall connector sync data action.
Action name	The name of the action being executed. For example **CleanSync - SCCM** and **Sync Data - SCCM** might be two actions executed when executing an overall Configuration Manager sync data action.
Repository	The name of the repository (if any) the action is being performed on. For example **Default Inventory**.
Started on	The date and time the action started.
Processed on	The date and time the action finished.
Status	This indicates the current state for the action and ultimately whether it succeeded, failed or was cancelled. This may be one of the following:

Status	Description
	The action succeeded.
	The action is in progress.
	The action is queued.

Column	Description
	The action has been cancelled.
	The action failed.

1.7.3.1.2 Execute an action

The **Execute** button allows you to *manually* run an action. To *schedule* an action, please refer to Schedules page.

1. Click the **Execute** button.
2. In the **Execute action** popup subsequently displayed, use the **Repository** menu to select the inventory repository you want to populate.
3. Once the repository has been selected you can then select the action to run. In the case of inventory repositories the actions will be restricted to inventory related actions. For a connector you will be looking for an action with the form **Sync Data - <connector name>**.
4. For inventory syncs (where you sync a connector) you have additional options to check as shown in the example picture opposite:

   Warning

   Clean Sync causes deletion of existing data previously imported by the selected combination of **action** and **repository**. Data imported by any other connector actions is left intact and consolidated with new data. To clear all data from a repository, please refer to Clearing data from a repository.

   If **Clean Sync** checkbox is not checked then an incremental sync occurs, consolidating new data with old. An incremental sync is quicker than a clean sync.

   Clean Sync will prevent the Management Groups feature and applications such as Patch Success from working until the sync is complete and new data has been consolidated. This operation should only be performed if you need a clean sync or are experiencing problems with sync times taking too long.

   Note

   Run AI action will cause the AI action to run, this is only available if AI Powered Auto-curation has been enabled. The **Run AI action** checkbox is also available if the selected Action is **Generate Report - Basic Inventory Consolidation**. For detail on how to enable AI Powered Auto-curation the information is on the AI Powered Auto-curation page.

   Note

   Data to Sync allows you to select some or all categories of data supported by the connector.
5. Click the **Execute** button in the **Execute action** popup to start the sync.

6. A popup appears momentarily informing you that the Sync has started and you can monitor progress in the **Process log**.

7. When the sync starts a number of actions are queued to be performed on the selected repository. To check the progress of the sync actions:

    a. Navigate to the **Monitoring→Process log** page.

    b. Here you can see the sequence of actions that have been queued for the selected repository related to the **Sync Data** action selected.

    c. When each action has finished running you'll see a check icon

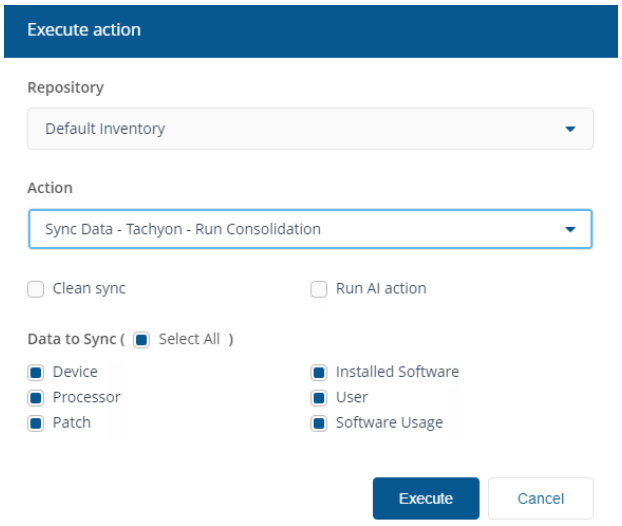
    appear in the **Status** column if it succeeds or a failed icon

    if it fails.

8. Once all the actions have succeeded you can check the results. To do this:

    a. Navigate to the **Monitoring→Sync log** page.

    b. This displays the items that have been added to the selected repository as a result of running the sync.



Note

The **Execute** button is also available on the Connectors page: Execute a connector sync action.

1.7.3.1.3 Cancelling actions

You can use the **Cancel** button to cancel individual actions or the **Cancel All** button to cancel all running or stuck actions.

Note

Only Full Administrators have permission to use the **Cancel All** and **Purge** buttons.

The**Cancel**button is used to cancel multiple or individual pending queued actions, you can do this by:

1. Select the queued

   action(s) you want to cancel from the **Process log** table by checking the box at the left-hand end of each action's row.

2. If any of the selected actions is queued the **Cancel** button will be enabled.

3. Click the **Cancel** button.

4. The **Cancel actions** popup asks if you want to proceed.

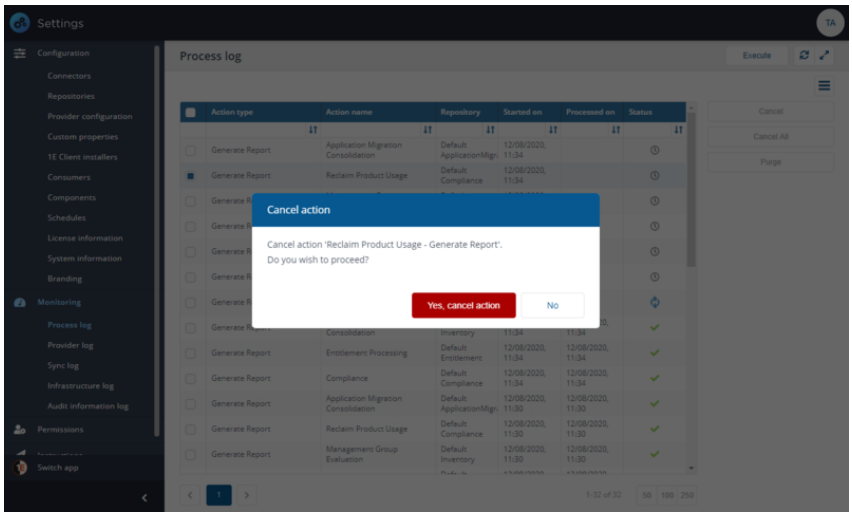
5. To proceed and cancel the selected queued actions click the **Yes, cancel actions** button.

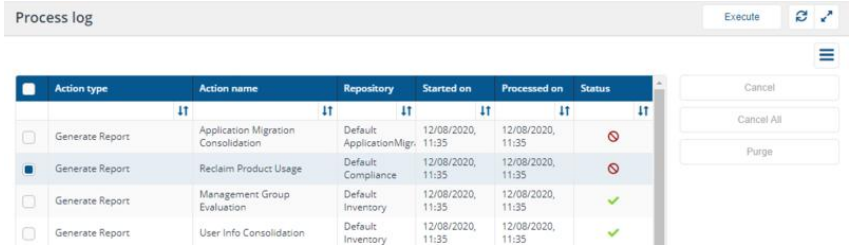
6. The actions will not longer be run and the status of the selected queued actions will change to cancelled

   .

Note

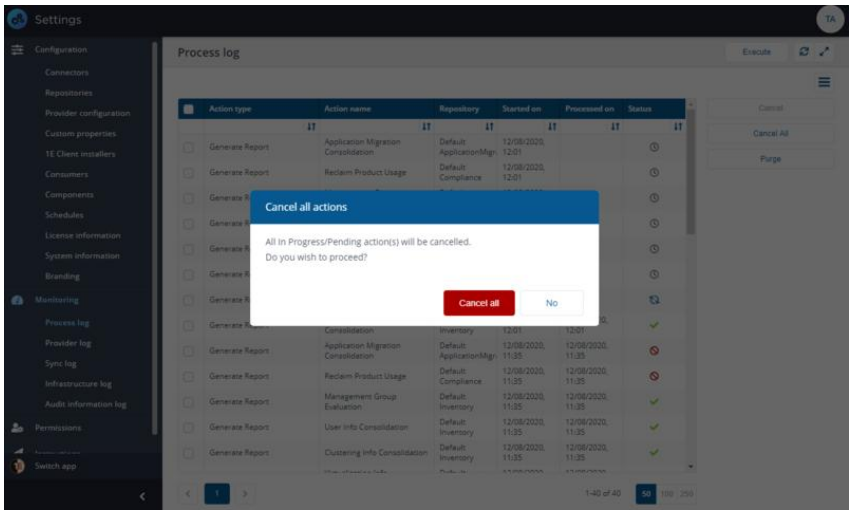
When one action is selected, all the dependent actions are also cancelled.

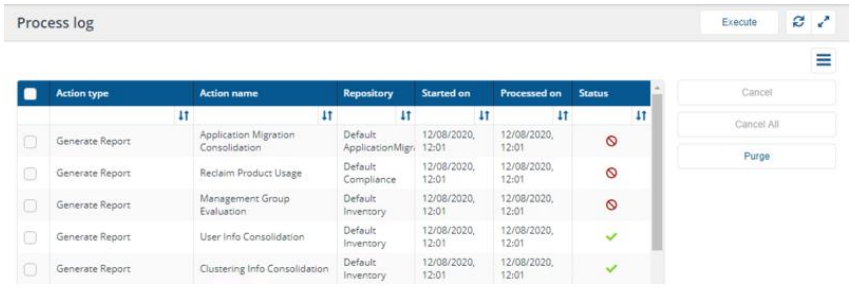




The **Cancel All** button can be used to cancel all currently running or stuck actions. You do not need to select an individual action before doing this.

You'll see a warning message if **Cancel All** is clicked, then all actions will be cancelled.





1.7.3.1.4 Purge logs

You can purge the entire Process Log history by:

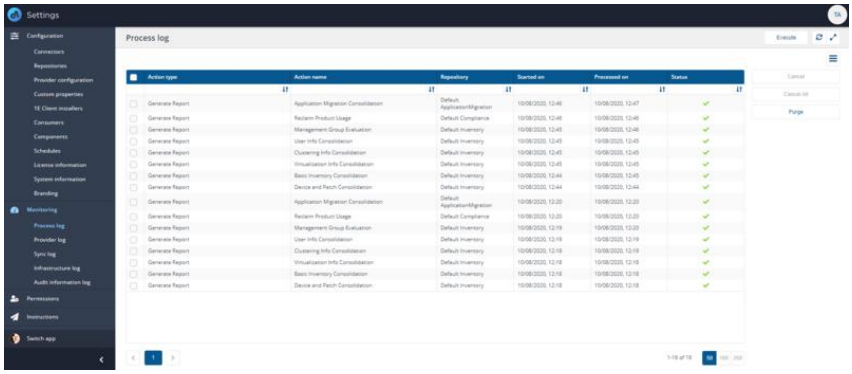
1. Clicking the **Purge** button.
2. The **Purge logs** popup asks if you want to proceed.
3. To proceed and purge the logs, click the **Yes, purge** button.
4. The Process log is then purged of all items.

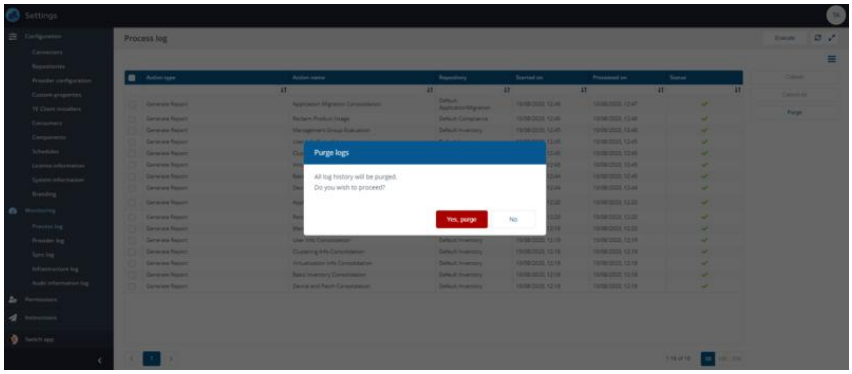
Note

If any **Action type** items are selected the **Purge** button will be disabled.

Note

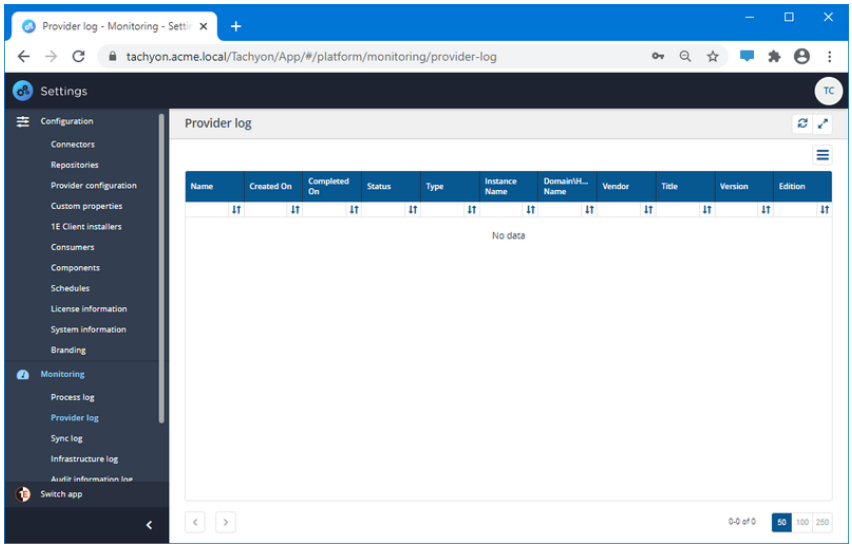
Only Full Administrators have permission to use the **Cancel All** and **Purge** buttons.





1.7.3.2 Provider log page

The **Provider log** page lets you view status log events related to Tachyon Provider operations.



1.7.3.2.1 The Provider log table

The columns in the **Provider log** are described in the following table:

Column	Description
Name	Shows the source of the Provider operation.
Created On	The date the Provider operation was created.
Completed On	The date the Provider operation completed.
Status	The current status of the Provider operation.

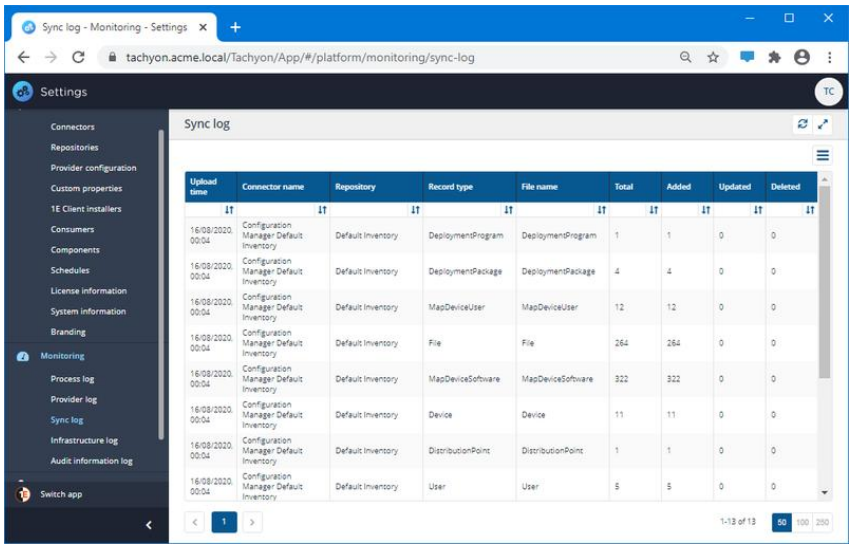
State	Description
NotStarted	The Provider operation does not yet have an assigned Provider. When one is found the operation state will be set to Pending.
InProgress	The Provider operation is currently being run.
Pending	The Provider operation has an assigned Provider but has not yet started to run.
Completed	The Provider operation has completed.
Failed	If a Provider operation is taking too long to complete it will be stopped and enter a Failed state. Provider operations in this state will then try to find another Provider to assign.
Cancelled	Cancelled Provider operations are stopped before they reach the Completed state, they take no further action and do not try to find another Provider to assign.

Type	The operation type.
Instance Name	The repository name where the Provider operation was created.
Domain\Host Name	The domain and device name where the Provider operation is run.
Vendor	The Vendor details for Product related Provider operations.
Title	The Title details for Product related Provider operations.
Version	The Version details for Product related Provider operations.

Column	Description
Edition	The Edition details for Product related Provider operations.

1.7.3.3 Sync log page

The **Sync log** page lets you review the records that have been added to repositories as a result of syncing connectors.



1.7.3.3.1 The Sync log table

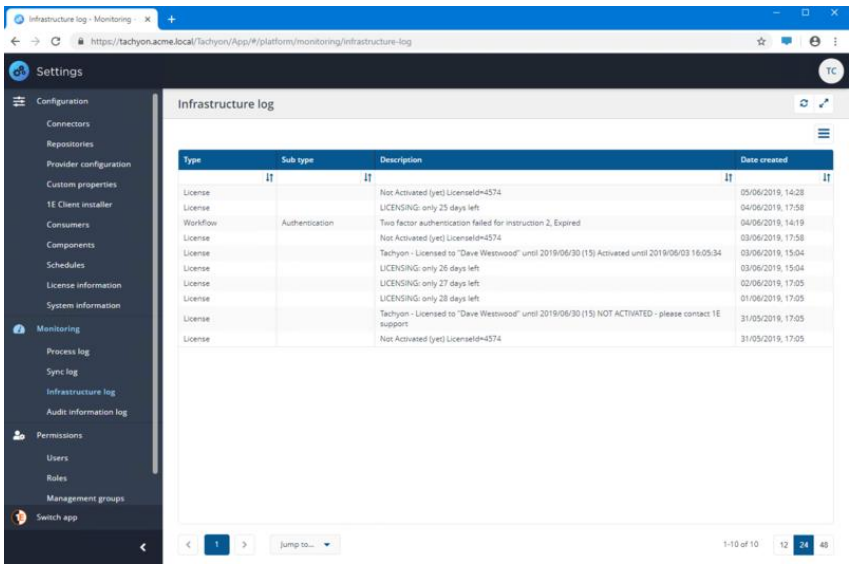
The **Sync log** table displays a list of records that have been uploaded to repositories by connectors. The columns displayed are described in the following table:

Column	Description
Upload time	The date and time the specific record type was uploaded.
Connector name	The name of the connector that uploaded the record type.
Repository	The name of the repository the record type was uploaded to.
Record type	The type of record uploaded.
File name	The file name created internally for this record type.
Total	The total number of records related to this record type sourced during the synchronization event.

Column	Description
Added	The number of records added to the platform for this record type.
Updated	The number of records that were updated as a result of uploading the record type.
Deleted	The number of records that were removed as a result of uploading the record type.

1.7.3.4 Infrastructure log page

The **Infrastructure log** page lets you view status log events related to the Tachyon infrastructure.



1.7.3.4.1 The Infrastructure log table

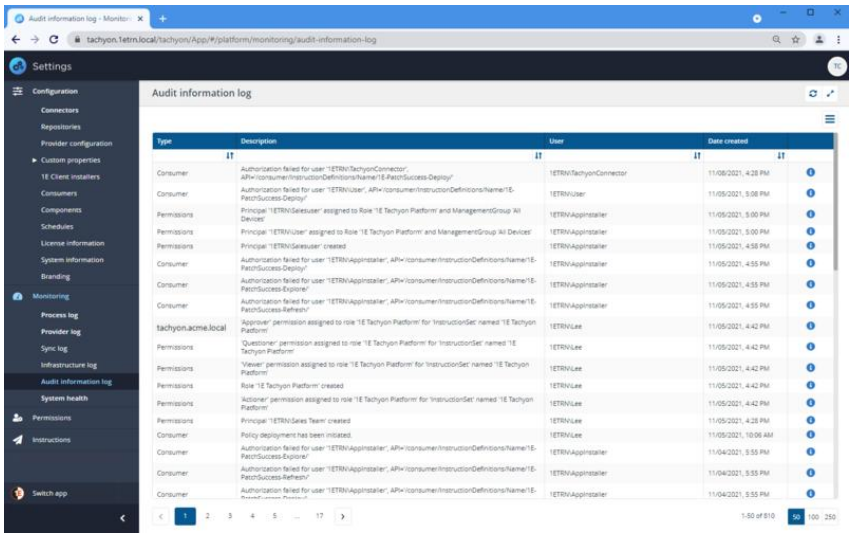
The columns in the **Infrastructure log** are described in the following table:

Column	Description
Type	Shows the type of event being logged. For example a **Workflow** event.
Sub type	Shows the sub type (if any) for more general type events. For example **Email Notification** is a sub type of a **Workflow** event.
Description	The description of the event. For example **Failure sending mail. Unable to connect to the remote server No connection could be**

Column	Description
	made because the target machine actively refused it shows a workflow event cause by a failure to connect to the specified mail server.
Date created	The date the event was created.

1.7.3.5 Audit information log page

The **Audit information log** page lets you view information on who is using Tachyon what actions they are performing.



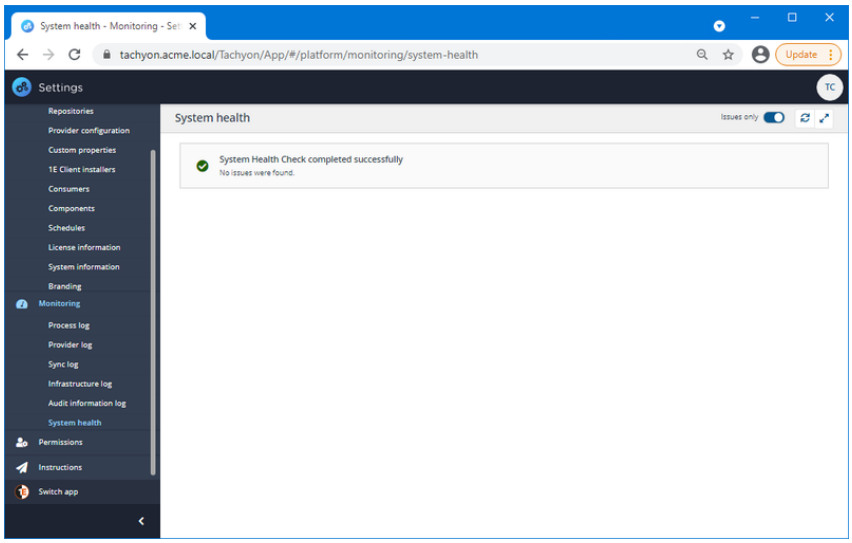
1.7.3.5.1 The Audit information log table

Column	Description
Type	The type of event. For example **Instruction Onboarding** events let you know who has been loading instructions into Tachyon.
Description	Description of the actual event that occurred. For example **Instruction definitions added to Instruction set 'Verification'** lets you know that some instructions were added to a particular instruction set.
User	The user who performed the action being logged. For example **ACME\TCNInstaller01** identifies the user who added instruction definitions to an instruction set.

Column	Description
Date created	The date and time the logged action occurred.
Detail message	Clicking the icon displays the **Detail message** for that row as a pop-up. The popup provides additional information related to the log item.

1.7.3.6 System health page

The **System Health** page runs a comprehensive series of component checks. By default, it shows issues, but you can see a full list of green lights by toggling **Issues only**.



1.7.3.6.1 Looking at the health checks

1.7.3.6.1.1 Showing all the checks

By default, the System health page shows only the checks where issues have been identified, unless there are no issues, in which case it displays an all clear message. You can set the page to show all the checks by toggling the **Issues only** switch to off in the banner for the page. The picture shows this and the types of check that will be subsequently displayed.

1.7.3.6.1.2 Showing the check details

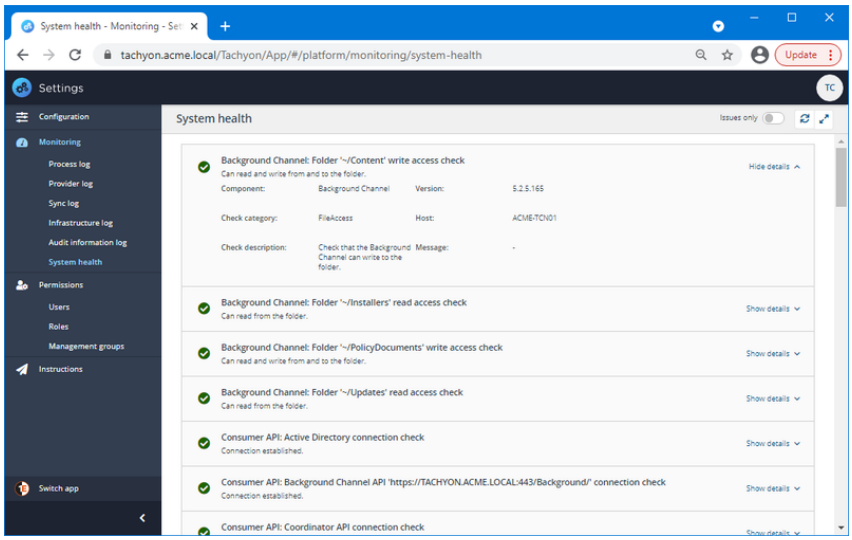
You can also expand each check to view the details related to it by clicking on the **Show details** link at the top-right of the check's entry in the System health table. The picture shows the **Background Channel Folder write access check** expanded.

When expanded you can see the following information for each check:

Information	Description
Component	The name for the component.
Version	The component version number.
Check category	The category the check belongs to.
Host	The host device the component is running on.
Check description	The description for the check being made.
Message	Any messages that have been generated by running the check.

Note

You will see four SLA Integrate errors after installation, which will disappear after you have installed a Connector.



1.7.3.6.2 The health checks

The following table provides an overview of all the health checks made by Tachyon:

Component	Check	Description
Background Channel	Folder '~/Content' write access check	Check that the Background Channel can write to the "Content" folder within the app pool user context.

Component	Check	Description
Folder '~/Installers' read access check	Check that the Background Channel can read from the "Installers" folder within the app pool user context.	
Folder '~/Policy Documents' write access check	Check that the Background Channel can write to the "PolicyDocuments" folder within the app pool user context.	
Folder '~/Updates' read access check	Check that the Background Channel can read from the "Updates" folder within the app pool user context.	
Consumer API	Active Directory connection check	Check that Consumer API can connect to Active Directory. *Uses the configured GC or LDAP connection string.*
Background Channel API connection check(s)	Check that Consumer API can connect to Background Channel API. *Uses the URL(s) stored in the TachyonMaster database.*	
Coordinator API connection check	Check that Consumer API can connect to Coordinator API. *Uses the OperationalSafeGuardsUrl application setting.*	
Core API '<Core server>'	Check that Consumer API can connect to Core API.	

Component	Check	Description
connection check(s)	*Uses the URL(s) stored in the TachyonMaster database.*	
Tachyon Master database connection check	Check that Consumer API can connect to the TachyonMaster database. *Uses the configured connection string (TachyonMaster) within the app pool user context.*	
TachyonResponse database connection check(s)	Check that Consumer API can connect to the TachyonResponse database(s). *Uses the stored connection strings within the TachyonMaster database under the app pool user context.*	
Coordinator service Agent Deployment module	Background Channel API connection check	Check that Coordinator Agent Deployment module can connect to Background Channel API. *Uses the URL(s) stored in the TachyonMaster database.*
Coordinator service Licensing module	Check license service URL	Verify that license service URL is from a trusted issuer.
Check license validity	Verify license expiry date.	

Component	Check	Description
Check trust with licensing component	Verify trust between coordinator and licensing component by comparing signatures between the licensing module DLL and licensing DLL.	
Coordinator service Management Groups module	Management Group API connection check	Check that Coordinator Management Groups module can connect to SLA Management Group API using the configured URL. *Uses the SLAEndpoint module setting.*
Coordinator service Policy module	Background Channel API connection check	Check that Coordinator Policy Module can connect to Background Channel API. *Uses the URL(s) stored in the TachyonMaster database.*
Coordinator service	Active Directory connection check	Check that Coordinator can connect to Active Directory. *Uses the configured GC or LDAP connection string.*
Coordinator certificate check	Check that Coordinator has a valid certificate used for the SSL API communication.	
SMTP connection check	Check that Coordinator can connect to the SMTP server using the "EHLO" command. *Only shown if SMTP emails has been enabled.*	

Component	Check	Description
Tachyon Master database connection check	Check that Coordinator can connect to the TachyonMaster database. *Uses the configured connection string (TachyonMaster) within the app pool user context.*	
Website application authentication check	Check that Consumer API site has Windows authentication enabled and that Anonymous authentication is disabled.	
Website certificate binding check	Check that Consumer API has a valid certificate binding.	
Core	TachyonMaster database connection check	Check that Core can connect to TachyonMaster database. *Uses the configured connection string (TachyonMaster) within the app pool user context.*
TachyonResponse database connection check(s)	Check that Core can connect to TachyonResponse database(s). *Uses the stored connection strings within the TachyonMaster database under the app pool user context.*	
SLA Admin	Consumer API connection check	Check that SLA Admin can connect to the Consumer API. *Uses the PermissionCheckerRootUrl application setting.*

Component	Check	Description
SLA Platform API connection check	Check that SLA Admin can connect to the SLA Platform API.	
SLA-Data database connection check	Check that SLA Admin can connect to the SLA-Data database. *Uses the configured connection string (DefaultCustomerConnection) within the app pool user context.*	
SLA-Shared database connection check	Check that SLA Admin can connect to the SLA-Shared database. *Uses the configured connection string (DefaultSharedConnection) within the app pool user context.*	
SLA Engine	1ECatalog database connection check	Check that SLA Engine can connect to the 1ECatalog database. *Uses the BaseUri application setting to request the 1ECatalog connection string from the SLA Platform API. The database connection check is performed within the service user context.*
Catalog API connection check	Check that SLA Engine can connect to the Catalog API. *Uses the URL retrieved from the SLA-Data.Component table for 1E Catalog within the service user context.*	

Component	Check	Description
Consumer API connection check	Check that SLA Engine can connect to the Consumer API. *Uses the TachyonConsumerRootUrl application setting.*	
SLA Platform API connection check	Check that SLA Engine can connect to the SLA Platform API. *Uses the BaseUri application setting.*	
SLA-Data database connection check	Check that SLA Engine can connect to the SLA-Data database. *Uses the configured connection string (DefaultCustomerConnection) within the service user context.*	
SLA-Shared database connection check	Check that SLA Engine can connect to the SLA-Shared database. *Uses the configured connection string (DefaultSharedConnection) within the service user context.*	
SLA Integrate Agent service *(part of SLA Integrate services)*	Folder '<ConnectorsRoot>' write access check	Check the SLA Integrate Agent can write to the 'dir-connectors' folder within the service user context.

Component	Check	Description
Folder '<Installer Root>' write access check	Check the SLA Integrate Agent can write to the 'dir-job-output' folder within the service user context.	
Folder '<JobOutputRoot>' write access check	Check the SLA Integrate Agent can write to the 'dir-job-output' folder within the service user context.	
SLA Integrate Manager connection check	Check that the SLA Integrate Agent can connect to the SLA Integrate Manager. *Uses the rest-api-address application setting.*	
SLA Platform API connection check	Check that the SLA Integrate Agent can connect to the SLA Platform API. *Uses the rest-api-address application setting to request the SLA Platform API address from the SLA Integrate Manager.*	
SLA Integrate Manager service *(part of SLA Integrate services)*	Folder '<InstallerRoot>' write access check	Check the SLA Platform Integrate Manager can write to the 'dir-installers' folder within the service user context.

Component	Check	Description
Folder '<JobOutputRoot>' write access check	Check the SLA Platform Integrate Manager can write to the 'dir-job-output' folder within the service user context.	
SLA Platform API connection check	Check that SLA Integrate Manager can connect to the SLA Platform API. *Uses the sla-data-address application setting.*	
SLA-Integrate database connection check	Check the SLA Integrate Manager service can connect to the SLA-Integrate database. *Uses the configured connection string (default) within the service user context.*	
SLA Platform Integrate Agent	Check at least one SLA Platform Integrate Agent has reporting health status.	
SLA Platform API *API includes the UI* *The following are not checked:* • *SLA I*	1ECatalog database connection check	Check that SLA Platform API can connect to the 1ECatalog database. *Uses the configured connection string (DefaultCatalogConnection) within the app pool user context.*

Component	Check	Description
nventory • *SLA Operations Provider API*		
Consumer API connection check	Check that SLA Platform API can connect to Consumer API. *Uses the PermissionCheckerRootUrl application setting.*	
SLA-Data database connection check	Check that SLA Platform API can connect to the SLA-Data database. *Uses the configured connection string (DefaultCustomerConnection) within the app pool user context.*	
SLA-Shared database connection check	Check that SLA Platform API can connect to the SLA-Shared database. *Uses the configured connection string (DefaultSharedConn*	

Component	Check	Description
	ection) within the app pool user context.	
SLA Engine	Check the SLA Engine has reported health status.	
Switch *Switch Host is not checked*	Core Connect (Device)	Check if this Switch can connect to core Device endpoint.
Core Connect (Instructions)	Check if this Switch can connect to core Instructions endpoint.	
Core Connect (Policy Response)	Check if this Switch can connect to core Policy Response endpoint.	
Core Connect (Policy)	Check if this Switch can connect to core Policy endpoint.	
Core Connect (Response)	Check if this Switch can connect to core Response endpoint.	
Core Connect (Switch)	Check if this Switch can connect to core Switch endpoint.	
Recent administrative events.	Check if this Switch has had any recent errors or warnings (since last instruction poke)	

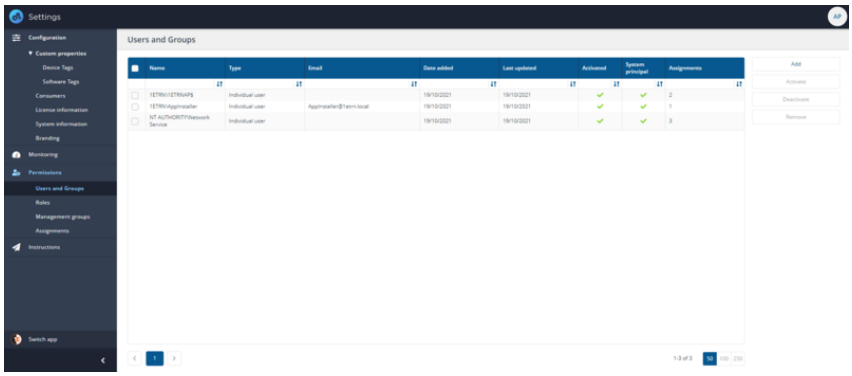
1.7.4 Permissions Menu

Configuring Tachyon users, roles, and management groups.

1.7.4.1 Users and Groups page

The **Users and Groups** page lets you view and manage current Tachyon users, from this page you can:

- Add new users and groups
- Reactivate deactivated users and groups
- Deactivate selected users and groups
- Remove users and groups
- View the details for particular users, groups and set their roles.



1.7.4.1.1 How to define Tachyonusers and set their access rights

Tachyon users are added using their Active Directory properties, fetched by Tachyon through a direct search of Active Directory. A Tachyon user may be defined as either a domain account or a security group. When using security groups, we recommend the use of Universal groups, as these will be compatible with any potential future changes to your AD infrastructure. Refer to Active Directory for more details.

Once a user or group has been added to Tachyon, you can then set any Tachyon roles to define what access they have to Tachyon features.

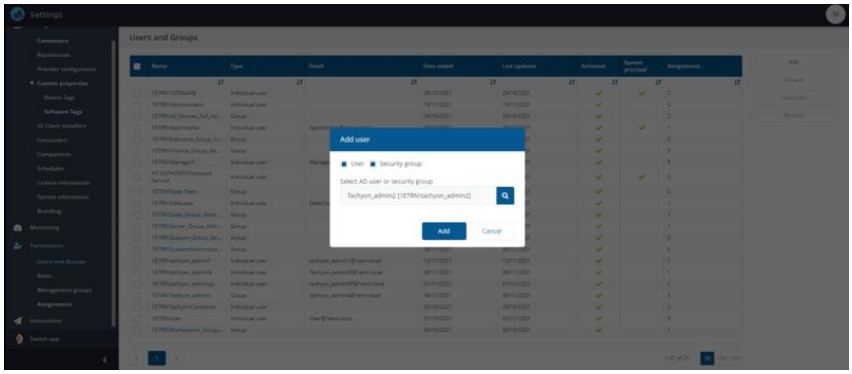
The following sections outline the steps to create a user and assign their access rights, for more details please see Configuring Access Rights - tutorial, which provides a step-by-step worked example.

1.7.4.1.1.1 Adding Tachyon users

1. Log on to the Tachyon portal using a user account with the **Full Administrator**, or the **Installer** role if it is a new installation.
2. Navigate to the **Settings**→**Permissions**→**Users and Groups** page.
3. Click on the **Add** button, doing this displays the **Add user** popup.

4. In the **Select AD user or security group** field, type the name, or part of the name, for the Active Directory user or security group that you want to add, then click the search icon.

5. Select the Active Directory user or security group from the list of matching names displayed in the drop-down list and click **Add**.



1.7.4.1.1.2 Adding Tachyon roles to users or groups

Once added to Tachyon, you can use **Assignments** to edit the roles for a Tachyon user or group:

1. On the **Settings→Permissions→Users and Groups** page, click on the **Assignments** link for the user or group you want to add the role to, this displays the Assignments page focused on the selected user.

2. On the Assignments page, the focus is on **Users and Groups**.

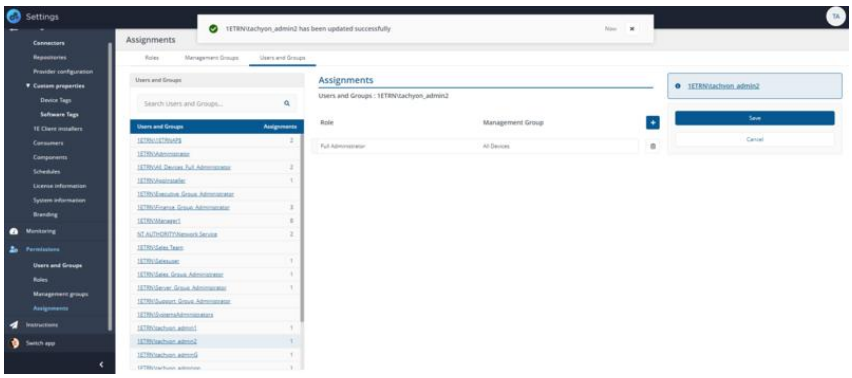
3. Click the plus sign button to add a **Role** and your choice of associated **Management Group**.

4. Once you've selected your Tachyon Roles and Management Groups, click the **Save** button.

Refer to the Assignments page for details about the Assignments page and walkthroughs of how to use the feature.

Refer to the Management Groups page for details about how you can use Management Groups to determine:

- Targets for questions, actions and reporting
- User permissions for targeting to particular devices based on management group membership.



1.7.4.1.2 Deactivating or removing Tachyon users or groups

Tachyon lets you add Active Directory users or security groups as users. It also provides a means for deactivating and removing those users. It's worthwhile discussing when you should use deactivate and when you should use remove.

1.7.4.1.2.1 Deactivating Tachyon users or groups

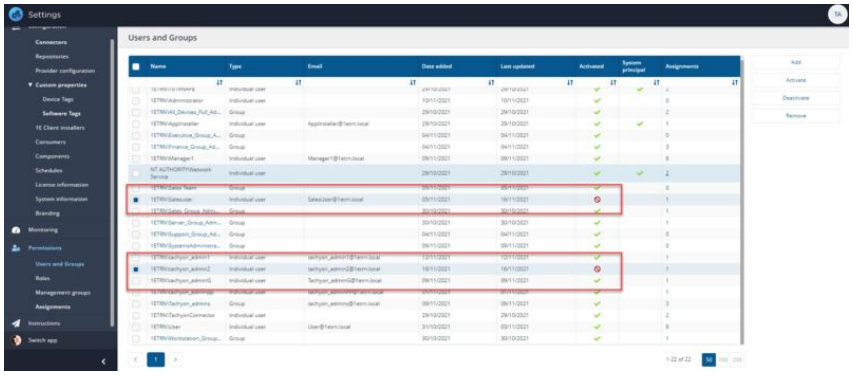
You can deactivate existing users if you need to temporarily prevent them from using the Tachyon portal without permanently removing all of their set roles.

To deactivate a user:

1. Navigate to the **Settings→Permissions→Users and Groups** page.
2. Check the checkbox at the left-hand end of one or more users you want to deactivate.
3. Click the **Deactivate** button.
4. The icon in the **Activation** column will change to

   , indicating that the user is now deactivated.
5. After deactivating, the selected user will no longer be able to perform further actions in the Tachyon portal (for any current sessions) and will not be able to log in to the portal for any subsequent sessions.

Deactivated users can be re-activated at a later date and all of their set roles will be re-instated. This does not affect any other Tachyon roles associated with the user or group by virtue of their membership of other Tachyon groups.



1.7.4.1.2.2 Re-activating Tachyon users or groups

You can re-activate currently deactivated users or groups to grant them access to the Tachyon portal.

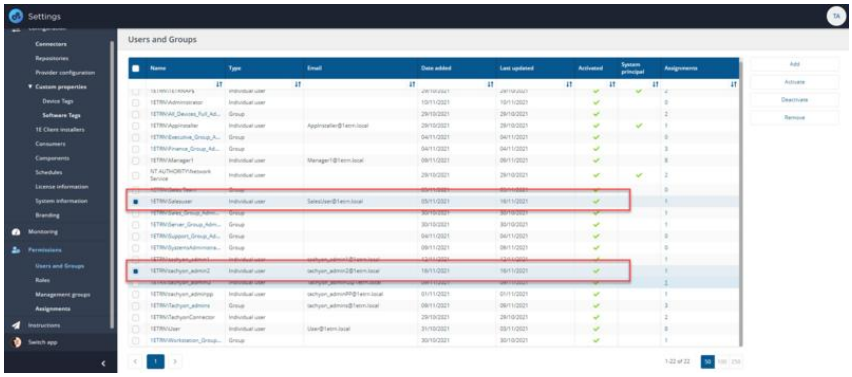
To re-activate a user:

1. Navigate to the **Settings→Permissions→Users and Groups** page.
2. Check the checkbox at the left-hand end of the user entry you want to re-activate.

3. Click the **Activate** button.
4. The icon in the **Activation** column will change to

   ✔

   , indicating that the user is now activated.
5. After activating, the selected user will be able to log in to the Tachyon portal and perform their permitted functions as before.



1.7.4.1.2.3 Removing users

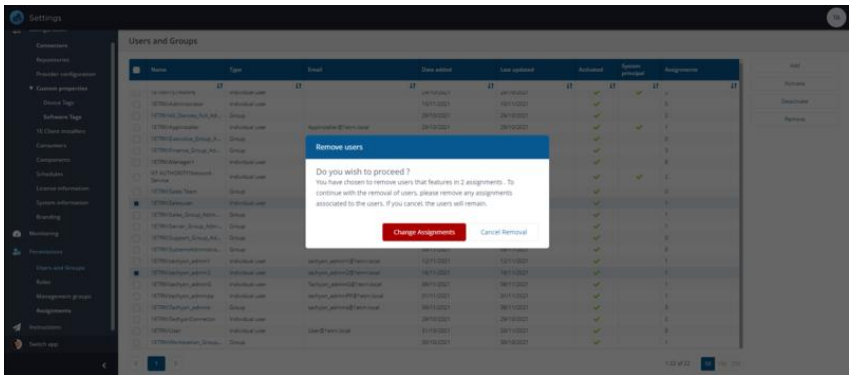
Use remove to delete the particular associations for the specific user or group with their roles. This does not affect any other roles associated with the user or group by virtue of their membership of other groups.

You can permanently remove one or more users or groups if they are no longer needed. Doing this removes any associations to roles.

To remove a user:

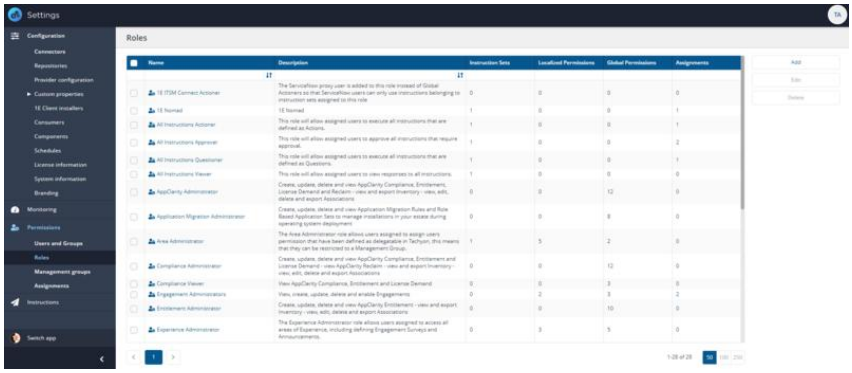
1. Navigate to the **Settings→Permissions→Users and Groups** page.
2. Check the checkbox at the left-hand end of the users you want to remove.
3. Click the **Remove** button.
4. A **Remove group** or **Remove user** popup will be displayed asking if you want to proceed with the removal of the selected group or user.
5. To proceed and remove them from Tachyon, you will need to remove any associated assignments, click the **Change Assignments** or **Cancel Removal** button.
6. The **Change Assignments** button launches the **Assignments** page, select the user or group you want to remove and delete any assignments they have using the trash can icon, click **Save**.
7. Navigate back to the **Users and Groups** page, re-select the user or group you want to remove, click **Remove**.
8. Click the **Yes, remove group** or **Yes, remove user** button, depending on whether it was a group or user being removed.

From this point on, all the associations for that user or group and their roles will be removed from Tachyon. If you did want to add them back in at a later date, you would have to rebuild them step by step.



1.7.4.2 Roles page

The **Roles** page lets you view system roles and currently defined custom roles. From here you can edit Role permissions and go into each role to set its users and group assignments and any associated management groups.



1.7.4.2.1 Tachyon roles

There are two types of roles that can be applied to the Tachyon users, system roles, and custom roles.

Tip

On the Roles page, you can see at a glance which Tachyon roles are system or custom roles, by using the icon in the **Name** column:

- System roles are indicated by an icon with a padlock

- Custom roles are indicated by an icon with a cog wheel

1.7.4.2.1.1 System and custom roles

Refer to Roles and Securables for a complete reference for the following:

- Platform system roles.
- The custom roles used by 1E applications.
- For customers upgrading from Tachyon Platform 5.2 or earlier, a list of role names that are automatically renamed.

1.7.4.2.2 Recommendations for using the Full Administrator role

The **Full Administrator** role can be used to provide across-the-board permissions to a user. While this may be convenient in certain circumstances, you should be aware that this is a powerful role and should be used with appropriate caution.

1.7.4.2.2.1 Using Full Administrator in a lab environment

To get things up and running quickly in a lab environment, you may choose to make the Setup user account a Full Administrator during installation on the Identity Providers page in 1E Setup. This will help minimize the number of users required for an evaluation and reduce the initial configuration required.

If the Setup user account was not elevated during setup then it will only have limited access and as this is a system principal user the permissions are locked down by default. You can allow it to assume the Full Administrator role using the following steps:

1. Add an Azure Active Directory group to 1E permissions
2. Apply the 1E Full Administrator role to this group.
3. Add the Setup user account to the same Azure Active Directory group.

In the short term, it's fine to make use of full administrators in this way, but this practice is not really suitable for large-scale deployments and should be used with care for the following reasons:

- The Full Administrator role has permission to do everything in 1E. It has across-the-board permissions to all Instruction Sets and therefore can be used to run actions that can have a major impact on your network.
- The Full Administrator accounts receive emails for all the transactions that are performed by 1E.

1.7.4.2.3 Different approaches for defining permissions

1E provides a flexible system for defining permissions for the features. There are a number of different ways of approaching the task, here we outline the general choices that can be made for assigning 1E users to system and custom roles.

1.7.4.2.3.1 Managing access primarily using the Tachyon Permissions console

In this approach, Tachyon users are added individually using their Active Directory credentials. This approach is more secure than alternatives because all users, roles, and access rights are managed only through the Tachyon Permissions console.

1.7.4.2.3.2 Managing access using Active Directory

Using this approach, Tachyon users are added as Active Directory security groups. Tachyon roles are then associated with those groups, and management of the individual users who can access Tachyon is subsequently done only through Active Directory. There are broadly three options when using this approach:

1. A one-to-one approach where you create a Tachyon-specific role-based Active Directory group for each Tachyon role. For example, you could create a **TCNGApprovers** Active Directory security group, and add that group as a user in Tachyon, and then assign the **All Instructions Approver** role to the user.
2. A many-to-one approach, where you use one or more of your existing role-based Active Directory groups for each Tachyon role. For example, you could use the Active Directory groups for your desktop and help desk teams, create a Tachyon user for each group, and then assign the Tachyon role to all those Tachyon users.
3. A mixture of the above

Note

It is possible for an Active Directory user to be associated with roles for both running and approving actions. In practice, this is safe because Tachyon prevents users from being able to directly approve their own actions regardless of the roles they have been assigned.

1.7.4.2.4 Defining a custom Instruction set 1E role

If you want to base your 1E permissions around access to specific Instruction sets, you will need to create custom 1E roles. The Custom roles section lists built-in custom roles used by 1E Applications.

To create a custom role:

1. Navigate to the **Settings**→**Permissions**→**Roles** page.
2. Click the **Add** button to start the add role process.
3. In the **New Role** page subsequently displayed set the **Name** and **Description**.
4. With the **Instruction Sets** tab selected, select your required Instruction Sets from the list.
5. Set the Instruction set access rights by checking the required **Actioner**, **Approver**, **Questioner** and **Viewer** checkboxes.
6. When the associated rights have been set click **Save** to save your changes and automatically return to the **Roles** page.
7. You can now add assignments of users and groups and management groups to the new custom role by clicking the link in the **Assignments** column.
8. Click the **+** (plus icon) to add a new item and, from the **Users and Groups** drop-down menu either search for, or select the users or groups you want to associate the role with.

9. From the **Management Group** drop-down menu either search for, or select the management group you want to associate the role with. This can either be the built-in **All Devices** or a management group you have created in **Settings→Permissions→Management groups**.

10. Click the **Save** button to associate the selected options with the custom role.

The following rights can be set for an Instruction set, these relate to the primary operator roles of the 1E system:

Right	Description
Actioner	Able to run actions defined in the Instruction Set.
Approver	Able to approve actions defined in the Instruction Set for anyone other than self. If email is enabled, will receive an approval request email for each requested action in the Instruction Set.
Questioner	Able to ask questions defined in the Instruction Set.
Viewer	Able to view responses to questions run from the Instruction Set.

Note

For details about how to load Instruction Definitions into 1E and then create, populate and delete Instruction sets, refer to the Instructions Menu page.

1.7.4.3 Configuring Access Rights - tutorial

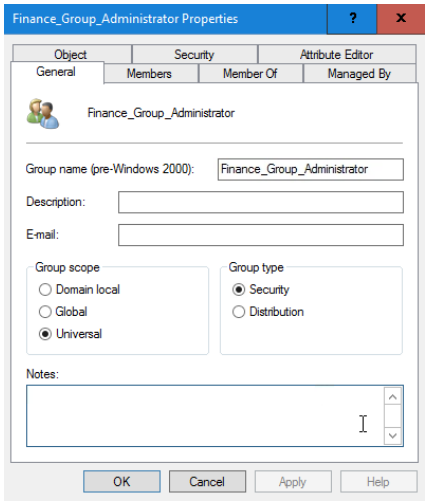
A quick tutorial on configuring access rights for Tachyon. Using a scenario where access to Tachyon will be managed through Active Directory groups, the tutorial illustrates the general setup required and the particular steps needed to add users.

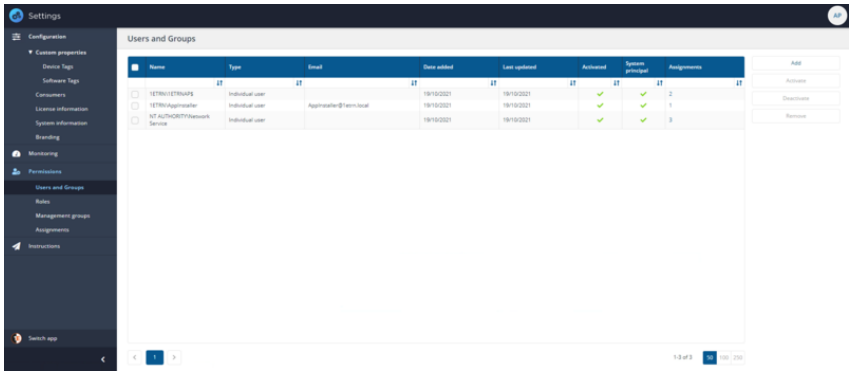
In this tutorial

In this tutorial we demonstrate a process for creating Active Directory (AD) managed permissions to the Tachyon portal. We use specifically created AD groups for each of the Tachyon system roles and create users for each one, we then define a custom role for a specific Instruction Set and create a user with an existing AD group that provides access to running actions in the Instruction Set.

1.7.4.3.1 Example AD group a Tachyon system role

As mentioned in Users and Groups page, we recommend that the AD security groups used for defining access to the Tachyon portal features are defined as **Universal** groups. The picture shows an example AD **Finance_Group_Administrator** security group intended for a **Group administrator** role. In our example, the **Finance_Group_Administrator** AD group is for workstation administrators of an AD OU called **Finance**.





1.7.4.3.2 1E roles

In this tutorial we will create an example 1E Azure Active Directory group user based on the possible roles given in the following 1E system and custom roles.

> **Tip**
>
> On the Roles page, you can see at a glance which 1E roles are system or custom roles, by using the icon in the **Name** column:

- System roles are indicated by an icon with a padlock

- Custom roles are indicated by an icon with a cog wheel

1.7.4.3.2.1 System and custom roles

Refer to Roles and Securables for a complete reference for the following:

- Platform system roles.
- The custom roles used by 1E applications.
- For customers upgrading from Tachyon Platform 5.2 or earlier, a list of role names that are automatically renamed.

1.7.4.3.3 Creating 1E users or groups

The general steps for creating a new user or group are as follows:

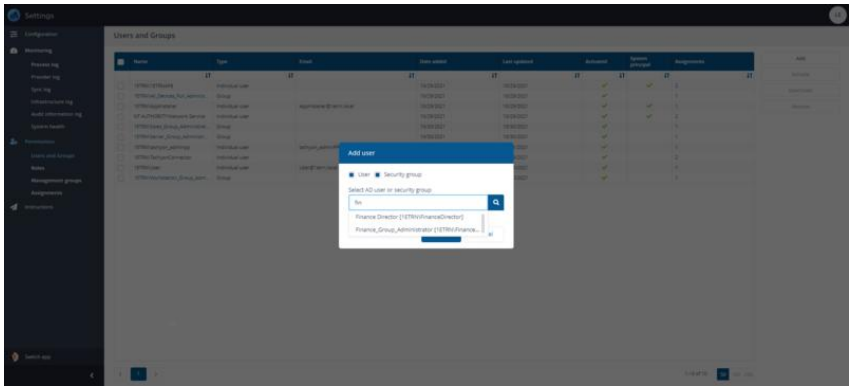
1.7.4.3.3.1 Adding 1E users

1. Log on to the 1E portal using a 1E user account with the **Full Administrator**, or the **Installer** role if it is a new 1E installation.
2. Navigate to the **Settings→Permissions→Users and Groups** page.
3. Click on the **Add** button, doing this displays the **Add user** popup.
4. In the **Select user or group** field, type the name, or part of the name, for the user or group that you want to add, then click the search icon.
5. Select the user or group from the list of matching names displayed in the drop-down list and click **Add**.

On the **Settings→Permissions→Users and Groups** page, after clicking the **Add** button, the **Add user** popup is displayed.

In the **Select user** edit field we type **FIN** because it is the first few characters of our group in our environment.

We then select the **Finance_Group_Administrator** group from the list. Once the group has been selected we click **Add** to create the new 1E user.



We then click the new **Finance_Group_Administrator** account's **Assignments** link to display the details for that group on the **Assignments** page.

> **Tip**
>
> Clicking the name of the group displays any AD accounts you have added to the Universal group using **Active Directory Users and Computers**.

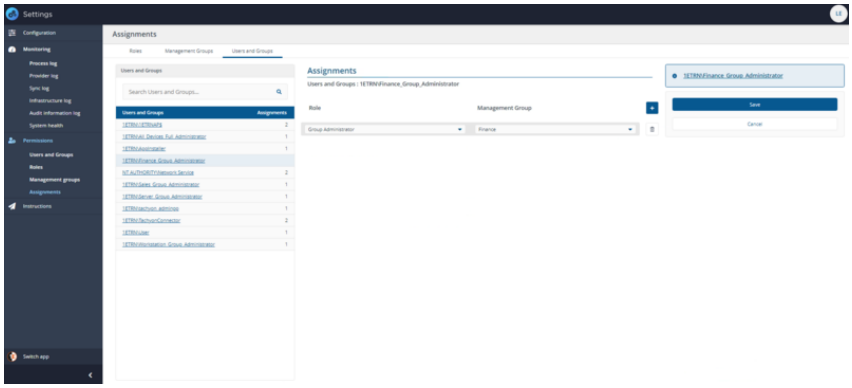
From here we can add assignments to our group account and the Management Group they will apply to.

In this case we choose the **Group Administrator** role for our **Finance** Management Group. We do not want our administrators for the Finance division to work on servers, or on devices belonging to other departments who have their own administrators, once we are satisfied with the changes, we click **Save**.

> **Note**

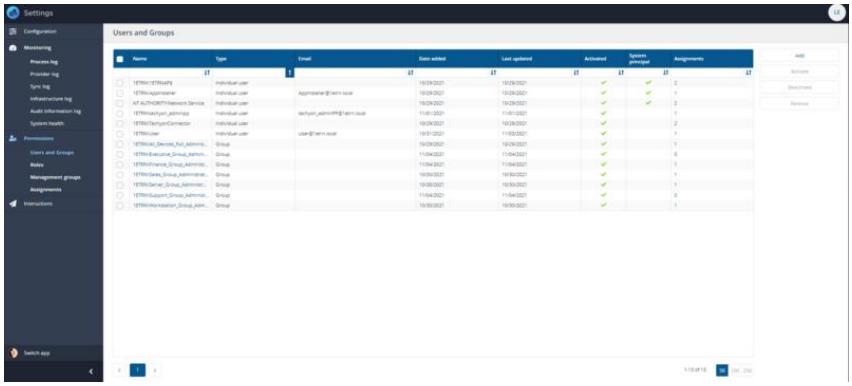
Refer to the Roles page for details about creating custom roles and a list of all built-in custom roles used by Tachyon Applications.

After the new user or group has just been added, 1E will display notifications for a short while showing the actions that have just been successfully performed.



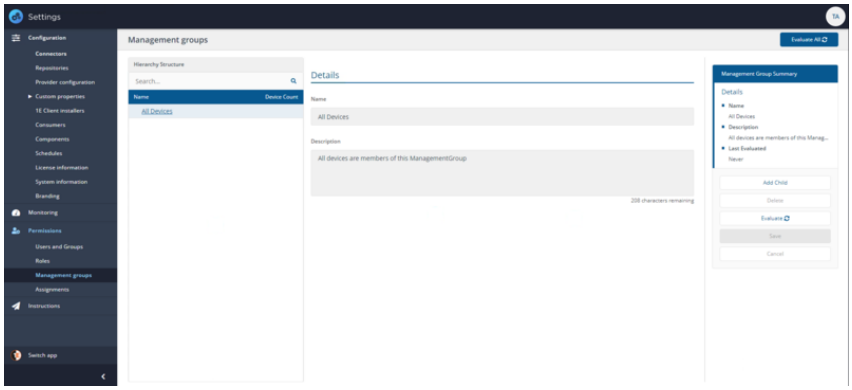
In the tutorial we then repeat the process of finding groups, adding 1E roles and saving for each of the 1E system roles. The purpose of this is that subsequently, specific user access to 1E can be managed through your Identity Provider using membership of selected groups and avoiding the necessity of managing the users through 1E.

The result of adding the groups can be seen in the picture.



1.7.4.4 Management Groups page

Management Groups are containers used to group devices and the software installed on those devices. Management Groups are defined using configurable rules that look at various properties of the devices and their installed software, these are then evaluated to determine the group membership. This means that Management Group membership adapts to changes to the devices and software in your environment.



1.7.4.4.1 Management Groups overview

Management Groups are used by 1E to determine:

- The targets for questions, actions, and reporting
- User permissions for targeting to particular devices based on Management Group membership.

In terms of permissions for determining how 1E users interact with the devices in your network, Management Groups work alongside Instruction sets.

In 1E, Management Groups are created in two different ways:

- **Rule based** - the page lets you add, edit, delete and evaluate Management Groups that are based on rules
- **Direct based** - these use scripts to create Management Groups by importing lists of devices using FQDN names only, this type of Management Group has no associated rules and cannot be edited and evaluated from the Management Groups page. 1E recommends using the 1E PowerShell Toolkit.

Both types of Management Group have the following properties:

- Each device known to 1E can be assigned to any number of Management Groups.
- Roles can be associated with specific Management Groups, so that users with those roles will only be able to target the devices in their Management Groups
- Management Groups can only contain devices, and they are completely independent of any other Management Group, even if they contain the same devices
- Each Management Group must have a unique name which is not case-sensitive.

Note

Please note the following considerations:

- Devices not assigned to any child Management Group will still be accessible, as all devices are members of the default **All Devices** Management Group
- Child Management Groups can only be created under the default **All Devices** Management Group

- The maximum number of child Management Groups are four (Five, including **All Devices**)
- However, there is no current limit on the number of child or "sibling" Management Groups which can be created.

1.7.4.4.1.1 Permissions

The following roles can add Users and Groups, Roles, Management Groups, Assignments, and Delegation:

- Full Administrator
- Group Administrator - cannot create roles unless they are delegated.

You can find out more about the system and custom roles available in 1E on the Roles page.

1.7.4.4.1.2 Connectors

Management Groups use device data stored in an Inventory repository, which is populated using one or more inventory connectors, as described in Connectors page. This is sufficient for inventory-based applications like AppClarity, Application Migration, and Patch Success.

If you want client-based applications like Explorer, Experience and Guaranteed State to use the Management Groups, then you must add a Tachyon Connector, which synchronizes its own data with inventory data. The username and password you provide for the Connector must be a valid user and belong to the **Management Group Administrator** role. Please refer to the Tachyon connector page for more details. You only require to configure the connector, you do not need to schedule or run the Tachyon connector unless you also want to collect data from clients.

> **Note**
>
> To take advantage of your Configuration Manager database and pull in its inventory and usage data, you'll need to configure a System Center Configuration Manager connector in your Tachyon system.

1.7.4.4.2 Creating direct-based Management Groups

Direct-based Management Groups are created using scripts. Two sample PowerShell scripts are provided.

- Each script creates a new log file in the same folder, with file name format as **<scriptname>_<ddMMyyyyhhmmss>.log** which must be deleted manually.
- If a Management Group already exists with the same name, the script will delete and recreate it, only with the new devices provided
- If the file or collection includes a device that is not present in the Tachyon Inventory repository, then it is ignored, and logged
- After a successful run, the script triggers a Management Group sync.

Once imported into Tachyon, your direct-based Management Groups will be added as child groups of the default **All Devices** Management Group.

1.7.4.4.2.1 Prerequisites

- User must have read/write permission in the folder where the PowerShell script is present
- User must use **UseCustomCredentials** parameter if the current logged-in user does not have permission in Tachyon to create Management Groups
- If Windows Task Scheduler is used to run a script, then the scheduled task should provide the current logged-in user.

1.7.4.4.2.2 Create Direct-based Management Groups from a file

Note

This script has changed to support an API change in Platform 8.1

Version 2.0

Disclaimer
Your use of this software is at your sole risk. All software is provided "as-is
", without any warranty, whether express or implied, of accuracy, completeness,
fitness for a particular purpose, title or non-infringement, and none of the so
ftware is supported or guaranteed by 1E. 1E shall not be liable for any damages
you may sustain by using this software, whether direct, indirect, special, inci
dental or consequential, even if it has been advised of the possibility of such
damages.

If you have an issue using this software, please ensure you are using an unmodi
fied version before contacting 1E Support.

.DESCRIPTION
This script reads the Device FQDN list in files and creates Direct Membership M
anagement Groups through SLA/Tachyon APIs. If the group does not exist
it is created and devices are added. If the group exists, the existing devices
are deleted and new devices are added.

.PARAMETER TachyonApiBaseUrl
Mandatory parameter.  The header name used to access the Tachyon web service.
Should match the header listed in the IIS bindings on the Tachyon server.

.PARAMETER FolderPath
Mandatory parameter.  The name of the input folder which contains the files to
```

```
be used in creating Direct Membership Management Groups. These files contain
the list of devices to be used in creating Management Groups.  The File name sh
ould be same as the name of Name of Management Group. Also, the first line
of the file should contain the description of Management Group to be created, f
rom next line onwards every line contains the Device FQDN.

.PARAMETER UseCustomCredentials
Optional switch.  If UseCustomCredentials is used, User will be prompted to ent
er the credentials, otherwise the script will use default credentials.

.EXAMPLE
.\Create-DirectManagementGroupUsingFile.ps1 -TachyonApiBaseUrl https://tachyon.
lab.local -FolderPath C:\Temp\MgFolder

Scenario:
A Tachyon server is accessed using URL https://tachyon.lab.local/Tachyon using
default credentials.  The files containing the Device FQDN list
is in the directory C:\Temp\MyFolder.

.EXAMPLE
..\Create-DirectManagementGroupUsingFile.ps1 -TachyonApiBaseUrl https://tachyon
.lab.local -FolderPath C:\Temp\MgFolder -UseCustomCredentials

Scenario:
A Tachyon server is accessed using URL https://tachyon.lab.local/Tachyon using
different credentials other than current default credentials.
The files containing the Device FQDN list is in the directory C:\Temp\MyFolder.

```
.\Create-DirectManagementGroupUsingFile.ps1 -TachyonApiBaseUrl https://tachyon.
testlab.com -FolderPath C:\Temp\DeviceFolder -UseCustomCredentials
```

Parameter name	Mandatory	Description
TachyonApiBaseUrl	Yes	Platform base URL, for example: https://tachyon.lab.local
FolderPath	Yes	Folder path which contains files containing Device FQDN list
UseCustomCredentials	No	Use custom credentials (the script will prompt) otherwise current windows credentials will be used to call APIs.

1. Create a folder which will contain text files to create Management Groups. This is the FolderPath passed as a parameter in the PowerShell script.
2. Create text files in the above folder with the name same as Management Group(e.g. ManagementGroupName.txt)
   - Enter **Management Group Description** in first line
   - Enter one or more **Device FQDN** from second line onwards, one device per line.
3. Optionally add more files if you want to create multiple Management Groups.
4. Execute the PowerShell script.

Note

To ensure all devices are present in the Tachyon Inventory repository, ensure you have configured a Connectors page for the inventory source you are using to create your device lists.

1.7.4.4.2.3 Create Direct-based Management Groups from a Configuration Manager collection

.DESCRIPTION
This script reads the memberships of ConfigMgr Collections (Both Direct and Que
ry based membership) and creates Direct Membership Management
Groups through SLA/Tachyon APIs. If the group does not exist it is created, and
devices are added. If the group exists, the existing devices
are deleted and new devices are added. The script is designed to run from the C
onfigMgr server It queries WMI and gets the information
necessary to connect to the ConfigMgr's site namespace.

.PARAMETER TachyonApiBaseUrl
Mandatory parameter.  The header name used to access the Tachyon web service.
Should match the header listed in the IIS bindings on the Tachyon server.

.PARAMETER FilePath
Mandatory parameter.  The name of the input file which contains the list of col
lections to be used in creating Direct Membership Management Groups.  Each line
in file
contains Collection Name, Management Group Name, and Management Group Descripti
on; all three values separated by a comma.
```

```
e.g.
Collection 1,Management Group 1, Management Group 1 Description
Collection 2,Management Group 2, Management Group 2 Description

.PARAMETER UseCustomCredentials
Optional switch.  If UseCustomCredentials is used, User will be prompted to ent
er the credentials, otherwise the script will use default credentials.

.EXAMPLE
.\Create-DirectManagementGroupUsingCmCollection.ps1 -TachyonApiBaseUrl https://
tachyon.lab.local -FilePath C:\Temp\Collection.txt

Scenario:
A Tachyon server is accessed using URL https://tachyon.lab.local/Tachyon using
default credentials.  The file containing the list of collections to process
is in the location C:\Temp\Collection.txt.

.EXAMPLE
..\Create-DirectManagementGroupUsingCmCollection.ps1 -TachyonApiBaseUrl https:/
/tachyon.lab.local -FilePath C:\Temp\Collection.txt -UseCustomCredentials

Scenario:
A Tachyon server is accessed using URL https://tachyon.lab.local/Tachyon using
different credentials other than current default credentials.
The file containing the list of collections to process is in the location C:\Te
mp\Collection.txt.

nd.Name -Type Message
```

```
.\Create-DirectManagementGroupUsingCmCollection.ps1 -TachyonApiBaseUrl https://
tachyon.testlab.com -FilePath C:\Temp\Collection.txt -UseCustomCredentials
```

Parameter name	Mandatory	Description
TachyonApiBaseUrl	Yes	Platform base URL, for example: https://tachyon.lab.local">https://tachyon.lab.local
FilePath	Yes	File path, which contains details of CM Collections.

Parameter name	Mandatory	Description
UseCustomCredentials	No	Use custom credentials (the script will prompt) otherwise current windows credentials will be used to call APIs.

1. Create a text file which will be passed as a parameter in PowerShell script.
2. In the file enter the following as a comma separated single line:
   Collection name, Management Group Name, Management Group Description
3. Optionally, enter more lines in the same format if you want to create multiple Management Groups.
4. Execute the PowerShell script.

Note

This script is designed to be run on the Configuration Manager Site server.

To ensure all CM devices are present in the Tachyon Inventory repository, ensure you have a System Center Configuration Manager connector and run its Data Sync action to populate the repository.

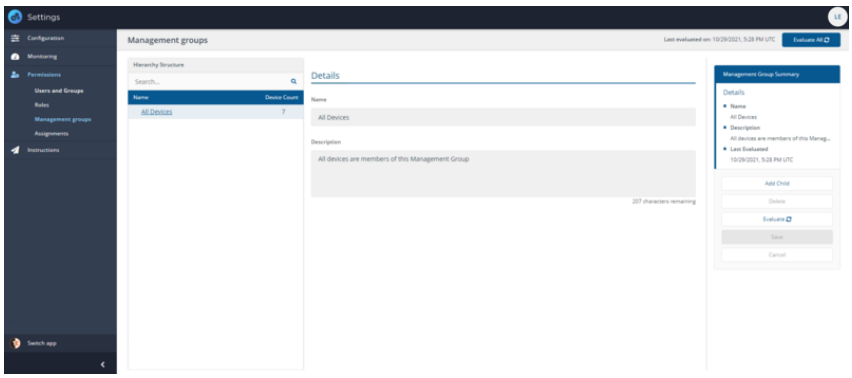
1.7.4.4.3 Working with direct-based Management Groups

Given the information provided in Creating direct-based Management Groups we can now give an example of how direct-based Management Groups can be added.

1.7.4.4.3.1 Before adding the direct-based Management Groups

In our example, we do not have any Management Groups except the default **All Devices** group with a total of all seven devices in our network, as shown in the picture opposite.

Once imported into Tachyon, your direct-based Management Groups will be added as child groups of the default **All Devices** Management Group.

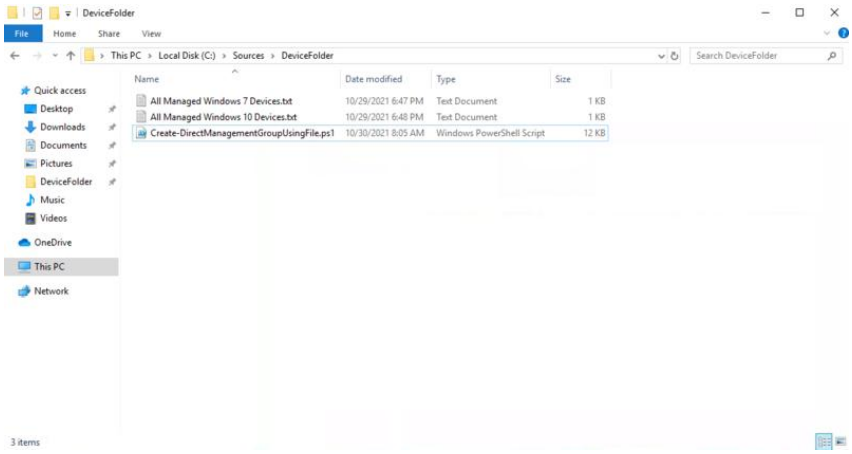


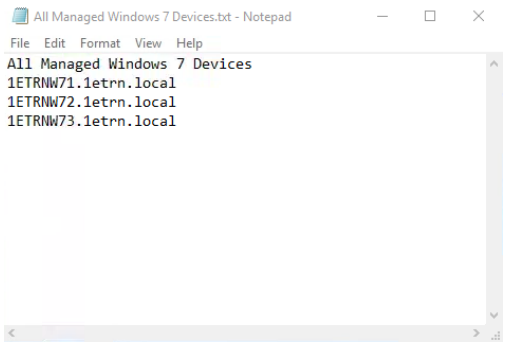
1.7.4.4.3.2 The device files

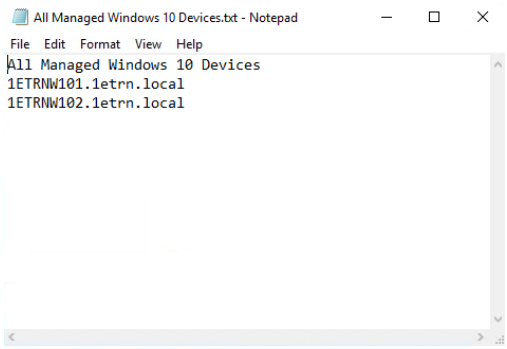
We've created a **C:\Sources\DeviceFolder** folder and added two files,
All Managed Windows 10 Devices.txt and **All Managed Windows 7 Devices.txt** that contain a list of device FQDN on separate lines.

We have also added the **Create-DirectManagementGroupUsingCmCollection.ps1** script to this folder, in our example we'll run the script from the same folder as the text files.

> **Tip**
>
> Unlike Rule based Management Groups, once a direct based Management Group is added to Tachyon, you cannot later change the name.
>
> To distinguish your direct-based Management Groups from your rule based groups, you should give them a meaningful naming convention, for the purposes of our example we have just used All Managed Windows as a prefix to indicate them.







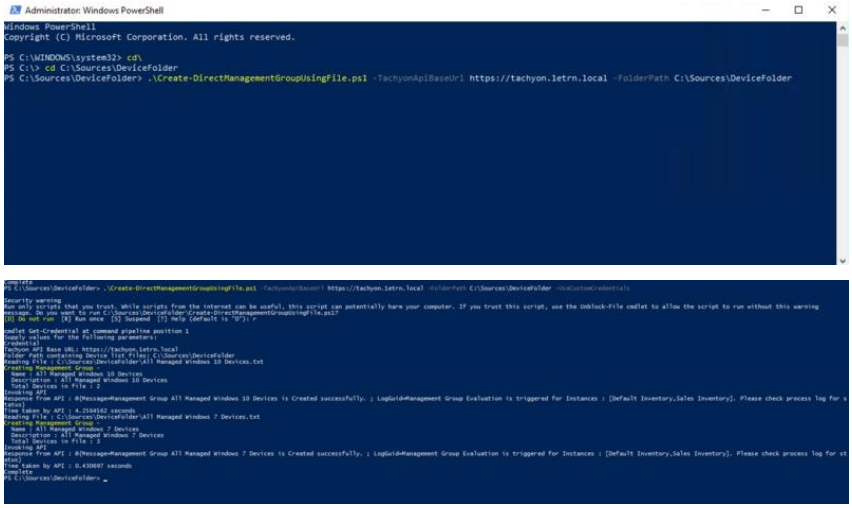
1.7.4.4.3.3 Running the script to populate the direct-based Management Groups

With the device files in place, in our example, we run the **Create-DirectManagementGroupUsingFile.ps1** file with the following command-line:

```
.\Create-DirectManagementGroupUsingFile.ps1 -TachyonApiBaseUrl https://tachyon.
testlab.com -FolderPath C:\Temp\DeviceFolder -UseCustomCredentials
```

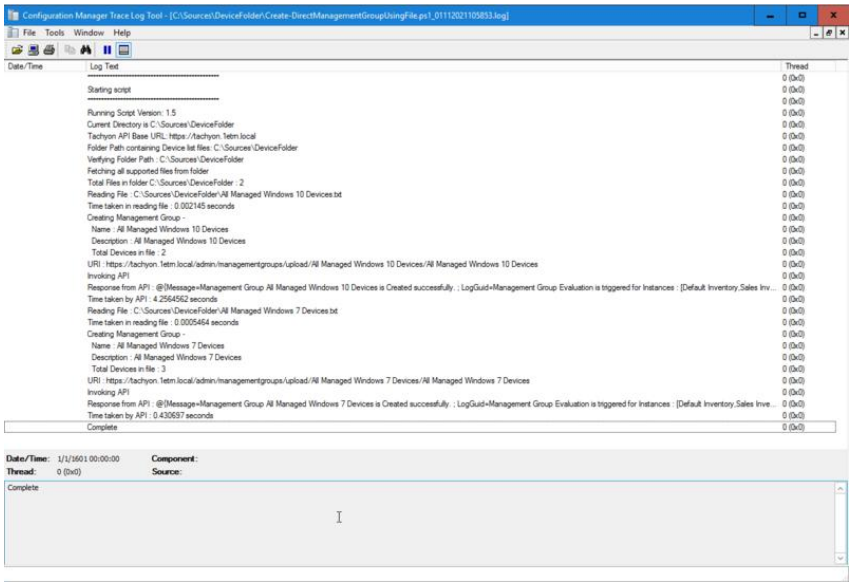
Where the **TachyonApiBaseUrl** is set to our example instance of **https://tachyon.1etrn.local** and the **-FolderPath** is set to the **C:\Sources\DeviceFolder** we set up earlier.

We don't bother with the **UseCustomCredentials** setting as the account we are running the script with has administrator permissions in Tachyon.



1.7.4.4.3.4 Checking the log file for Create-DirectManagementGroupUsingFile.ps1

After running the script you will find a log file is created in the same directory where the **Create-DirectManagementGroupUsingFile.ps1** is located. In our example we can see that the script completed without errors.



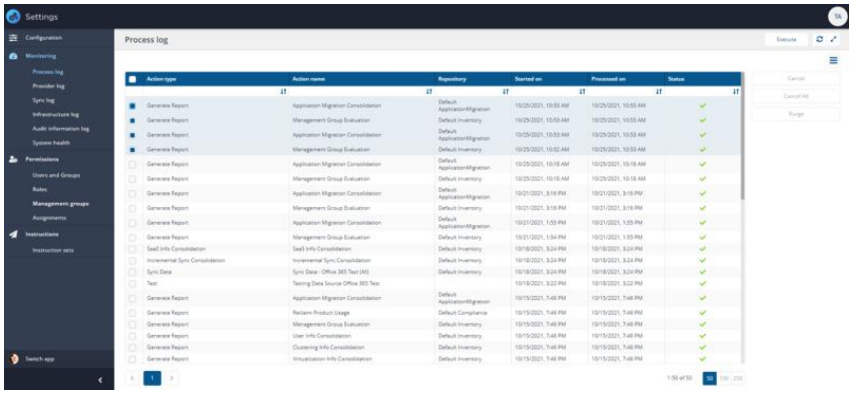
1.7.4.4.3.5 The reports for creating and enabling the direct-based Management Groups

When the direct-based Management Groups are added to Tachyon some reports will run to enable the Management Groups to be used.

If more than one direct-based Management Groups are being added you will see two **Management Group Evaluation** reports run on the default **Inventory** repository. You will also see an additional Management Group Evaluation report run on each additional non-default inventory repositories you have in your system.

If you have Application Migration installed you will also see two **Application Migration Consolidation** reports run on the default **ApplicationMigration** repository.

In our example we have Application Migration installed, so we see four reports run when the DB Management Groups are added. Two **Management Group Evaluation** reports and two **Application Migration Consolidation** reports, as can be seen in the picture.

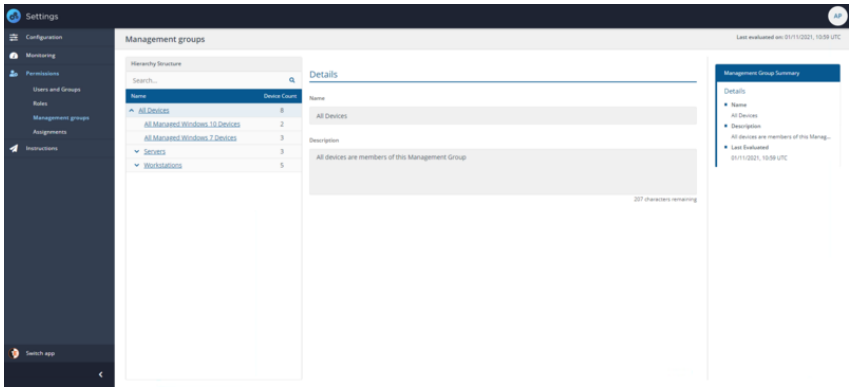


1.7.4.4.3.6 The direct-based Management Groups added

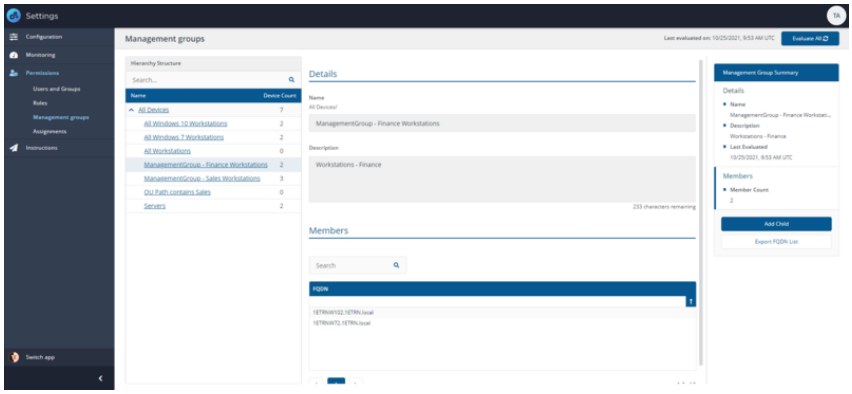
After running the script, two new direct-based Management Groups get added:

- **All Managed Windows 10 Devices.txt**
- **All Managed Windows 7 Devices.txt**

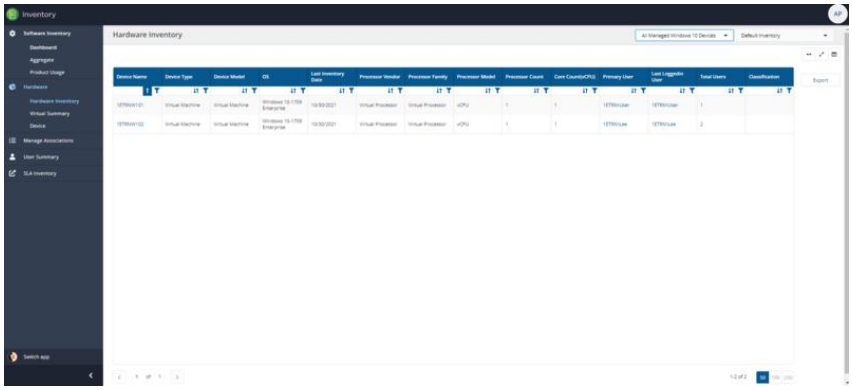
You can drill down to see the details of a Management Group by clicking the **Name** link.



Clicking on the **All Managed Windows 10 Devices.txt** Management Group name link displays the details for that Management Group. Here, you can view group members, export the membership as a .TSV file or add Child Management Groups as required.



You can use the **Inventory→Hardware Inventory** page with the Management Group selector set to the name of the Management Group, to view every device contained in the new Management Group.



1.7.4.4.4 Working with rule-based Management Groups

Rule-based Management Groups are defined and maintained in the **Settings**→Permissions→Management Groups page. They use device inventory data gathered from data sources by connectors and use Management Groups to control how instructions are applied in Tachyon applications. All child Management Groups must be created under the default **All Devices** Management Group.

You can easily create complex Management Group definitions by building rules for them, you'll find this in the **Rules** section of each Management Group. In the Rules section, you can define parameters that determine what devices are members of your Management Groups. The rules you create can be as simple as defining membership according to the OU path in your AD, or as complex as adding groups of rules that narrow membership down to details like **Processor Matched Threads per Core**. You can also use device or software tags that you have created to define Management Group membership, or a combination of all these parameters.

By default, in a new installation of Tachyon, all devices are members of the **All Devices** group. If you have upgraded from a previous version of Tachyon, your previously created Management Group will be preserved and will become a child Management Group of **All Devices** Management Group.

You can create **Child** Management Groups and nest them into a **Hierarchy Structure** where child Management Groups inherit rules from their parent groups.

Using child Management Groups you could create by hand a Management Group structure which mirrors your Configuration Manager collections, or divide your Management Groups by device type, for example into servers

and workstations. You can use the delegation feature to create Management Groups that mirror your organizational structure with associated delegated roles.

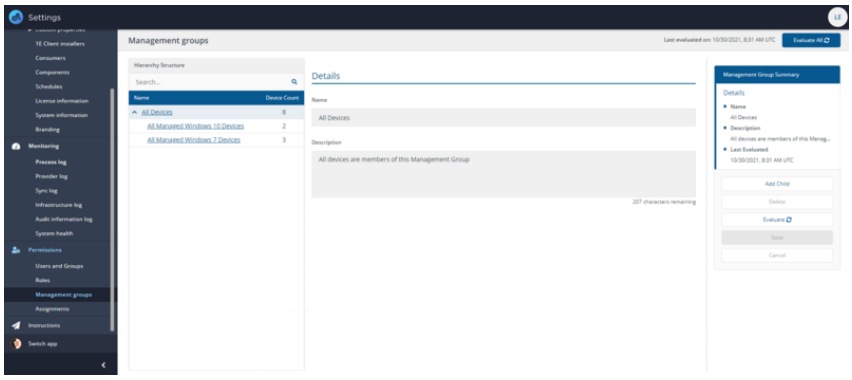
To find out how to use scripts to import a Management Group structure from a file or from Configuration Manager collection, refer to Creating direct-based Management Groups.

Note

Refer to Management Groups - tutorial for a conceptual example of how you might create a **Hierarchy Structure**, and for details about how you can use the delegation feature.

The following sections walk through the basic steps required to:

- Creating a rule-based Management Group
- Editing a rule-based Management Group
- Deleting a Management Group
- Evaluating Management Group membership.



1.7.4.4.4.1 Creating a rule-based Management Group

In this example we will create a Management Group for devices that are based in a different office location, this location contains Windows 7 devices and is named Sales. The new Management Group is going to be a child group of the **All Devices** group.

To create the rule-based Management Group:

1. Navigate to the **Settings**→**Permissions**→**Management Groups** page.
2. Click the **Add Child** button to display the new Management Group template.
3. Enter a suitable **Name** for the Management Group. For example **Sales**.
4. Add a **Description**, it's a good idea to use a description that provides an outline of the rules that are used to populate the Management Group. For example **OU Path Contains Sales.**
5. To add each rule:
    a. Click on the **Add rule** button. The first one is already added, all you need to do is fill out the parts of the rule.
    b. First, you select the rule name and description, for example, **OU Path**.

c. You then select the condition. For example **Contains**.

d. To complete the rule you then set the value. For example **Sales**.

e. Click **Save**.

6. Repeat step 5 for each rule you want to define.

7. When you have more than one rule added, you can:

   a. Use the gripper icon at the right-hand end of the rule to change the order the rules are applied by dragging the rule to a new place in the list.

   b. Change the conjunction operator at the left-hand end of the rule to select between **AND** and **OR**.

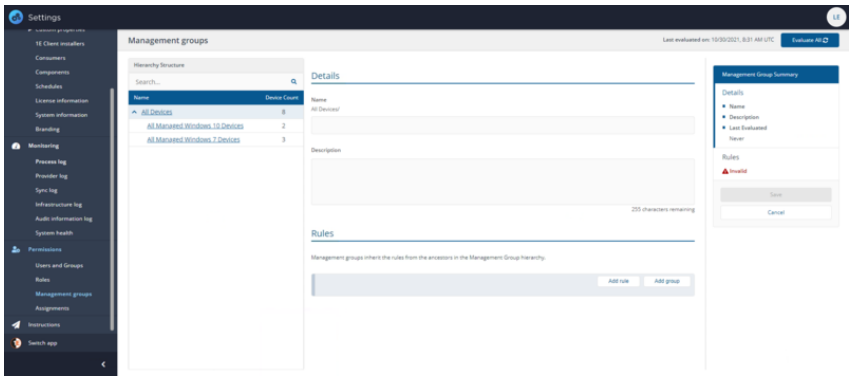
8. When you have finished adding the rules, you need to decide whether you want the Management Group membership to be evaluated immediately on adding the Management Group. If you are just adding one Management Group, it makes sense to click the **Evaluate** button. If you are adding a number of Management Groups, it may be a good idea to leave Click the **Evaluate All** button at the top of the page.

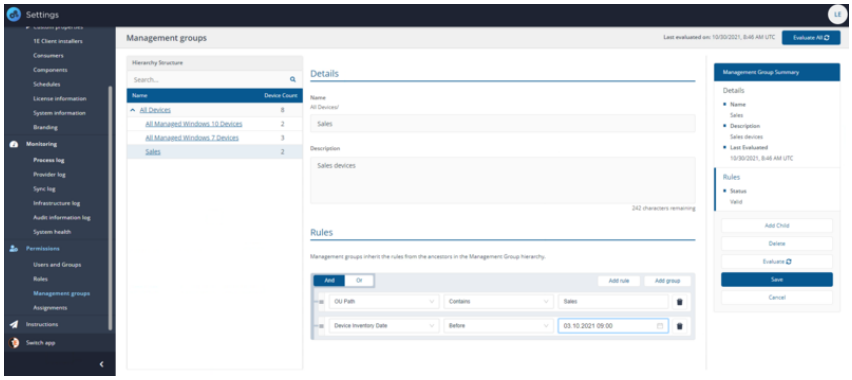
9. If you click **Evaluate All** and there is more than one inventory repository an additional control will be displayed prompting you to select which repository you want to evaluate the Management Group rules against.

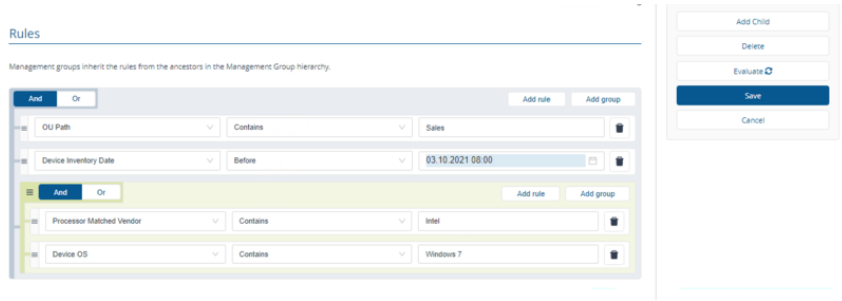
The Management Group will be added to the **Hierarchy Structure**.

Tip

You can create nested groups of rules using the **Add group** button. For example, we want to narrow the devices in the Sales group to those devices with an Intel processer and an OS of Windows 7 as we want to upgrade this legacy OS.



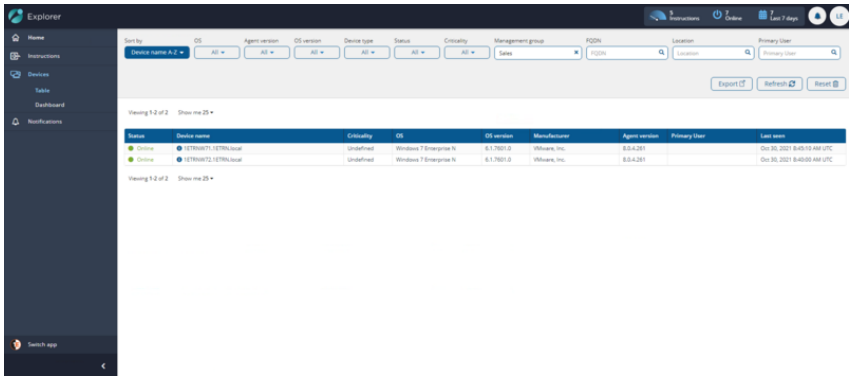




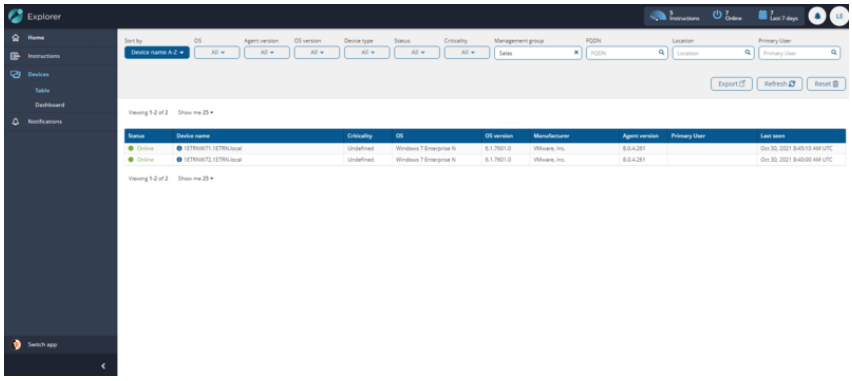
If you selected to evaluate rules immediately, the rules you set for the Management Group will be evaluated against the selected inventory repository.

To check how many devices are in the Management Group, switch to the **Inventory** app, select the Management Group name from the drop-down.

The picture shows the details for the **OU Path contains Sales** Management Group, showing that it contains **2** devices.



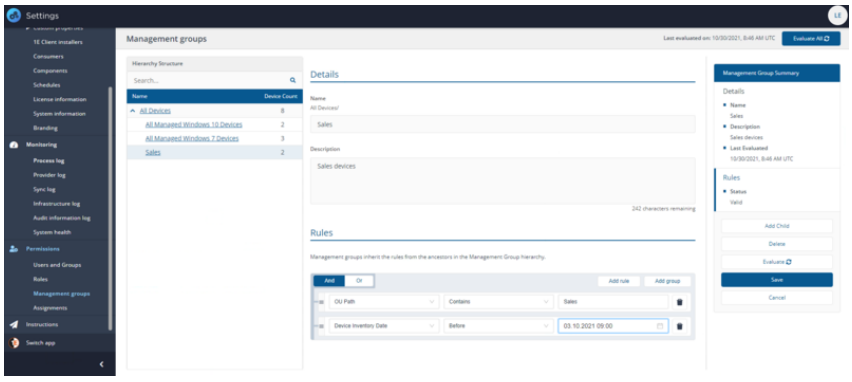
Once the Management Group rules have been evaluated, you should then be able to check the devices in Explorer contained in the group using the **Explorer→Devices→Table** page. The picture shows the **Devices** table with the **Management Group** filter set to **Sales**.



1.7.4.4.4.2 Editing a rule-based Management Group

To edit an existing rule-based Management Group:

1. Navigate to the **Settings**→**Permissions**→**Management Groups** page.
2. In the **Management Groups** table, locate the Management Group you want to edit and click the title at the left-hand end of its row in **Hierarchy Structure**.
3. Here you can edit the **Name**, **Description** and **Rules** that define the Management Group.
4. When you've finished editing, before you click the **Save** button you can click **Evaluate**, enables any modifications you've made to the rules to take effect right away. If you don't check the box, the rules won't be run, but you'll be able to evaluate the Management Groups later.

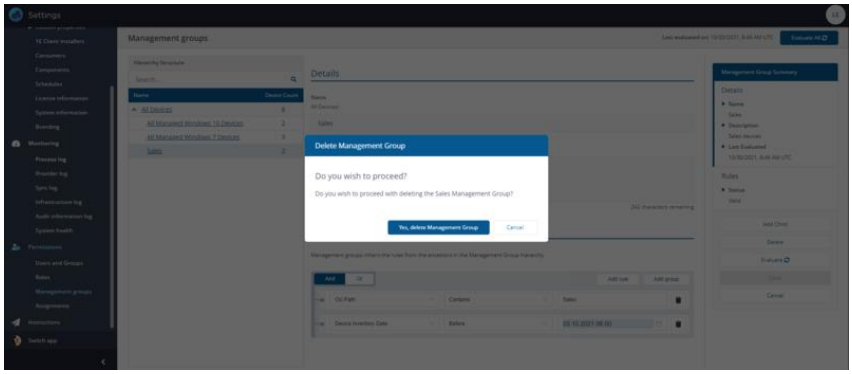


1.7.4.4.4.3 Deleting a Management Group

The following applies to rule-based and direct-based Management Groups.

To delete an existing Management Group:

1. Navigate to the **Settings**→**Permissions**→**Management Groups** page.
2. In the **Management Groups** table, locate the Management Group you want to delete and click the title at the left-hand end of its row in **Hierarchy Structure.**
3. Click the **Delete** button. This displays the **Delete Management Group** popup.
4. Here you are asked if you want to proceed with the delete process. Click the **Yes, delete Management Group** button to confirm the deletion, or **No** to cancel.



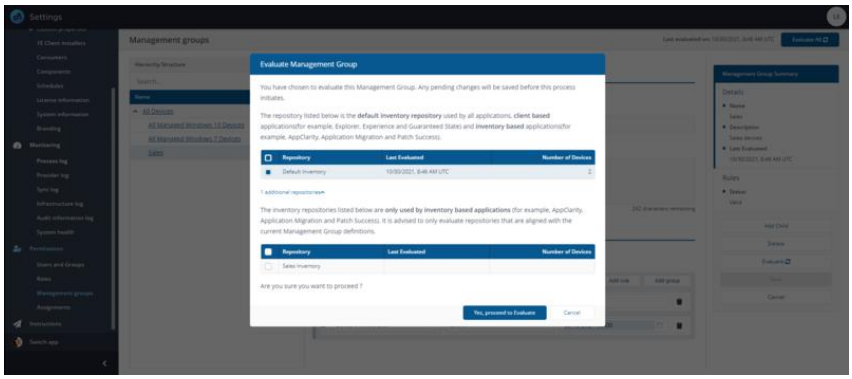
1.7.4.4.4.4 Evaluating Management Group membership

You can select to evaluate the Management Groups at any time.

Note

When a parent Management Group gets evaluated, all child Management Groups also get evaluated.

1. Navigate to the **Settings→Permissions→Management Groups** page.
2. Click the **Evaluate** button.
3. If there is only one inventory repository, the evaluation will be queued immediately. If there is more than one inventory repository, the **Evaluate Management Groups** popup will be displayed, and you will need to select a **Repository** then click the Evaluate button before the evaluation is queued.
4. When an evaluation is queued you will see a **Management Group Evaluation** action appear on the **Settings→Monitoring→Process** log page. From there you can view the progress of the evaluation.
5. When this action has run, Explorer will reflect any changes that have been made to the Management Group memberships.



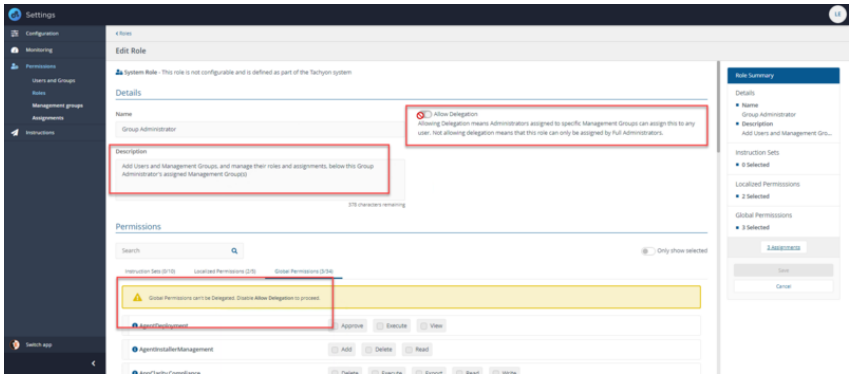
1.7.4.4.4.5 Delegation in Tachyon

Delegation in Tachyon is, a concept where an administrator can delegate some of their own responsibility to other users and limit the area where they can use that responsibility. In Tachyon, a Full administrator can create and modify Roles. They can also assign any Role to a Tachyon user or group using Management Groups, there are exceptions, like the **Group Administrator** Role which cannot be assigned to **All Devices**.

For example, a local security administrator with the **Group Administrator** role cannot create or modify Roles, but they can assign any Role that is marked as delegatable to a Management Group they have the security permission on, or any of its child Management Groups.

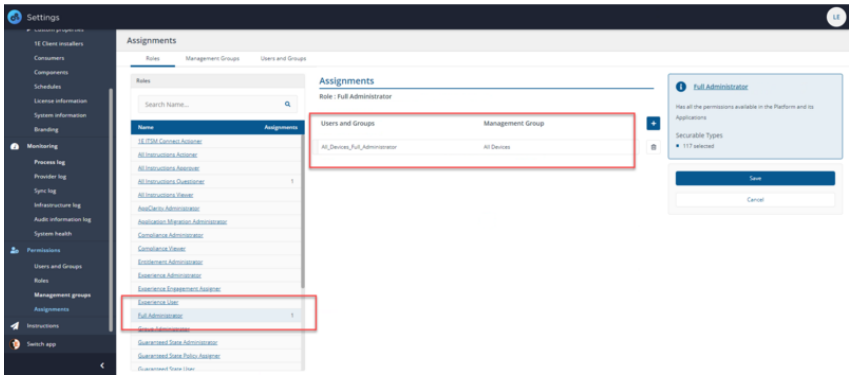
The exception is that a local security administrator cannot assign a Role that has the same security permission using the same Management Group they have permissions on. Instead, they have to use a child Management Group of the one they have security permissions on.

Essentially, a local security administrator cannot create an assignment that would result in another Tachyon user or group having the same security permissions as they do.



1.7.4.4.4.5.1 Delegation example

In our example we have a new Tachyon installation with only a few assignments, the one shown in the picture is of the **Full Administrator** role which is assigned to the group **All_Devices_Full_Administrator** and is assigned to **All Devices**. We have used a group to control the assignment instead of an individual user account.



In our example, we want to use the delegation feature of Tachyon and use the Group Administrator role to delegate some tasks to a child Management Group of **All Devices** called **Servers** to another administrator.

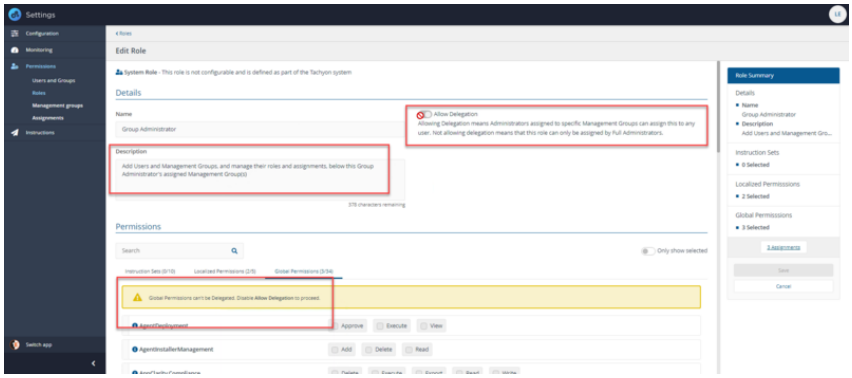
We'll assign the **Group Administrator** role to a Universal AD group called **Server_Group_Administrator** which we have added to Tachyon using the Users and Groups page.

To add the new assignment:

1. On the **Settings**→**Permissions**→**Assignments** page, we click on the title of the role to configure, in this case **Group Administrator** this displays the **Assignments** page focused on that role.

2. Clicking the plus sign button allows us to add our group, **Server_Group_Administrator** and the associated Management Group, **Servers**.

3. Once we've selected the group and Management Group, we click the **Save** button.



When a user in the **Server_Group_Administrator** group signs in to Tachyon, they will be able to create a child Management Group. For example a subset of the **Servers** Management Group for application servers called **App servers**, other Management Groups at the same level are locked because the **Server_Group_Administrator** has not been applied to those Management Groups.

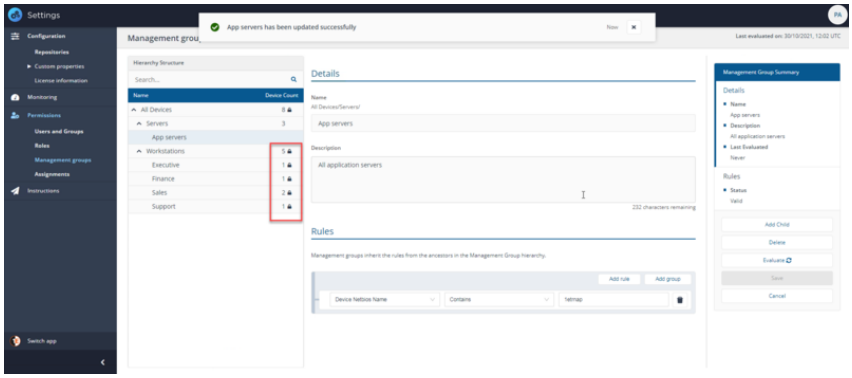
If, for example, our **Server_Group_Administrator** now wants to add a user with the **All Instructions Questioner** role to the new **App servers** Management Group, they can now do so.

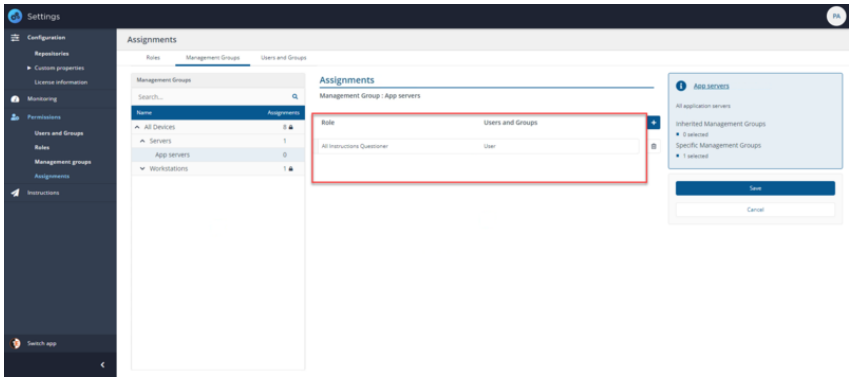
Note

For a complete reference table of Tachyon roles, please refer to the Roles and Securables page.

This page contains a full list of roles, their associated permissions, whether each role is delegatable and notes indicating if the role is new or renamed for the release.

Role	Description
System roles	System roles are built-in and are not configurable, however they can be assigned to users the same as any other role.
Custom roles	Custom roles can be used to define who is able to use specific Instruction Sets to ask questions, run actions or approve actions.
Securables and operations	A Permission is one or more Operations for a Securable. The remit for a Securable is either Localized or Global. A Role that has only Localized permissions can be delegated.





1.7.4.4.5 Management Group rules and conditions

In computing, a Boolean result means an expression is either true (1) or false (0). That is, expressions such as A AND B or A OR B give you a true or false result. Boolean expressions can be much more complex, and you can use brackets (groupings) to keep the same operators together, for example A AND B AND C. You would not write an expression such as A AND B OR C because it is ambiguous. It can be interpreted as either A AND (B OR C) or (A AND B) OR C.

When you are building rules, and you get different results to the ones you expect, write down each of your rules as A, B, C etc, and put them into a simple Boolean expression, like A OR (A AND B) = A.

This is perhaps the most important point to remember when building Management Group rules, and why it helps to write down what you are trying to achieve as a Boolean expression, then simplify it. The Rule examples section has some simple examples of how Boolean expressions translates to the rules you can apply to your own Management Groups.

1.7.4.4.5.1 Rule layout

The rows in the Rules section are laid out as follows:

Conjunction	Rule Name	Operators	Value	Delete	Gripper
When there is more than one rule, this field determines how it	Determines the type of information checked when	How the value compares against the type of information. This may be one of the following:	The value field is either	This field contains	This field lets you

<table>
<tr><th>Conjunction</th><th>Rule Name</th><th>Operators</th><th>Value</th><th>Delete</th><th>Gripper</th></tr>
<tr>
<td>is evaluated with the other rules. This may be one of:

<table>
<tr><th>Conjunction</th><th>Description</th></tr>
<tr><td>AND</td><td>This rule must be satisfied as well as any other rules.</td></tr>
<tr><td>OR</td><td>Either this rule must be satisfied or any other rules.</td></tr>
</table>
</td>
<td>evaluating the rule.

For example, selecting Device Computer Name will specify checking the set value against the information held internally for each device's computer name using the selected operand.

Please refer to List of available rules below.</td>
<td>
<table>
<tr><th>Operator</th><th>Attribute type</th><th>Comparison</th></tr>
<tr><td>Equal to</td><td>String, Date, Number, Yes/No</td><td>Your value is exactly equal to the device’s value.</td></tr>
<tr><td>Not Equal to</td><td>String, Date, Number</td><td>Your value is not equal to (different to) the device’s value.</td></tr>
<tr><td>Before</td><td>Date</td><td>Your date is before the device’s date.</td></tr>
<tr><td>After</td><td>Date</td><td>Your date is after the device’s date.</td></tr>
<tr><td>Begins with</td><td>String</td><td>The device’s value begins with your value.</td></tr>
<tr><td>Ends with</td><td>String</td><td>The device’s value ends with your value.</td></tr>
<tr><td>Less than</td><td>Number</td><td>Your value is less than the device’s value.</td></tr>
</table>
</td>
<td>a string, date, or numeric value, depending on the chosen rule name.

It may also be a Device tag. For more information about Deice tags, please refer to Device Tags page.</td>
<td>an icon that lets you delete the rule.</td>
<td>grab the rule and change its order where there is more than one rule.</td>
</tr>
</table>

Conjunction	Rule Name	Operators			Value	Delete	Gripper
		Less than or equal to	Number	Your value is **less than or equal to** the device's value.			
		Greater than	Number	Your value is **greater than** the device's value.			
		Greater than or equal to	Number	Your value is **greater than or equal to** the device's value.			
		Is one of	Tag	The specified Device tag exists on the device, and its value **is one of** the array of alternative values that you specified.			
		Is not one of	Tag	The specified Device tag exists on the device, and its value **is not one of** the array of alternative values that you specified.			

Conjunction	Rule Name	Operators			Value	Delete	Gripper
		Is Null	String, Date, Number, Tag	The device does not provide this information. If you have specified a Device tag, it does not exist on the device.			
		Is not Null	String, Date, Number, Tag	The device provides this information, but it can be any value. If you have specified a Device tag, it exists on the device, set to any value.			
		Contains	String	The device's value **contains** your text string.			
		Not Contains	String	The device's value **does not contain** your text string.			

1.7.4.4.5.2 Rule examples

The following examples may help to illustrate the logic underpinning the rules you can build and apply to the Management Groups in your environment.

1.7.4.4.5.2.1 Rule example 1

"Device Netbios Name begins with 1ETRNW" OR ("Device Netbios Name begins with 1ETRNW" AND "Device Netbios Name begins with 1ETRN")

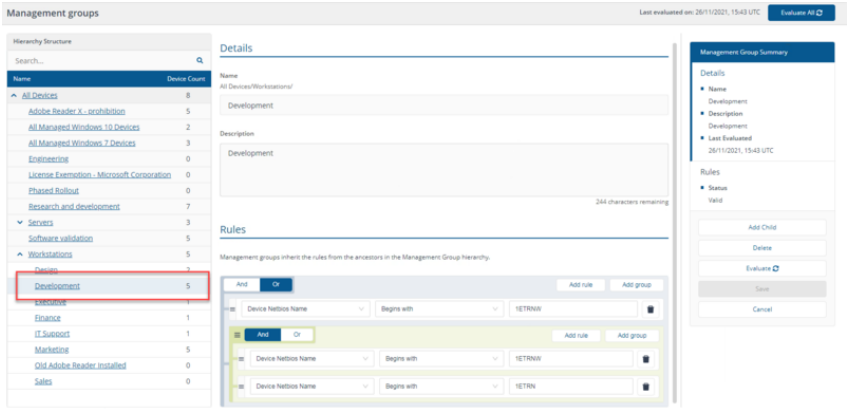
Is the same as saying:

"Device Netbios Name begins with 1ETRNW"

You could reduce this to the statement:

A OR (A AND B) = A

In our environment, this returns all five workstation devices with the NetBIOS name beginning 1ETRNW.

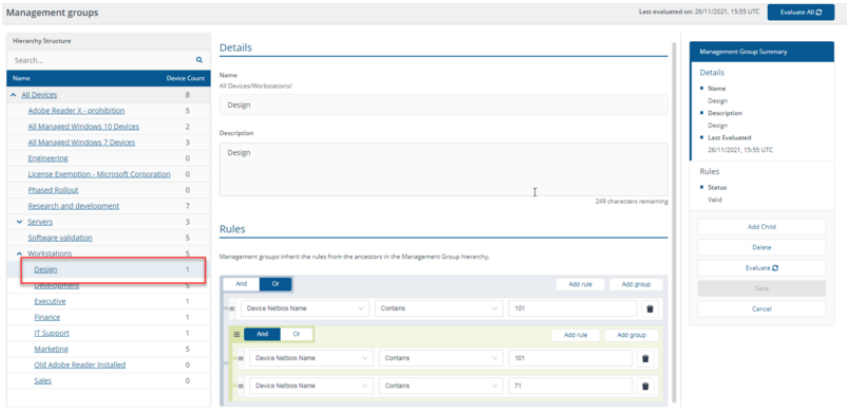


1.7.4.4.5.2.2 Rule example 2

"Device Netbios Name contains 101" OR ("Device Netbios Name Contains 101" AND "Device Netbios Name Contains 71")

Is the same as:

"Device Netbios Name Contains 101"



You could reverse the logic in the statement and say:

"Device Netbios name Contains 101" AND ("Device Netbios name Contains 101" OR "Device Netbios name Contains 71")

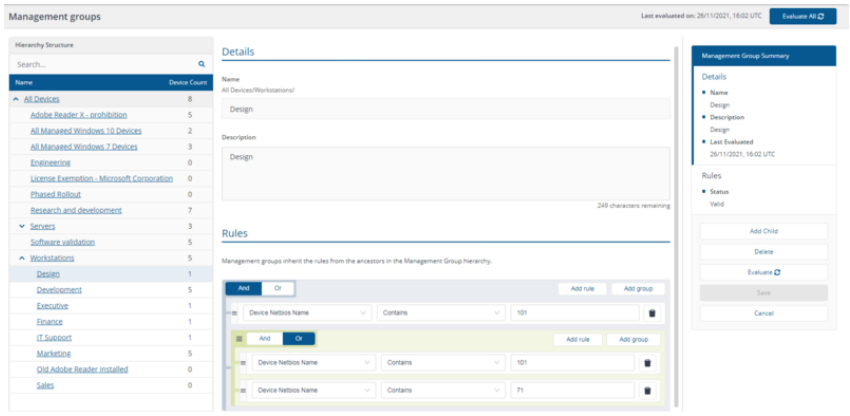
Which is the same as:

"Device Netbios Name Contains 101"

You could reduce this to the statement:

A AND (A OR B) = A

In our environment, this returns one workstation device with the NetBIOS name contains 101, which matches one device, 1ETRNW101.



1.7.4.4.5.2.3 Rule example 3

Management Group rules do not let you place a Boolean NOT operator around a grouping, but you can convert an expression into NOT rules, for example:

NOT ("Device Netbios Name Contains AP" OR "Device Netbios Name Contains CM")

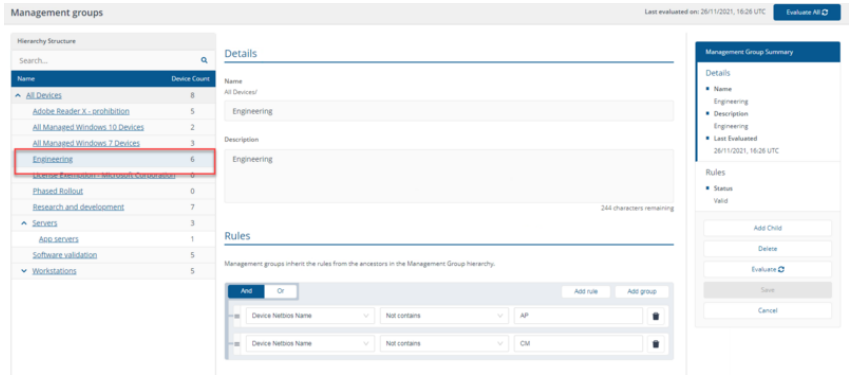
Using rules, you can express this as:

"Device Netbios Name Not contains AP" AND "Device Netbios Name Not contains CM"

You could reduce this to the statement:

NOT (A OR B) = (NOT A) AND (NOT B)

In our environment this returns the six devices where the NetBIOS name does not contain AP or CM, which are 1ETRNAP, our application server, and 1ETRNCM, our Configuration Manager server.



1.7.4.4.5.3 List of available rules

Rules used to create Management Groups, and connectors that provide the data to support the rules.

For details of how to create and use Management Groups, please refer to Management Groups page.

Warning

The number of rules that a single Management Group can contain is variable because of many factors including SQL Server version, server configuration and rule type used. 1E recommends not exceeding 10,000 rules per rule-based Management Group.

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
Device ADSite Name	AD Site the device is connected to.	✓	✓							
Device Assigned Cores	Maximum number of assigned cores for the device. Derived from	✓	✓	✓	✓	✓			✓	
Device Classification	Classification of the device. For example, **Test**, **Production** or **Development**. **Note** **Production** is the default.	✓	✓		✓					
Device Computer Name	Hostname of the computer.	✓	✓	✓	✓	✓	✓	✓	✓	✓
Device Criticality	By default, Device Criticality is set as one of the following, as described in Using Device Criticality. • Undefined • Non-critical • Low • Medium • High	✓	✓	✓	✓	✓	✓	✓	✓	✓

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
	• Critical.									
Device Domain Name	Domain the device is installed on.	✓	✓	✓			✓			
Device Inventory date	Date that the device was last updated.	✓	✓	✓	✓			✓	✓	✓
Device Matched Device Type	Normalized device type based on chassis type. For example **Desktop**.	✓	✓	✓	✓	✓		✓	✓	✓
Device Matched Family	Normalized family of the device. For example, **Aspire**.	✓	✓	✓	✓	✓			✓	
Device Matched Model	Normalized model of the device. For example, **A30**.	✓	✓	✓	✓	✓		✓	✓	✓
Device Matched Socket count	Normalized socket count of the device. For example, **1**.	✓	✓	✓	✓	✓		✓	✓	✓
Device Matched Vendor	Normalized vendor name of the device. For example, **Acer Inc.**.	✓	✓	✓	✓	✓		✓	✓	✓

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
Device Netbios Domain name	NetBIOS version of the device's domain name.	✓	✓	✓						
Device Netbios Name	NetBIOS version of the device name.	✓	✓	✓					✓	
Device OS	The normalized product title of the OS that is running on the device.	✓	✓	✓		✓	✓		✓	
Device Purchase date	Date that the device was purchased.	✓	✓							
Device Serial	Serial number of the computer.	✓	✓				✓	✓		
Device User Primary Username	The primary user of the device.	✓		✓						
OU Name (Deprecated)	Name of the OU that the device is in. For example **Sales**. **Note** All OUs with the same name will be used,	✓	✓							

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
	therefore the **OU Path** rule should be used instead. The **OU Name** rule is deprecated and should be re-defined using **OU Path**. This rule is deprecated, which means it will continue to work until it is removed in a future version of Tachyon.									
OU Path	The name or path of the OU location in the AD hierarchy, using pipe | as the delimiter. For example, to get all the computers in **OU=Sales, OU=Workstations, DC=acme, DC=local** you can either specify **Sales** or - if there is more than one OU called **Sales** in the AD structure - specify the whole path **acme.local|Workstations|Sales**. Note that the DC and OU parts of a distinguished name are treated differently.	✓	✓							

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
Processor Matched Chip Module Count	Normalized chip module count of the processor. For example, **1**.	✓	✓	✓	✓	✓				
Processor Matched Core Count	Normalized core count of the processor. For example, **2**.	✓	✓	✓	✓	✓			✓	
Processor Matched Family	Normalized family name of the processor. For example, **Athlon 64 X2**.	✓	✓	✓	✓	✓			✓	
Processor Matched Model	Normalized model name of the processor. For example, **3250e**.	✓	✓	✓	✓	✓			✓	
Processor Matched Processor Type	Normalized type of the processor. For example, **Desktop**.	✓	✓	✓	✓	✓			✓	
Processor Match	Normalized release date of the processor. For example, **31-03-2008**.	✓	✓	✓	✓	✓			✓	

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
ed Release Date										
Processor Matched Speed MHz	Normalized speed of the processor. For example, **2.100**.	✓	✓	✓	✓	✓			✓	
Processor Matched Threads per Core	Normalized threads per core of the processor. For example, **1**.	✓	✓	✓	✓	✓			✓	
Processor Matched Vendor	Normalized vendor name of the processor. For example, **Advanced Micro Devices, Inc**.	✓	✓	✓	✓	✓			✓	
Product Catalog Colloquial Version	Software colloquial version contained in the inventory source. For example, **2012**. **Note** This will usually be blank.	✓	✓				✓	✓		
Product Catalo	Software edition contained in the inventory source. For example, **Standard**. **Note**	✓	✓	✓			✓	✓		

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
g Edition	This will usually be blank in SCCM unless the relevant MOF extensions have been installed.									
Product Catalog Is Partial Version Matched	Flag that indicates whether the software title was partial matched or not (TRUE/**1**) or not (FALSE/**0**).	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Colloquial Version	Normalized software colloquial version. For example, **2016**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Edition	Normalized software edition. For example, **Standard**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog	Normalized software end of support date that of that	✓	✓	✓	✓	✓	✓	✓		

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
Matched End of Support	version. For example, **31-10-2008**.									
Product Catalog Matched is Bundle	Flag indicating whether the normalized software is a bundle (TRUE/**1**) or not (FALSE/**0**).	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Is License Required	Flag indicating whether that normalized software title requires a license (TRUE/**1**) or not (FALSE/**0**).	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Release Date	Normalized software release date of that version. For example, **31-10-2008**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Match	Normalized software title. For example, **Office**.	✓	✓	✓	✓	✓	✓	✓		

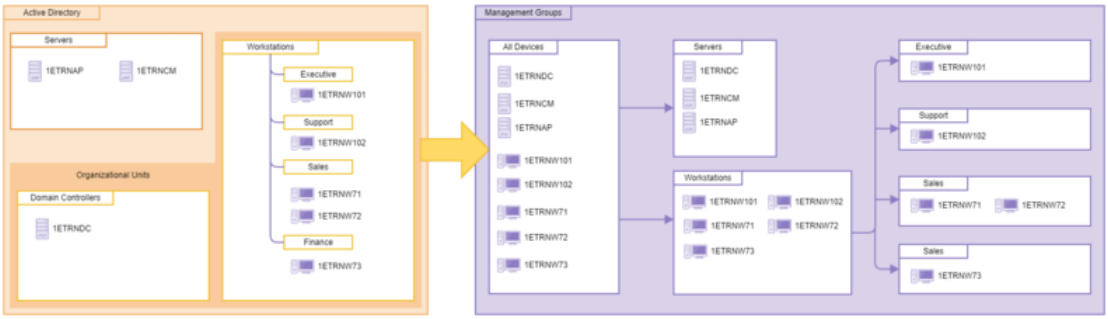
Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
ed Title										
Product Catalog Matched Vendor	Normalized software vendor name. For example, **Microsoft Corporation**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Version	Normalized software version. For example, **10.2.233**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Title	Software title contained in the inventory source. For example, **Office Standard en_pack**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog UN Standard Product Service Code	UNSPC code of the normalized software title.	✓	✓	✓	✓	✓	✓	✓		
Product Catalo	Software vendor name contained in the inventory	✓	✓	✓		✓	✓	✓		

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
g Vendor	source. For example, **Microsoft**.									
Product Catalog Version	Software version number contained in the inventory source. For example, **10.2.233**.	✓	✓	✓	✓	✓	✓	✓		
Product Install Date	Date that software installation was installed according to the inventory source.	✓		✓						
Product Instance Name	Instance name if used by a product, for example **MSSQLSERVER** for SQL Server.	✓	✓	✓	✓	✓				
Product Last Used date	Date that software installation was last run according to the inventory source.	✓		✓						
Product Usage Category	Usage category assigned to a specific installation of a normalized software title. Potential categories are: - Used - Unused - Rarely used - Unreported	✓	✓	✓	✓					

1.7.4.5 Management Groups - tutorial

In this tutorial

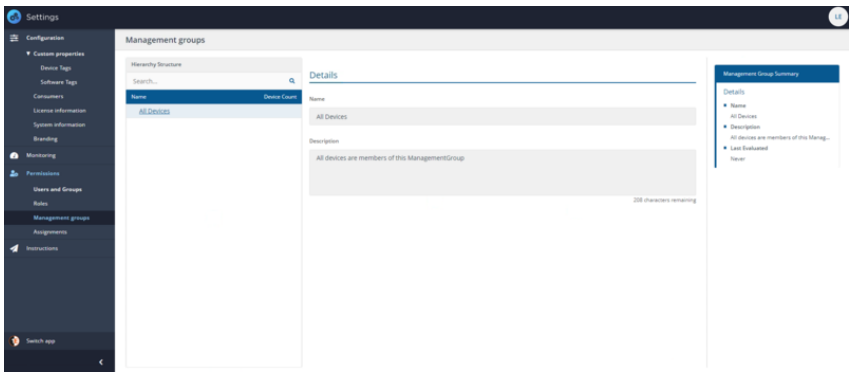
In this tutorial, we add a number of Management Groups for the ACME organization: one that uses the name of the devices and several that use the Organizational Unit (OU) the devices belong to. The following picture shows what we have in our example Active Directory and how this will appear as Management Groups in Tachyon. Here you can see there are two servers in the AD Computers group, an additional Domain Controller server and five workstations in the OU.



By the end of this example, you will have added six Management Groups in addition to the default All Devices Management Group:

- All Devices - this Management Group brings all devices into a single Management Group
- Servers, Workstations, Executive, Support, Sales and Finance - these Management Groups will use an OU rule to separate the devices according to the OU they belong to.

> **Note**
>
> If you want to take advantage of your Configuration Manager database, and pull in its inventory and usage data, so that you can mirror your Active Directory OU structure in your Management Groups, then you'll need to configure a System Center Configuration Manager connectorin your Tachyon system.

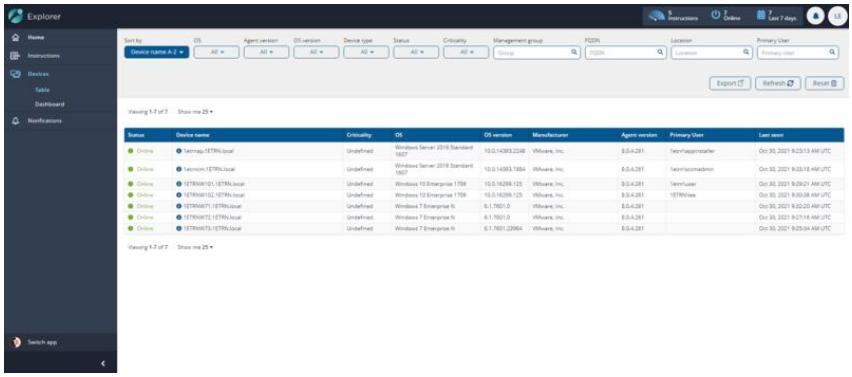


1.7.4.5.1 Without Management Groups

Before describing the process for creating the Management Groups, let's take a look at the Explorer application to see how things look without any Management Groups defined. The easiest way is to use the **Devices** table in Explorer:

1. Navigate to the **Explorer→Devices→Table** page.
2. On this page you will see all the devices with the Tachyon client installed. In our example, there are **7** connected devices.
3. Clicking on the **Management Group** filter edit field, you can see that no Management Groups are present.
4. Now switch to the **Settings** application using the **Switch app** menu.
5. Navigate to the **Settings→Configuration→Connectors** page.
6. Here you can check that a Tachyon connector has been added and tested.

If you have configured a connector, you can start adding Management Groups.



1.7.4.5.2 Adding example Management Groups

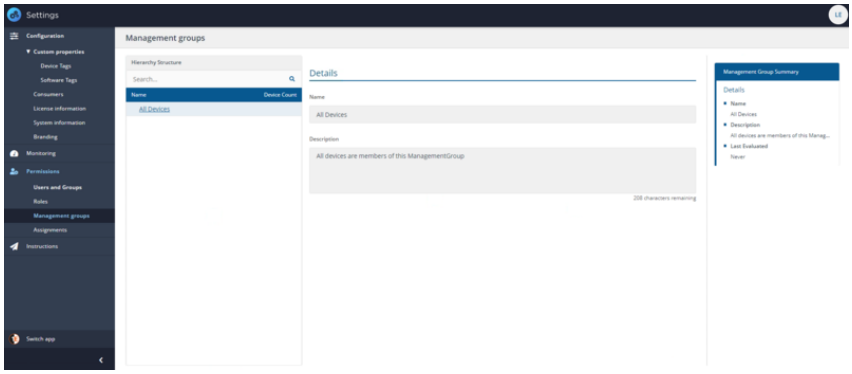
By default, in a new installation of Tachyon, all devices are members of the **All Devices** group. If you have upgraded from a previous version of Tachyon, your previously created Management Group will be preserved and will become a child Management Group of **All Devices** Management Group.

You can create **Child** Management Groups and nest them into a **Hierarchy Structure** where child Management Groups inherit rules from their parent groups.

Using child Management Groups you could create by hand a Management Group structure which mirrors your Configuration Manager collections, or divide your Management Groups by device type, for example into servers and workstations. You can use the delegation feature to create Management Groups that mirror your organizational structure with associated delegated roles.

To find out how to use scripts to import a Management Group structure from a file or from Configuration Manager collection, refer to Creating direct-based Management Groups.

Refer to the Roles page section for details about how you can use the delegation feature.



To add our Management Groups:

1. Navigate to the **Settings**→**Permissions**→**Management Groups** page.
2. To start creating groups click on the **Add Child** button to display the **Details** screen.
3. **Add Child** lets you set the following parameters for the Management Group:
   - **Name** - the name you will identify the group by
   - **Description** - the description for the group, use this to briefly describe the rules used to populate the Management Group
   - **Rules** - the rules that define the contents of the Management Group.
4. In our first Management Group, which will contain all the servers in the network, we set the following as shown in the first row of the table opposite :
   a. **Name** to **Servers**.
   b. **Description** to **All servers**.
   c. **Rules**: we set the first parameter to **Device OS**, the comparison operator to **Contains** and then the value to **Server**.
   d. Having made all the settings we then click on **Save** to save the Management Group.
   e. The last thing we could do is click **Evalute**. We don't do this immediately because we are going to create another 5 Management Groups, and we want to go straight onto doing that without waiting for the reports to run.
5. Our second group will contain all the devices in the **Workstations** OU and below. We make sure we select the **All Devices** level in our **Hierarchy Structure** as we want this OU to be a child of **All Devices**. We click on **Add** to start the process.
6. Set the following information for the second Management Group, as shown in the second row of the table opposite:
   a. **Name** to **Workstations**
   b. Description to **All workstations**
   c. **Rules**: this time we set the first parameter to **OU Path**, the comparison operator to **Contains** and the value to **Workstations**

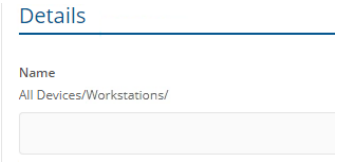
d. Having made all the settings we then click on **Add** to save the Management Group.

7. Repeat the steps outlined in step **6** for the remaining Management Groups but using the settings in the table opposite:

Note

The remaining four Management Groups are similar to our second Management Group in that they all use the **OU Path** property. The remaining Management Groups represent different departments in the organization and contain end user devices. These groups will be child Management Groups to the parent workstations Management Group, by creating a hierarchy in this way we can later delegate management responsibilities by assigning Tachyon users, groups and roles to them.

When creating Child Management Groups, check that you are creating that group in the correct part of your hierarchy. When you create a new group, it's place in the hierarchy is shown above the **Name** field.



Note

The **OU Path** rule was introduced in an accumulated hotfix to replace **OU Name** which was then deprecated (will be removed sometime in the future).

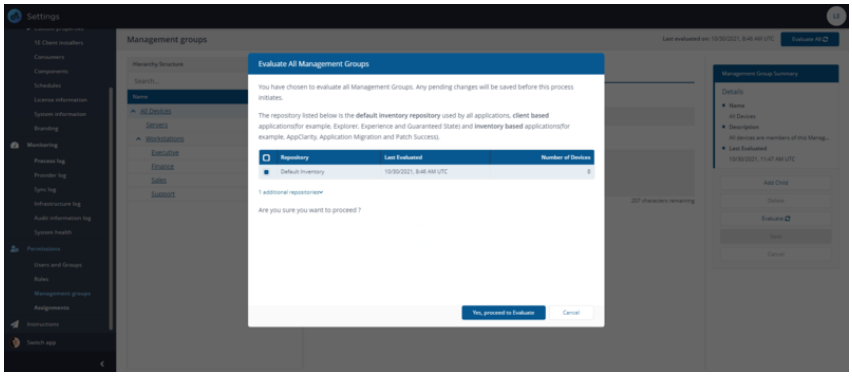
This tutorial uses **OU Path** in the same way as **OU Name**. However, **OU Path** also allows you to filter on *any* text in the OU path, using the pipe symbol | as a delimiter of different strings to search for, which must all be true to get a match. For example Workstations|Sales. **OU Path** allows you to be more explicit if you have OUs with the same name in different parts of your OU structure.

Child Management Group	Parameter	Value
Servers (steps 3 and 4)	Name	Devices
Description	All servers	
Rules	Device OS contains server	
Workstations (steps 5 and 6)	Name	Workstations
Description	OU Workstations	

Child Management Group	Parameter	Value
Rules	OU Path Contains Workstations	
Executive	Name	Executive Devices
Description	OU Executive	
Rules	OU Path Contains Executive	
Support	Name	Support
Description	OU Support	
Rules	OU Path Contains Support	
Finance	Name	Finance
Description	OU Finance	
Rules	OU Path Contains Finance	
Sales	Name	Sales
Description	OU Sales	
Rules	OU Path Contains Sales	

Having defined all the Management Groups we now need to evaluate all the rules.

1. Click on the **Evaluate All** button in the top right corner of the page, if you have more than one inventory in your Tachyon configuration you will be prompted to choose which repository you wish run evaluate your Management Groups against. Then click **Yes, proceed to Evaluate**.
2. To check the progress of the **Management Group Evaluation** action, navigate to the **Settings→Monitoring→Process log** page.
3. After a few seconds the **Status** column for the **Management Group Evaluation** action changes to display a green tick.

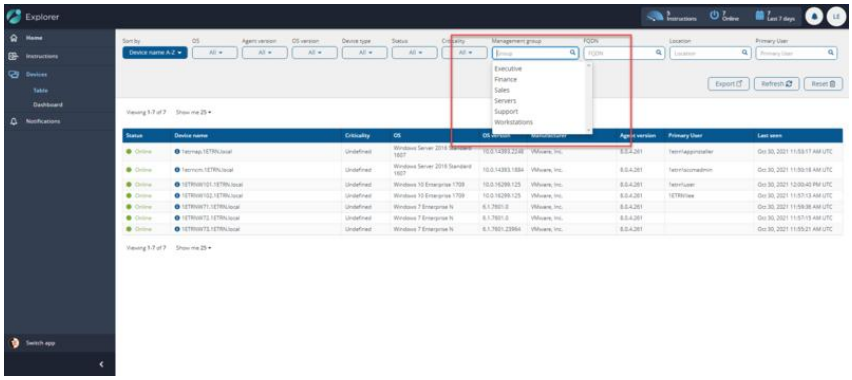


1.7.4.5.3 Checking the Management Groups in Explorer

The Management Group rules have now been evaluated and populated the Management Groups, it's now time to check how this has affected the **Devices** page in Explorer.

1. Navigate to **Explorer** using the **Switch app** menu.
2. Tachyonremembers that we were on the **Devices** page the last time we were in the Explorerapplication.
3. Click on the **Management Group** filter. A menu pops up displaying all 6 of the new Management Groups.
4. Selecting a Management Group from the menu filters the devices to show just the ones that belong to that Management Group.
5. Clicking on the **Sales** Management Group shows that it contains just 1 device.
6. Clicking on the **Workstations** Management Group shows that it contains 5 devices.
7. Clicking on **Executive** shows that it contains 2 devices.

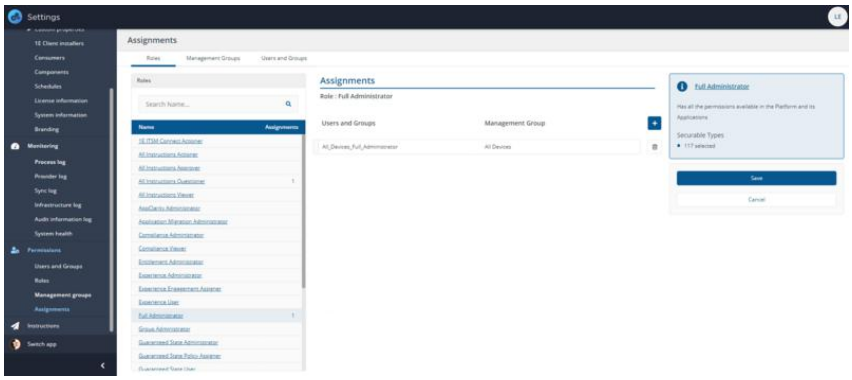
The example is now complete. We've created 6 new Management Groups, one of those with a rule that uses the OS type name and the other 5 using the OU the device belongs to. We've then evaluated the rules to populate the Management Groups with matching devices. At the same time, this has synchronized the information with the Explorer application, so we can now filter the devices displayed on the Devices table.



1.7.4.6 Assignments page

The **Assignments** page lets you view and manage current assignments for Tachyon roles, management groups, users and groups, from this page you can:

- View all current assignments
- Add new assignments
- Remove current assignments.

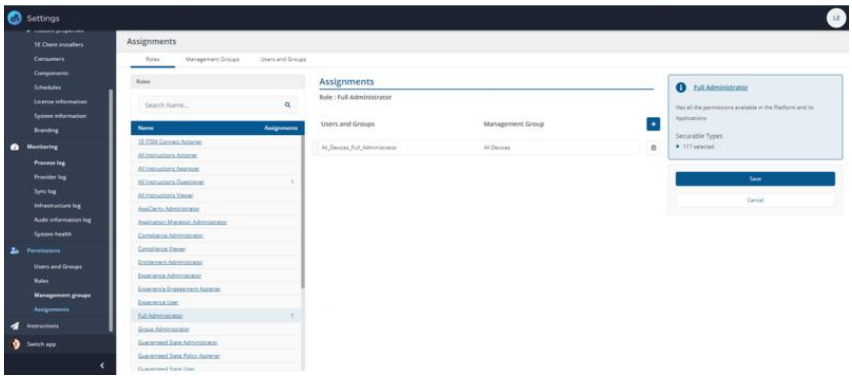


1.7.4.6.1 Roles assignments

Roles focus on all Tachyon roles, with the total of their current assignments listed next to each title. To add new assignments to a role, you can click on the role name. This displays that role's current assignments, with an information panel displaying a summary of that role and the securable types associated with that role.

In our example we have a new Tachyon installation with only a few assignments, the one shown in the picture is of the Full Administrator role which is assigned to the group **All_Devices_Full_Administrator** and is assigned to **All Devices**. We have used a group to control the assignment instead of an individual user account.

Refer to the Roles page for recommendations about how best to use roles, and for a full list of roles, permissions and if a role is delegatable.



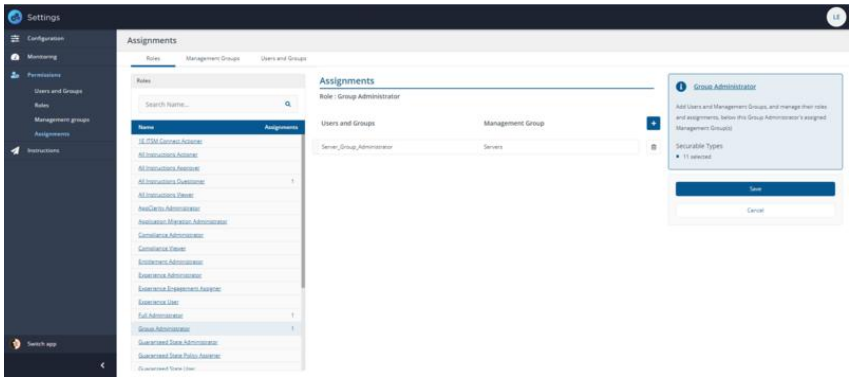
1.7.4.6.1.1 Example Role assignment

In our example, we want to use the delegation feature of Tachyon and use the Group Administrator role to delegate some tasks to a child management group of **All Devices** called **Servers** to another administrator.

We'll assign the **Group Administrator** role to a Universal AD group called **Server_Group_Administrator** which we have added to Tachyon using the Users and Groups page.

To add the new assignment:

1. On the **Settings→Permissions→Assignments** page, we click on the title of the role to configure, in this case **Group Administrator** this displays the **Assignments** page focused on that role.
2. Clicking the plus sign button allows us to add our group, **Server_Group_Administrator** and the associated management group, **Servers**.
3. Once we've selected the group and management group, we click the **Save** button.



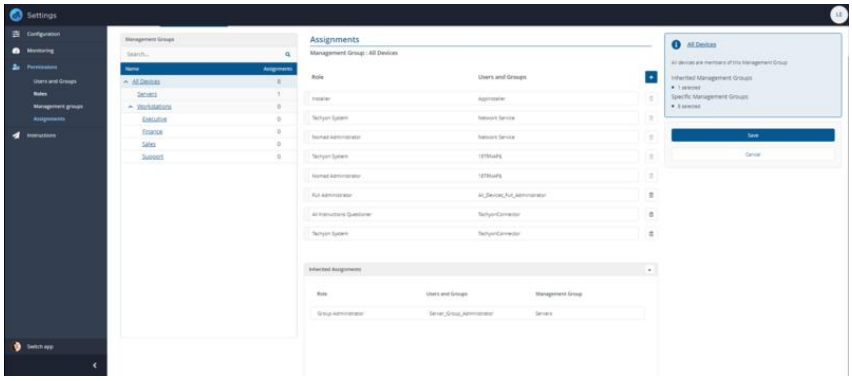
1.7.4.6.2 Management Groups assignments

The **Management Groups** tab focus on the management groups you have set up in your Tachyon installation, with the total of their current assignments listed next to each title. To add new assignments to a management group, you can click on the management group name. This displays that group's current assignments, with an information panel displaying a summary of that role and the assignments that are inherited with that group.

In our example we have a new Tachyon installation with only a few management groups, the one shown in the picture is of **All Devices** among the assignments is the group **All_Devices_Full_Administrator** and an inherited assignment **Server_Group_Administrator** from the management group **Servers**. We have used groups to control the assignments instead of individual user accounts.

Refer to the Roles page for recommendations about how best to use roles, and for a full list of roles, permissions and if a role is delegatable.

For recommendations about using and creating management groups refer to the Management Groups page and Management Groups - tutorial.



1.7.4.6.2.1 Example Management Group assignment

In our example, we want to use the delegation feature of Tachyon and use the **Group Administrator** role to delegate some tasks to a child management group of **All Devices** called **Workstations** to another administrator.

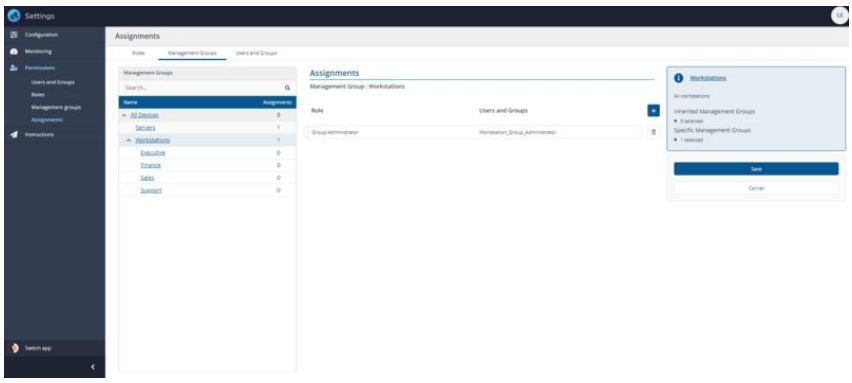
We'll assign the Group Administrator role to a Universal AD group called **Workstation_Group_Administrator** which we have added to Tachyon using the Users and Groups page.

To add the new assignment:

1. On the **Settings**→**Permissions**→**Assignments** page, we click on **Management Groups** and then the title of the group to configure, in this case **Workstations** this displays the **Assignments** page focused on that group.

2. Clicking the plus sign button allows us to add our group, **Workstation_Group_Administrator** and the associated delegatable role, **Group Administrator**.

3. Once we've selected the group and role, we click the **Save** button.



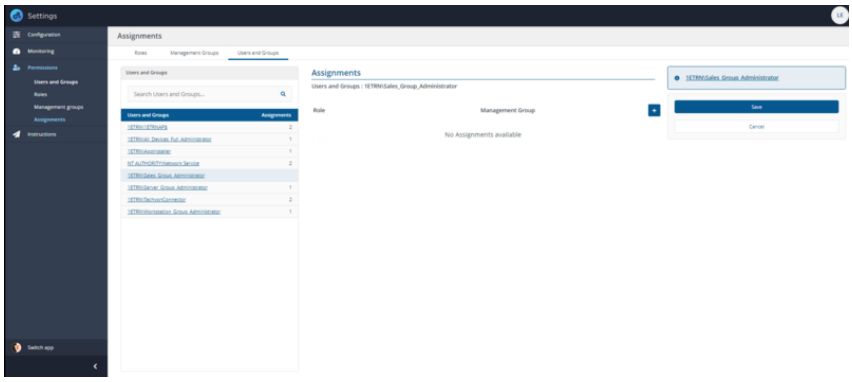
1.7.4.6.3 Users and Groups assignments

Users and Groups focuses on the users and groups you have set up in your Tachyon installation, with the total of their current assignments listed next to each title. To add new assignments, you can click on the user or group name. This displays that user or group's current assignments, with an information panel displaying a summary of that user or group.

In our example we have a new Tachyon installation with only a few groups and accounts, the one shown in the picture is of **All Devices** among the potential groups we can assign is the group **Sales_Group_Administrator**. We have used groups to control the assignments instead of individual user accounts.

Refer to the Users and Groups page for recommendations about how to define users and set their access rights and deactivating or removing Tachyon users or groups.

Refer to the Roles page for recommendations about how best to use roles, and the Roles and Securables page for a full list of roles and permissions.



1.7.4.6.3.1 Example Users and Groups assignment

In our example, we want to use the delegation feature of Tachyon and use the **Group Administrator** role to delegate some tasks to a child management group of **All Devices\Workstations** called **Sales** to another administrator.

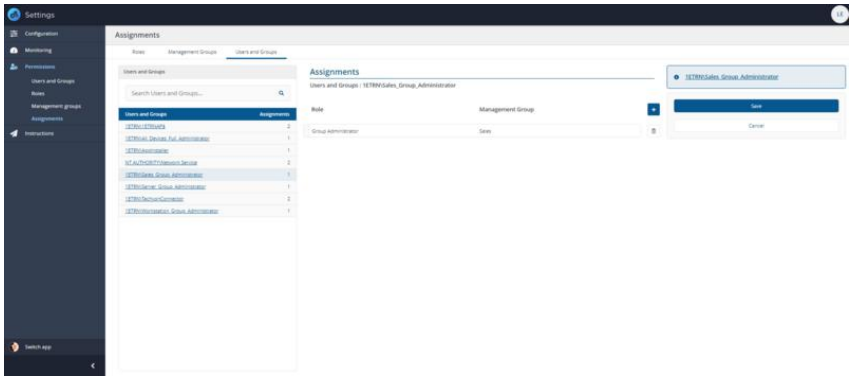
We'll assign the Group Administrator role to a Universal AD group called **Sales_Group_Administrator** which we have added to Tachyon using the Users and Groups page.

To add the new assignment:

1. On the **Settings**→**Permissions**→**Assignments** page, we click on **Users and Groups** and then the title of the group to configure, in this case **1ETRN\Sales_Group_Administrator** this displays the **Assignments** page focused on that group.

2. Clicking the plus sign button allows us to add the **Sales** management group and the associated role, **Group Administrator**.

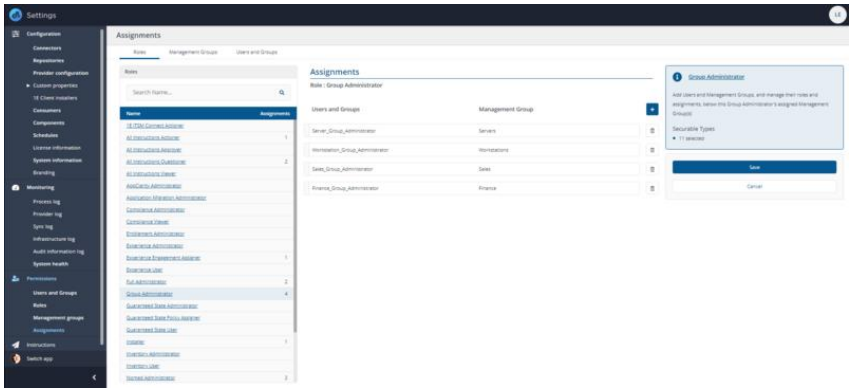
3. Once we've selected the group and role, we click the **Save** button.

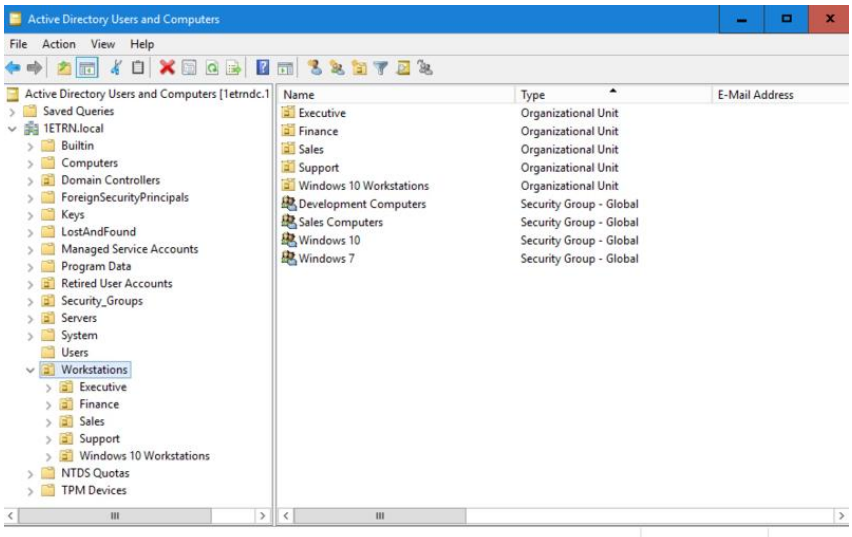


Using this type of structure, we can mirror the organization we have in our Configuration Manager collections or Active Directory.

Once we have completed assigning our **Group Administrator** role to our management groups and associated Tachyon groups, we can effectively delegate responsibility for groups of devices. In our example, this is based on department, where we have OUs in AD that represent different business functions and where we use different administrators to manage each department's devices.

This model could easily apply to organizations that have offices in different locations, whether that is in one country or many. Indeed, you could use management groups to manage different types of device or model or just by OS.





1.7.5 Instructions Menu

Loading and managing Tachyon Instruction sets.

1.7.5.1 Instruction sets page

How to load Instruction Definitions into Tachyon and then create, populate and delete Instruction sets.

The **Instruction sets** page enables users with the **Full Administrator** role, to add, remove and modify the product packs used by Tachyon. This page can be viewed by users with the **All instructions actioner** role.

You can perform these tasks:

- Adding Instruction Definitions into Tachyon
- Creating Instruction sets
- Moving Instructions to Instruction sets
- Deleting Instructions sets and Instructions
- Updating Instructions.

Note

You can create your own platform instructions using SCALE.

SCALE is a powerful, lightweight, cross-platform programming language which combines 1E Client Methods and Modules with SQL commands to enable you to create questions, actions, preconditions, checks, and fixes that can automate almost anything on a Windows, Linux or macOS device.

Refer to 1E SDK.

1.7.5.1.1 Instruction sets overview

Tachyon functionality is based around Instructions, until these are added to the system you will not be able to ask questions or perform actions. 1E provides instructions in zip files called Product Packs. A collection of Product Packs necessary for zip files available in the **Tachyon Platform** zip (available on the 1E Support Portal) and from the 1E Exchange (tachyonexchange.1e.com). Each Product Pack contains a related collection of Instruction Definitions. Product Packs and Instruction Definitions can be added to Tachyon by a **Full Administrator**.

When added into Tachyon, Instructions are immediately allocated to the built-in **Unassigned** Instruction set. Instruction sets provide a way of determining the permissions for the Instructions they contain, but the **Unsassigned** Instruction set is only intended as a staging area for newly loaded Instructions - and Instructions in this set cannot be used directly. An Instruction can only belong to a single Instruction set, so after loading it into Tachyon, and before it can be used, it must be moved to another Instruction set - one created by a **Full Administrator**.

Instruction sets created by a **Full Administrator** can be used as the basis for custom roles created by a **Full Administrator** or **Group Administrator**. These custom roles determine the permissions for the Instruction sets and all the Instructions they contain. This enables the administrator to complete the assignment of specific Instruction set roles to users and determine which Instructions they can action, approve, question or view.

Note

Custom roles cannot be defined for the **Unassigned** set and none of the global roles in Tachyon have permissions on the **Unassigned** set. So at least one Instruction set must be added and populated before you can begin to use Tachyon Instructions.

1.7.5.1.2 Adding Instruction Definitions into Tachyon

Instructions can be added to Tachyon from the Instruction sets page in **Settings**.

1.7.5.1.2.1 Uploading Product Packs

You upload Product Packs into the Settings application using the system file open dialog. To do this:

1. Navigate to the **Settings**→**Instructions**→**Instruction sets** page.
2. Click the **Upload** button on the header for the page.
3. In the **Open** dialog, locate and select the file(s) you want.
4. Click the **Open** button.
5. At this point all the Instructions from the selected Product Packs or Instruction Definition files will be uploaded into Tachyon and added to the default **Unassigned** Instruction set.

1.7.5.1.3 Creating Instruction sets

Instruction sets can be created in the following ways:

1.7.5.1.3.1 Creating an Instruction set from selected Instructions

To add an Instruction set from selected Instructions (as shown in the animation):

1. Navigate to the **Settings**→**Instructions**→**Instruction sets** page.
2. Select the Instructions you want to move to the new set by checking the checkbox at the left-hand end of the instruction's row.
3. Click the **Add New set** button.
4. In the **Add new instruction set** popup, enter a suitable name for the Instruction set.
5. You can optionally add a custom icon, in JPG or PNG format, that will be used when displaying the instruction:
    a. Click the **Choose File** button.
    b. In the **Open** dialog, locate and select the JPG or PNG file you want to use.
    c. Click **Open** to load the file into Tachyon.
    d. The file location and a preview of the file will be displayed in the popup.
6. Ensure that the **Include *n* selected instructions** checkbox is checked
7. Click the **Add** button

When familiarizing yourself with the new instructions contained in a Product Pack it can be convenient to create a matching Instruction set to hold all its instructions. You can then set permissions for all the instructions contained in the Product Pack in one go. Later on you can then add other Instruction sets and move the Instructions in order to refine the permissions for each instruction.

1.7.5.1.3.2 Creating an empty Instruction set

To add an empty Instruction set where you can subsequently move Instructions:

1. Navigate to the **Settings→Instructions→Instruction sets** page.
2. Click the **Add new set** button.
3. In the **Add new instruction set** popup, enter a suitable name for the Instruction set.
4. You can optionally add a custom icon, in JPG or PNG format, that will be used when displaying the instruction:
    a. Click the **Choose File** button.
    b. In the **Open** dialog, locate and select the JPG or PNG file you want to use.
    c. Click **Open** to load the file into Tachyon.
    d. The file location and a preview of the file will be displayed in the popup.
5. Click the **Add** button.

1.7.5.1.4 Moving Instructions to Instruction sets

The following steps are used to move instructions between Instruction sets:

1.7.5.1.4.1 Move one or more selected Instructions:

1. Select the source Instruction set you want to move the Instruction(s) from, or select **All**, from the list of Instruction sets, and locate the Instruction(s) you want to move.
2. Check the checkbox at the start of each Instruction item in the Instructions table for each Instruction you want to move.
3. When the selection has been made click the **Move** button.
4. In the **Move instructions** popup subsequently displayed:
    a. Select the desired destination Instruction set from the **Destination instruction set** dropdown list.
    b. Click **Move** when the set has been selected.

1.7.5.1.5 Deleting Instructions sets and Instructions

Instruction sets are relatively simple to add, populate and delete, making the re-organization of Instruction permissions easy to do.

When deleting you get to choose whether you just want to delete the Instruction set or to also remove the Instructions in the Set from Tachyon:

- If you choose to delete just the Instruction set, any Instructions it contained will be returned to the **Unassigned** Set, effectively making them unavailable until they are assigned to another Instruction set.

- If you choose to delete both the Instruction set and all the Instructions it contains, those Instructions will be unavailable to Tachyon until they are loaded back into the system and assigned to another Instruction set.

Before deleting you need to be aware:

- Instructions in the Instruction set you want to delete may currently be running. Deleting an Instruction set will invalidate any role-based permissions from that point onwards, though any instructions that are in flight will not change.
- Any Custom Roles that were previously configured for the deleted Instruction set will still remain but will be disconnected from the deleted Instruction set.

1.7.5.1.5.1 Deleting an Instruction set

The following steps can be used to delete an Instruction set:

1. Navigate to the **Settings→Instructions→Instruction sets** page.
2. Locate the Instruction set you want to delete in the Instruction sets list.
3. Hover the mouse over the Instruction set name, a tooltip with three vertical dots will appear. Click on this to display a menu.
4. Select **Delete**.
5. In the **Delete instruction set** popup subsequently displayed you have the choice as to whether you want to just delete the Instruction set or delete the Instruction definitions it contains too. To delete both you check the **Delete both instruction set and instructions inside set** checkbox.
6. Once you've made your choice click the **Yes, delete instruction set** button to proceed with the deletion.
7. If you chose to just delete the Instruction set, as shown in our example, the Instructions previously held in the Instruction set go back to the **Unassigned** Instruction set.
8. If you chose to delete the Instruction set and instructions all the instructions contained in the set are removed from Tachyon.

1.7.5.1.5.2 Deleting one or more selected Instructions from Tachyon

The following steps can be used to delete one or more selected Instructions:

1. Navigate to the **Settings→Instructions→Instruction sets** page.
2. In the Instructions table, select the Instruction set containing the Instruction(s) you want to delete, or select **All**.
3. Select the checkbox at the left-hand end of the Instruction's row in the Instructions table for each one you want to delete.
4. Click on **Delete** button in the button panel on the right.
5. In the **Confirm delete** dialog subsequently displayed click **Delete** to continue and remove the selected Instruction(s) from Tachyon or **Cancel** to cancel the operation.

1.7.5.1.6 Updating Instructions

To update an Instruction you load the newer version into Tachyon, and it will be updated in place, keeping any currently set Instruction set intact.

Statistics for the upload operation can be viewed by clicking on the drop zone.

1.7.5.1.6.1 Upgrading and updating Instructions

Tachyon Instructions are designed as far as possible to be backwards compatible, but as a general rule we recommend that you update your Tachyon Product Packs to the latest version so that you can gain the benefit of newer features.

When upgrading you should be able to safely keep your existing Instructions. We recommend that newer versions of Instructions are verified in a test environment to ensure that they still behave as expected before updating in your production environment.

> **Note**
>
> An instruction is not upgraded if it is the same version, or is currently *in use*. You will be notified if any instructions are not upgraded because they are in use. You can upload the product pack again later, after the instruction has completed, or cancelled.

Your license should retain any code signing certificates you may have registered. This means your custom instructions should continue to be licensed as normal following an upgrade of Tachyon. You may want to check the /document/preview/736743#UUID-33c212b3-863e-21bc-bc5d-52e41a0492b3 in the TachyonSDK pages to check for any changes to the SCALE language.

1.8 Introducing Inventory

How to use the Inventory application to view and export inventory, and manage associations.

Inventory provides normalized inventory, software usage analytics, and (enterprise tier only) ServiceNow CMDB Augmentation:

- **Normalized inventory** - consolidate and normalize software inventory into a consistent Vendor, Product, and Version schema to get a clear view on what's out there. Understand hardware usage, such as which employees use the most devices.
- **Software usage analytics** - group all software into Used, Rarely Used, and Unused so you can make better licensing decisions and reduce software bloat.
- **ServiceNow CMDB augmentation** (enterprise only) - augment ServiceNow CMDB with real-time, hyper-accurate inventory to solve the stale data problem.

1.8.1 Inventory features

The Inventory app captures data from different sources, then consolidates, normalizes, and stores it in repositories. The Inventory app is also used to view and export inventory, and manage associations.

Inventory uses connectors to capture software, hardware, and other data from sources such as Tachyon, Configuration Manager, Big Fix, and vCenter where it is consolidated, de-duplicated, and normalized. Normalization uses software and hardware entries in The 1E Catalog.

An empty repository called **Default Inventory** is provided out of the box. You can optionally create additional inventory repositories to partition data by source, time period, or other purposes. To populate a repository, you must use one or more inventory connectors, and either manually sync the data or schedule a sync. For more detail, please refer to Repositories page and Schedules page in Settings.

Inventory repositories are used by the following applications:

- Introducing Patch Success - reports on and ensures successful patching of your enterprise
- Introducing Application Migration - automates the migration of applications during a Configuration Manager OS deployment
- Introducing AppClarity - manages entitlements, compliance and reclaiming unused software.
- Any application - if you need it to use Management Groups.

You will need to decide which of the following connectors you will use to populate Inventory repositories.

Connectors are used to connect to other 1E and third party systems, retrieve their data and populate repositories. The following inventory connectors are provided to populate the Repositories page:

- BigFix connector — Connects to a BigFix Inventory database server.
- BigFixInv connector — Connects to a BigFix Inventory database.
- File Upload connectorr — Uploads inventory data from a folder containing tab (TSV) and comma (CSV) separated value file(s).
- Intune connector — Connects to an Intune application and collects inventory and usage data.
- Microsoft Office 365 connector — Connects to an Office 365 application in Intune and pulls in inventory and usage data.
- OpenLM connector — Connects to an OpenLM database server.
- Oracle LMS connector — Connects to Oracle LMS and queries it for inventory information.
- ServiceNow connector — Connects to a ServiceNow instance to import basic inventory data.
- System Center Configuration Manager connector — Connects to a Configuration Manager database and pulls in inventory and usage data.
- Tachyon connector — Connects the Inventory and SLA components to support the Management group and Inventory Powered Inventory features. The Inventory Powered Inventory feature uses instructions to fetch inventory data from clients, and is a prerequisite for Patch Success.
- vCenter connector — Connects to a vCenter server and pulls in inventory data.
- Windows Server Update Services connector — Connects to a WSUS database and pulls in patch data.

Use the links above to find more information about each type of connector. Please refer to Introducing Inventory for more information about viewing and exporting inventory repositories.

Additional connectors may exist for add-on Consumer applications that have been installed. For example, Connectors page has the following connectors to populate its entitlement repository:

- AppClarity v5.2 connector — Exports entitlements from an AppClarity 5.2 database into a TSV file, which can then be reviewed and imported into.
- Entitlement .tsv connector — Uploads entitlements from a folder containing one or more tab or comma separated value file(s).

Note

AppClarity and some other Consumer applications add additional connectors to populate their repositories.

1.8.1.1 AI Powered Auto-curation

Using the AI Powered Auto-curation feature, you'll be able to increase the total amount of normalized software in your Inventory repositories. This is done using AI that integrates with the inventory consolidation process. By using AI, your organization will benefit from significant numbers of normalized software and a reduced manual effort needed to normalize software.

You can enable AI Powered Auto-curation either when you install Tachyon or post installation. Refer to AI Powered Auto-curation to find out how you can do this.

1.8.1.2 AI Powered Auto-curation

Using the AI Powered Auto-curation feature, you'll be able to increase the total amount of normalized software in your Inventory repositories. This is done using AI that integrates with the inventory consolidation process. By using AI, your organization will benefit from significant numbers of normalized software and a reduced manual effort needed to normalize software.

You can enable AI Powered Auto-curation either when you install Tachyon or post installation. Refer to AI Powered Auto-curation to find out how you can do this.

1.8.2 Hardware

Hardware Inventory shows data captured from sources such as Configuration Manager, Big Fix, and vCenter if you have them configured.

The dashboard is refreshed (recalculated) when the page is opened or the page is refreshed in the browser.

1.8.2.1 Hardware Inventory

The Hardware Inventory page shows a list of all hardware gathered using the Configuration Manager software inventory.

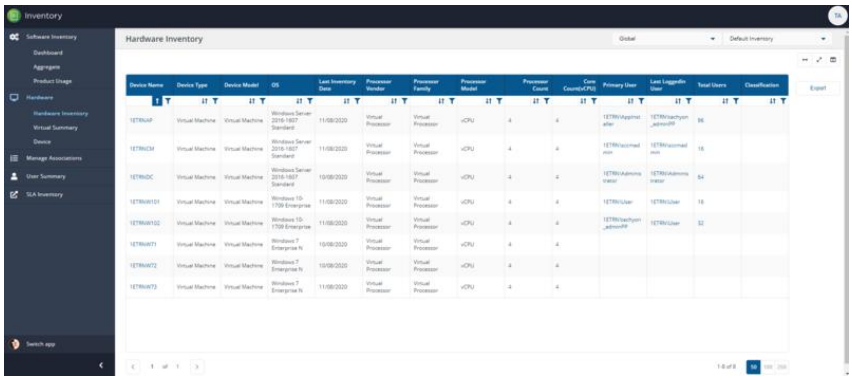
In the top right of the page in line with the screen title are two dropdown lists, **Global** and **Default Inventory**. If you select the **Global** dropdown list and look at the available options, you'll see any Management groups you have configured listed there.

If you have multiple Management Groups, choose each option and see how the display changes to show the software installed on each Management group, you may need to scroll to see all the groups. To find out more about Management Groups refer to the Management Groups page.

If you have configured more than one Inventory they will be available to choose from the **Default Inventory** dropdown list.

You can customize which fields are displayed on the page by using the **Choose Columns** control.

> **Note**
>
> You can choose which columns are displayed in some detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one below:
>
>
>
> To find out more about this feature refer to Choosing the columns displayed in reports.

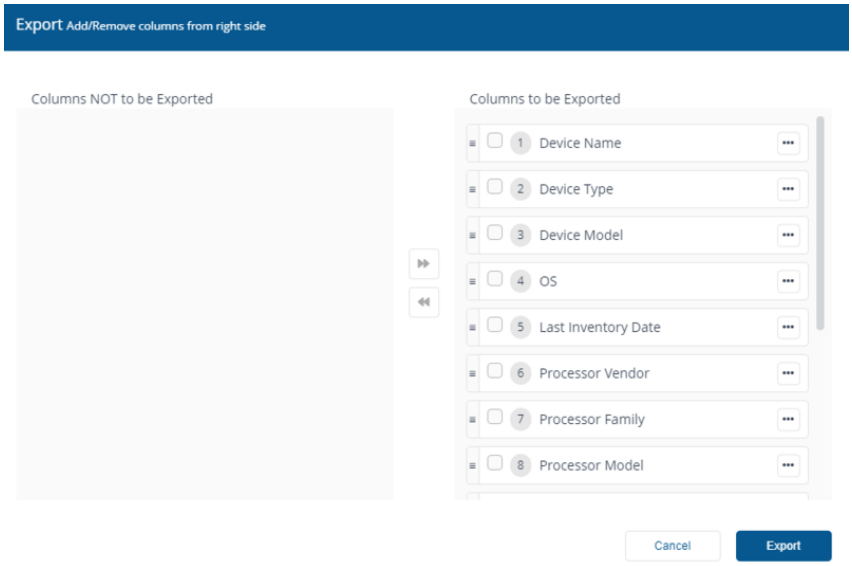


1.8.2.1.1 Exporting Hardware Inventory

You can use the **Export** button to the right of the table to export currently displayed data in a downloadable report.

When you click on the **Export** button you'll see the **Export** popup. You can choose which columns to export in the same way you can choose columns to display in the main report panel.

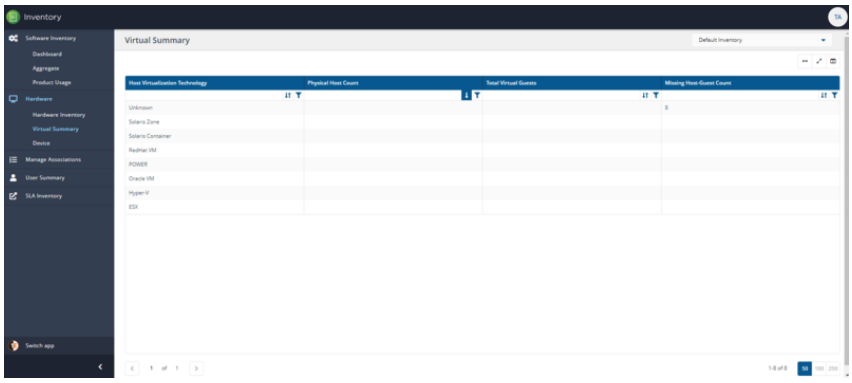
The report is exported in a .TSV format, for example, **HardwareInventory_20200813111828.tsv**. The file is exported and downloaded to the default location for the browser you are using.



1.8.2.2 Virtual Summary

This page displays information on the **Host Virtualization Technology**, **Physical Host Count**, **Total Virtual Guests** and **Missing Host-Guest Count** in your environment, in the example we only have eight devices shown.

In the top right of the page in line with the screen title, there is a dropdown list, **Default Inventory**. If you have configured more than one Inventory they will be available to choose from here.



1.8.2.3 Device

The **Device** page will be blank by default.

When you enter a device name in the **Search device** field at the top of the screen, it will resolve, so you can select it. The information returned shows **Basic Info** for the selected device and **User Details** such as **User Name** and **Last Login**.

At the bottom of the page, there are two tabs showing the software titles installed on the device:

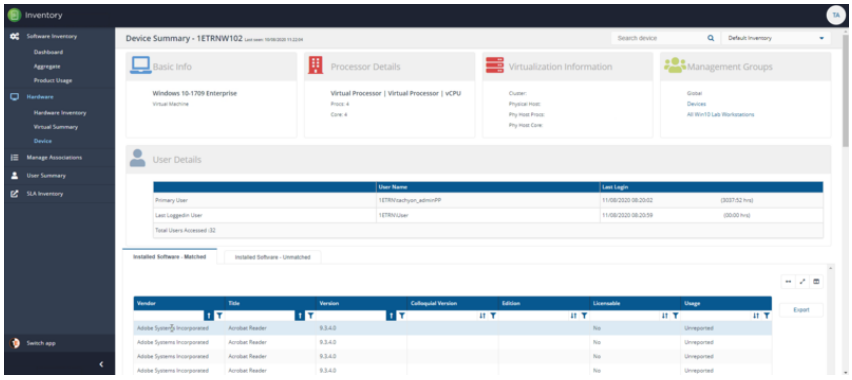
- Installed Software - Matched tab- titles matched with titles in Inventory
- Installed Software - Unmatched tab titles unmatched with titles in Inventory.

In the top right of the page in line with the screen title there is a dropdown list, **Default Inventory**. If you have configured more than one Inventory they will be available to choose from here.

Note

The **Export** button is only enabled for users with either a Full or Group Administrator role. For more details about roles refer to the Roles page.

The Roles page lets you view the system roles and currently defined custom roles. From the Roles page, you can also go into each role to set its membership and any associated management groups.



1.8.2.3.1 Installed Software - Matched tab

The Installed Software - Matched tab shows titles matched with titles in Inventory using the following default fields:

- Vendor
- Title
- Colloquial Version
- Edition
- Licensible
- Usage.

You can customize which fields are displayed on the page by using the **Choose Columns** control.

Note

You can choose which columns are displayed in some detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one below:

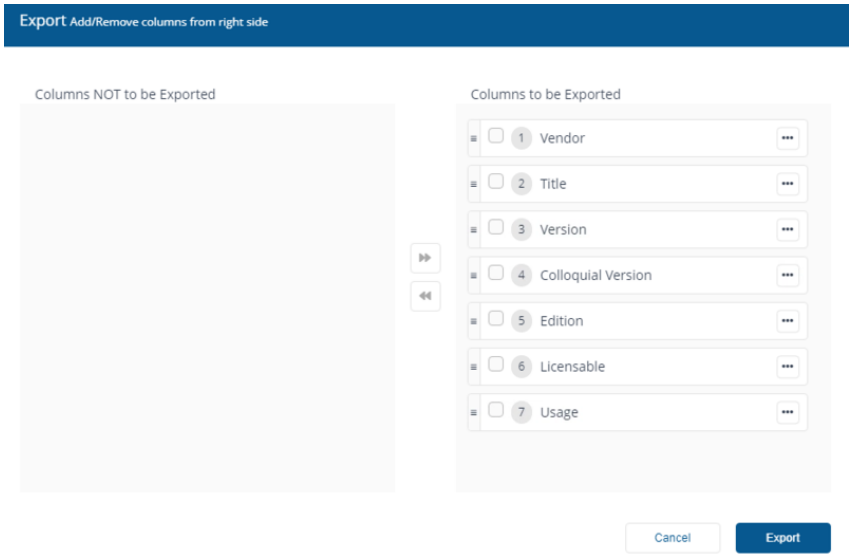
To find out more about this feature refer to Choosing the columns displayed in reports.

1.8.2.3.1.1 Exporting the Installed Software - Matched and Installed Software table

You can use the **Export** button to the right of the table to export currently displayed data in a downloadable report.

When you click on the **Export** button you'll see the **Export** popup. You can choose which columns to export in the same way you can choose columns to display in the main report panel.

The report is exported in a .TSV format, for example, **MatchedSoftware_20200813111828.tsv**. The file is exported and downloaded to the default location for the browser you are using.



1.8.2.3.2 Installed Software - Unmatched tab

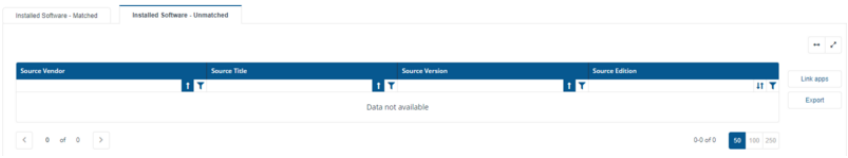
The Installed Software - Unmatched tab shows titles unmatched with titles in Inventory using the following default fields:

- Source Vendor
- Source Title
- Source Version
- Source Edition.

You can customize which fields are displayed on the page by using the **Choose Columns** control.

> **Note**
>
> You can choose which columns are displayed in some detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one below:

To find out more about this feature refer to Choosing the columns displayed in reports.

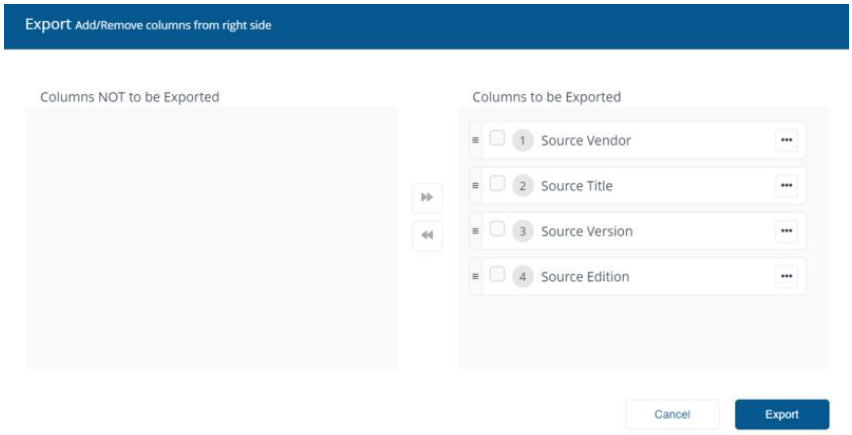


1.8.2.3.2.1 Exporting the Installed Software - Unmatched and Installed Software table

You can use the **Export** button to the right of the table to export currently displayed data in a downloadable report.

When you click on the **Export** button you'll see the **Export** popup. You can choose which columns to export in the same way you can choose columns to display in the main report panel.

The report is exported in a .TSV format, for example, **UnmatchedSoftware_20201022124749.tsv**. The file is exported and downloaded to the default location for the browser you are using.



1.8.3 Software Inventory

Software Inventory shows data captured from sources such as Configuration Manager, Big Fix and vCenter if you have them configured.

The dashboard is refreshed (recalculated) when the page is opened or the page is refreshed in the browser.

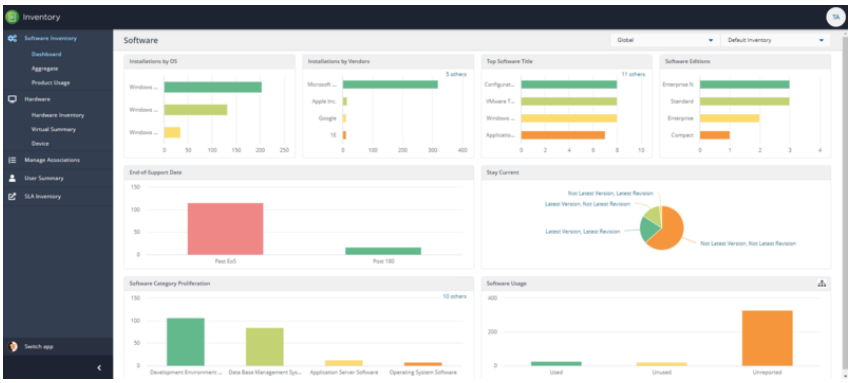
1.8.3.1 Dashboard

The dashboard page displays eight panels, reflecting the current Inventory.

The Software Inventory dashboard presents a number of panels:

- Installations by OS
- Installations by Vendors
- Top Software Title
- Software Editions

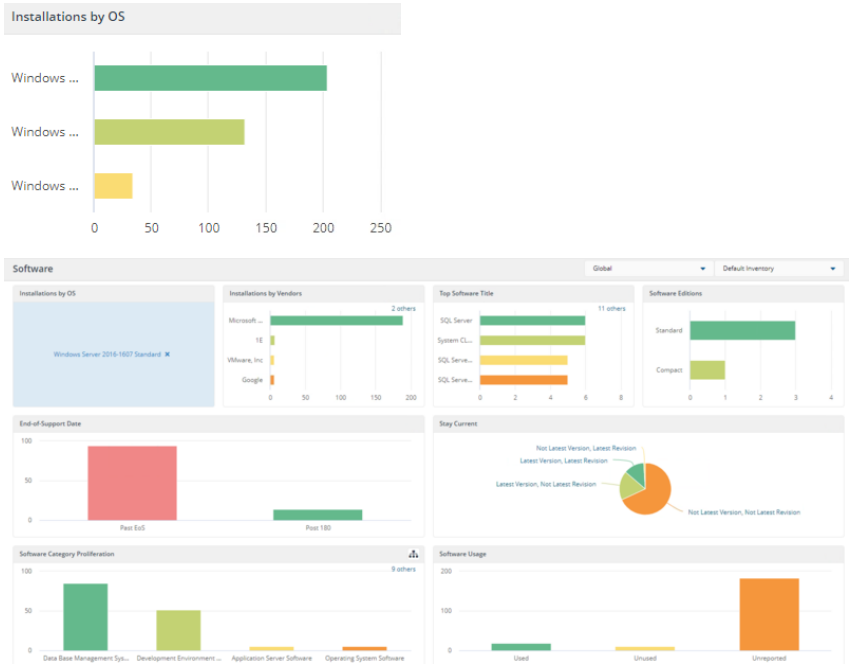
- End-of-Support Date
- Stay Current
- Software Category Proliferation
- Software Usage.



1.8.3.1.1 Installations by OS

This panel presents installations grouped by the operating system.

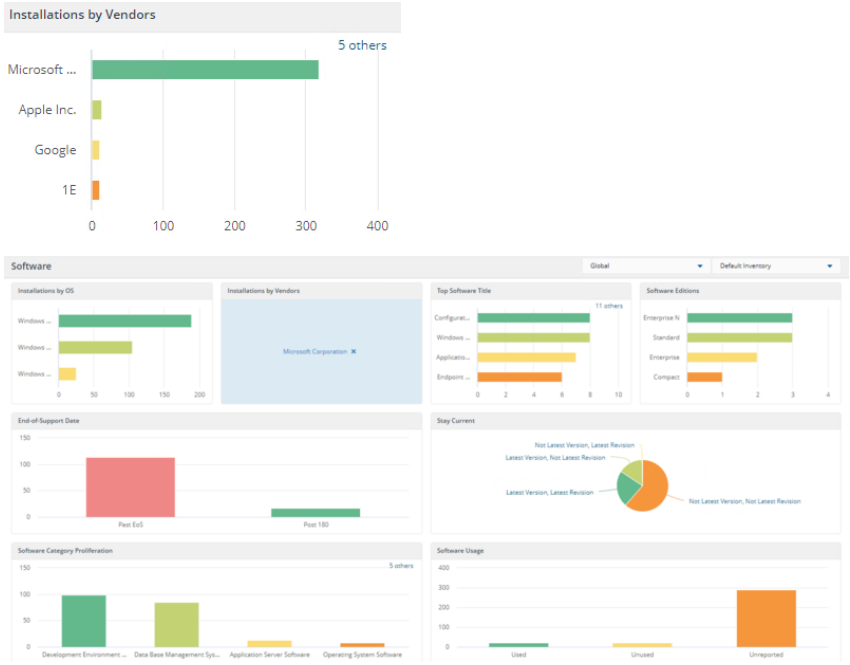
The user has the ability to drill down into each installation for each group by clicking on each color bar. This updates the other fields on the dashboard with data related to your choice. Our example shows details for **Windows Server 2016-1607 Standard**.



1.8.3.1.2 Installations by Vendors

This panel presents installations grouped by vendors.

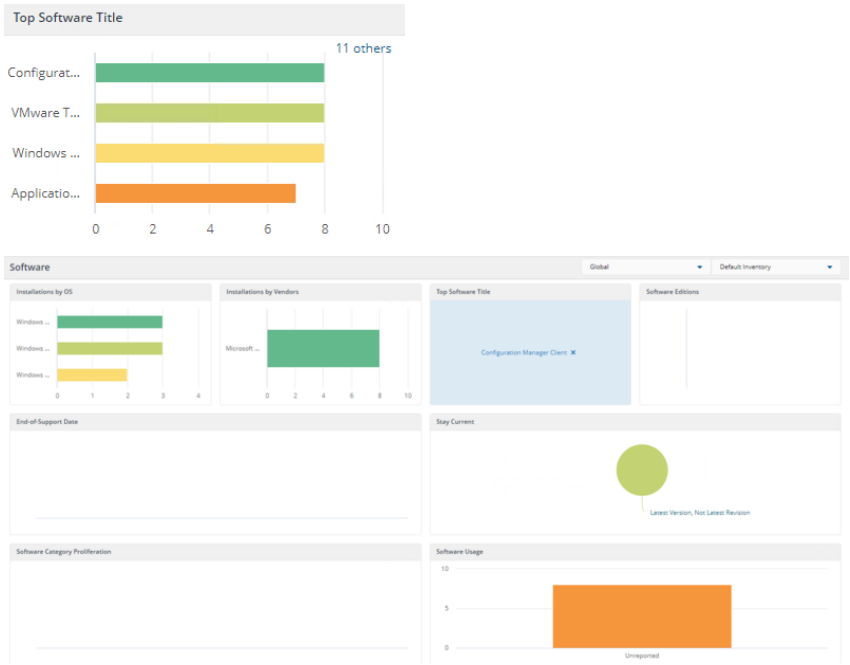
The user has the ability to drill down into each installation for each group by clicking on each color bar. This updates the other fields on the dashboard with data related to your choice. Our example shows details for **Microsoft Corporation**.



1.8.3.1.3 Top Software Title

This panel presents installations grouped by **Top Software Title**.

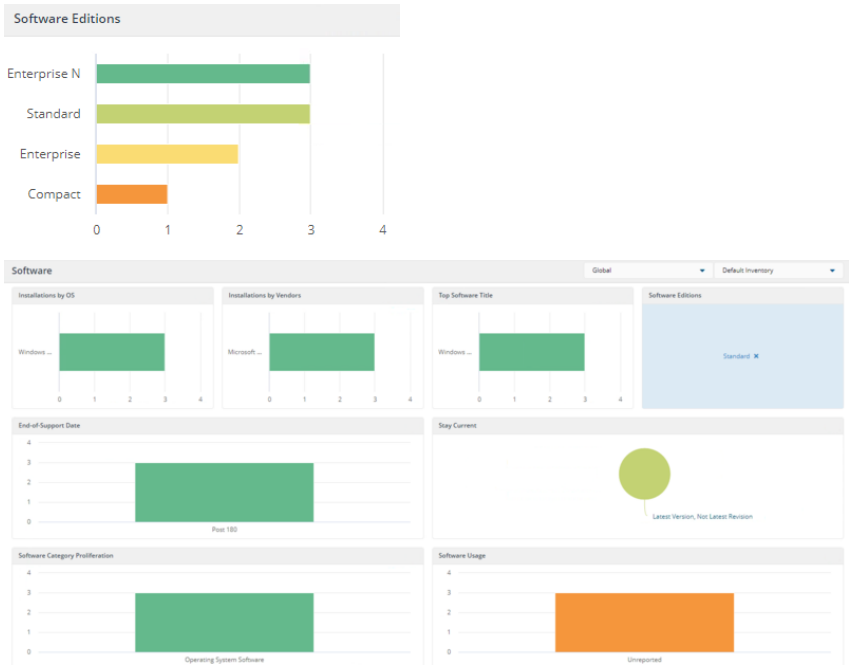
The user has the ability to drill down into each installation for each group by clicking on each color bar. This updates the other fields on the dashboard with data related to your choice. Our example shows details for **Configuration Manager Client**.



1.8.3.1.4 Software Editions

This panel presents installations grouped by **Software Edition**.

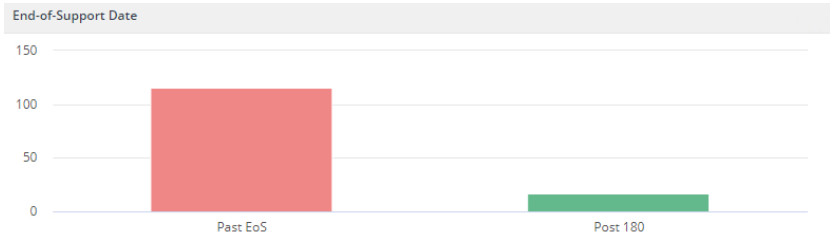
The user has the ability to drill down into each installation for each group by clicking on each color bar. This updates the other fields on the dashboard with data related to your choice. Our example shows details for **Standard** editions.

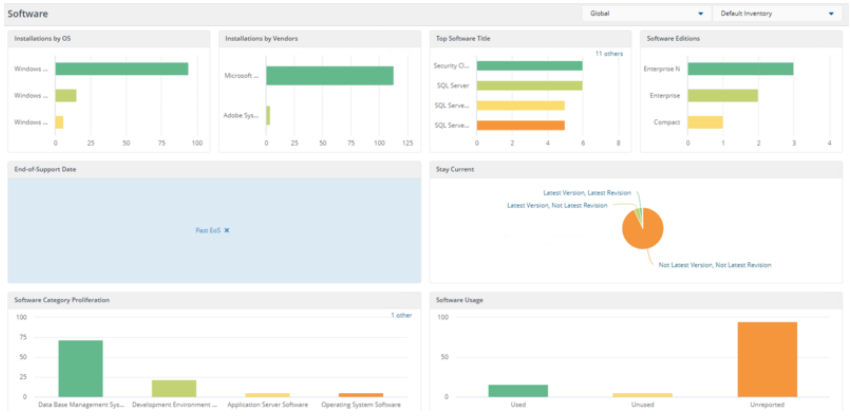


1.8.3.1.5 End-of-Support Date

This panel presents installations grouped by **End-of-Support Date**.

The user has the ability to drill down into each installation for each group by clicking on each color bar. This updates the other fields on the dashboard with data related to your choice. Our example shows details for **Past EoS**.

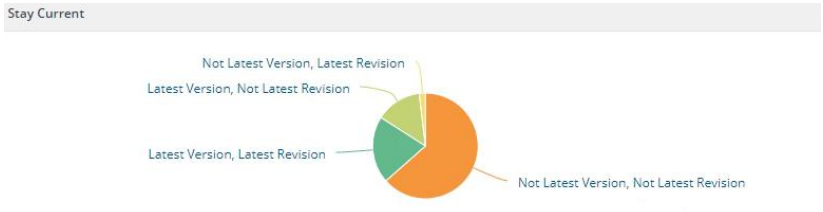


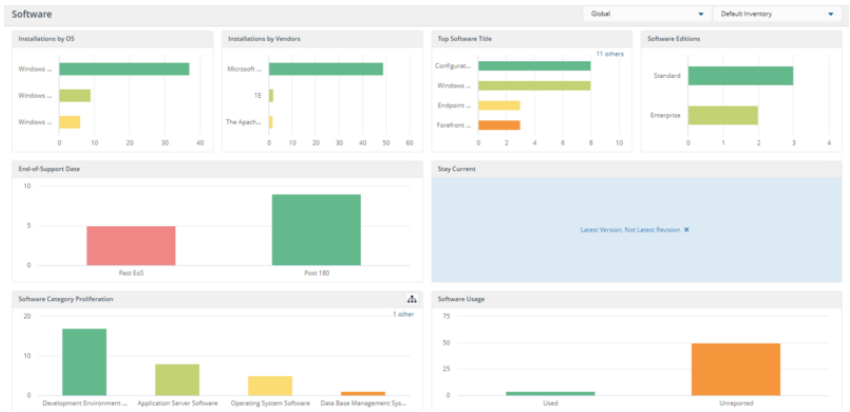


1.8.3.1.6 Stay Current

This panel presents installations grouped by **Stay Current**.

The user has the ability to drill down into each installation for each group by clicking on each color segment. This updates the other fields on the dashboard with data related to your choice. Our example shows details for **Latest Version, Not Latest Revision**.

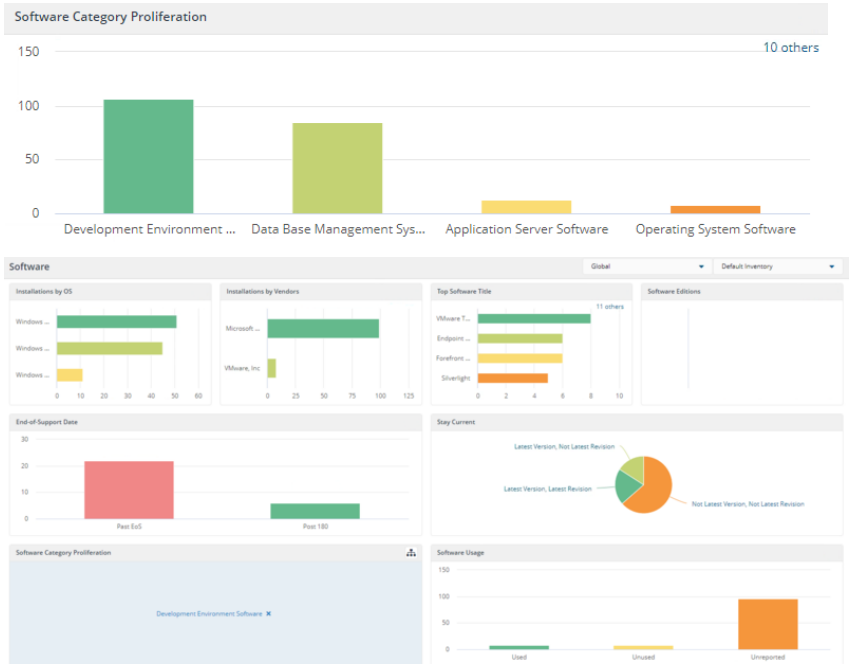




1.8.3.1.7 Software Category Proliferation

This panel presents installations grouped by **Software Category Proliferation**.

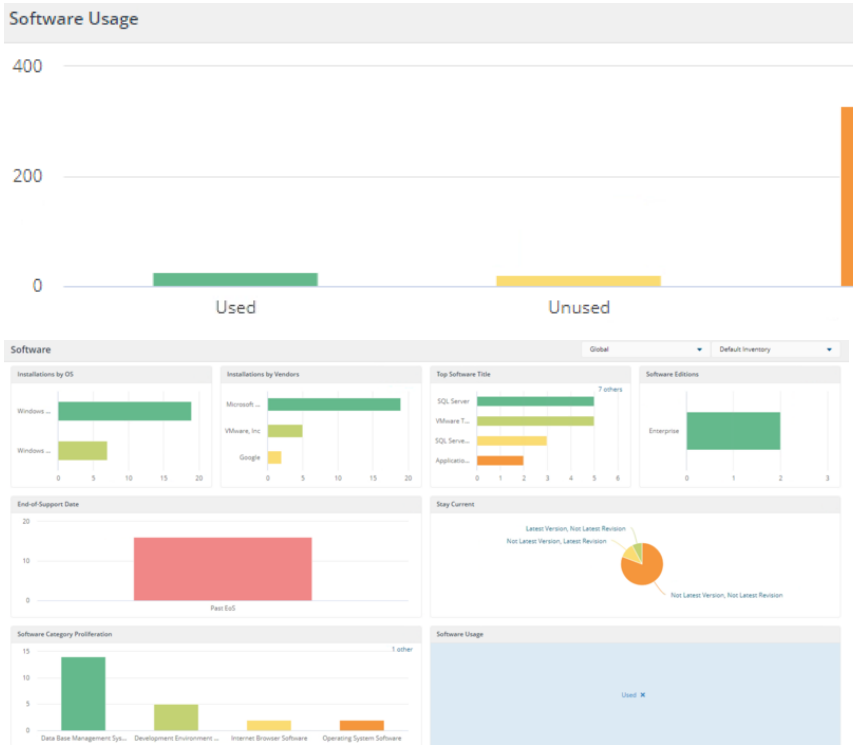
The user has the ability to drill down into each installation for each group by clicking on each color bar. This updates the other fields on the dashboard with data related to your choice. Our example shows details for **Development Environment Software**.



1.8.3.1.8 Software Usage

This panel presents installations grouped by **Software Usage**.

The user has the ability to drill down into each installation for each group by clicking on each color bar. This updates the other fields on the dashboard with data related to your choice. Our example shows details for **Used**.



1.8.3.2 Aggregate

The Aggregated Software Inventory page shows a list of all software gathered using Configuration Manager software inventory.

In the top right of the page in line with the screen title are two dropdown lists, **Global** and **Default Inventory**. If you select the **Global** dropdown list and look at the available options, you'll see listed any additional Management groups you have configured.

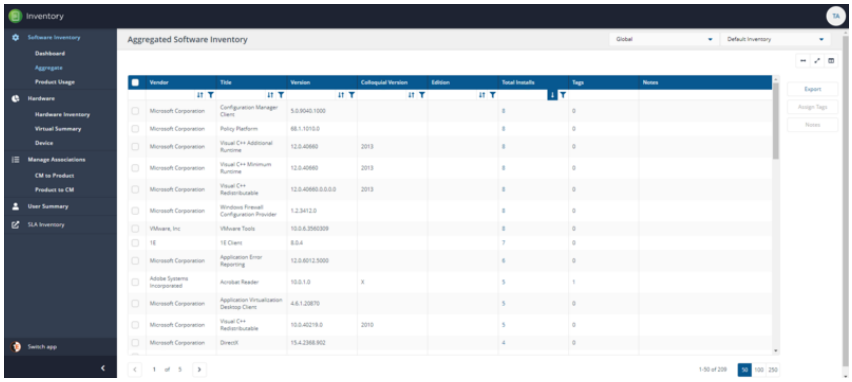
If you have multiple Management Groups, choose each option and see how the display changes to show the software installed on each Management group, you may need to scroll to see all the groups. To find out more about Management Groups refer to the Management Groups page. If you have configured more than one Inventory, they will be available to choose from the **Default Inventory** dropdown list.

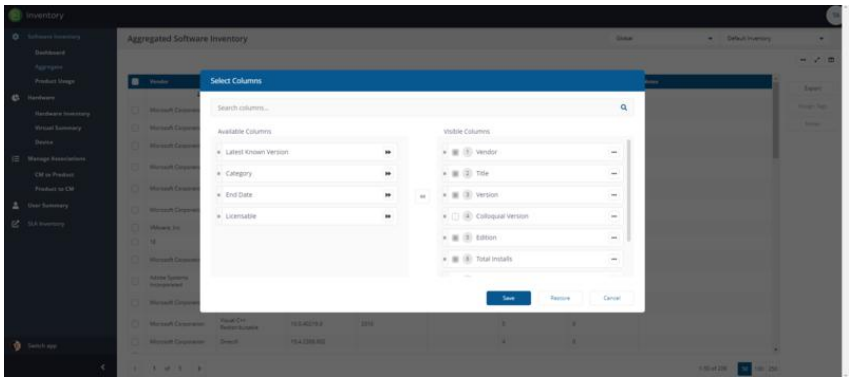
> **Note**
>
> You can choose which columns are displayed in some detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one below:
>
>
>
> To find out more about this feature refer to Choosing the columns displayed in reports.

The following table shows the available **Aggregated Software Inventory** columns, not all columns are displayed by default. You can add other columns or remove them using the column chooser control.

Column	Description	Displayed by default
Vendor	The software vendor.	Yes
Title	The software title.	Yes
Version	The version of the software installed.	Yes
Colloquial Version	If known or exists, the Colloquial version is installed.	Yes
Edition	The edition installed.	Yes
Total Installs	The number of times the software has been installed on the estate.	Yes
Latest Known Version	The latest version was discovered using AI matching.	No

Column	Description	Displayed by default
Category	Category information is set in Configuration Manager.	No
End Date	If provided, the end date for the License.	No
Licensable	Yes or No if the software is Licensed.	No



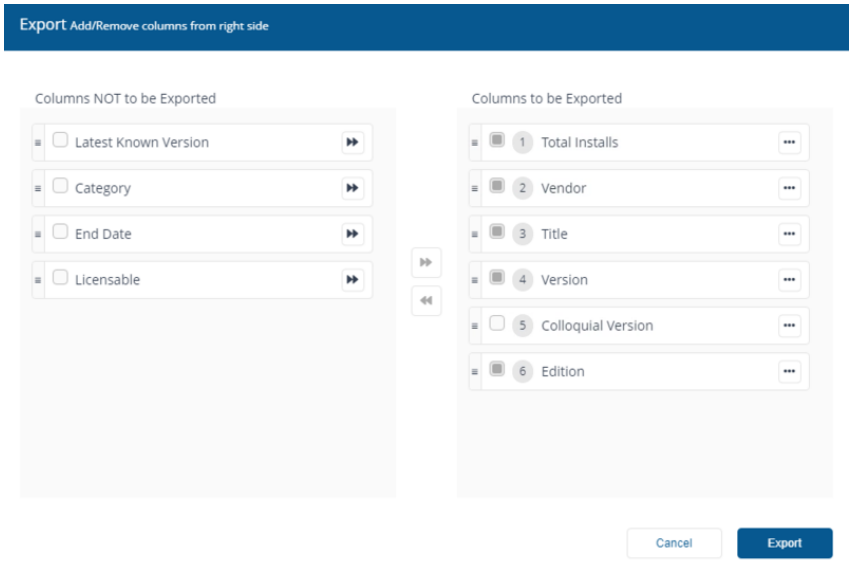


1.8.3.2.1 Export

You can use the **Export** button to export currently displayed data in a downloadable report.

When you click on the **Export** button you'll see the **Export** popup. You can choose which columns to export in the same way you can choose columns to display in the main report panel.

The report is exported in a .TSV format, for example, **AggregatedSoftwareInventory_20200813095415.tsv**. The file is exported and downloaded to the default location for the browser you are using.



1.8.3.2.2 Assign Tags

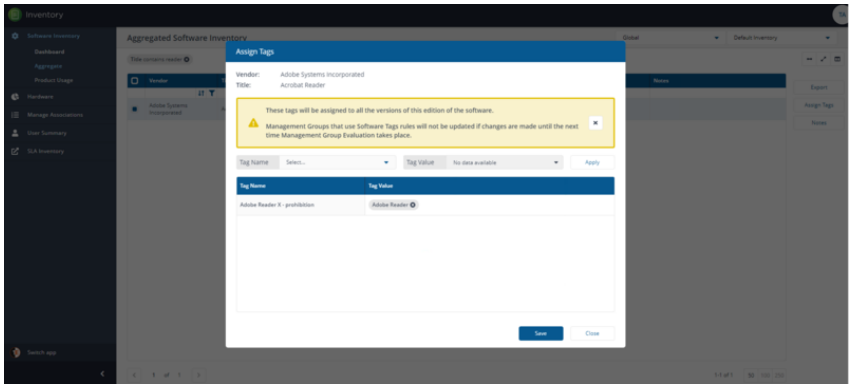
Using Software Tags allows you to create custom labels and associate them with the software titles you have deployed in your estate. An administrator with either the **Full Administrator** or **Group Administrator** role can set Software Tags in their environment, they can also create Management Groups based on the tag name and value. For details about configuring Users, Roles, and Management Groups refer to the Permissions Menu pages.

In short, you can work with Software tags by:

1. Creating your Software Tag.
2. Associating the new tag with a software title.
3. Creating a Management Group based on the Software Tag name and Tag value rules (This step can be run anytime before an evaluation).
4. Evaluating the new Management Group by running a Basic Inventory Consolidation.

If an administrator adds or modifies Software Tags or associations, they will have to run the Management Group evaluation report again to see the updated devices reflected in the Inventory.

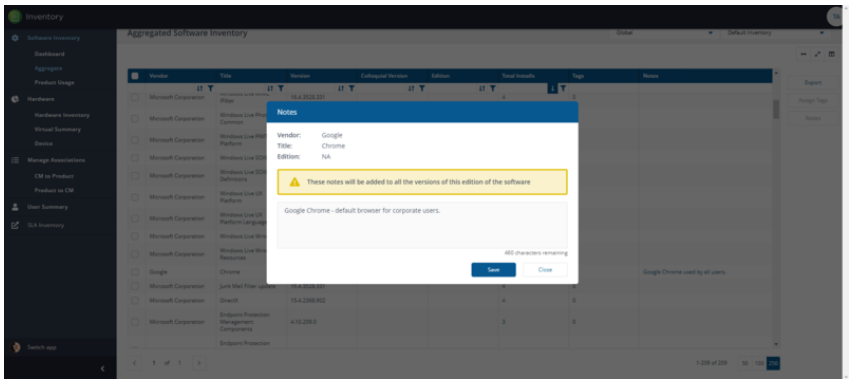
To find out more about using Software Tags, refer to the Software Tags page.



1.8.3.2.3 Notes

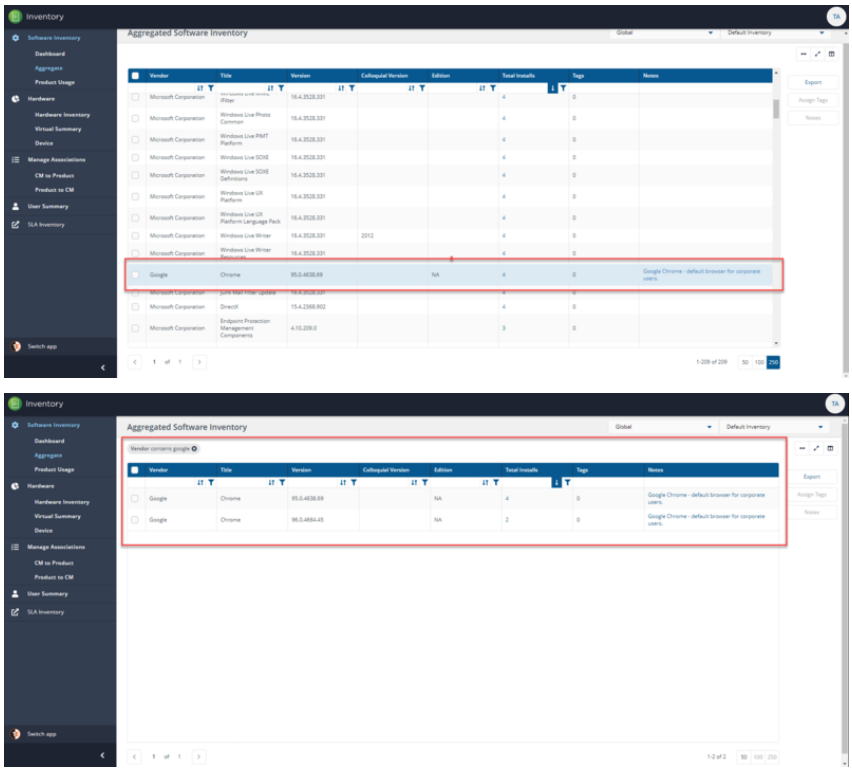
An important feature of software management is to provide additional information for each software title.

From Inventory 8.0 you can add notes which allow you to add additional information for each software title. Software notes are a simple text field that can be added to any software title as required.



You can add a note to each title, and it will be added to every version of that software edition. In our example, we applied a note to **Google Chrome v95.0.4638.69**.

But as the note applies to all versions of Google Chrome when we filter **Aggregated Software Inventory** by **Vendor contains google**, we can see that our note was also applied to **Google Chrome v95.0.4664.45**.



1.8.3.3 Product Usage

The **Product Usage** page shows the distribution of software installs, the top five categories by install and top saving opportunities across your software estate.

In the top right of the page in line with the screen title are two dropdown lists, **Global** and **Default Inventory**. If you select the **Global** dropdown list and look at the available options, you'll see any Management groups you have configured listed there.

If you have multiple Management Groups, choose each option and see how the display changes to show the software installed on each Management group, you may need to scroll to see all the groups. To find out more about Management Groups refer to the Management Groups page. If you have configured more than one Inventory they will be available to choose from the **Default Inventory** dropdown list.

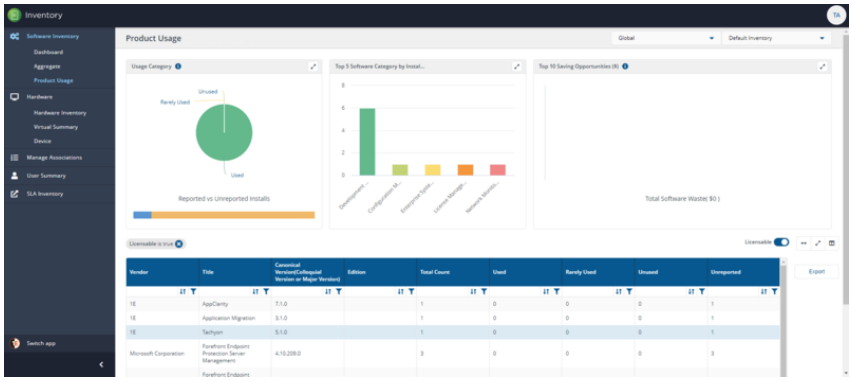
By clicking each colored bar and segment in the three top panels you can narrow the view to only those related products. The table below the top panels is then dynamically updated with these results which are exportable to a downloadable .TSV format. For both the displayed table and the exported file you can choose which columns are shown and exported.

> **Note**
>
> You can choose which columns are displayed in some detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one below:
>
>
>
> To find out more about this feature refer to Choosing the columns displayed in reports.

Available **Product Inventory** columns:

Column	Description
Vendor	The software vendor.
Title	The software title.
Canonical Version (Colloquial Version or Major Version)	If known or exists the Colloquial version is installed.
Edition	The edition installed.
Total Count	Total count per software title.
Used	Total count of used instances of a title.
Rarely Used	Installs are categorized as rarely used.
Unused	Installs are categorized as unused.

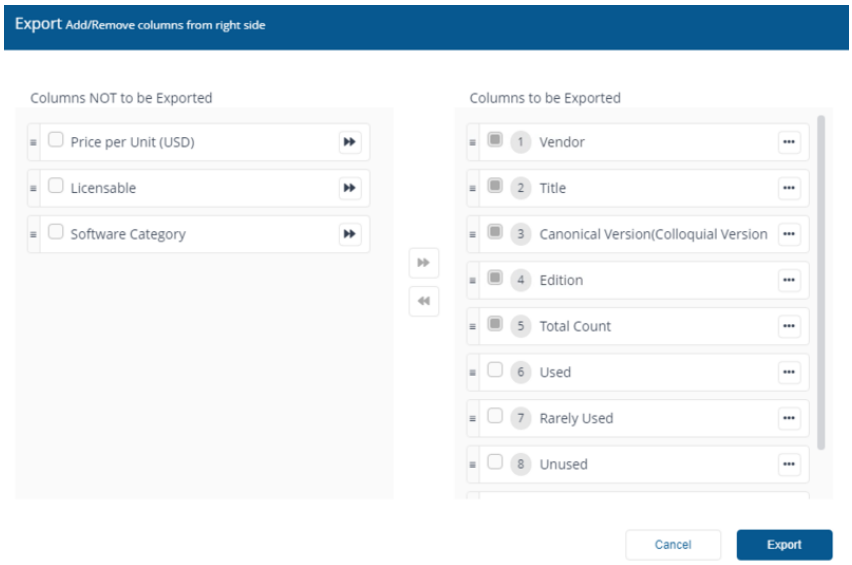
Column	Description
Unreported	Total count of titles where usage information is unavailable.
Price per Unit (USD)	The price per title is shown in the default currency.
Licensable	Yes or No if the software is Licensed.
Software Category	Category information is set in Configuration Manager.



You can use the **Export** button to export currently displayed data in a downloadable report.

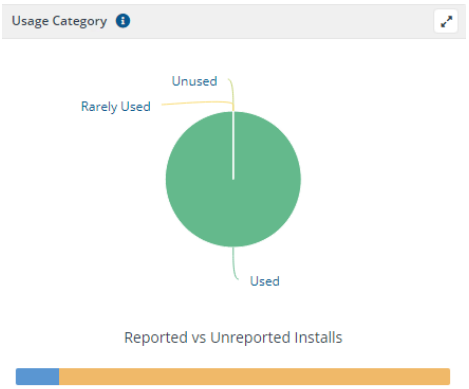
When you click on the **Export** button you'll see the **Export** popup. You can choose which columns to export in the same way you can choose columns to display in the main report panel.

The report is exported in a .TSV format, for example, **InventoryProductUsage_20200813102621.tsv** and is downloaded to the browser's download folder.



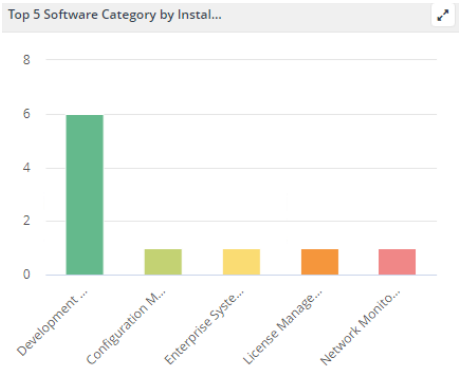
1.8.3.3.1 Usage Category

The pie chart shows the distribution of installs **Used**, **Rarely used**, and **Unused** as a percentage of total installs that report usage (i.e. **Total Reported Installs**). The bar at the bottom shows the distribution of installs as **Reported** and **Unreported** as a percentage of **Total Installs**.



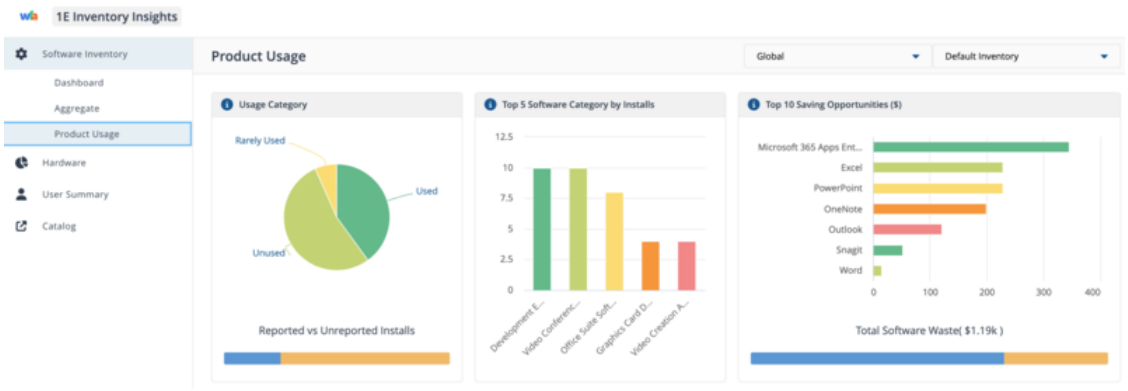
1.8.3.3.2 Top 5 Software Category by installation

The bar chart shows the top five categories by installs. The chart ignores operating systems and internet browser categories for calculating the top five categories.



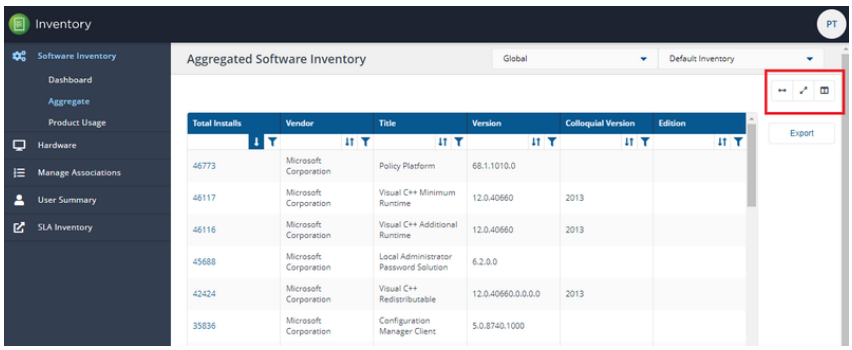
1.8.3.3.3 Top 10 Saving Opportunities ($)

The bar chart shows the top ten products offering maximum saving opportunities in USD. The calculation is based on multiplying a product's unit price and the sum of **Unused** and **Rarely Used** installs. The bar at the bottom shows the total opportunity in USD, segregated from **Unused** and **Rarely Used** installs.



1.8.3.4 Choosing the columns displayed in reports

To increase readability, you can choose the columns displayed in detail tables. On the pages where you can pick the displayed columns you'll see the control highlighted in the opposite example.



When you click on the **Choose columns** control it opens a popup displaying every column on the current screen, the controls are:

Control	Explanation
Available Columns	Columns which are hidden by default from being displayed on screen. You can still include any of them to display on screen.
Visible Columns	Displays the list of columns displayed on screen. Mandatory Columns cannot be excluded, the selection controls for these items are disabled. They can still be moved up or down. **Tip** Some pages have mandatory columns and a set of default hidden columns.
Arrow buttons	To move up or move down, exclude or include any column, clicking on the ellipsis displays these additional controls:

Control	Explanation
Drag and drop	You can drag and drop columns to change how they are displayed.
Exclude columns	Exclude column button allows you to select columns to exclude from the current display.

For example, in**Inventory**→**Aggregated Software Inventory** we use the **Choose columns** control to pick which columns are displayed.

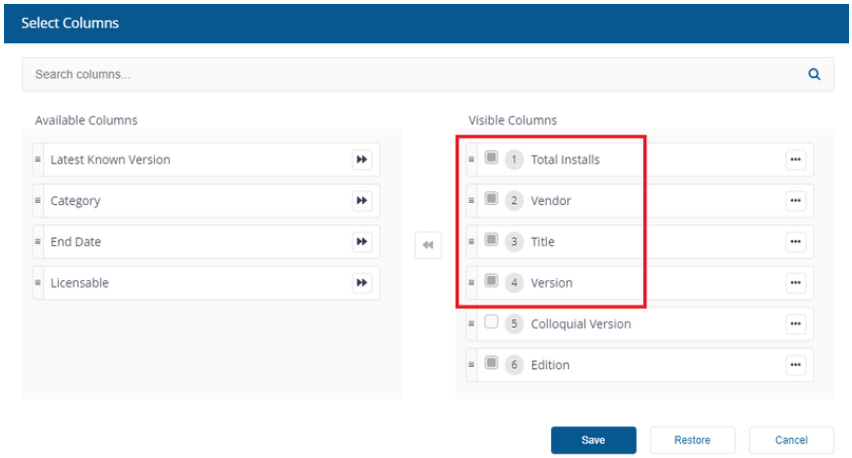
On this page the default columns are:

- Total Installs
- Vendor
- Title
- Version
- Colloquial Version
- Edition.

Some pages also have mandatory columns which cannot be excluded from the display. The excluded columns are greyed out and cannot be removed.

The Aggregated Software Inventory page has the following mandatory columns which you cannot remove:

- Total Installs
- Vendor
- Title
- Version
- Edition.



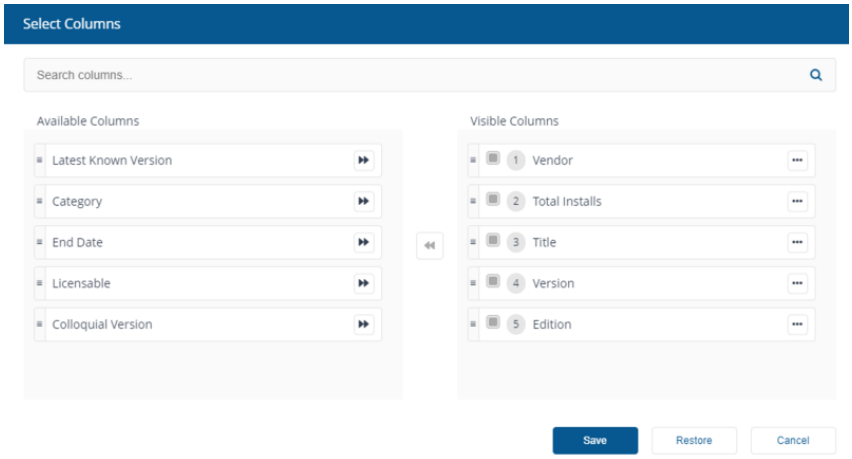
From this screen we chose to exclude **Colloquial Version** and move **Vendor** to the top of the list.

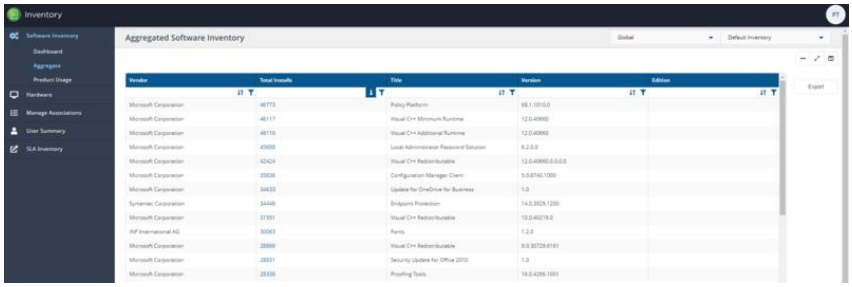
To apply this view to the current report, we click **Save**.

You can also choose **Restore** to reset the column chooser or **Cancel** to cancel your changes and exit the **Choose columns** control.

Note

When you refresh reports on a page where you have amended the displayed columns, the report view will reset back to its default view once the refresh completes and the page reloads.





1.8.4 Manage associations

Applications and Packages in Configuration Manager are identified by a name and optionally publisher and version arbitrarily determined by the Configuration Manager administrator that created them. The Inventory platform uses a standard format of Vendor, Title, Version, and Edition to identify applications.

The **Manage Associations** section of Inventory enables an administrator to effectively normalize the Applications and Packages imported from Configuration Manager by associating them with a Vendor, Title, Version, and Edition defined in the 1E Catalog. These associations are then used to define migration rules in Introducing Application Migration and reclaim rules in Introducing AppClarity.

To manage associations, the Inventory repository used by your application must be populated by a System Center Configuration Manager connector that collects details of Applications and Packages defined in Configuration Manager.

1.8.4.1 The Manage Associations section

The Manage Associations section allows you to associate Applications and Packages in CM with a Vendor, Title, Version and Edition from the 1E catalog. It provides two views of the data.

- The **CM to Product** view lists all Applications and Packages that were imported from CM during the last Inventory sync. You typically use this view when initially setting up Application Migration, as it allows you to work through each Application and Package available for deployment and associate them with a suitable Vendor, Title, Version and Edition.

  You would also use this view after new Applications or Packages have been added in CM. Once you've created the associations you can then create migration rules that refer to the products without having to refer back to the CM Application or Package that installs them.

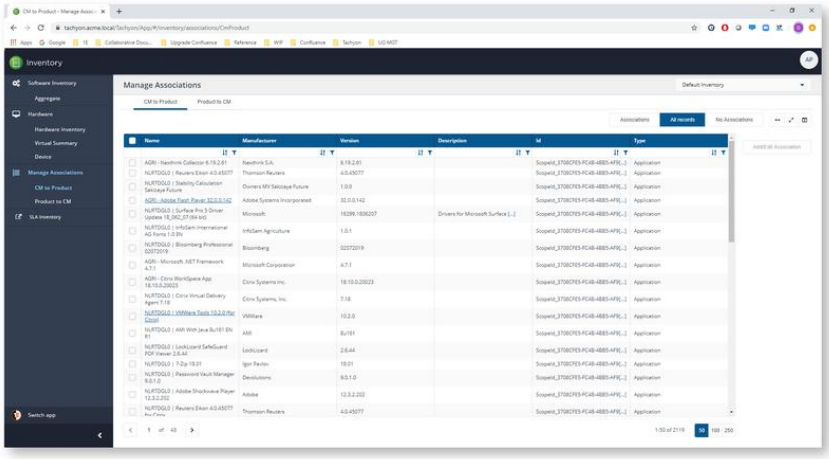
- The **Product to CM** view lists all products (by Vendor, Title, Version and Edition) installed in your environment, indicating the products that have been associated with an Application or Package in CM and can therefore be installed through Application Migration or removed using AppClarity reclaim.

  This view is ideal for identifying the products installed in your environment that are not currently set up for automated installation or removal using Application Migration and AppClarity.

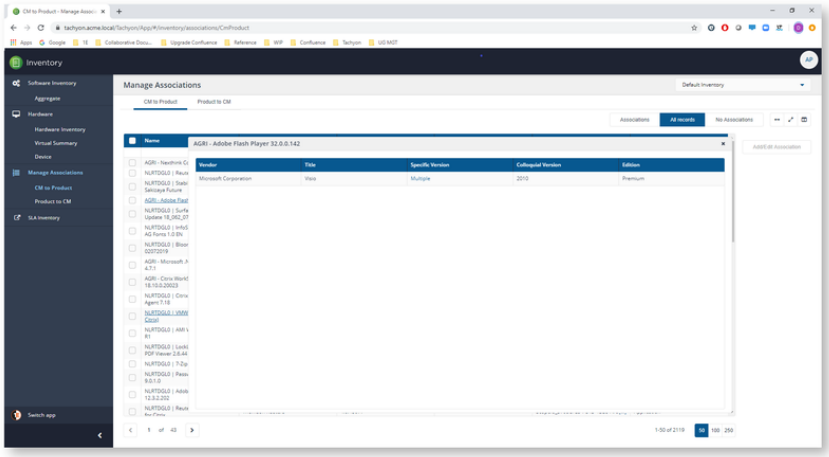
1.8.4.1.1 Associating a Configuration Manager application or package with a product (Vendor, Title, Version, and Edition)

After syncing a connector with Configuration Manager, the **Inventory→Manage Associations->CM to Product** tab on the Manage Associations page lists the applications and packages found in Configuration Manager.

> **Note**
>
> You can choose which columns are displayed in some detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one below:
>
>
>
> To find out more about this feature refer to Choosing the columns displayed in reports.

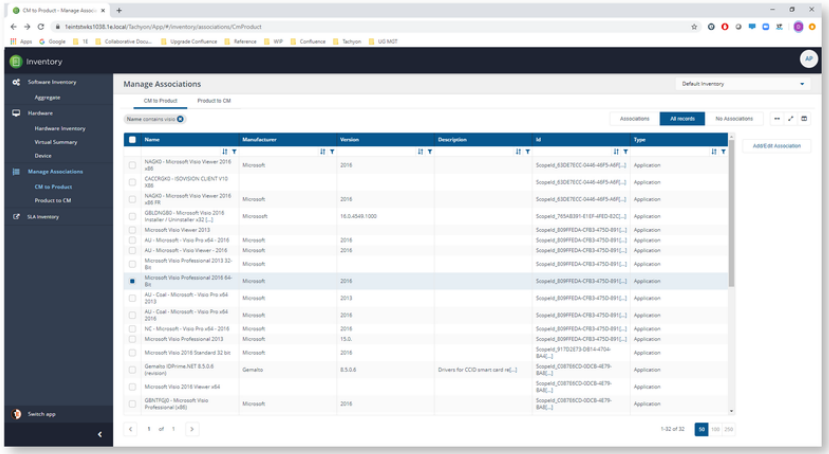


For any Configuration Manager applications/packages, where there are any product associations present, the application/package name in the **Name** column is a link that displays a pop-up that shows the existing association.

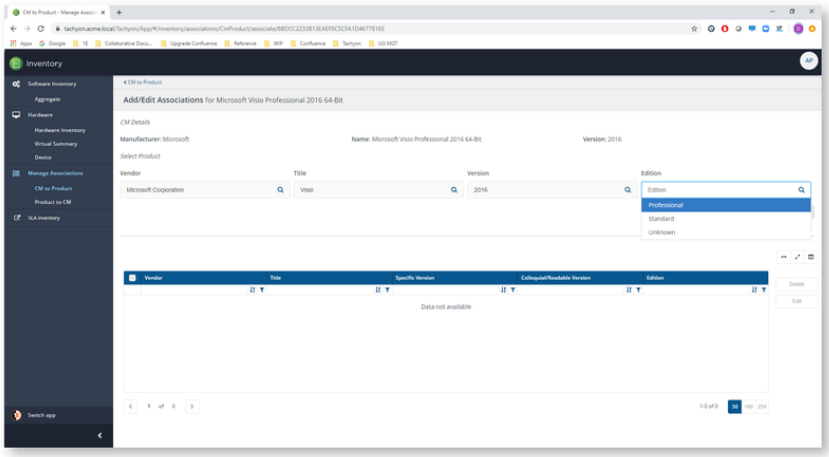


After selecting a single application/package from the table the **Add/Edit Associations** button is enabled. If the application/package already has an association you get to edit the association, if any other application/package is selected you get to create a new association for it.

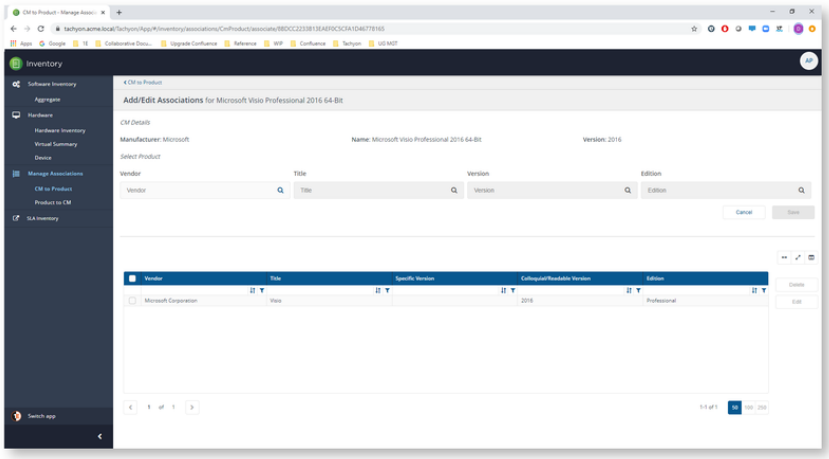
The picture shows an unassociated application/package for Microsoft Visio.



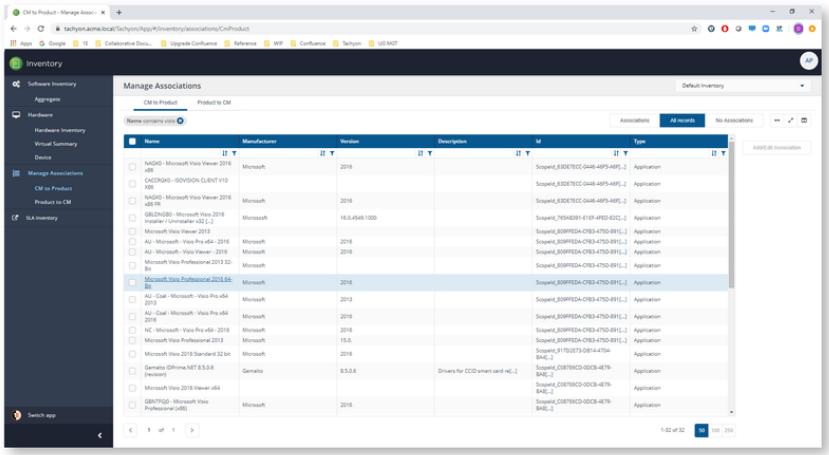
To set a new association you must specify the VTVE in the top **Vendor**, **Title**, **Version** and **Edition** drop downs to search for a product.



After clicking the **Save** button, just below the VTVE fields, the association is saved.



Now when you navigate back to the **CM to Product** screen, the Visio application/package name is a link indicating that it has an association.



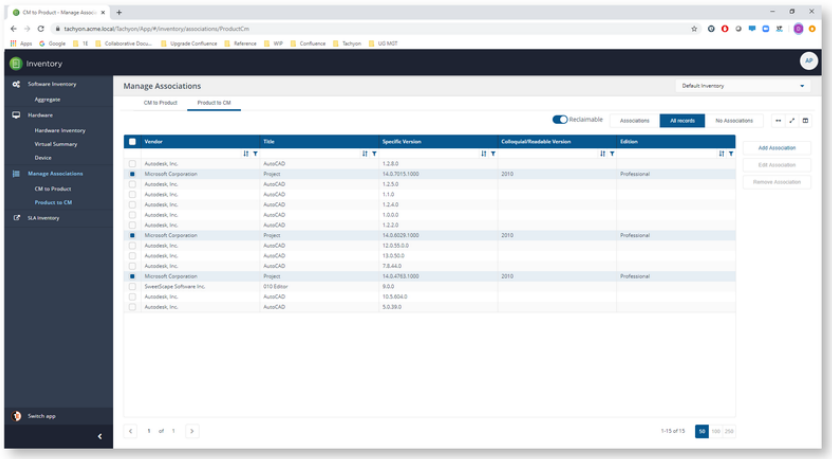
1.8.4.1.2 Associating one or more products (Vendor, Title, Version and Edition) with a Configuration Manager application or package

Navigate to the **Inventory->Manage Associations→Product to CM** page.

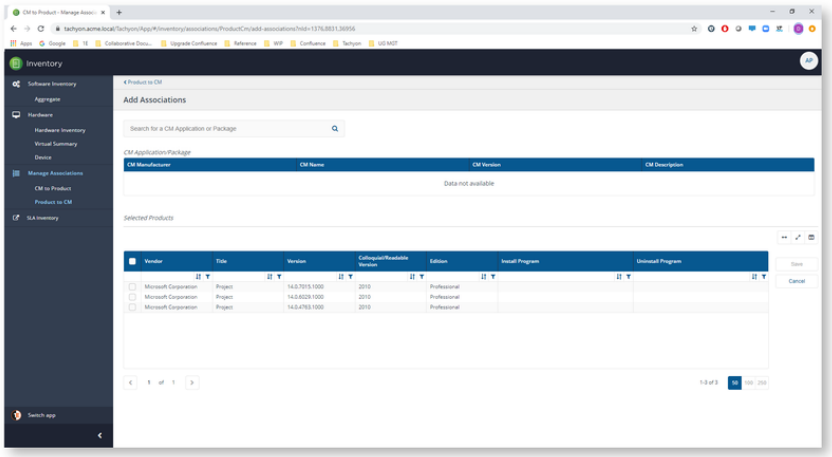
The products which are installed in the selected inventory are listed in the table.

For any product, where there are any associations present, the version number in the **Specific Version** column is a link that displays a pop-up that shows the existing association.

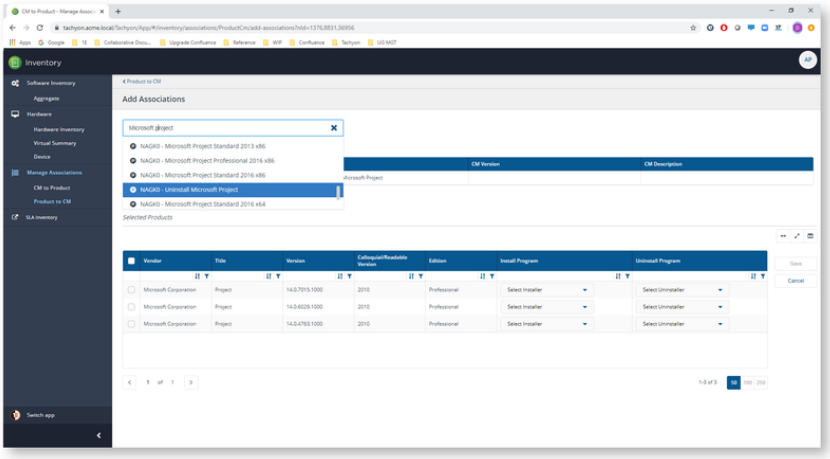
You can set associations for more than one version of a product at a time. The picture shows three versions of the Microsoft Project selected.



Clicking the **Add Association** button displays the **Add Associations** page with the selected products added, as shown in the picture.

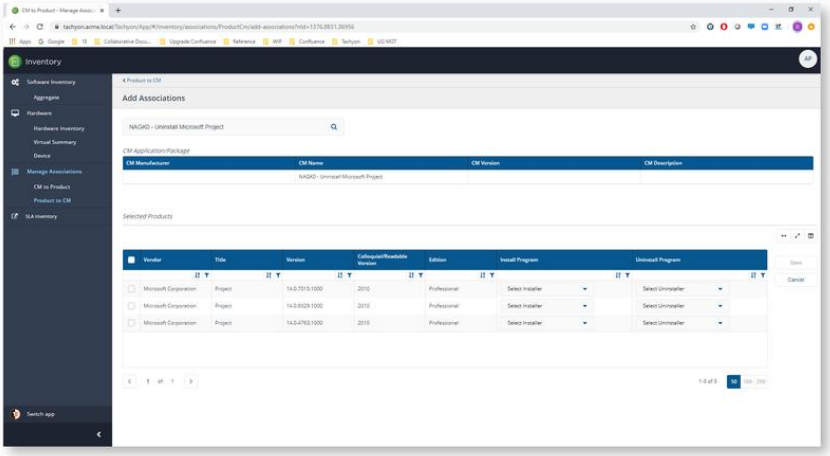


You can search Configuration Manager for a specific application or legacy package by typing into the search field at the top of the page. The picture shows a search for Microsoft Project and the selection of a specific legacy package option called **NAGKO - Uninstall Microsoft Project**.



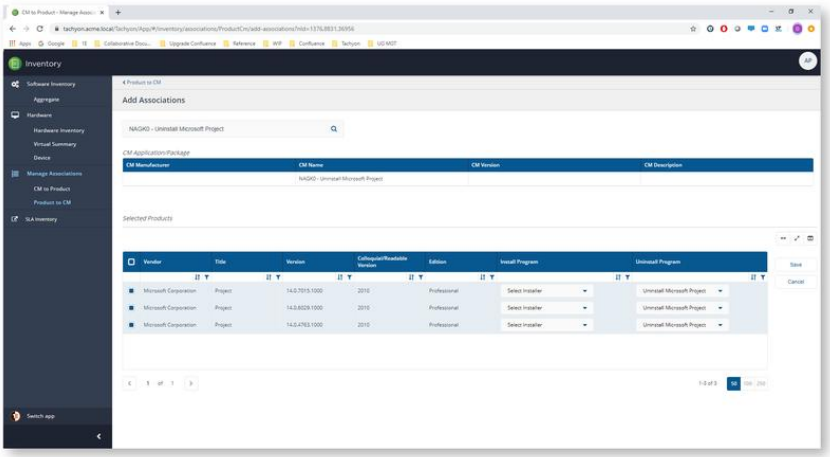
If you select a legacy package the listed selected products change appearance slightly to allow you to select any associated install and uninstall programs, as shown in the picture.

If you select an application there is no option to select the Install/Uninstall Program as that is not necessary for applications.



In our example, we will apply the selected **CM Application/Package** to all the selected products and then set their **Uninstall Program** items to **Uninstall Microsoft Project**, as shown in the picture.

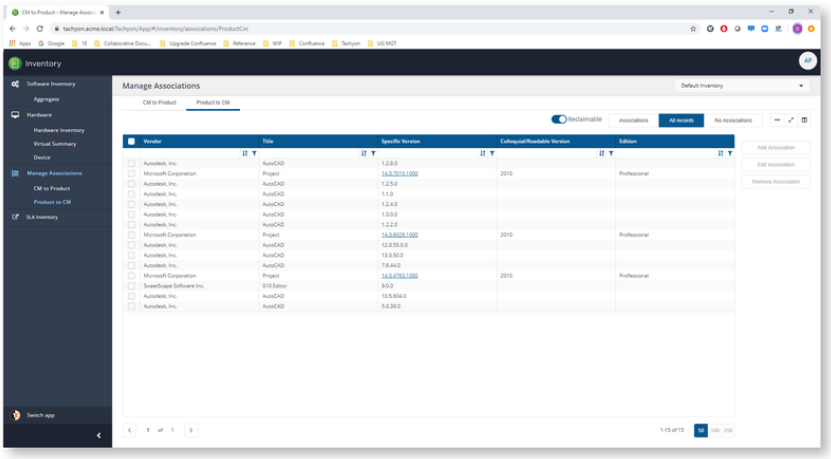
Click the **Save** button to save the associations.



Now when you navigate back to the **Product to CM** page you'll see that your selected products now have associations added. You can see this in the picture where the three Microsoft Project versions now have links.

1.8.4.1.2.1 The Reclaimable toggle

You will also notice that there is a toggle button just above the table on the **Product to CM** tab. When this is turned on the table will be filtered to only display the products that have a reclaim policy associated with them in AppClarity. This can be useful after having defined reclaim policies for installed products in AppClarity to then easily associate them with Configuration Manager applications or programs.



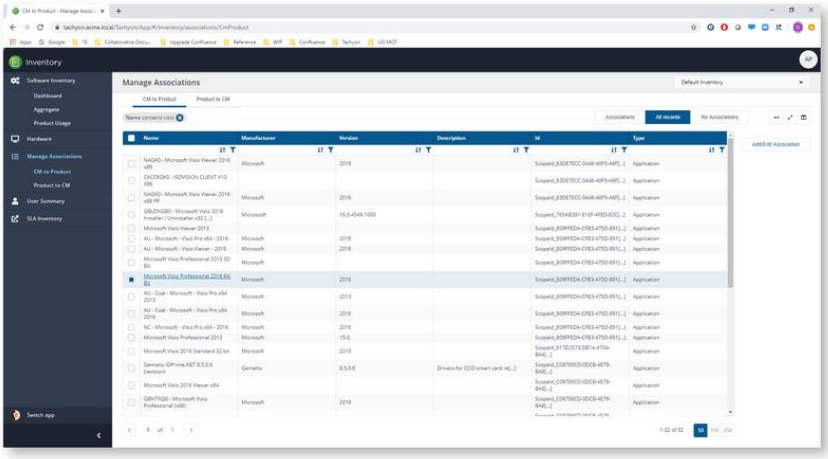
1.8.4.2 Editing associations

The steps for editing associations are different depending on which page the association was created.

1.8.4.2.1 Editing CM to Product associations

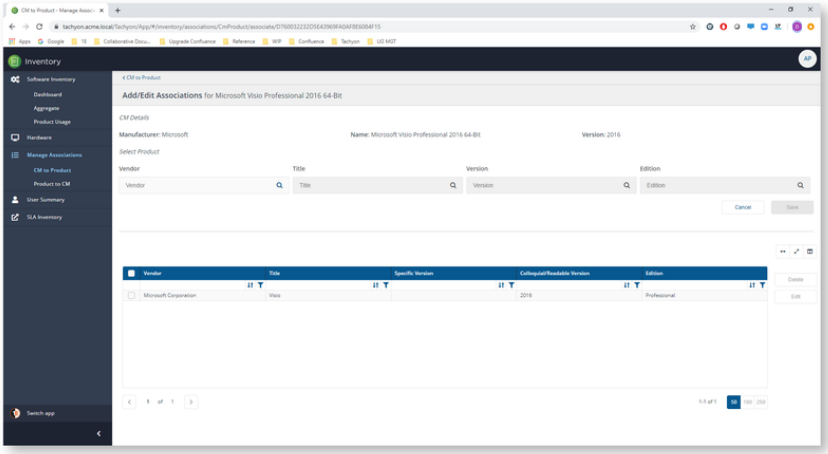
You can edit an existing CM to Product association by selecting it from the **CM to Product** associations list and then clicking on the **Add/Edit Association** button. The picture shows the previously created Microsoft Visio association selected.

> **Note**
>
> You can only select one association to edit at a time. If you make multiple selections the **Add/Edit Association** button will be disabled.



On the **Add/Edit Associations** page subsequently displayed you can save new associations in the top part of the page and edit or delete existing ones on the lower part. The picture shows the previously added Microsoft Visio association being edited.

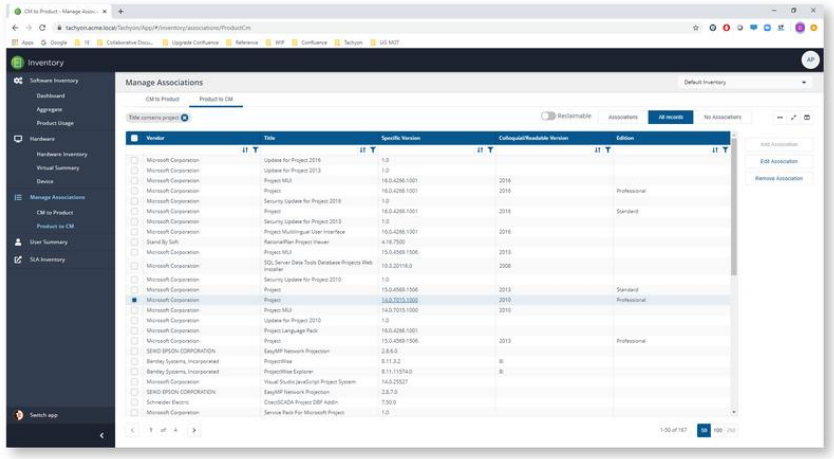
Modifications are stored whenever you click on **Save** or **Delete**. Once you've finished making the changes you need you can navigate back to the main **CM to Product** page by clicking on the **< CM to Product** link at the top of the page or using the navigation tree on the left.



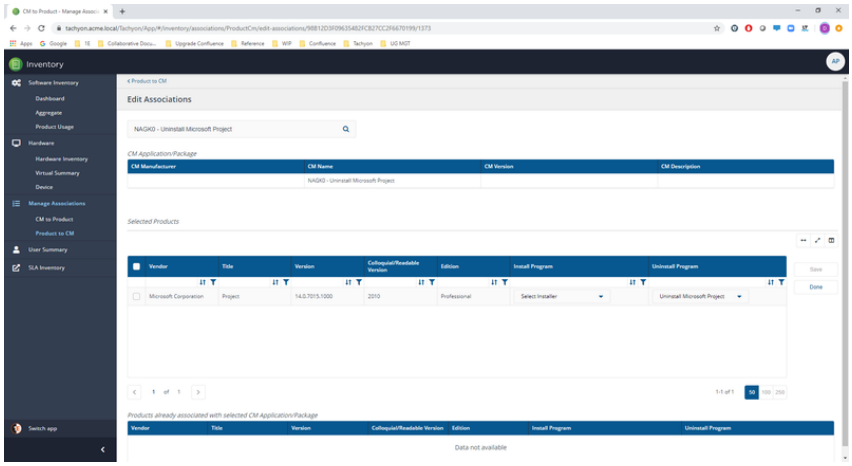
1.8.4.2.2 Editing Product to CM associations

You can edit an existing CM to Product association by selecting it from the **Product to CM** associations list and then clicking on the **Edit Association** button. The picture shows one of the previously created Microsoft Project associations selected.

> **Note**
>
> You can only select one association to edit at a time. If you make multiple selections the **Edit Association** button will be disabled.

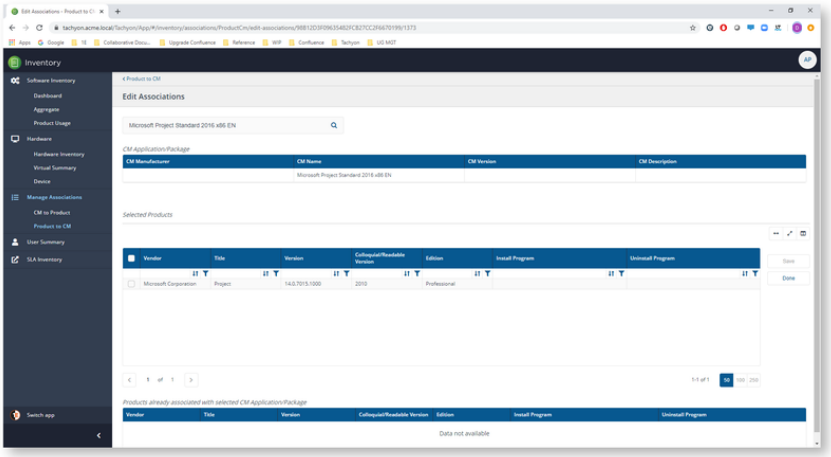


On the **Edit Associations** page subsequently displayed you can select a new Configuration Manager application or legacy package in the top part of the page and edit the specific product association on the lower part, including setting the **Install Program** and **Uninstall Program** for legacy packages. The picture shows the previously added Microsoft Project association being edited.



To select another Configuration Manager application or legacy package you search for it using the search field at the top of the page, in the same way as you would if you were creating a completely new product for CM association. In the picture we've changed the original **NAGK0 - Uninstall Microsoft Project** CM legacy package to the **Microsoft Project Standard 2016 x86 EN** application.

Once you've made this change you'll need to select the product in the **Selected Products** list and then click on **Save** to commit any changes made to the listed product.



Click **Done** to close the **Edit Associations** page without saving, a notification popup will be displayed. You can also navigate back to the main **Product to CM** page by clicking on the **< Product to CM** link at the top of the page or using the navigation tree on the left.

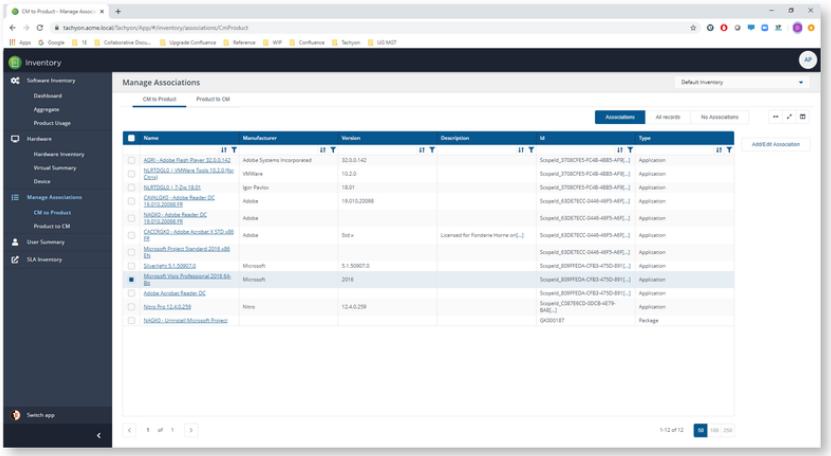
1.8.4.3 Deleting associations

The steps for deleting associations are different depending on which page the association was created.

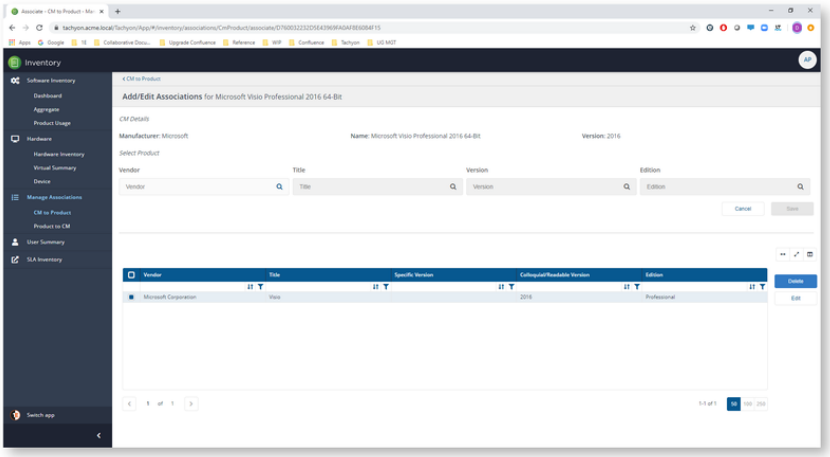
1.8.4.3.1 Deleting CM to Product associations

You delete a **CM to Product** association by deleting all the product associations it holds. This is done via the **Add/Edit Associations** page. First, select the association you want to delete from the **CM to Product** associations list and then click on the **Add/Edit Association** button. The picture shows the previously created Microsoft Visio association selected.

> **Note**
>
> You can only select one association to edit at a time. If you make multiple selections the **Add/Edit Association** button will be disabled.

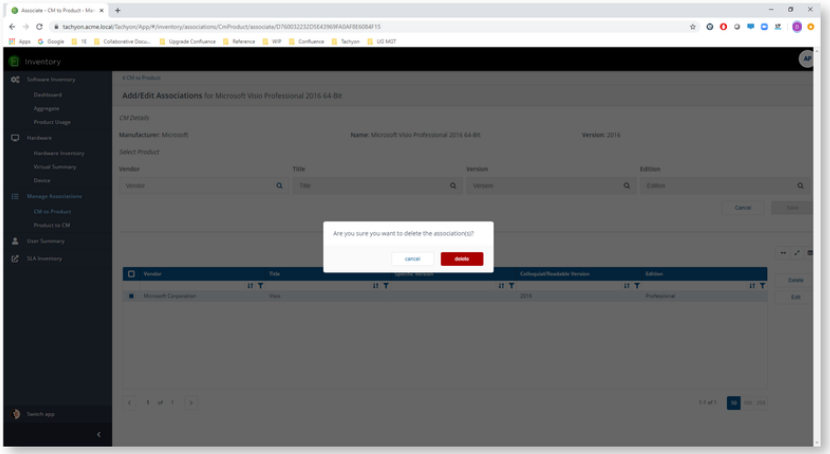


When the **Add/Edit Associations** page is displayed select all the associations by clicking on the selection field at the left-hand end of the products table. Then click on the **Delete** button, as shown in the picture.



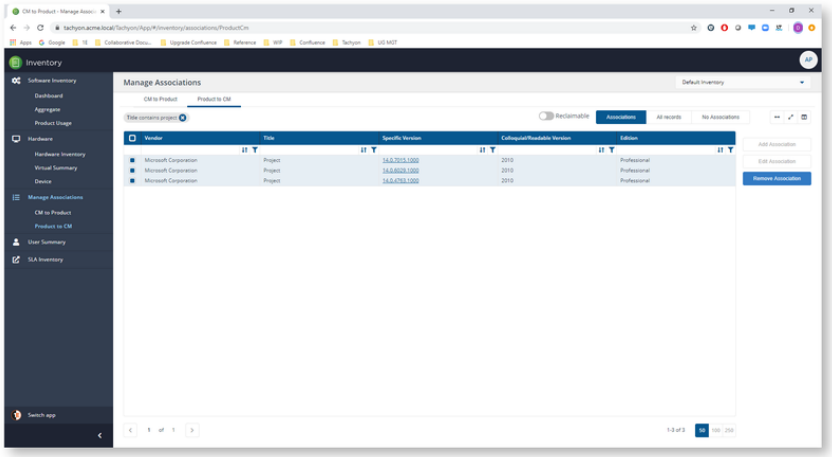
A popup will be displayed asking whether you want to delete the association(s). Click on **delete** to remove all the products from the association.

Subsequently, when you navigate back to the **CM to Product** page you will see that the association has been deleted as a result of all the products having been deleted from the association.

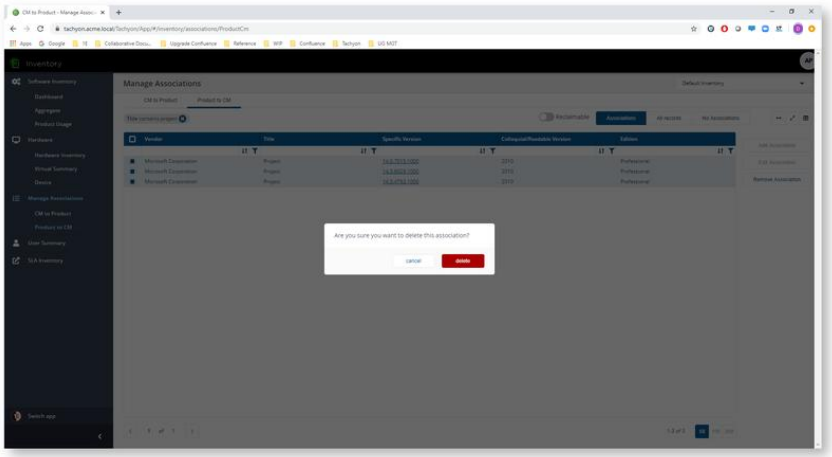


1.8.4.3.2 Removing Product to CM associations

You can remove one or more **Product to CM** associations in a single operation on the **Product to CM** page. To do this you select all the associations you want to remove and then click on the **Remove Association** button. The picture shows the Microsoft Project associations selected that we created earlier, with the **Remove Association** button highlighted.



Clicking on the button displays a notification popup asking if you want to continue with the process of removing the selected associations, as shown in the picture. Click **delete** to continue and remove all the selected associations. At this point, the associations will be removed and no longer appear in the console.



1.8.5 User Summary

User Summary shows data captured from sources such as Configuration Manager, Big Fix, and vCenter if you have them configured.

The dashboard is refreshed (recalculated) when the page is opened or the page is refreshed in the browser.

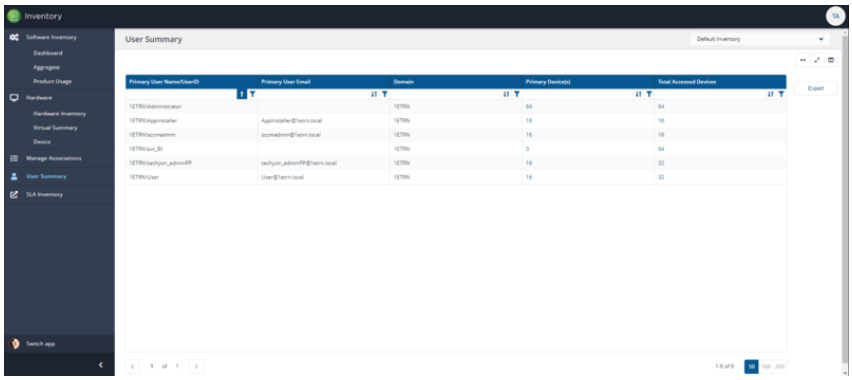
The User Summary page shows a list of active users gathered using the Configuration Manager software inventory.

In the top right of the page in line with the screen title, there is a dropdown showing **Default Inventory**. If you have configured more than one Inventory they will be available to choose from here.

You can also customize which fields are displayed on the page by using the **Choose Columns** control.

> **Note**
>
> You can choose which columns are displayed in some detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one below:

To find out more about this feature refer to Choosing the columns displayed in reports.

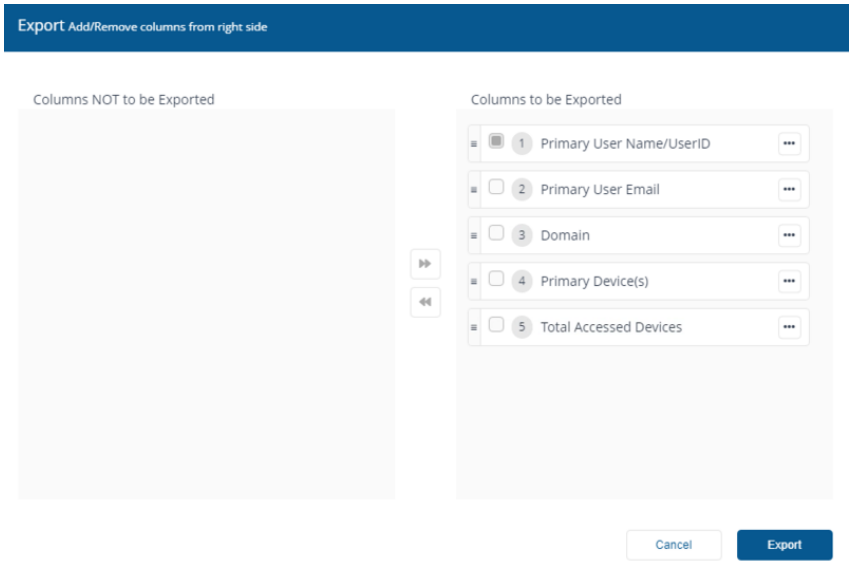


1.8.5.1 Export

You can use the **Export** button to export currently displayed data in a downloadable report.

When you click on the **Export** button, you'll see the **Export** popup. You can choose which columns to export in the same way you can choose columns to display in the main report panel.

The report is exported in a .TSV format, for example, **InventoryProductUsage_20200813120506.tsv**. The file is exported and downloaded to the default location for the browser you are using.



1.8.6 The 1E Catalog

An introduction to 1E Catalog and how to access and use the feature.

1E Catalog provides the following capabilities within the Inventory and other applications:

- Have a consistent view of your estate
- Uniquely identify software products deployed in your estate

- Identify device types (laptop, desktop, virtual machine), operating system, device family, device manufacturer, and maximum number of processors
- Normalize processor information like processor model, processor family, vendor name, and number of cores of processors running on your devices
- Define and apply bundling rules to identify suites and their components
- Define and apply entitlement rights, such as version upgrade/downgrade, edition downgrade, and software assurance rights which are used during license demand and compliance calculations
- Apply autofill entitlement information using software SKU.

1E Catalog and SLA are components of the Inventory application. Other applications such as AppClarity access it directly and many Catalog related operations are carried out within these companion applications and features. Therefore you will rarely need to directly access the Catalog UI, but it can be used for the following:

- Managing software products
- Adding a new version
- Managing match rules - so the Catalog can link and normalize inventory products.

1.8.6.1 Connecting to the CatalogWeb UI

Note

The Catalog UI can be reached directly using the following URL:

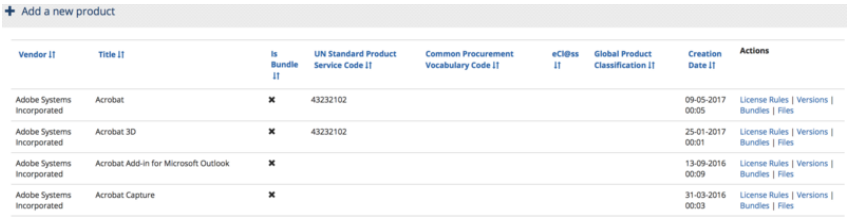
```
https://<tachyon DNS Name FQDN>/CatalogWeb
```

where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names.

1.8.6.2 Software Products page

When you access the Catalog UI, the first page displays a list of software products in the Catalog.

The top right of the screen shows navigation elements for each section of the UI:

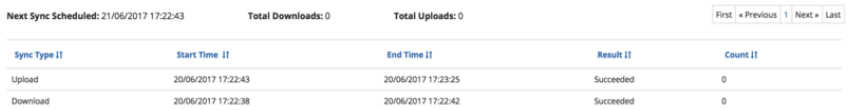


1.8.6.2.1 Admin

Allows you to manage who runs resynchronization events to refresh Catalog data. Only users with admin privileges see this tab.

1.8.6.2.2 Updates

Provides the status for catalog updates - only if you subscribe to the service.



Next Sync Scheduled: 21/06/2017 17:22:43 **Total Downloads:** 0 **Total Uploads:** 0

First « Previous 1 Next » Last

Sync Type	Start Time	End Time	Result	Count
Upload	20/06/2017 17:22:43	20/06/2017 17:23:25	Succeeded	0
Download	20/06/2017 17:22:38	20/06/2017 17:22:42	Succeeded	0

1.8.6.2.3 Products

The software products screen, which is also the Catalog landing page where you can perform tasks like:

- Managing software products
- Adding a new version
- Managing bundles
- Adding a fileset
- Managing license rules.

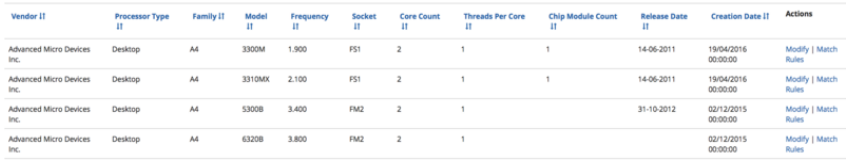
1.8.6.2.4 Devices

List of Catalog devices - click **Managing match rules** to update details of a device or Match Rules to edit an existing rule or associate a new rule with it.

Vendor	Device Type	Family	Model	Max Socket Count	Release Date	Creation Date	Actions
1E652	Motherboard		A30	1		21/04/2016 00:00:00	Modify | Match Rules
AAEON	Motherboard		FSB-B75H	1		21/04/2016 00:00:00	Modify | Match Rules
Acer Inc.	Notebook	Aspire	E1-532	2	01-10-2013	13/04/2016 00:00:00	Modify | Match Rules
Acer Inc.	Desktop	Veriton	M410	1		18/08/2015 00:00:00	Modify | Match Rules
Acer Inc.	Desktop	AspireRevo	R3610	1		18/08/2015 00:00:00	Modify | Match Rules

1.8.6.2.5 Processors

List of Catalog processors - click **Modify** to update the details of a processor or Managing match rules to edit an existing rule or associate a new rule with it



Vendor	Processor Type	Family	Model	Frequency	Socket	Core Count	Threads Per Core	Chip Module Count	Release Date	Creation Date	Actions
Advanced Micro Devices Inc.	Desktop	A4	3300M	1.900	FS1	2	1	1	14-06-2011	19/04/2016 00:00:00	Modify | Match Rules
Advanced Micro Devices Inc.	Desktop	A4	3310MX	2.100	FS1	2	1	1	14-06-2011	19/04/2016 00:00:00	Modify | Match Rules
Advanced Micro Devices Inc.	Desktop	A4	5300B	3.400	FM2	2	1		31-10-2012	02/12/2015 00:00:00	Modify | Match Rules
Advanced Micro Devices Inc.	Desktop	A4	6320B	3.800	FM2	2	1			02/12/2015 00:00:00	Modify | Match Rules

1.8.6.2.6 Vendors

List of software publishers in the Catalog

Vendor	Short Name	Creation Date	Actions
Adobe Systems Incorporated	Adobe	02/12/2015 00:00:00	Aliases
Adolfo Marinucci		31/03/2016 00:00:00	Aliases
Adolix		31/03/2016 00:00:00	Aliases

1.8.6.2.7 Glossary

List of terms used in the Catalog UI

1.8.6.3 Managing software products

To add a new software product:

1. Click the **Add a new product** link.
2. On the Product Information page, complete the following mandatory fields:

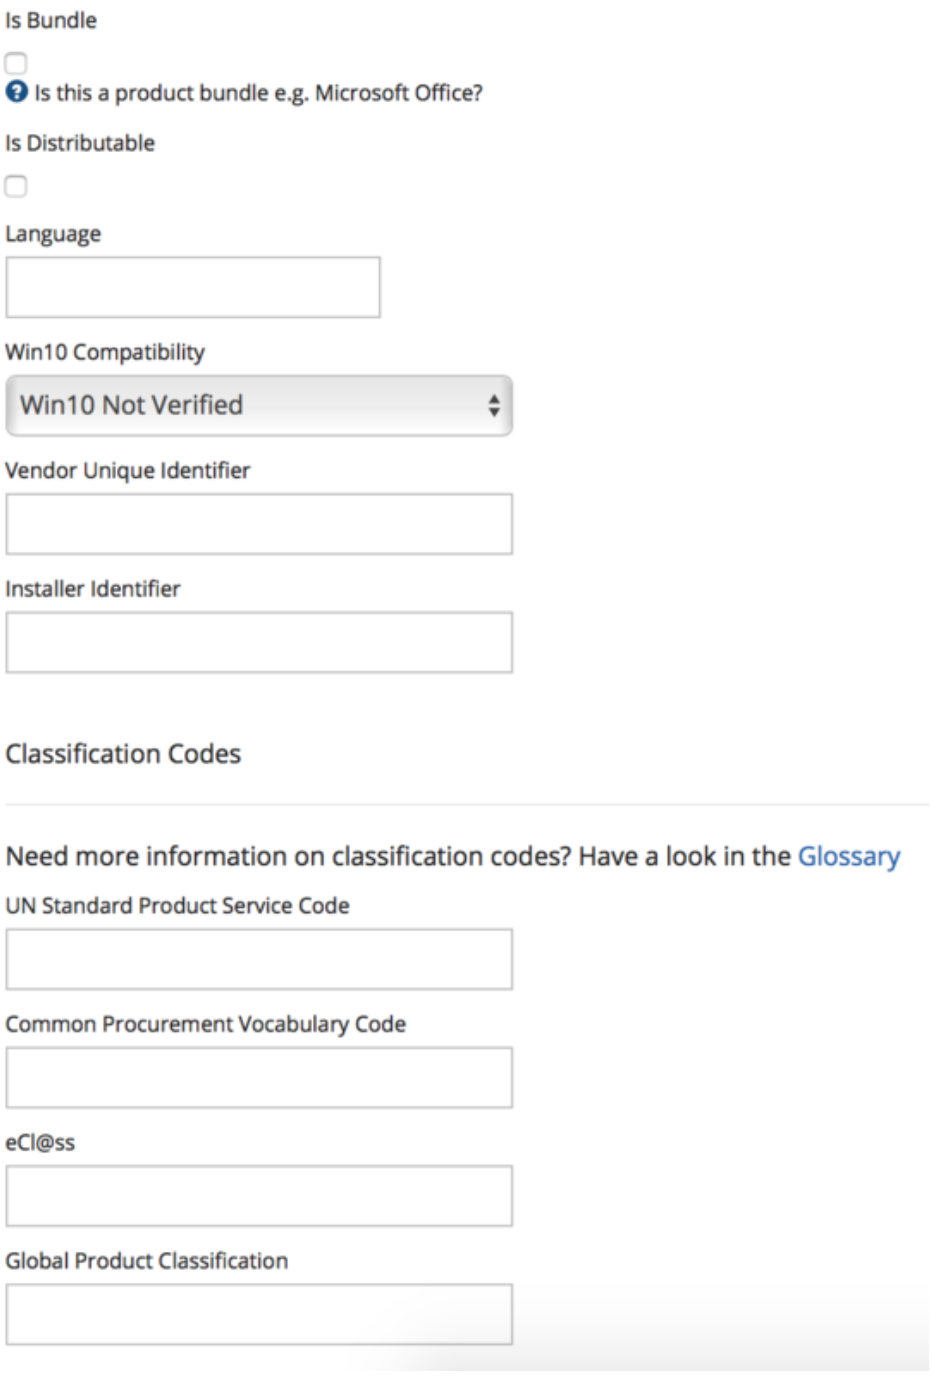
   - Vendor
   - Title
   - Version

   And optionally:

   - Colloquial Version

- Edition
- Release Date
- End of Support Date
- Is a License Required?

3. Click **Save**.
4. To provide more information about the new product, click the **Additional details** tab and complete these fields or tick the checkboxes as necessary:



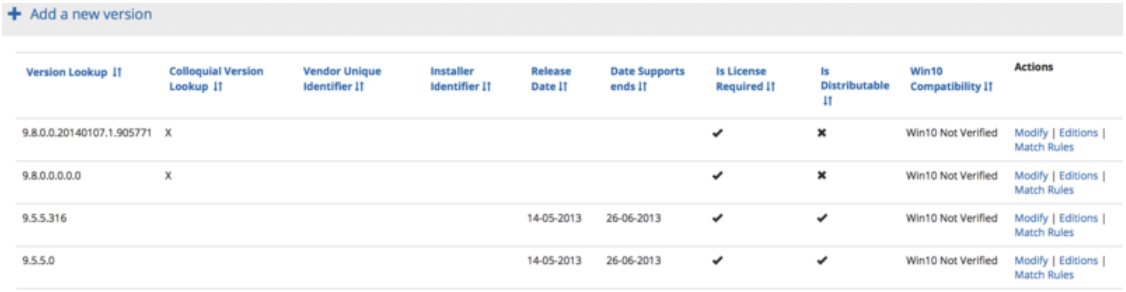
- Is Bundle
- Is Distributable - is this software title distributed separately?
- Language
- Windows 10 Compatibility
- Vendor Unique Number
- Installer Identifier

- UN Standard Product Service Code
- Common Procurement Vocabulary Code
- eCl@ss
- Global Product Classification.

5. Click **Save**.

1.8.6.4 Managing versions

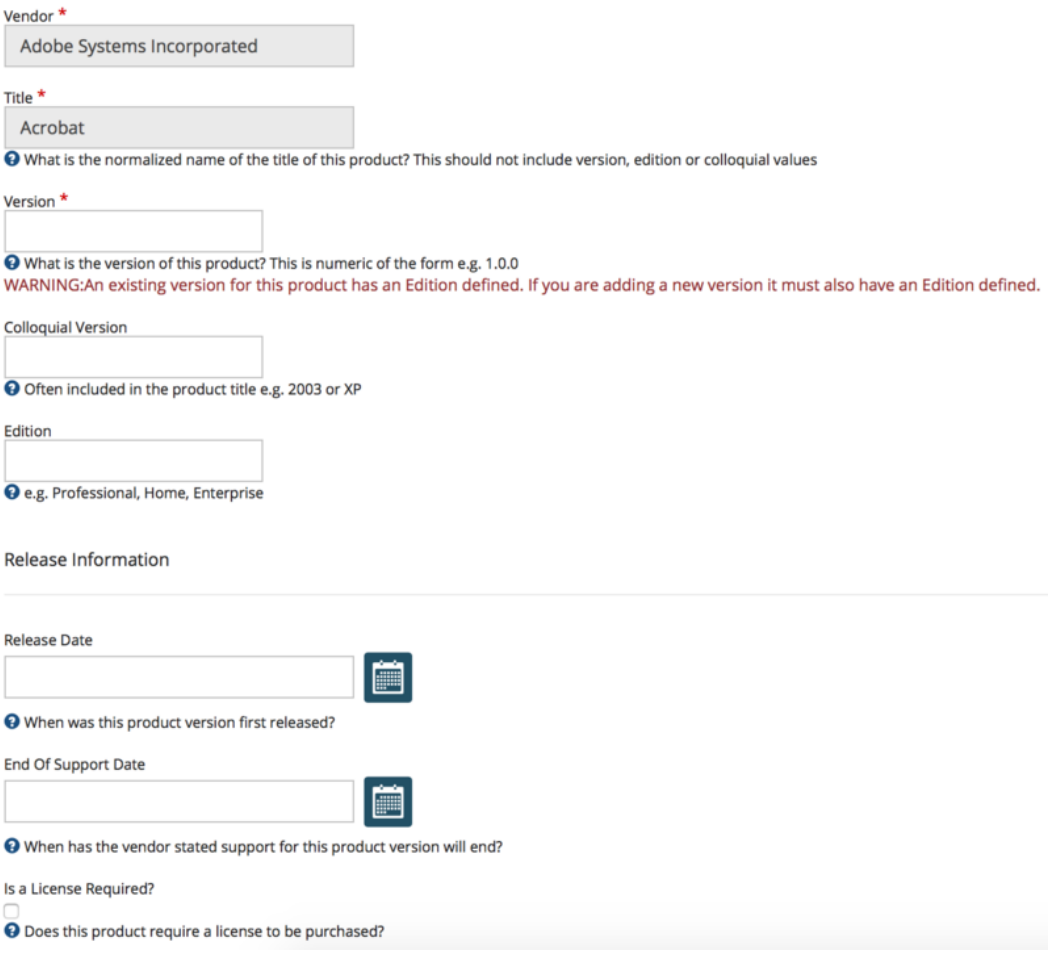
To view a software product's versions, click the **Version** link to the right of the product screen to show a list of versions for that product, refer to Using filters.



1.8.6.4.1 Adding a new version

To add a new version:

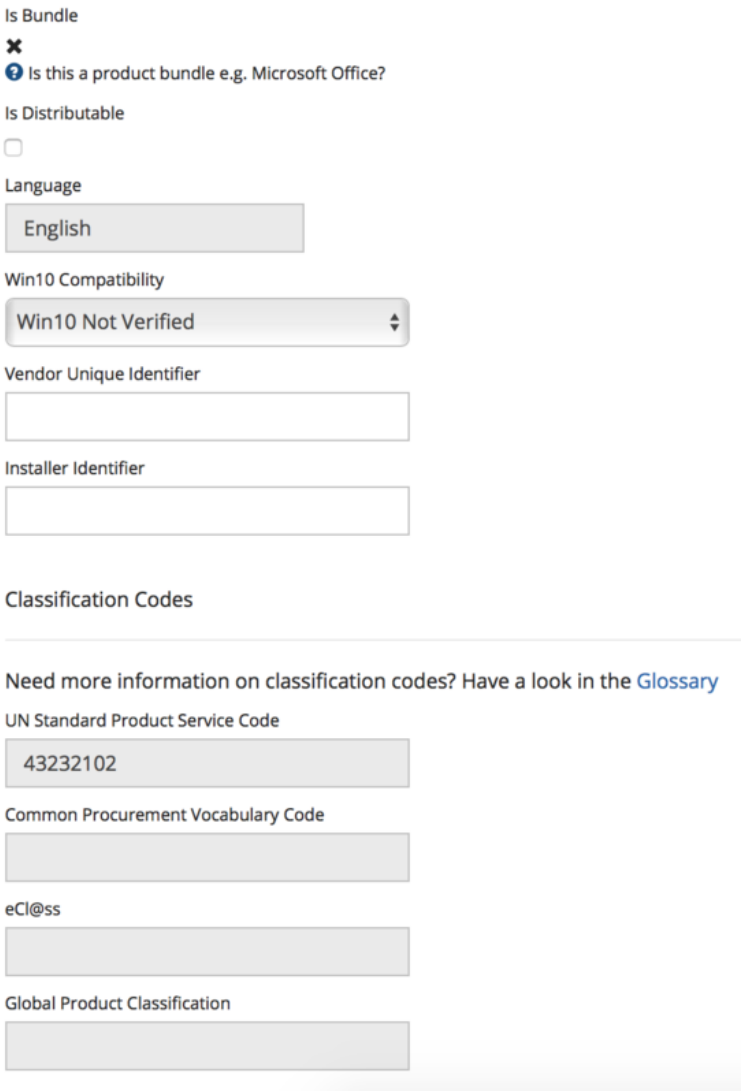
1. Click the **Add a new version** link at the top of the screen - Adobe Acrobat in this example.
2. On the **Product details** tab for Adobe Acrobat, complete the **Version** field.



And optionally:

- Colloquial Version
- Edition
- Release Date
- End of Support date
- Is a License Required?

3. Click **Save**.
4. To provide additional information associated with this particular version, click the **Additional details** tab and complete the fields or tick the checkboxes as necessary:



- Is Distributable?
- Vendor Unique Identifier
- Installer identifier.

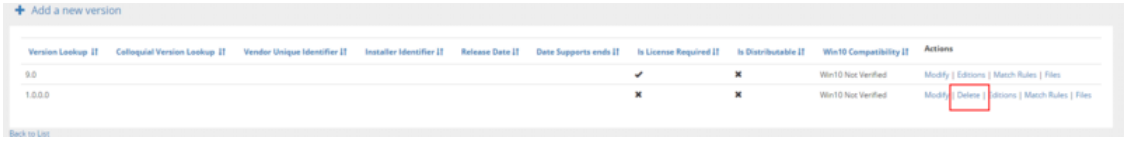
5. Click **Save**.

1.8.6.5 Deleting an existing product version or edition

You can only delete products, versions, or editions you created. New product items added by the 1E curation team are marked as 1E Verified and cannot be deleted.

To delete an existing product version or edition:

1. On the **Version** screen find the item in the list.

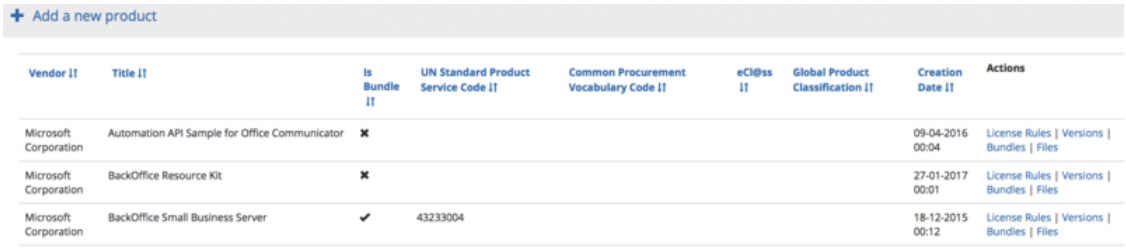


2. Under the **Actions** column, click **Delete**.

1.8.6.6 Managing bundles

Bundles are a collection of products and the 1E Catalog already contains all the bundles you should need. In the event you need to create a bundle:

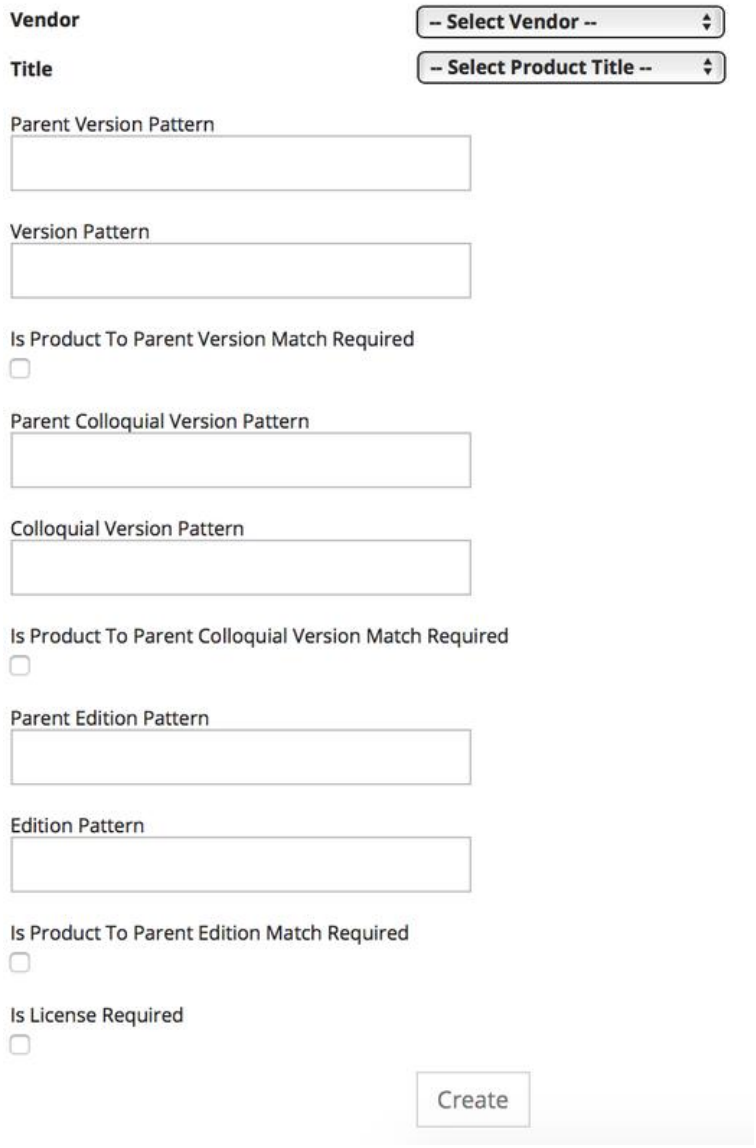
1. On the **Products** screen, find the item from the list, for example, Microsoft BackOffice Small Business Server.



2. Under the **Actions** column, click **Bundles**.

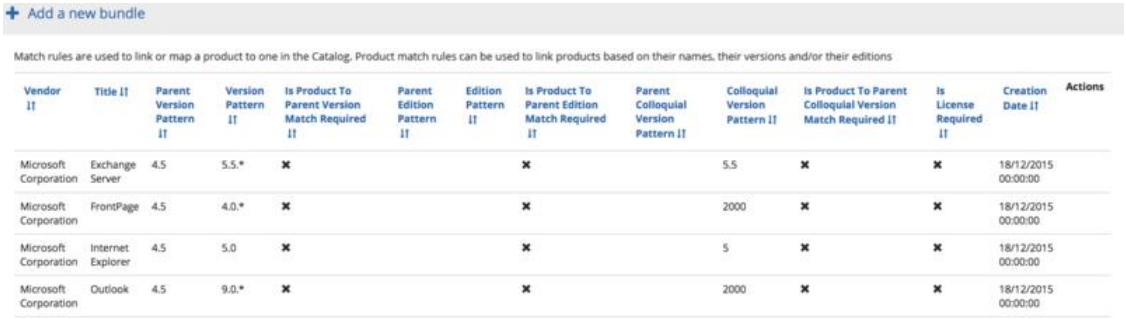
3. Click **Add a new bundle**.

4. On the **Bundles** screen:



- In **Vendor**, click the list and choose a vendor for this bundle. The title list displays after you pick a vendor - the image displays both the Vendor and Title pick lists
- In Title, click the list and choose a product title for this bundle
- Complete the remaining fields as necessary.

5. Click **Create**.



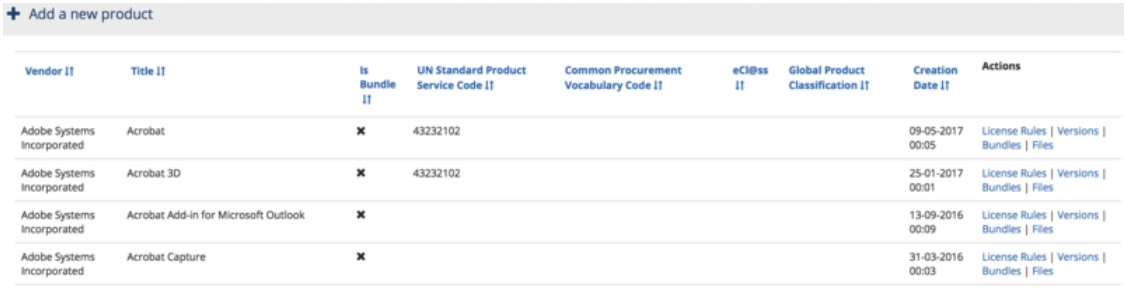
1.8.6.7 Managing filesets

Filesets define which files are used by a particular product. AppClarity consumer uses filesets to determine its usage, it does this by looking at the last run dates for that filename.

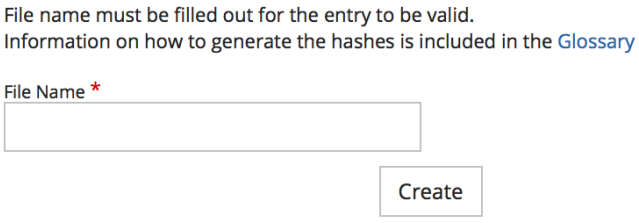
1.8.6.7.1 Adding a fileset

To add a fileset:

1. On the **Product** screen, find the item you want to add files to.
2. Under **Actions** click on Files.



3. On the **Product Files** screen, click **Add a new Product File**.
4. On the **Product File** screen, enter the filename:



Note

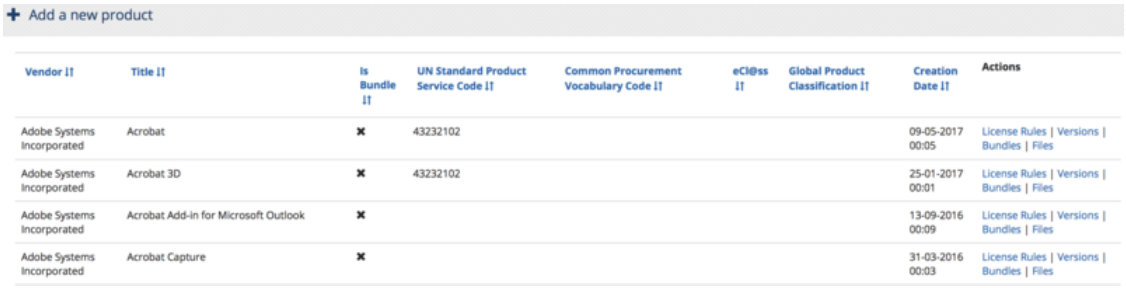
From 1E Catalog 2.0 and later products can be associated with more than one executable, before this version products were restricted to a single executable.

5. Click **Create**.

1.8.6.7.2 Modifying an existing fileset

To modify an existing fileset:

1. On the **Product** screen, find the item you want to modify.



2. Under the **Actions** column, click **Files**.
3. From the list of files, locate the one you want and click **Edit**.

4. In the **Product File** screen, update its filename
5. Click **Save**.

1.8.6.7.3 Deleting an existing fileset

To delete an existing fileset:

1. Repeat steps 1 and 2 above.
2. From the list of files, locate the one you want and click **Delete**.
3. You will be prompted to confirm your actions.

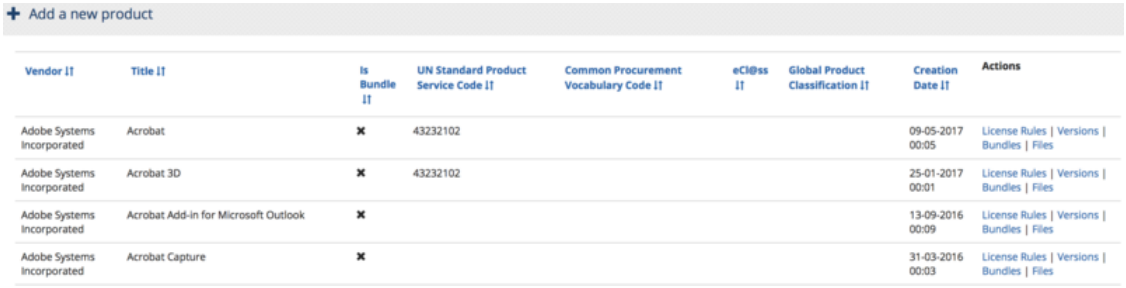
4. Click **Delete** to remove the file or **Back to List** to cancel the action.

1.8.6.8 Managing license rules

Licensing rules define how a product or a specific version of a product is licensed, for example, what metric they use or the average price of the license. You can set up different license rules for specific versions by using version patterns, for example, 10.*.* has license metric = Device; 11.* is licensed by User.

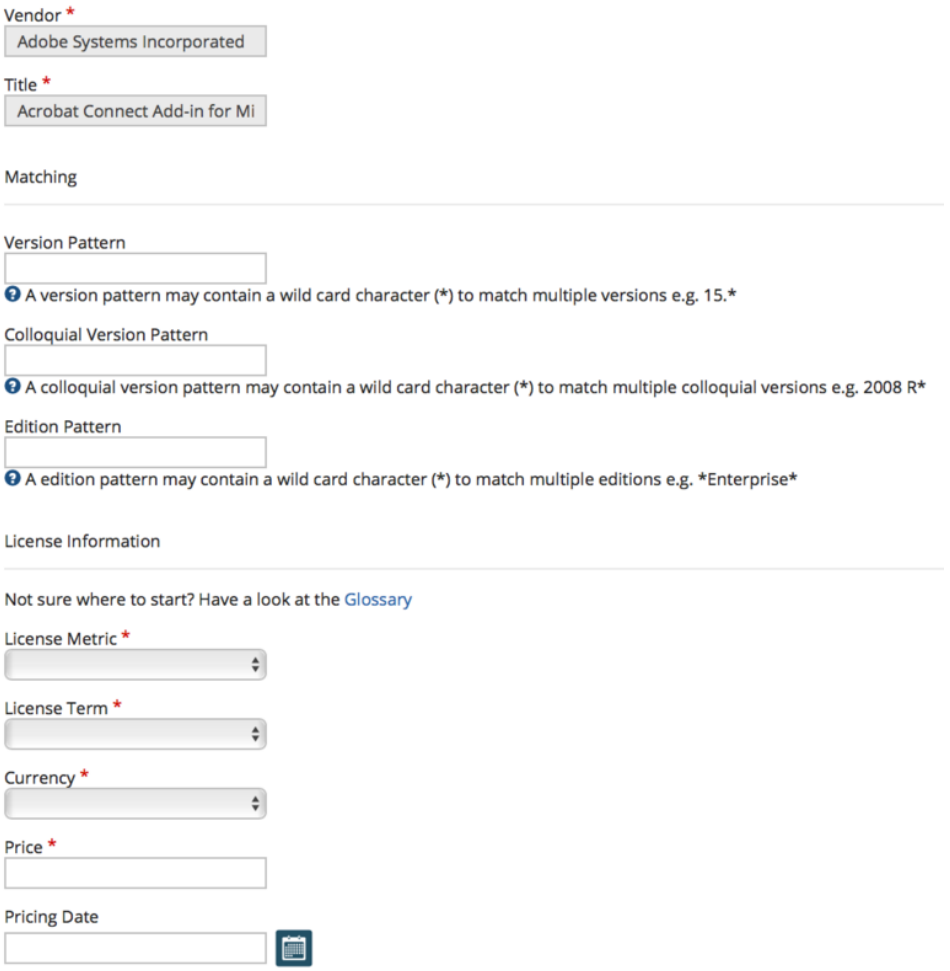
To add a licensing rule:

1. On the **Product** screen, locate the item you want to associate a licensing rule with.
2. Under the **Actions** column for that product, click **License Rules**.



3. Click **Add a new license rule**.

4. In the **Product Information** screen:



a. In the **Matching** section, populate the pattern fields if you are using patterns - you can use the wildcard (*) in the pattern.

b. In the **License information** section for these mandatory fields:

- **License Metric** - click the list and choose one
- **License Term** - click the list and choose from device, non-perpetual, perpetual or subscription
- **Currency** - click the list and choose one
- **Price** - enter the unit price for it

Optionally:

- **Pricing Date**.

5. Click **Save**.

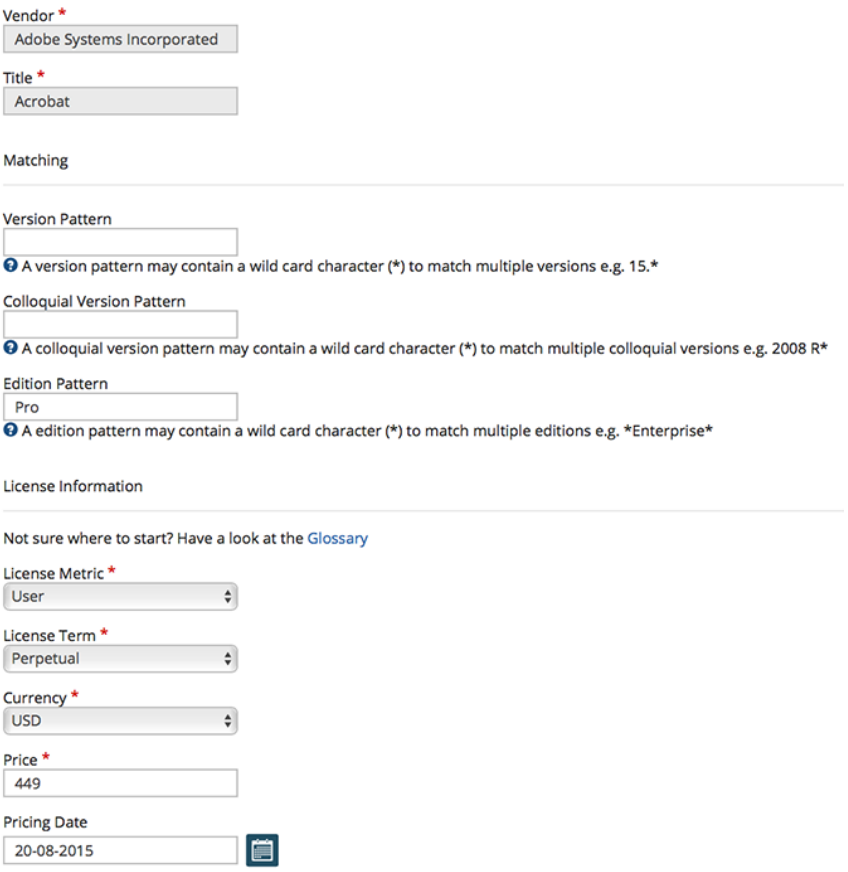
1.8.6.8.1 Updating an existing license rule

You can modify or delete an existing Licensing Rule associated with a product, for example the licensing rules for Adobe Acrobat.

Version Pattern	Colloquial Version Pattern	Edition Pattern	License Metric	License Term	Currency	Price	Pricing Date	Actions
		Pro Extended	User	Perpetual	USD	$ 699	20-08-2015	Modify | Delete
		Standard	User	Perpetual	USD	$ 299	20-08-2015	Modify | Delete
		Pro	User	Perpetual	USD	$ 449	20-08-2015	Modify | Delete

To modify an existing license rule:

1. Locate the item from the list and under the **Actions** column, click **Modify**.
2. In the **Product Information** screen, update the fields as necessary.



3. Click **Save**.

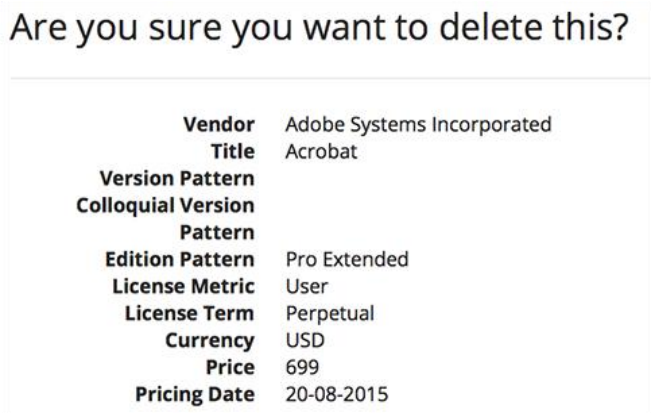
1.8.6.8.2 Deleting an existing license rule

To delete an existing license rule:

1. Locate the item from the list and under the **Actions** column, click **Delete**.

Version Pattern	Colloquial Version Pattern	Edition Pattern	License Metric	License Term	Currency	Price	Pricing Date	Actions
		Pro Extended	User	Perpetual	USD	$ 699	20-08-2015	Modify | Delete
		Standard	User	Perpetual	USD	$ 299	20-08-2015	Modify | Delete
		Pro	User	Perpetual	USD	$ 449	20-08-2015	Modify | Delete

2. You will be prompted to confirm your actions.

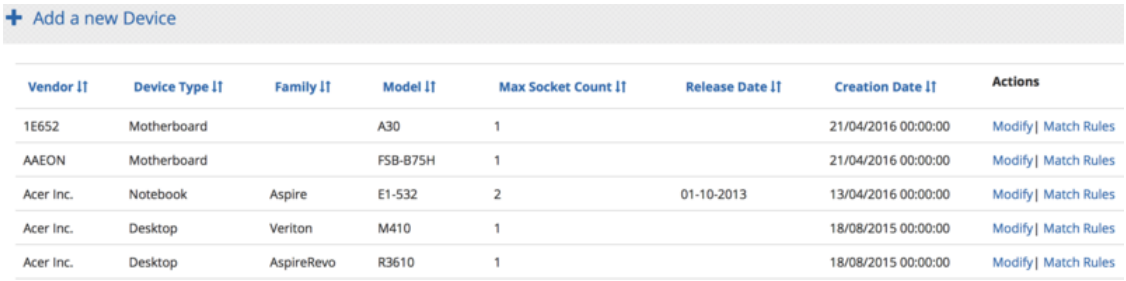


3. Click **Delete** to remove the rule for that product or click **Back to List** to cancel the action.

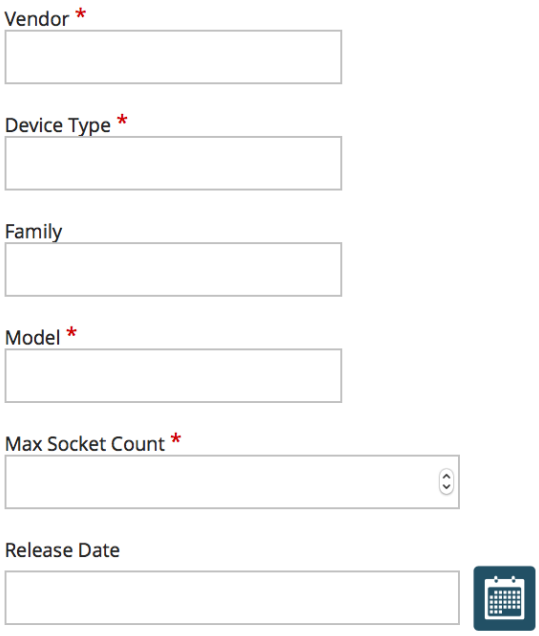
1.8.6.9 Managing devices

To add a new device:

1. Click the **Devices** link - top right of the screen.
2. On the **Devices** screen, click **Add new Device**.



3. On the **Add a new Device** screen - fields marked with a red asterisk are mandatory:



- **Vendor** - enter the name of the vendor
- **Device Type** - enter the type of device, for example, motherboard, laptop, notebook, desktop, server, or blade server
- **Family** - enter the family of the device such as EliteBook, HP Omni, Pavilion, Pro, TouchSmart
- **Model** - enter the model number of the device
- **Max Socket Count** - enter the socket count for the device
- **Release Date** - click the calendar icon and choose a date.

4. Click **Save**.

1.8.6.10 Managing processors

Note

From 1E Catalog 1.2.100 and later Processor identification and normalization has greater accuracy and coverage.

To achieve this we removed the current dependency on Processor frequency during normalization. We did this because processors can run at a variety of speeds, so using the processor frequency for normalization does not help to identify processor type. For example, you could have up to 10 different speeds for a single processor because an OS typically reports the speed of a processor as it's currently running.

Now, one of the following criteria has to match during normalization:

- SourceFamily and SourceModel
- SourceName.

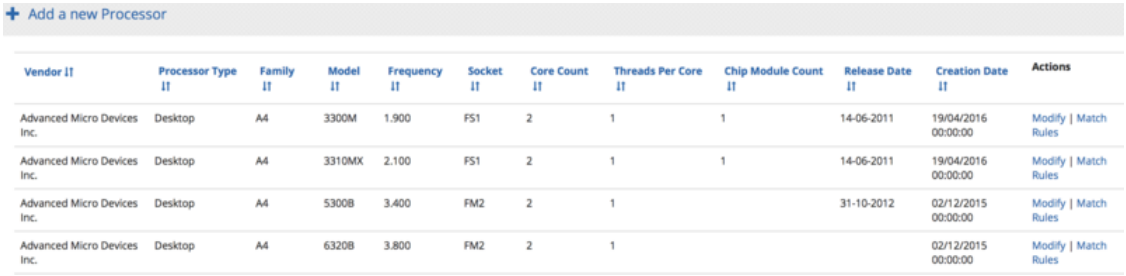
This change makes finding matches more successful because there's no need to evaluate every source field.

In the following example, the two source entries will be matched to the same processor because the SourceName values are the same:

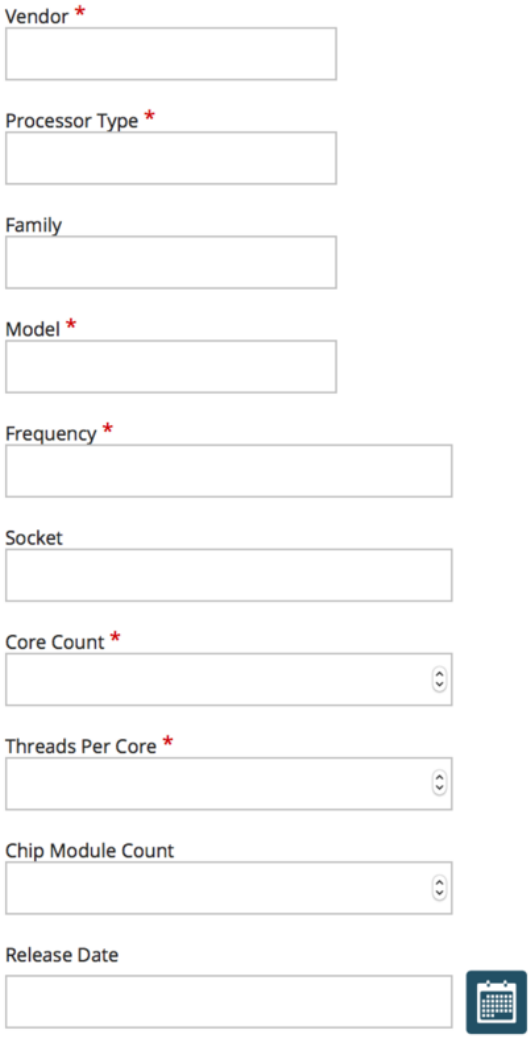
SourceVendor	SourceFamily	SourceName	SourceModel	SourceFrequency	SourceSocket
GenuineIntel	Intel Xeon	Intel(R) Xeon(R) CPU E5-2637 v4 @ 3.50GHz	NULL	3500	NULL
GenuineIntel	NULL	Intel(R) Xeon(R) CPU E5-2637 v4 @ 3.50GHz	NULL	NULL	NULL

To manage processors:

1. Click the **Processors** link - top right of the screen.
2. On the **Processor** screen, click **Add new processor**.



3. On the **Add a new Processor** screen - fields marked with a red asterisk are mandatory:



- **Vendor** - enter the name of the vendor
- **Processor Type** - enter the type of processor such as desktop, server

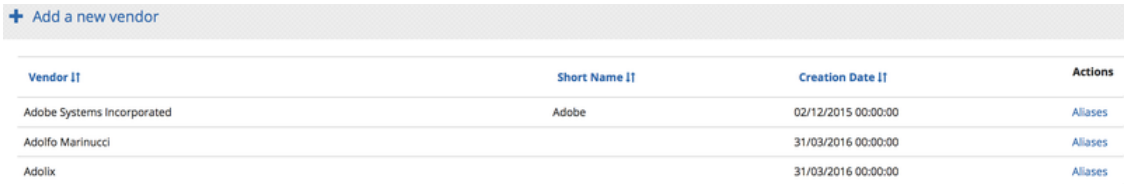
- **Family** - enter the family for the processor such as A4, Athlon XP, Atom, Corei5, Corei7, Pentium, Xeon
- **Model** - enter the model of the processor such as 260M, T2500, Z670
- **Frequency** - enter the processor frequency in GHz such as 0.600, 2.500
- **Socket** - enter the model of the socket supported by the processor such as FM1, FCBGA676
- **Core Count** - enter the number of cores for the processor such as 1, 2, 4, 8
- **Threads Per Core** - enter the threads for the processor core such as 1, 2
- **Chip Module Count** - enter the count for it such as 1
- **Release Date** - click the date icon and choose a date.

4. Click **Save**.

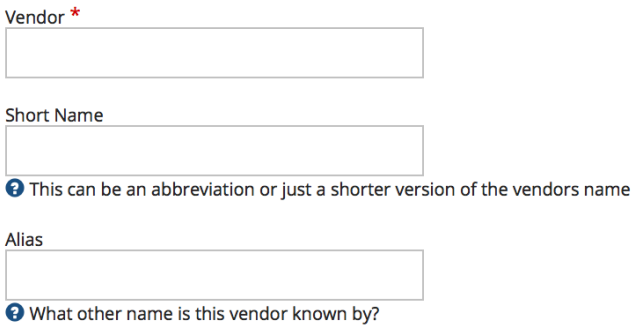
1.8.6.11 Managing vendors

To add a new vendor:

1. Click the **Vendors** link - top right of the screen.
2. On **Vendors** screen, click **Add new vendor**



3. On the **Add a new vendor screen**:



- **Vendor** - enter the name of the vendor - a mandatory field.
- **Short Name** - enter a short name for the vendor.
- **Alias** - enter an alias if there is one.

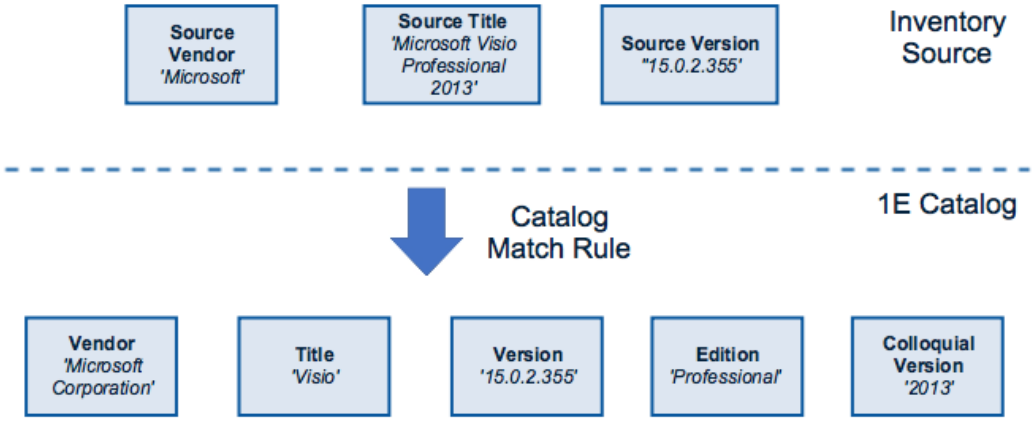
4. Click **Save**.

1.8.6.12 Managing match rules

Match rules are the method used to link source inventory to catalog entries. Match rules can be assigned to a specific:

- Version of a product - typically used if the product is not an edition-based product
- Edition of a version of a product - typically used if the product is an edition-based product.

For example, the inventory source holds the following information about a software title:



- Source Vendor = Microsoft
- Source Title = Microsoft Visio Professional 2013
- Source Version = 15.0.2.355

However, the corresponding entry in the Catalog has a different vendor and title resulting in a mismatch. To resolve this, the Catalog contains rules which directly match these types of entries. In this example, the product is edition-based (Visio) so the Catalog match rule is an edition match rule – linking the source to a specific edition of a specific version (15.0.2.355) of this title.

- Vendor Microsoft resolves to Microsoft Corporation
- The Microsoft Visio Professional 2013 title resolves to:
  - Title = Visio
  - Edition = Professional
  - Colloquial Edition = 2013
- Version 15.0.2.355 maps directly to 15.0.2.355

This is how the Catalog normalizes the source inventory. The same match rule principles apply equally to devices and processors in the Catalog.

1.8.6.12.1 Adding a match rule to a version of a product

To associate a match rule to a version of a product:

1. On the **Product** screen, click **Filtering** and enter your search criteria.
2. Click the **Versions** link to the right of the product.
3. Filter by version number to narrow the list and select the product version you want.
4. Under the **Actions** column, click the **Match Rules** link for that specific version.
5. Click the **Add a new match** rule link.

6. Enter the source inventory data that will be used to link to this product and version combination:

   - **Source** - the source for this inventory, for example SCCM
   - **Source Vendor** - the text that's in the Vendor field in the source data
   - **Source Title** (mandatory) - the text that's in the Title field in the source data
   - **Source Version** - the text that's in the Version field in the source data
   - **Source Colloquial Version** - the text that's in the colloquial version field in the source data
   - **Source Edition** - the text that's in the edition field in the source data.

7. Click **Save**

When a source inventory contains all the information that's recorded in the match rule fields, it's linked to the product version containing that match rule.

To add a match rule to an edition of a version, follow steps 1 through 3, and then:

1. Under the **Actions** column, click **Editions**.
2. From the list of editions, choose the one you want and click the **Match Rules** link to the right of it.
3. Repeat steps 5 to 7 above.

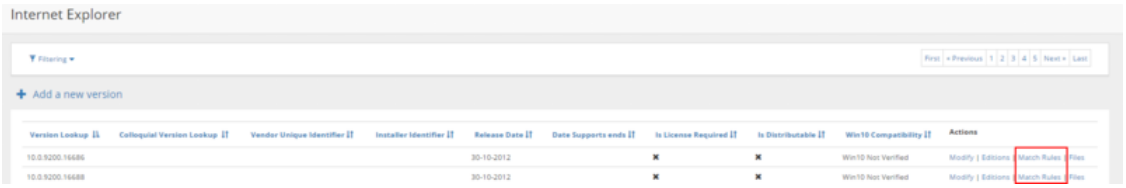
You can add match rules to **Devices** and **Processor** by simply following the procedures above in the respective **Devices** and **Processor** sections.

1.8.6.12.2 Removing an existing match rule

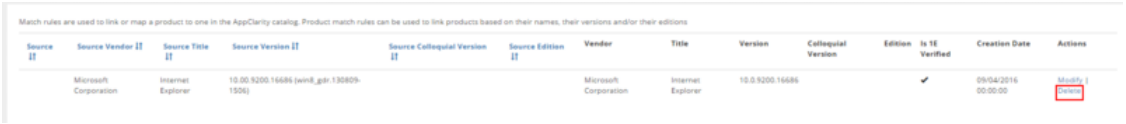
You can disassociate the link between a source inventory and a catalog item by deleting its match rule.

Follow the steps above to navigate to the product or version the current match rule is associated with, or the product, version, or edition.

Click on the **Match Rules** link on the right-hand side of the specific version, or edition.



Then click **delete** on the match rule to be removed:



This unlinks the source inventory from this catalog entry.

1.8.6.13 Using filters

The **Filtering** feature narrows the results of your search list. To do this:

1. Click Filtering.

2. Enter your search criteria.

3. Click **Filter**.

1.8.6.14 How we manage versions

The same number of version parts are required for each **major.minor** version of a product, the logic is:

1. If the first entry for a product is 9.0, we accept it.

2. If a new entry in the Catalog has 9.0.1, the original 9.0 entry will be automatically updated to 9.0.0 thereby forcing a three-part version number for consistency (9.0.0 and 9.0.1).

3. If there are two entries in the Catalog with the same **major.minor** version and title (like 9.0 and 9.0.0) they will be merged to form one record (after merging just 9.0.0 will be left).

4. Any existing match rules are added to the new consolidated record.

For example:

- Adobe After Effects 9.0 has a match rule:

Source			Target				
Vendor	Title	Version	Vendor	Title	Version	Coll Version	Edition
Adobe Systems Incorporated	Adobe After Effects CS4	9	Adobe Systems Incorporated	After Effects	9.0	CS4	

- Adobe After Effects 9.0.0 has a match rule:

Source			Target				
Vendor	Title	Version	Vendor	Title	Version	Coll Version	Edition
Adobe Systems Incorporated	Adobe After Effects CS4	9.0	Adobe Systems Incorporated	After Effects	9.0.0	CS4	

- The source parts of these two match rules are merged to produce two new match rules associated with the new 9.0.0.0 version:

Source			Target				
Vendor	Title	Version	Vendor	Title	Version	Coll Version	Edition
Adobe Systems Incorporated	Adobe After Effects CS4	9	Adobe Systems Incorporated	After Effects	9.0.0.0	CS4	
Adobe Systems Incorporated	Adobe After Effects CS4	9.0	Adobe Systems Incorporated	After Effects	9.0.0.0	CS4	

1.8.7 AI Powered Auto-curation

Describes the AI Powered Auto-curation feature that improves software inventory results. Using the AI Powered Auto-curation feature, you'll be able to increase the total amount of normalized software in your Inventory repositories. This is done using AI that integrates with the inventory consolidation process. By using AI, your organization will benefit from significant numbers of normalized software and a reduced manual effort needed to normalize software.

> **Note**
>
> The Inventory app captures data from different sources, then consolidates, normalizes, and stores it in Inventory repositories. It is also used to view, export, and manage associations.

Inventory uses connectors to capture software, hardware, and other data from sources such as Tachyon, Configuration Manager, Big Fix, and vCenter where it is consolidated, de-duplicated, and normalized. Normalization uses software and hardware entries in The 1E Catalog.

An empty repository called **Default Inventory** is provided out-of-the-box. You can optionally create additional inventory repositories to partition data by source, time period, or another purpose. To populate a repository, you must use one or more inventory connectors, and either manually sync the data or schedule a sync. For more detail, please refer to Repositories page and Schedules page in Settings.

In old versions normalization of software product names was handled by 1E Catalog. This used rules that map source Programs and Features data into an accurate standardized form of Vendor, Title, Version, and Edition (VTVE) fields. These normalized records could then be referred to with the same signature. Although the rules in the 1E Catalog cover the most common software, there is always new software that needs to be manually mapped.

AI Powered Auto-curation normalizes software product names that are not in the 1E Catalog. It first extracts the VTVE from varied raw Programs and Features data by removing excess data and extracting the relevant strings. The AI then standardizes the VTVE fields to a single, accurate form of representation. It also produces a numeric value called the confidence score, this score:

- Represents how confident the AI is in its prediction.
- Is set to a high threshold through testing and validation across a large data set.
- Can be calibrated according to the variety of software data at a customer site to optimize the normalization rate.
- Is controlled by 1E through collaboration with customers.

You can enable AI Powered Auto-curation either during or after the installation of Tachyon.

Note

AI Powered Auto-curation is used by all Inventory connectors. Please refer to the Connectors page for more information about how Connectors are used to connect to other 1E and third party systems.

AI Powered Auto-curation uses model files that govern its behavior and, when the feature is enabled, the versions of the files are compared with the versions in the 1E Cloud, and downloaded whenever a new version is made available.

1.8.7.1 Preparation

Before you enable AI Powered Auto-curation, ensure you've met the additional disk and memory requirements on the Tachyon web server.

Note

The minimum total disk space required for the downloaded AI Package ZIP is approximately 13 GB at installation. This includes:

- Binary and support files for AI and the directory structure is 8 GB
- The ZIP file is approximately 5 GB and stored in the **Download path** - this location is not configurable
- The ZIP file is then temporarily copied to the **Deployment path**, and extracted - the ZIP plus extracted files are approx. 13 GB
- The temporary ZIP is then deleted from the **Deployment path**, leaving approx. 8GB of extracted files - this location is configurable, as described below.

1E Catalog regularly checks it has the latest AI package synced from the 1E Catalog cloud. It downloads the AI Package ZIP (5GB) from the Cloud into the **Download path** folder.

Whenever the **Basic Inventory Consolidation (BIC)** process runs, with the **AI Engine option** enabled, the **1E-AIEngine.exe** uses the AI package files to run the AI process.

When the **1E-AIEngine.exe** is run, it uses a hash comparison of its current AI package, with the Catalog's ZIP.

- If the hash is different, it will make a copy of the new ZIP (5GB) to its **Deployment path**, extract it (8GB), and then delete the ZIP copy.
- If the folder contains the correct AI package, the BIC processes the new inventory data using the package.

Note

1E Catalog is included in the Tachyon Platform zip, and installed by Tachyon Setup.

1.8.7.1.1 Memory requirements

Distinct Software Titles	Extra GB RAM for AI engine
1 to 5000	17
10000	19
20000	21
30000	24
40000	26
50000	29
60000	32

Distinct Software Titles	Extra GB RAM for AI engine
70000	35
80000	39
90000	42
100000	46
110000	50
120000	54
130000	58
140000	62
150000	66
160000	71
170000	76

Values last updated 04 Mar 2022.

The physical memory required for AI Powered Auto-curation is based on the number of distinct software titles in your source data, that AI has to process that do not already have a match in the 1E Catalog. Use the accompanying table as a quick reference for the memory requirements needed by the AI.

> **Note**
>
> For virtual machines, the AI Engine action will not work if you're using a dynamic memory configuration. You'll need to allocate dedicated memory.

If you're only using a System Center Configuration Manager connector for your source data, then use the below **SCCM database query** as a guide for how much extra RAM you need on the Tachyon web server before installing Tachyon.

SCCM database query Expand source

```
/*SCCM database query to get number of distinct software titles from SCCM datab
ase*/
USE [YourSCCMDBName]
GO
SELECT COUNT(*) AS 'Distinct Software Titles'
FROM (
```

```
        SELECT DISTINCT DisplayName0 AS Title FROM [v_ADD_REMOVE_PROGRAMS] WITH
(NOLOCK)
        UNION
        SELECT DISTINCT [Caption0] AS Title FROM [v_GS_OPERATING_SYSTEM] WITH (
NOLOCK)
) AS Titles
```

After installation, we recommend you use the below **SLA-Data database query** to double-check memory requirements. You will need to use the SLA query anyway, if you use a Tachyon connector (for Inventory or Patch Success) either on its own, or with other connectors including SCCM. In this case, use the **SLA-Data database query** after installation and you have collected your source data.

SLA-Data database query Expand source

```
/*SLA query to get number of distinct software titles from SLA-Data database*/
USE [SLA-Data]
CREATE TABLE #Software
       (
              [SoftwareID]                    INT IDENTITY(1,1) PRIMARY KEY,
              [DataSource]                    NVARCHAR(255) COLLATE DATABASE_
DEFAULT,
              [SoftwareIdent]                 NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
              [SoftwareIdent_Hash]                   VARBINARY(128),
              [Vendor]                        NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
              [Vendor_Hash]                             VARBINARY(128),
              [Title]                         NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
              [Title_Hash]                    VARBINARY(128),
              [Version]                       NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
              [Version_Hash]                  VARBINARY(128),
              [ColloquialVersion]             NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
              [ColloquialVersion_Hash]        VARBINARY(128),
              [Edition]                       NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
              [Edition_Hash]                  VARBINARY(128),
              [NormalizedProductID]           INT
       );
SELECT * FROM #Software
EXEC [usp_ReportDataEx_se] 1, N'Software', N'#Software';

SELECT count(*) AS 'Distinct Software Titles'
FROM
(
SELECT DISTINCT [Title] FROM #Software
) a

DROP TABLE #Software
```

1.8.7.2 Enabling AI Powered Auto-curation

You can enable AI Powered Auto-curation either during or after installation of Tachyon.

1.8.7.2.1 Enabling AI Powered Auto-curation during installation of Tachyon

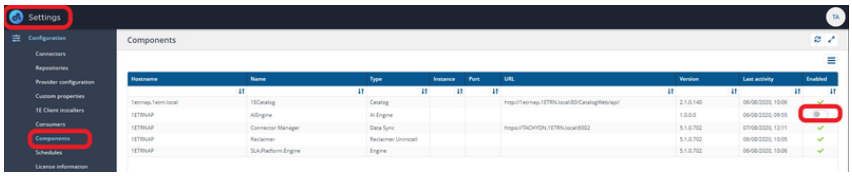
AI is switched off by default in the Tachyon Setup, this is because the feature requires additional memory to run correctly. For more details please refer to the AI Powered Auto-curation requirements.

During Tachyon setup you'll need to check the **Enable AI-based auto-curation** checkbox on the **SLA and Catalog** screen of the Tachyon Setup wizard. For more details please refer to the Tachyon Setup and SLA and 1E Catalog.

1.8.7.2.2 Enabling AI Powered Auto-curation after installation of Tachyon

You can enable AI Powered Auto-curation after you've installed Tachyon, but before enabling check these pages for more details on the disk space and RAM requirements: Tachyon Setup and SLA and 1E Catalog.

Once you have confirmed the pre requisites to enable AI you should access the Settings→Configuration→Components and toggle the Enabled switch on the AI Engine row.



At the point when you enable AI, a popup will be displayed, shown opposite.

1.8.7.2.3 Disabling AI Powered Auto-curation after installation of Tachyon

You can use the same **Enabled** toggle on the AI Engine row in the **Settings → Configuration → Components** page to turn off the AI Powered Auto-curation by sliding it to the left, off position.

1.8.7.2.4 Changing the AI Deployment path

The AI feature consists of an **1E-AIEngine.exe** and AI model files contained in an **AIPackage_<version>.zip**.

The minimum total disk space required for the downloaded AI Package ZIP is approximately 13 GB at installation. This includes:

- Binary and support files for AI and the directory structure is 8 GB
- The ZIP file is approximately 5 GB and stored in the **Download path** - this location is not configurable
- The ZIP file is then temporarily copied to the **Deployment path**, and extracted - the ZIP plus extracted files are approx. 13 GB

- The temporary ZIP is then deleted from the **Deployment path**, leaving approx. 8GB of extracted files - this location is configurable, as described below.

1E Catalog regularly checks it has the latest AI package synced from the 1E Catalog cloud. It downloads the AI Package ZIP (5GB) from the Cloud into the **Download path** folder.

Whenever the **Basic Inventory Consolidation (BIC)** process runs, with the **AI Engine option** enabled, the **1E-AIEngine.exe** uses the AI package files to run the AI process.

When the **1E-AIEngine.exe** is run, it uses a hash comparison of its current AI package, with the Catalog's ZIP.

- If the hash is different, it will make a copy of the new ZIP (5GB) to its **Deployment path**, extract it (8GB), and then delete the ZIP copy.
- If the folder contains the correct AI package, the BIC processes the new inventory data using the package.

Name	Default path	Purpose
Download path	C:\ProgramData\1E\Catalog\CatalogSynchronization\Prediction Model	This path is not configurable.
Deployment path	C:\ProgramData\1E\SLA Platform\AI	This path is configurable using the SQL script described below.

SQL script to configure AIModelDeploymentPath setting Expand source

```
/* Script to change SLA Deployment Path for AI Package */
/* The value is copied from SLA-Shared to instance in SLA-Data when a new inven
tory repository is created */
/* Updating SLA-Shared means script is not required for each new repository */
/* Updating all values in SLA-Data means all repositories use the same value */

DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
)
SELECT @newvalue = 'C:\ProgramData\1E\SLA Platform\AI'
SELECT @setting = 'AIModelDeploymentPath'

USE [SLA-Shared]
SELECT @oldvalue = [VALUE] FROM [dbo].[ProjectSetting]
WHERE [Group] = 'ProcessAIEngine' AND [Name] = @setting

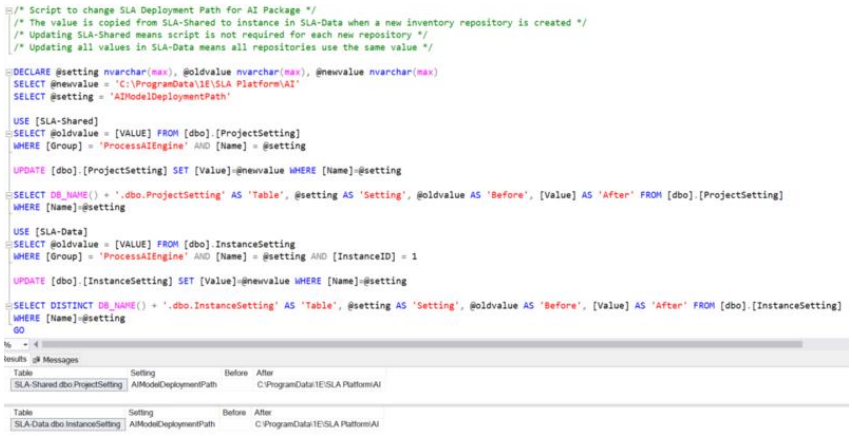
UPDATE [dbo].[ProjectSetting] SET [Value]=@newvalue WHERE [Name]=@setting
```

```
SELECT DB_NAME() + '.dbo.ProjectSetting' AS 'Table', @setting AS 'Setting', @ol
dvalue AS 'Before', [Value] AS 'After' FROM [dbo].[ProjectSetting]
WHERE [Name]=@setting

USE [SLA-Data]
SELECT @oldvalue = [VALUE] FROM [dbo].InstanceSetting
WHERE [Group] = 'ProcessAIEngine' AND [Name] = @setting AND [InstanceID] = 1

UPDATE [dbo].[InstanceSetting] SET [Value]=@newvalue WHERE [Name]=@setting

SELECT DISTINCT DB_NAME() + '.dbo.InstanceSetting' AS 'Table', @setting AS 'Set
ting', @oldvalue AS 'Before', [Value] AS 'After' FROM [dbo].[InstanceSetting]
WHERE [Name]=@setting
GO
```



1.8.7.3 Verifying AI Auto-curation is working

The process for downloading the latest AI Package is described above in Changing the AI Deployment path.

You can review the Catalog sync progress in the following logs located at: **C:\ProgramData\1E\Catalog**

- Catalog.Integration.UI.log
- Catalog.UpdateService.log

A successful sync should be similar to the example **Catalog.UpdateService.log** opposite.

Catalog.UpdateService.log Expand source

```
[Info] T11 2020-01-31 15:45:48.567: Syncing AI Package with cloud
[Info] T11 2020-01-31 15:45:48.756: Downloading AI Package version 1.3.0.700 wi
th cloud of size 4804685823 from url  api/sync/aiengine?Version=1.3.0.700
[Info] T11 2020-01-31 15:45:48.772: Indexes re-creation started after Sync.

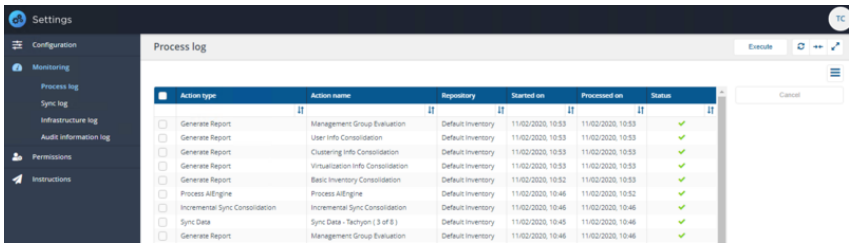
[Info] T5 2020-01-31 16:31:07.120: Successfully synced AI Package version 1.3.0
.700 with cloud
```

When enabled, a new action called **Process AIEngine** is created. This is automatically run after the **Sync Data** action for a supported connector. The sync time for the **Process AIEngine** action depends on the number of distinct software records being processed, hardware and environment configuration.

AI Powered Auto-curation is used by all Inventory connectors. Please refer to the Connectors page for more information about how Connectors are used to connect to other 1E and third party systems.

You can see the **Process AIEngine** action in **Settings**→Monitoring→Process log .



You can review its progress using the **Engine.log** located at **C:\ProgramData\1E\SLA Platform**

In the log, you should see something similar to the opposite example.

Engine.log Expand source

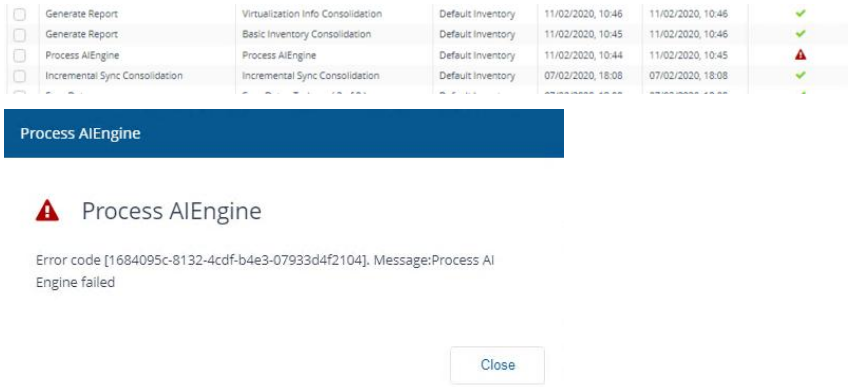
If you see a red warning triangle in the Process log, this indicates a problem.

The most common reason for the Process AIEngine to fail is due to insufficient memory when it runs, refer to Memory requirements for details.

In this example, clicking on the red warning triangle displays an error message explaining that the Process AIEngine has failed.

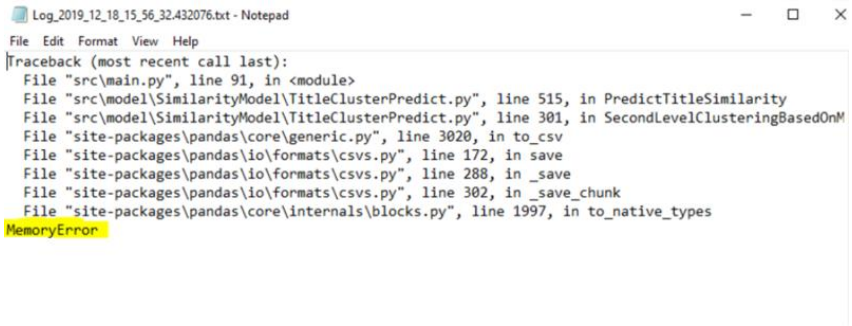


You can review the AI logs at: **C:\ProgramData\1E\SLA Platform\AI\Log_*.txt**

The picture opposite shows an example of a failure logged due to insufficient memory. **Log_*.txt**

> **Note**
>
> If the AI processing step does fail, the overall inventory consolidation will not. In the event of a failure, the AI processing step is skipped, making sure the rest of the process takes place as expected.

Log_*.txt > Expand



1.8.7.4 Differences in SLA Inventory screens when AI Powered Auto-curation is enabled

The SLA Inventory UI screens differ if AI Powered Auto-curation is enabled or disabled.

The process of setting up connectors, creating inventory repositories and running the basic inventory consolidation remains the same.

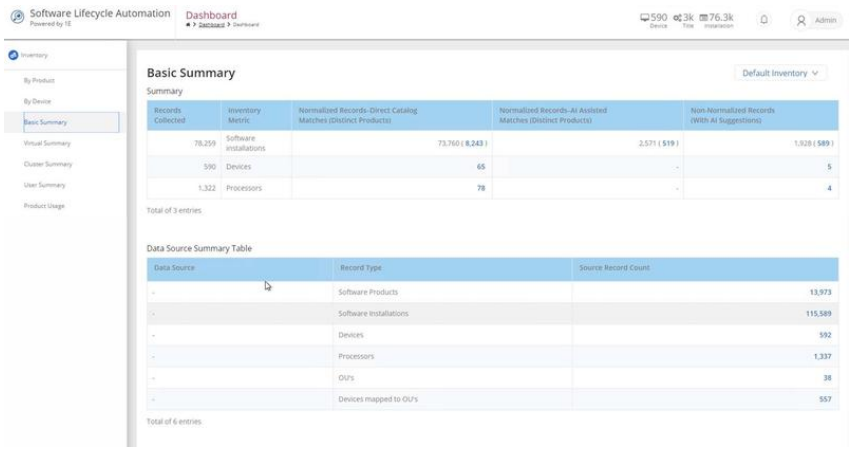
1.8.7.4.1 Basic Summary screen

You can access the Basic Summary screen using the **Inventory** app and by choosing **SLA Inventory** from the left-hand menu. The data in this screen is updated by the Basic Inventory Consolidation process.

The **Summary** table now includes software records curated by AI. The first column in the table shows the total **Records Collected**. The next three columns are:

- **Normalized Records-Direct Catalog Matches (Distinct Products)** - corresponds to software records identified using existing rules in the 1E Catalog. Exploring these will show you the normalized entries with enriched data regarding licensability, end-of-support date etc.
- **Normalized Records-AI Assisted Matches (Distinct Products)** - the software records which AI has automatically matched and normalized. The AI recognizes the vendor, title, version and edition and normalizes them. Over time, the 1E Catalog reviews records identified by AI and enriches them with data regarding licensability, end-of-support date etc. for inclusion in future downloads.
- **Non-Normalized Records (With AI Suggestions)** - software records which AI has low confidence in automatically matching. AI makes predictions for all source data, but predictions with a low confidence score should be manually reviewed by drilling down to the Unidentified Software Records screen.

The numbered links in brackets allow you to drill down to more detailed screens.



1.8.7.4.2 Unidentified Software Records screen

You can access this screen by clicking on the number link in the **Non-Normalized Records (With AI Suggestions)** column of the **Basic Summary** screen. This screen shows AI predictions that have a low confidence score preventing them being automatically matched and normalized. These predictions should still be close to accurate, therefore making the task of manually adding rules to the Catalog much easier.

This screen has the following elements:

1.8.7.4.2.1 Overview

Shows a count of distinct software records to be identified, so you can keep track of progress.

- Software Products left to identify - show all records
- **AI predicted** - records the AI was unable to identify, but was able to provide suggestions
- **AI predicted and partially matched** - where the vendor or title was identified through previous knowledge from the 1E Catalog, these records have a default high confidence score
- **Cannot be identified** - these records have insufficient information to recognize the software or make a prediction.

1.8.7.4.2.2 Application Type

Filters by application type.

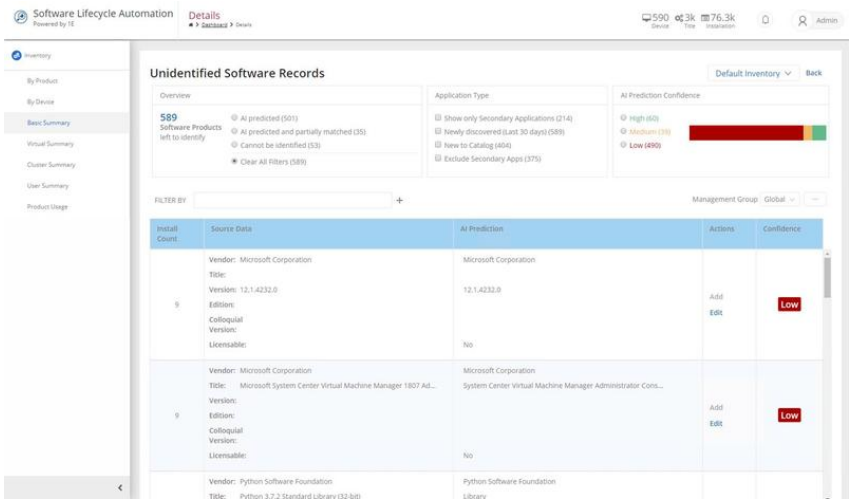
- **Show only Secondary Applications** -filters to only secondary applications (for example, updates, hotfixes or language packs)
- **Newly discovered (Last 30 days)** - filters to applications discovered within the last 30 days
- **New to Catalog** - filters to applications that are either new vendors or titles previously unknown to the 1E Catalog
- **Exclude Secondary Apps** - removes any applications considered secondary, like updates, hot fixes or language packs.

1.8.7.4.2.3 AI Prediction Confidence

Confidence scores for predictions are divided into three equal parts below the threshold. **High**, **Medium** and **Low** confidence relate to the ease at which the AI engine suggestions can be manually reviewed and added as rules.

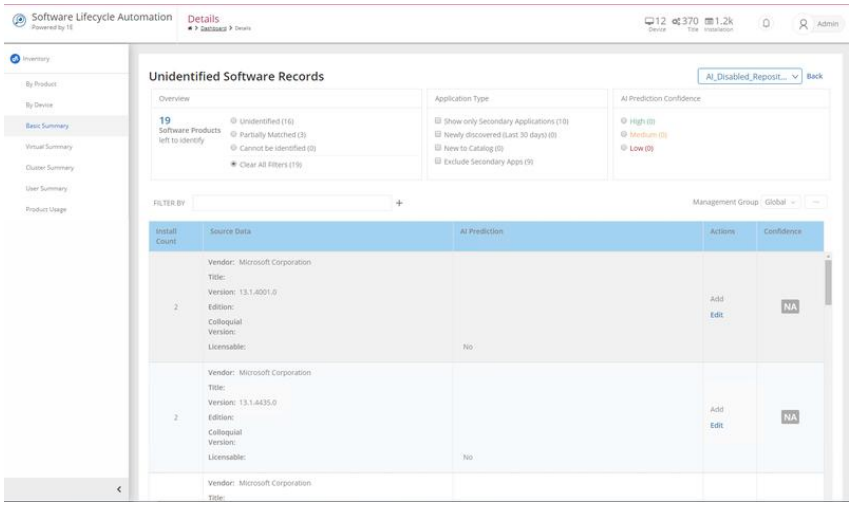
1.8.7.4.2.4 FILTER BY

Use this to add conditional filters for various fields on the **Unidentified Software Records Table**, for example you could filter on "Vendor Contains Micro" to return results based on Microsoft as a software vendor.



Note

If the AI feature is disabled the **Basic Summary** screen will differ to when AI is enabled, note the difference in the **Overview** element.



1.8.7.4.2.5 Unidentified Software Records Table

Each row on this table corresponds to a distinct set of software records. There are four values **Install Count**, **Source Data** , **AI Prediction** , **Confidence** and a number of actions to perform for each distinct record. The values are:

Action	Explanation
Install Count	The total number of records found with the same source data across the estate.
Source Data	ARP data extracted into **Vendor, Title**, **Version**, **Edition**, **Colloquial Version** and **Licensable** fields.

Action	Explanation
AI Prediction	The AI suggestion after attempting to extract **Title**, **Version**, **Vendor**, **Edition**, **Colloquial Version** and **Licensable** fields from source data, Licensability is set to a default of **No** on the suggestions table, this can be edited before adding.
Confidence	Abstracted to high, medium or low based on the exact numeric value for prediction confidence, these confidences values will always be lower than the threshold required to automatically normalize records.

For each record the **Actions** are:

Action	Explanation
Add	When clicked, this will add records directly to 1E Catalog. This option is enabled if AI suggestions for a source Vendor, Title, Version and Edition (VTVE) are generated. In case the product is not Edition based then Vendor, Title and Version (VTV) suggestions are enough. After the record(s) is added to 1E Catalog then whenever you run the next**Basic Inventory Consolidation** then the same record(s) will be available in the **Catalog Matched** items.
Edit	Edit functionality is available for all unidentified records. When clicked, it opens a dialog where you can provide details for the selected software record. You also have the option to add this information to 1E Catalog.
Exclude	Exclude is available for all **Unidentified Software Records,** except for **Partially Matched** and **Secondary Application** types of records. Once excluded, the items are moved to **Secondary Applications**. You can also **Include** it again until the next **Basic Inventory Consolidation** is run, afterwards the **Include** option will be unavailable, and the item will become a part of **Secondary Applications**.

You can explore these records to see what the AI has curated by clicking on the related links in the **Basic Summary Report**.

Note

We have also introduced a new screen for AI suggestions for any software records that remain non-normalized. This is a replacement for the **Best Match Screen** which allowed you to add rules.

1.8.8 Configuring 1E Catalog connection to 1E Cloud

Post-install configuration of 1E Catalog synchronization and AI Powered Auto-curation.

1.8.8.1 1E Catalog synchronization options

1E Catalog regularly synchronizes itself with the catalog curated by 1E in the 1E Cloud. Options are:

- **bi-directional synchronization (default)** - pushes site-defined entries to the 1E Cloud Catalog for verification by the 1E curation team and pulls new content entries or updates from the cloud
- **uni-directional synchronization** - pulls new content or updates from the 1E Cloud Catalog
- **no synchronization** - no attempts to synchronize with 1E Cloud Catalog.

For each batch, the synchronization event writes the number of processed records to the log files.

Please refer below for details of Data sent from the 1E Catalog to the 1E Cloud.

1E Catalog can also be configured during installation to download the files related to the AI Powered Auto-curation feature. Please refer to AI Powered Auto-curation for more details.

1.8.8.2 Modifying 1E Catalog Cloud synchronization behavior post-installation

The following script can be used to modify the **SubscriptionType** setting in the **Settings** table of the **1ECatalog** database. You can set the new value to be one of the following:

Value	Description
0	no synchronization
1	uni-directional synchronization
2	bi-directional synchronization (default)

After changing the value you will need to restart the **1E Catalog Update Service** for your changes to take effect.

SQL script to configure SubscriptionType setting

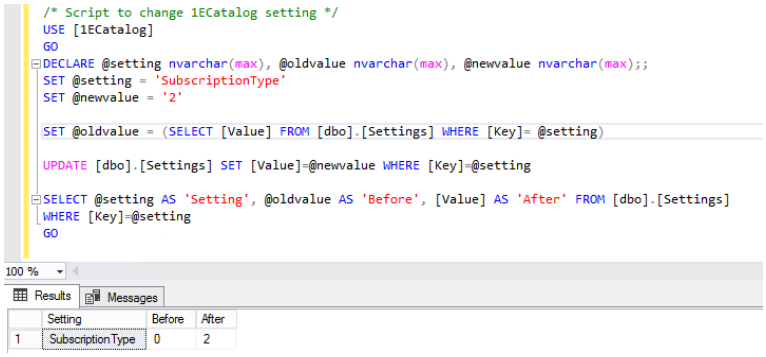
```
/* Script to change 1ECatalog setting */
USE [1ECatalog]
GO
DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
);;
SET @setting = 'SubscriptionType'
SET @newvalue = '2'

SET @oldvalue = (SELECT [Value] FROM [dbo].[Settings] WHERE [Key]= @setting)

UPDATE [dbo].[Settings] SET [Value]=@newvalue WHERE [Key]=@setting

SELECT @setting AS 'Setting', @oldvalue AS 'Before', [Value] AS 'After' FROM [d
bo].[Settings]
```

```
WHERE [Key]=@setting
GO
```



1.8.8.3 Modifying 1E Catalog AI Powered Auto-curation file download post-installation

The following script can be used to modify the **EnableAIPackageSync** setting in the **Settings** table of the **1ECatalog** database . You can set the new value to be one of the following:

Value	Description
True	Download will be enabled.
False	Download will be disabled.

After changing the value you will need to restart the **1E Catalog Update Service** for your changes to take effect.

SQL script to configure EnableAIPackageSync setting

```
/* Script to change 1ECatalog setting */
USE [1ECatalog]
GO
DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
);;
SET @setting = 'EnableAIPackageSync'
SET @newvalue = 'True'

SET @oldvalue = (SELECT [Value] FROM [dbo].[Settings] WHERE [Key]= @setting)

UPDATE [dbo].[Settings] SET [Value]=@newvalue WHERE [Key]=@setting

SELECT @setting AS 'Setting', @oldvalue AS 'Before', [Value] AS 'After' FROM [d
bo].[Settings]
WHERE [Key]=@setting
GO
```

```
/* Script to change 1ECatalog setting */
USE [1ECatalog]
GO
DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max);;
SET @setting = 'EnableAIPackageSync'
SET @newvalue = 'True'

SET @oldvalue = (SELECT [Value] FROM [dbo].[Settings] WHERE [Key]= @setting)

UPDATE [dbo].[Settings] SET [Value]=@newvalue WHERE [Key]=@setting

SELECT @setting AS 'Setting', @oldvalue AS 'Before', [Value] AS 'After' FROM [dbo].[Settings]
WHERE [Key]=@setting
GO
```

100 %

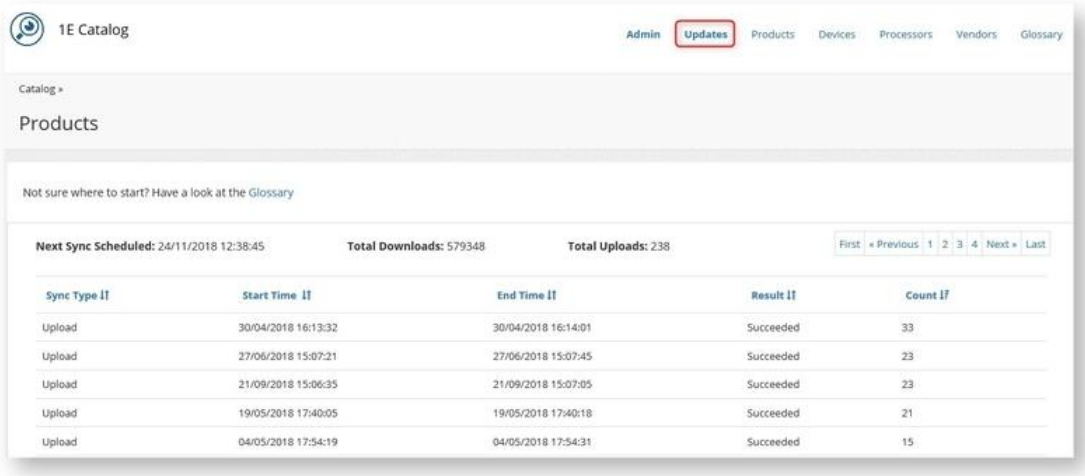
Results | Messages

	Setting	Before	After
1	EnableAIPackageSync	False	True

1.8.8.4 Viewing synchronization events in Catalog UI

View synchronization event history from the **Updates** screen, listing:

- **Sync Type** – whether it was an upload or a download
- **Start Time**
- **End Time**
- **Result** – success or failure - event details are written to log files typically located in *C:\ProgramData\1E\Catalog\Catalog.Updateservice.log*
- **Count** - number of synchronized records.

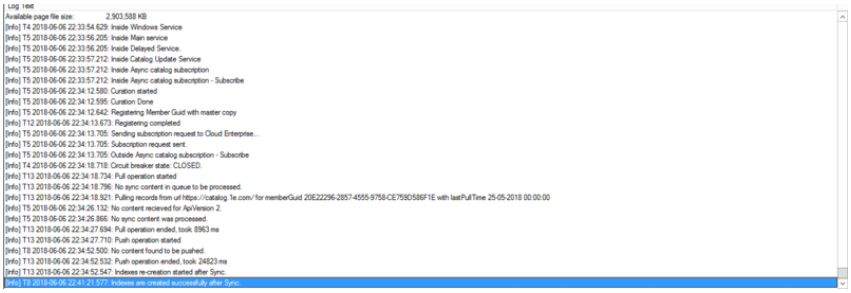


1.8.8.5 Reviewing the log file

The regular synchronization with the 1E Cloud Catalog is logged in **Catalog.UpdateService.log**. In general, the process is as follows:

1. Catalog Registers with the master copy.
2. The Catalog will then pull content.
3. Push content if enabled.

4. The Catalog will then index the content.



1.8.8.6 1E Catalog data files

The 1E Catalog data files, both installed and downloaded from the 1E Cloud during synchronization, are stored in the following locations. These locations are not configurable in this version of 1E Catalog.

Data	Location
Catalog data	%ProgramData%\1E\Catalog
Installer data	%ProgramData%\1E\Catalog\CatalogSynchronization\Data
Synchronization data from the 1E Cloud Catalog	%ProgramData%\1E\Catalog\CatalogSynchronization\Sync
Lucene index	%ProgramData%\1E\Catalog\CatalogSynchronization\LuceneIndex
AI Powered Auto-curation files	%ProgramData%\1E\Catalog\CatalogSynchronization\PredictionModel

1.8.8.7 Data sent from the 1E Catalog to the 1E Cloud

The following show the tables of data sent from the 1E Catalog to the 1E Cloud to help improve the quality of the 1E Catalog data for all customers. The data is mainly related to software products and AI prediction models, no identifiable customer-related information is sent.

- Add/Remove Programs data
- Site-defined processor information
- Device type (not including the device name)
- Software bundling
- Software category

- Start/end dates
- .exe to product mapping data.

1.8.9 Rebuilding the 1E Catalog

Resynchronize the 1E Catalog using admin access. You can rebuild your Catalog data by running a resynchronization event if you have admin privileges. By default, no one has admin access – you'll need to create an Azure Active Directory group to manage who runs resynchronization events and accesses the admin menu item in the Catalog UI.

Typical reasons for running a re-synchronization event are if you:

- Think your Catalog data is corrupted or incomplete as a result of normally scheduled synchronization cycles

- Have not updated your Catalog data over a long period - it's quicker to run a resynchronization event instead of executing a normal synchronization cycle
- Migrate your Catalog to a newer version – to deduplicate any Catalog entries
- Have upgraded to a newer version of Catalog.

1.8.9.1 Granting administrative privileges

The only feature available on the **Admin** screen is **Resynchronize Catalog**. It's only accessible to users who are members of an AD account or an AD security group present in the **Admins** key for the Catalog Web. By default, the 1E Catalog is installed with **Admins = Catalogue Admin**.

You can create and populate this group in Azure Active Directory, or you can change the configuration of the website to include a comma-separated list of alternative Azure Active Directory groups and user accounts.

> **Note**
>
> If you choose to have additional groups, make sure there are no spaces between the list values. If there are, the additional groups will not have admin privileges as intended.

1.8.9.2 How to reconfigure the website to grant admin access

Changing the website configuration needs an account with local admin rights, like the Catalog installation account. See Preparation.

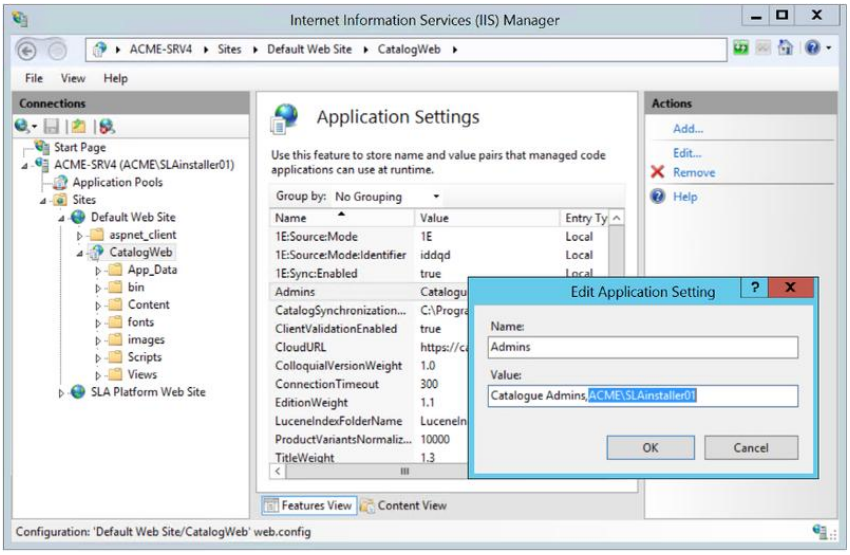
To modify the Admins key, use one of the following methods:

- IIS Manager
- Edit web.config

1.8.9.2.1 IIS Manager

Modify the **Admins** key using **IIS Manager**, navigate to the CatalogWeb web application, and select **Application Settings**.

You'll need to do an IIS reset after the change.



Edit web.config

1. Edit the ***web.config*** file, located by default in *%PROGRAMFILES%\1E\Catalog\CatalogWebUI\web.config*

2. In the following example, under *<appSettings>*, locate the *<add key="Admins" value="Catalog Admin" />* element (line 18).

   Note

   If you choose to have additional groups, make sure there's no space between the values in the list, otherwise, additional groups will not have the admin privileges you intended.

```
<appSettings>
        <add key="webpages:Version" value="3.0.0.0 />
        <add key="webpages:Enabled" value="false" />
        <add key="ClientValidationEnabled" value="true" />
        <add key="UnobtrusiveJavaScriptEnabled" value="true" />
        <add key="1E:Sync:Enabled" value="true" />
        <add key="1E:Source:Mode" value="1E" />
        <add key="1E:Source:Mode:Identifier" value="iddqd" />
        <add key="VendorWeight" value="1.4" />
        <add key="TitleWeight" value="1.3" />
        <add key="VersionWeight" value="1.2" />
        <add key="EditionWeight" value="1.1" />
        <add key="ColloquialVersionWeight" value="1.0" />
        <add key="ConnetionTimeout" value="300" />
        <add key="LuceneIndexFolderName" value="LuceneIndex" />
        <add key="ProductValiantsNormalizeBatchSize" value="10000" />
        <add key="CatalogSynchronizationDirectory" value="C:\ProgramData\
1E\Catalog\CatalogSynchronization\" />
        <add key="Admins" value="Catalog Admin" />
        <add key="CloudURL" value="https://catalog.1e.com" />
</appSettings>
```

3. Modify the value parameters by adding your Catalog Azure Active Directory group or individual users. For example, if your Catalog Azure Active Directory groups are called Catalog Curators, modify the value parameter by updating the default Catalog Admin to the name of your Azure Active Directory group. To add individual users, modify the value parameter to include their user names, in the format domain\user name, separating each parameter with a comma.

   ```
   <add key="Admins" value="Catalog Curators, ACME\SLAinstaller01" />
   ```

4. Save the file.

5. Restart IIS.

1.8.9.3 Rebuilding your Catalog data

Only users with admin privileges can rebuild your Catalog data.

When you run the resynchronization event with site-defined Catalog entries:

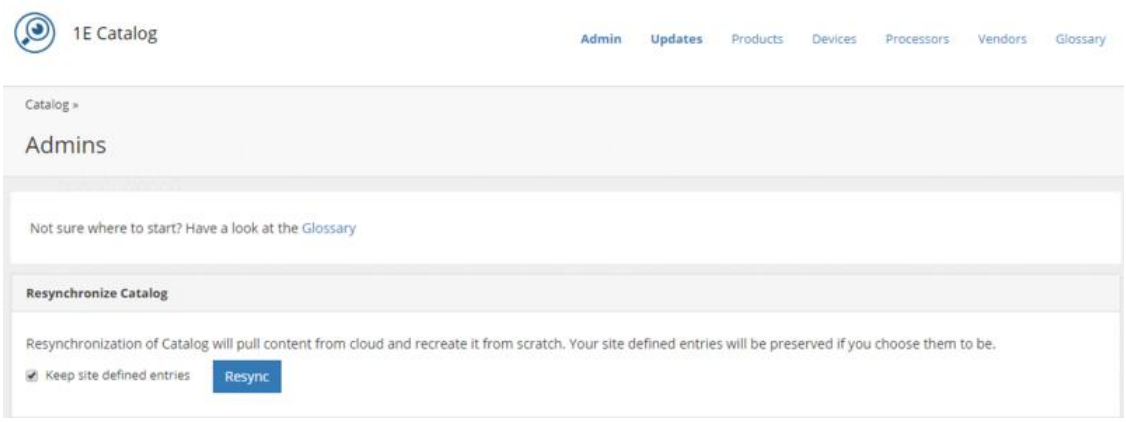
- **user** - site-defined entries are optionally kept or deleted
- **auto-curated** - site-defined entries are kept.

We recommend keeping any user site-defined entries. If you choose not to keep your user site-defined entries, they will be deleted and you will have to recreate them again.

To rebuild your Catalog data:

1. On the **Catalog UI**, click **Admin**.

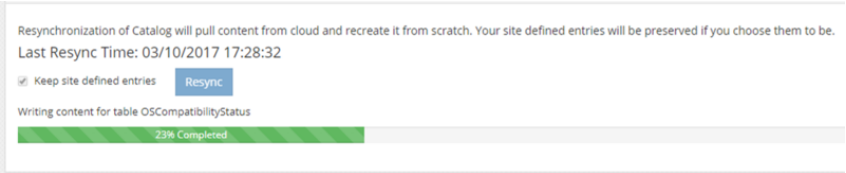
2. On the **Admin screen** under **Resynchronize Catalog**, click **Resync**.



Note

Ensure that the **Keep site defined entries** checkbox is ticked to preserve your existing site-defined Catalog entries. If not, you will have to recreate all your site-defined entries again.

3. A progress bar displays synchronization progress.



1.8.9.4 Modifying the resynchronization schedule

You can modify the default resynchronization schedule (the default is 7 days) to a time suited to your environment.

1. Edit the **CatalogUpdateService.exe.config** file, located in **%PROGRAMFILES%\1E\Catalog** *CatalogUpdateService*.

2. Under *<appSettings>* look for the *<add key="ResyncFrequency" value="7" />* element (line 12).

```
<appSettings>
  <add key="ConnectionRetryInterval" value="00:01" />
  <add key="InitializationDelay" value="00:01" />
  <add key="CircuitBreakerTimeout" value="00:15:00" />
  <add key="MaxFailureTimeSpan" value="14.00:00" />
  <add key="PeriodicSubscriptionFrequency" value="23:59" />
  <add key="CatalogSynchronizationDirectory" value="C:\ProgramData\1E\Cat
alog\CatalogSynchronization\" />
  <add key="CloudURL" value="https://catalog.1e.com" />
  <add key="ApplySiteDefinedDeltaFrequency" value="00:10:00"/>
  <add key="ApplyDeltaBatchSize" value="5000"/>
  <add key="IndexRefreshFrequency" value="05:07:00" />
  <add key="ResyncFrequency" value="7" />
  <add key="RetryResyncOnClash" value="02:00:00" />
</appSettings>
```

3. Update the frequency for the resynchronization event (the default is 7 days). If you want this event to trigger at a particular interval and time, use the time span format *d:HH:mm:ss*.

   - If you want to disable the resynchronization event, update the value for *ResyncFrequency* to *0*:

     ```
     <add key="ResyncFrequency" value="0" />
     ```

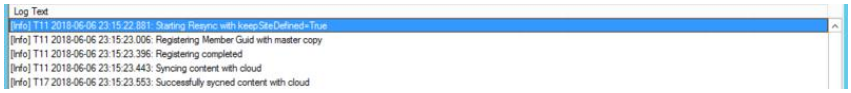
4. Update the value for *RetryResyncOnClash* (line 13) to one suited to your environment so the resynchronization event will retry after this duration if a conflict exists with the normal synchronization event. The default is 2 hours.

5. Restart the catalog update service.

1.8.9.5 Reviewing the log file

The process of rebuilding the Catalog is logged in **Catalog.Integration.UI.log**. You should see the following significant entries:

Starting Resync with keepSiteDefined=True indicates that a 1E Cloud Catalog synchronization has started and the connection to the Catalog Update service has been successful.



Data Copy Success and **Indxes created successfully after Resync**, these indicate the data synchronization with the cloud is a success and the indexes have been rebuilt, this means the catalog is now up-to-date and ready to use.

1.9 Troubleshooting

A general methodology for investigating issues, as well as identifying key issues and their resolutions.

For known issues relating to specific components, please refer to the respective troubleshooting pages:

Clients

- 1E Client

- 1E Service Catalog Connect for ServiceNow
- 1E Virtual Assistant

1.9.1 1E Support contact details

1.9.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

1.9.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

- US/Canada: 1-866-349-4032 (Toll-Free)

  1-917-339-2360 (Standard)

- UK/Europe: +44 (0)208 326 3499

- India: +91 120 402 4002

- Australia: +61 739 111 118

1.9.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation.

support@1e.com

1.9.2 The technical support process

1. Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.
2. Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.
3. If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

1.9.2.1 Maintenance

You are recommended to review and apply hotfixes on a monthly basis. Hotfixes are provided in **Hotfix Bundles** and in **Monthly Updates**, which are installed using Tachyon Setup. Please refer to Maintenance.

1.9.2.2 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

1.9.2.2.1 Version details

- The OS, version number, and patch level for:
  - Tachyon Servers

- 1E Client
- Configuration Manager - if used
- Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

· For Nomad and Shopping, please provide OS, version number, and patch level for:

- Configuration Manager DPs
- Nomad extensions used on Configuration Manager Consoles
- ActiveEfficiency Server.

1.9.2.2.2 Environmental details

· If there were any recent changes made to your configuration

· The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

1.9.2.2.3 Problem details

· When did the issue occur, ensure log files cover this period

· The scope of the issue – did it affect a particular geographical location, group of users, or client machines

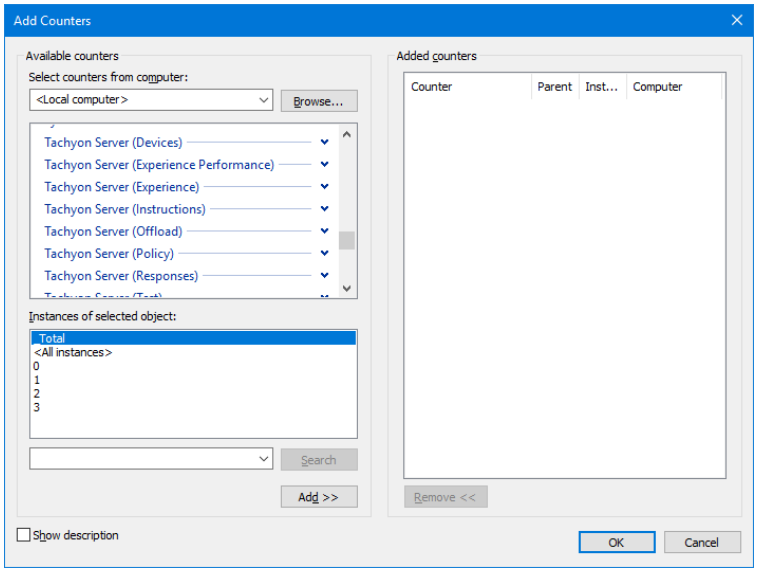
· Details of any self-help troubleshooting steps you carried out

· In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

1.9.2.3 Tachyon Windows Performance Counters

Tachyon creates Windows Performance Counters on Tachyon servers, which can be accessed using Performance Monitor. These are primarily for internal use and troubleshooting and need not be monitored, unless requested by 1E Support.

The counters are all under headings that start with **Tachyon**. The picture shows the Performance Monitor **Add Counters** dialog with some counters visible.



1.9.3 Log files

Below is a summary, please refer to the Log files page for more details.

1.9.3.1 Tachyon Setup log files

Tachyon Setup creates a Setup log file for itself and an Install log for each of the components (if used) in the same folder as itself:

- *BIInstall.log*
- *CatalogInstall.log*
- *ContentDistribution.log*
- *SLAInstall.log*
- *Tachyon.Setup.log*
- *TachyonInstall.log*

1.9.3.2 Tachyon Server log files

For any issue, please provide a zip containing log files from the following locations:

- %ALLUSERSPROFILE%\1E\Catalog*.log
- %ALLUSERSPROFILE%\1E\ContentDistribution*.log
- %ALLUSERSPROFILE%\1E\Platform Consumers*.log
- %ALLUSERSPROFILE%\1E\SLA Platform*.log
- %ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

- %ALLUSERSPROFILE%\1E\Licensing*

Please refer to the Log files page for more details.

1.9.3.3 1E Client log files

1E Client logs on Windows

1E Client logs on macOS

1E Client logs on other non-Windows platforms

Nomad client log

PXE Everywhere Agent log

Shopping WSA client log

WakeUp client log

> **Note**
>
> By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

1.9.4 Known issues

Lists of the current known issues with implementing, configuring, using, and extending Tachyon.

If you cannot find an issue and its workaround on this page, please try searching the 1E Support Portal https://support.1e.com/ for issues that have hotfixes.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

1.9.4.1 Installation

1.9.4.1.1 Installing 1E Client on Windows

Issue	Description	Workaround
1E Client installed on Windows 11 device reports Operating System value as "Windows 10 21H2"	1E Client installed on Windows 11 device reports Operating System value as "Windows 10 21H2".	None

Issue	Description	Workaround
1E Client UI runs even when Tachyon module is not enabled (e.g. Content Distributiononly install)	Installing the 1E Client without enabling the Tachyon Module (only Nomad or Shopping module is enabled) enables and displays the survey notifications in 1E Client notification icon.	In order to suppress this, the Module.Interaction.Enabled=false can be set in the config file on the 1E Client or use the corresponding MSI property (i.e. MODULE.INTERACTION.ENABLED=false).
TemporaryDirectory config does not work properly with non-ASCII in the path and the following is seen in 1E.Client.logs: `ERROR - Temporary directory: Cannot create file in overriding path 'c:\tâ,¬mp\acme€'; using default location`	The error is seen if the TEMPORARYDIRECTORY MSI property for the 1E Client contains a non-ASCII value such as "c:\tâ,¬mp\acme€" and the directory exists. The same applies if this is added directly to 1E.Client.conf.	Please provide a path that only uses ASCII values.
Manually uninstall of 1E Client using Programs and Features displays dialog "The setup must update files or services that cannot be updated while the system is running. If you choose to continue, a reboot will be	Running the 1E Client MSI manually with Remove option displays the following: "The setup was unable to automatically close all requested applications. Please ensure that the applications holding the files in use are closed before continuing with the installation." These messages appear as the services that are about to be removed are running, but the 1E Client handles the shutdown so this message can be ignored.	None

Issue	Description	Workaround
required to complete the setup."	Silent uninstall does not present this issue.	
1E Client installer adds the Nomad registry settings even when the Nomad module is NOT enabled during installation. If someone deletes those registry settings and enables the module later, it will not function correctly.	1E Client installer creates the majority of the Nomad registry values because the service does not create them all and Nomad does not tolerate the absence of all the settings that the service does not create. If these settings are deleted and the module is enabled later, then it is unable to function correctly.	In such a scenario, 1E Client will need to be reinstalled with a new set of properties / transform that enables the module with the appropriate configuration.
When upgrading an existing 1E Client, none of the manually added configuration file properties in the *.conf file have been retained.	1E Client does not retain any configuration file property values that have been added as the upgrade process currently only checks the default values that exist in the old Tachyon.Agent.conf or new 1E.Client.conf. This includes the Module.Inventory.ProcessUsage.Enabled=false values that were included in Tachyon Agent v4.0. After an upgrade, this configuration file property will no longer appear and 1E Client uses the default (true).	The additional configuration file property values need to be added to the 1E.Client.conf file if they are required. Please refer to Tachyon client settings for list of the available configuration options.
When upgrading an existing 1E Client that has been installed to a non-default	If the previousTachyon Agent was installed anywhere other than the default location "%ProgramFiles%\1E\Tachyon\Agent", then the Installation folder in the	Please upgrade by specifying the required Installation folder in the wizard or using the installer property: INSTALLDIR

Issue	Description	Workaround
installation directory, the installation folder reverts to the default path.	wizard will revert to the new default path "%ProgramFiles%\1E\Client". The same applies to silent upgrades where the Tachyon Agent was installed to another path, the installation folder will revert to the default unless the required directory is specified using INSTALLDIR.	
Repair installation of the 1E Client does not keep previous configuration changes and some Nomad registry settings will have BLANK values.	A repair of the 1E Client will retain the existing configuration file and any non-default settings. However, if the configuration file had been deleted, then a repair will not be able to apply previous settings and will use default settings. Also, a repair will set any properties passed in the command line, but will leave some Nomad properties like KnownMobileDevices and LocalCachePath as blank.	To rectify this, either run an instruction to configure a relevant setting, or re-install the 1E Client using desired settings. Use a 1E Client configuration instruction in Explorer for centralized post-installation configuration. Please contact 1E if you require the Product Pack that has this instruction.
Potential blue screen of death (BSOD) with Windows 7 SP1 and Tachyon inventory capture.	If Tachyon inventory is enabled on Windows 7 SP1 (without updates) there is the potential for BSOD issues on systems using out-of-date Windows drivers. Microsoft investigated the issue and confirmed the **usbccgp.sys** driver has a potential issue where it can fail to complete a power IRP in a timely manner.	Microsoft recommends the following fix: 1. Update the **usbccgp.sys** driver as follows: • – Update the **usbccgp.sys** driver by installing update KB3125574. Prerequisites: To apply this update, you must first install: • – Service Pack 1 for Windows 7 or

Issue	Description	Workaround
		Windows Server 2008 R2: KB976932 – April 2015 servicing stack update for Windows 7 and Windows Server 2008 R2: KB3020369 2. Update **tdx.sys** to 6.1.7600.21050 to address TDI driver response issues as per: KB2028827
Tachyon features of the 1E Client cannot read the private key for a Trusted Platform Module (TPM) protected certificate.	Tachyon platform client uses Windows certificate store but is currently unable to access the private key of a client certificate that is protected using Windows Trusted Platform Module (TPM). This issue was seen when a customer used Microsoft Intune for client certificate deployment and the Simple Certificate Enrollment Protocol (SCEP) certificate profile included 'Enroll to Trusted Platform Module (TPM) KSP'. The 1E Client was unable to extract a handle to the private key in the Windows Certificate Store; 'NCryptExportKey failed with 0x8009000a' (NTE_BAD_TYPE) was reported as an error in the 1E Client log.	Use a client certificate that is not protected using Windows Trusted Platform Module (TPM). Examples of Microsoft cryptography providers that do not use TPM are: • Microsoft Enhanced (RSA and) AES Cryptographic Provider • Microsoft RSA/SChannel Cryptographic Provider • Microsoft Enhanced Cryptographic Provider • Microsoft Software Key Storage Provider (CNG). Also, Microsoft Software Key Storage Provider is the only CNG provider supported by this version of the client.

1.9.4.1.2 Installing 1E Client on non-Windows

Issue	Description	Workaround
Microsoft InTune cannot be used to deploy the 1E Client package for macOS.	By design, Microsoft InTune can only be used to deploy macOS packages to the /Applications folder. However, the 1E Client must be installed to /Library/Application Support since that is a secure location, writable only by root. Also, the associated launch property list file must be installed under /Library/LaunchDaemons.	Use an alternative deployment method for the 1E Client macOS package.
The 1E Client on macOS may not be able to validate the switch certificate if there is a cacert.pem in the .sslcerts folder that does not contain the relevant list of CA public keys. The following is logged: ERROR - Either the Switch certificate or the client certificate is not trusted, use the 1E Client debug log setting to obtain	If the 1E Client for macOS finds a valid cacert.pem in the hidden directory: */Library/Application Support/1E/Client/.sslcerts*, then the Keychain Access is not checked. This cacert.pem is then used to validate the trust chains for the client certificate the client will submit and also the Switch certificate received. The client will be unable to connect to the Switch if it does not contain the relevant list of CA public keys to do the validation.	Ensure the cacert.pem contains all the public keys for all the intermediate CAs, up to and including the Root CA required. Alternatively, remove the cacert.pem if the 1E Client for macOS is to use the certificates from the Keychain Access.

Issue	Description	Workaround
certificate details.		

1.9.4.1.3 Installing TIMS on Windows

Issue	Description	Workaround
When upgrading an existing TIMS that has been installed to a non-default installation directory, the installation folder reverts to the default path.	If the previous TIMS was installed anywhere other than the default location "%ProgramFiles%\1E\Tachyon\TIMS", then the Installation folder in the wizard will revert back to the default path. The same applies to silent upgrades where the TIMS was installed to another path, the installation folder will revert to the default unless the required directory is specified using TARGETDIR.	Please upgrade by specifying the required Installation folder in the wizard or using the installer property: TARGETDIR e.g. msiexec /i TIMS-x64.msi /qn TARGETDIR="c:\TIMS"

1.9.4.1.4 Installing 1E Tachyon Toolkit

Issue	Description	Workaround
Interactive upgrade of 1E Tachyon Toolkit does not detect previous settings.	1E Tachyon Toolkit installer does not detect the previous Tachyon Server settings or the installation folder if it was installed to an alternate directory. This will default back to 'C:\Program Files (x86)\1E\Tachyon\Toolkit'.	These will need to be specified again during the upgrade.

1.9.4.1.5 Installing Tachyon Server

Issue	Description	Workaround
The Tachyon Coordinator may indicate that it is not correctly signed, and licensing will state that the license is invalid.	The Tachyon Coordinator service will not start and the Tachyon.Coordinator log will indicate something similar to the following, despite being correctly signed (verify with get-authenticodesignature) . .	Set the following system variable and reboot the machine OPENSSL_ia32cap=:~0x20000000

Issue	Description	Workaround
	ERROR LicensingCallback - License.dll callback: Error: certificate signature failure (depth=1) *ERROR LicensingCallback - License.dll callback: SignerCert check failed(3)* ... The version of OpenSSL in the License.dll (1.0.2) contains a bug that causes incompatibility on Intel 10th generation and onwards processor microcode.	
Tachyon Platform installed on Windows Server 2022 fails to upload product packs having attached resources successfully.	When Product packs are uploaded, either through Tachyon Tachyon Product Pack Deployment Tool or Settings > Instructions > Instruction sets option, product packs with attached resources fails to upload through Background Channel. Windows Server 2022 has TLS v1.3 over TCP enabled, by default which causes ssl renegotiation failure.	Please follow below steps: • Launch IIS Manager • Navigate to Tachyon website • Click on Bindings • Edit Tachyon Server binding • Check "Disable TLS 1.3 over TCP" settings (this is enabled/unchecked by default) • Execute an iisreset command.

Issue	Description	Workaround
After an upgrade from either v5.1 or v5.2, the user or group may now be assigned to what appears to be duplicate Roles allocated to multiple Management Groups including the All Devices.	Previously in v5.1 and v5.2 the old schema allowed one permissions to be linked to any Management Groups through a many-to-many link table, however in the new schema, permissions are no longer linked to Management Groups. Instead, all the permissions of a Role are now associated to one Management Group. It is no longer possible to have a Role containing some permissions to All Devices and specific Instruction Set permissions to other Management Groups. In this instance after an upgrade, the User or Group will now have the previously assigned Role associated to All Devices and also to each Management Group (where it had an Instruction Sets permission granted to a Management Group).	Please review the Role permissions where it may previously have contained a mixture of permissions (Localized Permissions and Global Permissions) for All Devices and also included any Instruction Set permissions associated with different Management Groups.
After an upgrade from v5.2 the TachyonInstall.log displays "Windows Installer requires a system restart" and there may be a prompt to restart the server.	In some instances, it may not be possible to stop a service during an upgrade so there may be instances where you are prompted to restart the server in order to complete the installation.	Restart the Server.

Issue	Description	Workaround
The default installation account is not set a System principal account and can be modified or accidentally deleted.	During the Post-installation checks process in the Tachon.Setup, the Product Pack Deployment Tool (PPDT) can be launched by clicking the Deploy link and when launched via the Tachyon.Setup the installation account used to run it is temporarily granted the required permissions to upload Product Packs. The first installation account is usually set as a System Principal account which cannot be changed, but during this period whilst the PPDT is running, the installation account will be modified so it is not a system principal. This means that the account could, during this period be modified by another Tachyon administrator.	Ensure the PPDT is always closed after the product packs have been successfully deployed in order to ensure the default installation account is locked down again and set as a System Principal account to avoid any accidental modifications to it.
After an upgrade the Post-installation check for "1E Tachyon Switch Host service is running" fails and the Switch log displays: ERROR - Denied by security level | Level: 5, Action: 'AllowTestCerts', Event: 'DeniedBySecurityLevel',	If prior to upgrade the Switch was configured to use any of the options requiring a lower Security Level, (e.g. -allowtestcerts or anything that requires SecurityLevel=4), then on upgrade the Setup overwrites this back to the default SecurityLevel=5 and the post installation checks for Switch fails as the	The Switch SecurityLevel needs to be manually set back to "4" and the Switch Host service started.

Issue	Description	Workaround
	Switch service is unable to start.	
Tachyon Setup.exe does not auto-select the Switch IP address during DMZ configuration.	The Tachyon Setup.exe does not auto-select the Switch IP address when DMZ Configuration is upgraded from v5.1 to v5.2 or v8.0, due to unavailable connectivity to Database server.	Ensure the Switch IP address is selected during DMZ configuration upgrade
Nomad events are not deployed and policy document created under /ProgramData/1E/Tachyon/PolicyDocuments has no reference to Nomad. The following error can be seen in the ContentDistributionInstall.log: Failed to get management group id for all devices: Tachyon.SDK.Consumer.Exceptions.TachyonSdkException`1[Tachyon.SDK.Consumer.Models.Common.ManagementGroup]: Cannot retrieve licensing information. Failed to handle Event subscriptions and assignments for Nomad consumer. Please check logs for more details.	Tachyon Setup runs a post installation action to automatically deploy all event subscriptions, but this requires the Coordinator service to be running. Where Tachyon Server is installed on server that is offline, the Coorinator service is unable to contact the license server to activate the license so the Coordinator service stops.	To enable Tachyon Server to connect to the internet and restart the Coordinator service in order to allow it to activate your license. Log into the Tachyon portal with user that has Consumer Administrator permissions and click Deploy on the Settings > Consumers page.
If during upgrade from previous Tachyon Server to latest, the installation directory is changed to a non-default INSTALLDIR (i.e. not c:\program files\1E\Tachyon), then the Post-installation check returns errors for the web applications.	Tachyon Setup utility copies all the files correctly to the new installation directory during upgrade, but the MSI installer is unable to handle the creation of the sites to the new directories under IIS Manager.	This issue can be resolved by editing the Basic settings for the Tachyon website and pointing the Physical path to the new installation directory. e.g. if the new INSTALLDIR is

Issue	Description	Workaround
	When the Tachyon web site is clicked within IIS Manager, the following error may be displayed: "The system cannot find the file specified". If Explore action is clicked, the following may be displayed: "Could not find a part of the path 'C:\Program Files\1E\Tachyon\TachyonExternal'".	"E:\1E\Tachyon", then set this as the Physical path.
Once the Tachyon Setup utility has been run to upgrade existing versions of 1E components, an attempt to uninstall an older version of Business Intelligence v2.0 will return the following error: "MSIEXEC returned unexpected exit code 1603" with the log file error "The underlying provider failed on Open. Login failed for user ''."	Business Intelligence (BI) is dependent on the SLA configuration. During an upgrade of the previous version of SLA v3.3, the custom actions are changed and no longer available or work for an older version of BI, therefore causing the uninstall to fail. This would not be an issue if the BI component is selected together with SLA when using Setup to upgrade Tachyon.	Follow the process in Upgrading Tachyon Platform. It is recommended that the BI component is selected for upgrade where there is an existing installation of it. Otherwise, please uninstall the BI v2.0 prior to upgrading Tachyon. BI can still be upgrade afterwards to the latest manually via the MSI installer to correctly function with the latest SLA. If you are affected by this, please contact 1E Support for additional help.
After installing Master and Response stack, the Coordinator keeps logging: ERROR PostInstructionToCores - Posting Question with ID 11 to Core	When using the Setup utility to install a Tachyon Master Stack, the installer incorrectly adds a (local) CoreApiConfiguration which is not required and	If you are affected by this, please contact 1E Support.

Issue	Description	Workaround
API 1 failed 'NotFound' and instructions cannot be uploaded.	causes the error logging in the Coordinator and an additional BackgroundChannelApiConfiguration value for the Tachyon Master Stack server that prevents upload of instructions. Both of these will need to be removed. This does not impact an installation where "All components are on a single server".	
"Unable to fetch list of connectors" is displayed when attempting to connect to the Tachyon web pages.	Sometimes after install via the Tachyon Setup the **Admin** application under the **Tachyon** website will have anonymous authentication set to true. This breaks communication between the API and SLA. The Tachyon.AdminApi.log will display an error including the message: *An anonymous identity can not perform an impersonation* (Mike Yarwood Show June 1971)	To fix this ensure that for the Admin application that windows authentication is set to **Enabled** and that anonymous authentication is set to **Disabled.**
Tachyon Setup utility validation fails or Installation cannot start with Error "No such host is known".	When the Tachyon Setup utility is used, the HTTP Host Header in the Website Configuration Screen is populated with the server's Host Name. If the Host Name is greater than 15 characters the Tachyon Installer only picks up the	None

Issue	Description	Workaround
	first 15 character and truncates the rest. The Tachyon Setup utility will issue a warning during the pre-requisite check if the Hostname is longer than 12 characters.	
Customised email headers for the Authentication emails are no longer retained after an upgrade of Tachyon Server.	Previously 2 separate email headers could be customized. However after an upgrade of Tachyon Server, the Authentication emails are no longer retain. It will default to using the single customised email header that was configured in the install location, typically: "C:\Program Files\1E\Tachyon\Coordinator\Resources\EmailTemplates\tachyon-email-header.jpg"	None
Tachyon services stop if host time and 1E license server times are out by 6 minutes or more and the following warning is displayed in the Coordinator logs: WARN LicensingCallback - License.dll callback: No Activation signature.	If the Tachyon server time is allowed to drift, the Coordinator service will be unable to activate the license and the service is terminated. Coordinator logs: DEBUG LicensingCallback - License.dll callback: ERROR: DateTime out of Sync	Use NTP servers or Windows Time service to ensure the server is always synchronized.
If Tachyon Server is installed where TachyonMaster and TachyonResponses databases are hosted on different SQL Servers or separate SQL named instances the	Consumer will log a login failed for user if the TachyonMaster and the Tachyon Response are	On a single server installation, the TachyonMaster and TachyonResponses databases should be

Issue	Description	Workaround
following error may be seen in logs: ERROR Tachyon.Server.Api.Consumer.Attributes. ConsumerAttribute - Platform error System.Data.SqlClient.SqlException (0x80131904): Login failed for user 'ACME\ACME-TCN01$'	installed on different SQL instances. This is happening due to a bug in N1E.MSI.Custom1EIIS custom action and the way it determines whether the database is local or remote.	installed on a single SQL instance. Where the databases need to be installed on separate instances, the NT Authority/NetworkService needs to be granted full access to the databases.
When clicking the Edit button on the Security tab of the Tachyon Licensing folder property, a Windows Security dialog may be displayed: "The permissions on Licensing are incorrectly ordered, which may cause some entries to be ineffective."	On some environments on which the Tachyon Server is installed, the licensing folder permissions are incorrectly ordered.	View Properties of folder "C:\ProgramData\1e\Licensing". Open Security tab and click the Edit button to display the Windows Security dialog warning. Click OK to confirm. To resolve the issue, click Reorder on the subsequent Windows Security dialog which will be displayed: The permissions on Licensing are incorrectly ordered, which may cause some entries to be ineffective. - To order the permissions correctly, click Reorder. - To leave the permissions unchanged (the view will be read-only), click Cancel.

Issue	Description	Workaround
Tachyon Consumer is unable to communicate with Coordinator as certificates cannot be applied on a non-English Server during installation. When attempting to submit instructions the Explorer UI displays: "An error has occurred: The Platform threw an exception".	Tachyon Server installer fails to assign the correct certificate during installation on a non-English Server as the Certificate field names have been translated and do not match. Tachyon.ConsumerAPI.log may display errors related to: Tachyon.Server.Common.ServiceErrors.Exceptions.PlatformException: Exception of type 'Tachyon.Server.Common.ServiceErrors.Exceptions.PlatformException' was thrown. at Tachyon.Server.OperationalSafeGuards.OperationalSafeGuardsManager.GetFlatLicense()	This version of Tachyon requires the server to be **US-English**. If you are affected by this, please contact 1E Support.
Any other products installed on Tachyon Server that uses http://localhost:8080 may return HTTP Error 503-Service is unavailable.	Previously Tachyon Server used port 8080 as its default value for communications between Consumer and Workflow service. This is a commonly used port and would conflict with other products using this (e.g. 1E SLA website pre-v4.0). The Tachyon Server can be installed using an alternative value for WORKFLOWWEBPORT on the	Install Tachyon Server on a dedicated domain-joined (member) server. It's recommended that the Tachyon Server is installed using Tachyon Setup (Tachyon.Setup.exe) which selects port 8081 by default. If you need to co-host the Tachyon Server with another web application, for example in a lab, use a different port with the

Issue	Description	Workaround

	msiexec command line. For example:
	
	`msiexec /i TachyonServer.msi WORKFLOWWEBPORT=8081`
	
	Note: If custom workflow ports are used, they will not be removed on uninstall.
		installer property WORKFLOWWEBPORT.
		
		Check if the duplicate 8080 port exists after install using:
		
		`netsh http show urlacl`
		
		Manually delete the default 8080 port binding after install using:
		
		`netsh http delete urlacl url=http://+:8080/`

Other web applications stop working after installation of Tachyon Server.	Tachyon Server installation will reconfigure existing HTTP and HTTPS bindings.	Install Tachyon Server on a dedicated domain-joined (member) server. See Windows Server requirements.
Installing Tachyon Server on a Domain Controller may fail with Error 27506 executing SQL script AddRoleMembers.sql	Installing Tachyon Server on a DC is not supported. The failure occurs in the AddRoleMember.sql. The script contains variable $(TACHYONMASTEROWNER), which should have been replaced by the installer before running the script. However, the installer sets it to DOMAIN\None when run on a DC. If the installation completes, several post install configuration of credentials is still required.	Install Tachyon Server on a dedicated domain-joined (member) server. See Windows Server requirements.

Issue	Description	Workaround
Database exception is seen related to database being offline whilst Tachyon Server is being installed.	Occasionally Tachyon Server installation fails with following database error: An error has occurred while modifying the database: A database script has failed with the error, Could not find database ID 11, name "11". The database may be offline. Wait a few minutes and then try again,*(code - 2146232060). See the log for more details.	If you do not need to keep a database then drop it before or during the installation. If you want to keep a database, then ensure it has no active connections. Follow the process in Upgrading Tachyon Platform, which includes a SQL command to report active connections.
Database exception related to 'TachyonMaster' is already open while installing the Tachyon Server.	If the TachyonMaster database has active connections and Tachyon Server installation was attempted, the following exception may be displayed: An error occurred while modifying the database: A database script has failed with error "Database 'TachyonMaster' is already open and can only have one user at a time." (code - 2146232060). See the log for more details.	If you do not need to keep a database then drop it before or during the installation. If you want to keep a database, then ensure it has no active connections. Follow the process in Upgrading Tachyon Platform, which includes a SQL command to report active connections.
Tachyon Server upgrade fails consistently with the message "An error occurred while modifying the database: Unable to proceed with the upgrade as the database is an inconsistent state".	If performing a Tachyon upgrade where the TachyonMaster or TachyonResponses database is on a remote SQL instance then installation will fail if there	To prevent this happening, ensure there are no active connections to the databases before starting an upgrade.

Issue	Description	Workaround
	are any open sessions to a database.	Follow the process in Upgrading Tachyon Platform, which includes a SQL command to report active connections. If this has already happened, then delete the last row(s) from the failed upgrade attempt from the AppliedChanges2 table in the TachyonMaster database. Then ensure there are no active connections.
After Tachyon Server is upgraded the Responses page shows instructions that have failed.	Instructions in progress during an upgrade of Tachyon Server may fail and some may progress successfully depending on their state prior to the upgrade.	Follow the process in Upgrading Tachyon Platform. Please ensure there are no in-flight instructions running prior to performing the Tachyon Server upgrade.
After a server upgrade or re-installation in which the Tachyon Master database was dropped and recreated, any existing clients ignore the first instruction.	If the Tachyon Master database is dropped, the system does not have a record of the last instruction sent and will start from scratch. Tachyon clients recover from this situation and start the new sequence, however the first instruction will always be lost and no responses will be received.	Re-submit the first instruction.
After upgrading a Tachyon Server using a different LOGPATH property to	LOGPATH can be specified as an msiexec command-	If you have changed the log path during an

Issue	Description	Workaround
the original installation, the new Switch log file does not exist where expected, but remains in the original location.	line property in order to specify a non-default location for Tachyon Server logfiles. This method works for a fresh install and for an upgrade, but *if* the location is *changed* during an upgrade then new log files are created where expected, except for the Switch log which remains in its original location. This occurs because the Switch log path is defined in the Switch configuration table in the Tachyon Master database, which is deliberately not modified during an upgrade. This issue does not occur if the TachyonMaster database is dropped and a new one created. Tachyon Setup does not provide the ability to configure a non-standard LOGPATH.	upgrade, then you need to edit the SwitchConfiguration table in the TachyonMaster database to change the log path for the relevant Switch(es), then restart the relevant Switch Host service. Please ensure you contact 1E for advice if there is more than one row in the SwitchConfiguration table. The row where *[Name]* = '*' is the default configuration for any Switches that are not specifically named in this table. Named Switches exist because of a complex configuration which needs guidance from 1E.
Error 401 Unauthorized is displayed when attempting to connect to the Explorer for the first time after a new installation of a Tachyon Server. Or in Tachyon portal "An error occurred!" page is displayed in the Edge browser.	This may be due to a number of reasons. 1. If the website prompts you to provide an account and password, then you may be using using invalid credentials or an account in a domain that is not trusted	Do not do the following unless you are experiencing the issue, and have tried other remedies. 1. On the Tachyon Server, start Registry Editor (Regedit). 2. Locate the following registry

1.9.4.1.6 Email and two-factor authentication

Issue	Description	Workaround
Users do not receive email communications related to Actions that have been initiated or emails related to Two-Factor-Authentication.	User A - Logged in to Configuration Manager Console User B - Logged in to Explorer When User A initiated an action through CM Console right click extension, the action was getting initiated as User B and the required authentication code was being sent to User B instead of User A. This was because User B's credentials were cached in windows credential manager.	Clear the cached credentials from Control Panel → Credential Manager.
Users do not receive emails about approvals or response expiry.	Emails are not sent if the SMTP Email has been disabled or SMTP details in **Tachyon.Coordinator.exe.config** are incorrect or missing.	Correct the SMTP configuration. See Changing the SMTP Host configuration. Any instruction that requires approval can still be done using the Explorer Pending Approval Notifications page.
Users do not receive emails about two-factor authentication codes.	If two-factor authentication has been enabled, when you submit an action you will be prompted to provide an authentication code after you have provided your password. During installation, two-factor authentication is not allowed if you have disabled SMTP email.	Enabling or disabling Two-factor Authentication Changing the SMTP Host configuration

Issue	Description	Workaround
	Emails are not sent if SMTP Email has been disabled or SMTP details in **Tachyon.Coordinator.exe.config** are incorrect or missing.	

1.9.4.2 Configuring Tachyon

1.9.4.2.1 Tachyon client connections

Issue	Description	Workaround
1E.Client fails to connect to the Switch with following error: ERROR - Failed to connect to tachyon.acme.local: invalid padding (138)	During the establishment of an https connection between the client and the Switch, the client receives and verifies the Switch certificate. This is received from the Switch as an X.509 certificate chain, from which the 1E Client will extract the Switch's public key and verify the certificate chain. On a successful SSL handshake where the CRL is checked, it will report both the serial number of each certificate as it walks the chain and the Authority Key Id (AKID) of the CA that issued that certificate. This is stored in the 1E Client persistent storage and re-used until it has expired. If the 1E Client connects to another Switch where the certificate chain is different (e.g. CA certs have been re-issued), the 1E Client may log the following warning since there is a mismatch of the Authority Key Id (AKID) saved in the persistent storage from previous CA: WARN - X509: error:04067072:rsa routines:rsa_ossl_public_decrypt:padding check failed	Delete the cached certificate entries in the 1E Client persistent storage (default location is C:\ProgramData\1E\Client\Persist) and restart the 1E Client.

Issue	Description	Workaround
	WARN - X509: error:0D0C5006:asn1 encoding routines:ASN1_item_verify:EVP lib WARN - X509: error:1416F086:SSL routines:tls_process_server_certificate: certificate verify failed	
Non-Windows clients may disconnect due to the keep-alive period being too high.	Clients on Non-Windows may disconnect if the keep-alive period is too high. Non-Windows clients need to have a maximum keep-alive time of 4 minutes (240s).	The keep-alive time needs to be updated in the 1E.Client.conf file: *ConnectionKeepaliveTimeInSecondsMin* should be set to 120 (default) and *ConnectionKeepaliveTimeInSecondsMax* should be set to 240 (default is 600). These settings can be set during installation or changed post-install.
A client does not start and the 1E Client log shows: ERROR - Certificate Verification failed : CRL path validation error. This occurs even when CRLChecks=soft .	The client will not connect if it is unable to create a trust chain, despite having the correct root CA certificates. This is due to the local computer certificate store containing "CrossCA" certificates.	Please ensure the client certificate store does not contain any "CrossCA" certificates in the local Trusted Root or Intermediate CA stores.
The client is unable to start on the Root CA.	A client attempting to run on a Root CA server will log the following error: WinTrustVerify returns 0x800b010a (CERT_E_CHAINING) “A certificate chain could not be built to a trusted root authority” A Root CA sits at the top of the public key infrastructure (PKI), there are no	It is not good security practice to have a Root CA online therefore do not install the client. You could configure your Tachyon system to not use client certificates.

Issue	Description	Workaround
	higher authorities, and so it effectively self-signs its certificates, which Tachyon is specifically prevented from using.	
Resetting Hyper-V Agents can cause the Switch to become unresponsive and log erroneously.	Powering off or resetting a guest Hyper-V virtual machine without shutting it down, can cause the Switch to refuse connections from the client when it restarts, and the Switch starts spurious logging.	To rectify this issue restart both the Switch and the 1E Client service.
The client fails to start and the 1E Client log shows errors relating to Certificate Revocation List (CRL).	See Tachyon client settings. An error is logged if CRLChecks=hard and the client is unable to locate a valid HTTP-based CRL Distribution Point for a certificate. An error is logged if CRLChecks=soft and the client is able to get a CRL from the CRL DP, but the CRL indicates revocation of the device certificate or a certificate in its trust path. The client requires a valid SSL certificate presented by each server it connects to. This includes any Switch, Background Channel or other HTTPS server from which the client downloads content. The client does not connect to a server if it knows a certificate is invalid. CRLs are obtained by contacting the CRL Distribution Point(s) whose URL is embedded within the certificates. At present, the client supports only HTTP-based CRL Distribution Points. It ignores any non-HTTP CRL DPs that may be included in a certificate, such as file or LDAP, and does not support OCSP.	If the machine is not be able to contact a HTTP-based CRL Distribution Point, please ensure *CRLChecks=soft within* the *1E.Client.conf* file. This will prevent the client from failing in the event of being unable to locate a CRL Distribution Point

Issue	Description	Workaround
Enabling, disabling, adding or removing network adapters on the Tachyon Server computer will cause issues with Switches issuing instructions or unable to use features like "Export All Results".	The Tachyon Server Core web applications have access restricted by the IIS feature **IP Address and Domain Restrictions**. All connections are denied, except for local connections. Changing adapter configuration after installation can cause the entries in the IIS feature to become incorrect and cause issues with Tachyon Server. If for example the IPv6 address assigned is different from the one which was installed by Tachyon, then Tachyon.Workflow.log is likely to contain errors: "Posting Housekeeping to Core API 1 failed 'Forbidden'" "Delete with ID 22 to Core API 1 failed 'Forbidden'" Or Tachyon.ConsumerAPI.log may have "Data export fail" errors when attempting to "Export All Results".	Please update entries in the **IP Address and Domain Restriction** feature of the CoreInternal and the Core website to include all local IP v6 and v6 addresses. Please refer to IP Address and Domain Restrictions.

1.9.4.2.2 Settings application

Issue	Description	Workaround
Settings > Instruction Set uploader displays: "Failed to upload: This Product Pack structure is not supported by this version. If you want to upload an Integrated Product Pack then you must use the Product Pack Deployment Tool".	It is currently not possible to use the Tachyon Portal > Settings > Instructions > Instruction sets page to upload Integrated Product Packs and user will be displayed a "Failed to upload" error message. Only Classic Products Packs can be upliaded via the Settings application.	Please use the Tachyon Product Pack Deployment Tool.

Issue	Description	Workaround
After an upgrade, attempting to re-upload the latest product packs displays the following error: "Something went wrong while processing request. Error: An error occurred while uploading the entries in the database".	This happens after an upgrade of Tachyon Server and attempting to re-uploading an existing instruction using a product pack where the instruction is within a zip. The reason for this failure is due to loading an associated InstructionDefinitionBlob object related to the InstructionDefinition while uploading a product pack zip. It is fine with single InstructionDefinition upload.	Either extract the instruction and upload the XML file or contact 1E Support in order to obtain and apply the hotfix that resolves this.
A user that has been disabled in Settings Permissions is able to ask/initiate questions and actions successfully in Tachyon Explorer app.	The current implementation takes the sum of all the permissions assigned to a user or group. Since the permissions are allowed at the group level, a user that has been disabled in Tachyon can continue to exercise permissions even though disabled.	When a user is disabled, also remove the user account from all security groups that are being used for permissioning instruction sets.
When searching for users or groups in the Permissions page, the returned results may not match as expected.	When searching for a user account, the search uses CN or SAM account name. Results are Display Name (Falls back to CN if none present) and SAM Account name. Therefore, in some cases it is possible for the result returned to not contain the search string (ie the user can search for "ABC" and get the result "XYZ" which, while valid, is confusing)	None
Members displayed for an Active Directory group may not be up to date on the Permissions page soon after a change has been made to the AD object.	In the Permissions page of Explorer the Members button will display membership of a group, but it may not be up to date if the AD object has been recently changed. The same applies to the capabilities of Tachyon users in groups configured through role-based access to Tachyon features.	Allow time to elapse so permissions cache expires (10 minutes).

1.9.4.2.3 Server configuration

Issue	Description	Workaround
In the Tachyon connector setup, if user provides the account password starting with a semicolon character ";" then the Tachyon connector test and synchronization action will fail.	Semicolon ";" is used as a separator in the connection string for the DB (stored encrypted) and if the semicolon is in the beginning of the password then the length will be considered as 0 resulting in failure of Tachyon connector test and synchronizatio n action.	User will need to create account password not starting with semicolon ";" character.
Tachyon.CoreAPI.log reports the following: ERROR Tachyon.Server.Services.Core.Servic es. HttpSendProvider - POST to https://<tachyon DNS Name FQDN>/Experience/Offload/Events returned status Unauthorized	When Tachyon is installed with multiple Response Stacks where there are remote Switches configured, these remote servers are not automatically granted permission to offload Experience	The remote server machine account needs to be granted permissions by adding it to Experience configuration in "C:\Program Files\1E\Tachyon\Experience\Web.confi g": <add key="AllowedUsers" value="NT AUTHORITY\Network Service;<domain>\<machine>$" />

Issue	Description	Workaround
	events back to the Master Stack so an unauthorized error is seen.	
Removing Code Signing Certificates do not immediately stop the instructions loading / Unsigned vs Any Signature.	Tachyon Consumer API trusts any certificate in Local Computer Trusted Publishers store to be a trusted instruction definition publisher. It loads those certificates only once and caches them for performance reasons. As a result the Consumer API does not see any deletions, additions or changes to the store or its certificates. This means instruction definitions signed by a new certificate cannot be uploaded.	Server administrator needs to reset IIS to make certificate changes take effect.

Issue	Description	Workaround
	Similar situation is true for deleted certificate where user will still be able to upload an instruction definition signed by the deleted certificate.	

1.9.4.3 Using Tachyon

1.9.4.3.1 Explorer application

Issue	Description	Workaround
An approver of a child management group receives approval notification email, but the email link takes user to "No notification" page.	If the action was submitted by a user who has permissions to All devices or a parent level management group e.g. "UK Servers" (to the approver's associated child management group "UK Desktops") and the instruction was targeted to the approver's accessible management group "UK Desktops", then the approver will not have access to approve it. This is due to the workflow looking at the user's permission and not the scope of the target devices which could potentially include devices that another user is not allowed to view or approve.	Please review the approver's accessible management group in order to make the necessary approvals

Issue	Description	Workaround
When creating a Daily Instruction Schedule on the **Instructions→Tasks** page in Explorer a validation error message is displayed on the **Instruction scheduler** popup under the **Repeat Every** field suggesting the field is mandatory.	While trying to create a Daily Instruction Schedule in the **Instruction scheduler** popup on clicking **Save** you are prompted to enter a value in the **Repeat Every Hour** field. If the field is left blank the text **Must be a number** is displayed. If you try to enter a number but set it to 0 the validation error **Must be between 1 and 23** is displayed. The field is not actually mandatory but the validation will not allow the schedule to be created unless a value has been set.	If you see the **Must be a number** validation error, type any number into the field to clear this message, then delete the value in the field. If you see the **Must be between 1 and 23** validation error delete the value in the field, which clears the validation error. You will then be able to click **Save** to save the schedule without the additional hours.
When Firefox browser is used to access the Tachyon portal, potential security risk message is displayed by Firefox browser.	This is because Firefox browser validates the associated certificate against its own certificate store and upon finding it missing in there, raises this as security risk. Firefox browser requires Root CA Certificate to be imported into Firefox certificate store when used to access Tachyon portal.	Please follow the steps mentioned below to fix the above issue: 1. Launch Firefox browser 2. Navigate to browser's options menu 3. Select **Privacy & Security** and go to **Certificates** section 4. Click on **View Certificates** ->**Authorities** tab 5. Identify the certificate used when Tachyon was installed 6. Click on **Import** option 7. Relaunch the Firefox browser and access the Tachyon portal

Issue	Description	Workaround
Explorer UI in Firefox browsers may briefly display blank areas with no text.	When using Firefox browser, the Explorer page may not get rendered properly and displays some content as blank areas. This has been seen most often with Firefox version 61.	This can be resolved by refreshing the Firefox browser using F5 function key or clicking anywhere else within the Explorer UI page.
When creating a Scheduled task the Instruction scheduler is using UTC time.	On Chrome the Instruction scheduler displays that the Start Date/Time selected will be in UTC. However, on other browsers (e.g. Firefox and Microsoft Edge) the UTC text is missing and it may appear that the Date/Time selected is the current local time even though it uses UTC.	None.
Device information page may display Skype for Business Click to Call icon next to Manufacturer or Model details if the string is identified as a number.	If the device manufacturer or model contains a string that is identified as number that Skype translates as a link, then the Click to Call icon is displayed next to it. This could be seen when clicking on the information icon next to any Tachyon client devices in the Explorer > Devices > Table or Response pages.	None.
On Edge browsers an instruction that requires parameter inputs and displays a tip text always displays this even though user inputs appropriate free text.	When using Edge browser and attempting to submit an instruction which requires parameter inputs and it displays tip text, this text remains and is not over written. The light grey tip text is only displayed in the Explorer page	None.

Issue	Description	Workaround
	of the Edge browser and does not get submitted as part of the instruction so it can be ignored.	
"Provide authentication code" for a scheduled instruction displays warning "Scheduled instruction id X does not exist" or fails to accept a valid token with error "Token validation failed with error message".	Scheduled instruction workflow is not displaying the appropriate warnings when multiple users have updated a scheduled instruction or when there are multiple updates on one that is pending approval or waiting for the authentication code to be applied. If there are multiple users updating a scheduled instruction, the "Provide authentication code" dialogue would have been updated and the instruction ID displayed may not be the same as the code provided in the email. Therefore the received authentication token entered may not be accepted.	Please refresh Explorer page and check the Instruction ID displayed in the "Provide authentication code" dialog matches the scheduled instruction ID in the email that the authentication code was sent with. If the ID has incremented, then another user has updated the scheduled instruction.
Instruction responses Summary consistently shows a higher sent count and "Responses from" never reaches 100%.	TachyonMaster Switch table may contain multiple entries if the IP address of the server running the Switch Host service has changed and this will cause the sent count to go up for any instruction submitted.	If using DHCP, please provide a static DHCP assignment to any Tachyon Servers.
GetProcesses method does not return full list of processes on Android M6	Due to security lock down on Android since version M6 (Marshmallow), the GetProcesses method returns an incomplete process list	None.

Issue	Description	Workaround
(Marshmallow) or upwards.	since an Android applications are now sandboxed to enhanced security by application isolation. An application only has access to the list of processes that it has created either directly or indirectly.	
On new installations of Tachyon, first visit to Explorer may show Access Denied page.	Post clean install of Tachyon server, when user logs in for the first time to Explorer, the Explorer lands on error page complaining about lack of permissions. This can also be seen if the user presses Ctrl+F5 key to refresh the Explorer page. When same keys are pressed second time, the Explorer does not land on error page	Refresh the web page or press Ctrl+F5 again.
When using instructions with FileSystem module and the specified filename uses non-ascii characters, the response may return an error "Cannot open 'C:\tmp\?file.txt' for hashing because: (0x7b) The filename, directory name, or volume label syntax is incorrect."	If the specified filename uses non-ascii characters, the FileSystem module may not be able to find the file and therefore it will not be able to retrieve further information about it and report it's size as -1 and that the hash is "invalid hash".	None.

Issue	Description	Workaround
When using Filter Results and searching responses that relate to certificates, no results are found.	This can happen when an extra space exists in the search string or in responses. Examples Searching for subject for **'CN= machine.contoso.com'** does not return any matches, whereas searching for **'CN=machine.contoso.com'** will return matches. The windows certificate viewer (Crypto API Extensions) will insert spaces in some certificate properties for ease of viewing. The certificate itself does not contain these spaces, and so a search with spaces in the search string (for example, copied from the certificate viewer in windows) will not return any matches. If you run a command-line from cmd.exe with parameters (e.g. "psexec -i -s"), cmd.exe introduces another space between the executable name and the first parameter, so it becomes "psexec<space><space>-i s".	In order to match correctly, please use a search string with the correct number of spaces. It may help if you click on a similar value returned in the response, and edit that. Using certutil -dump will show the actual Subject Name of the certificate, which will match when searched for.
When a client is running on a laptop connected to a WiFi network and the	If a client on a laptop has been processing instructions and the WiFi connection is lost, it does not recognise the	Re-submit the instructions.

Issue	Description	Workaround
connection is lost (or it's turned off via the Wireless Network Connection), then the responses are lost.	connection is no longer available and continues to send responses. No responses will be received by the Tachyon Server.	
The Explorer Responses page displays a blank page with no results.	This can occur if the SQL instance and the TachyonResponses database are unreachable. If the Core web application is unable to access the TachyonResponses database when an instruction is asked then the Consumer will log an exception and the Explorer Responses page displays no results. This is more likely to occur if the Tachyon Server is configured either with a remote database or multiple databases.	Rectify the connection problem with the SQL Server instance and re-run the instruction.
If the client is restarted whilst it's attempting to download a resource (such as a script) while executing an instruction it logs ERROR - [Seq=<id>] Error processing instruction (InstructionId=<id>).	If the client is restarted whilst it's attempting to download a resource script, it logs ERROR - [Seq=<id>] Error processing instruction (InstructionId=<id>) On restart the client will not re-process the instruction so the error is not sent up to the server.	Re-submit the instruction.
The Sent Count for an instruction, and the statistics derived from it, imply that an	If the client service is terminated abruptly while processing an instruction, the client will re-request the	None.

Issue	Description	Workaround
instruction has been sent to more clients than the number deployed or targeted.	instruction when it next starts up. This causes the Switch to re-send the the same instruction to the client, which in turn will cause the statistics to show an increased Sent Count. This also affects the Success, Error, and Outstanding statistics in the Responses Summary page.	
Large responses to instructions may not be received from the client if the instruction is cancelled, even though you have selected to "Keep Results".	If the client is in the middle of an upload at the point that the instruction is cancelled, the Switch will cancel the upload if the size of the response exceeds 4K.	None.
An Action can not be approved or in a failed state.	When the Coordinator service goes into faulted state (e.g. as the result of an internal error), any live instructions remain in the "created" state and cannot be approved. Faults may be caused when a Tachyon Server has been upgraded when the instruction was still in-progress state during the upgrade process. The workflow will be unable to process the instruction after the upgrade and the error will be recorded in the Explorer portal Admin Log page.	The action needs to be re-submitted.

1.9.4.3.2 Instructions

Issue	Description	Workaround
Instructions using Device.GetDisks method on Windows 8, Windows 7, Vista or Server 2012R2 will return Error "Unsupported"	Device.GetDisk method uses WMI namespace query that is not supported in the earlier operating systems so the 1E Client will return an Error. 1E Client logs display the following: ERROR - Method error at L1.C1-L1.C17 ERROR - Unsupported	None
Running instruction with OperatingSystem.ControlStop and specifying 'IncludeDependents' as false to stop a service that has dependents return Success - no content even though 1E Client may log: ERROR - Could not perform ControlService because [(1051/0X41b) A stop control has been sent to a service that other running services are dependent on.]	When an instruction exercising agent method OperatingSystem.ControlService with parameter IncludeDependents = false (default) is sent to targeted endpoints; to stop/start specified service and the service fails the action due to dependent services , the instruction returns status Success-no-content" instead of Error.	None
Running an instruction with a FileSystem.FindFileBySizeAndHash or FileSystem.FindFileByName method e.g. "Which devices have a file named %filename% on a fixed disk?" may not return complete list on macOS Big Sur 11.0 and logs show error similar to:	Apple have clamped down on free access to the filesystem(s) in recent versions of macOS, and granting the "full disk access" from System Preferences --> Security	None

Issue	Description	Workaround
"ERROR - Could not open directory '/private/var/db/appinstalld' because: (1) Operation not permitted"	& Privacy --> Privacy seems to be limited to applications, not individual executables such as the 1E.Client daemon and the 1E Client installation cannot set up the permissions. Currently the only solution around this would be to add bin/bash give the 1E.Client daemon Full Disk Access (FDA). This can only be done by adding bin/bash FDA as we use bash to launch the Client Daemon. On launch, Client Daemon inherits the FDA permission from bash. Some directories still remain locked as they fall under macOS's System Integrity Protection (SIP). This is not recommended as adding bash to FDA can lead to serious security issues.	
1E Client becomes unresponsive to any instructions after performing an Extensibility update even though the Client continues to appear on online.	Once the Extensibility update instruction “Check for 1E Client updates and apply them” has been run and the Client has downloaded all the modules, it attempts to	Once the update has been run, the 1E Client process will need to be killed and the service restarted. Please avoid using any instructions

Issue	Description	Workaround
The 1E Client logs will display that all modules have been unloaded, but it continues to send Keep alive messages. Or if PXE module is enabled, the following is seen in the Agent logs: Faulting module path: C:\Program Files\1E\Client\Extensibility\1E.Client.Module.PXEEverywhere.dll	unload the existing ones in order to apply the updates. However, if the Inventory module is currently processing, it causes the Client to become unresponsive even though it continues to send keep alive messages to the Switch. This applies to all 1E Client (including the non-windows platforms).	which use the Agent.CheckForUpdates method.
Responses Chart view only displays as text.	Some instructions (e.g. What BIOS firmware is installed?) are authored so the responses are displayed as Chart view, but on Firefox this view may not be displayed correctly.	Use alternative web browser.
Instructions that have aggregation on floating point or DateTime values fail to return results.	When the instruction is run in TIMS, the raw values are shown correctly, but when uploaded to Tachyon the aggregation fails to sum the values, returning an empty row set. Aggregation on DateTime values where the input data looks like this also fail to return results: 01/17/2018 16:32:47.648	None.

Issue	Description	Workaround
Explorer response displays error 'Could not deserialize JSON into DataTable'.	If an instruction includes the Scripting.Run method running a PowerShell script, and the script fails or generates error output that is sent to standard out, this will be considered part of the output of the script, and cannot be converted into the format (JSON schema) expected for the response.	Please ensure the PowerShell script is written to either output data according to the JSON schema specified in the instruction definition, or exit with an exitcode, and not a mixture.
1E Client installed on macOS - Big Sur "(1) Operation not permitted" errors from FindFileByName	Apple have clamped down on free access to the filesystem(s) in recent versions of macOS, and granting the "full disk access" from System Preferences --> Security & Privacy --> Privacy seems to be limited to applications, not individual executables such as the 1E.Client daemon and the 1E Client installation cannot set up the permissions.	None.

1.9.4.3.3 Patch Success application

Issue	Description	Workaround
Patch Success instructions that are using SCCM as a patch source log remote	1E Client logs creating a remote connection to Microsoft WSUS Server with a CheckOnline property set to false to indicate that 1E Client is using Windows Update Agent	The log message should be interpreted as 1E Client performing a query against a Windows

Issue	Description	Workaround
connections to Microsoft WSUS server.	local cache to retrieve data. This log can easily be interpreted as an attempt to connect to internet to collect data, which is not what the 1E Client is doing. Instead the instructions are collecting additional information from WUA local cache in order to supplement missing data collected by ConfigMgr client and will therefore be regularly logged during normal operation of Patch Success instructions. ConfigMgr client omits Patch IDs for all installed patches and therefore require additional information to be collected from a different source to match missing Patch IDs.	Update Agent local cache.
Deploying a missing patch directly via the internet returns the following error "overallDownloadResult is Null"	If a missing patch is deployed onto a target device, but the Windows Update service is not running or stopped, the 1E Client will return error: "overallDownloadResult is Null" In later versions of the 1E Client, the returned error will be: "End search for updates because: (0x8024001E). Operation did not complete because the service system was being shutdown"	Ensure the Windows Update service is running before attempting to re-deploy the patch.
Deploying a missing patch to 1E Client may result with it logging "WARN - No updates to install" and the patch gets updated as "Not applicable"	If a missing patch is deployed, but there is no associated deployment package in ConfigMgr then the response will be returned as "Not applicable".	Ensure the patch has been packaged and deployed through ConfigMgr so that it is available to the CM clients before attempting to re-deploy the patch.

Issue	Description	Workaround
Patch Success charts and tables have inconsistent data.	Tachyon sync schedule process leads to new patch data being replaced with stale patch data when BI ETL is run. When syncs are scheduled in the recommended way then the nightly BI ETL will replace all device and patch data in the BI star schema and cube with potentially stale SLA inventory data.	Execute a new Tachyon sync, once the expected devices have reported in patch data (check Tachyon Explorer → Instructions → History → "Returns Patch status for...") then execute a new BI ETL. This will result in up to date device and patch data in both the BI star schema and the cube.
Deploying a patch directly via the internet may return failure "End search for updates failed because: Not enough storage is available to complete this operation" and WindowsUpdate.log will show an associated error: "WARNING: WU client failed Searching for update with error 0x8007000e"	On Windows 7 / Server 2008 R2 there is a known issue with the Windows Update that causes it to return an "8007000E" error message. This may be seen if in the Patch Success page, a patch is deployed with the check box enabled for "Enable patches to be downloaded onto devices directly from the internet instead of the default (SCCM)".	Please ensure the update that contains the improvements to Windows Update Client is applied in order to allow for further Patch Success deployments to function correctly.
History page should be hidden when user only has Patch success viewer permissions	History page is displayed when user has no access to Patch Success instructions.	None
Patch Success will show all devices irrespective of the permissions on management groups.	BI cube does not have permissions model required to filter the management groups correctly. In addition, permissions model only assigns management groups to instructions therefore will not cater for BI cube permissions.	None

1.9.4.3.4 Guaranteed State application

Issue	Description	Workaround
Any pending changes in Guaranteed State and/or Experience applications that are deployed during upgrade process from Tachyon platform v5.1 to v5.2 or v8.0. This is also true if there is an already deployed unlicensed rule/recondition/check or fix.	Tachyon Setup runs a post installation action to automatically deploy all policies and event subscriptions.	Ensure any pending deployment changes under review are either deployed prior to upgrade process is initiated or respective rule/policy/Survey should be marked as disabled to prevent deployment during upgrade process
Guaranteed State Overview pages show incorrect devices when Policy with no Rules have been assigned to a Management Group.	On the Guaranteed State Overview page, the Online, Online last 7 days and Last seen per Criticality Level charts all show incorrect counts when a Policy is assigned to a Management Group, but no Rules have been assigned yet. This will display correct values once Rules are assigned and devices have responded to the events.	None
Opening an instruction or fragment that has been exported using the Consumer API displays the following message when viewed in TIMS: "This instruction definition was signed by CN=Tachyon Explorer Instructions but the content has been tampered with.	An instruction exported through Postman can generate file with whitespace differences and file size between the original file which is not accepted by TIMS as it's considered to be tampered.	Use alternative API tools (e.g Fiddler).
"Ensure Nomad can communicate through the Windows Firewall" remediation is	"Ensure Nomad can communicate through the Windows Firewall" remediation is being carried out when there is a firewall	None

Issue	Description	Workaround
being executed even when firewall is disabled from the GPO.	policy that has been disabled through group policy. This means that when firewall policy has been disabled explicitly, instead of ignoring the fix, the firewall is set to enabled and the firewall exceptions are set for Nomad.	
On a ConfigMgr Distribution Point, the Rule to "Check the Nomad has a virtual directory on ConfigMgr distribution points to perform LSZ generation" always passes even though a failure reason may be returned in the Data field.	The check fragment should verify that the LSZFILES website setup by Nomad on a DP has certain characteristics, but even when errors are found the check status is "Passed". The logic in the PowerShell parts of the fragments uses a $errorOccurred variable to set the exit code, but this variable is initialized to $false and then never changed even when an error is detected. e.g Data field returns: "Windows authentication not enabled. Require SSL flag is not disabled. Directory browsing not correctly set."	None
1E Client logs several unsuccessful remediation attempts within a 24hr period.	There is currently no longer a cap on the number of time a remediation step can occur on a machine within 24hrs. This differs from 1E Client Health where after 3 failures to remediate an issue, further remediation would not occur until 24hrs have passed.	None

1.9.4.3.5 Experience application

Issue	Description	Workaround
Experience - Software > Duplicate row for a product is displayed on Software screen when architecture column is added from column picker following an upgrade from 8.0.	The architecture column did not exist in pre-v8.0 SoftwarePerformance table. When upgraded to v8.0 or later, architecture column has been introduced as nullable column to accommodate pre-upgrade data. It will be set as null for all existing data from before the upgrade. Gradually as new experience performance data comes in post upgrade architecture will now be included. This means that for 90 days after the upgrade aggregations within the Software screen of experience can have two entries, one with an unknown architecture and one with a valid architecture.	The existing data will correct itself 90 days after the upgrade. If you need to fix this issue in the meantime, a maintenance Stored Procedure for the Experience database can be obtained from 1E. The SP will update the null architecture for pre-upgrade software performance rows by using post-upgrade rows to identify and correct old software architectures.
Experience Analytics - Tiles have an additional text "score" added to them when view between saved preset is changed.	When user changes the view between Default and user saved presets; an additional text "Score" gets added to the tile title, e.g: StabilityScore, ResponsivenessScore.	Refreshing the browser removes the additional text "Score".
A survey that has been dismissed by the user will reappear if it is disabled then re-enabled.	If a user engagement (survey or announcement) is disabled then re-enabled then it appears to the 1E Client as a completely new engagement and the previous state (dismissed, in this case) is lost.	Do not disable an engagement then re-enable it! In effect this creates a new instance, at least in terms of data sent to the 1E Client.
Application Interaction table can contain processes reported as *.tmp files where the	The Application Interaction view is reached by launching the Experience > Devices and viewing the Device hyperlink.	None

Issue	Description	Workaround
Product and Version columns are blank.	When viewing the Experience > Application Interaction tab, the *.tmp records are also displayed which do not have associated Product or Version details. These should be filtered out.	
The Survey response page displays responses from a device that do not match the score seen when viewing the Device details due to duplicate survey names	When a survey is deleted, the old responses do not get removed and current behavior causes issues when a new survey is created with the same name. The calculations for sentiment score includes responses from the old survey where the names match.	Where this occurs, recreate the survey using a unique name that has not been previously used. If you are affected by this, please contact 1E Support for additional help.
When doing a search on Survey page, the page size resets back to the default (50)	On the Experience > Survey page, the page size can be increased to to display 100 or 250 rows. However, when a search is performed on the page, the page size jumps back to the default 50.	None
Survey reports always shows Applicable devices as 100%	Even when a general purpose survey has been assigned to a Management Group, the filter for survey reports always shows 100% for Applicable devices and not consistent with the devices assigned to the selected Management Group	None

1.9.4.3.6 Inventory

Issue	Description	Workaround
No issues currently known.		

1.9.4.3.7 1E Catalog

Issues	Notes	Workaround
Any Title of a Vendor with two different colloquial versions should not be allowed when other fields are same.	There may be instances where a product has different colloquial versions for the same version such as Microsoft Excel 15.0 with a 2013 colloquial version and Microsoft Excel 15.0 with a 2015 colloquial version.	None
Timeout is displayed during updates and the Catalog UI is not available during that time.	The Catalog Web UI is unavailable when it's downloading data from the 1E Cloud Catalog.	If you try again after some time the Catalog Web UI should work.
The installer creates the database when you cancel the process in the setup wizard.	If you decide to abort the installation after providing the name of the Catalog database, the installer creates the database despite the cancellation.	None
Pressing Cancel when prompted for your credentials on the Web UI Admin page displays an error.	If you click Cancel on the Web UI Admin page when prompted for your credentials, an HTTP error 401.1 – Unauthorized error is displayed.	None
Unable to create new versions with more than 4-part numbers in the Catalog Web UI.	If you attempt to curate a version with more than 4-parts (for example, 1.2.0.1.2) in the Catalog Web UI, it displays the error – The version is not in the correct format.	None
The Catalog Web UI does not report if the Catalog service is unavailable.	During a downtime, if you try to navigate through Catalog Web UI, it becomes unresponsive but does not display a message that the service is unavailable.	None
The Catalog Web UI displays an incorrect message if you leave the page and return to it.	During a resynchronization event, if you navigate to a different page and immediately return to the Admin page, it displays a Resync completed Successfully message, even though it	None

Issues	Notes	Workaround
	has not. The resynchronization event keeps running in the background until it successfully completes.	
Best Match API times out when indexes are being compiled.	If the Best Match API is called while the indexes are being compiled, it times-out. However, the second call will succeed.	The second call will succeed.
Unable to cancel the installer while it is migrating to a new version.	During a migration to a newer version of the Catalog, pressing Cancel does not stop or roll back the installation – it continues uninterrupted.	None
The number of records pulled during a 1E Cloud Catalog synchronization event is not known at the start of it.	When the Catalog synchronization event starts, you're not able to discover the total number of records that will be inserted into the database. The logs register the number of records it inserts successfully but you would not know the total records to be inserted beforehand.	None
Clicking Back to list in Catalog Web UI navigates to the Home page instead of the previous page.	If you filter on a vendor and go to any next page to set license rules for that vendor, and then click Back to list, it takes you back to the Home page and does not retain the filter applied in the previous step.	None
The unattended install does not check Catalog prerequisites.	The installation will fail if requirements are not met.	None
Indexing fails when if the rebuild index and incremental index events are run simultaneously.	If a rebuild index and incremental index conflict, indexing will not complete successfully.	It will complete successfully the next time the incremental index event runs.

Issues	Notes	Workaround
Error when user modifies an edition from Catalog Web UI.	If you attempt to modify the edition of a product then "An error has occurred while processing your request" message is displayed.	None
Log files and other folders not deleted from program data folder after uninstalling catalog.	If the Catalog is uninstalled, its logs folder structure is not deleted from the Program Data folder.	None
On the Catalog Web UI new bundles screen selection of multiple dropboxes gives wrong filtered record.	On Catalog Web UI new bundles screen, selection of multiple dropboxes returns an incorrect filtered record.	None
File Version filter on Catalog Web UI does not work.	File Version on product file screen filter is not working.	None
A prompt to reboot the server is displayed when you upgrade or uninstall the product.	There may be instances where you are prompted to restart the server in order to complete the installation.	Restart the server.
Installer unable to connect to the database when you run a repair on the Catalog from Programs and Features.	In a TLS environment, if you opt to repair the Catalog from Programs and Features by choosing the Repair option, you will be prompted with this error: *Error 27502: Could not connect to Microsoft SQL Server ... SSL Security error. (18)*	Uninstall and reinstall the Catalog
Lucene index folder is not deleted on uninstalling catalog.	On uninstalling the catalog, Index directory from program data is not getting deleted.	None
Wrong Surrogate key mapping is formed in case product is deleted from client side and upgrade is performed	On upgrading the catalog deleted site define entries are not getting persists	None

Issues	Notes	Workaround
Installer should have a check for ASP.NET as Catalog is not failing when "ASP.NET" is not installed	The Prerequisite check of installer does not check for ASP.NET	None
Re-Sync: Timeout error is observed while getting site defined on one client machine while Re-Sync with another client machine is in progress	Re-Sync is successful on one of the client and error is observed on second client while it's getting the site defined entries. Following is observed in the logs:- *The timeout period elapsed prior to completion of the operation or the server is not responding.*	None
Error message is observed in logs while indexes are recreated after sync in edge case installation scenario	Install catalog through unified tachyon installer, after successful installation, uninstall the catalog. If user Installs the catalog stand-alone start the sync then its IIS services should shift into different pool due to which indexes will break.	None
Catalog 2.0 error '500 Internal server Error)Index is getting failed' in the 'Catalog.UpdateService.log' when the 1E Catalog service account uses domain user account. (Highly Intermittent).	When the 1E Catalog service account is using a domain user account rather than Network Service account, the index is getting failed after sync is completed.	This issue does not cause functional issues and can be safely ignored.
Catalog 2.0 if an upgrade fails, the 1E Catalog installer will roll back the installation and remove any customizations in the 'web.config' and 'CatalogUpdateService.exe.config' files.	If an upgrade fails, the 1E Catalog installer will roll back the installation and remove any customizations in the 'web.config' and 'CatalogUpdateService.exe.config' files.	This is resolved by backing up the configuration files prior of upgrading as covered in the 'installation and upgrades' section of the documentation.

1.9.4.3.8 1E Tachyon Toolkit

Issue	Description	Workaround
1E Tachyon Toolkit extensions are not visible on the CM Console for both Devices and Device Collections	In the past, any installed extension was allowed to be displayed. Microsoft has changed the way that the Console Extensions are allowed to be displayed within the ConfigMgr Console and if in the Administration -> Site Configuration -> Sites -> Hierarchy Settings from the ribbon. and under the General tab: "Only allow console extensions that are approved for the hierarchy" is selected it will prevent the Tachyon right-click actions and the Instruction Runner from becoming available.	Ensure the "Only allow console extensions that are approved for the hierarchy" is not selected in the Hierarchy Settings Properties. Please contact 1E Support for additional help where the Tachyon right-click extensions only appear for the Devices and not Device collections.
Configuration Manager console shows duplicate right-click options for Tachyon.	Tachyon shows multiple times in a collection property when the collection belongs to nested folders in the Configuration Manager console.	Restart the Configuration Manager console.

1.9.5 Server installation issues

Troubleshooting common issues that you may be having with implementation.

If your problem is not identified on this page, then please review Installing Tachyon Server.

Please ensure you have run through the steps in the Verifying page before making any configuration changes. Several verification steps refer back to this page.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

1.9.5.1 Unable to install

If for any reason you are unable to install it, then please review the Preparation page. You should also re-run Tachyon Server post-installation tasks.

When installing interactively, please confirm you are logged on using an account that has local Administrator rights.

For Tachyon Servers, you can troubleshoot installation issues by reviewing the installation log file that is created in the same directory as **Tachyon.Setup.exe** after Tachyon Setup has run the installer.

For clients, you can troubleshoot installation issues by reviewing the installation log file. If you are having issues with 1E Client, please refer to Troubleshooting.

1.9.5.2 Verify the Tachyon Server certificate bindings

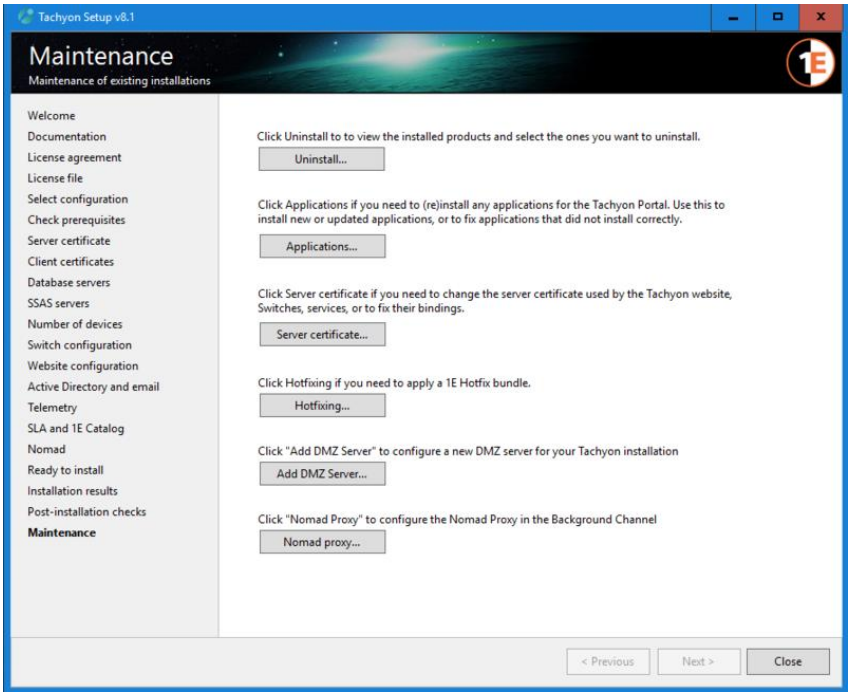
The server installer detects which Web Server certificate to use by matching the certificate's **Subject Alternative Name** (DNS) with the **HTTPS Host header** supplied during installation. As discussed in Certificate requirements, the **Subject Alternative Name** must include the DNS Alias FQDN of the server of type DNS Name, for example, **DNS=TACHYON.ACME.LOCAL**

To check the HTTPS binding of the website use the following steps. These steps can also be used to change the certificate if it has expired, or a new certificate needs to be used.

1. Logon to the Tachyon Server using the Tachyon installation account or user with local administrator rights.

2. Start Tachyon Setup and navigate directly to the Maintenance screen.

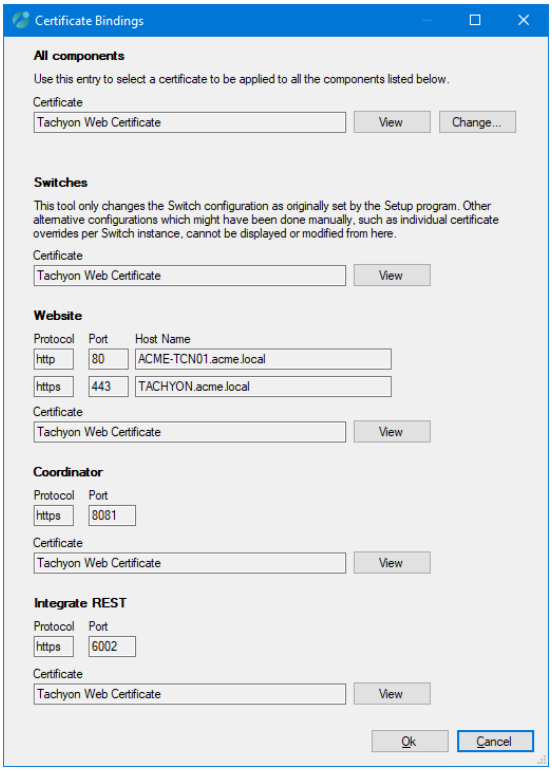
3. Click on **Server certificate...**



4. Review the **Certificate Bindings** screen.

   It shows the **thumbprint** of the certificate used by each of the bindings required by Tachyon, or the **Friendly name** if one has been used, as shown in the picture.

   If the bindings are using different certificates, then this may be deliberate, and you should find out why.

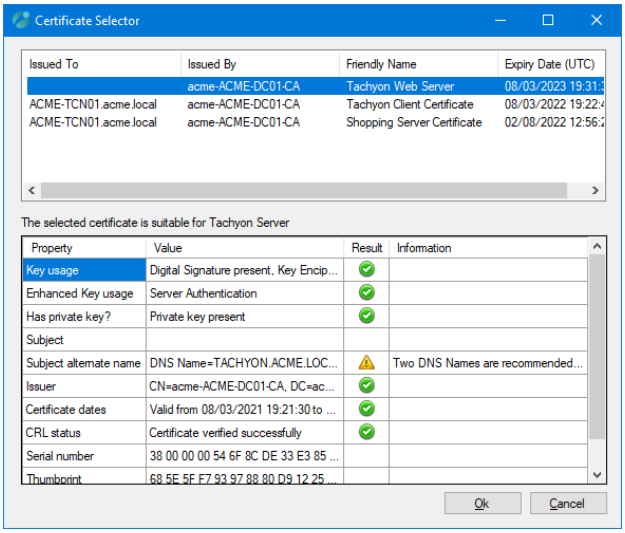


5. To view the details of a certificate, click **View**

6. To change the certificate, click **Change...**

   This will start the **Certificate Selector** similar to the Server certificate screen.

   This will let you select a certificate and apply it to all the bindings.



Note

If for any reason you need to apply a different certificate to each binding, then please contact 1E for details of how to configure them.

Note

The Coordinator may be using port 8080 if you have upgraded from Tachyon 3.3.

7. In the **Certificate Selector** screen, select a certificate, and the Selector will evaluate its suitability.

   Click **OK** when you have selected a suitable certificate.

   This will return you to the **Certificate Bindings** screen.

8. In the **Certificate Bindings** screen, click **OK** to save the new bindings configuration.

   You do not require an IIS reset.

1.9.5.2.1 Tachyon Switch certificate issues

The Switch will start and then stop if there is an issue with its certificate.

Check the following log files for errors. The default location for Tachyon Server logs is the **%AllUsersProfile%\1E\Tachyon** folder on the server where Tachyon Server is installed.

- Tachyon.Switch.Host.log
- Tachyon.Switch.log

1.9.5.3 Verify IIS Configuration

For minimum requirements for IIS see Windows Server roles and features.

To review the configuration:

1. Start PowerShell with Admin privileges.
2. Type **Get-WindowsFeature** and wait for the listing to complete. It can be useful to pipe this output to a file.
3. Check the results and confirm that each of the minimum requirements is listed with an [X].
4. Alternatively, run Tachyon Setup and run the Post-installation check.

The table below shows the IIS web applications used by Tachyon, and the IIS features that affect how users and clients connect. For more detail about these IIS web applications, please refer to Tachyon Single-Server system.

IIS web application	Server	Authentication Enabled	SSL Settings	IP Address and Domain Restrictions
Admin	Master	Windows	Not configured	Not configured
Background	Response & DMZ	Anonymous and Windows	Require SSL (accept)	Not configured

IIS web application	Server	Authentication Enabled	SSL Settings	IP Address and Domain Restrictions
		Anonymous is used by clients, Windows is used by Consumer API		
CatalogWeb	Master	Anonymous and Windows	Not configured	Not configured
Consumer	Master	Windows Basic Authentication must also be enabled if using 1E Core (for ServiceNow integration)	Require SSL (ignore)	Not configured
ContentDistribution	Master	Anonymous and Windows	Not configured	Not configured
Core	Response & DMZ	Anonymous	Require SSL (ignore)	Local IP addresses, plus the following added manually if used: • remote Master stack server • remote DMZ Server
CoreExternal	Master	Anonymous	Not configured	Not configured
Experience	Master	Windows Basic Authentication must also be enabled if using 1E Core (for ServiceNow integration)	Require SSL (ignore)	Not configured
Platform	Master	Windows	Not configured	Not configured

IIS web application	Server	Authentication Enabled	SSL Settings	IP Address and Domain Restrictions
Tachyon	Master	Windows	Require SSL (ignore)	Not configured

Note

The **IP Address and Domain Restrictions** feature is described in more detail below. Steps for verifying its configuration are provided in Verify IIS security of the Tachyon website.

1.9.5.4 IP Address and Domain Restrictions

The Tachyon **Core** web application (Response Stack) uses the IIS feature **IP Address and Domain Restrictions** to restrict access so that connections are only allowed from specific IP addresses. Other web applications, including Tachyon, Background, and CoreExternal, are not configured, and therefore they allow all local and remote connections.

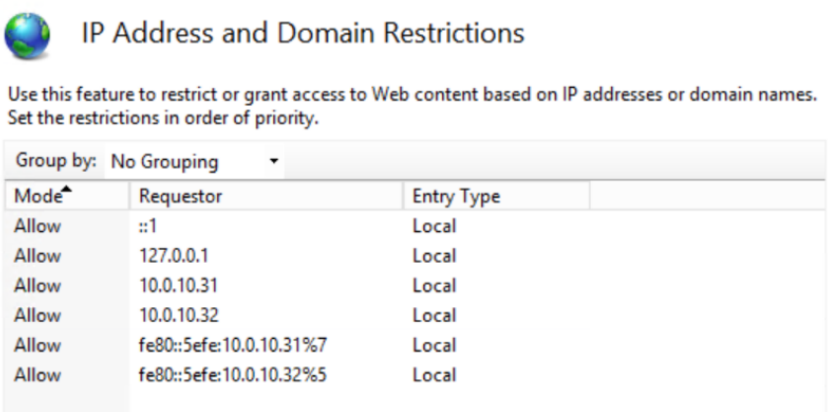
The list of IPv4 and IPv6 addresses is updated by Tachyon Setup during installation (and upgrade) of the following configurations.

Configuration choice in Tachyon Setup	What Tachyon Setup (or TachyonServer installer) does during installation/upgrade
All components on a single server	Adds all the IP Addresses of the local server during installation of the server. This allows the Core to receive connections from local Switches and components of the local Master Server.
Response Stack	Adds all the IP Addresses of the local Response Server and the remote Master Server that are resolvable from the local server during installation of the Response Stack. This allows the Core to receive connections from local Switches and components on the remote Master Server.
DMZ Server	Adds the IP Addresses of the DMZ Server that are resolvable from the local Response Server (Core) during the first phase of DMZ Server setup. This allows the Core to receive connections from Switches on the remote DMZ Server.

Below is an example of what the configuration looks like for a Tachyon Server which has a two network adapters, one for a Switch, the other for SQL traffic, with IPv4 enabled and IPv6 disabled on each interface. The IPv6 addresses shown are isatap addresses, which is enabled by default on the server.

- **::1** is the IPv6 loopback address
- **127.0.0.1** is the IPv4 loopback address

- **10.0.10.31** is the IPv4 address for network interface #7
- **10.0.10.32** is the IPv4 address for network interface #5
- **fe80::5efe:10.0.10.31%7** is the isatap address for network interface #7
- **fe80::5efe:10.0.10.32%5** is the isatap address for network interface #5



1.9.5.4.1 When to modify IP Address and Domain Restrictions

The Tachyon installer uses the PowerShell cmdlet **Get-NetIPAddress** to list all the IPv4 and IPv6 Addresses and adds them all to the restricted web applications during installation or upgrade. You must modify the configuration of **IP Address and Domain Restrictions** if the network interface configuration has changed on a Tachyon Server, for example if an IP Address is changed, or a new network interface is installed.

You will also need to modify the configuration of the Response Stack's Core web application to manually add the internal-facing IP Address of a DMZ Server.

1.9.5.4.2 Changing the configuration of Network Adapters

If the configuration of any network adapters is changed, then the Tachyon website configuration for **IP Address and Domain Restrictions** may need to be updated with the server's new IPv4 and IPv6 addresses. Failure to update the configuration after a network change will cause issues between the Switch and the Core and prevent the Tachyon Server from functioning.

Use the PowerShell cmdlet **Get-NetIPAddress** to determine the current IP Addresses, and if necessary update the configuration of the Core web application.

The following **AddIpSec.ps1** script can be used to refresh local IP Addresses. It does *not* remove old, unwanted, or remote IP Addresses. Nor does it add addresses for remote Switches, which would need to be added manually.

```
# Adds local IPv4, v6 and loopback addresses to the IP Address and Domain Restr
ictions of the specified web applications. It does not delete any addresses
# Remote addresses must be manually configured.
# It only adds addresses if the specified web application exists.

Import-Module "WebAdministration"
```

```
Function AddIpSec() {
    param(
        [Parameter(Mandatory=$true)][string]$SiteName,
        [Parameter(Mandatory=$true)][string]$AppName
    )

    Write-Output "Adding IP restrictions to $AppName"

    $fullAppPath = "IIS:\Sites\" + $SiteName + "\" + $AppName

    if (Test-Path -Path $fullAppPath) {
        $appPath = $SiteName + "/" + $AppName
        $ipAddreses = Get-NetIPAddress | sort IpAddress | foreach { $_.IPAddres
s }
        Set-WebConfigurationProperty /system.webserver/security/ipsecurity -Nam
e allowUnlisted -Value "false" -Location $appPath -PSPath IIS:\
        foreach ($ipAddress in $ipAddreses)
        {
            $existingRestriction = Get-WebConfiguration system.webServer/Securi
ty/ipSecurity/add -Location $appPath -PSPath IIS:\ | where { $_.ipAddress -eq $
ipAddress }
            if (-not ($existingRestriction)) {
                Add-WebConfiguration system.webServer/security/ipSecurity -Loca
tion $appPath -Value @{ipAddress="$ipAddress";allowed="true"} -PSPath IIS:\
                Write-Output "Allowed restriction on IP $ipAddress added to $Ap
pName"
            }
            else {
                Write-Output "Restriction on IP $ipAddress already exists in $A
ppName. So skipping."
            }
        }
    }
    else {
        Write-Output "$AppName web application does not exist"
    }
}

$siteName = "Tachyon"

AddIpSec -SiteName $siteName -AppName "Core"
AddIpSec -SiteName $siteName -AppName "WelcomeCore"
```

1.9.5.4.3 Remote Access to the Core

A post-installation test is to confirm web browsers do not have remote access to the Core. A remote web browser is not expected to be able to access the Core web application, which should return a 'Server Error 403 - Forbidden: Access is denied'. If you are able to access these web applications from a remote computer then it is probable that the **IP Address and Domain Restrictions** feature is not installed.

Use the following steps to check if the **IP Address and Domain Restrictions** feature is installed and to install it.

1. Logon to the Tachyon Server using an account that has administrator privileges.
2. Start Powershell with Admin privileges.
3. Type **Get-WindowsFeature** and wait for the listing to complete.
4. Check to see if Web Server Security feature **IP Address and Domain Restrictions** is installed or not.
5. If installed, then Verify IIS Configuration to determine if there may be another reason for the issue.
6. If not installed, then:
    a. type **Install-WindowsFeature Web-IP-Security** and wait for the feature installation to complete (a reboot or IIS restart is not required).
    b. after the feature installation, the Core web application will have its configuration settings restored to the settings configured at the time that Tachyon was installed.
7. Use the PowerShell cmdlet **Get-NetIPAddress** to determine the current IP Addresses, and if necessary update the configuration for the Core web application.
8. Repeat the Verifying steps.

1.9.5.5 401 Not Authorized

There are a number of reasons why you may see this error when you browse to the Tachyon portal for the first time. You may also see errors saying Not Authorized or Unauthorized in server log files.

The usual reason for this is your server is configured to use Kerberos authentication and the HTTP class SPN is not registered in AD for the DNS Name used to access the server.

Service Principal Names (SPN) are attributes of AD accounts. A domain administrator will need to create an HTTP class SPN for the web server service account, by using one of the following methods:

- By editing the ServicePrincipalName attribute of the web server's computer account
- Using the following SETSPN commands, substituting your DNS Name, server, and service account:

```
setspn -l ACME\ACME-TCN01$
setspn -s http/acme-tcn01.acme.local ACME\ACME-TCN01$
setspn -s http/tachyon.acme.local ACME\ACME-TCN01$
```

Use each command as follows:

1. List existing SPNs for the service account. Run this to record details before you request for any new SPN(s) to be created. Re-run this after creation, ensuring you wait sufficient time for AD replication to occur.
2. Use this if **tachyon.acme.local** is a CNAME record and its (A) Host record is **acme-tcn01.acme.local**
3. Use this if **tachyon.acme.local** is a (A) Host record.

The above example assumes the:

- Service account for all Tachyon web application pools is Network Service
- Tachyon server name is **ACME-TCN01** with a computer account in the **ACME** domain, which means the service account is **ACME\ACME-TCN01$**
- DNS Name for the server is **tachyon.acme.local**.

Tip

If in doubt, it does no harm to create an SPN for each DNS Name used to access the Tachyon Server, including its CNAMEs and (A) Host records using: *setspn -s http/<DNS Name> ACME\ACME-TCN01$*

To determine which type of record a DNS Name is, run the following command:

```
nslookup tachyon.acme.local
```

- If the command returns Name: **acme-tcn01.acme.local** and alias **tachyon.acme.local** then tachyon.acme.local is a CNAME record.
- If the command returns Name: **tachyon.acme.local** and no aliases then tachyon.acme.local is a (A) Host record.

More complex scenarios can be configured which requires in-depth knowledge of IIS, SPN, and DNS configuration and are beyond the scope of this documentation.

1.9.5.6 403 Access Denied

You may see this error when doing post-installation tests (refer to Verifying). When you use a browser to open an application in the Tachyon portal, you will see **Server Error 403 - Forbidden: 'Access denied'** if the internal account used by the Application Pool does not have read access to the Tachyon web application folders. This can happen if Tachyon is installed in a non-default location and the NTFS permissions on the installation folder are not correct. To remedy the issue, you should review and correct NTFS permissions as described in Services and NTFS Security.

Warning

Do not enable Anonymous authentication to fix this type of issue.

1.9.5.7 404 File not found

You may see this error when doing post-installation verification tests, (refer to Verifying).

When you use a browser to open an application in the Tachyon portal, and you see **Server Error 404 - 'File not found'** the reason is probably that you have not installed the IIS features **Web-ASP** and/or **Web-Asp-Net45**.

Use the following steps to check if the **Web-ASP** and/or **Web-Asp-Net45** features are installed and to install them.

1. Logon to the Tachyon Server using an account that has server administrator privileges.
2. Start Powershell with Admin privileges.

3. Type **Get-WindowsFeature** and wait for the listing to complete.
4. Check to see if the Web Server Application Development feature **Web-ASP** and/or **Web-Asp-Net45** is installed or not.
5. If not installed:
    a. Type **Install-WindowsFeature Web-ASP, Web-Asp-Net45** and wait for the feature installation to complete (a reboot or IIS restart is not required).
    b. Perform an IIS Reset.
6. If installed, then Verify IIS Configuration to determine if there may be another reason for the issue.
7. Repeat the Verifying steps.

1.9.6 Client issues

For troubleshooting common issues that you may be having with the installation and configuration of the client, refer to Client issues.

1.10Extending Tachyon

Information about tools used to extend Tachyon beyond Tachyon Explorer.

1.10.1 The 1E Tachyon Toolkit

What's included in 1E Tachyon Toolkit, and how to install it.

The kit includes:

- **1E Tachyon Toolkit** - Run Instruction (command-line tool)
- **TachyonConfigMgr UI Extensions** - only installed if the installer detects the Configuration Manager console on the local device.

1.10.1.1 1E Tachyon Toolkit requirements

Requirements for installing the 1E Tachyon Toolkit components.

1.10.1.1.1 Toolkit supported platforms

Category	Product	Notes
Client OS	• Windows Server 2022 • Windows	For OS supported by Configuration Manager Current Branch (CB) see https://technet.microsoft.com/en-us/library/mt589499.aspx).

Category	Product	Notes
	Server 2019 • Windows Server 2016 • Windows 10 CB 21H2 • Windows 11 CB 21H2 • Windows 10 CB 21H1 • Windows 10 CB 20H2	
Microsoft Endpoint Configuration Manager console	• SCCM CB 2203 • SCCM CB 2111 • SCCM CB 2107 • SCCM CB 2103	These are the versions of Configuration Manager that 1E has tested and therefore support, but later versions are assumed to work also. Please see Preparing for the Tachyon extensions for the Configuration Manager Console..

Category	Product	Notes
	• SCCM CB 2010	

1.10.1.1.2 Installing the 1E Tachyon Toolkit

To install the toolkit the installation account must have local Administrator rights on the device.

Toolkit component	Requirements for installation	Requirements for use
Tachyon ConfigMgr UI Extensions	Local administrator on the Windows computer. Configuration Manager Console already installed. The option to install the Tachyon ConfigMgr UI Extensions is available only if the toolkit installer detects the Configuration Manager console is installed on the local computer. The Configuration Manager Console should be closed when installing or uninstalling. To install the Nomad Download Pause feature aspect of the Tachyon ConfigMgr UI Extensions the installation account must be a full Configuration Manager administrator. For more details, please refer to Nomad Download Pause.	Configuration Manager Administrative User. Tachyon user with actioner permission on the instructions.
Tachyon Run Instruction command-line utility	Local administrator on the Windows Computer.	Tachyon user with permission to run instructions (questioner and/or actioner).

1.10.1.2 Preparing for the Tachyon extensions for the Configuration Manager Console.

A step-by-step guide to configuring prerequisites required for the Tachyon extensions for the Configuration Manager Console., before /document/preview/616279#UUID-e8f99f2a-bb21-f1e3-de43-ec7231143bee.

1.10.1.2.1 Requirements

1.10.1.2.1.1 Supported Platforms

Supported versions of client OS and Configuration Manager that are supported by the Tachyon Configuration Manager Console extensions are:

- Windows Server 2022
- Windows Server 2019
- Windows Server 2016
- Windows 10 CB 21H2
- Windows 11 CB 21H2
- Windows 10 CB 21H1
- Windows 10 CB 20H2
- SCCM CB 2203
- SCCM CB 2111
- SCCM CB 2107
- SCCM CB 2103
- SCCM CB 2010

1.10.1.2.1.2 Tachyon user accounts

To prepare Tachyon for using the Configuration Manager Console extensions, you will need a Tachyon user account that has at the **Full Administrator** role.

To use the Tachyon Configuration Manager Console extensions, you must have a Tachyon user account and Configuration Manager administrative user account. Guidance for this is given below in User roles.

1.10.1.2.2 User roles

The two systems, Configuration Manager and Tachyon, both use RBAC to define the capabilities for their corresponding users. To enable Tachyon instructions to be run from Configuration Manager, the Configuration Manager Console users must also have a presence defined in Tachyon. This presence can take many forms, for example you could define a user in Tachyon from an AD group and then add all your Configuration Manager users to that group - and manage the Tachyon roles for the users as a group, or you could define individual users in Tachyon for each Configuration Manager user - and manage the Tachyon roles on a per-user basis. You will likely have determined roles for your Configuration Manager users based on their function within the organization, the following heading provides a rough guide to matching Tachyon and Configuration Manager roles.

1.10.1.2.2.1 A rough comparison of the Tachyon User Roles and Configuration Manager Roles

The Configuration Manager Console may be installed and used by any user that is configured as an Administrative User. There are a number of Security Roles that may be given to the user and not all of these roles are permitted to use Configuration Manager to make changes that affect the network. When configuring any corresponding Tachyon users, you should take this into account when assigning the Tachyon Roles. For example, it would be unusual for a user with just the **Read-only Analyst** role in Configuration Manager to be granted the **All Instructions Actioner** role in Tachyon and therefore be able to perform Tachyon actions on all the devices in a particular collection but not be able to use Configuration Manager to perform any other tasks. There is no one-to-one mapping of the Tachyon and Configuration Manager roles, but the following table provides some rough comparisons between the two.

Tachyon Role	Configuration Manager Role
Viewer	Read-only Analyst.
Questioner	Read-only Analyst.
Actioner	Examples of equivalent Configuration Manager roles could be: • Application Deployment Administrator • Remote Tools Operator • Software Update Manager.
Approver	Any Configuration Manager Security Role that would be appropriate for the Approver to approve actions run from Configuration Manager.

1.10.1.2.3 Setting up Tachyon for Configuration Manager integration

The following instructions show how to configure the integration between Configuration Manager and Tachyon after the Tachyon extensions for the Configuration Manager Console. have been installed.

The animation below (available soon) shows an end-to-end example of configuring Tachyon to support the Tachyon extensions for the Configuration Manager Console.. This example generally uses the following steps. We'll highlight in the steps where optional decisions have been taken in the example.

1.10.1.2.3.1 1. Add the Configuration Manager Console extensions consumers to Tachyon

To run any of the Client Actions using Tachyon menu items, other than the Instruction Runner, you will need to add (register) the **CmConsoleExtensions** consumer to Tachyon using the Explorer Administration Consumers page. The steps to take are:

1. Logon to the TachyonPortal using a user account with the **Full Administrator** role.

2. Navigate to the **Settings→Instructions→Consumers** page
3. Click the **Add** button to create a new consumer
4. The new consumer should be configured with the default values, except for the following:

Parameter	Value
Name	CmConsoleExtensions
Maximum simultaneous instructions	10
Enabled	Check this checkbox

5. Click the **Add** button to save the new consumer

To run the Instruction Runner, you will need to add the **RunInstructionUI** consumer to Tachyon using the Explorer Administration Consumers page. The steps to take this are:

1. Log on to the Explorer as an administrator with the **Consumer Administrators** role
2. Navigate to the **Administration Consumers** page
3. Click the **Add+** button to create a new consumer
4. The new consumer should be configured with the default values, except for the following:

Parameter	Value
Name	RunInstructionUI
Maximum simultaneous instructions	250
Enabled	Check this checkbox

5. Click the **Add** button to save the new consumer

1.10.1.2.3.2 2. Upload the Configuration Manager Console extensions product pack to Tachyon and create an instruction set

First upload the instructions:

1. Logon to the Tachyon Portal using a user account with the **Full Administrator** role.
2. Open the **Settings** application.
3. Navigate to the **Settings→Instructions→Instruction sets** page.
4. Click on the **Upload** button.
5. In the Open dialog navigate to the location of the **1E-ConfigMgrConsoleExtensions.zip** file.
6. Select **1E-ConfigMgrConsoleExtensions.zip** and click **Open**.

All the instructions contained in the zip file will initially be added to the default **Unassigned** instruction set. Instructions in the **Unassigned** instruction set cannot be used, so first you will need to create a new instruction set with the verification instructions.

1. Select the 16 instructions you want to add to the new set, by clicking the checkbox at the start of each instruction row in the list.
2. Click the **Add new set** button in the button panel to the right of the page.
3. In the **Add new instruction set** popup subsequently displayed, and type:
    a. **1E ConfigMgrConsoleExtensions** as the name.
    b. **Tachyon Configuration Manager console extensions** as the description.
4. Ensure that the **Include 16 selected instructions** checkbox is checked.
5. Click the **Add** button to add the new instruction set, with the selected instructions.

1.10.1.2.3.3 3. Enable Configuration Manager Console user access to Tachyon

You will need to ensure that the account you will be using to run the Configuration Manager Console is also represented in Tachyon with appropriate permissions.

The roles and permissions are described in the following table.

Role/Permission	Description
Viewer	This permission is required for any instruction set you want listed in the **Instruction Runner**. The **Viewer** permission is automatically included as part of the **Questioner** and **Actioner** permissions.
Questioner	This permission is required for any instruction set you want the Configuration Manager/Tachyon user to ask questions on using the **Instruction Runner**. The **Questioner** permission is automatically included as part of the **Actioner** permission.
Actioner	This permission is required for any instruction set you want the Configuration Manager/Tachyon user to run actions on using the **Instruction Runner**. If you are not using the **Instruction Runner** and want to run any of the other options directly accessible from the **Client Actions using Tachyon** sub-menu, you will need to set the **Actioner** permission on the **Microsoft Configuration Manager** instruction set for the Configuration Manager/Tachyon user.

In our example we use the following steps to define the user access for a specific Configuration Manager Console user, called **CMUser01**, to the **1E ConfigMgrConsoleExtensions** instruction set created earlier. This involves creating a custom role for that Instruction set and then assigning the custom role to the user. You

would normally use a domain security group for all of your Configuration Manager Console users, but here we are using a single user **CMUser01**.

To create a custom role:

1. Navigate to the **Settings**→**Permissions**→**Roles** page.
2. Click the **Add** button to start the add role process.
3. On the **New role** page set the name as **1E ConfigMgrConsoleExtensions** and click the **Save** button.
4. The new role will be added to the **Roles** page. Locate its entry and click on the link in the **Name** column for that row.
5. In the **Permissions** section:
    a. In the **Instruction Sets** list scroll down and select the **1E ConfigMgrConsoleExtensions** instruction set.
    b. Select the **Actioner** and **Questioner** checkboxes from the list of permissions.
    c. Click the **Save** button.
6. Navigate to the **Settings**→**Permissions**→**Assignments** page.
7. Select **1E ConfigMgrConsoleExtensions**.
8. Select the plus button and select the **CMUser01** and the **All Devices** management group, click **Save**.

1.10.1.2.4 Instructions

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
What is the health of the SCCM clients (checking inventory has run and policy has been evaluated in the last <numdays> days)?	Question	Evaluates the ConfigMgr Client health on the device over the last <numdays> days. The health will be reported as 'Poor' if it has not updated any one of	**1E-ConfigMgrConsoleExtensions-ClientHealth**	17

Trigger a ConfigMgr client software metering usage report cycle with a stagger of <limitSecs> seconds.	Action	Trigger a software metering usage report cycle. This trigger will be delayed by a number of seconds up to the specified stagger value	**1E-ConfigMgrConsoleExtensions-TriggerSoftwareMeteringUsageReportCycle**	14
Trigger a ConfigMgr client software update deployment evaluation cycle with a stagger of <limitSecs> seconds.	Action	Triggers a software update deployment evaluation cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerSoftwareUpdatesDeploymentEvaluationCycle**	14
Trigger a ConfigMgr client software update scan cycle with a stagger of	Action	Triggers a software update scan cycle. This trigger will be	**1E-ConfigMgrConsoleExtensions-TriggerSoftwareUpdatesScanCycle**	14

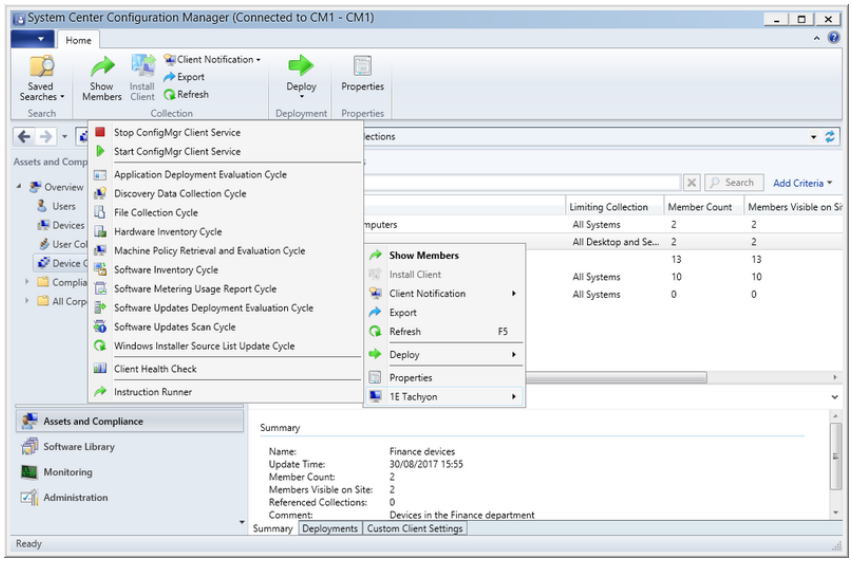
Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
<limitSecs> seconds.		delayed by a number of seconds up to the specified stagger value.		
Triggers a ConfigMgr client Windows installer source list update cycle with a stagger of <limitSecs> seconds.	Action	Triggers a Windows installer source list update cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerWindowsInstallerSourceListUpdateCycle**	14

1.10.2 Using Tachyon in Configuration Manager

The Configuration Manager Console extensions are an optional part of the 1E Tachyon Toolkit.

1.10.2.1 Options available on the Tachyon menu

Once the Tachyon extensions for the Configuration Manager Console. extensions have been installed, a **Tachyon** sub-menu gets added to the context menu for device collections or devices. The following picture shows the Tachyon sub-menu on the All Systems device collection context menu**All Systems** device collection.



Most of the menu items, with the exception of the last **Instruction Runner**, work by getting Tachyon to perform an action where the coverage is set to a list of the FQDN of client devices that are members of the selected device collection. The actions must be approved using Explorer before they are performed on the target client devices.

There are four sections in the sub-menu, these sections, the menu items, and associated Tachyon actions are described in the following table:

Section	Menu item	Tachyon Action	Notes
Configuration Manager Agent emergency stop and resume actions These options can be used in emergency situations where the Configuration Manager Agent needs to be stopped immediately to prevent certain actions from taking place. A tutorial showing the stopping and restarting of the ConfigMgr Client Service is provided in Stopping and resuming the ConfigMgr Client Service - Tutorial.	Stop ConfigMgr Client Service	Emergency shutdown and disable the ConfigMgr client service.	Stops and then disables the CcmExec service on the target devices.
Start ConfigMgr Client Service	Restart and enable the ConfigMgr client	Enables and then starts the CcmExec service on the target devices with a random delay between 1 and 3600 seconds.	

	service with maximum stagger of 3600.		
Configuration Manager Agent actions These options provide a quick method for immediately invoking each of the Configuration Manager Agent actions via Tachyon, as shown in the following picture:  The one notable exception is that the **User Policy Retrieval & Evaluation Cycle** is not implemented because this must be run in the context of a specific user.	Application Deployment Evaluation Cycle	Trigger ConfigMgr client application deployment evaluation cycle with maximum stagger of <maxStagger> seconds.	Runs the Application Deployment Evaluation Cycle on the target devices with a random delay of <maxStagger> seconds. Where <maxStagger> is calculated when the action is selected according to the number of target devices. This is done so that the CM site server will be hit by no more than 10 devices per second.

Discovery Data Collection Cycle	Trigger ConfigMgr client discovery data collection cycle with maximum stagger of <maxStagger> seconds.	Runs the Discovery Data Collection Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.
File Collection Cycle	Trigger ConfigMgr client file collection cycle with maximum stagger of <maxStagger> seconds.	Runs the File Collection Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.
Hardware Inventory Cycle	Trigger ConfigMgr client hardware inventory cycle with maximum stagger of <maxStagger> seconds.	Runs the Hardware Inventory Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.
Machine Policy Retrieval and Evaluation Cycle	Trigger ConfigMgr machine policy retrieval & evaluation cycle with	Runs the Machine Policy Retrieval & Evaluation Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.

	maximum stagger of <maxStagger> seconds.	
Software Inventory Cycle	Trigger ConfigMgr software inventory cycle with maximum stagger of <maxStagger> seconds.	Runs the Software Inventory Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.
Software Metering Usage Report Cycle	Trigger ConfigMgr software metering usage report cycle with maximum stagger of <maxStagger> seconds.	Runs the Software Metering Usage Report Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.
Software Updates Deployment Evaluation Cycle	Trigger ConfigMgr software updates deployment evaluation cycle with maximum stagger of <maxStagger> seconds.	Runs the Updates Deployment Evaluation Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.

Software Updates Scan Cycle	Trigger ConfigMgr software updates scan cycle with maximum stagger of <maxStagger> seconds.	Runs the Software Updates Scan Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.	
Windows Installer Source List Update Cycle	Trigger ConfigMgr Windows installer source list update cycle with maximum stagger of <maxStagger> seconds.	Runs the Windows Installer Source List Update Cycle on the target devices with a random delay of <maxStagger> seconds. See **Notes** for **Application Deployment Evaluation Cycle** above.	
Client Health Check	Client Health Check	Trigger ConfigMgr client health check and remediation with maximum stagger of <maxStagger> seconds.	Invokes **Ccmeval.exe** on the target devices.
Instruction Runner See Instruction Runner.	Instruction Runner	AnyIf the user has permission, any Tachyon instruction from the currently imported product packs can be run using this option.	

1.10.2.2 Stopping and resuming the ConfigMgr Client Service - Tutorial

A quick tutorial on stopping and resuming the ConfigMgr Client Service in response to an emergency.

1.10.2.2.1 The example

Suppose a deployment of the **ACMEFinance** software has just been advertised to a number of devices across a range of departments using Configuration Manager and you've realized that the extra feature used by the Finance department has not been configured properly and will cause issues preventing the Finance department from doing their work. To make sure that the Finance devices are not affected by the implementation you want to immediately stop the Configuration Manager Client Service on just the Finance devices, until you can sort out the issue with the deployment.

The **1E Tachyon** menu, added to Configuration Manager after the extensions have been installed, is available on Device Collections and individual devices displayed in Configuration Manager. The top two items on the menu let you stop and resume the Configuration Manager Client Service on all the devices within the selected context. Tachyon will process the request as fast as it can, the most time-consuming part of the process would likely be the safety checks and balances of two-factor authentication and approval.

1.10.2.2.2 Selecting the emergency stop from the menu

The following steps show the complete workflow for running the **Stop ConfigMgr Client Service** action from the Tachyon menu in the Configuration Manager console:

1.10.2.2.2.1 Selecting the action and authenticating

1. The user **CMUser01** is logged in to the Configuration Manager console. They right-click on the Device Collection they want to target, in this case **Finance** devices, which has already been configured with the devices where the Configuration Manager Client Service needs to be stopped.

2. On the context menu, they expand the **1E Tachyon** sub-menu

3. They then select the **Stop ConfigMgr Client Service** item from the sub-menu

4. A dialog will be displayed asking if they really want to run the selected action and how many devices will be affected. They click **Yes** to continue

5. With two-factor authentication enabled the user is then be prompted for an authentication code for the instruction with the ID **1**

6. **CMUser01** then checks their email for the authentication email which is sent by Tachyon on requesting an action

7. Having copied the authentication code they then return to Configuration Manager, paste the code into the dialog and click **OK**

8. If the authentication passes, a dialog is then displayed that notifies the user that their reques has been submitted to Tachyon and how many devices it will be performed on after it has been approved.

1.10.2.2.2.2 Approving the action

The Tachyon actions triggered from the Configuration Manager console are approved in exactly the same way as any other Tachyon action.

1. A Tachyon approver for the Configuration Manager extensions product pack, in our example the full administrator **TCNAdmin01**, receives an email asking them to approve the requested action

2. The Approver can use the link at the bottom of the email to go directly to their Tachyon **Notifications** page, or they can browse the Tachyon Explorer and select the **Notifications** page independently from the email

3. On the **Notifications** page they can see the pending **Request for action approval**. Here they can view details related to the request in order to judge their approval

4. Once they have made their decision to approve they add a suitable comment and check the **I understand approving my request impacts my IT environment** checkbox

5. They can then click the **Approve** button to approve the request

6. Tachyon will respond to show them that their **Approval has been processed successfully**

1.10.2.2.2.3 Viewing the responses

1. After approval, **CMUser01** receives an email telling them that their action has been approved

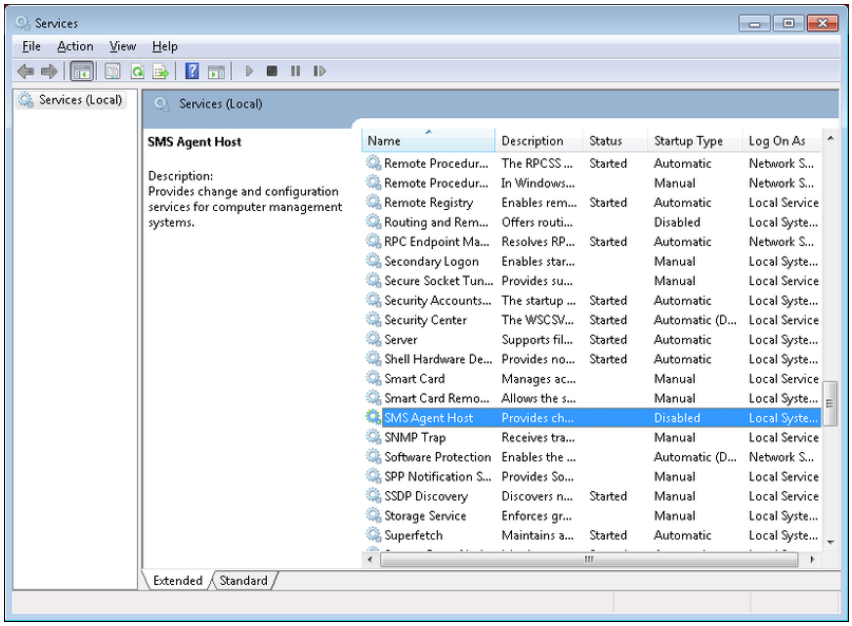
2. The email contains a **Go to results page** button. Clicking on this displays the results page for the approved instruction

3. The responses page shows the two devices in the **Finance devices** collection have responded to indicate that the Configuration Manager Client Service has been stopped and disabled

4. **CMUser01** then checks the information for one of the devices. They can see that the device has previously had the **DEPARTMENT = Finance** coverage tag set in Tachyon - showing for this device that the Device Collection defined in Configuration Manager corresponds to the finance department tags set using Tachyon.

1.10.2.2.2.4 Confirming the action has taken place

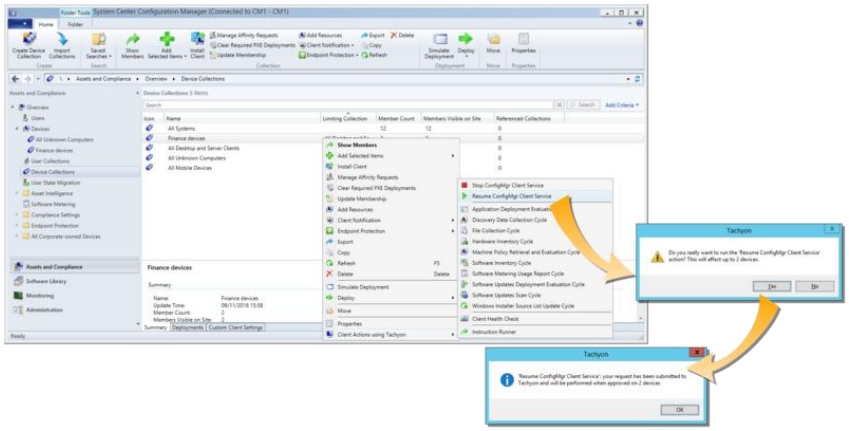
Going to one of the devices in question and opening the Services panel confirms that this is now the case, as shown in the picture.



1.10.2.2.3 After resolving the issue, restarting the Configuration Manager Client Service

Once you've resolved the configuration of the **ACMEFinance** software for the Finance department you will then want to restart the Configuration Manager Client Service. Doing this follows a similar process to stopping the service in that it involves selecting the menu option from Configuration Manager and then approving the subsequently created action in the Tachyon Explorer.

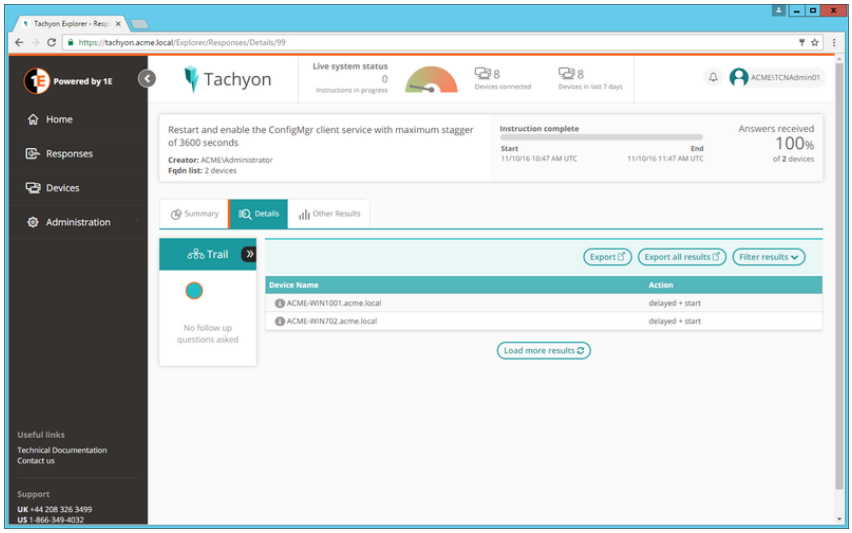
The picture shows the **Resume ConfigMgr Client Service** menu item being selected from the context menu for the **Finance devices** collection and the subsequent confirmation and notification dialogs.



When the **Resume ConfigMgr Client Service** menu item is selected from the Configuration Manager console an action named **Restart and enable the ConfigMgr client service with maximum stagger of 3600 seconds** gets added to Tachyon.

Following the normal approval process the action gets run on the Tachyon client devices. In the case of this action the time at which the Configuration Manager Client Service is started is subject to a random delay with a maximum of 3600 seconds. This is to prevent the Configuration Manager encountering problems through large numbers of client services attempting to contact it at the same time. This will mean that you may have to wait for an hour for the clients to be available to Configuration Manager again.

The picture shows the answers retrieved for the restart action.



1.10.2.3 Instruction Runner

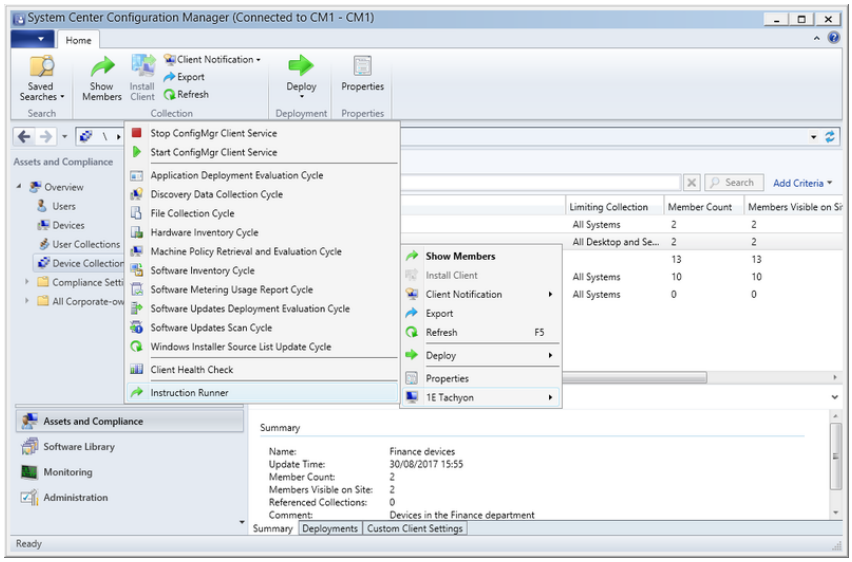
How to use the Instruction Runner to submit questions and actions from Configuration Manager. The Instruction Runner is a right-click tool for the Configuration Manager console which starts a client-based version of the Tachyon Explorer, which is limited to devices in a Collection.

1.10.2.3.1 Starting the Instruction Runner

The Instruction Runner can be started from the **1E Tachyon** context menu and by selecting the **Instruction Runner** menu item.

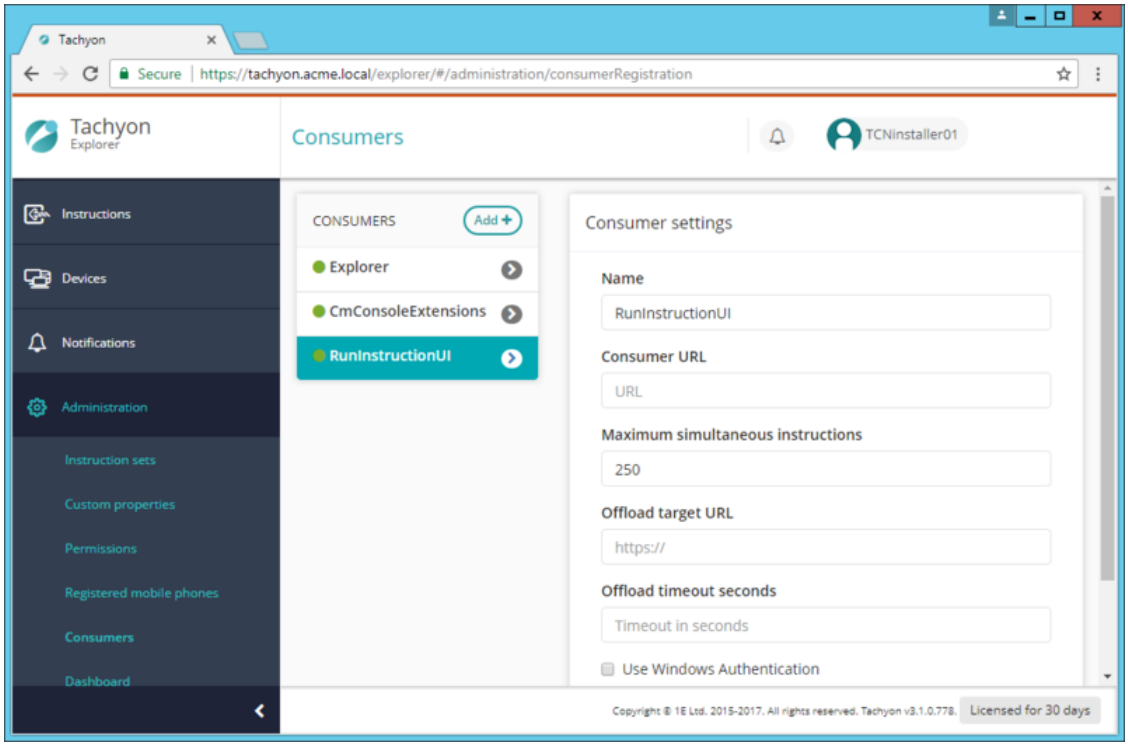
The context menu is displayed by right-clicking on a Device Collection in the Configuration Manager console. This Device Collection also defines the set of client devices that the Instruction Runner will question or action.

The picture shows the context menu for the **Finance devices** collection with the **1E Tachyon** sub-menu displayed and the **Instruction Runner** menu item selected.



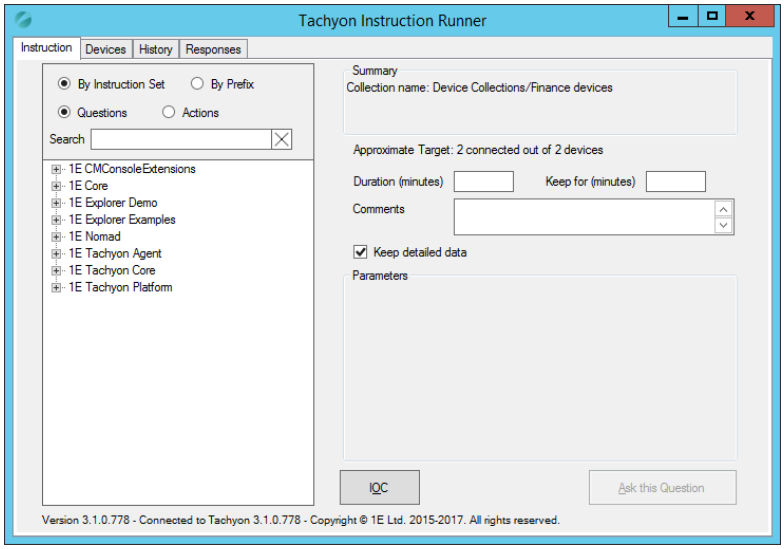
1.10.2.3.1.1 Loading the Instruction Runner for the first time

The first time the Instruction Runner menu item is selected, Tachyon will automatically attempt to create a Consumer for the Instruction Runner. For this to work correctly, the account used to run the Configuration Manager console must have the **Full Administrator** role assigned in Tachyon. If the appropriate permissions are there, a **RunInstructionUI** consumer will be created, as shown in the picture. This operation only needs to succeed once, and no further configuration is necessary.



1.10.2.3.1.2 The Instruction Runner

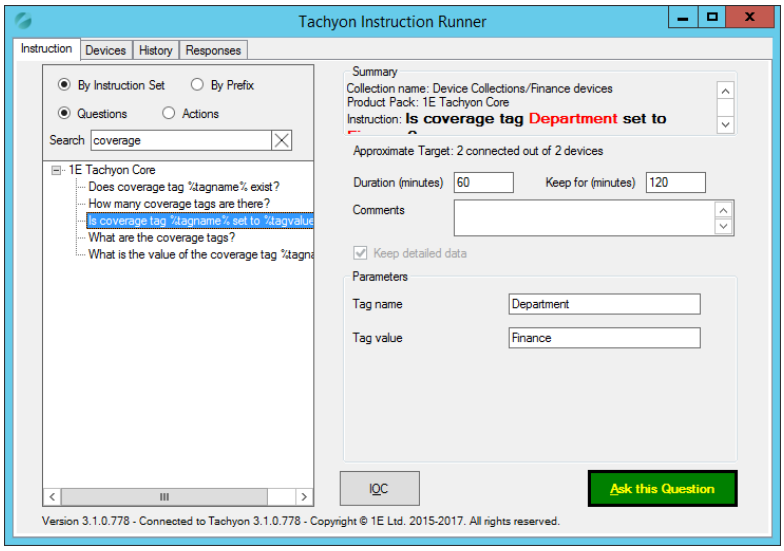
Selecting the Instruction Runner menu item starts the **Instruction Runner**. The picture shows the **Instruction Runner** with the **Instruction** tab selected.



1.10.2.3.2 Running a question on the Instruction tab

As an example, we're going to run an action to determine whether the Finance department devices all have the correct coverage tag set by Tachyon.

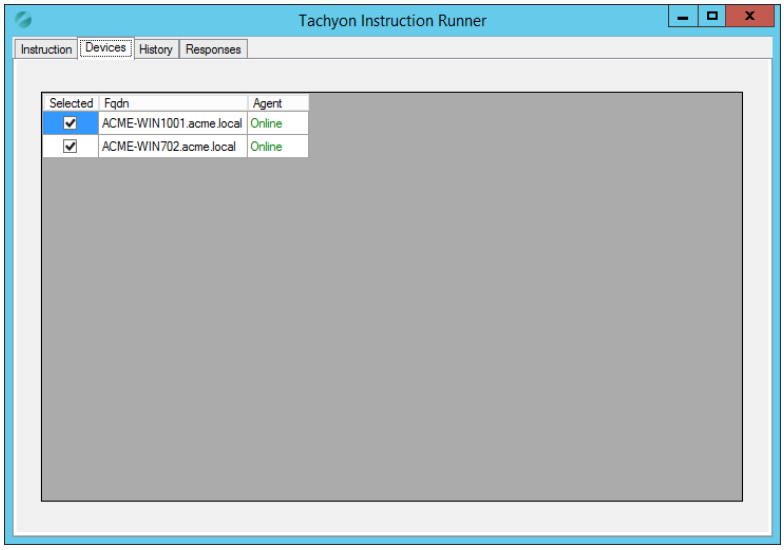
The picture shows the instructions sorted by product pack and with the questions displayed. The **Is coverage tag %tagname% set to %tagvalue%** question has been selected and the **Tag name** and **Tag value** fields have been set to **Department** and **Finance** respectively.



1.10.2.3.2.1 Looking at the Devices tab

The **Devices** tab shows the devices contained in the selected Configuration Manager Device Collection. In our example, as shown in the picture opposite, it shows the two devices in the **Finance devices** collection. You can further reduce the devices that the question will be run on by unchecking the checkbox at the beginning of the row with the device name you want to exclude.

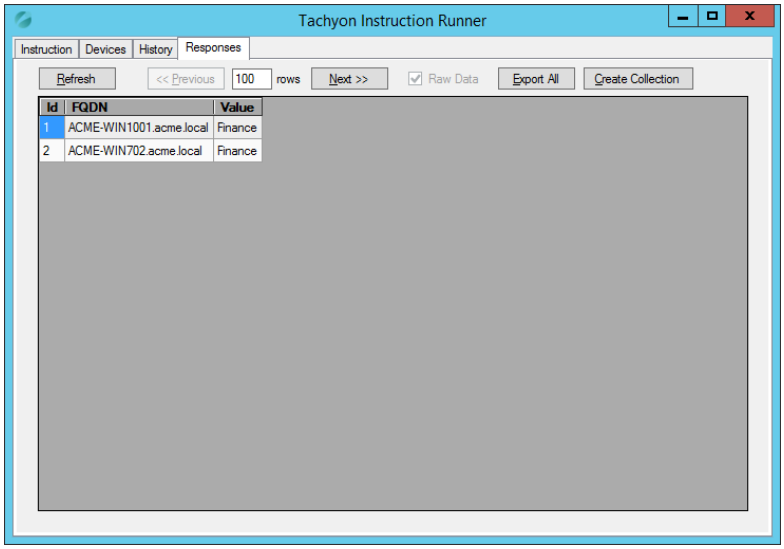
In our example, we will leave both devices selected, click back on the **Instruction** tab and click the **Ask this Question** button to run the question configured in the previous heading.



1.10.2.3.2.2 Checking the responses

Asking the coverage tag question displays the devices with that tag name and value set. In our example this results in two devices responding to say that they have the **Department Finance** tag

set. This exactly corresponds to the two devices on the **Devices** tab, so we can conclude that all the devices in the Finance department have the correct tag set.



1.10.3 Configuring NightWatchman Online Status

Tachyon uses a very secure, highly scalable, and extensible client-server architecture supporting a wide variety of operating systems and device types. A web interface allows authorized users to query all clients in your organization and get responses almost immediately. Users can also make immediate changes. Tachyon is especially valuable for addressing immediate concerns, such as newly discovered security vulnerabilities or to correct accidental misconfigurations. Despite its power and responsiveness, it is engineered to not overwhelm your network, clients, or servers.

For full details, refer to NightWatchman Enterprise 7.3 - Enabling Online Status using Tachyon integration.

1.10.4 Installing TIMS

TIMS is a graphical user interface for authoring and testing instructions, which can then be uploaded and used in your Tachyon system.

For full details, refer to /document/preview/736862#UUID-96565ece-64c7-9ede-a537-7addd547511a.

1.10.5 Setting up custom Tachyon Instructions for the first time

For a getting-started guide to configuring and verifying your Tachyon system so that you can run customized Instructions, refer to /document/preview/736871#UUID-66857689-bfb0-8dbc-ae8d-1de40c66fad9.

1.10.6 1E ITSM Connect

1.10.6.1 1E ITSM Connect 2.0 app

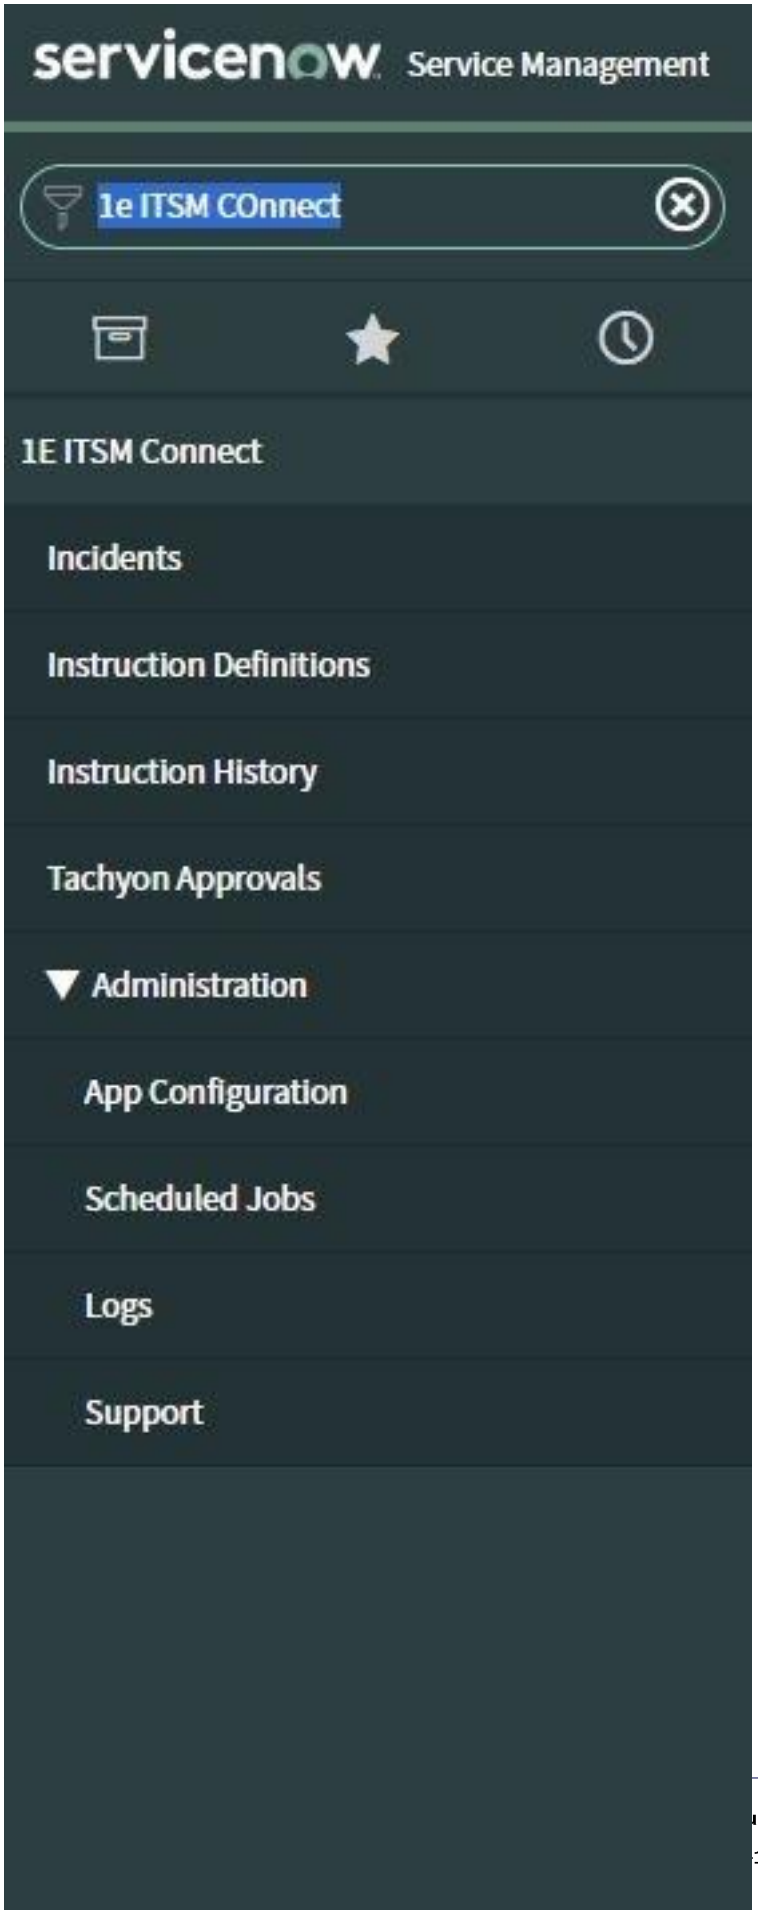
Integration between Tachyon and the ServiceNow ITSM (Information Technology Service Management) module is enabled using the 1E ITSM Connect 2.0 app, which is available for download from the ServiceNow app store and can be installed on any ServiceNow instance.

- 1E ITSM Connect now works with 1E Core, which provides connectivity to Tachyon and other core features for the 1E ServiceNow applications. Please refer to ITSM Connect - Requirements: Service Now requirements
- Instruction approval is now done in ServiceNow by ServiceNow users and not inside of Tachyon using a proxy Tachyon user. Please refer to ITSM Connect - Design Considerations: Tachyon Users and Roles for more details.
- Checkbox to configure if approval is needed/not needed for instruction in V2. ServiceNow Admin can choose which instructions require approval.
- Application settings and API configuration pages merged into 1 and called APP Configuration in V2.

To implement 1E ITSM Connect 2.0 please refer to ITSM Connect - Implementing 1E ITSM Connect.

1.10.6.2 App Menu in Application Navigator

ServiceNow provides an application navigator that enables users to navigate from one screen to another easily. To use **1E ITSM Connect**, first install it from ServiceNow app store and then search for **1E ITSM Connect** in the application navigator. The menu is shown below:



servicenow Service Management
1e ITSM COnnect
1E ITSM Connect
Incidents
Instruction Definitions
Instruction History
Tachyon Approvals
Administration
App Configuration
Scheduled Jobs
Logs
Support

Here's an overview of the 1E ITSM Connect menu items and the roles needed to access each page:

Item	Description	Roles needed to view the Item's page
Incidents	Displays a list of incidents.	• x_1e_connect.Tachyon_User • ITIL
Instruction Definitions	Displays a list of available Tachyon instructions.	Any of the following: • x_1e_connect.Tachyon_Admin • x_1e_connect.Tachyon_Approver • x_1e_connect.Tachyon_User n/a
Instruction History	Displays a history of previously run instructions.	Either of the following: • x_1e_connect.Tachyon_Admin • x_1e_connect.Tachyon_User n/a
Tachyon Approvals	Displays the instruction approval records generated from ServiceNow.	Either of the following: • x_1e_connect.Tachyon_Admin • x_1e_connect.Tachyon_Approver n/a
Administration	App Configuration	Displays the App Settings screen. • x_1e_connect.Tachyon_Admin n/a
Scheduled Jobs	Displays a list of any scheduled jobs	• x_1e_connect.Tachyon_Admin n/a

Item	Description	Roles needed to view the Item's page	
	specific to this app.		
Logs	Displays the app specific logs.	n/a	• admin(System Administrator)
Support	Displays information on how to contact 1E Support.	• x_1e_connect.Tachyon_Admin	n/a

1.11 Reference

All the list type information, such as installer properties, in alphabetical lists etc.

1.11.1 Supported Platforms

A list of all the platforms supported by Tachyon components, and the prerequisite software required to allow them to be installed or to work.

1.11.1.1 Server software

Category	Product	Notes
Server OS	• Windows Server 2022	For more detail about configuration of servers, please refer to Windows Server requirements.
	• Windows Server 2019	Only 64-bit server OS are supported. The server must be domain-joined.
	• Windows Server 2016	This version of Tachyon requires the server OS to be **English** because of a Known issues with certain regional settings.

Category	Product	Notes
		If TLS 1.0 is disabled, then please ensure you follow the steps in If TLS1.0 is disabled to add registry entries, for the 1E Catalog Update Service to successfully connect to the 1E Cloud Catalog. **Note** This list shows only those OS versions in mainstream support by Microsoft, and therefore supported by Tachyon, and by 1E Client 8.1. Please refer to Constraints of Legacy OS regarding the end of mainstream support. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Refer to Support for Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions.
SQL Server and SQL Server Analysis Services (SSAS)	• SQL Server 2019 • SQL Server 2017	For more detail, please refer to SQL Server requirements. Standard and Enterprise editions of these versions of SQL Server and SQL Server Analysis Services (SSAS) are supported.

Category	Product	Notes
	• SQL Server 2016 SP3	SQL Server 2016 RTM is not supported due to some issues, which are resolved by SP3. **Note** Tachyon only supports AlwaysOn Availability Groups on **SQL Server Enterprise Edition**. Please refer to High Availability options for SQL Server for HA options and their requirements. **Note** If you intend to integrate with third-party business intelligence products such as Power BI, you must install the **Enterprise edition of SSAS** as per their requirements. A SQL Server database instance is required for the following databases: • **1ECatalog** • **ContentDistribution** (optional - required for Nomad) • **SLA-BI** (optional - required for Patch Success) • **SLA-Data** • **SLA-Integrate** • **SLA-Shared** • **TachyonExperience** (optional - required for Tachyon Experience)

Category	Product	Notes
		• **TachyonMaster** • **TachyonResponses** **SLA Inventory databases** Tachyon Setup can install the above databases on separate SQL Server instances, however SLA-Data, SLA-Integrate, and SLA-Shared must exist on the same instance. A SQL Server Analysis Services (SSAS) instance installed in **Multidimensional** mode is required for SLA Business Intelligence. **SLA Business Intelligence** SLA Business Intelligence (BI) is only required for the Patch Success application. Together, the SLA Platform and BI installers create the following: • A database called **SLA-BI** on the SQL Server database instance. • A MOLAP cube called **SLA-BI** on the SSAS instance. • A linked server for the SLA databases to get data from the SLA-BI database and then from the SLA-BI cube. • A linked server for the SLA-BI database to get data from the SLA databases.

Category	Product	Notes

- A datasource definition used by the SLA-BI cube to connect to the BI database.

If the SLA databases, BI database, or SSAS instance for BI, are on *different* SQL Servers then the BI installer enforces the use of a SQL login on each instance. If they are on the *same* SQL Server then the installer gives you a choice of using integrated security (domain user account) or a SQL login.

However, if you are installing all the components using Tachyon Setup instead of their individual installers, then you are not given the choice. Tachyon Setup always uses integrated security. Contact your 1E Account Team if your scenario requires the above-mentioned databases to be on *different* SQL Servers. This affects different servers, not different instances.

All SQL Server instances *must* be configured with the following:

- A case-insensitive, accent-sensitive collation which is **SQL_Latin1_General_CP1_CI_AS** by default,

Category	Product	Notes
		• **Allow remote connections t o this server** enabled. All SQL Servers should be configured with the **SQL Server Browser service** running in order for the BI installer to select from a list of instances. **SQL Server Management Studio** is required to review the configuration and edit settings in 1E database tables. If installing SQL Server locally, note: • SQL Server 2016 and 2017 require .NET Framework 4.6 or later • SQL Server setup requires PowerShell 2.0. For the latest information about SQL Server prerequisites, please refer to http://go.microsoft.com/fwlink/?LinkId=622999.
Microsoft Endpoint Configuration Ma nager	• MECM CB 2303 • MECM CB 2211 • MECM CB 2207 • MECM CB 2203 • MECM CB 2111	Tachyon uses Configuration Manager for the following optional apps and features: • Reclaiming a product using SCCM Uninstall • Introducing Application Migration • Introducing Inventory captures data using the System Center Configuration Manager connector • Tachyon extensions for the Configuration Manager

Category	Product	Notes
	• MECM CB 2107	Console. - installed on Configuration Manager consoles using the 1E Tachyon Toolkit installer • Introducing Nomad requires 1E Client with Nomad client features enabled. Nomad provides the following Content Distribution features for Configuration Manager: • Nomad app overview provides visibility of content distribution activity • Single Site Download (SSD) (SSD). • Task sequence actions to augment OS Deployment: – Peer Backup Assistant - PBA – High Availability PBA (HAPBA) – Get Migration Settings to manage computer associations. • Nomad Pre-caching • Nomad Download Pause. Nomad requires the Content Distribution web service to synchronize with the Configuration Manager database. For standalone primary site environments, permissions are automatically assigned to the service account of Content Distribution's web application pool service (by default

Category	Product	Notes
		Network Service) using the **ConfigMgr_DViewAccess** localgroup native to Configuration Manager. For a CAS, this group is not created natively therefore additional steps are required to allow access. Please refer to Preparation: Microsoft Endpoint Configuration Manager preparation.
Web Server	• IIS 10	See Windows Server roles and features for details about required Web Server roles and features.
Runtime libraries	• Visual C++ 2013 Redistributable • Visual C++ 2015-2019 Redistributable • ASP.NET Core Framework 3.1 • .NET Framework 4.8	See Windows Server roles and features for details about required .NET Framework roles and features. To know supported combinations of OS and .NET Framework, please refer to: https://docs.microsoft.com/en-us/dotnet/framework/migration-guide/versions-and-dependencies. • Windows Server 2022 has .NET Framework 4.8 installed by default. • Windows Server 2019 has .NET Framework 4.7.2 installed by default. • Windows Server 2016 has .NET Framework 4.6.2 installed by default. **ASP.NET Core Hosting Bundle** is required only for the Nomad. It is not included with the Operating System, and must be downloaded and installed separately. If it not already installed, Tachyon Setup

Category	Product	Notes
		will attempt to automatically download version **3.1.11** and install it. Alternatively you can download it, or a later version, and install it yourself. For more detail please refer to ASP.NET Core Hosting Bundle. Installers include and automatically installs the redistributable packages for **Visual C++ 2013** and **Visual C++ 2015-2019**. The Coordinator (licensing module on the Master Stack), and Switch (on Response Stack) are written in C++ using Visual Studio 2013 and 2019, therefore require the **runtime (x64)** versions of these packages. Other server components use .NET Framework. **SQL BCP** is required by the **Export All** feature described in Exporting data from Explorer, and must be installed on each Tachyon Response Stack server (specifically the servers which have the Tachyon Core installed). BCP uses ODBC, which requires **Microsoft ODBC Driver versions 13. 1 and 17** and **Visual C++ 2017 Redistributable** to be installed first. Please refer toP SQL BCP for more detail.
Other software	• PowerShell	PowerShell is required by Tachyon installer during installation.
Browsers	Latest version of: • Google Chrome	A browser is not a prerequisite for installation of Tachyon servers but is required to use and administer the Tachyon platform. The administration is performed via the

Category	Product	Notes
	• Microsoft Edge (Chromium) • Mozilla Firefox	Tachyon portal and can be on a remote computer. These browsers are supported on all OS platforms which the browser vendor supports. The Portal and any API should be added as a trusted site. This is especially important when running scripts that may produce unexpected errors. Please review Known Issues Using Tachyon. **Note** **Microsoft legacy browsers** Support has been withdrawn for **Internet Explorer 11** and **legacy Microsoft Edge** (non-Chromium version) because Microsoft no longer supported them since 2021. We recommend you use Google Chrome, Firefox, or Microsoft Edge Chromium browser.

1.11.1.2 Tachyon portal

Category	Product	Notes
Browsers	Latest version of: • Google Chrome	These browsers are supported on all OS platforms which the browser vendor supports. Please refer to Whitelisting connections to 1E Cloud for details of URL that must be whitelisted for administrator browsers.

Category	Product	Notes
	• Microsoft Edge (Chromium)	The Portal and any API should be added as a trusted site. This is especially important when running scripts that may produce unexpected errors.
	• Mozilla Firefox	Please review Known Issues: Using Tachyon. **Note** **Microsoft legacy browsers** Support has been withdrawn for **Internet Explorer 11** and **legacy Microsoft Edge** (non-Chromium version) because Microsoft no longer supported them since 2021. We recommend you use Google Chrome, Firefox, or Microsoft Edge Chromium browser.

1.11.1.3 1E Tachyon Toolkit

1.11.1.3.1 Configuration Manager console extensions

Category	Product	Notes
Client OS	• Windows Server 2022 • Windows Server 2019 • Windows Server 2016 • Windows 11 CB 22H2 • Windows 11 CB 21H2 • Windows 10 CB 22H2 • Windows 10 CB 21H2	For OS supported by Configuration Manager Current Branch (CB) see supported configurations for Configuration Manager, https://technet.microsoft.com/en-us/library/mt589499.aspx
Microsoft Endpoint Configuration Manager console	• MECM CB 2303	These are the versions of Configuration Manager that 1E has tested and

Category	Product	Notes
	• MECM CB2211 • MECM CB 2207 • MECM CB 2203 • MECM CB 2111 • MECM CB 2107	therefore support, but later versions are assumed to work also. Please see Preparing for the Tachyon extensions for the Configuration Manager Console..
Runtime libraries	• Visual C++ 2015-2019 Redistributable	1E Tachyon Toolkit installer includes the Visual C++ 2015-2019 Redistributable package.

1.11.1.4 TIMS

Category	Product	Notes
Windows OS	• Windows Server 2022 • Windows Server 2019 • Windows Server 2016 • Windows 11 CB 22H2 • Windows 11 CB 21H2 • Windows 10 CB 22H1 • Windows 10 CB 21H2	Professional and Enterprise editions of Windows 10 and 11 are supported. All versions are provided with 32-bit & 64-installers. TIMS is currently only available for Windows OS. For installation guidance, please refer /document/preview/736744#UUID-69b33e47-7b6d-90dc-e5a4-7bb34231ba85.

Category	Product	Notes
Runtime libraries	• .NET Framework 4.8 • Visual C++ 2015-2019 Redistributable	One of these versions of .NET Framework is required. **Note** Tachyon supports .NET Framework versions that are in mainstream support by Microsoft. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. TIMS installer includes the Visual C++ 2015-2019 Redistributable package.
Other Windows Software	• PowerShell 3.0 (or later)	PowerShell 3.0 or later is required when testing instructions that have PowerShell commands embedded or scripts that are downloaded.

1.11.1.5 Connectors

The following table shows the supported versions of software used by the Tachyon out-of-box connectors.

Connector	Product	Notes
BigFix	• BigFix	Please refer to the BigFix connector or BigFixInv connector pages for prerequisites.
Intune	• Intune	Please refer to the Intune connector page for prerequisites.
Microsoft Office 365	• Azure	Please refer to the Microsoft Office 365 connector page for prerequisites.
OpenLM	• OpenLM Server	Please refer to the OpenLM connector page for prerequisites.

Connector	Product	Notes
	21.12	
Oracle LMS	• Oracle LMS	Please refer to the Oracle LMS connector page for prerequisites.
ServiceNow	• ServiceNow Jakarta release	Please refer to the ServiceNow connector page for prerequisites.
System Center Configuration Manager	• MECMCB2211 • MECMCB2207 • MECMCB2203 • MECMCB2111 • MECMCB2107	Please refer to the System Center Configuration Manager connector page for prerequisites.

Connector	Product	Notes
Tachyon	• Tachyon 8.1	Please refer to the Tachyon connector page for prerequisites.
vCenter	• VMware PowerCLI 11.1.0	VMware PowerCLI 11.1.0 (code.vmware.com/web/dp/tool/vmware-powercli/11.1.0) must be installed on the Tachyon Master server (where the SLA Integrate Services Agent service is hosted) before you can configure and use the vCenter connector. Earlier or later versions of PowerCLI are not supported and may cause errors. VMware PowerCLI is freeware and was previously known as vSphere PowerCLI. VMware PowerCLI supports multiple versions of VMware vCenter Server. For details, please refer to the VMware compatibility matrix using the following link: https://www.vmware.com/resources/compatibility/sim/interop_matrix.php#interop&2=&106= Please refer to the vCenter connector page for configuration details.
WSUS (Windows Server Update Services)	• WSUS	Please refer to the Windows Server Update Services connector page for configuration details.

1.11.1.6 Constraints of Legacy OS

In this documentation, the following are referred to as legacy OS. Below are described some known issues for these OS.

1E does not provide support for 1E products on the following OS unless the OS is explicitly listed as being supported for a specific 1E product or product feature. This is because Microsoft has ended mainstream support for these OS or they are not significantly used by business organizations.

- **Windows XP ***
- **Windows Vista**
- **Windows 7**
- **Windows 8.0**
- **Windows Server 2003 ***
- **Windows Server 2008**
- **Windows Server 2008 R2**
- **Windows Server 2012**

- **Windows 8.1**
- **Windows Server 2012 R2**

Note

1E Client 8.1 and later will not install on Windows XP and Windows Server 2003. Please contact 1E if you intend to continue using any of the other legacy OS. If you experience an issue, then please try replicating the issue on a supported OS.

For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.

1.11.1.6.1 Microsoft legacy browsers

Support has been withdrawn for **Internet Explorer 11** and **legacy Microsoft Edge** (non-Chromium version). 1E has taken this decision for new releases that are expected to remain in support by 1E beyond March 2021 when **Microsoft Edge** goes end of life and August 2021 when **Internet Explorer 11** goes end of life. We recommend you use Google Chrome, Firefox or Microsoft Edge Chromium browser.

1.11.1.6.2 Certificate limitations - SHA2

Like most software vendors, 1E software requires the OS to support SHA2. If your organization has a PKI configured to use SHA2 256 or higher encryption, then your legacy OS may have already been updated to support it.

- Windows XP and Server 2003 require an update as described in **KB968730.** Microsoft no longer provides this hotfix as a download. You must contact Microsoft Support if you need it
- Windows 7 and Server 2008 R2 require an update as described in **KB3033929**. This update is not available for Vista and Server 2008
- Windows 8, 8.1, Server 2012, Server 2012 R2 and later OS already support SHA2.

1.11.1.6.3 Certificate limitations - encrypted certificate requests

Windows XP and Server 2003 are unable to encrypt certificate requests, whereas later OS are able to support higher more secure RPC authentication levels. If you are using a Microsoft CA and expect these clients to request (enrol) certificates then the CA must have its IF_ENFORCEENCRYPTICERTREQUEST flag disabled. It is disabled by default on Windows 2003 and 2008 CA, but is enabled by default on Windows 2012 CA.

To determine which InterfaceFlags are set, execute the following command on the CA server:

```
certutil -getreg CA\InterfaceFlags
```

If the following is specified then it means the flag is enabled.

```
IF_ENFORCEENCRYPTICERTREQUEST -- 200 (512)
```

To disable the encrypt certificate requests flag, execute the following commands on the CA server:

```
certutil -setreg CA\InterfaceFlags -IF_ENFORCEENCRYPTICERTREQUEST
sc stop certsvc
  sc start certsvc
```

1.11.1.6.4 Certificate limitations - signing certificates missing

On Windows computers, the installation MSI files, and binary executable and DLL files of 1E software are digitally signed. The 1E code signing certificate uses a timestamping certificate as its countersignature. 1E occasionally changes its code signing certificate, and uses it for new releases and patches for older versions, as shown in the table(s) below.

Root Certificate Authorities are implicitly trusted to validate certificates, and their certificates must be correctly installed to do this. Your computers should already have the necessary **root CA** certificates installed, however this may have been prevented by your organization's security policies, or inability to connect to the Internet, or they are legacy OS. In general this is not an issue because by default Windows allows software to be installed and run without validation, although you may see a warning or experience a delay. However, you *must* have relevant CA certificates installed if you are using 1E Client (which self-validates its own files), or your organization has applied more secure polices (for example UAC, AppLocker or SmartScreen).

Typical reasons for issues with signing certificate are:

- If your organization has disabled **Automatic Root Certificates Update** then you must ensure the relevant **root CA** certificates are correctly installed on each computer
- If computers do not have access to the Internet then you must ensure the relevant **root and issuing CA** certificates are correctly installed on each computer, numbered in the table(s) below.

The signature algorithm of the 1E code signing certificate is SHA256RSA. In most cases, the file digest algorithm of an authenticode signature is SHA256, and the countersignature is a RFC3161 compliant timestamp. The exception is on legacy OS (Windows XP, Vista, Server 2003 and Server 2008) which require the file digest algorithm of an authenticode signature to be SHA1, and a legacy countersignature.

The table below applies to software and hotfixes released in 2020.

2020	Signing certificate	Timestamping certificates
Certificate	1E Limited	TIMESTAMP-SHA256-2019-10-15 ***and*** DigiCert Timestamp Responder
Issuing CA	**DigiCert EV Code Signing CA (SHA2)** Thumbprint: 60ee3fc53d4bdfd1697ae5beae1cab1c0f3ad4e3	**DigiCert SHA2 Assured ID Timestamping CA** Thumbprint: 3ba63a6e4841355772debef9cdcf4d5af353a297 ***and*** **DigiCert Assured ID CA-1**

2020	Signing certificate	Timestamping certificates
		Thumbprint: 19a09b5a36f4dd99727df783c17a51231a56c117
Root CA	**DigiCert High Assurance EV Root CA** Thumbprint: 5fb7ee0633e259dbad0c4c9ae6d38f1a61c7dc25	**DigiCert Assured ID Root CA** Thumbprint: 0563b8630d62d75abbc8ab1e4bdfb5a899b24d43

1.11.1.6.5 Certificate limitations - expired root certificates

Ensure that your Root CA Certificates are up-to-date on clients and servers. The **Automatic Root Certificates Update** feature is enabled by default, but its configuration may have been changed or restricted by Group Policy **Turn off Automatic Root Certificates Update**.

If this GPO is enabled, then you will see *DisableRootAutoUpdate = 1 (dword)* in *HKLM\Software\Policies\Microsoft\SystemCertificates\AuthRoot.*

1.11.2 Communication Ports

Diagrams and tables with all the external Tachyon communication ports. Useful, if needed, for network and device firewalls.

Please refer to Tachyon Architecture for architecture diagrams.

1.11.2.1 Connections diagram

The diagram shows connections for Tachyon and its applications. It includes connections from clients and administration workstations, and outgoing connections to inventory sources, and to Microsoft Endpoint Configuration Manager that is optionally used by some applications.

It does not show connections for WakeUp, NightWatchman Enterprise, or Shopping, which have their own back-end servers. Their connection diagrams can be found in their documentation.

1.11.2.2 Firewall requirements for a Single-Server

The following table lists firewall requirements for a **single-server** where **Tachyon Master Stack** and **Response Stack** are installed on the same server. The table assumes a remote SQL Server hosting TachyonMaster and TachyonResponses databases. Each Tachyon component described in the table has at least one output and/or input. For each Tachyon component with output, there is a matching input.

Firewalls normally protect against incoming traffic from remote devices, however, the table below also includes outgoing connections. The table does not include internal communications within the Server.

In addition to but not included in the table are various ports that Tachyon uses to communicate with Microsoft services, including Certificate Services and Active Directory. The Coordinator **Workflow service** queries AD for email details; the **Consumer API** queries AD for security details.

Port requirements are not provided here for Nomad, Shopping and WakeUp modules of the **1E Client**. Only the ports used by the client feature of the **1E Client** are listed.

If Nomad is being used by the client on Windows computers, it has additional port requirements of its own, which are not changed by Tachyon.

Additional ports may be required if Tachyon instructions need to connect to non-Tachyon content sources.

There may be additional requirements if the environment has had default security settings changed.

1.11.2.2.1 Tachyon Servers

Device	Port	Protocol	Direction	Usage	Configurable
Tachyon Server (Master Stack)	TCP 443	HTTPS	Incoming	• Console browser connections to **Tachyon Portal UI** • Console browser connections to **SLA Platform UI** • Console browser connections to	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesHTTPSIISPORTHTTPSIISPORT. Setup installs other components using the same settings as Tachyon Server.

Device	Port	Protocol	Direction	Usage	Configurable
				1E Catalog UI • Consumer connections to **Catalog API** • Consumer connections to **Consumer API** • Consumer connections to **SLA Operations Provider API**	
Tachyon Server (Master Stack)	TCP 80	HTTP	Incoming	• Console browser connections to **SLA Platform UI**	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesHTTPSIISPORTHTTPSIISPORT. Tachyon Setup installs other components using the same settings as Tachyon Server.

Device	Port	Protocol	Direction	Usage	Configurable
				• Console browser connections to **1E Catalog UI** • Consumer connections to**Catalog API** • Consumer connections to **SLA Operations Provider API**	
Tachyon Server (Response Stack)	TCP 443	HTTPS	Incoming	• Client retrieving content from the **Background Channel**.	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesHTTPSIISPORTHTTPSIISPORT.

Device	Port	Protocol	Direction	Usage	Configurable
Tachyon Server (Master Stack)	TCP 443	HTTPS	Outgoing	• Tachyon **Coordinator service** contacting the **1E Cloud License Service** via an Internet connection. • **1E Catalog Update service** contacting the **1E Cloud Catalog Service** via an Internet connection.	The port used to connect to the **1E Cloud Services** is not configurable.
Tachyon Server (Master Stack)	TCP 6002	WebSocket (ws)	Incoming Ou	• **Integrate Agent** service connecting to	Yes, configurable after installation. **Note** **Integrate Agent** component is not shown on the diagram, and

Device	Port	Protocol	Direction	Usage	Configurable
			tgoing	the **Integrate Manager Web API** to get connector jobs	installation on remote systems is not supported.
Tachyon Server (Response Stack)	TCP 4000	WebSocketSecure (wss)	Incoming	• Client receiving instructions from and sending compressed responses to the Tachyon Switch.	Switch ports are not configurable using the Server installer. A Switch port can be changed post-installation, by configuring the value in the **Port** column for the relevant Switch in the **SwitchConfiguration** table in the Tachyon Master database. If the Switch port is changed after deploying 1E Client (with Tachyon features enabled) then the corresponding Switch port must be updated in each Client's configuration file. Clients initiate and maintain a WebSocket Secure connection to a Switch, which the Switch uses to communicate back to the clients.
Tachyon Server (Master Stack)	TCP 25	SMTP	Outgoing	• Tachyon **Coordinator service** sending two-factor authenticatio	Yes. In this version of Tachyon, **SMTP Authentication** is not configurable using the Server installer. The default is anonymous authentication. However, it can be changed post-installation. For details of changing the SMTP configuration and disabling email notifications, please refer to Changing the SMTP Host configuration.

Device	Port	Protocol	Direction	Usage	Configurable
				n emails. • Tachyon **Coordinator service** sending workflow emails.	
Tachyon Server (Master Stack)	TCP 1433	TDS	Outgoing	• Tachyon Web Site application pools (**Portal**, **Consumer API**) communicating with SQL Server. • SLA Platform Web Site application pools (**Admin**,	Not configurable from Setup. In the **Database Servers** panel in Tachyon Setup you can select a SQL Server instance. The instance can be installed using a non-standard port. However, selecting an instance that uses a non-standard port will not change the port used by the Tachyon Installer, and installation will fail. If you require the use of a non-standard port on a Default SQL Server instance, contact 1E for guidance on a manual workaround. If using a Named Instance that is set to its default configuration where the server automatically chooses a random port (or if you manually configured the instance to use a fixed port), then the **SQL Browser** service needs to be enabled to let the Tachyon Server determine the port in use. You will need to open UDP port 1434 used by the SQL Browser. See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesSQLSERVER_MASTERSQLSERVER_MASTER.

Device	Port	Protocol	Direction	Usage	Configurable
				CoreExternal, **Platform**) communicating with SQL Server. • Tachyon **Coordinator service** communicating with SQL Server. • Catalog services and application pool communicating with SQL Server. • **1E Catalog Update serv**	

Device	Port	Protocol	Direction	Usage	Configurable
				ice communicating with SQL Server.	
Tachyon Server (Master Stack)	TCP 1433	TDS	Outgoing	• Inventory connectors fetching data from sources that use SQL Server.	Configurable in various Connectors, please refer to Connectors page.
Tachyon Server (Master Stack)	TCP 135 and 445 (initially)	WMI (DCOM)	Outgoing	• SCCM WMI Server provider connection to Configuration Manager. • Nomad connection to Configuration	Not configurable. Please refer to Provider configuration page and Nomad.

Device	Port	Protocol	Direction	Usage	Configurable
				Manager used by the Nomad Sync feature.	
Tachyon Server (Response Stack)	TCP 1433	TDS	Outgoing	• Tachyon Web Site application pools (**Core** and **Core Internal**) communicating with SQL Server (mainly uncompressed responses).	Not configurable from Setup. See the comments above for the Tachyon Server (Master Stack). See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesSQLSERVER_RESPONSESSQLSERVER_RESPONSES.
SQL Server (TachyonMaster	TCP 1433	TDS	Incoming	• Tachyon Web Site application pools (**Consu**	Not configurable from Setup. See the comments above for the Tachyon Server (Master Stack). See #UUID44187c3f8a182c06d4353770a23bb3e4_id_Tac

database)					pools (**Core** and **Core Internal**) communicating with SQL Server (mainly uncompressed responses).	See #UUID44187c3f8a182c06d4353770a23bb3e4_id_TachyonServerinstallerpropertiesSQLSERVER_RESPONSESSQLSERVER_RESPONSES.

1.11.2.2.2 Tachyon clients

Device	Port	Protocol	Direction	Usage		Configurable
Clients	TCP 4000	WebSocket Secure (wss)	Outgoing	•	Client receiving instructions from and sending **compressed responses** to the Tachyon Switch.	Yes. See Tachyon client settings. Switch=<SwitchName>:<SwitchPort> Anything other than port 4000 requires a Tachyon Server with a Switch using the same port number. Clients initiate and maintain a WebSocket Secure connection to a Switch, which the Switch uses to communicate back to the client.
Clients	TCP	HTTPS	Outgoing	•	Client retrieving content from the	Yes, during installation. See Tachyon client settings.

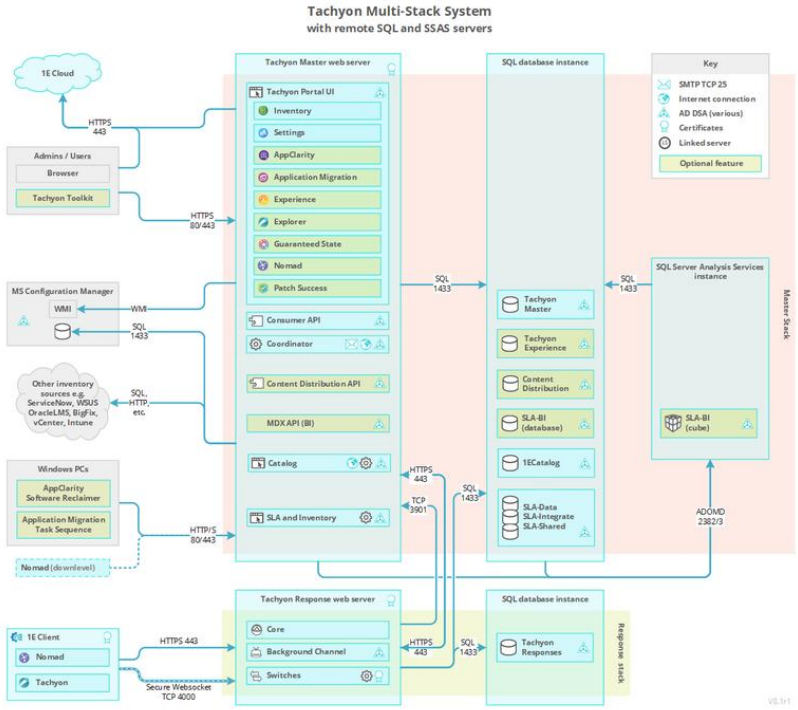
Device	Port	Protocol	Direction	Usage	Configurable
	443			**Background Channel**.	BackgroundChannelUrl=https:/<1Eplatform FQDN>:<port>/Background
Clients	TCP 7766	HTTPS	Outgoing and Incoming	• Communication between the 1E Client service and 1E Client UI.	Yes, during installation. See Tachyon client settings. MODELE.INTERACTION.PORT=<port>
Browsers	TCP 443	HTTPS	Outgoing	• Browsers connection to the **Tachyon Portal** (Explorer, Settings, and other applications). • Browser connection to the **SLA Platform UI**. • Browser connection to the **Consumer API**.	Anything other than port 443 requires the port number to be included in the browser URL when connecting to the Tachyon portal, API or SLA Platform UI.
Browsers	TCP 80	HTTP	Outgoing	• Console browser connections to the **1E Catalog UI**	Anything other than port 80 requires the port number to be included in the browser URL when connecting to the 1E Catalog UI.

1.11.2.3 Firewall requirements for a remote Catalog Web Server

The following table lists firewall requirements when the Catalog Web Server is on a different server than the Tachyon Server. This can happen if Tachyon Server is installed in an environment that already has a 1E Catalog server installed to support **Application Migration** or **AppClarity**.

Device	Port	Protocol	Direction	Usage	Configurable
Catalog Server	TCP 80	HTTP	Incoming	• Console browser connections to the **1E Catalog UI** • Consumer connections to the **Catalog API**	Yes, during installation. See 1E Catalog installer properties.
Catalog Server	TCP 443	HTTPS	Outgoing	• **1E Catalog Update service** contacting the **1E Cloud Catalog Service** via Internet connection.	The port used to connect to the **1E Cloud Services** is not configurable.
Catalog Server	TCP 1433	TDS	Outgoing	• Catalog services and application pool communicating with SQL Server. • **1E Catalog Update service** communicating with SQL Server.	Yes, during installation. See 1E Catalog installer properties.
SQL Server (1E Catalog database)	TCP 1433	TDS	Incoming	• **1E Catalog application pool** communicating with SQL Server. • **1E Catalog Update service** communicating with SQL Server.	Yes, during configuration of the SQL Server instance.
Browsers	TCP 80	HTTP	Outgoing	• Console browser connections to the **1E Catalog UI**	Yes, during installation. See 1E Catalog installer properties.

1.11.2.4 Firewall requirements for a remote Tachyon Response Stack



The following table lists firewall requirements when using a **Tachyon Response Stack** that is remote from the **Tachyon Master Stack**, which is additional to the ports required for a Single-Server. Each Tachyon component described in the table has at least one output and/or input. For each Tachyon component with an output, there is a matching input.

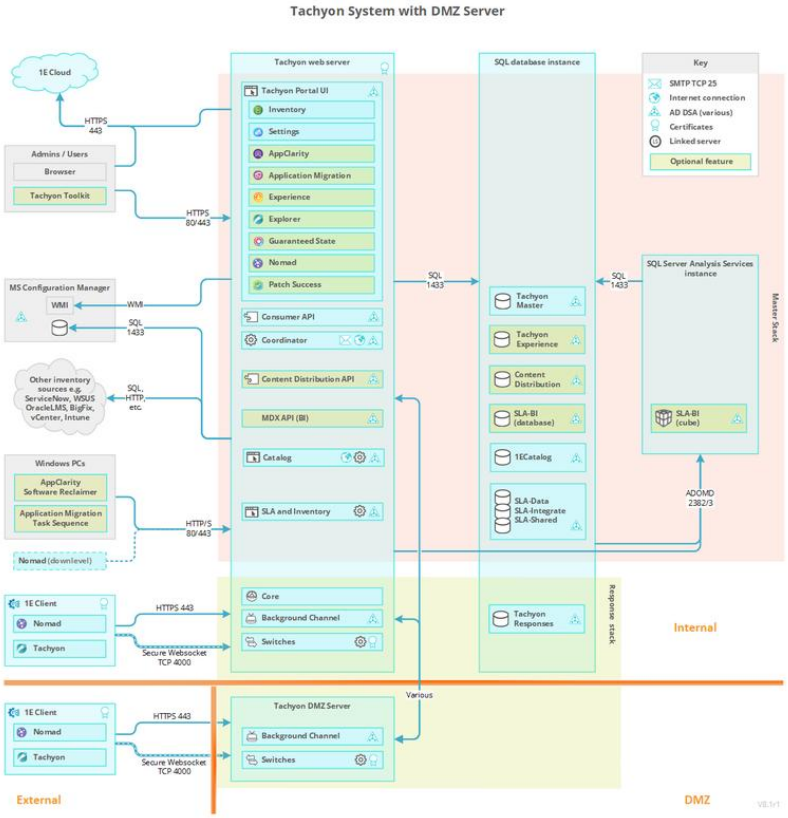
Device	Port	Protocol	Direction	Usage	Configurable
Tachyon Server (Response Stack)	TCP 443	HTTPS	Incoming	• Tachyon Coordinator **Workflow service** on the remote Master Stack connecting to the Core on a remote Response Stack • **Consumer API** on the remote Master Stack connecting to the remote **Background Chan**	Yes, during the installation of the Response Stack. In the **Website Configuration** panel in Tachyon Setup. See Server installer property HTTPSIISPORT refer to Tachyon Server installer properties. The Consumer API connection to the

Device	Port	Protocol	Direction	Usage	Configurable
				nel on a remote Response Stack • **Consumer API** on the remote Master Stack connecting to the **Core** on a remote Response Stack	Core is only used for remote Response Stacks.
Tachyon Server (Master Stack)	TCP 3901	WebSocket (ws)	Incoming	• Tachyon Switches sending **instrumentation data** to the Instrumentation module in the Coordinator on the Master Stack • Tachyon Web Site **Core** application pool sending **instrumentation data** to the Instrumentation module in the Coordinator on the Master Stack	Yes, but please contact 1E for advice.
Tachyon Server (Response Stack)	TCP 3901	WebSocket (ws)	Outgoing	• Tachyon Switches sending **instrumentation data** to the Instrumentation module in the Coordinator on the Master Stack • Tachyon Web Site Core application pool sending **instrumentation data** to the	Yes, but please contact 1E for advice.

Device	Port	Protocol	Direction	Usage	Configurable
				Instrumentation module in the Coordinator on the Master Stack	
SQL Server (TachyonMaster database)	TCP 1433	TDS	Incoming	• Tachyon Web Site **Core** application pool on a remote Response Stack communicating directly with the Tachyon Master database	Not configurable from Setup. In the **Database Servers** panel in Tachyon Setup you can select a SQL Server instance. The instance can be installed using a non-standard port. However, selecting an instance that uses a non-standard port will not change the port used by the Tachyon Installer, and installation will fail. If you require the use of a non-standard port on a Default SQL Server instance, contact 1E for guidance on a manual workaround. If using a Named Instance that is set to its default configuration where the server automatically chooses a random port (or if you

Device	Port	Protocol	Direction	Usage	Configurable
					manually configured the instance to use a fixed port), then the **SQL Browser** service needs to be enabled to let the Tachyon Server determine the port in use. You will need to open UDP port 1434 used by the SQL Browser. See Server installer property, SQLSERVER_MASTER, refer to Tachyon Server installer properties.
Tachyon Server (Response Stack)	TCP 1433	TDS	Outgoing	• Tachyon Web Site **Core** application pool communicating directly with the remote Tachyon Master database	Not configurable from Setup. See the comments above for SQL Server (TachyonMaster database). See Server installer property SQLSERVER_MASTER, refer to Tachyon Server installer properties.

1.11.2.5 Firewall requirements for a Tachyon DMZ Server



The following table lists the subset of ports needed when hosting Tachyon Switch and Background Channel components on a DMZ Server to support devices external to the network. Each Tachyon component described in the table has at least one output and/or input. For each Tachyon component with an output there is a matching input.

Note

If the server is a domain joined server it needs to be able to access Microsoft services, including Certificate Services and Active Directory. If the server is not domain joined (a workgroup server) you will need to manually install its Web Server certificate.

In both cases you will also need to ensure that the server is able to validate the certificate, including accessing the certificate's remote CRL Distribution Point.

The following table does not cover port requirements when using ADFS and SAML tokens to authenticate clients. In this documentation we just provide details of the simplest option, which uses certificates for client authentication. For details of how to configure Tachyon to support the more complex implementations, please contact 1E.

Device	Port	Protocol	Direction	Usage	Configurable
DMZ Server	TCP 443	HTTPS	Outgoing	• The **Switch** forwards compressed responses from the Internet-facing client devices to the **Core** on the Response Stack	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See Server installer property HTTPSIISPORT, refer to Tachyon Server installer properties.
DMZ Server	TCP 3901	WebSocket (ws)	Outgoing	• Tachyon Switches sending **instrumentation data** to the **Instrumentation** module in the Coordinator on the Master Stack	Yes, but please contact 1E for advice.
DMZ Server	TCP 400n	TCP	Incoming	• Each Switch (from 1 to n) listens for prompts (pokes) from the **Core** on the Response Stack forwarding **workflow commands**. Each **Switch** requires its own port to be registered in the **Core**.	If the value for the Switch port has been changed, the port you need to open should be the Switch client port + 1. For example, if a Switch client port is 4000 then Switch poke port is 4001.
DMZ Server	TCP 4000	WebSocket Secure (wss)	Incoming	• Internet-facing client requesting instructions from and sending compressed responses to the Tachyon **Switch**	Switch client ports are not configurable using the Server installer. A Switch client port can be changed post-installation, by configuring the value

Device	Port	Protocol	Direction	Usage	Configurable
					in the **Port** column for the relevant Switch in the **SwitchConfiguration** table in the Tachyon Master database. Clients initiate and maintain a WebSocket Secure connection to a Switch, which the Switch uses to communicate back to the client.
DMZ Server	TCP 80	HTTP	Outgoing	• See note above about accessing the certificate's remote CRL Distribution Point.	
Tachyon Server (Response Stack)	TCP 443	HTTPS	Incoming	• The **Core** receives compressed responses forwarded by the Switch	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See Server installer property HTTPSIISPORT, refer to Tachyon Server installer properties.
Tachyon Server (Master Stack)	TCP 443	HTTPS	Outgoing	• The **Consumer API** on the Master Stack sends content to the **Background Channel**	Yes, during installation. In the **Website Configuration** panel in Tachyon Setup. See Server installer property

Device	Port	Protocol	Direction	Usage	Configurable
					HTTPSIISPORT, refer to Tachyon Server installer properties.
Tachyon Server (Response Stack)	TCP	TCP	Outgoing	• The **Core** on the Response Stack prompts each **Switch** on the DMZ Server	Switch client ports are not configurable using the Server installer. A Switch client port can be changed post-installation, by configuring the value in the **Port** column for the relevant Switch in the **SwitchConfiguration** table in the Tachyon Master database. If the value for the Switch client port has been changed the port you need to open should be the Switch client port + 1. For example, if Switch client port is 4000 then Switch poke port is 4001.
Tachyon Server (Master Stack)	TCP 3901	WebSocket (ws)	Incoming	• Tachyon **Switches** sending **instrumentation data** to the **Instrumentation** module in the Coordinator on the Master Stack	Yes, but please contact 1E for advice.

Device	Port	Protocol	Direction	Usage	Configurable
Internet-facing clients	TCP 443	HTTPS	Outgoing	• Internet-facing client retrieves content from the **Background Channel**	Yes, during installation. See Tachyon client settings.
Internet-facing clients	TCP 4000	WebSocket Secure (wss)	Outgoing	• Internet-facing client requests instructions from and sends compressed responses to the Tachyon **Switch**	Yes. See Tachyon client settings. There must be a matching Switch using the same port. Clients initiate and maintain a WebSocket Secure connection to a Switch, which the Switch uses to communicate back to the client.

1.11.2.6 Internal Server communications

The following is a list of ports used within the Tachyon Platform, and not listed in the Single-Server table above, and as such should not affect firewall requirements. Some of these are listed in the DMZ table above.

Port	Protocol	Usage	Configurable
TCP 3900	WebSocket (ws)	• Tachyon Switch registering with the Switch Host	Yes, post-installation, but not recommended. Contact 1E for advice. The following may be configured during installation. TCP 443 HTTPSIISPORT (Website configuration) TCP 80 IISPORT (Website configuration)

Port	Protocol	Usage	Configurable
			TCP 8081 WORKFLOWWEBPORT (Tachyon) TCP 6002 INTEGRATE_REST_PORT (SLA)
TCP 3901	WebSocket (ws)	• Tachyon Web Site **Consumer API** application pool requesting **instrumentation data** • Tachyon Web Site **Core** application pool sending **instrumentation data** • Tachyon Web Site **Core Internal** application pool sending **instrumentation data** • Tachyon Coordinator **Workflow** service sending **instrumentation data** • Tachyon **Switch** sending **instrumentation data**	
TCP	TCP	• A prompt (poke) from the **Core** forwarding **workflow commands** to each **Switch** (from 1 to n). Each **Switch** requires its own port to be registered in the **Core**.	
TCP 443	HTTPS	• Tachyon **Switch** retrieving **instruction definitions** from the Core • Tachyon Coordinator **Workflow service** connections to the Core • **Consumer API** connections to the **Background Channel**	

Port	Protocol	Usage	Configurable
		• **Consumer API** connections to the Tachyon Coordinator **Workflow service**	
TCP 80	HTTP	• Tachyon **Switch** forwarding responses to the Core Internal (fast) - but a Switch on a DMZ server will use 443 HTTPS instead.	
TCP 8081	HTTPS	• Tachyon Web Site **Consumer API** application pool issuing **workflow commands** to the Tachyon Coordinator **Workflow service**	
TCP 6002	HTTP	• **SLA Integrate Agent** service connecting to the **SLA Integrate Manager** Web API to get connector jobs.	

1.11.3 1E Companion Products

A list of the feature dependencies between Tachyon and other 1E companion products.

This page describes the dependencies to and from Tachyon in regard to certain features that are implemented across companion 1E products. To view the general platform-related dependencies for Tachyon please refer to Supported Platforms.

1.11.3.1 1E companion products that Tachyon platform 8.1 depends on

Supported versions of 1E companion products that Tachyon platform 8.1 features depend on.

Products and features that Tachyon Platform depends on	Supported versions of companion products	
1E Client	Tachyon requires the 1E Client to be installed on all client computers. This replaces the legacy Agent. Client features:	• 1E Client • 1E Client 8.0

Products and features that Tachyon Platform depends on	Supported versions of companion products	
	• Real-time response to instructions, which supports the retrieval of information using questions, and running actions • Tags (freeform and device/coverage) • Criticality and Location • 1E Client UI to support the Real-Time Control Center, Announcements, Surveys, and Sentiment features of the Experience application # • Inventory, including process usage, to support, the: – Tachyon Activity Record feature – Inventory and other consumer applications. • Performance metrics features to support the Experience application # • Policy feature to support consumer applications: Guaranteed State ##, Experience #, and Nomad # Modules to support: • The Patch Success application # • Command and script execution • Nomad • Device criticality • Manipulation of files and processes • Manipulation of the registry and WMI # • Security #	• 1E Client 5.2 • 1E Client 5.1

Products and features that Tachyon Platform depends on	Supported versions of companion products	
	• Software uninstallation • User sessions, including Primary User. # not supported on non-Windows, ## partially supported on non-Windows Tachyon clients can optionally use the Nomad client module of 1E Client to more efficiently download content.	
Nomad	Clients can optionally use Nomad (1E Client with Nomad client features enabled) to provide more efficient downloading of content.	• 1E Client • 1E Client 8.0 • 1E Client 5.2 • 1E Client 5.1

1.11.3.2 1E companion products that depend on Tachyon platform 8.1

Supported versions of 1E companion products with features that depend on Tachyon platform 8.1.

(For products that depend on the 1E Client, please refer to urn:resource:component:647597).

Products and features that depend on Tachyon platform	Supported versions of companion products	
AppClarity	AppClarity is a consumer application of the platform and requires a full Tachyon infrastructure.	• AppClarity 8.1

Products and features that depend on Tachyon platform	Supported versions of companion products	
Application Migration	Application Migration is a consumer application of the platform and requires a full Tachyon infrastructure.	• Application Migration 8.1
Guaranteed State	Guaranteed State is a consumer application of the platform and requires a full Tachyon infrastructure.	• Guaranteed State 8.1
NightWatchman	Console live status of NightWatchman clients is an optional feature of NightWatchman and requires a full Tachyon infrastructure. NightWatchman is not a platform application and requires its own server(s).	• NightWatchman Enterprise 7.3
Nomad	Nomad is a consumer application of the platform and requires a full Tachyon infrastructure. It includes the Content Distribution feature that replaces the legacy ActiveEfficiency Server and the Nomad features provided.	• Nomad 8.1 (app) and associated (tools)
Patch Success	Patch Success is a consumer application of the platform and requires a full Tachyon infrastructure. It also requires 1E SLA Platform Business Intelligence to be installed and a SQL Server Analysis Server (SSAS) instance.	• Patch Success 8.1
Shopping	Shopping uses the platform and 1E Client for its client-side order notifications, and to allow end-users to shop for instructions. Shopping is not a platform application and requires its own server(s).	• Shopping 6.1
Experience	Experience is a consumer application of the platform and requires a full Tachyon infrastructure.	• Experience 8.1

Products and features that depend on Tachyon platform	Supported versions of companion products
Explorer	Explorer is a consumer application of the platform and requires a full Tachyon infrastructure.	• Explorer 8.1

Note

In addition to the consumer applications listed above, Tachyon Setup is also used to install the Inventory and Settings applications.

1.11.3.3 Cross-reference of Platform Application and Client versions

Each row in this table shows the 1E products versions that were released together, or intended to work with each other. It is not a complete listing of all supported 1E products.

1.11.3.4 Tachyon platform

Tachyon	Explorer	Patch Success	Guaranteed State	Experience	AppClarity	Application Migration	Active Efficiency	Nomad
8.1	8.1	8.1	8.1	8.1	8.1	8.1	replaced by CD	8.1
8.0	8.0	8.0	8.0	8.0	8.0	8.0	replaced by CD	8.0
5.2	5.2	1.3	1.5	1.3	7.1.105	3.1.105	replaced by CD	1.0
5.1	5.1	1.2.104	1.4	1.2	7.1	3.1	1.10	n/a
5.0	5.0	1.2	1.2	1.0	7.0	3.0	1.10	n/a

1.11.3.5 Other Platforms

Nomad Tools	PXE Everywhere	NightWatchman	Shopping
8.1	**8.1**	**7.3**	**6.1**

* 1E Client includes hotfixes

1.11.4 Device View

The **Device View** is a shared page accessible from many applications.

The **Overview** and **1E Client** tabs are always present in the **Device View**. Other tabs are visible if an app has been installed and is licensed.

Each tab has one or more panels with tiles populated with data from various sources, some by instructions that are run instantly, with results cached for 3 minutes. An appropriate error message is displayed instead of a tile in the following circumstances:

- If the device is offline, as indicated by the color of the icon in the top left
- The user does not have at least Viewer permission to view use the license the tab or panel
- The user does not have questioner permission to run the instruction

- An instruction has not been uploaded.

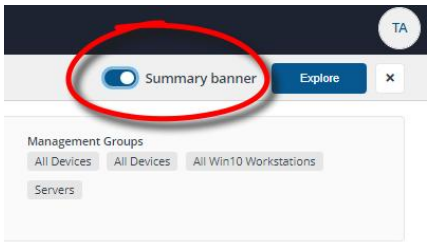
The Device View tabs and panels page lists the names of tabs and their panels, and a description of each tile indicating how the tile is populated.

1.11.4.1 The Device view in other Tachyon platform applications

The **Device View** is a common view used in multiple apps to present device details. The aim of the Device view is to provide a combined overview of all the information known about a device along with the ability to retrieve information about the device in real-time. Each application displays a different default tab (see below), other tabs are visible if an application has been installed and licensed, and the user has permission to use the application.

Tachyon application	Device page	Device page default tab	Device view
Introducing Tachyon Experience	Devices page	Clicking on one of the links in the **FQDN** column of the Experience Devices page displays the Device view for the selected device. When displaying the Device view from a Experience page the view defaults to the **Experience** tab. The **Experience** tab contains information	
Tachyon application	Device page	Device page default tab	Device view
		derived from and useful for Experience.	
Introducing Tachyon Explorer	The Devices Table	Clicking on the information icon next to the device name in the **Device Name** column of the **Devices Table** page displays the Device view for the selected device. When displaying the Device view from the Explorer Devices Table page, the view defaults to the **Overview** tab.	
Tachyon application	Device page	Device page default tab	Device view
Introducing Guaranteed State	Devices page	Clicking on one of the links in the **Device Name** column of the Explorer **Devices** page displays the Device view for the selected device. When displaying the Device view from a Explorer page the view defaults to the Policies tab. The **Policies** tab contains information derived from and useful for using Explorer.	
Tachyon application	Device page	Device page default tab	Device view
Introducing Nomad	Devices page	Clicking on one of the links in the **FQDN** column of the Nomad **Devices** page displays the Device view for the selected device. The default view in the Nomad devices view is **Downloads**.	
1.11.4.2 Summary banner

The Summary banner displays a quick summary of the information provided in the various tabs displayed in the Device View. It can be viewed by toggling the **Summary banner** switch to on.



The following picture shows the Summary banner displayed for a particular device.

1.11.4.2.1 Summary banner panels

The following table describes the information provided in the Summary banner.

<table>
<tr><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td> </td><td>Shows details equivalent to the following tiles:
<table>
<tr><th>Tab</th><th>Panel</th><th>Column</th><th>Tile</th><th>Description</th><th>Example</th></tr>
<tr><td>Overview</td><td>Details</td><td>Hardware and Operating System</td><td>Operating System</td><td>Version</td><td>Windows 10 Pro 20H2 (x86)</td></tr>

Overview	Details	Identification	Location	Timezone	UTC+00 - Europe/London

Panel	Description					Data source
					(Inferred)	
	Identification	Identification	Domain	1ETRN		
	Connectivity and Activity	Activity	User	1ETRN\Administrator		
	Connectivity and Activity	Connectivity	Local IP Address	10.0.1.3/24		
					Netmask	255.255.255.0

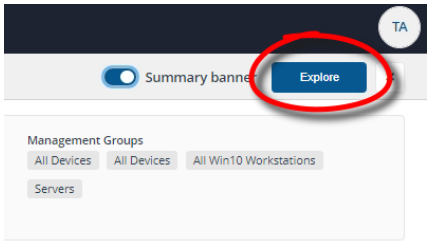
Shows details equivalent to the following tiles:

Tab	Panel	Column	Tile	Description	Example
Overview	Details	Connectivity and Activity	Connectivity	First Connected	22 March 2021, 12:17 UTC
Connectivity and Activity	Connectivity	Last Connected	27 April 2021, 09:23 UTC		
Connectivity and Activity	Activity	Last Boot	18 March 2021, 12:24 UTC		

Panel	Description	Data source
	Up time a month	
	Shows details equivalent to the following tiles: Tab: Overview; Panel: Details; Column: Identification; Tile: Grouping; Description: Mgmt. Groups; Example: • All Devices • All Win10 Workstations • Servers.	

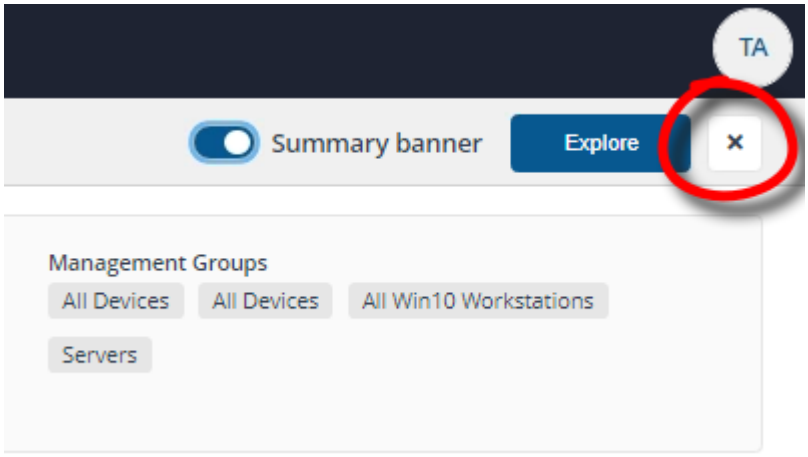
1.11.4.3 Exploring a device from the Device View

You can click on the **Explore** button in the Device View to launch Explorer with the current device set as the scope.



1.11.4.4 Closing the Device View

The Device View is a popup that is displayed when clicking on the name of a device on a page where devices are displayed. To return to the page you came from you need to click the x button.



1.11.4.5 The Device View tabs and panels

Tab	Panel	Description	Data source
Overview	**Details**	Displays a number of tiles sorted into **Identification**, **Hardware and Operating System** and **Connectivity and Activity** columns that show information for the selected device retrieved from the online status information stored in the TachyonMaster database. The columns and tiles are shown in the following table: Column / Tile / Description **Identification** / Identification / Displays the current device: • FQDN	Data from Tachyon Master (the latest online status message)

Tab	Panel	Description	Data source
		• Name • Domain • Criticality • SerialNumber • 1EClient • TachyonGU	

Tab	Panel	Description		Data source
			ID.	
		Location	Displays the device's: • Timezone • Offset • Location • Locale.	

Tab	Panel	Description		Data source
		Grouping	Displays the device: • Tags - free form tags applied to the device • Cove	

Tab	Panel	Description	Data source
		rageTags - any coverage tags applied to the device	

Tab	Panel	Description	Data source
		• Mgmt.Groups-lists the management groups the dev	

Tab	Panel	Description			Data source
				i c e i s a m e m b e r o f .	
		Hardware and Operating System	Hardware	Shows hardware details for the device: • Virtual/Phyiscal • Manufacturer	

Tab	Panel	Description	Data source
		• Model • DeviceType • ChassisType • RAM • CPUType • CPUArchi	

Tab	Panel	Description			Data source
				tecture • SMBIOSGUID.	
		Operating System	Shows operating system, type and version for example: • Type • Version • Ver		

Tab	Panel	Description		Data source
		sionNumber • Architecture • Installation.		
		Connectivity and	Connectivity	Shows current device connecti

Tab	Panel	Description	Data source
		Activity	vity status: • Status • LastConnected • FirstConnected • CertificateType

Tab	Panel	Description	Data source
		• Certificate Expiry • Connection State • Local IP Address • MAC Addr	

Tab	Panel	Description			Data source
				es s • Connecting IP.	
			Activity	Shows Last Boot date and time and current user.	
	Env. Variables	Shows a list of the environment variables set on the device.			
	Resource Usage	Two panels: • **Resource Usage over the last hour** - shows system disk, CPU and memory usage per minute for the last one hour • **Resource Usage at** *day/month/year time* - shows executable resource usage for a specific minute:			1E-TachyonPlatform-Hardware-ResourceUsage 1E-TachyonPlatform-Hardware-ResourceUsageByMinute

Tab	Panel	Description	Data source

Column	Description
Product	Resource name, for example 1E Client
Executable	Resource executable, for example 1e.client.exe
Instance Count	Number of currently running instances.
Cpu Percent	Percentage of CPU currently being consumed.
Memory Virtual Mb	Virtual memory consumed in Mb.
Memory Physical Mb	Physical memory consumed in Mb.
Io Read Kb Per Second	Number of associated read input/output operations per second.
Io Write Kb Per Second	Number of associated write input/output operations per second.
Handle Count	The number of object handles.

Downloads	**Summary**	Download activity and status for the device. Whenever you click on an FQDN on any of the Nomad pages then the **Device View** will be displayed with the **Downloads** tab selected.	Data from Nomad.

Tab	Panel	Description	Data source
Content	Content Titles on the selected device, the default view is from **All Sources**, **All Types** and **All Status**. **Note** You may see a difference in the number of items in a device's Nomad cache versus that displayed in the Nomad app Device View. This is because if downloaded content has been deleted from Configuration Manager, the content titles cannot be resolved in the Nomad app and are not displayed. This is under consideration for re-design and may be revised in future versions of Nomad.	Data from Nomad.	
Nomad Configuration	**1E Nomad Branch Settings .**	1E-Nomad-NomadBranchSettings	
Experience	**Metrics**	Metrics are the data points that are collected by the 1E Client and sent to the Tachyon server. They are collected at different intervals depending on the type of data that is being collected.	Data from Experience metrics
Trends	The Trends tab shows the changes in the scores over time. Hovering over any of the bars shows the details for that time and event. If the user viewing the device details also has the ability to at least ask a question in Explorer the Explore button will be visible.	Data from Experience metrics	
Logs	The Event Logs tab gives you a listing of the Windows Event log entries for that device.	Data from Experience metrics	

<table>
<tr><th>Tab</th><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td></td><td>This brings that data to this view and is very useful when determining the root cause of an issue that has been reported on the device.</td><td></td><td></td></tr>
<tr><td>Application Interactions</td><td>Shows user interaction times and ratios across applications measured over the last 30 days</td><td>1E-Experience-ApplicationInteraction</td><td></td></tr>
<tr><td>User interactions</td><td>Shows user interactive sessions with activity over last 30 days.</td><td>1E-Experience-UserInteractionHistory</td><td></td></tr>
<tr><td>Hardware</td><td>Disk drives</td><td>Shows disk drives, including hardware and usage information.

Column — Description

Drive — Drive letter.

Volume Name — Volume name, if set.

Drive Type — Drive type, for example:
• Removable Disk
• Local Disk
• Compact Disk.</td><td>1E-TachyonPlatform-Hardware-DiskDrives</td></tr>
</table>

Tab	Panel	Description		Data source
		Size Gb	Total disk size in Gb.	
		Free Space Gb	Current free space in Gb.	
		Usage Percent	Percentage used of total drive space.	
		File System	File system, for example NTFS.	
		Manufacturer	Standard or SSD drive.	
		Model	Drive manufacturer.	
		Serial Number	Unique disk serial number.	
		Partition	Drive and partition of the specific drive.	
		Firmware Revision	Drive firmware version.	
		Device ID	Device ID of the specified disk.	
Peripherals	Shows the list of plug and play hardware devices (Windows only).			1E-TachyonPlatform-Hardware-Devices

Tab	Panel	Description	Data source

Column	Description
Device Type	Hardware device, including for example things like: • Battery • Monitor • Keyboard • Mouse • Ports • SoftwareDevice.
Name	Device name.
Instance Count	Number of instances of a peripheral device.
Service	Associated Windows service, for example atapi, serial, PCI, ACPI.

Network	**Throughput**	Shows network throughput on all adapters for the last hour, represented by the following tiles: • **Average throughput** - including Timestamp, Bytes Received per Second, Bytes Sent Per Second • **Bytes received per second** • **Bytes sent per second**.	1E-TachyonPlatform-Network-AverageThroughput

<table>
<tr><th>Tab</th><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td>Interface configuration</td><td>Returns the output from the native network interface configuration command (e.g. ipconfig or ifconfig).</td><td>1E-TachyonPlatform-Network-InterfaceConfiguration</td><td></td></tr>
<tr><td>DNS</td><td>Shows the Cache and Host file tiles:
DNS Cache Contents - with the entries from local DNS cache, Host Name and Address.
HOSTS file - shows the content of the drivers/etc/hosts file.</td><td>1E-TachyonPlatform-Network-DnsCache
1E-TachyonPlatform-Network-HostFileContent</td><td></td></tr>
<tr><td>TCP connections</td><td>Returns a list of established TCP connections.<table><tr><th>Column</th><th>Description</th></tr><tr><td>Process Name</td><td>Local process name.</td></tr><tr><td>Process Id</td><td>Uniquely identifies an active process.</td></tr><tr><td>Class</td><td>Class of Internet networking protocol.</td></tr><tr><td>Local Address</td><td>Local network address.</td></tr><tr><td>Local Port</td><td>Network port used by a specific process.</td></tr><tr><td>Remote Address</td><td>Source IP address from which the traffic came from.</td></tr><tr><td>Remote Port</td><td>Remote port used by a specific process.</td></tr></table></td><td>1E-TachyonPlatform-Network-TcpConnections</td><td></td></tr>
</table>

Tab	Panel	Description	Data source
	Latency Ms The time taken in milliseconds for data or a request to go from a source to a destination.		
Listening ports	Returns a list of processes which are listening for network connections. Column: Description **Process Name**: Local process name. **Process Id**: Uniquely identifies an active process. **Class**: Class of Internet networking protocol. **Local Address**: Local network address. **Local Port**: Network port used by a specific process. **Product**: Related product, for example host process for Windows Services, Local Security Authority Process, SCNotification.	1E-TachyonPlatform-Network-ListeningPorts	
ARP Cache	Returns a list of processes which are listening for network connections and also shows routing tables.	1E-TachyonPlatform-Network-ArpCache 1E-TachyonPlatform-Network-RoutingTable	
WIFI	Shows a list of visible wifi networks, including basic network properties.	1E-TachyonPlatform-Network-WiFiNetworks	

Tab	Panel	Description	Data source

Column	Description
SSID	WiFi network name.
Is Connected	Shows as either true or false, dependent on whether the corresponding adapter is connected to the network.
Is Hidden	Shows as true if the WiFi network is not broadcasting a public SSID.
Is Secure	Shows as either true or false: • true - if the WiFi network is secure • false - if the network is open.
Signal	Shows WiFi signal quality; from 0 (worst) to 100 (best).
Authentication	The default authentication mechanism supported by the network.
BSSI IDs	The Service Set Identifier (SSID) of the network, it will be empty if the network is hidden.
Encryption	Shows the default encryption mechanism

Tab	Panel	Description	Data source
		supported by the network.	
	Adapter	Shows the WiFi network adapter name to which this network is visible.	
Policies	**Rules Compliance**	Column: **Rule Name** — Name of rules applied to the current device. The viewable list relates to the selected Tachyon policy from the policy dropdown on the page. **State** — If the device state is Compliant, Noncompliant or Not Applicable. **Type** — Rule type: • Check - allows you to verify that a device has a particular state, such as a registry	Data from Guaranteed State

Tab	Panel	Description		Data source
			key having a specific value • Fix - allows you to define a desired state for the device and then enforce that state.	
		Effectiveness	Policy rule effectiveness is the usefulness of policy rules and is represented as either: • Disabled - the rule has not yet been enabled from the Guaranteed State Rule Administration page, so it is not	

Tab	Panel	Description	Data source
		currently active • Unassigned - the rule is enabled, but has not been deployed to any devices • Ineffective - the rule has been deployed, but no devices have changed their compliance position for this rule in the last thirty days • Effective - the rule has been deployed and at least	

Tab	Panel	Description	Data source
		one device has changed its compliance position for this rule in the last thirty days. **History** Rule history.	
Software	**Installations**	Shows (per-device) installed software. **Product** Software product name. **Publisher** Software publisher. **Version** Product version number. **Architecture** Instruction set architecture (ISA) version. **Install Date** Software installation date.	1E-TachyonPlatform-Software-Installations

<table>
<tr><th>Tab</th><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td>Windows services</td><td>Shows list of installed Windows services and their current state.

<table><tr><th>Column</th><th>Description</th></tr><tr><td>Name</td><td>Windows service name.</td></tr><tr><td>State</td><td>Windows service state, Running or Stopped.</td></tr><tr><td>Startup Type</td><td>Windows service startup type, for example Automatic, Automatic (Delayed Start), Manual, Disabled.</td></tr><tr><td>Process Id</td><td>Uniquely identifies an active process.</td></tr><tr><td>Description</td><td>Windows service description.</td></tr><tr><td>Logon Account</td><td>Windows service logon account context.</td></tr><tr><td>Type</td><td>Windows services type, for example file system driver, kernel driver, shared process.</td></tr></table></td><td>1E-TachyonPlatform-Software-Services</td><td></td></tr>
<tr><td>Env. Variables</td><td>Shows operating system environment variables.</td><td>1E-TachyonPlatform-Software-EnvironmentVariables</td><td></td></tr>
<tr><td>Processes</td><td>Shows detailed information about all running processes.</td><td>1E-TachyonPlatform-Software-Processes</td><td></td></tr>
</table>

Tab	Panel	Description	Data source

Column	Description
Product	Software product name.
Executable	Executable name.
Version	Product version number.
Devices count	How many devices are reporting.
Crashes	Number of times this software crashed during the last 24-hour reporting period.
Hangs	Number of times this software crashed during the last 24-hour reporting period. **Note** Software crash and hang information is obtained from Windows event data. For background information on Windows events and the event viewer refer to https://support.microsoft.com/en-gb/help/302542/how-to-diagnose-system-problems-with-event-viewer-in-microsoft-windows
Performanc	Number of performance anomalies detected in this

Tab	Panel	Description	Data source
	e anomalies	software during the last 24-hour reporting period.	
	I/O write KB/s	Average disk I/O read rate per second during the last 24-hour reporting period.	
	I/O write KB/s	Average disk I/O write rate per second during the last 24-hour reporting period. **Note** For background information on analyzing disk storage performance refer to https://docs.microsoft.com/en-gb/archive/blogs/cotw/analyzing-storage-performance	
	Virtual Memory Usage KB	Average Virtual Memory Usage KB during the last 24-hour reporting period. **Note** For an explanation of Windows Virtual Memory organization refer to https://answers.microsoft.com/en-us/windows/forum/windows_10-performance/physical-and-virtual-memory-in-windows-10/e36fb5bc-9ac8-49af-951c-e7d39b979938 and https://support.microsoft.com/en-	

Tab	Panel	Description	Data source
		us/help/2160852/ram-virtual-memory-pagefile-and-memory-management-in-windows	
	Processor Time Seconds	Each instance of the executable will burn processor time. This column gives the average of the total time consumed by each process instance per second. Each instance uses the sum of all time used by each core in parallel. Therefore, it is possible to see more seconds here than in a day (usually 60 x 60 x 24 = 86400) for the whole column, if your system is working extremely hard 24x7. The theoretical maximum would be somewhere near ***number of cores*** x ***seconds per day*** . Hence, 'Processor Time' rather than 'Human Time'	
	Processor Time %	This is an easier notion than Processor Time Seconds. This is the average of the processor consumption of each instance. Each instance of this process will have caused different percentages of compute resource in all the processors and cores to be used over time (unless they have specifically requested certain core affinity). For each minute each process is running, a profile of the usage is built for the whole day. This value is the average of all of those samples. There is no way to work	

Tab	Panel	Description	Data source
		out, for any one of the process instances involved, how long any particular instance was running for. This could indicate a process that is going wild with resources, but it would take more investigation on the device to discover for how long this is happening. It is perfectly possible to see all the values in this column adding up to more than 100% as the processes were not necessarily running at the same time. **Note** For further information on Processor time refer to https://social.technet.microsoft.com/wiki/contents/articles/12984.understanding-processor-processor-time-and-process-processor-time.aspx	
	Responsiveness Impact %	An indicator of how reactive a process is to activity by other processes on the device. Typically, anti-virus products watch and respond to potentially suspicious activity such as increased network traffic. Anti-virus products will differ in their impact on the overall performance of a device. **Note** Responsiveness Impact % is used to indicate how sensitive a process appears to be to the use of system resources by other	

Tab	Panel	Description	Data source
		processes on a device. For example, Security Protection software present on a device may reveal a spike in its activity whenever a new process is started on that device. This would typically be because the Security Protection software may wish to ensure that the new process starting on the device is present in a security white list. Other software may also react to activity by other processes and by reacting they impact system resource uses, thereby adversely affecting the user's experience. So it is useful to be able to identify software with the highest Responsiveness Impact on a device and potentially investigate further. **Note** Responsiveness Impact % represents the proportion of the increased CPU activity detected by the 1E Client as a result of performing a set of operating system-level operations that can be	

Tab	Panel		Description	Data source
		attributed to a given running process. Examples of these would be Windows registry and resource creation operations. It is reported as a percentage to normalize results across devices that offer a range of computing power. For example, if *software.exe* on a device is attributed a Responsiveness Impact of 53% this means that more than half of the spike in CPU usage caused by software monitoring activity on that device can be attributed to *software.*		
	Handle Count	Average number of Windows handles used by this software during the last 24-hour reporting period. **Note** For further information on Windows handles refer to https://docs.microsoft.com/en-us/windows/win32/sysinfo/handles-and-objects For tips on examining open handles for any Windows process refer to https://docs.microsoft.com		

Tab	Panel	Description	Data source
		/en-us/sysinternals/downloads/handle and https://techcommunity.microsoft.com/t5/windows-blog-archive/pushing-the-limits-of-windows-handles/ba-p/723848	
	Physical Memory Usage KB	Average Physical Memory Usage KB during the last 24-hour reporting period. **Note** Please refer to https://docs.microsoft.com/en-us/sysinternals/downloads/rammap for a useful tool to examine physical memory allocation on a device.	
1E Client	**Binaries**	Shows a list of the binary files in the executable folder of the 1E Client. Column: Description **File Name**: Associated 1E Client file name. **File Version**: Software version. **File Size**: File size in bytes. **Description**: File description	1E-TachyonPlatform-Client-Binaries

Tab	Panel	Description		Data source
		Date Created	The date the file was written to disk.	
		Date Modified	The date the file was last saved.	
Configuration file	Shows the full content of the 1E Client configuration file, including: • Logging settings • Communication settings • Agent settings • Module settings.			1E-TachyonPlatform-Client-ConfigFileContent
Extensibility	Shows extensibility objects (modules and providers) loaded by the 1E Client.			1E-TachyonPlatform-Client-Extensibility
	Column	Description		
	Type	Module or Provider component.		
	Binary Name	Associated 1E Client binary name, for example 1E.Client.Module.Interaction.dll		
	Name	Name, for example Interaction.		
	Version	1E Client version, for example 5.2.5.251		
Local Storage	Shows **Data Files** and **Client Inventory Database Use** tiles that display the list of:			1E-TachyonPlatform-Client-DataFiles 1E-TachyonPlatform-Client-InventoryDatabaseUse

Tab	Panel	Description	Data source
		• Data files (logs, databases, etc) created by the 1E Client • Tables in the1E Client Inventory database, along with a row count per table.	

1.11.4.6 Product Pack references

The Device View page requires the following feature-related Product Packs that contain instructions used by the page.

Product Pack name	Instruction name	Device View panel	Readable Payload
1E-Experience	**1E-Experience-LogonSessions**	n/a	Current user logon sessions
1E-Experience	**1E-Experience-UserInteractionHistory**	Experience\User Interaction	Get user interaction history over last 30 days
1E-Nomad	**1E-Nomad-NomadBranchSettings**	Downloads\Nomad Configuration	Nomad Branch service settings
1E-Tachyon-Platform	**1E-TachyonPlatform-Client-Binaries**	1E Client\Binaries	List deployed 1E Client binary files
1E-Tachyon-Platform	**1E-TachyonPlatform-Client-ConfigFileContent**	1E Client\Configuration File	Show 1E Client configuration file content
1E-Tachyon-Platform	**1E-TachyonPlatform-Client-DataFiles**	1E Client\Local Storage	List 1E Client data files
1E-Tachyon-Platform	**1E-TachyonPlatform-Client-Extensibility**	1E Client\Extensibility	Show 1E Client extensibility (modules and providers)

Product Pack name	Instruction name	Device View panel	Readable Payload
1E-Tachyon-Platform	**1E-TachyonPlatform-Client-InventoryDatabaseUse**	1E Client\Local Storage	List of inventory database tables
1E-Tachyon-Platform	**1E-TachyonPlatform-Hardware-Devices**	Hardware\Peripherals	List of hardware devices
1E-Tachyon-Platform	**1E-TachyonPlatform-Hardware-DiskDrives**	Hardware\Disk Drives	List disk drives
1E-Tachyon-Platform	**1E-TachyonPlatform-Hardware-ResourceUsage**	Overview\Resource Usage	Hardware resource usage over time
1E-Tachyon-Platform	**1E-TachyonPlatform-Hardware-ResourceUsageByMinute**	Overview\Resource Usage	Resource usage by executable for %minute%
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-ArpCache**	Network\ARP and Routing	List entries in ARP cache
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-AverageThroughput**	Network\Throughput	Network throughput for last 60 minutes
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-DnsCache**	Network\DNS	DNS cache entries
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-HostFileContent**	Network\DNS	Host file content (for DNS overrides)
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-InterfaceConfiguration**	Network\Interface configuration	Network interface configuration
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-ListeningPorts**	Network\Listening ports	Processes listening on TCP and UDP ports
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-RoutingTable**	Network\ARP and Routing	Routing table information

Product Pack name	Instruction name	Device View panel	Readable Payload
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-TcpConnections**	Network\TCP connections	Established TCP connections
1E-Tachyon-Platform	**1E-TachyonPlatform-Network-WiFiNetworks**	Network\WiFi	List visible WiFi networks
1E-Tachyon-Platform	**1E-TachyonPlatform-Software-EnvironmentVariables**	Software\Env. Vars	List environment variables
1E-Tachyon-Platform	**1E-TachyonPlatform-Software-Installations**	Software\Installations	List software installations
1E-Tachyon-Platform	**1E-TachyonPlatform-Software-Processes**	Software\Processes	List running process details
1E-Tachyon-Platform	**1E-TachyonPlatform-Software-Services**	Software\Windows Services	List Windows Services

1.11.5 Log files

Names and locations of log files created by Tachyon Server, 1E Client, and Tachyon tools.

1.11.5.1 Tachyon Setup logs

Setup creates a Setup log file for itself and an Install log for each of the components (if used) in the same folder as itself:

- *BIInstall.log*
- *CatalogInstall.log*
- *ContentDistribution.log*
- *SLAInstall.log*
- *Tachyon.Setup.log*
- *TachyonInstall.log*

1.11.5.2 Tachyon Server logs

The default location for all logs is the folder *%ALLUSERSPROFILE%\1E*

Subsystem	Component		
Tachyon Master	Tachyon portal UI and applications (Tachyon)	1E\Tachyon\	*Tachyon.Portal.log*
Consumer API	1E\Tachyon\	*Tachyon.ConsumerAPI.log*	
Coordinator service	1E\Tachyon\	*Tachyon.Coordinator.log* *Tachyon.Instrumentation.log*	
Experience web application	1E\Tachyon\	*Tachyon.Experience.log*	
1E Catalog	Catalog UI (CatalogWeb - Admin sync)	1E\Catalog\	*Catalog.Integration.UI.log*
Catalog API			
Catalog Update Service	1E\Catalog\	*Catalog.UpdateService.log*	
Nomad	Nomad web application	1E\ContentDistribution	*ContentDistribution.log*

Please refer to Services and NTFS Security if changing the location of log files.

In this version of Tachyon Server, some installers do not support the LOGPATH property and the logs folder is not configurable during installation.

Each component has a configuration file in the Tachyon Server installation folder structure, which contains log configuration details. Defaults are:

- Filepath *%ALLUSERSPROFILE%\1E\<product>* where the product is Tachyon, SLA Platform, and 1E Catalog.
- Filename as shown in the table above.
- Maximum size 10MB (2MB for Switch logs).
- 2 rollover files numbered 1 to 2 with the rollover number included as n.log (5 rollover files for Switch logs).
- Date and timestamps are UTC to help troubleshooters synchronize logs on systems in different time zones.

Switch logs have the following names:

- The first Switch installed will typically have a log filename **Tachyon.Switch.4000.SW1.log** (where 4000 is the port it is listening on and SW1 is the **config name** in the SwitchConfiguration table in the TachyonMaster database).
- Other Switches on the same server will have different config names appended.
- The log filename will be unique on a server, but there may be the same named log on a different server.
- A Switch will continue to use the same log unless the SwitchConfiguration table is modified so that a different ID is used.
- If you see a Tachyon.Switch.log without a config name appended, this is a special case where a Switch cannot find its correct configuration and has fallen back to using the template * row which has ID=1. In which case you will need to troubleshoot how that happened.
- Rollover logs have numbers appended, for example, Tachyon.Switch_A.1.log, up to a default maximum of 5.

Tachyon server components use the **log4net RollingFileAppender** class. Details can be found in http://logging.apache.org/log4net.

1.11.5.2.1 Tachyon Server log files

For any issue, please provide a zip containing log files from the following locations:

- %ALLUSERSPROFILE%\1E\Catalog*.log
- %ALLUSERSPROFILE%\1E\ContentDistribution*.log
- %ALLUSERSPROFILE%\1E\Platform Consumers*.log
- %ALLUSERSPROFILE%\1E\SLA Platform*.log
- %ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

- %ALLUSERSPROFILE%\1E\Licensing*

Please refer to the Log files page for more details.

1.11.5.2.2 Logging Levels

The table below describes the logging levels which are configurable for server components.

Value	Description
Error	Only outputs errors. An error is a serious problem, typically requiring operator intervention of some sort to restore full functionality.
Warn	Outputs errors and warnings. A warning indicates a potential problem, where the system can nonetheless function without intervention.
Info	Outputs general information in addition to errors and warnings. This is the default.
Debug	Outputs debugging information in addition to all the previous levels.

Warning

Logging levels should only be changed from **info** only if requested by 1E Support and reset to **info** after investigation is complete.

Tip

The method of configuring logging levels uses the above text values, where -log=0 is the default to mean the same as *-log=info*.

1.11.5.3 1E Client logs

1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

1E Client logs on macOS

/Library/Logs/1E.Client.Daemon.log (shows any service start errors)

/Library/Logs/1E.Client.log (shows the current operation of the 1E Client)

1E Client logs on other non-Windows platforms

/var/log/1E/Client/1E.Client.log

Nomad client log

%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles\NomadBranch.log

PXE Everywhere Agent log

%ALLUSERSPROFILE%\1E\PXEEverywhere\PXEEverywhere.log

Shopping WSA client log

%ALLUSERSPROFILE%\1E\Client\WSA.log

WakeUp client log

%ALLUSERSPROFILE%\1E\Agent\WakeUpAgt.log

Note

By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

1.11.5.4 Software Reclaimer logs

Every time the Reclaimer runs it will create a local log file of the process it is doing. The location and name of the log file depends on what task the reclaimer is doing.

Task	Logpath	Notes
Optout	**C:\Users\{USER}\AppData\Local\Temp\ AppClarity.SoftwareReclaimer.log**	Optout mode is normally run under user context so that the user can interact with the dialog. This means the log file will be in the users Temp folder within the

Task	Logpath	Notes
		user profile.
Mandatory	**C:\windows\Temp\AppClarity.SoftwareReclaimer.log**	Mandatory mode is normally set to run under system context, in order to process reclaim uninstall commands. Therefore, the log file will be under the system temp directory.
Reclaim	**C:\windows\Temp\AppClarity.SoftwareReclaimer.MSI.log**	For a mandatory reclaim, if a reclaim occurs using an MSI then an MSI log file is also created.

1.11.5.5 Configuration Manager Console Extensions log

%ALLUSERSPROFILE%\1E\Tachyon\Tachyon.CmConsole.log

%ALLUSERSPROFILE%\1E\Tachyon\Tachyon.RunInstructionUI.log

1.11.5.6 The Instruction Management Studio (TIMS) log

%ALLUSERSPROFILE%\1E\Tachyon\Tachyon.InstructionManagementStudio.log

1.11.5.7 Tachyon Product Pack Deployment Tool log

Tachyon.ProductPackDeploymentTool.log

In the same location as the tool.

1.11.6 Scripts

All scripts are referenced on other pages within the documentation.

1.11.6.1 Scripts for installation and upgrades

1.11.6.1.1 Install Windows Server roles and features

The following PowerShell script is used on Windows Server roles and features. Tachyon Setup can do all of this except for **Basic Authentication** (required by 1E Core) and **HTTP redirect** (required if Nomad is supporting down-level clients after replacing ActiveEfficiency).

```
Import-Module ServerManager

Get-WindowsFeature | Out-file $PSScriptRoot\ServerManager-1.txt -Append
Install-WindowsFeature Web-Server,
Web-Http-Redirect,
Web-Dyn-Compression,
Web-Basic-Auth,
Web-IP-Security,
Web-Windows-Auth,
Web-Asp-Net45,
Web-Mgmt-Console,
Net-Framework-45-Core,
Net-Framework-45-ASPNET

Uninstall-WindowsFeature Web-DAV-Publishing

Get-WindowsFeature | Out-file $PSScriptRoot\ServerManager-2.txt -Append
```

1.11.6.1.2 Changing the configuration of Network Adapters

The following extract is used here: Changing the configuration of Network Adapters.

If the configuration of any network adapters is changed, then the Tachyon website configuration for **IP Address and Domain Restrictions** may need to be updated with the server's new IPv4 and IPv6 addresses. Failure to update the configuration after a network change will cause issues between the Switch and the Core and prevent the Tachyon Server from functioning.

Use the PowerShell cmdlet **Gevt-NetIPAddress** to determine the current IP Addresses, and if necessary update the configuration of the Core web application.

The following **AddIpSec.ps1** script can be used to refresh local IP Addresses. It does *not* remove old, unwanted, or remote IP Addresses. Nor does it add addresses for remote Switches, which would need to be added manually.

```
# Adds local IPv4, v6 and loopback addresses to the IP Address and Domain Restr
ictions of the specified web applications. It does not delete any addresses
# Remote addresses must be manually configured.
# It only adds addresses if the specified web application exists.

Import-Module "WebAdministration"

Function AddIpSec() {
    param(
        [Parameter(Mandatory=$true)][string]$SiteName,
        [Parameter(Mandatory=$true)][string]$AppName
    )

    Write-Output "Adding IP restrictions to $AppName"

    $fullAppPath = "IIS:\Sites\" + $SiteName + "\" + $AppName

    if (Test-Path -Path $fullAppPath) {
        $appPath = $SiteName + "/" + $AppName
        $ipAddreses = Get-NetIPAddress | sort IpAddress | foreach { $_.IPAddres
s }
        Set-WebConfigurationProperty /system.webserver/security/ipsecurity -Nam
e allowUnlisted -Value "false" -Location $appPath -PSPath IIS:\
        foreach ($ipAddress in $ipAddreses)
        {
            $existingRestriction = Get-WebConfiguration system.webServer/Securi
ty/ipSecurity/add -Location $appPath -PSPath IIS:\ | where { $_.ipAddress -eq $
ipAddress }
            if (-not ($existingRestriction)) {
                Add-WebConfiguration system.webServer/security/ipSecurity -Loca
tion $appPath -Value @{ipAddress="$ipAddress";allowed="true"} -PSPath IIS:\
                Write-Output "Allowed restriction on IP $ipAddress added to $Ap
pName"
            }
            else {
                Write-Output "Restriction on IP $ipAddress already exists in $A
ppName. So skipping."
            }
        }
    }
    else {
        Write-Output "$AppName web application does not exist"
    }
}

$siteName = "Tachyon"
```

```
AddIpSec -SiteName $siteName -AppName "Core"
AddIpSec -SiteName $siteName -AppName "WelcomeCore"
```

1.11.6.1.3 Change Shopping 6.0 Sync from ActiveEfficiency to direct Configuration Manager

The following SQL script is used on In-place upgrade of ActiveEfficiency Server for Nomad.

```
-- Disclaimer:
-- Your use of this script is at your sole risk. This script is provided "as-is
", without any warranty,
-- whether express or implied, of accuracy, completeness, fitness for a particu
lar purpose, title or
-- non-infringement, and is not supported or guaranteed by 1E. 1E shall not be
liable for any damages
-- you may sustain by using this script, whether direct, indirect, special, inc
idental or consequential,
-- even if it has been advised of the possibility of such damages.

UPDATE dbo.tb_Preference
SET
Description = 'Sets the interval for synchronizing the members in Computer Cate
gory groups held in the Shopping database with Active
Directory. Also used for the ConfigMgr, Intune Machine sync and the ConfigMgr,
Intune user sync. The value for the interval uses the units defined in the
Active Directory Sync Units parameter.'
WHERE
preferencename = 'Users and Machines, AD Sync Interval'
GO

UPDATE dbo.tb_Preference
SET
Description = 'The unit is used by the AD, ConfigMgr, Intune Machine and User S
ync Interval setting. This may be set to one of the
following values: Days, Hours or Minutes.'
WHERE
preferencename = 'Users and Machines, AD Sync Units'
GO

UPDATE dbo.tb_Preference
SET
PreferenceValue = 'False'
WHERE
preferencename = 'Sync Machines and Users From Active
Efficiency'
GO

UPDATE dbo.tb_Preference
SET
Hidden = 1
WHERE
preferencename = 'Sync Machines From Old Sccm'
```

```
GO

UPDATE dbo.tb_Preference
SET
Hidden = 1
WHERE
preferencename = 'ActiveEfficiency ServerName'
GO
```

1.11.6.1.4 Manually migrate Nomad data from ActiveEfficiency to Content Distribution

The following PowerShell and SQL scripts are used on Side-by-side upgrade of ActiveEfficiency Server for Nomad. Click to download - AE-CD Data Migration Scripts.zip

Note

1. **ExportData.ps1** - run on any computer that has read access to the ActiveEfficiency database
2. **CreateTables.sql** - run on the SQL Server instance that hosts the ContentDistribution database created by Tachyon Setup
3. **ImportData.ps1** - run on any computer that has write access to the ContentDistribution database.

1.11.6.1.5 Granting Network Service access to Configuration Manager

The following SQL script is used on System Center Configuration Manager connector configuration.

```
-- Connect to the SQL instance using an account that has sysadmin rights.
-- Execute this SQL script on the Configuration Manager database.
-- The script creates a SQL Login on the instance for [hostname\ConfigMgr_DView
Access]
-- and grants it the following rights on the Configuration Manager database:
-- [db_datareader]
-- EXECUTE on [dbo].[fn_GetAppState]
-- EXECUTE on [dbo].[fnGetSiteNumber]

DECLARE @SqlLogin nvarchar(2000)
DECLARE @SqlString nvarchar(max)

SET @SqlLogin = CAST(host_name() AS varchar(512)) + '\ConfigMgr_DViewAccess'
PRINT 'Granting permissions for ''' + @SqlLogin + ''' on database ' + DB_NAME()
+ ' ...'

SET @SqlString = '
IF NOT EXISTS ( SELECT schema_name FROM information_schema.schemata WHERE schem
a_name = '''+@SqlLogin +''' )
EXEC (''CREATE SCHEMA [' + @SqlLogin + ']'')
'
EXEC sp_executesql @SqlString
```

```
SET @SqlString = '
IF NOT EXISTS (SELECT * FROM sys.server_principals WHERE name = '''+ @SqlLogin
+''')
CREATE LOGIN [' + @SqlLogin + '] FROM WINDOWS WITH DEFAULT_DATABASE=[master]
'
EXEC sp_executesql @SqlString

SET @SqlString = '
IF NOT EXISTS (SELECT * FROM sys.database_principals WHERE name = '''+ @SqlLogi
n +''')
CREATE USER [' + @SqlLogin + '] FOR LOGIN [' + @SqlLogin + '] WITH DEFAULT_SCHE
MA=[' + @SqlLogin + ']
'
EXEC sp_executesql @SqlString
PRINT 'SQL Login created.'

SET @SqlString = '
ALTER ROLE [db_datareader] ADD MEMBER [' + @SqlLogin + ']
GRANT EXECUTE ON [dbo].[fn_GetAppState] TO [' + @SqlLogin + '] AS [dbo]
GRANT EXECUTE ON [dbo].[fnGetSiteNumber] TO [' + @SqlLogin + '] AS [dbo]
'
EXEC sp_executesql @SqlString
PRINT 'Permissions granted.'
```

1.11.6.1.6 Estimating the RAM requirements for AI Powered Auto-curation

The following scripts are used on AI Powered Auto-curation to calculate the amount of additional RAM that is required before you enable this feature.

The following script is run on the Configuration Manager database before Tachyon is installed.

```
/*SCCM database query to get number of distinct software titles from SCCM datab
ase*/
USE [YourSCCMDBName]
GO
SELECT COUNT(*) AS 'Distinct Software Titles'
FROM (
        SELECT DISTINCT DisplayName0 AS Title FROM [v_ADD_REMOVE_PROGRAMS] WITH
(NOLOCK)
        UNION
        SELECT DISTINCT [Caption0] AS Title FROM [v_GS_OPERATING_SYSTEM] WITH (
NOLOCK)
) AS Titles
```

The following script is run on SLA-Data database after Tachyon is installed and has already populated the inventory repository.

```
/*SLA query to get number of distinct software titles from SLA-Data database*/
USE [SLA-Data]
CREATE TABLE #Software
       (
              [SoftwareID]                    INT IDENTITY(1,1) PRIMARY KEY,
```

```
            [DataSource]                        NVARCHAR(255) COLLATE DATABASE_
DEFAULT,
            [SoftwareIdent]                     NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
            [SoftwareIdent_Hash]                        VARBINARY(128),
            [Vendor]                            NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
            [Vendor_Hash]                                   VARBINARY(128),
            [Title]                             NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
            [Title_Hash]                        VARBINARY(128),
            [Version]                           NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
            [Version_Hash]                      VARBINARY(128),
            [ColloquialVersion]                 NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
            [ColloquialVersion_Hash]            VARBINARY(128),
            [Edition]                           NVARCHAR(MAX) COLLATE DATABASE_
DEFAULT,
            [Edition_Hash]                      VARBINARY(128),
            [NormalizedProductID]               INT
      );
SELECT * FROM #Software
EXEC [usp_ReportDataEx_se] 1, N'Software', N'#Software';

SELECT count(*) AS 'Distinct Software Titles'
FROM
(
SELECT DISTINCT [Title] FROM #Software
) a

DROP TABLE #Software
```

1.11.6.1.7 Modifying 1E Catalog AI Powered Auto-curation file download post-installation

The following script can be used to modify the **EnableAIPackageSync** setting in the **Settings** table of the **1ECatalog** database, and is used on the Configuring 1E Catalog connection to 1E Cloud page. Click below to view the SQL script to configure the this setting.

```
/* Script to change 1ECatalog setting */
USE [1ECatalog]
GO
DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
);;
SET @setting = 'EnableAIPackageSync'
SET @newvalue = 'True'

SET @oldvalue = (SELECT [Value] FROM [dbo].[Settings] WHERE [Key]= @setting)

UPDATE [dbo].[Settings] SET [Value]=@newvalue WHERE [Key]=@setting
```

```
SELECT @setting AS 'Setting', @oldvalue AS 'Before', [Value] AS 'After' FROM [d
bo].[Settings]
WHERE [Key]=@setting
GO
```

1.11.6.1.8 Modifying the AI Package Deployment Path

The *Script to change SLA Deployment Path for AI Package* script can be used to modify the **AIModelDeploymentPath** setting in the **Settings** tables of the **SLA-Shared** and **SLA-Data** databases and is used on the AI Powered Auto-curation page. It is not possible to modify the download path use by the 1E Catalog Update service. Click below to view the SQL script to configure this setting.

```
/* Script to change SLA Deployment Path for AI Package */
/* The value is copied from SLA-Shared to instance in SLA-Data when a new inven
tory repository is created */
/* Updating SLA-Shared means script is not required for each new repository */
/* Updating all values in SLA-Data means all repositories use the same value */

DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
)
SELECT @newvalue = 'C:\ProgramData\1E\SLA Platform\AI'
SELECT @setting = 'AIModelDeploymentPath'

USE [SLA-Shared]
SELECT @oldvalue = [VALUE] FROM [dbo].[ProjectSetting]
WHERE [Group] = 'ProcessAIEngine' AND [Name] = @setting

UPDATE [dbo].[ProjectSetting] SET [Value]=@newvalue WHERE [Name]=@setting

SELECT DB_NAME() + '.dbo.ProjectSetting' AS 'Table', @setting AS 'Setting', @ol
dvalue AS 'Before', [Value] AS 'After' FROM [dbo].[ProjectSetting]
WHERE [Name]=@setting

USE [SLA-Data]
SELECT @oldvalue = [VALUE] FROM [dbo].InstanceSetting
WHERE [Group] = 'ProcessAIEngine' AND [Name] = @setting AND [InstanceID] = 1

UPDATE [dbo].[InstanceSetting] SET [Value]=@newvalue WHERE [Name]=@setting

SELECT DISTINCT DB_NAME() + '.dbo.InstanceSetting' AS 'Table', @setting AS 'Set
ting', @oldvalue AS 'Before', [Value] AS 'After' FROM [dbo].[InstanceSetting]
WHERE [Name]=@setting
GO
```

1.11.6.1.9 Modifying 1E Client Cloud synchronization behavior post-installation

The *Script to change 1ECatalog setting* script is used to configure the 1E Catalog **SubscriptionType** setting and is used on the Configuring 1E Catalog connection to 1E Cloud page. Click below to view the SQL script to configure this setting.

```
/* Script to change 1ECatalog setting */
USE [1ECatalog]
GO
DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
);;
SET @setting = 'SubscriptionType'
SET @newvalue = '2'

SET @oldvalue = (SELECT [Value] FROM [dbo].[Settings] WHERE [Key]= @setting)

UPDATE [dbo].[Settings] SET [Value]=@newvalue WHERE [Key]=@setting

SELECT @setting AS 'Setting', @oldvalue AS 'Before', [Value] AS 'After' FROM [d
bo].[Settings]
WHERE [Key]=@setting
GO
```

1.11.6.2 Operational scripts

1.11.6.2.1 Create Direct-based management groups from a file

The following PowerShell script is used on Management Groups page.

> **Note**
>
> This script has changed to support an API change in Platform 8.1

Click here to download - Create-DirectManagementGroupUsingFile.ps1

Click **Read more...** to view **Create-DirectManagementGroupUsingFile.ps1**.

```

fied version before contacting 1E Support.
```

```
.DESCRIPTION
This script reads the Device FQDN list in files and creates Direct Membership M
anagement Groups through SLA/Tachyon APIs. If the group does not exist
it is created and devices are added. If the group exists, the existing devices
are deleted and new devices are added.

.PARAMETER TachyonApiBaseUrl
Mandatory parameter.  The header name used to access the Tachyon web service.
Should match the header listed in the IIS bindings on the Tachyon server.

.PARAMETER FolderPath
Mandatory parameter.  The name of the input folder which contains the files to
be used in creating Direct Membership Management Groups. These files contain
the list of devices to be used in creating Management Groups.  The File name sh
ould be same as the name of Name of Management Group. Also, the first line
of the file should contain the description of Management Group to be created, f
rom next line onwards every line contains the Device FQDN.

.PARAMETER UseCustomCredentials
Optional switch.  If UseCustomCredentials is used, User will be prompted to ent
er the credentials, otherwise the script will use default credentials.

.EXAMPLE
.\Create-DirectManagementGroupUsingFile.ps1 -TachyonApiBaseUrl https://tachyon.
lab.local -FolderPath C:\Temp\MgFolder

Scenario:
A Tachyon server is accessed using URL https://tachyon.lab.local/Tachyon using
default credentials.  The files containing the Device FQDN list
is in the directory C:\Temp\MyFolder.

.EXAMPLE
..\Create-DirectManagementGroupUsingFile.ps1 -TachyonApiBaseUrl https://tachyon
.lab.local -FolderPath C:\Temp\MgFolder -UseCustomCredentials

Scenario:
A Tachyon server is accessed using URL https://tachyon.lab.local/Tachyon using
different credentials other than current default credentials.
The files containing the Device FQDN list is in the directory C:\Temp\MyFolder.

1.11.6.2.2 Create Direct-based management groups from a Configuration Manager collection

The following PowerShell script is used on Management Groups page.

Note

This script has changed to support an API change in Platform 8.1

Click here to download - Create-DirectManagementGroupUsingCmCollection.ps1

Click **Read more...** to view **Create-DirectManagementGroupUsingCmCollection.ps1**.

.DESCRIPTION
This script reads the memberships of ConfigMgr Collections (Both Direct and Que ry based membership) and creates Direct Membership Management
Groups through SLA/Tachyon APIs. If the group does not exist it is created, and devices are added. If the group exists, the existing devices
are deleted and new devices are added. The script is designed to run from the C onfigMgr server It queries WMI and gets the information
necessary to connect to the ConfigMgr's site namespace.

.PARAMETER TachyonApiBaseUrl
Mandatory parameter. The header name used to access the Tachyon web service. Should match the header listed in the IIS bindings on the Tachyon server.

.PARAMETER FilePath
Mandatory parameter. The name of the input file which contains the list of col lections to be used in creating Direct Membership Management Groups. Each line in file
contains Collection Name, Management Group Name, and Management Group Descripti on; all three values separated by a comma.
e.g.
Collection 1,Management Group 1, Management Group 1 Description
Collection 2,Management Group 2, Management Group 2 Description

.PARAMETER UseCustomCredentials
Optional switch. If UseCustomCredentials is used, User will be prompted to ent er the credentials, otherwise the script will use default credentials.

.EXAMPLE
.\Create-DirectManagementGroupUsingCmCollection.ps1 -TachyonApiBaseUrl https:// tachyon.lab.local -FilePath C:\Temp\Collection.txt

Scenario:
A Tachyon server is accessed using URL https://tachyon.lab.local/Tachyon using default credentials. The file containing the list of collections to process is in the location C:\Temp\Collection.txt.

.EXAMPLE

```
..\Create-DirectManagementGroupUsingCmCollection.ps1 -TachyonApiBaseUrl https:/
/tachyon.lab.local -FilePath C:\Temp\Collection.txt -UseCustomCredentials

Scenario:
A Tachyon server is accessed using URL https://tachyon.lab.local/Tachyon using
different credentials other than current default credentials.
The file containing the list of collections to process is in the location C:\Te
mp\Collection.txt.

1.11.7 Server installers

Windows Installer properties for each of the Tachyon server installers.

> **Warning**
>
> Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.
>
> Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary for complex installations, using non-interactive (quiet/silent) command lines, and may require further post-install configuration steps.

1.11.7.1 Tachyon Setup installation order

When installing all components on a single server, Tachyon Setup installs them in the following order:

1. Tachyon Server - **TachyonServer.msi**
2. 1E Catalog - **1ECatalog.msi**
3. SLA Platform - **SLA.Platform.Installer.msi**
4. SLA Business Intelligence - **SLA.BI.Installer.msi** (optional but required for Patch Success)
5. Nomad - **ContentDistribution.msi** (optional but required for Nomad)
6. AppClarity - **AppClarity.msi**
7. Application Migration - **ApplicationMigration.msi**

The installer properties for these MSI are provided in the following pages, including some notes on how the setup uses the properties.

- Tachyon Server installer properties
- Content Distribution installer properties
- 1E Catalog installer properties
- SLA Platform installer properties
- SLA Business Intelligence installer properties
- Application Migration installer properties
- AppClarity installer properties.

1.11.7.2 Tachyon platform zip file

The **Tachyon Platform** file can be downloaded from 1E Support Portal https://support.1e.com/. Extracting the zip will create a folder structure containing the following, where the files highlighted in bold are required by setup.

- Licenses.txt
- Tachyon Release Information.html
- **Tachyon.Setup.exe**

Please refer to:

- Tachyon Setup, for detailed information about each screen in setup
- Quick Start if you want a brief overview of installing Tachyon.

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

- Installers**1ECatalog.msi**
- Installers**AppClarity.msi**
- Installers**ApplicationMigration.msi**

This folder contains **msi installer files** for components and applications that will be installed by setup if their prerequisites are met.

- Installers**ContentDistribution.msi**
- Installers**SLA.BI.Installer.msi**
- Installers**SLA.Platform.Installer.msi**
- Installers**TachyonServer.msi**
- Installers\TachyonToolkit.msi
- Installers\Apps\Experience**Experience.zip**
- Installers\Apps\Experience**metadata.json**
- Installers\Apps\Explorer**Explorer.zip**
- Installers\Apps\Explorer**metadata.json**
- Installers\Apps\GuaranteedState**GuaranteedState.zip**
- Installers\Apps\GuaranteedState**metadata.json**
- Installers\Apps\Inventory**Inventory.zip**
- Installers\Apps\Inventory**metadata.json**
- Installers\Apps\Nomad**metadata.json**
- Installers\Apps\Nomad**Nomad.zip**
- Installers\Apps\PatchSuccess**metadata.json**
- Installers\Apps\PatchSuccess**PatchSuccess.zip**
- Installers\Apps\Settings**metadata.json**
- Installers\Apps\Settings**Platform.zip**
- ProductPacks\Newtonsoft.Json.dll

This folder contains **apps folders** for consumer applications that will be installed by setup if their prerequisites are met.

If you do not want to install a consumer application, then delete the folder before running setup.

Later, if you need to install the consumer application, then you can reinstate the folder and install the app using setup as described in Tachyon Setup.

Note

Some consumer applications are installed using their msi instead of an apps folder, for example AppClarity and Application Migration.

These Product Packs are required to support various features, for more detail please refer to

- ProductPacks\Tachyon.ProductPackDeploymentTool.exe
- ProductPacks\Tachyon.ProductPackDeploymentTool.exe.config
- ProductPacks\Tachyon.SDK.Consumer.dll
- ProductPacks\Classic\1E-ConfigMgrConsoleExtensions.zip
- ProductPacks\Classic\1E-Experience.zip
- ProductPacks\Classic\1E-Explorer-TachyonAgent.zip
- ProductPacks\Classic\1E-Explorer-TachyonCore.zip
- ProductPacks\Classic\1E-Inventory.zip
- ProductPacks\Classic\1E-Nomad.zip
- ProductPacks\Classic\1E-Patch-Success.zip
- ProductPacks\Classic\1E-Tachyon-Platform.zip
- ProductPacks\Integrated\MEMCMClientHealth.zip
- ProductPacks\Integrated\NomadClientHealth.zip
- ProductPacks\Integrated\TachyonCore.zip
- ProductPacks\Integrated\WindowsClientHealth.zip

Tachyon Product Packs reference. If your license permits, you can use additional Product Packs available from 1E Exchange to meet specific use cases.

Classic Product Packs	Contain instructions, for use in Explorer and other applications. They can be uploaded using the **Tachyon Product Pack Deployment Tool**, or using **Settings→Instructions→Instruction sets** page in the Tachyon portal.
Integrated Product Packs	Contain policies, rules and fragments for use by Guaranteed State, and may also include instructions. They can only be uploaded using the **Tachyon Product Pack Deployment Tool**.

Tip

The **Tachyon Product Pack Deployment Tool** can be started independently or at the end of the **Tachyon Setup** process via the Post-installation checks screen, where the screen contains a link that launches the tool. The **Tachyon Setup** method of starting the tool is recommended because Tachyon Setup ensures you have the correct permissions to upload the Product Packs.

1.11.7.3 Tachyon Server installer properties

A table of the Windows Installer properties for the Tachyon Server installer.

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

Note

Mandatory properties must be provided when installing using a command-line.

The installer file is: **TachyonServer.msi**

The fields in the table below are:

ACTIVE_DIRECTORY_SERVER | ADDLOCAL | DEVICECOUNT | DROPOLDDB_EXPERIENCE | DROPOLDDB_MASTER | DROPOLDDB_RESPONSES | EXTERNALIISHOSTHEADER | HTTPSIISPORT | IISIPADDRESS | IISPORT | INSTALLDIR | INTERNALIISHOSTHEADER | LICENSEFILEPATH | LOGPATH | MAILFROM | SERVERCERTIFICATETHUMBPRINT | SMTPENABLED | SMTPPORT | SMTPSERVER | SQLSERVER_EXPERIENCE | SQLSERVER_MASTER | SQLSERVER_RESPONSES | SSASDROPDB_EXPERIENCE | SSASSERVER_EXPERIENCE | STARTCOORDINATOR | STARTSWITCH | TWOFACTORAUTHENABLED | WORKFLOWWEBPORT

Property	Default	Mandatory	Description
ACTIVE_DIRECTORY_SERVER	GC://	Yes	A list of Active Directory URLs. Tachyon services locate users and computers and membership of security groups by querying a semi-colon delimited list of Active Directory GC and/or LDAP URLs. GC URL: This is the quickest and simplest method of resolving users and group membership. A single GC URL will normally resolve all users and groups within a single **forest**. Supports only Universal security groups. LDAP URL: A single LDAP URL will normally resolve all users and groups within a single **domain**. Supports Universal and Global security groups. Required if a Global Catalog (GC) server does not exist in a trusted forest, or if Global security groups must be used.

Property	Default	Mandatory	Description
			Any domain which contains Tachyon servers, users or groups must: • be resolvable from the Tachyon Server using DNS - that is, the server must be able to resolve domain names using DNS • have a two-way trust with the domain in which the Tachyon (Master Stack) Server exists - so that users trust the server, and the server trusts users • allow the Tachyon Server to read computer, user and security group objects in each domain The default **GC://** is sufficient for a Tachyon Server in a simple Active Directory environment of one forest which has a Global Catalog. You can include, but it is not required, the name of the server's local domain or root domain, for example: **GC://acme.local** To add support for a remote forest which has its own GC, you would for example have **GC://acme.local;GC://nadir.local** and so forth adding the root domain of any other forests to the list of GC URLs. If you prefer to use LDAP, or there are difficulties with trusts between forest domains, then you would create a list of LDAP URLs including *all* domains that have Tachyon users and groups, as well as domains in which a Tachyon server resides. For example: **LDAP://acme.local;LDAP://pop.acme.local;LDAP://rock.acme.local;LDAP://country.acme.local;LDAP://nadir.local;LDAP://disco.nadir.local** You can mix GC and LDAP URLs, but you should avoid mixing LDAP URLs that are also resolved by a GC URL. For example: **GC://;LDAP://nadir.local;LDAP://disco.nadir.local** The Coordinator Workflow module queries AD for email details of Tachyon users, and the Consumer API queries AD

Property	Default	Mandatory	Description

			for security details of Tachyon users to support Role-Based Access Control.
			
			Tachyon Setup will verify the details you have supplied. However you can run the following command on your server to confirm it can resolve the name of the local domain in DNS and locate Domain Controllers with the Global Catalog role.
			
			`nslookup gc._msdcs`
			
			Use the following command to resolve **<domain>** and its GC DCs.
			
			`nslookup gc._msdcs.<domain>`

ADDLOCAL	ALL	No	Default is **ALL** when installing all components on a single-server. The following components (MSI features) are selected when installing a Master Stack, Response Stack and Custom configuration. Names are delimited by a comma and are case-sensitive. Master Stack: • ConfigurationViewer • Coordinator • Consumer • Database_EXPERIENCE • Database_MASTER • Experience • Portal • SSASDatabase_EXPERIENCE Response Stack: • Background • Core • CoreInternal • Database_RESPONSES • Switch Specifying Portal or Experience does not install Tachyon applications, but are required in order for relevant

Property	Default	Mandatory	Description
			applications to work. Tachyon applications are installed separately by Tachyon Setup.
DEVICECOUNT	1000	No	This is the number of devices supported by the Tachyon server which is being installed. The number of devices supported by a Tachyon Server determines the number of Switches configured on the server. The range is 1 to 250,000; default is 1,000. A single server with suitable resources can support up to five Switches and up to 250,000 devices, with each Switch supporting up to 50,000 devices. Additional servers or configuration may be required according to the design of the Tachyon system. The total number of devices supported across the Tachyonsystem must not exceed the license file allocation.
DROPOLDDB_EXPERIENCE	0	No	If set to 1 then the installer will drop the TachyonExperience database and attempt to create a new database. To create the database requires the server installation account has sysadmin rights on the SQL Server instance SQLSERVER_MASTER. If set to 0 (default) then the installer will keep the existing TachyonResponses database. This requires the installation account has db_owner rights on the database. This setting is used in the following scenarios. • For a new installation and an empty database has been pre-created. • When the database has been restored and Tachyon is being re-installed either during a recovery, or because the database has been moved to a new SQL Server instance. • Upgrading.

Property	Default	Mandatory	Description
DROPOLDDB_MASTER	0	No	If set to 1 then the installer will drop the TachyonMaster database and attempt to create a new database. To create the database requires the server installation account has sysadmin rights on the SQL Server instance SQLSERVER_MASTER. If set to 0 (default) then the installer will keep the existing TachyonResponses database. This requires the installation account has db_owner rights on the database. This setting is used in the following scenarios. • For a new installation and an empty database has been pre-created. • When the database has been restored and Tachyon is being re-installed either during a recovery, or because the database has been moved to a new SQL Server instance. • Upgrading.
DROPOLDDB_RESPONSES	0	No	If set to 1 then the installer will drop the TachyonResponses database and attempt to create a new database. To create the database requires the server installation account has sysadmin rights on the SQL Server instance SQLSERVER_RESPONSES. If set to 0 (default) then the installer will keep the existing TachyonResponses database. This requires the installation account has db_owner rights on the database. This setting is used in the following scenarios. • For a new installation and an empty database has been pre-created. • When the database has been restored and Tachyon is being re-installed either during a recovery, or because the database has been moved to a new SQL Server instance. • Upgrading.

Property	Default	Mandatory	Description
EXTERNALIISHOSTHEADER	TACHYON.<DomainFQDN>	Yes	Sets the host header used by the HTTPS binding of the Tachyon Website. This must be the same as the DNS Alias FQDN. EXTERNALIISHOSTHEADER and HTTPSIISPORT configure the HTTPS binding that uniquely identifies the Tachyon Website used by the following: • Browsers connection to the Explorer (Explorer and Admin) • Tachyon clients retrieving content from the Background Channel • Internal Tachyonservices
HTTPSIISPORT **HTTPSIISPORT**	443	Yes	Sets the port used by the HTTPS binding of the Tachyon Website. EXTERNALIISHOSTHEADER and HTTPSIISPORT configure the HTTPS binding that uniquely identifies the Tachyon Website used by the following: • Browsers connection to the Explorer (Explorer and Admin) • Tachyon clients retrieving content from the Background Channel • Internal Tachyon services
IISIPADDRESS	*	Yes	Sets the IP Address used by the HTTP and HTTPS bindings of the Tachyon Website. The default value of * sets IIS to listen on all IP addresses. On multihomed servers with multiple IP addresses you may optionally set this value, but in general we recommend leaving this as * to bind to all IP addresses. If this value is set it must correspond to one of the IP addresses configured for the DNS Alias FQDN.

Property	Default	Mandatory	Description
			INTERNALIISHOSTHEADER, IISIPADDRESS and IISPORT configure the HTTP binding that can be used to access IIS web applications that are *not* configured to **Require SSL**, for example ContentDistribution, CoreExternal and CatalogWeb. Please refer to Verify IIS Configuration for configuration details of IIS web applications.
IISPORT	80	Yes	Sets the port used by the HTTP binding of the Tachyon Website. INTERNALIISHOSTHEADER, IISIPADDRESS and IISPORT configure the HTTP binding that can be used to access IIS web applications that are *not* configured to **Require SSL**, for example ContentDistribution, CoreExternal and CatalogWeb. Please refer to Verify IIS Configuration for configuration details of IIS web applications.
INSTALLDIR	%ProgramFiles%\1E\Tachyon\	No	Sets the installation folder for all the Tachyon components. For a non-default installation please refer to Services and NTFS Security.
INTERNALIISHOSTHEADER	<computername>.<DomainFQDN>	Yes	Sets the host header used by the HTTP binding of the Tachyon Website. This should be the computername FQDN of the Tachyon Server. INTERNALIISHOSTHEADER, IISIPADDRESS and IISPORT configure the HTTP binding that can be used to access IIS web applications that are *not* configured to **Require SSL**, for example ContentDistribution, CoreExternal and CatalogWeb. Please refer to Verify IIS Configuration for configuration details of IIS web applications.
LICENSEFILEPATH		Yes (UI) No (comm	The full path, including the file name, must be provided for a valid Tachyon license file. 1E will provide you with a **Tachyon.lic** license file that defines the applications, tools, and features your Tachyon System is able to use, for how long, and how many

Property	Default	Mandatory	Description
		and-line)	devices it supports, this may be an evaluation or subscription license. • The license must be activated. Once activated, it may be used only by the Tachyon System that activated it. • Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable. • For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk. • For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server.
LOGPATH	%AllUsersProfile%\1E\Tachyon\	No	Sets the path to the Tachyon server log files. It does not set the filename of each log. See Log files for more details. For a non-default installation please refer to Services and NTFS Security. **Warning** Not supported by Tachyon Setup. If you need to change the default location, please contact 1E.
MAILFROM		Yes	Sets the mail-from email address used by the Tachyon Server when it sends emails. For guidance about the Mail-From address see Email and 2FA requirements.
SERVERCERTIFICATETHUMBPRINT		No	Used by Tachyon Setup to uniquely identify which certificate was selected by the user for use by Tachyon components. Tachyon Setup uses the selected certificate

Property	Default	Mandatory	Description
			to assign to the main binding for the Tachyon website, the coordinator web service, and Switches. `SERVERCERTIFICATETHUMBPRINT=3d699d8f28c2d7e0514cb0e047a1fd2f9db9bf4f` If you are using the installer instead of Tachyon Setup, and do not specify a thumbprint property in the command-line, the installer will automatically select the first suitable certificate it finds in the server's Personal certificate store. In which case you must ensure there is only one suitable certificate, otherwise you may find Switches, and the bindings for the website and coordinator using different certificates. You can review the bindings using Tachyon Setup→ Maintenance→ Server certificate... as decribed in Verify the Tachyon Server certificate bindings. See Certificate requirements for requirements.
SMTPENABLED	1	No	Determines whether Tachyon email features are available. It uses email for • notifications • two-factor authentication • sending Telemetry data to 1E. For guidance about using non-default SMTP settings, see Email and 2FA requirements. If email notifications need to be disabled after installation, then see Changing the SMTP Host configuration. To configure Telemetry after installation, please refer to Enabling or disabling Telemetry features. If set to 1 then email is enabled. If set to 0 then the following are disabled: • Email notifications

Property	Default	Mandatory	Description
			• Two-factor authentication - see TWOFACTORAUTHENABLED • Sending Telemetry data to 1E
SMTPPORT	25	No	Sets the port used to connect to the SMTP relay/gateway Default is 25. If the port needs to be changed after installation, then see Changing the SMTP Host configuration.
SMTPSERVER		Yes	Sets the FQDN of the SMTP relay/gateway. If the FQDN needs to be changed after installation, then see Changing the SMTP Host configuration.

SQLSERVER_EXPERIENCE	(local)	Yes	Sets the name for the SQL Server instance that hosts the TachyonExperience database.
			This can be set in one of the following formats depending on the setup of the instance.
			`(local)`
			`ServerName`
			`ServerName,PortNumber`
			`ServerName\InstanceName`
			`ServerName\InstanceName,PortNumber`

SQLSERVER_MASTER	(local)	Yes	Sets the name for the SQL Server instance that hosts the TachyonMaster database.
			This can be set in one of the following formats depending on the setup of the instance.
			`(local)`
			`ServerName`
			`ServerName,PortNumber`
			`ServerName\InstanceName`
			`ServerName\InstanceName,PortNumber`

SQLSERVER_RESPONSES	(local)	Yes	Sets the name for the SQL Server instance that hosts the TachyonResponses database.

Property	Default	Mandatory	Description

			This can be set in one of the following formats depending on the setup of the instance.
			
			`(local)`
			`ServerName`
			`ServerName,PortNumber`
			`ServerName\InstanceName`
			`ServerName\InstanceName,PortNumber`

SSASDROPDB_EXPERIENCE	0	No	If set to 1 then the installer will drop the TachyonExperience cube and attempt to create a new cube. To create the cube requires the server installation account has sysadmin rights on the SQL Server Analysis Service instance SSASSERVER_EXPERIENCE. If set to 0 (default) then the installer will keep the existing TachyonExperience cube.

SSASSERVER_EXPERIENCE	(local)	Yes	Sets the name for the SQL Server Analysis Service instance that hosts the TachyonExperience cube.
			
			This can be set in one of the following formats depending on the setup of the instance.
			
			`(local)`
			`ServerName`
			`ServerName,PortNumber`
			`ServerName\InstanceName`
			`ServerName\InstanceName,PortNumber`

STARTCOORDINATOR	1	No	Flag indicating if the Coordinator service should be started after installation.
STARTSWITCH	1	No	Flag indicating if the Switch Host service should be started after installation.
TWOFACTORAUTHENABLED	1	No	Determines whether Tachyon uses two-factor authentication. If email is disabled then so is two-factor authentication which relies on email.

Property	Default	Mandatory	Description
			See Email and 2FA requirements. Default is same as SMTPENABLED.
WORKFLOWWEBPORT	8080	No	Sets the port used by HTTPS binding of the Coordinator Workflow module. This is separate from the Tachyon Website. **Tachyon Setup** suggests **8081** by default, and should not need to be changed. **Note** **TachyonServer.msi** installer defaults to **8080** if the WORKFLOWWEBPORT parameter is not provided. Tachyon Setup uses **8081** to avoid conflict with HTTP port 8080 which is the default used by SLA Platform 3.3 and earlier versions.

1.11.7.4 Content Distribution installer properties

A table of the Windows installer properties for the Content Distribution installer.

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

Note

Mandatory properties must be provided when installing using a command-line.

The installer file is: **ContentDistribution.msi**

CMSERVER | DATABASE_MODE | DBNAME | DBSERVER | DROPOLDDB | IDLETIMEOUTMINS | INSTALLDIR | NOMADSYNCINTERVAL | PLATFORMURL | RECYLEMINS | SITENUMBER | WAKEUPURL

Property	Default	Mandatory	Description
CMSERVER		Yes	Name of the Configuration Manager Site server. ContentDistribution will fetch CM database details for synchronization. The Content Distribution installer connects and reads the root\sms WMI namespace on ConfigMgr site server to get the associated SMS Providers and their details. Query - SELECT SiteCode, Machine, NamespacePath FROM SMS_Providerlocation WHERE ProviderForLocalSite=TRUE. The connection could be locally or remotely depending on where the SiteServer is. Then connects to each SMS Provider WMI Namespace \\providerfqdn\root\sms\site_XXX one by one and uses the one it is able to connect to get the details like SMS DB Name and ServerName etc. The WMI Access could be local or remote depending on where the SMS Provider is. Query - SELECT * FROM SMS_SCI_SiteDefinition WHERE ItemName = "Site Definition" AND SiteCode = "XXX". You can also provide a SMS provider server name as value of CMSERVER property but in that case only that provider will be tried and if installer fails to connect to it, no other sms provider associated with the site will be tried.
DATABASE_MODE	*SingleUser*		Database usage mode. It may be set to one of the following values: • *SingleUser* - Sets the upgrade scripts to run in single user mode • *MultiUser* - Sets the upgrade scripts to run in multi-user mode The default value sets the upgrade scripts to run in single-user mode to avoid multiple connections during upgrade (Only for SQL 2005).

Property	Default	Mandatory	Description
			Enabling *MultiUser* mode, by setting the following property on the installer command-line, may be necessary for larger databases to help to smooth the upgrade process: *DATABASE_MODE= "MultiUser"* **Note** Please Note: MultUser and SingleUser are case sensitive
DBNAME	ContentDistribution		Name for the ContentDistribution database.
DBSERVER	localhost	Yes	Name of the SQL Server instance where the ContentDistribution database is installed.
DROPOLDDB	0		If set to 1 on the command-line, it drops the current ContentDistribution database during installation. The default behavior for this property is to not drop the old database. **Note** Exercise caution when using this option, as any existing data will be deleted. Do not use this option if you want to preserve your existing data.
IDLETIMEOUTMINS	0		Specify the amount of time (in minutes) for which a worker process (of CD app pool) should remain idle before it's shutdown.
INSTALLDIR	C:\Program Files\1E\Content Distribution		The installation directory in the Destination Folder screen.
NOMADSYNCINTERVAL	30		The interval (in minutes) before the next data synchronization takes place between Nomad and Configuration Manager. The valid range for this interval is between 5 and 1440 (1 day) minutes. If you set the interval below the lower limit, it

Property	Default	Mandatory	Description
			defaults to the minimum (5 minutes). Similarly, if you set the interval above the upper limit, it defaults to 1440 minutes. If a synchronization fails, it restarts after 15 minutes. Used in the Nomad screen.
PLATFORMURL		Yes	Platform base URL of the Tachyon website.
RECYLEMINS	0		Specify the amount of time (in minutes) after which ContentDistribution application pool should be recycled.
SITENUMBER			Exposed to Tachyon Setup only. Tachyon Setup sets its value to Tachyon website Site ID. Installer installs the Content Distribution application under the Web site whose site number matches the specified one.
WAKEUPURL			To support Nomad integration with WakeUp. Specify either an HTTP or HTTPS URL to match the binding used on the NightWatchman web server. The port does not need to be included if using a standard HTTP/S port 80 or 443. • http://<NightWatchmanServer>:8080/nwmc/MachineSearchService • https://<NightWatchmanServer>:8443/nwmc/MachineSearchService This adds a **Url** setting to the **AppSettings** section of %Program Files%1E\ContentDistribution\Web\WebService\appsettings.json file.

1.11.7.5 1E Catalog installer properties

A table of the Windows installer properties for the 1E Catalog installer.

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

Note

Mandatory properties must be provided when installing using a command-line.

The installer file is: **1ECatalog.msi**

DATABASENAME | DROPOLDDB | IISHOSTHEADER | IISIPADDRESS | IISPORT | INSTALLDIR | LOGPATH | SQLSERVER | SVCPASSWORD | SVCUSER

Property	Default	Mandatory	Description
DATABASENAME	1ECatalog	No	Name for the 1E Catalog database.
DROPOLDDB	0	No	If set to 1 on the command-line, it drops the 1ECatalog database during installation if it exists on the specified SQL Server instance. The default behavior for this property is to not drop the existing database. **Note** Exercise caution when using this option as any existing data will be deleted. Do not use this option if you want to preserve your existing data.
IISHOSTHEADER		No	Host header used for the HTTP binding of the website hosting the CatalogWeb web application. If used, this should be a DNS FQDN of the web server, recommended to be a CNAME, for example: *catalog.acme.local* **Note**

Property	Default	Mandatory	Description
			See HTTP binding note below. **Note** When installed by Tachyon Setup the HTTP host header is not specified, causing the CatalogWeb application to be installed under the Default website or its own CatalogWeb website.
IISIPADDRESS	*	No	IP address used for the HTTP binding of the website hosting the CatalogWeb web application. If you want to be non-specific about the IP address, use the default *. **Note** See HTTP binding note below. **Note** When installed by Tachyon Setup the HTTP IP Address is not specified, causing the CatalogWeb application to be installed under the Default website or its own CatalogWeb website.
IISPORT	80	No	Port used for the HTTP binding of the website hosting the CatalogWeb web application. **Note** See HTTP binding note below. **Note** When installed by Tachyon Setup the HTTP port is not specified, causing the CatalogWeb application to be installed under the

Property	Default	Mandatory	Description
			Default website or its own CatalogWeb website.
INSTALLDIR	C:\Program Files\1E\Catalog\	No	The installation directory in the Destination Folder screen. **Note** When installed by Tachyon Setup the installation folder for Catalog has the same parent folder as the Tachyon installation.
LOGPATH	C:\ProgramData\1E\Catalog\	No	The folder where the Catalog.UpdateService.log file is found.
SQLSERVER	(local)	Yes	Name of the SQL Server instance where the 1E Catalog database is installed.
SVCPASSWORD		No	Password for SVCUSER.
SVCUSER	NT AUTHORITY\Network Service	No	User name for the **1E Catalog Update Service** service account and website **application pool**. **Note** Do not use the SVCUSER property if you want to use the default. **Note** Tachyon Setup uses **NT AUTHORITY\Network Service**.

HTTP binding

If an existing website uses the same HTTP binding (combination of HTTP port and IP address, and also Host Header if used) then the Catalog web application will be created under that website. For example, the Catalog web application is normally created under

Default Web Site because it uses port 80 and * by default. If an existing web site does not have a matching HTTP binding then the installer will create a new website called CatalogWeb with the specified HTTP binding.

HTTPS is not supported. Please contact 1E if this is required.

1.11.7.6 SLA Platform installer properties

A table of the Windows installer properties for the SLA Platform installer.

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

Note

Mandatory properties must be provided when installing using a command-line. The table shows which default values are managed by Tachyon Setup

The installer file is: **SLA.Platform.Installer.msi**

CATALOG_DATABASE_NAME | CATALOG_DATABASE_SERVER | CATALOG_DATABASE_USEINTEGRATEDSECURITY | COMMON_DATABASE_SERVER | COMMON_DATABASE_USEINTEGRATEDSECURITY | CUSTOMER_USERNAME | IIS_HOST_HEADER | IIS_HTTP_PORT | IIS_HTTPS_PORT | IIS_IP_ADDRESS | IIS_SITE_NAME | IIS_SSL_CERTIFICATE_SERIAL | IIS_SSL_CERTIFICATE_STORE_NAME | IIS_SSL_CERTIFICATE_STORE_LOCATION | IIS_SSL_CERTIFICATE_THUMBPRINT | INSTALLFOLDER | INTEGRATE_REST_PORT | LOG_FOLDER | SLA_ENABLE_HTTPS | SLA_PLATFORM_FQDN | SVC_USEACCOUNT | SVC_USEACCOUNT_PASSWORD | SVC_USEACCOUNT_USERNAME | TARGETDIR

Property	Default	Mandatory	Description
CATALOG_DATABASE_NAME	1ECatalog	No	The name of the 1E Catalog database.
CATALOG_DATABASE_SERVER		Yes	The SQL Server instance name which hosts the 1E Catalog database. **Note** Tachyon Setup prompts for the SQL Server database instance.

Property	Default	Mandatory	Description
CATALOG_DATABASE_USEINTEGRATEDSECURITY	1	No	Determines which method the SLA Platform services and application pools will acess the 1E Catalog database • 1 - Windows authentication uses the specified SVC_USEACCOUNT service account • 0 - SQL authentication uses the specified SQL Login The SLA Platform uses a Linked Server on the SQL Server instance that hosts the SLA Platform databases, to access the 1E Catalog database. The SLA Platform also connects to the Catalog API, which it finds by reading the CatalogSettings table in the 1E Catalog database. **Note** Tachyon Setup uses 1: Windows authentication.
COMMON_DATABASE_SERVER		Yes	The SQL Server instance name which will host the four SLA Platform databases. **Warning** Do not specify (local) even if the SQL Server instance is local. This avoids issues with Linked

Property	Default	Mandatory	Description
			servers used by SLA Platform and companion products. **Note** DROPOLDDB is not supported. If you want to create new databases then manually drop the old ones first, after backing them up. **Note** Tachyon Setup prompts for the name of the SQL Server instance.
COMMON_DATABASE_USEINTEGRATEDSECURITY	1	No	Determines which method the SLA Platform services and application pools will acess the SLA Platform databases • 1 - Windows authentication uses the specified SVC_USEACCOUNT service account • 0 - SQL authentication uses the specified SQL Login **Note** Tachyon Setup uses 1: Windows authentication.
CUSTOMER_USERNAME	The installer account	No	The **default web user**.

Property	Default	Mandatory	Description
			• Must be a domain user account • Normally the same as the Installer account • Specified in the **Customization Settings** panel in the SLA Platform installer (not available in Tachyon Setup) • This is the only account that can be used when first logging into the SLA Platform website, until the account is used to create additional users **Warning** The **Domain** part of the username will restrict access to SLA Platform to just users from that domain. See Server installation account **Note** Tachyon Setup uses the default: the installer account.
IIS_HOST_HEADER			Host header used for the HTTP binding of the SLA Platform website. **Note**

Property	Default	Mandatory	Description
			See HTTP binding note below. **Note** Tachyon Setup uses the same HTTP host header as the Tachyon website, which defaults to the servername FQDN.
IIS_HTTP_PORT	8080	No	Port used for the HTTP binding of the SLA Platform Website. **Note** See HTTP binding note below. **Note** Tachyon Setup uses the same HTTP port as the Tachyon website, which defaults to **80**. This causes the SLA Platform web applications to be installed under the Tachyon website.
IIS_HTTPS_PORT	8443	No	Port used for the HTTPS binding of the SLA Platform website. Used only if SLA_ENABLE_HTTPS=1. **Note** See HTTPS binding note below. **Note** Tachyon Setup uses the same HTTPS port

Property	Default	Mandatory	Description
			as the Tachyon website, which defaults to **443**. This causes the SLA Platform web applications to be installed under the Tachyon website.
IIS_IP_ADDRESS	*	No	IP address used for the HTTP binding of the SLA Platform website. If you want to be non-specific about the IP address, use the default *. **Note** See HTTP binding note below. **Note** Tachyon Setup uses the same HTTP IP Address binding as the HTTP binding IP Address of the Tachyon website, which defaults to *** (all)**. This causes the SLA Platform web applications to be installed under the Tachyon website.
IIS_SITE_NAME	SLA Platform Web Site	No	Website name. Not configurable in the installer UI. **Note** Tachyon Setup does not use this as it

Property	Default	Mandatory	Description
			expects the SLA Platform will be installed under the Tachyon website.
IIS_SSL_CERTIFICATE_SERIAL		Yes, if HTTPS is enabled	The **serial number** of the specified SSL certificate. Used only if SLA_ENABLE_HTTPS=1. **Note** See HTTPS binding note below. **Note** Tachyon Setup uses the same web server certificate as the Tachyon website.
IIS_SSL_CERTIFICATE_STORE_NAME	My	No	The **certificate store** in which to search for the specified SSL certificate. **My** is the Personal store. Used only if SLA_ENABLE_HTTPS=1. **Note** Tachyon Setup uses the default: My.
IIS_SSL_CERTIFICATE_STORE_LOCATION	LocalMachine	No	The **account type** for the specified certificate store. **LocalMachine** is the Computer account. Used only if SLA_ENABLE_HTTPS=1. **Note** Tachyon Setup uses the default: LocalMachine.

Property	Default	Mandatory	Description
IIS_SSL_CERTIFICATE_THUMBPRINT		Yes, if HTTPS is enabled	The **thumbprint** of the specified SSL certificate. Used only if SLA_ENABLE_HTTPS=1. **Note** See HTTPS binding note below. **Note** Tachyon Setup uses the same web server certificate as the Tachyon website.
INSTALLFOLDER	C:\Program Files\1E\SLAPlatform\	No	The installation directory in the **Custom Setup** screen. **Note** If you change the install location please ensure the service account has the necessary NTFS security permissions, as described in Services and NTFS Security. **Note** Tachyon Setup uses the same parent folder as the Tachyon installation. **Warning** The SLA Platform installer does not support INSTALLDIR.
INTEGRATE_REST_PORT	6002	No	Port used by SLA Integrate services. The Integrate

Property	Default	Mandatory	Description
			Manager listens on this port for the Integrate Agent. **Note** Tachyon Setup uses the default 6002.
LOG_FOLDER	C:\ProgramData	No	The folder where the SLA Platform log files are found, as well as other resource files, including inventory product packs. • 1E.SLAConnector.sccm_sync.log • 1E.SLAPlatformIntegrateAgent.log • 1E.SLAPlatformIntegrateManager.log An additional logs folder is found in C:\ProgramData\1E\Platform Consumer **Note** If you change the logs folder location please ensure the service account has the necessary NTFS security permissions, as described in Services and NTFS Security **Warning** The SLA Platform installer does not support LOGPATH

Property	Default	Mandatory	Description
			Note Not used by Tachyon Setup.
SLA_ENABLE_HTTPS	1	No	Determines whether an HTTPS binding is created in addition to the HTTP binding. **Note** Tachyon Setup uses **1**: enable HTTPS.
SLA_PLATFORM_FQDN	The FQDN of the server	No	The FQDN of the SLA Platform server.
SVC_USEACCOUNT	1	Yes	Specifies whether the service account is a domain account (1) or Network Service (0). **Note** Tachyon Setup uses **0**: Network Service. The service account is used for the following: • 1E SLA Platform Engine service • 1E SLA Platform Integrate Agent service • 1E SLA Platform Integrate Manager service • SLAPlatform web application pools (3)
SVC_USEACCOUNT_PASSWORD		Yes	Password for SVC_USEACCOUNT_USERNAME.

Property	Default	Mandatory	Description
			Note Not used by Tachyon Setup.
SVC_USEACCOUNT_USERNAME		No	The service account if SVC_USEACCOUNT=1. Must be specified as **domain\username**. **Note** Not used by Tachyon Setup.
TARGETDIR	C:\	No	*TARGETDIR*is used only for administrative installation, it is not used for normal installations. You need to use the *TARGETDIR* property for an administrative installation of SLA Platform, for example if you want to unpack the MSI to find a specific file. `msiexec /a SLA.Platform.Installer.msi TARGETDIR="C:\Source\SLAPlatform"` **Note** Not used by Tachyon Setup.

HTTP binding

If an existing website uses the same HTTP binding (combination of HTTP port, host header and IP address) then the SLA Platform web applications will be created under that website instead of under a dedicated website called SLA Platform Web Site.

HTTPS binding

When doing a non-interactive install, an HTTPS binding is created only if all of the following are specified:

- SLA_ENABLE_HTTPS=1

- IIS_SSL_CERTIFICATE_SERIAL
- IIS_SSL_CERTIFICATE_THUMBPRINT

1.11.7.7 SLA Business Intelligence installer properties

A table of the Windows installer properties for the SLA Business Intelligence installer. Business Intelligence is only required by the Patch Success application.

> **Warning**
>
> Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.
>
> Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.
>
> **Note**
>
> Mandatory properties must be provided when installing using a command-line.

The installer file is: **SLA.BI.Installer.msi**

BI_DATABASE_DROPDB | BI_DATABASE_NAME | BI_DATABASE_PASSWORD | BI_DATABASE_SERVER | BI_DATABASE_USEINTEGRATEDSECURITY | BI_DATABASE_USERNAME | COMMON_DATABASE_NAME | SSAS_DATABASE_DROPDB | SSAS_DATABASE_NAME | SSAS_DATABASE_PASSWORD | SSAS_DATABASE_SERVER | SSAS_DATABASE_USERNAME

Property	Default	Mandatory	Description
BI_DATABASE_DROPDB	0		If set to 1 on the command-line, it drops the SLA-BI database during installation if it exists on the specified SQL Server instance. The default behavior for this property is to not drop the existing database. **Note** Exercise caution when using this option as any existing data will be deleted. Do not use this option if you want to preserve your existing data.

Property	Default	Mandatory	Description
BI_DATABASE_NAME	SLA-BI		The name of the SLA-BI database.
BI_DATABASE_PASSWORD		Depends	If not using integrated security, this property specifies the password for the SQL authentication username specified in BI_DATABASE_USERNAME.
BI_DATABASE_SERVER		Yes	Name of a SQL Server database instance to host the SLA-BI database. **Note** Tachyon Setup prompts for the SQL Server database instance.
BI_DATABASE_USEINTEGRATEDSECURITY	1		Specifies if integrated security is to be used to access BI database. Values are: • 0 – false • 1– true If integrated security is used, then BI will use the SLA Platform service account (specifically the **1E SLA Platform Engine** service account). **Note** Tachyon Setup uses integrated security, which means BI uses **Network Service** assuming SLA was installed by Tachyon Setup.

Property	Default	Mandatory	Description
BI_DATABASE_USERNAME		Depends	If not using integrated security, this property specifies the SQL Login of the **BI SQL user**: • a SQL login must be pre-created in the SQL instance hosting the BI database • an identical SQL login must be pre-created in the SQL database instance hosting the SLA Platform databases, if the BI database is hosted on a separate instance
COMMON_DATABASE_NAME	SLA-Shared		The name of the SLA Platform database used by BI.
SSAS_DATABASE_DROPDB	0		If set to 1 on the command-line, it drops the SLA-BI cube during installation if it exists on the specified SQL Server instance. The default behavior for this property is to not drop the existing cube. **Note** Exercise caution when using this option as any existing data will be deleted. Do not use this option if you want to preserve your existing data.
SSAS_DATABASE_NAME	SLA-BI		The name of the SLA-BI cube.
SSAS_DATABASE_PASSWORD		Yes	Password for the Windows account used by the BI API to query the cube.

Property	Default	Mandatory	Description
			Note Tachyon Setup prompts for the password of the SSAS_DATABASE_USERNAME user account.
SSAS_DATABASE_SERVER		Yes	Name of a SSAS database instance to host the SLA-BI cube. **Note** Tachyon Setup prompts for the SSAS instance.
SSAS_DATABASE_USERNAME		Yes	Username for the **BI SSAS user** domain account. This is used by the BI Multidimensional Expressions (MDX) API on the Master Stack to query the SLA-BI cube. **Note** Tachyon Setup prompts for a domain user account.

1.11.7.8 Application Migration installer properties

A table of the Windows installer properties for the Application Migration installer.

> **Warning**
>
> Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.
>
> Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.
>
> **Note**
>
> Mandatory properties must be provided when installing using a command-line.

The installer file is: **ApplicationMigration.msi**

Property	Default	Mandatory	Description
PLATFORMBASEURL	n/a	Yes	The URL used to access the Tachyon Portal website. You can connect either using HTTP or HTTPS. In either case, the URL will be based on the settings made on the **Website Configuration** screen of the Tachyon Setup program. Please refer to Website configuration for more details. For example, if your Tachyon server FQDN is **ACME-TCN01.ACME.LOCAL** and your Tachyon DNS alias is **TACHYON.ACME.LOCAL**, and these have been configured as the host headers on the **Website Configuration** screen of the Tachyon Setup program, then either of the following URLs can be used: • http://ACME-TCN01.ACME.LOCAL • https://TACHYON.ACME.LOCAL If you have specified a custom port on the **Website Configuration** screen of the Tachyon Setup program, then this should also be added to the URLs. For example: • http://ACME-TCN01.ACME.LOCAL:8080 • https://TACHYON.ACME.LOCAL:8443

Ensure all steps on the Requirements page have been completed before installation.

See Installation for more details about installations.

1.11.7.9 AppClarity installer properties

A table of the Windows installer properties for the AppClarity installer.

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

Note

Mandatory properties must be provided when installing using a command-line.

The installer file is: **AppClarity.msi**

Property	Default	Mandatory	Description
SLAPLATFORMURL		Yes	You can connect either using HTTP or HTTPS. In either case, the URL will be based on the settings made on the **Website Configuration** screen of the Tachyon Setup program. Please refer to Website configuration for more details. For example, if your Tachyon server FQDN is **ACME-TCN01.ACME.LOCAL** and your Tachyon DNS alias is **TACHYON.ACME.LOCAL**, and these have been configured as the host headers on the **Website Configuration** screen of the Tachyon Setup program, then either of the following URLs can be used: • http://ACME-TCN01.ACME.LOCAL • https://TACHYON.ACME.LOCAL If you have specified a custom port on the **Website Configuration** screen of the Tachyon Setup program, then this should also be added to the URLs. For example: • http://ACME-TCN01.ACME.LOCAL:8080 • https://TACHYON.ACME.LOCAL:8443 The URL used to access the Tachyon Portal. This must be set to a valid URL for Tachyon "https://Tachyon.acme.local" (https://<alias>.<domain>)

Ensure all steps on the Preparation page have been completed before installation.

See Installing and upgrading for more details about installations.

1.11.8 Tachyon Server reference

Reference information specific to Tachyon Server components of the platform.

1.11.8.1 Switch Command Lines

Details of command line parameters used by the **SwitchCommandLine** entry in the Tachyon Switch Host 's **Tachyon.Switch.Host.exe.config** file.

> **Warning**
>
> This page is for information only. Do not make configuration changes unless instructed to do so by 1E.

1.11.8.1.1 Switch Command Lines

The Tachyon Switch Host has a **Tachyon.Switch.Host.exe.config** file, which has one or more **SwitchCommandLine** keys. If there is more than one Switch then each key is uniquely numbered: **key="SwitchCommandLine.n"**

The following is an example default key.

```
<add key="SwitchCommandLine" value="-cfgName=ACME-TCNMST-SW1 -config=https://tachyon.acme.local:443/Core -NoStdOut -NoSumm -NoSw2Sw -Log=INFO" />
```

The configuration file has a single command-line for each Switch, which should not need to be updated after installation. However, there are some complex scenarios where 1E may instruct you to make some changes.

Parameters	Comment	Notes
-cfgname=<name>	Specifies which row to use in the TachyonMaster database **SwitchConfiguration** table by matching the **<name>** using the following rules: 1. If **-cfgName=<name>** is specified, then the Switch expects to find a matching name in the **SwitchConfiguration** table. The convention for **<name>=<hostname>-<switchnumber>** where Switch number is unique and starts with SW1 2. If **-cfgName=<name>** is not specified, then the Switch will use the configuration where **<name>** is the	For a Switch on a DMZ Server this will be -cfgName=ACME-TCNDMZ-SW1 if ACME-TCNDMZ is the hostname of the DMZ server.

Parameters	Comment	Notes
	hostname of the server on which the Switch is running 3. If the **SwitchConfiguration** table does not have a row matching the server's name or hostname, then the Switch will use the default * row. If there is no match then the Switch will log an error and will not start. Example -cfgName=ACME-TCNMST-SW1	
-config=<fqdn>	The fully qualified domain name (fqdn) used by the Switch to connect to the Core. For example -config=https://tachyon.acme.local:443/Core	Included in template config.
-dmz	Allows the use of the Switch on a DMZ Server that is not domain-joined and is using SAML. Not required for domain-joined DMZ Server.	
-fips	Add this parameter to force client-Switch communications to use only FIPS-compliant algorithms. Windows and .NET Framework support a range of cryptographic algorithms, collectively known as cipher suites. There are various ways you can configure operating systems to permit use of specific cipher suites and security policies, which can include or enforce the use of FIPS-compliant algorithms.	

Parameters	Comment	Notes
	Tachyon components, including Switches, use whichever algorithms you have permitted without additional configuration. To enforce use of FIPS-compliant algorithms therefore requires you to correctly configure the OS of servers and devices. Switches are an exception because they do not rely on Windows, and will negotiate the strongest algorithm an client is permitted to use, which may not be FIPS-compliant, but will always negotiate the strongest FIPS-compliant algorithm if the **-fips** parameter is used.	
-ignoreClientCerts	The Switch does not require clients to present certificates. Requires **SecurityLevel** to be set to 4 (default is 5). Instructs the Switch to ignore any client certificate presented. Tachyon clients are allowed to connect if they provide no client certificate, an invalid client certificate, or a valid client certificate.	Added by TachyonSetup if **Switches require client certificates to be presented by 1E Client** is unchecked in Client certificates screen. For a new installation, Tachyon Setup also changes the **SecurityLevel** from default 5 to 4 in the **SwitchConfiguration** table of the **TachyonMaster** database.
-log.<log area>=<logging level>	Specifies the logging level for a logging area. The default value is -log=0 (same as -log=info) which provides logging of all Switch areas at info level. The following table shows permitted logging levels.	Included in template config as -log=0

Parameters	Comment	Notes

Value	Description
Error	Only outputs errors. An error is a serious problem, typically requiring operator intervention of some sort to restore full functionality.
Warn	Outputs errors and warnings. A warning indicates a potential problem, where the system can nonetheless function without intervention.
Info	Outputs general information in addition to the errors and warnings. This is the default.
Debug	Outputs debugging information in addition to all the previous levels.
Trace	Outputs the maximum information available. Used only in exceptional circumstances as it will generate huge amounts of logging output.

Warning

Logging levels should only be changed from

Parameters	Comment	Notes
	info only if requested by 1E Support and reset to **info** after investigation is complete. 1E Support may ask you to increase or reduce specific areas of logging. The example below increases the level of logging for http, decreases metrics, and leaves other areas as normal. `-log=info -log.http=debug -log.metrics=warn`	
-NoStdOut	Prevent the Switch echo logging to stdout in addition to the Switch log file. Remove only for testing.	
-NoSumm	Prevent the Switch logging warnings about not being able to connect to the Summarizer component. If this parameter is omitted, the Switch will attempt to report to a Summarizer using the URL specified in the **SummaryUrl** value in the **SwitchConfiguration** table, and log errors if it cannot connect. The Summarizer component monitors performance and is a separately installed component, only if required.	Included in template config.
-NoSw2Sw	Disable switch-to-switch communications.	Included in template config.
-skipCrlChecks	The Switch does not attempt to retrieve certificate revocation lists. Requires **SecurityLevel** to be set to 4 (default is 5).	

Parameters	Comment	Notes
	This affects the Switch and clients, that is, the Switch does not check the CRL of its own certificate, nor those of clients. This does not impact browsers connecting to Explorer, or the internal functions of the server.	

Warning

SecurityLevel is configurable in the **SwitchConfiguration** table of the **TachyonMaster** database. Typically, each Switch will have its own row in this table, and therefore has its own configuration.

By default, **SecurityLevel** is 5, and is only changed to allow Switches to use lower security options.

Do NOT change the **SecurityLevel** unless required. ONLY change this to the value required to support the necessary Switch configuration.

1.11.8.2 Device Deduplication

Several scenarios can lead to the same device being reported more than once within Tachyon, which can find their way into Experience and other applications. The main issue is duplicates having different TachyonGuid's. TachyonGuid is the primary distinct identifier of a device, meaning that when calculating the total number of devices within the system it can easily show a count that is higher than the real world number. It also means that data associated with a device (for example, Experience performance data) will eventually be split among multiple TachyonGuids, affecting access to the device's data as well as affecting aggregations.

In most cases, deduplicating using the device FQDN should suffice, in that it is reasonable to assume that multiple devices with the same FQDN are the same device. However, this is not true in all cases - for various reasons some organizations do not use FQDN to identify a device, they may uniquely identify devices based on Make, Model and Serial Number. For this reason, the deduplication feature can be configured with one or more device attributes to uniquely identify a distinct device.

Note

The Coordinator runs a device grooming task that deletes devices from the TachyonMaster database. This deletes devices that have not connected to the platform in a set number of days (99 by default). When devices are groomed a deleted event will be sent. The *tachyonGuid* specifies the device being deleted, for delete events payload will be null.

1.11.8.2.1 Configuration

Tachyon stores its Device Deduplication configuration in:
<INSTALLDIR>\Tachyon\Coordinator\Tachyon.Server.Coordinator.exe.config

> **Note**
>
> After any changes reboot the server or restart the **1E Tachyon Coordinator** service.

The time and frequency of when the Device Deduplication process runs is changed by adding and editing the **DeviceDeduplication** setting:

```
<module assemblyName="Tachyon.Server.Coordinator" providerName="Tachyon.Server.
Coordinator.Scheduling.SchedulingModule">
  <settings>
    <add key="Crontab1" value="50 23 * * * LogDevicesSeenInTheLast7Days" />
    <add key="Crontab2" value="15 * * * * MaintainPolicyRulePartitioning" />
    <add key="Telemetry" value="40 23 * * 5 SendTelemetryStats" />
    <add key="DeviceDeduplication" value="0 1 * * 0 DeviceDeduplication {Delete
Devices:'false',UpdateDeviceData:'false',DeleteOrphanedDeviceData:'false',Devic
eIdentifier:['FQDN']}" />
  </settings>
</module>
```

The numbers that you see after **value** is a crontab schedule expression. The schedule **0 1 * * 0** means "at 01:00 hours, any day of the month, any month of the year, on weekday 0 (Sunday)". In other words, this configuration runs the Device Deduplication process at 1AM UTC every Sunday night.

You can use an online tool such as https://crontab.guru/ to verify your crontab schedule expression.

> **Warning**
>
> Please ensure there are no spaces in the **arguments** text {within the brackets}.
>
> Do not change the other crontab keys unless advised by 1E.

1.11.8.2.1.1 Modifying when Device Deduplication runs

By default, **Device Deduplication** runs at 1AM UTC every Sunday night. Another process called **Experience Synchronization** runs at 2AM UTC daily. It is very important that Experience Synchronization is not running when Device Deduplication starts, therefore if you change the time when either of these processes start, then you must ensure **Experience Synchronization** process starts **after** the **Device Deduplication** process start, and ideally there should be at least a 1 hour gap to avoid overlap. You may need a longer gap for very large systems.

1.11.8.2.2 Arguments

Running with all "Update..." and "Delete..." arguments set to false will make no database changes and is considered a diagnostic/practice run. Following a run such as this the DeviceDeduplication and DeviceDeduplicationLog tables could then be analyzed to figure out how many duplicates are in the environment based on the **DeviceIdentifier** input. This would provide a projected impact for

a subsequent run with one or more of these arguments set to true. Alternatively, the user could then also choose to modify the **DeviceIdentifier** value to include more/less/different columns that would provide a more fine tuned target of what the user expects a truly unique device to be.

Argument	Default	Usage
Instance	Instance number of last run +1	This can optionally be added to the list of parameters in the app setting. By default, the orchestration will handle this automatically. If specifying, previous instance numbers can be found in the DeviceDeduplicationLog table. A use case for specifying this is retroactive execution, see **Instance** below section for more details.
DeleteDevices	False	Delete duplicate devices from both databases, and any management group associations for those devices.
UpdateDeviceData	False	Relink TachyonExperience performance data from duplicate devices (that will be deleted) to the singular active device that will be kept.
DeleteOrphanedDeviceData	False	Remove TachyonExperience performance data that is associated with a device that no longer exists.
DeviceIdentifier	['FQDN']	This is an array of one or more **passes**, with each **pass** made up of one or more **device attributes** (column names) from the **Device** table in the **TachyonMaster** database. Please refer to Device Deduplication below for more details about using multiple passes. You can use any column from the**Device**table that is a**device attribute**, however, you should only use attributes that uniquely identify a device. Device attributes that are commonly used to uniquely identify a device are: **Fqdn**,**SMBiosGuid**, **MAC**, **SerialNumber**,**Manufacturer**, **Model**, **Domain**, **Name**,**User**, and**Location**. Some of these attributes can be used on their own, whilst others must be used in combination. You should avoid using TachyonGuid, or any of the date columns. Each pass must be wrapped in **single quotes**. Any attributes specified within a pass are create a single hash per device. When

Argument	Default	Usage
		using multiple passes, or multiple attributes within a pass, they must each be separated by a**comma**. For example: DeviceIdentifier:['SerialNumber,SMBiosGuid**',**'Manufacturer,Model,Location**',**'FQDN',] **Note** Any devices that contain identical values across all the specified attributes will be assigned the same hash. Of these devices, the one that has the most recent **LastConnUtc** value will be marked as **ToBeDeleted**=0 whilst the others will be marked as **ToBeDeleted**=1. This is how we identify duplicates as well as the single active device that we want to keep. The **CreatedUtc**that is retained for the kept device is not necessarily the earliest or the latest of all its duplicates. **Note** If the column schema of the **Device** table changes between runs, then the **DeviceDeduplication** table will have to be backed up and deleted before the next run. This will generate a new version of the table in the next run with up-to-date device columns, which also means new columns can now be specified within the **DeviceIdentifier** value.

The following table describes the system behavior for every permutation of boolean arguments passed to DeviceDeduplication:

DeleteDevices	UpdateDeviceData	DeleteOrphanedDeviceData	Device Deduplication process behavior
F	F	F	This is the default configuration (3 x False). Before you change these settings, you should run a diagnostic/practice run where no changes will be made to the devices or their data. Check

DeleteDevices	UpdateDeviceData	DeleteOrphanedDeviceData	Device Deduplication process behavior
			DeviceDeduplication and **DeviceDeduplicationLog** table for results analysis.
T	F	F	Delete devices identified as duplicates, do not update or merge any existing performance data.
F	T	F	Do not delete devices identified as duplicates, reassign duplicate devices performance data to the single device that has been identified as the most recent instance of the device. ***1***
F	F	T	Do not delete devices identified as duplicates, do not update or merge any existing performance data. Delete any performance data that is associated with a TachyonGuid that no longer exists in the TachyonMaster Device table. This might be useful as a database cleanup exercise to remove "unparented data". ***1 2***
T	T	F	Delete devices identified as duplicates and merge any existing performance data that was associated with duplicates.
F	T	T	Do not delete devices identified as duplicates, reassign duplicate devices performance data to the

DeleteDevices	UpdateDeviceData	DeleteOrphanedDeviceData	Device Deduplication process behavior
			single device that has been identified as the most recent instance of the device. Finally, after relinking the data, delete any performance data that is associated with a TachyonGuid that no longer exists in the TachyonMaster Device table. ***1***
T	F	T	Delete devices identified as duplicates, do not update or merge any existing performance data. Delete any performance data that is associated with a TachyonGuid that no longer exists in the TachyonMaster Device table. ***2***
T	T	T	Delete devices identified as duplicates, reassign duplicate devices performance data to the single device that has been identified as the most recent instance of the device. Finally, after relinking the data, delete any performance data that is associated with a TachyonGuid that no longer exists in the TachyonMaster device table.

1 *- This could lead to continued inflated device counts in the system*

2 *- Be careful as this data will be deleted and cannot be recovered or merged at a later date even if the Tachyo nGuid that reported it comes online again.*

1.11.8.2.2.1 Instance

Each run of Device Deduplication will result in entries in the **DeviceDeduplicationLog** table. All rows for the run will be assigned an instance number. The Instance number is also used to be able to share context between the TachyonMaster and TachyonExperience parts of the process.

Retroactive execution: An old instance can also be passed to the process via the app setting. When an old instance is provided duplicates will not be recalculated, instead the list of devices from that previous run will be used (from the **DeviceDeduplication** table). This will also be logged in the **DeviceDeduplicationLog** table, an entry that reads "This is a rerun of a previous instance. Previous history from the DeviceDeduplication table will be used for this instance". In an execution such as this any new value for **DeviceIdentifier** will be ignored however all other new arguments will be applied.

1.11.8.2.2.2 Multiple Passes of Deduplication

The DeviceIdentifier argument is a comma separated list of passes, each pass itself being a comma separated list of device attributes. The order of specified passes is adhered to for Device Deduplication. Each pass further refines duplicate devices against the **results of the previous pass**. There is no limit to the number of passes specified.

For example, the passes listed in the table below would be run if the DeviceIdentifier is set to *`DeviceIdentifier:['SerialNumber,SMBiosGuid','Manufacturer,Model,Location','FQDN',]:`*

Pass number	Device attributes used	Identify duplicates based on...
1	SerialNumber SmBiosGuid	Devices in the TachyonMaster Device table that have the same SerialNumber AND SMBiosGuid.
2	Manufacturer Model Location	Devices identified as duplicates in pass 1 that also have the same Manufacturer, Model and Location.
3	FQDN	Devices identified as duplicates in pass 2 that also have the same FQDN.

The results of pass 3 alone are then used for the rest of the process and considered duplicates going forward.

1.11.8.2.3 Experience Synchronization

If any of the Boolean arguments are set to true, Device Deduplication may affect existing data in the system, whether through relinking to a new TachyonGuid or removing as orphaned data. For this reason, when the Device Deduplication process completes (with any settings set to true), it triggers a **full** Experience Synchronization. By default, the regular Experience Synchronization process is **incremental**, and runs at 2AM UTC daily.

The **full** Experience Synchronization includes a **full process** of the TachyonExperience aggregated data, which is initiated regardless of the current ProcessMode option specified (GlobalSetting table in the TachyonExperience database). A **full process** is required because data which typically Tachyon handles as additive can have historical data modified by the DeviceDeduplication process, which could otherwise lead to inaccurate counts and aggregations.

For large environments the **full process** of the aggregable data is likely to be a long running background process, it will not impact data displayed in the UI until it has completed. If it conflicts with an ongoing Experience Synchronization process it will be skipped. Server resource demand is likely to increase during an aggregation process. Be aware that depending on the resources available, this could affect the query response time of the UI.

The latest Accumulated Hotfix for Tachyon Platform Server allows you to add the **ExperienceSync** setting to the Coordinator configuration file. You do not need to add or modify this unless advised by 1E.

```
<module assemblyName="Tachyon.Server.Coordinator" providerName="Tachyon.Server.
Coordinator.Scheduling.SchedulingModule">
  <settings>
    <add key="Crontab1" value="50 23 * * * LogDevicesSeenInTheLast7Days" />
    <add key="Crontab2" value="15 * * * * MaintainPolicyRulePartitioning" />
    <add key="Telemetry" value="40 23 * * 5 SendTelemetryStats" />
    <add key="DeviceDeduplication" value="0 1 * * 0 DeviceDeduplication {Delete
Devices:'false',UpdateDeviceData:'false',DeleteOrphanedDeviceData:'false',Devic
eIdentifier:['FQDN']}" />
    <add key="ExperienceSync" value="0 2 * * * ExperienceSynchronization" />
  </settings>
</module>
```

The numbers that you see after **value** is a crontab schedule expression. The schedule **0 2 * * *** means "at 02:00 hours, any day of the month, any month of the year, any day". In other words, this configuration runs the Experience Synchronization process at 2AM UTC daily.

You can use an online tool such as https://crontab.guru/ to verify your crontab schedule expression.

1.11.8.2.4 Logging and analysing results

The Device Deduplication process creates logs in the **Tachyon.Coordinator.log** file.

The **DeviceDeduplicationLog** table - in the TachyonMaster database - logs more granular detail including the arguments used for the instance, details of each pass if more than one is specified, numbers of duplicates found, as well as rows affected in specific tables by various actions.

The **DeviceDeduplication** table - in the TachyonMaster database - stores a list of devices to be kept and their duplicates for the instance. The **ToBeDeleted** column is either 0 (false) for a device to be kept, and 1 (true) for a duplicate to be deleted. Kept and duplicate devices are associated by the **Hash** column.

With all arguments set to **false** you can review whether the specified **DeviceIdentifier** is able to uniquely identify devices and genuine duplicates. Once you are sure the **DeviceIdentifer** is suitable, you can then change other arguments from **false** to **true** according to your needs.

When the **DeleteDevices** argument is set to true, the **Device** table is updated for each device where older duplicates of it have been identified. Each device will have a timestamp set for **LastDeduplicationUtc** column, as well as an Experience event logged. The timestamp is updated when one or more new duplicates are found. There is also a **DeduplicationCount** column which represents the number of complete Device Deduplication

processes where a device has been found to have duplicates. These values will only be set on the device identified as being the most recent device that will be kept, not it s duplicates.

Devices with a **LastDeduplicationUtc** value can be found using the below SQL query.

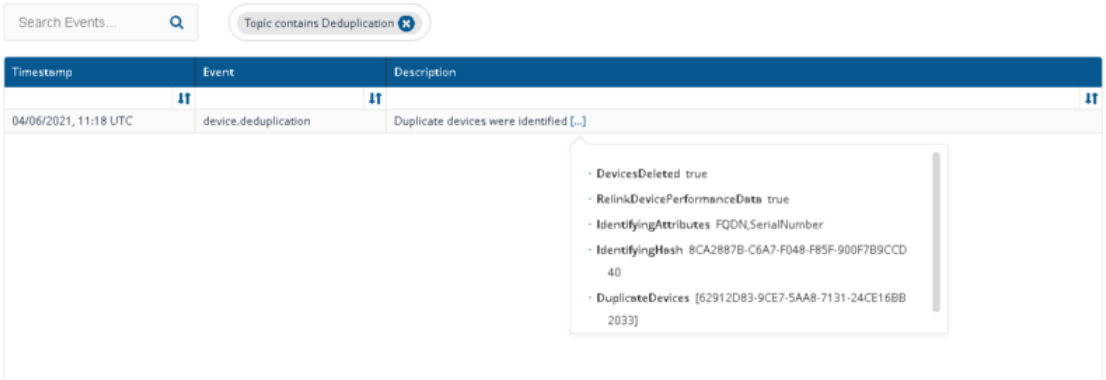
Genuine devices that have had duplicates identified

```
SELECT * FROM [TachyonMaster].[dbo].[Device] WHERE LastDeduplicationUtc IS NOT NULL and DeduplicationCount IS NOT NULL
```

The Experience event can be viewed within Experience (Devices → {Select a device} → Logs).

The details of the log will show what attributes were used when it was identified as having duplicates, if multiple passes were specified they will be delimited with a '#' in the order of execution. The **IdentifyingHash** value can be used to query the **DeviceDeduplication** table **Hash** column, in the TachyonMaster database.

This will provide all device details of the device itself as well as all of it's duplicate devices.



1.11.8.3 Roles and Securables

1.11.8.3.1 System roles

On the Roles page, a system role is indicated by an icon with a padlock

System roles are built-in and are not configurable, however, they can be assigned to users the same as any other role. The following table lists the built-in system roles.

Tachyon system role	Permissions	Allows delegation	Description	Notes
All Instructions Actioner	• InstructionSet (Actioner) for **All Instruction Sets**	Yes	Use Tachyon Explorer, execute any Instruction (Action and Question), and view	Renamed in 8.0 - was **Global Actioners**.

Tachyon system role	Permissions	Allows delegation	Description	Notes
			any Instruction response	
All Instructions Approver	• InstructionSet (Approver) for **All Instruction Sets**	Yes	Use Tachyon Explorer, approve any Instruction for anyone other than self	Renamed in 8.0 - was **Global Approvers**. If email is enabled, this role will receive an approval request email for each requested action instruction.
All Instructions Questioner	• InstructionSet (Questioner) for **All Instruction Sets**	Yes	Use Tachyon Explorer, ask any Question and view any Instruction response	Renamed in 8.0 - was **Global Questioners**.
All Instructions Viewer	• InstructionSet (Viewer) for **All Instruction Sets**	Yes	Use Tachyon Explorer, view any Instruction response	Renamed in 8.0 - was **Global Viewers**.
Full Administrator	• All	No	Has all the permissions available in the Platform and its Applications	Renamed in 8.0 - was **Global Administrators**.

Tachyon system role	Permissions	Allows delegation	Description	Notes
Group Administrator	• CustomProperty (Read) • ManagementGroup (Read, Write, Synchronize, Delete) • Security (Read, Write, Delete) • Repository.Inventory (Read, EvaluateManagementGroup)	Yes	Add Users and Management Groups, and manage their roles and assignments, below this Group Administrator's assigned Management Group(s)	**New role in 8.0** This role is similar to previous **Management Group Administrators** role, with permissions extended to support using Management Groups for RBAC, however the role is only allowed to manage Management Groups below the Management Groups they have been assigned to.
Guaranteed State Administrator	• GuaranteedState (Read,Write,Delete) • PolicyAssignment (Assign) • PolicyDeployment (Execute)	No	Use Guaranteed State, manage Rules and Polices, and assign and deploy Policies	Renamed in 8.0 - was **Guaranteed State Administrators**.
Guaranteed State Policy Assigner	• PolicyAssignment (Assign)	Yes	Assign Policies to Management Groups (does not allow use of Guaranteed State)	**New role in 8.0**

Tachyon system role	Permissions	Allows delegation	Description	Notes
Guaranteed State User	• GuaranteedState (Read)	No	Use Guaranteed State, view dashboards	Renamed in 8.0 - was **Guaranteed State Viewers**.
Installer	• Application (Write, Delete) • Consumer (Read, Write) • CustomProperty (Read) • EventSubscription (Read, Write, Delete) • Infrastructure (Read) • InfrastructureLog (Read) • InstructionSetManagement (Delete, Add, Read) • ManagementGroup (Read) • Security (Read, Write, Delete)	No	Install and upgrade the Platform and Applications, register Consumers, upload Product Packs, manage Instruction Sets, and configure Roles and Permissions	**New role in 8.0**
Inventory Administrator	• Component (Read, Write) • Connector (Read, Write, Delete, Execute) • CustomProperty (Read, Write)	No	Manage Inventory repositories - populate and archive them - export data - manage Inventory	Renamed in 8.0 - was **Inventory Administrators**.

Tachyon system role	Permissions	Allows delegation	Description	Notes
	• Inventory (Read, Export) • Inventory.Association (Read, Write, Delete, Export) • ManagementGroup (Read, Write, Synchronize, Delete) • ProcessLog (Read) • ProviderOperationLog (Read) • Repository.Inventory (Archive, Delete, EvaluateManagementGroups, Populate, Read, Write) • Schedule (Read, Delete, Write) • SynchronizationLog (Read)		associations	
Inventory User	• Inventory (Read, Export) • Inventory.Association (Read) • Repository.Inventory (Read)	No	View Inventory repositories, data and Inventory associations	Renamed in 8.0 - was **Inventory Viewers**.
Tachyon System	• Component (Read) • Connector (Execute) • Consumer (Read)	No	For service and equivalent accounts to perform Tachyon	**New role in 8.0**

Tachyon system role	Permissions	Allows delegation	Description	Notes
	• EngagementAssignment (Assign) • Engagements (Read, Write, Delete, Execute) • InstructionSetManagement (Read) • ManagementGroup (Read, Synchronize) • OffloadingData (Offload) • PolicyDeployment (Execute) • ProcessLog (Read) • ProviderOperationLog (Read) • Repository.Inventory (Read, EvaluateManagementGroups) • Security (Read)		system operations	

Questions, responses, actions are examples of securables. Other Consumers may create their own system roles and securables.

Note

When upgrading from Tachyon Platform 5.2 or earlier, roles names are automatically renamed as listed above. Other roles are deleted during the upgrade, unless they have members.

Click here to expand and see details of changes made by upgrading to this latest version of Tachyon Platfrom...

The upgrade process makes the following changes:

1. New roles are created, if they do not exist already:

New system roles

- Group Administrator
- Guaranteed State Policy Assigner
- Installer
- Tachyon System

New Custom roles

- Experience Administrator
- Experience Engagement Assigner
- Patch Success Administrator

2. The Tachyon user doing the upgrade is automatically assigned to the **Installer** role. The user is also *unassigned* from the following roles, if assigned before the upgrade:

   - Applications Administrators
   - Consumer Administrators
   - Event Subscription Administrators
   - Instruction Set Administrators
   - Permissions Administrators

3. Tachyon users associated with the NT AUTHORITY/NETWORK SERVICE and machine accounts, are assigned to the **Tachyon System** role. These users will also be *unassigned* from the following roles, if assigned before the upgrade:

   - Applications Administrators
   - Consumer Viewers
   - Engagement Administrator
   - Management Group Sync Initiators
   - Offloaders
   - Permissions Viewers
   - Survey Administrators

4. Several old roles are renamed
   a. Some are renamed from plural to singular, for example if the **Nomad Administrators**role exists it is renamed to**Nomad Administrator**
   b. An exception is in the unlikely event that the **Nomad Admins** role exists, it is renamed to **Nomad Administrator** unless that role already exists, in which case it is renamed to **Nomad Administrators** instead

c. **Global Questioner**, **Global Actioner**, **Global Viewer**, and **Global Approver** roles have been renamed with **Global...** replaced by **All instructions...**

d. **Inventory Viewers**, **Experience Viewers**, **Patch Success Viewers**, have been renamed with **...Viewers** changed to **...User**

System roles renamed from

- Global Actioners
- Global Administrators
- Global Approvers
- Global Questioners
- Global Viewers
- Guaranteed State Administrators
- Guaranteed State Viewers
- Inventory Administrators
- Inventory Viewers
- Survey Administrators
- Survey Viewers

System roles renamed to

- All Instructions Actioner
- Full Administrator
- All Instructions Approver
- All Instructions Questioner
- All Instructions Viewer
- Guaranteed State Administrator
- Guaranteed State User
- Inventory Administrator
- Inventory User
- Experience Engagement Administrator *
- Experience Engagement Viewer *

Note

* These roles are retired, and will only be kept if a user or group is assigned to it.

Custom roles renamed from

- AppClarity Administrators
- Application Migration Administrators

Custom roles renamed to

- AppClarity Administrator
- Application Migration Administrator
- Compliance Administrator

- Compliance Administrators
- Compliance Viewers
- Entitlement Administrators
- Experience Viewers
- Nomad Administrators
- Patch Success Viewers
- Reclaim Administrators
- Reclaim Viewers
- Compliance Viewer
- Entitlement Administrator
- Experience Viewer
- Nomad Administrator
- Patch Success User
- Reclaim Administrator
- Reclaim Viewer

5. Other system and custom roles are deleted. A role is kept only if it is **(a)** on the list of roles to be kept, or **(b)** the role has a user or group assigned to it

System roles that are kept

- All Instructions Actioner
- All Instructions Approver
- All Instructions Questioner
- All Instructions Viewer
- Full Administrator
- Group Administrator
- Guaranteed State Administrator
- Guaranteed State Policy Assigner
- Guaranteed State User
- Installer

System roles that have been retired

- 1E Client Deployment Administrators
- 1E Client Installer Administrators
- Applications Administrators
- Component Administrators
- Connector Administrators
- Consumer Administrators
- Consumer Viewers
- Custom Properties Administrators
- Event Subscription Administrators
- Event Subscription Viewers
- Infrastructure Administrators
- Instruction Set Administrators
- Log Viewers

- Inventory Administrator
- Inventory User
- Tachyon System

Custom roles that are kept

- 1E ITSM Connect Actioner
- AppClarity Administrator
- Application Migration Administrator
- Compliance Administrator
- Compliance Viewer
- Entitlement Administrator
- Experience Administrator
- Experience Engagement Assigner
- Experience User
- Nomad Administrator
- Patch Success Administrator
- Patch Success User
- Reclaim Administrator
- Reclaim Viewer
- Management Group Administrators
- Management Group Sync Initiators
- Offloaders
- Permissions Administrators
- Permissions Viewers
- Policy Administrators
- Provider Configuration Administrators
- Schedule Administrators
- Survey Administrators (Experience Engagement Administrator)
- Survey Viewers (Experience Engagement Viewer)
- VDI Administrators

Custom roles that have been retired

- Any custom role created by Tachyon administrators

Tip

A retired role is kept if it has a user or group assigned to it.

The following roles are retired (deleted) during an upgrade.

Retired Tachyon system role	Permissions	Notes
1E Client Deployment	• AgentDeployment (Execute, View, Approve)	Use **Full Administrator** role instead.

Retired Tachyon system role	Permissions	Notes
Administrators		
1E Client Installer Administrators	• AgentInstallerManagement (Add, Delete, Read)	Use **Full Administrator** role instead.
Applications Administrators	• Application (Write, Delete)	Use **Full Administrator** role instead.
Component Administrators	• Component (Read, Write)	Use **Inventory Administrator** role instead.
Connector Administrators	• Connector (Read, Write, Delete) • ProcessLog (Read) • ProviderOperationLog (Read)	Use **Inventory Administrator** role instead.
Consumer Administrators	• Consumer (Read, Write)	Use **Full Administrator** role instead.
Consumer Viewers	• Consumer (Read)	Create a custom role if required.
Custom Properties Administrators	• CustomProperty (Read, Write)	Use **Full Administrator** role instead.
Event Subscription Administrators	• EventSubscription (Read, Write, Delete)	Use **Full Administrator** role instead.

Retired Tachyon system role	Permissions	Notes
Event Subscription Viewers	• EventSubscription (Read)	Use **Full Administrator** role instead.
Experience Engagement Administrators	• Consumer (Read) • Engagements (Read, Write, Delete, Execute) • EventSubscription (Read, Write, Delete) • ManagementGroup (Read) • PolicyDeployment (Execute)	If this role is retained during an upgrade, it will have been renamed from **Survey Administrators**.
Experience Engagement Viewers	• Engagements (Read) • EventSubscription (Read)	If this role is retained during an upgrade, it will have been renamed from **Survey Viewers**.
Infrastructure Administrators	• Infrastructure (Read, Write, Delete)	Use **Full Administrator** role instead.
Instruction Set Administrators	• InstructionSetManagement (Delete, Add, Read)	Use **Full Administrator** role instead.
Log Viewers	• InfrastructureLog (Read) • ProcessLog (Read) • ProviderOperationLog (Read) • SynchronizationLog (Read)	Create a custom role if required.

Retired Tachyon system role	Permissions	Notes
Management Group Administrators	• ManagementGroup (Read, Write, Synchronize, Delete) • Repository.Inventory (Read, EvaluateManagement Groups)	Use **Full Administrator** or **Group Administrator** role instead.
Management Group Sync Initiators	• ManagementGroup (Read, Synchronize) • ProcessLog (Read) • ProviderOperationLog (Read) • Repository.Inventory (Read, EvaluateManagement Groups)	Not required for users. It is only needed for system accounts and replaced by the **Tachyon System** role.
Offloaders	• OffloadingData (Offload)	Not required for users. It is only needed for system accounts and replaced by the **Tachyon System** role.
Permissions Administrators	• InfrastructureLog (Read) • InstructionSetManagement (Read) • ManagementGroup (Read) • Security (Read, Write, Delete)	Use **Full Administrator** or Group Administrator role instead.
Permissions Viewers	• InstructionSetManagement (Read) • ManagementGroup (Read) • Security (Read)	Create a custom role if required.

Retired Tachyon system role	Permissions	Notes
Policy Administrators	• Consumer (Read) • PolicyDeployment (Execute)	Use **Guaranteed State Administrator** roles instead.
Provider Configuration Administrators	• ProviderConfiguration (Read, Write, Delete)	Use **Full Administrator** role instead.
Schedule Administrators	• Connector (Execute) • ProcessLog (Read) • ProviderOperationLog (Read) • Repository.* (All) • Schedule (Read, Write, Delete)	Use one or more of the following roles depending which repositories you need to use: • **Inventory Administrator** (system) • **AppClarity Administrator** (custom) • **Compliance Administrator** (custom) • **Entitlement Administrator** (custom) • **Reclaim Administrator** (custom)
VDI Administrators	• EventSubscription (Read, Write) • ManagementGroup (Read) • VDI (Read, Write)	Use the **Experience Administrator** custom role instead.

1.11.8.3.2 Custom roles

On the Roles page, a custom role is indicated by an icon with a cogwheel

The following table lists built-in custom roles used by Tachyon Applications.

Tachyon custom role	Permissions	Allows delegation	Description	Notes
1E ITSM Connect Actioner	• InstructionSet (Actioner) on the instruction sets you wish to allow ServiceNow to use	Yes	The ServiceNow proxy user is added to this role instead of All Instructions Actioner so that ServiceNow users can only use instructions belonging to instruction sets assigned to this role	The ServiceNow proxy user is added to this role instead of **All Instructions Actioner** so that ServiceNow users can only use instructions belonging to instruction sets assigned to this role.
AppClarity Administrator	• AppClarity.Compliance (Read, Write, Export, Delete, Execute) • AppClarity.Entitlement (Read, Write, Export, Delete, Execute) • AppClarity.Reclaim (Read, Write, Export, Delete, Execute) • Connector (Execute) • Inventory (Read, Export)	No	Create, update, delete and view AppClarity Compliance, Entitlement, License Demand and Reclaim - view and export Inventory - view, edit,	Renamed in 8.0 - was **AppClarity Administrators**.

Tachyon custom role	Permissions	Allows delegation	Description	Notes
	• Inventory.Association (Read, Write, Export, Delete) • ProcessLog (Read) • ProviderOperationLog (Read) • Repository.Compliance (Read, Write, Delete, Archive, Populate) • Repository.Entitlement (Read, Write, Delete, Archive, Populate) • Repository.Inventory (Read) • Schedule (Read, Write, Delete)		delete and export Associations	
Application Migration Administrator	• Connector (Execute) • Inventory (Read) • Inventory.Association (Read,Write,Delete) • ProcessLog (Read) • ProviderConfiguration (Read) • ProviderOperationLog (Read) • Repository.ApplicationMigration (Read,Write,Delete,Archive,Populate) • Repository.Inventory (Read,Write,Populate,EvaluateManagementGroups)	No	Create, update, delete and view Application Migration Rules and Role Based Application Sets to manage installations in your estate during operating system deployment	Renamed in 8.0 - was **Application Migration Administrators**.

Tachyon custom role	Permissions	Allows delegation	Description	Notes
Compliance Administrator	• AppClarity.Compliance (Read, Write, Export, Delete, Execute) • AppClarity.Entitlement (Read, Write, Export, Delete, Execute) • AppClarity.Reclaim (Read) • Connector (Execute) • Inventory (Read, Export) • Inventory.Association (Read, Write, Export, Delete) • ProcessLog (Read) • ProviderOperationLog (Read) • Repository.Compliance (Read, Write, Delete, Archive, Populate) • Repository.Entitlement (Read, Write, Delete, Archive, Populate) • Repository.Inventory (Read) • Schedule (Read, Write, Delete)	No	Create, update, delete and view AppClarity Compliance, Entitlement and License Demand - view AppClarity Reclaim - view and export Inventory - view, edit, delete and export Associations	Renamed in 8.0 - was **Compliance Administrators**.
Compliance Viewer	• AppClarity.Compliance (Read) • AppClarity.Entitlement (Read) • ProviderOperationLog (Read)	No	View AppClarity Compliance, Entitlement and License Demand	Renamed in 8.0 - was **Compliance Viewers**.

Tachyon custom role	Permissions	Allows delegation	Description	Notes
Entitlement Administrator	• AppClarity.Entitlement (Read, Write, Export, Delete, Execute) • Connector (Execute) • Inventory (Read, Export) • Inventory.Association (Read, Write, Export, Delete) • ProcessLog (Read) • ProviderOperationLog (Read) • Repository.Compliance (Read) • Repository.Entitlement (Read, Write, Delete, Archive, Populate) • Repository.Inventory (Read) • Schedule (Read, Write, Delete)	No	Create, update, delete and view AppClarity Entitlement - view and export Inventory - view, edit, delete and export Associations	Renamed in 8.0 - was **Entitlement Administrators**.
Experience Administrator	• Consumer (Read) • EngagementAssignment (Assign) - **new** • Engagements (Read, Write, Delete, Execute) • EventSubscription (Delete, Read, Write) • Experience (Read) - **new** • ManagementGroup (Read) • PolicyDeployment (Execute) • VDI (Read, Write)	No	Use Experience, manage, assign and deploy Engagements (Surveys and Announcements), and manage Metrics	**New role in 8.0** Effectively a combination of previous **Survey Administrators** and **VDI Administrators** roles.

Tachyon custom role	Permissions	Allows delegation	Description	Notes
Experience Engagement Assigner	• EngagementAssignment (Assign)	Yes	Assign Engagements to Management Groups (does not allow use of Experience)	**New role in 8.0**
Experience User	• Engagements (Read) • EventSubscription (Read) • Experience (Read)	No	Use Experience, view Survey responses, and view Metrics	Renamed in 8.0 - was **Experience Viewers**.
Nomad Administrator	• GuaranteedState (Read) • InstructionSet (Actioner) for the **1E Nomad** instruction set on **All Devices** • Nomad (Read, Write, Delete)	No	Use Content Distribution, manage Pre-cache jobs, view the results of related Instructions and Client health policies	Renamed in 8.0 - was **Nomad Administrators**. Instruction set assigned manually after installation.
Patch Success Administrator	• Consumer (Read) • InstructionSet (Actioner) for the **1E Patch Success** instruction set on **All Devices**	No	Use Patch Success, manage and populate	**New role in 8.0** Instruction set assigned manually after installation.

Tachyon custom role	Permissions	Allows delegation	Description	Notes
	• Repository.BI (Read, Populate) • Repository.Patch (Read)		its Repository, and deploy Policies, use Explorerto deploy patches	
Patch Success User	• Consumer (Read) • InstructionSet (Questioner) for the **1E Patch Success** instruction set on **All Devices** • Repository.Patch (Read)	No	Use Patch Success, and use Explorer to ask about Patch status on devices	Renamed in 8.0 - was **Patch Success Viewers**. Instruction set assigned manually after installation.
Reclaim Administrator	• AppClarity.Reclaim (Read, Write, Export, Delete, Execute) • Connector (Execute) • Inventory (Read, Export) • Inventory.Association (Read, Write, Export, Delete) • ProcessLog (Read) • ProviderOperationLog (Read) • Repository.Compliance (Read, Populate) • Repository.Inventory (Read) • Schedule (Read, Write, Delete)	No	Create, update, delete and view AppClarity Reclaim - view and export Inventory - view, edit, delete and export Associations	Renamed in 8.0 - was **Reclaim Administrators**.

Tachyon custom role	Permissions	Allows delegation	Description	Notes
Reclaim Viewer	• AppClarity.Reclaim (Read) • ProviderOperationLog (Read)	No	View AppClarity Reclaim	Renamed in 8.0 - was **Reclaim Viewers**.

1.11.8.3.3 Securables and operations

In the SDK documentation, Securables are also known as Securable Types.

A Permission is one or more Operations for a Securable. The remit for a Securable is either Localized or Global. A Role that has only Localized permissions can be delegated.

Securable	Operations	Remit	Description
AgentDeployment	Approve, Execute, View	Global	View, create, and cancel 1E Client deployment jobs
AgentInstallerManagement	Add, Delete, Read	Global	View, upload, and delete 1E Client installers
AppClarity.Compliance	Delete, Execute, Export, Read, Write	Global	View, create, edit, delete, export, and manage AppClarity Compliance and LDC
AppClarity.Entitlement	Delete, Execute, Export, Read, Write	Global	View, create, edit, delete, export, and manage AppClarity Entitlement
AppClarity.Reclaim	Delete, Execute, Export, Read, Write	Global	View, create, edit, delete, export, and manage AppClarity Reclaim
Application	Delete, Write	Global	Install and uninstall Portal applications

Securable	Operations	Remit	Description
Component	Read, Write	Global	View and configure Components
Connector	Delete, Execute, Read, Write	Global	View, create, edit, delete, and test Connectors
Consumer	Read, Write	Global	View, add, edit, and delete Consumers
CustomProperty	Read, Write	Global	View, add, edit, and delete Custom properties
EngagementAssignment	Assign	Localized	Assign Engagements (Surveys and Announcements) to Management Groups
Engagements	Delete, Execute, Read, Write	Global	View, create, edit, delete, and enable Engagements (Surveys and Announcements) - this securable has been renamed in version 8.0 from **Surveys**
EventSubscription	Delete, Read, Write	Localized	View, create, edit, and delete the configurations of event subscriptions
Experience	Read	Global	View Experience dashboards
GuaranteedState	Delete, Read, Write	Global	View, add, edit, and delete Rules, Fragments, Trigger templates, and

Securable	Operations	Remit	Description
			Policies - view Guaranteed State dashboards
Infrastructure	Delete, Read, Write	Global	View System health and System information - view, add, and edit global settings
InfrastructureLog	Read	Global	View Infrastructure log
InstructionSet	Actioner, Approver, Questioner, Viewer	Localized	Execute, schedule, cancel, and approve instructions - view responses
InstructionSetManagement	Add, Delete, Read	Global	Upload Product Pack-add, modify, and delete instruction sets - delete instruction definitions
Inventory	Export, Read	Global	View Inventory dashboards and export inventory data
Inventory.Association	Delete, Export, Read, Write	Global	View, create, edit, and delete SCCM Associations in Inventory
ManagementGroup	Delete, Read, Synchronize, Write	Localized	Create, delete, edit, and initiate synchronization of Management Groups
Nomad	Delete, Read, Write	Global	View Content Distributiondashboar

Securable	Operations	Remit	Description
			ds and SSD peer data. View, add, and delete pre-cache jobs. Pause and resume download activity of Content Distribution clients
OffloadingData	Offload	Global	Offload (forward) event data to any Web API responsible for processing that data
PolicyAssignment	Assign	Localized	AssignGuaranteed State policies to Management Groups
PolicyDeployment	Execute	Global	Deploy all types of policies (including metrics, events, and engagements) except for Reclaim policies
ProcessLog	Delete, Read, Write	Global	View and purge the Process log, Cancel all actions
Protect	Read, Write	Global	View and deploy patches at all endpoints
ProviderConfiguration	Delete, Read, Write	Global	View, create, edit, and delete Providers
ProviderOperationLog	Read	Global	Update, delete and view provider configurations
Repository.ApplicationMigration	Archive, Delete, EvaluateManagementGrou	Global	

Securable	Operations	Remit	Description
	ps, Execute, Populate, Read, Write		
Repository.BI	Populate, Read	Global	View and populate the BI respository
Repository.Compliance	Archive, Delete, Populate, Read, Write	Global	
Repository.Entitlement	Archive, Delete, Populate, Read, Write	Global	
Repository.Inventory	Archive, Delete, EvaluateManagementGroups, Populate, Read, Write	Global	View, create, edit, and delete Inventory repositories - populate and archive them
Repository.Patch	Read	Global	View Patch Success dashboards
Schedule	Delete, Read, Write	Global	View, create, edit, and delete Schedules - view Schedule history
Security	Delete, Read, Write	Localized	Add and remove Users - view all Roles - add, modify, and delete Custom roles - assign roles to users - view Audit information log
SynchronizationLog	Read	Global	View Sync log
VDI	Read, Write	Global	View, create, edit, and delete application servers

1.11.9 Client reference

Reference information for Tachyon features of the 1E Client.

Please refer to:

- Introducing 1E Client for more information about other client features and modules, and deploying the 1E Client
- /document/preview/736743#UUID-33c212b3-863e-21bc-bc5d-52e41a0492b3 for information about the SCALE and writing your own instruction using TIMS.

1.11.9.1 1E Client command-line parameters

For a full reference of Command-line interface (CLI) parameters available to the 1E Client executable, refer to 1E Client command-line parameters.

1.11.9.2 Tachyon client settings

For a full reference of installer properties and configuration file settings for the Tachyon client features of the 1E Client, refer to Tachyon client settings.

These settings are common to Windows and non-Windows platforms.

1.11.10 Settings reference

Reference information specific to the Settings application.

1.11.10.1 Naming conventions

Suggested naming conventions for connectors, repositories, schedules, and management groups.

Tachyon and its applications create a number of default objects, therefore useful names will help differentiate them. Naming conventions will make it easier for you to see what you are working on in various places in the user interface, especially in drop-down menus where you might not see descriptions.

Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

Object	Convention	Reason	Examples
Connector name	<connector type> <scope> <RCR>	Naming a connector with **connector type** first causes them to be grouped together in lists. This helps when creating an action or schedule and selecting a connector. In fact, when creating an action or schedule, it is **actions types** which are listed, but their names include the **connector name**. For example, if the	SCCM Demo SCCM with RCR File upload Uploads folder

Object	Convention	Reason	Examples
		connector name is **SCCM Demo** then the resulting action type is **Sync Data - SCCM Demo**. Note the drop-down list of **actions types** shows only the **connector types** relevant to the **repository type**. Including the **scope** in the name helps to identify the data source. Include **RCR** in the name if you have enabled **Run Consolidation Reports**.	
Repository name	<scope> <repository type>	Naming with **scope** first makes it easier to know which repository you are using. The name of the **repository** you are currently using is visible in a drop-down list at the top of pages in the user interface. Including the **repository type** in the name helps when creating an action or schedule.	Demo Inventory Default Inventory
Schedule name	<action type> <repository name> <schedule>	A schedule is used to sync data or generate a report, using a specified **action type** for a specified **repository** on a specified **schedule**. The names of **action types** have two parts, for example **Sync Data - SCCM Demo** and **Generate Report - Basic Inventory Consolidation**, in which case you would only use the second part in the schedule name. Naming with **action type** first causes the same types of action to be grouped together so you can more easily	SCCM Demo Inventory 11pm *(only need to say Demo once)* SCCM Demo Default Inventory 3am *(demo connector but default in ventory)* SCCM with RCR Default Inventory Friday 2am

Object	Convention	Reason	Examples
		identify if there would be any contention between them. Typically, the **scope** will be the same for your **action type** and **repository name** therefore you can omit the repeated scope name.	
Management groups	<type> <rule summary>	**Type** helps by listing similar types together, for example, role, location, business unit, region, etc. **Rule summary** is some text that summarizes the rules used to define group membership. You can be more specific in the group description.	Region EMEA workstations City Paris datacenter servers Role Exec laptops BU Finance workstations

1.11.10.2 Server telemetry data

Details of 1E product usage statistics gathered by Tachyon to help with 1E's continued product improvement initiative.

1.11.10.2.1 What data is collected?

At a high level, the following data is collected:

- Instruction usage (by Instruction Definition and by day), and statistics on the type of resources attached to Instruction Definitions
- 1E Client configuration details, versions, operating system variants, device types, age of installation, last connected time and status, and time zones
- Registered Portal applications and Consumers
- Database table sizes
- Tachyon server component information and basic configuration
- (Anonymized) Management Group information (number of devices)
- Tachyon upgrade history

Tachyon will periodically send summarized, statistical information about usage of the product to 1E. This enables 1E to improve your experience with Tachyon as it helps us understand how features are being used, focus future development, ensure we continue to support the Operating Systems you currently use, spot early warning signs of potential issues and identify instructions

that may be causing issues or could be improved. No personally identifiable data is collected. The data is compressed, encrypted and sent to 1E through email.

> **Note**
>
> By default, Tachyon collects data continuously and sends a **compressed** and **encrypted** summary by email to 1E **every Friday at 23:40 UTC**.

Configuration

For on-premises installations of Tachyon platform, customers have the option to configure the frequency this data is sent to 1E. This option is not available for customers using SaaS versions of the platform, SaaS customers should contact their 1E Account Team.

1.11.10.2.2 Metrics

The following tables list all the telemetry metrics. Numeric values are integers unless otherwise stated.

Application

Instance format	ApplicationName
Example instance	`Explorer`
Value format	Version number
Example value	*`5.1.0.20`*
Notes	Sourced from *`Application`* table in the TachyonMaster database.

ClientAgeMonths

Instance format	NumberOfMonthsAgo
Example instance	7
Value format	Count of number of devices
Example value	*42*
Notes	Sourced from *`Device`* table in the TachyonMaster database.

ClientAgeMonths

	Based on calendar months, rather than multiples of 30 days - e.g. if today is 2nd July, a device "first seen" on the 30th June will be counted as first seen as one month ago. An instance of zero means "within the last month". Can be used to determine client deployment rate.

ClientConfiguration

Instance format	"1EClientConfiguration"
Example instance	`"NM:E0505,PX:0,TAC:40AA4A,TAI:3FFE3,TUI:60080006"`
Value format	Number of clients with that configuration
Example value	`88`
Notes	Sourced from *`Device`* table in the TachyonMaster database.

ClientConnectivity

Instance format	OnlineStatus|SwitchId|ConnectivityFlags
Example instances	`Online|1|384` `Offline|0|384`
Value format	Count of number of devices for that combination
Example value	*42*
Notes	Sourced from *`Device`* table in the TachyonMaster database. Where devices are offline, their connection flags represent the values as they were at the time of their last connection.

ClientLastSeenDays

Instance format	NumberOfDays
Example instance	7
Value format	Count of number of devices
Example value	*42*
Notes	Sourced from *Device* table in the TachyonMaster database. Milestones are 1, 2, 4, 7, 30, 90 and 365 days. The numbers will be *cumulative*, because a device which has been since in the last 1 day will also be counted in 2 days, 4 days, 7 days, etc.

ClientOsVersion

Instance format	DeviceType|OsVersionText|OsArchitecture|VirtualizationPlatform

Example instances	`Desktop|CentOS Linux release 8.2.2004 (Core) |x64|Hyper-V`
	`Desktop|Red Hat Enterprise Linux release 8.1 (Ootpa)|x64|Hyper-V`
	`Desktop|Ubuntu 18.04.4 LTS|x64|Hyper-V`
	`Desktop|Windows 10 Pro N 2004|x86|Hyper-V`
	`Desktop|Windows 7 Enterprise|x86| <- absence of Virtualization platform implies physical device`
	`Server|Windows Server 2016 Standard 1607|x64|`

Value format	Count of number of devices running that OS variant
Example value	*42*
Notes	Sourced from *Device* table in the TachyonMaster database.

ClientTimeZone

Instance format	TimeZoneIdentifier

ClientTimeZone

Example instances	`Europe/London` `Asia/Calcutta`
Value format	Count of number of devices detected in that timezone
Example value	*42*
Notes	Sourced from *`Device`* table in the TachyonMaster database.

ClientVersion

Instance format	ClientVariant|ClientVersionNumber
Example instances	`Windows|5.1.0.885` `Linux|5.0.0.234`
Value format	Count of number of devices running that variant/version of the 1E Client
Example value	*182*
Notes	Sourced from *`Device`* table in the TachyonMaster database.

Component

Instance format	Component
Example instances	`BackgroundChannel` `SwitchConfiguration.2`
Value format	For components other than the Switch, a count of instances of that component For Switch components, a pipe-delimited sequence of: • X w - number of configured workers • X s - number of configured slots

Component

	• X seclvl - configured security level • X switches - number of Switches with this configuration • X cores - number of cores bound to Switches with this configuration
Example values	`2 (for non-Switch components)` `SwitchConfiguration.2,1 w|10 s|5 seclvl|1 switches|1 cores`
Notes	Sourced from *SwitchConfiguration, Switch, BackgroundChannel, CoreApiConfiguration*tables in the TachyonMaster database.

Consumer

Instance format	Consumer
Example instance	`CmConsoleExtensions`
Value format	0 = disabled, 1 = enabled
Example value	*1 (i.e. enabled)*
Notes	Sourced from *Consumer* table in the TachyonMaster database.

InstructionDefinitionUse

Instance format	Instruction Definition Name|Instruction Definition Version
Example instance	`1E-Explorer-TachyonAgent-AgentConnectionDiagnostics|17.3`
Value format	Pipe-delimited sequence of: • X use - number of times the instruction definition has been run • X targeted - total number of devices targeted

InstructionDefinitionUse

	• X sent - total number of devices to which this instruction has been sent • X no data - total number of "success, no content" responses • X error - total number of "error" responses • X not_impl - total number of "not implemented" responses • X too_large - total number of "response too large" responses • X success_rows - total number of rows of data returned in responses • X mb_sent - total number of megabytes of network traffic sent from Switch to 1E Client • X mb_recv - total number of megabytes of network traffic received by Switch from 1E Client • X mb_urecv - total number of megabytes of equivalent uncompressed network traffic received by Switch from 1E Client All the values above are based on the sum of all executions of that instruction definition.
Example value	`2 use|900 targeted|876 sent|1 no_data|3 error|7 not_impl|0 too_large|52286 success_rows|17 mb_sent|35 mb_recv|208 mb_urecv`
Notes	Sourced from *`InstructionDefinition`* and *`InstructionStatistics`* tables in the TachyonMaster database. If an instruction definition is updated, this row reflects usage only of the most recent version of that instruction definition.

InstructionResourceCount

Instance format	ResourceType
Example instance	`Perl`

InstructionResourceCount

Value format	Total number of resources of that type
Example value	*33*
Notes	Sourced from *InstructionDefinitionResource* table in the TachyonMaster database.

InstructionResourceKb

Instance format	ResourceType
Example instance	`PowerShell`
Value format	Total size in kilobytes
Example value	*69*
Notes	Sourced from *InstructionDefinitionResource* table in the TachyonMaster database.

InstructionThroughput

Instance format	Localized date/time
Example instance	`8/4/2020 12:00:00 AM +01:00`
Value format	Pipe-delimited sequence of: • X instr - number of instructions run on that day • X targeted - total number of devices targeted • X sent - total number of devices to which instructions were sent • X no data - total number of "success, no content" responses • X error - total number of "error" responses

InstructionThroughput

	• X not_impl - total number of "not implemented" responses • X too_large - total number of "response too large" responses • X success_rows - total number of rows of data returned in responses • X mb_sent - total number of megabytes of network traffic sent from Switch to 1E Client • X mb_recv - total number of megabytes of network traffic received by Switch from 1E Client • X mb_urecv - total number of megabytes of equivalent uncompressed network traffic received by Switch from 1E Client All the values above are based on the sum of all executions of instructions on that day.
Example value	`19 instr|94 targeted|94 sent|28 no_data|36 error|0 not_impl|0 too_large|2419 success_rows|0 mb_sent|0 mb_recv|1 mb_urecv`
Notes	Sourced from *`InstructionStatistics`* table in the TachyonMaster database.

ManagementGroup

Instance format	ManagementGroupId|ManagementGroupType
Example instance	76|2
Value format	Number of devices in that management group
Example value	777
Notes	Sourced from *`ManagementGroup`* table in the TachyonMaster database. Management group types are (System = 0, Internal = 1, External = 2)

Table

Instance format	TableName
Example instance	`PolicyRuleStatus`
Value format	Pipe-delimited sequence of: • X rows - number of rows in the table • X kb_resv - total size (data and index) of reserved space for this table (i.e. space consumed on disk) • X kb_data - total size of data for this table • X kb_idx - total size of index data for this table
Example value	*95 rows|144 kb_resv|16 kb_data|32 kb_idx*
Notes	Sourced from SQL table metadata; this data may not be available if the account used to perform the query does not have permissions to query sys.* tables for TachyonMaster database. The query to derive this information is based on the query used by SQL Server Management Studio to build the "Disk Usage" report.

Upgrade

Instance format	VersionNumber
Example instance	`5.1.0.607`
Value format	Localized date/time
Example value	`8/4/2020 11:10:33 PM +01:00`

Upgrade	
Notes	Sourced from *AppliedChanges2* table in the TachyonMaster database. The version number is derived from the "SourceVersion" column, which typically is the binary version of the database resource DLLs containing the database changes to apply. Hotfixes will only be registered if they perform a database change.

1.11.10.3 System health components and checks

The **System Health** page runs a comprehensive series of component checks. By default, it shows issues, but you can see a full list of green lights by toggling **Issues only**.

The System Health page is accessible from **Settings**→**Monitoring**→**System health**.

The components in the table are:

Background Channel | Consumer API | Coordinator service Agent Deployment module | Coordinator service Licensing module | Coordinator service Management Groups module | Coordinator service Policy module | Coordinator service | Core | SLA Admin | SLA Engine | SLA Integrate Agent service | SLA Integrate Manager service | SLA Platform API | Switch

Component	Check	Description
Background Channel	Folder '~/Content' write access check	Check that the Background Channel can write to the "Content" folder within the app pool user context.
Folder '~/Installers' read access check	Check that the Background Channel can read from the "Installers" folder within the app pool user context.	
Folder '~/Policy Documents' write access check	Check that the Background Channel can write to the "PolicyDocuments" folder within the app pool user context.	
Folder '~/Update	Check that the Background Channel can read from the	

Component	Check	Description
s' read access check	"Updates" folder within the app pool user context.	
Consumer API	Active Directory connection check	Check that Consumer API can connect to Active Directory. *Uses the configured GC or LDAP connection string.*
Background Channel API connection check(s)	Check that Consumer API can connect to Background Channel API. *Uses the URL(s) stored in the TachyonMaster database.*	
Coordinator API connection check	Check that Consumer API can connect to Coordinator API. *Uses the OperationalSafeGuardsUrl application setting.*	
Core API '<Core server>' connection check(s)	Check that Consumer API can connect to Core API. *Uses the URL(s) stored in the TachyonMaster database.*	
Tachyon Master database connection check	Check that Consumer API can connect to the TachyonMaster database. *Uses the configured connection string (TachyonMaster) within the app pool user context.*	
TachyonResponse database	Check that Consumer API can connect to the TachyonResponse database(s).	

Component	Check	Description
connection check(s)	*Uses the stored connection strings within the TachyonMaster database under the app pool user context.*	
Coordinator service Agent Deployment module	Background Channel API connection check	Check that Coordinator Agent Deployment module can connect to Background Channel API. *Uses the URL(s) stored in the TachyonMaster database.*
Coordinator service Licensing module	Check license service URL	Verify that license service URL is from a trusted issuer.
Check license validity	Verify license expiry date.	
Check trust with licensing component	Verify trust between coordinator and licensing component by comparing signatures between the licensing module DLL and licensing DLL.	
Coordinator service Management Groups module	Management Group API connection check	Check that Coordinator Management Groups module can connect to SLA Management Group API using the configured URL. *Uses the SLAEndpoint module setting.*
Coordinator service	Background Channel API connection check	Check that Coordinator Policy Module can connect to Background Channel API.

Component	Check	Description
Policy module		*Uses the URL(s) stored in the TachyonMaster database.*
Coordinator service	Active Directory connection check	Check that Coordinator can connect to Active Directory. *Uses the configured GC or LDAP connection string.*
Coordinator certificate check	Check that Coordinator has a valid certificate used for the SSL API communication.	
SMTP connection check	Check that Coordinator can connect to the SMTP server using the "EHLO" command. *Only shown if SMTP emails has been enabled.*	
Tachyon Master database connection check	Check that Coordinator can connect to the TachyonMaster database. *Uses the configured connection string (TachyonMaster) within the app pool user context.*	
Website application authentication check	Check that Consumer API site has Windows authentication enabled and that Anonymous authentication is disabled.	
Website certificate binding check	Check that Consumer API has a valid certificate binding.	

Component	Check	Description
Core	TachyonMaster database connection check	Check that Core can connect to TachyonMaster database. *Uses the configured connection string (TachyonMaster) within the app pool user context.*
TachyonResponse database connection check(s)	Check that Core can connect to TachyonResponse database(s). *Uses the stored connection strings within the TachyonMaster database under the app pool user context.*	
SLA Admin	Consumer API connection check	Check that SLA Admin can connect to the Consumer API. *Uses the PermissionCheckerRootUrl application setting.*
SLA Platform API connection check	Check that SLA Admin can connect to the SLA Platform API.	
SLA-Data database connection check	Check that SLA Admin can connect to the SLA-Data database. *Uses the configured connection string (DefaultCustomerConnection) within the app pool user context.*	
SLA-Shared database connection check	Check that SLA Admin can connect to the SLA-Shared database. *Uses the configured connection string (DefaultSharedConn*	

Component	Check	Description
	ection) within the app pool user context.	
SLA Engine	1ECatalog database connection check	Check that SLA Engine can connect to the 1ECatalog database. *Uses the BaseUri application setting to request the 1ECatalog connection string from the SLA Platform API. The database connection check is performed within the service user context.*
Catalog API connection check	Check that SLA Engine can connect to the Catalog API. *Uses the URL retrieved from the SLA-Data.Component table for 1ECatalog within the service user context.*	
Consumer API connection check	Check that SLA Engine can connect to the Consumer API. *Uses the TachyonConsumerRootUrl application setting.*	
SLA Platform API connection check	Check that SLA Engine can connect to the SLA Platform API. *Uses the BaseUri application setting.*	
SLA-Data database connection check	Check that SLA Engine can connect to the SLA-Data database. *Uses the configured connection string (DefaultCustomerConnection) within the service user context.*	

Component	Check	Description
SLA-Shared database connection check	Check that SLA Engine can connect to the SLA-Shared database. *Uses the configured connection string (DefaultSharedConnection) within the service user context.*	
SLA Integrate Agent service *(part of SLA Integrate services)*	Folder '<ConnectorsRoot>' write access check	Check the SLA Integrate Agent can write to the 'dir-connectors' folder within the service user context.
Folder '<InstallerRoot>' write access check	Check the SLA Integrate Agent can write to the 'dir-job-output' folder within the service user context.	
Folder '<JobOutputRoot>' write access check	Check the SLA Integrate Agent can write to the 'dir-job-output' folder within the service user context.	
SLA Integrate Manager connection check	Check that the SLA Integrate Agent can connect to the SLA Integrate Manager. *Uses the rest-api-address application setting.*	

Component	Check	Description
SLA Platform API connection check	Check that the SLA Integrate Agent can connect to the SLA Platform API. *Uses the rest-api-address application setting to request the SLA Platform API address from the SLA Integrate Manager.*	
SLA Integrate Manager service *(part of SLA Integrate services)*	Folder '<InstallerRoot>' write access check	Check the SLA Platform Integrate Manager can write to the 'dir-installers' folder within the service user context.
Folder '<JobOutputRoot>' write access check	Check the SLA Platform Integrate Manager can write to the 'dir-job-output' folder within the service user context.	
SLA Platform API connection check	Check that SLA Integrate Manager can connect to the SLA Platform API. *Uses the sla-data-address application setting.*	
SLA-Integrate database connection check	Check the SLA Integrate Manager service can connect to the SLA-Integrate database.	

Component	Check	Description
	Uses the configured connection string (default) within the service user context.	
SLA Platform Integrate Agent	Check at least one SLA Platform Integrate Agent has reporting health status.	
SLA Platform API *API includes the UI* *The following are not checked:* • *SLA Inventory* • *SLA Operations Provider API*	1ECatalog database connection check	Check that SLA Platform API can connect to the 1ECatalog database. *Uses the configured connection string (DefaultCatalogConnection) within the app pool user context.*

Component	Check	Description
Consumer API connection check	Check that SLA Platform API can connect to Consumer API. *Uses the PermissionCheckerRootUrl application setting.*	
SLA-Data database connection check	Check that SLA Platform API can connect to the SLA-Data database. *Uses the configured connection string (DefaultCustomerConnection) within the app pool user context.*	
SLA-Shared database connection check	Check that SLA Platform API can connect to the SLA-Shared database. *Uses the configured connection string (DefaultSharedConnection) within the app pool user context.*	
SLA Engine	Check the SLA Engine has reported health status.	
Switch *Switch Host is not checked*	Core Connect (Device)	Check if this Switch can connect to core Device endpoint.
Core Connect (Instructions)	Check if this Switch can connect to core Instructions endpoint.	

Component	Check	Description
Core Connect (Policy Response)	Check if this Switch can connect to core Policy Response endpoint.	
Core Connect (Policy)	Check if this Switch can connect to core Policy endpoint.	
Core Connect (Response)	Check if this Switch can connect to core Response endpoint.	
Core Connect (Switch)	Check if this Switch can connect to core Switch endpoint.	
Recent administrative events.	Check if this Switch has had any recent errors or warnings (since last instruction poke)	

1.11.11 Inventory reference

Reference information specific to the Catalog and SLA components of the Tachyon Platform.

1.11.11.1 Autocuration and Partial Matching

How inventoried products are matched with the Catalog.

In cases where we don't have an exact match, partial matching and autocuration will be used to attempt to create valid matches.

The order of precedence for attempts is:

- Exact Match
- Full Match
- Autocuration
- Partial Match

1.11.11.1.1 Exact Match

Exact match for non edition based products:

- source V & T & Version = catalog V & T & Version

Exact match for edition based products:

- source V & T & Version & Edition = catalog V & T & Version & Edition

1.11.11.1.2 Full Match

Full match for non edition based products:

- source V & T & Version = catalog match rule l.h.s. V & T & Version

Exact match for edition based products:

- source V & T & Version & Edition = catalog match rule l.h.s. V & T & Version & Edition

1.11.11.1.3 Autocuration

Source must have number of version parts>= matching catalog entry.

When exact and full match fail, we attempt auto curation. This involves add a new version to the catalog for a specific Vendor and Title where one didn't exist before. Before doing this, we need to be confident that the version we are about to create is a valid version.

Once the new versions is added, a match is returned between the source VTVCE and the new catalog VTVCE record

The following rules must be adhered to before autocurating an entry:

- The source VT matches with a catalog VT either directly (exact) or via a match rule
  - e.g. Source Vendor = 'Microsoft' and Source Title 'Microsoft Visio'
  - there should be at least one match rule that matches the source VT to catalog VT
- The source version doesn't contain **any letters or special characters** (e.g. '/' or '-')
- If there is already an entry in the catalog with the same version major.minor, then the source major.minor must have equal or greater than number of version parts than the catalog version
  - This is to have confidence that the version we are about to add to catalog is an accurate version rather than missing some version parts
- If there is no existing major.minor in the catalog, then autocuration can occur i.e. new major.minor can be created
- For edition based product
  - The match rule being used for autocuration must be on the edition rather than the version

1.11.11.1.4 Partial Match

Source version must be same major.minor as catalog match.

If autocuration hasn't taken place, then Partial Matching is attempted. For partial matching to occur, the source version should have less than the number of version parts of the major.minor of the catalog.

Note: if it has the same or greater number of version parts then it would have autocurated

So, for example, if the catalog has version 3.2.1.1 for a specific VT and the source version was 3.2 then partial matching can take place. In partial matching, the lowest version for that catalog major.minor is returned.

1.11.11.1.5 Glossary

Edition based product is defined as a product that has at least one edition for a specific major version

Number of Version parts: how many different parts of the version number there are – e.g. 1.2.3 , number of version parts is 3

Exact match is when source VTV matches exactly a catalog VTV. If its an edition based product then it's the source VTVE matches exactly catalog VTVE

Full match is when the source VTV does not match a catalog VTV directly, but matches the source VTV via a match rule. If its an edition based product that the source VTV or VTVE matches a catalog VTVE via a match rule

l.h.s: left hand side of match rule , i.e. the source VTVCE of the match rule

VTVCE - Vendor, Title, Version, Colloquial version, Edition

VT - Vendor and Title only

Partial Match - the source Vendor and Title match the Catalog Vendor and Title

Partial Version Match - the conditions are fulfilled (see below) whereby the lowest version number for a speciific major.minor is returned as a match

1.11.11.2 By Device table

The table column headings and descriptions for the **By Device** table.

1.11.11.2.1 The By Device table

The following table shows the headings in the **By Device** table, accessible from the **Inventory→By Device** node in the navigation console:

Column heading	Description
Host Name	The name for the device. This is a link that navigates to the Product Details table for the selected device.
Last Inventory Date	The date when inventory information was last returned for the device.

Computer Type	The type of the device. For example **Workstation**, **Desktop**, **Laptop**, **Server** or **Virtual Machine** etc.
Device Model	The model for the device. For example: **Virtual Machine**, **Surface Pro 3**, **Optiplex 910** etc.
OS	The Operating System installed on the device. For example **Windows 10 Pro**.
Number of Unnormalized Software Records	The number of unnormalized software records associated with the device, i.e. the number of installed software titles on the device that couldn't be automatically matched by 1E Catalog. This is formatted as a link, click to match the records to the catalog.
Number of Normalized Software Records	The number of normalized software records associated with the device, i.e. the number of software titles installed on the device that were matched by 1E Catalog.

1.11.11.3 Product Details table

The table column headings and descriptions for the Product Details table.

1.11.11.3.1 The Product Details table

The following table shows the headings in the **Product Details** table, accessible from the **Products By Vendor** screen:

Column heading	Description
Vendor	The vendor who sells the installed software title. For example **Microsoft Corporation** is the vendor for **Office 365**.
Title	The title name for the installed software title. For example the title for Microsoft Office 365 can be **Office 365**.
Colloquial Version	Any associated informal name for the version of the installed software title. For example the Colloquial Version for Microsoft Office 365 could be **2016**.
Edition	The specific edition of the installed software title. For example the Edition for Microsoft Office 365 could be **ProPlus**.
Version	The specific version for the installed software title. For example the specific version for Microsoft Office 365 could be **16.0.10228.20080**.

Host	The host where the software title is installed. For example **Acme-win1002**.
Host Computer Name	The computer name for the host where the software title is installed.
Computer Type	The type of the computer where the software title is installed. For example **Workstation**, **Server** or **Virtual Machine**.
OS	The Operating System where the software title is installed. For example **Windows 10 Pro**.

1.11.11.4 Secondary App Rules

1.11.11.4.1 Rules used to define whether an unnormalized application is defined as a 'Secondary app'

Rules are run against all unmatched applications to identify whether they should be categorized as one of the following:

- Unidentified
- Secondary Apps

The table below shows all the rules used to categorize unmatched applications as a **Secondary Apps** rather than **Unidentified**.

Rules with the same RuleID use an **AND** operator; those with a different RuleID use an **OR** operator.

RulesetName	RuleID	FieldName	Operation Name	Value	IsDeleted	Is1EVerified
RuleSetInventory	1	SOURCE_TITLE	CONTAIN	Policy	0	1

1.11.11.5 Usage categories

Usage data is held in inventory repositories, and is obtained using the following types of connector:

- System Center Configuration Manager connector
- Tachyon connector

Software installations can have one of the following 4 usage categories:

- Used
- Rarely Used
- Unused
- Unreported:
- Unreported - Device stopped reporting usage: Device has a usage record but it has been 30 or more days since we received inventory from the device
- Unreported - Invalid usage date: there is a usage date but it's in the future
- Unreported - Recently installed: there is no usage date, the device has usage and the software was installed less than 7 days ago
- Unreported - Invalid install date: there is no usage date, the device has usage and the software was installed at a date in the future according to the source
- Unreported - No Product Usage: the software is not showing usage across any of its installs
- Unreported - No Device usage: the device is not reporting usage (possibly due to a corrupted Tachyon client or 1E Client)

- Unreported - Device Inventory too old: the device is not reporting usage and the inventory date is older than 30 days
- Unreported - Invalid Device Inventory date: the device is not reporting usage and the inventory date is in the future
- Unreported - No Device Inventory date: the device is not reporting usage and the inventory date is not present

How a software installation is categorized depends upon its **Last Usage Date** and the **Install Date**, both of which are derived from the inventory sources used.

- **Device Inventory Date** = maximum of device inventory dates for the consolidated device
- **Last Usage Date** = maximum of product usage date for the consolidated installation
- **End of Sync Date** = maximum of device inventory dates and maximum usage dates excluding dates in the future

	Device Inventory Date (relative to End of Sync Date)	No Device Inventory Date
Device Inventory Date < 30 days	Device Inventory Date >30 days	Device Inventory Date > End of Sync
Last Usage Date (relative to End of Sync Date)	No Last Usage Date	

All Usage on Device > 30 days old since Device Inventory	Last Usage Date > End of Sync Date	<=30 days	31-89 days	>=90 days	Device usage	No Device Usage
Product Usage across estate	No Product Usage across estate					

Install Date	Null	**Unreported** - Device stopped reporting usage	**Unreported** - Invalid Usage date	**Used**	**Rarely Used**	**Unused**	**Unused**	**Unreported** - No Product Usage	**Unreported** - No Device Usage	**Unreported** - Device inventory date too old	**Unreported** - Invalid Device inventory date	**Unreported** - No Device inventory date
< 7 Days	**Unreported** - Recently installed											
>=7 Days	**Unused**											
In the future	**Unreported** - Invalid install date											

If there is no usage data found for a normalized software installation, then :

1) A check is made to see if any installation on this device is reporting usage. If not, then the **Install Date** is categorized as **Unreported - No Device Usage**

2) A check is then made to see if this software installation is reporting usage anywhere else in the inventory repository. If no, then the **Install Date** is categorized as **Unreported - No Product Usage**

3) If the device is showing usage and the product is reporting usage across the inventory repository, the **Install Date** of the software installation is used to categorize usage:

- If **Install Date** is NULL, then the software is assumed to be **Unused**
- If **Install Date** is less than 7 days, then the install is deemed to be **Unreported - Recently installed**, as the user may not have had a chance to run the application yet
- If **Install Date** is greater than or equal to 7 days, then the install is deemed to be **Unused**, as the user has had a chance to run the application and yet there is no usage record
- If **Install Date** is set in the future (as some can sometimes happen due to error in the source data), then categorize the usage as **Unreported - Invalid install date**

For bundled products, the Last Usage Date of each component is analyzed and the most recent Last Usage Date is used to determine its usage category for the bundle.

Warning

For AppClarity 7.0 onwards the 7, 30 and 90 day limits are configurable, but they must not be changed unless advised by 1E.

- InstallDateCutOffLimit - default 7
- UsedCategoryLimit - default 30
- UnusedCategoryLimit - default 90

The settings are configurable in **[SLA-Shared].[dbo].[ProjectSetting]** table, which gets copied to **[SLA-Data].[dbo].[InstanceSetting]** when a new Inventory repository is created. Each Inventory repository will have its own group of settings in the InstanceSetting table. You can edit **[SLA-Data].[dbo].[InstanceSetting]** to change the settings for an existing repository. If that repository contains reclaim policies, the new settings will take effect and update the policies after an action is run on the repository.

Use the following SQL script to view settings in both tables.

```
SELECT [Project].[Title] AS 'ProjectTitle'
      ,[ProjectSetting].[Name] AS 'ProjectName'
      ,[ProjectSetting].[Value]
  FROM [SLA-Shared].[dbo].[ProjectSetting]
  JOIN [SLA-Shared].[dbo].[Project]
  ON [Project].[ProjectID]=[ProjectSetting].[ProjectID]
  WHERE [ProjectSetting].[Group] = 'UsageCategory'

SELECT [Instance].[InstanceID]
      ,[Instance].[Name] AS 'InstanceName'
      ,[InstanceSetting].[Name] AS 'SettingName'
      ,[InstanceSetting].[Value]
  FROM [SLA-Data].[dbo].[InstanceSetting]
  JOIN [SLA-Data].[dbo].[Instance]
  ON [Instance].[InstanceID]=[InstanceSetting].[InstanceID]
```

```
AND [Instance].[ProjectID]=[InstanceSetting].[ProjectID]
WHERE [InstanceSetting].[Group] = 'UsageCategory'
```

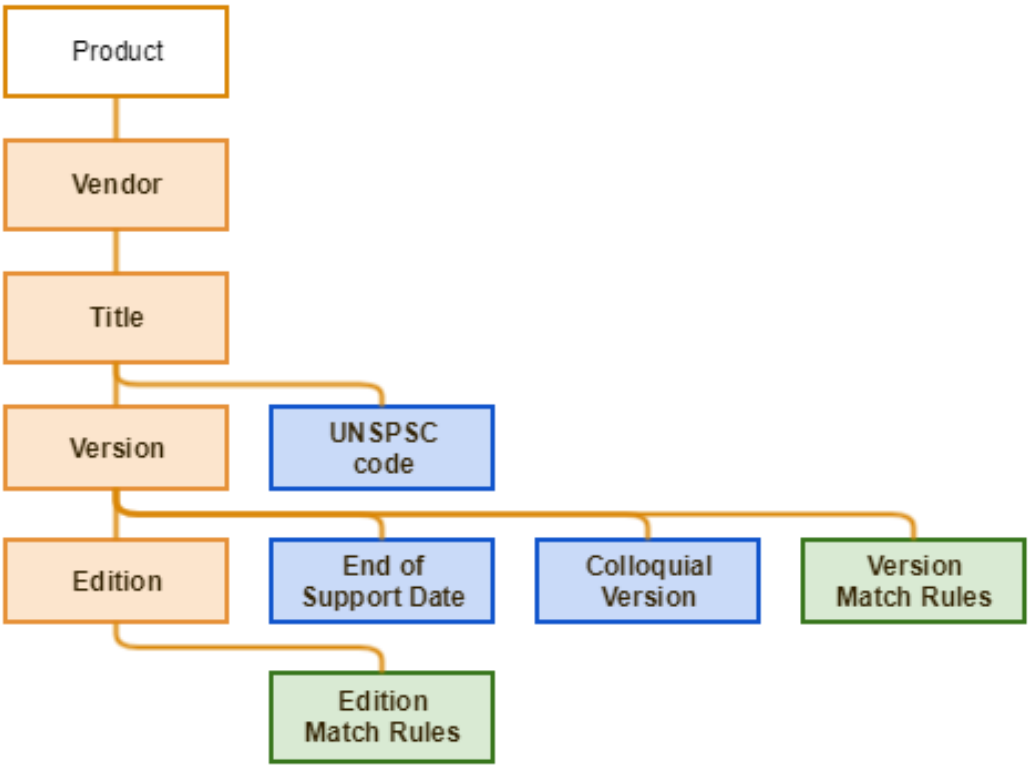
1.11.11.6 The Catalog structure

The 1E Catalog stores the canonical representation of software products, devices and processors, and the match rules used to identify them from inventory sources.

1.11.11.6.1 Products

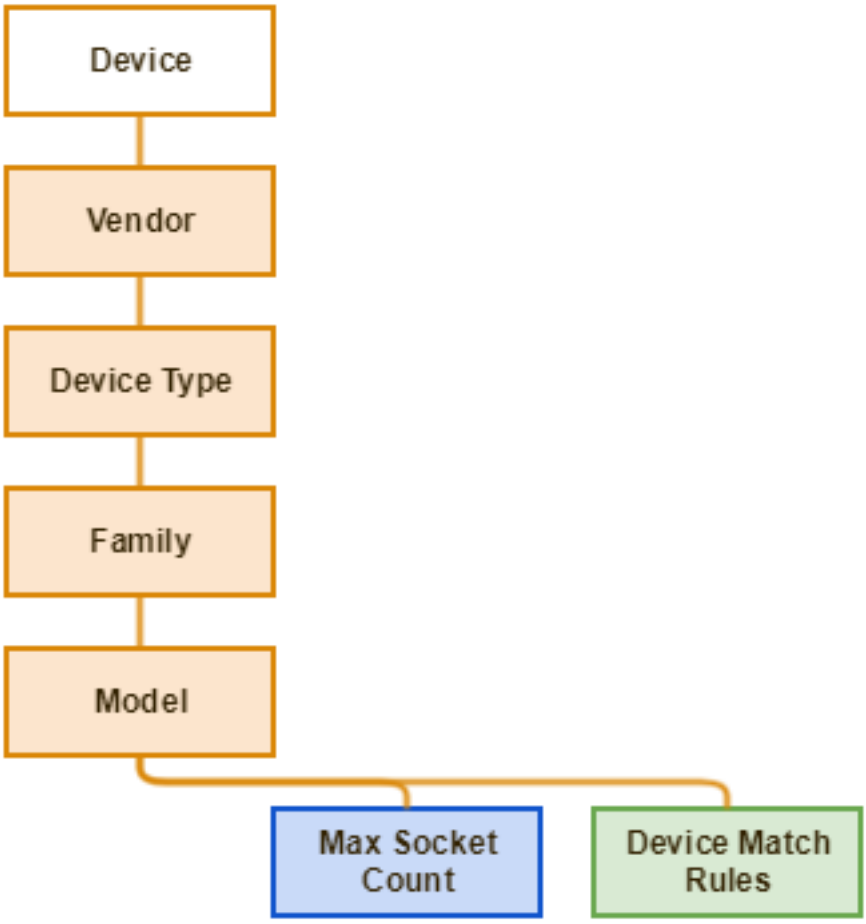
Products consist of software vendor, title, version and edition entries in the catalog that are structured as follows.

Attribute	Description
Vendor	Publisher of the software title, for example Microsoft Corporation.
Title	Name of the software product, for example Visio.
Version	Full version number of each release of the product.
Edition	If the product is an edition based product, the editions of this specific version of the product.
Edition Match rules	Rules that link one or more inventory source data entries to this specific edition, of this version, of this product.
End of support dates	Date when this version of the product is due to go end of support.
Colloquial version	If the product uses colloquial versions, then the one related to this specific version, for example 2013.
Version match rules	Rules that link one or more inventory source data entries to this specific version of this product.
UNSPSC	United Nations Standard Products and Services Code for this product, for example 43233004 for operating systems.



1.11.11.6.2 Devices

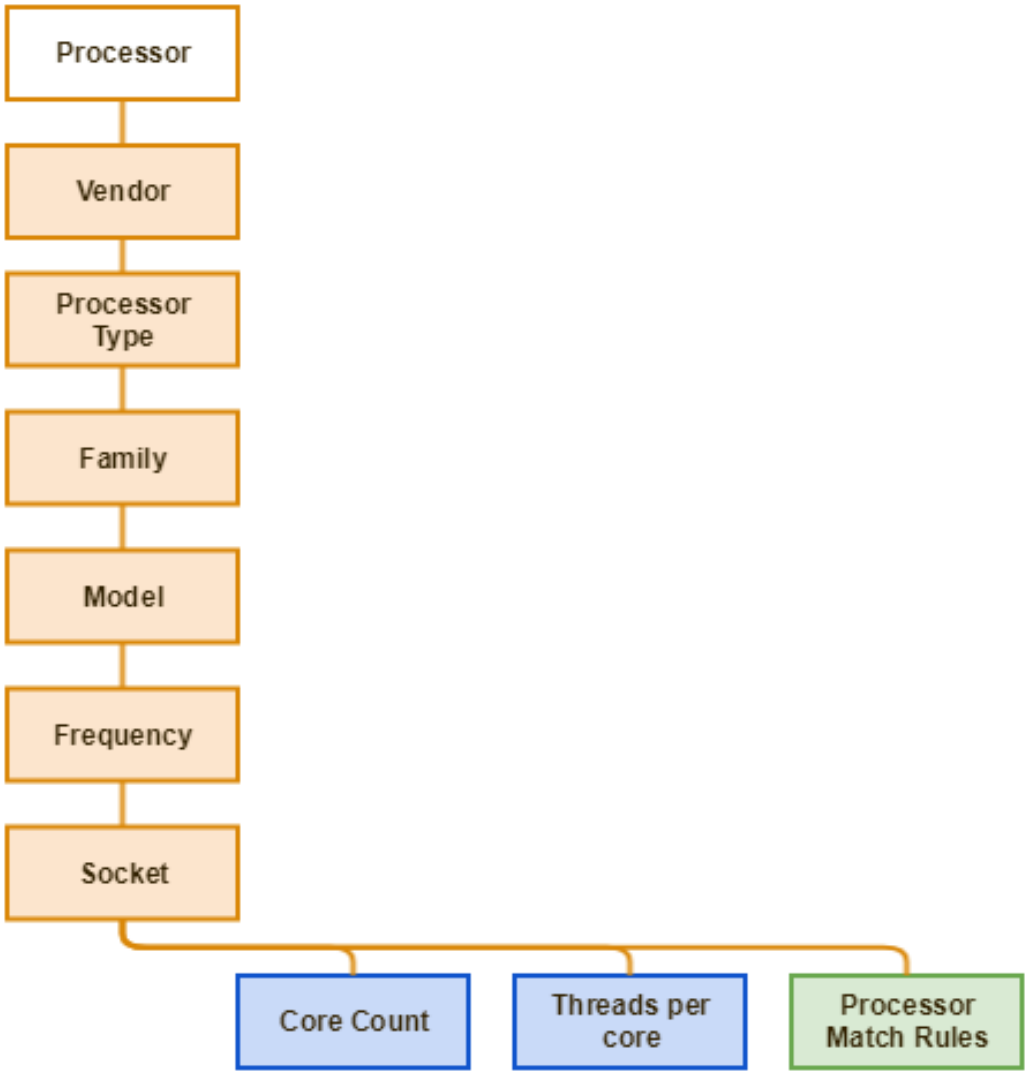
Attribute	Description
Vendor	Device vendor, for example, Dell.
Device Type	Device type, for example Desktop.
Family	Device family, for example, Inspiron.
Model	Device Model, for example, 400.
Max Socket Count	Maximum number of sockets for the device, for example, 1.
Device Match Rules	Rules that link one or more inventory source data entries to this specific device, device type, family and model.



1.11.11.6.3 Processors

Attribute	Description
Vendor	Processor vendor, for example, Advanced Micro Devices Inc.
Processor Type	Processor type, for example, Desktop.
Family	Processor family, for example, A10.
Model	Processor model, for example, 5700.
Frequency	Processor frequency, for example, 3,400.
Socket	The socket type the processor uses, for example, FMZ.
Core Count	Processor core count, for example, 4.

Attribute	Description
Threads per core	The number of threads per core for the processor, for example, 2.



1.11.11.7 Management groups rules

Rules used to create Management Groups, and which connectors that provide the data to support the rules.

For details of how to create and use Management Groups, please refer to Management Groups page.

Warning

The number of rules that a single Management Group can contain is variable because of many factors including SQL Server version, server configuration and rule type used. 1E recommends not exceeding 10,000 rules per rule-based Management Group.

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
Device ADSite Name	AD Site the device is connected to.	✓	✓							
Device Assigned Cores	Maximum number of assigned cores for the device. Derived from	✓	✓	✓	✓	✓			✓	
Device Classification	Classification of the device. For example, **Test**, **Production** or **Development**. **Note** **Production** is the default.	✓	✓		✓					
Device Computer Name	Hostname of the computer.	✓	✓	✓	✓	✓	✓	✓	✓	✓
Device Criticality	By default, Device Criticality is set as one of the following, as described in Using Device Criticality. • Undefined • Non-critical • Low • Medium • High	✓	✓	✓	✓	✓	✓	✓	✓	✓

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
	• Critical.									
Device Domain Name	Domain the device is installed on.	✓	✓	✓			✓			
Device Inventory date	Date that the device was last updated.	✓	✓	✓	✓			✓	✓	✓
Device Matched Device Type	Normalized device type based on chassis type. For example **Desktop**.	✓	✓	✓	✓	✓		✓	✓	✓
Device Matched Family	Normalized family of the device. For example, **Aspire**.	✓	✓	✓	✓	✓			✓	
Device Matched Model	Normalized model of the device. For example, **A30**.	✓	✓	✓	✓	✓		✓	✓	✓
Device Matched Socket count	Normalized socket count of the device. For example, **1**.	✓	✓	✓	✓	✓		✓	✓	✓
Device Matched Vendor	Normalized vendor name of the device. For example, **Acer Inc.**.	✓	✓	✓	✓	✓		✓	✓	✓

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
Device Netbios Domain name	NetBIOS version of the device's domain name.	✓	✓	✓						
Device Netbios Name	NetBIOS version of the device name.	✓	✓	✓					✓	
Device OS	The normalized product title of the OS that is running on the device.	✓	✓	✓		✓	✓		✓	
Device Purchase date	Date that the device was purchased.	✓	✓							
Device Serial	Serial number of the computer.	✓	✓				✓	✓		
Device User Primary Username	The primary user of the device.	✓		✓						
OU Name (Deprecated)	Name of the OU that the device is in. For example **Sales**. **Note** All OUs with the same name will be used,	✓	✓							

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
	therefore the **OU Path** rule should be used instead. The **OU Name** rule is deprecated and should be re-defined using **OU Path**. This rule is deprecated, which means it will continue to work until it is removed in a future version of Tachyon.									
OU Path	The name or path of the OU location in the AD hierarchy, using pipe | as the delimiter. For example, to get all the computers in **OU=Sales, OU=Workstations, DC=acme, DC=local** you can either specify **Sales** or - if there is more than one OU called **Sales** in the AD structure - specify the whole path **acme.local|Workstations|Sales**. Note that the DC and OU parts of a distinguished name are treated differently.	✓	✓							

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
Processor Matched Chip Module Count	Normalized chip module count of the processor. For example, **1**.	✓	✓	✓	✓	✓				
Processor Matched Core Count	Normalized core count of the processor. For example, **2**.	✓	✓	✓	✓	✓			✓	
Processor Matched Family	Normalized family name of the processor. For example, **Athlon 64 X2**.	✓	✓	✓	✓	✓			✓	
Processor Matched Model	Normalized model name of the processor. For example, **3250e**.	✓	✓	✓	✓	✓			✓	
Processor Matched Processor Type	Normalized type of the processor. For example, **Desktop**.	✓	✓	✓	✓	✓			✓	
Processor Match	Normalized release date of the processor. For example, **31-03-2008**.	✓	✓	✓	✓	✓			✓	

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
ed Release Date										
Processor Matched Speed MHz	Normalized speed of the processor. For example, **2.100**.	✓	✓	✓	✓	✓			✓	
Processor Matched Threads per Core	Normalized threads per core of the processor. For example, **1**.	✓	✓	✓	✓	✓			✓	
Processor Matched Vendor	Normalized vendor name of the processor. For example, **Advanced Micro Devices, Inc**.	✓	✓	✓	✓	✓			✓	
Product Catalog Colloquial Version	Software colloquial version contained in the inventory source. For example, **2012**. **Note** This will usually be blank.	✓	✓				✓	✓		
Product Catalo	Software edition contained in the inventory source. For example, **Standard**. **Note**	✓	✓	✓			✓	✓		

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
g Edition	This will usually be blank in SCCM unless the relevant MOF extensions have been installed.									
Product Catalog Is Partial Version Matched	Flag that indicates whether the software title was partial matched or not (TRUE/**1**) or not (FALSE/**0**).	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Colloquial Version	Normalized software colloquial version. For example, **2016**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Edition	Normalized software edition. For example, **Standard**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog	Normalized software end of support date that of that	✓	✓	✓	✓	✓	✓	✓		

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
Matched End of Support	version. For example, **31-10-2008**.									
Product Catalog Matched is Bundle	Flag indicating whether the normalized software is a bundle (TRUE/**1**) or not (FALSE/**0**).	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Is License Required	Flag indicating whether that normalized software title requires a license (TRUE/**1**) or not (FALSE/**0**).	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Release Date	Normalized software release date of that version. For example, **31-10-2008**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Match	Normalized software title. For example, **Office**.	✓	✓	✓	✓	✓	✓	✓		

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
ed Title										
Product Catalog Matched Vendor	Normalized software vendor name. For example, **Microsoft Corporation**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Matched Version	Normalized software version. For example, **10.2.233**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog Title	Software title contained in the inventory source. For example, **Office Standard en_pack**.	✓	✓	✓	✓	✓	✓	✓		
Product Catalog UN Standard Product Service Code	UNSPC code of the normalized software title.	✓	✓	✓	✓	✓	✓	✓		
Product Catalo	Software vendor name contained in the inventory	✓	✓	✓		✓	✓	✓		

Rule name	Description	SCCM	ServiceNow	Tachyon	OracleLMS	BigFix	BigFixInv	Intune	vCenter	WSUS
g Vendor	source. For example, **Microsoft**.									
Product Catalog Version	Software version number contained in the inventory source. For example, **10.2.233**.	✓	✓	✓	✓	✓	✓	✓		
Product Install Date	Date that software installation was installed according to the inventory source.	✓		✓						
Product Instance Name	Instance name if used by a product, for example **MSSQLSERVER** for SQL Server.	✓	✓	✓	✓	✓				
Product Last Used date	Date that software installation was last run according to the inventory source.	✓		✓						
Product Usage Category	Usage category assigned to a specific installation of a normalized software title. Potential categories are: - Used - Unused - Rarely used - Unreported	✓	✓	✓	✓					

1.11.12 Tachyon Product Packs reference

Reference information for Product Packs included in the Tachyon Platform zip. These Tachyon Platforms are required to support various features of Tachyon.

The Tachyon Platform zip is downloaded from the 1E Support Portal https://support.1e.com/. Additional Product Packs are available from 1E Exchange (1E Exchange) that are not documented here.

- **Classic Product Packs** contain instructions, for use in Explorerand other Tachyon applications.
- **Integrated Product Packs** contain policies, rules and fragments for use by Guaranteed State, and may also include instructions.

Note

You can create your own platform instructions using SCALE.

SCALE is a powerful, lightweight, cross-platform programming language which combines 1E Client Methods and Modules with SQL commands to enable you to create questions, actions, preconditions, checks, and fixes that can automate almost anything on a Windows, Linux or macOS device.

Refer to 1E SDK.

1.11.12.1 1E ConfigMgrConsoleExtensions product pack

Classic Product Pack used to create the **1E ConfigMgrConsoleExtensions** instruction set required by the Tachyon Configuration Manager console extensions. For more details please refer to:

- Preparing for the Tachyon extensions for the Configuration Manager Console.
- Using Tachyon in Configuration Manager

1.11.12.1.1 Instructions

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
What is the health of the SCCM clients (checking inventory has run and policy has been evaluated in the last <numdays> days)?	Question	Evaluates the ConfigMgr Client health on the device over the last <numdays> days. The health will be	**1E-ConfigMgrConsoleExtensions-ClientHealth**	17

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		reported as 'Poor' if it has not updated any one of the three time critical items. If all updated then they are considered 'Average' if two thirds of all the checks are ok, and 'Good' if everything is within expected parameters. This instruction makes use of a PowerShell script and will only work on Windows devices.		
What components are installed on the SCCM clients?	Question	Returns all the SCCM client components installed on the	**1E-ConfigMgrConsoleExtensions-InstalledComponents**	17

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		device. This instruction makes use of a PowerShell script and will only work on Windows devices.		
What Management Points are the SCCM clients using?	Question	Returns the ConfigMgr management points configured on the device. This instruction makes use of a PowerShell script and will only work on Windows devices.	**1E-ConfigMgrConsoleExtensions-ManagementPoint**	17
Enable and start the ConfigMgr client service (CcmExec) with a stagger of <limitSecs> seconds.	Question	Enables and starts the ConfigMgr client service (CcmExec). The service start will	**1E-ConfigMgrConsoleExtensions-StartConfigMgrClientService**	14

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		be delayed by a number of seconds up to the specified stagger value.		
Emergency stop and disabling of the ConfigMgr client service (CcmExec).	Question	Stops and disables the ConfigMgr client service (CcmExec).	**1E-ConfigMgrConsoleExtensions-StopConfigMgrClientService**	14
Trigger ConfigMgr client application deployment evaluation cycle with a stagger of <limitSecs> seconds.	Action	Triggers the application deployment evaluation cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerApplicationDeploymentEvaluationCycle**	14
Trigger ConfigMgr client health check and remediation with a stagger	Action	Trigger a client health check and remediation. This	**1E-ConfigMgrConsoleExtensions-TriggerClientHealthCheck**	15

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
of <limitSecs> seconds.		trigger will be delayed by a number of seconds up to the specified stagger value.		
Trigger ConfigMgr client discovery data collection cycle with a stagger of <limitSecs> seconds.	Action	Trigger the discovery data collection cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerDiscoveryDataCollectionCycle**	14
Trigger a ConfigMgr client file collection cycle with a stagger of <limitSecs> seconds.	Action	Trigger a file collection cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerFileCollectionCycle**	14

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Trigger a ConfigMgr client hardware inventory cycle with a stagger of <limitSecs> seconds.	Action	Trigger a hardware inventory cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerHardwareInventoryCycle**	14
Trigger a ConfigMgr client machine policy retrieval and evaluation cycle with a stagger of <limitSecs> seconds.	Action	Trigger a machine policy retrieval and evaluation cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerMachinePolicyRetrievalAndEvaluationCycle**	14
Trigger a ConfigMgr client software inventory cycle with a stagger of <limitSecs> seconds.	Action	Triggers the software inventory cycle. This trigger will be delayed by a	**1E-ConfigMgrConsoleExtensions-TriggerSoftwareInventoryCycle**	14

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		number of seconds up to the specified stagger value.		
Trigger a ConfigMgr client software metering usage report cycle with a stagger of <limitSecs> seconds.	Action	Trigger a software metering usage report cycle. This trigger will be delayed by a number of seconds up to the specified stagger value	**1E-ConfigMgrConsoleExtensions-TriggerSoftwareMeteringUsageReportCycle**	14
Trigger a ConfigMgr client software update deployment evaluation cycle with a stagger of <limitSecs> seconds.	Action	Triggers a software update deployment evaluation cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerSoftwareUpdatesDeploymentEvaluationCycle**	14

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Trigger a ConfigMgr client software update scan cycle with a stagger of <limitSecs> seconds.	Action	Triggers a software update scan cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerSoftwareUpdatesScanCycle**	14
Triggers a ConfigMgr client Windows installer source list update cycle with a stagger of <limitSecs> seconds.	Action	Triggers a Windows installer source list update cycle. This trigger will be delayed by a number of seconds up to the specified stagger value.	**1E-ConfigMgrConsoleExtensions-TriggerWindowsInstallerSourceListUpdateCycle**	14

1.11.12.2 1E Experience product pack

Classic product pack used to create the **1E Experience** instruction set in Tachyon, required by the Experience features of the Device View.

1.11.12.2.1 Instructions

This product pack contains Server instructions.

Server instructions are special type of instruction, which cannot be run in Explorer. They are for internal use only, run on the server, and used to carry out on-demand or scheduled processing of data across various

datasources, such as SQL databases. For example, the Dashboards app uses them to populate tiles and charts with data from Tachyon Master and Experience databases.

1.11.12.3 1E Explorer TachyonAgent product pack

Classic Product Pack used to create the **1E Explorer TachyonAgent** instruction set that can be used to configure and query Tachyon clients.

Please refer to:

- Explorer - Using Device Criticality about instructions used to get and set **Criticality** devices
- Explorer - Using Location about instructions used to get and set **Location** on devices
- Explorer - Tachyon Activity Record about instructions used to configure 1E Client configuration settings for Tachyon Agent inventory

1.11.12.3.1 Instructions

Instruction text (Readable Payload)	Type	Description	Instruction file name	Version
What is the Tachyon Agent's connection summary?	Question	Retrieves connectivity diagnostic information from Tachyon Agents.	**1E-Explorer-TachyonAgent-AgentConnectionDiagnostics**	11
What is the Tachyon Agent diagnostic information detail?	Question	Get live diagnostic information from Tachyon Agents.	**1E-Explorer-TachyonAgent-AgentDiagnostics**	11
What is the Tachyon Agent instruction	Question	Retrieves instruction execution diagnostic information from Tachyon Agents.	**1E-Explorer-TachyonAgent-AgentExecutionDiagnostics**	11

Instruction text (Readable Payload)	Type	Description	Instruction file name	Version
execution summary?				
Which devices are connected to which Tachyon Switches?	Question	Get Switch connection information for each device.	**1E-Explorer-TachyonAgent-AgentSwitchConnections**	11
How many 1E Clients are installed?	Question	Returns a count of each version of 1E Client installed.	**1E-Explorer-TachyonAgent-AgentVersionCount**	11
Disable 1E Client process usage inventory collection	Action	Disables process usage inventory collection. This only affects Windows devices, and will take up to the 1E Client configuration setting 'ConnectionRetryTimeInSecondsMax' to take effect. Please refer to Tachyon Activity Record.	**1E-Explorer-TachyonAgent-DisableProcessUsage**	4
Echo message <msg>	Question	Send an echo request to devices	**1E-Explorer-TachyonAgent-Echo**	11
Enable 1E Client process usage inventory collection	Action	Enables process usage inventory collection. This only affects Windows devices, and will take up to the 1E Client configuration setting 'ConnectionRetryTimeInSecondsMax' to take effect. .Tachyon Activity RecordPlease refer to	**1E-Explorer-TachyonAgent-EnableProcessUsage**	4
What are the modules and providers	Question	Get a list of modules and providers registered with each 1E Client.	**1E-Explorer-TachyonAgent-Extensibility**	11

Instruction text (Readable Payload)	Type	Description	Instruction file name	Version
reported by the 1E Client Extensibility Update?				
What are the 1E Client settings?	Question	Returns values of settings configured on the 1E Client. This instruction makes use of a PowerShell script and will only work on Windows devices. Uses **getConfig.ps1** script to get the following subset of configuration settings for the Tachyon client: • AuthenticationPolicy • BackgroundChannelUrl • ConnectionKeepaliveTimeInSecondsMax • ConnectionKeepaliveTimeInSecondsMin • ConnectionRetryTimeInSecondsMax • ConnectionRetryTimeInSecondsMin • ConnectionTimeout • CRLChecks • CRLTimeoutInSeconds • DefaultStaggerRangeSeconds • EnablePayloadCompression • LoggingLevel • NomadContentDownloadEnabled • NomadContentDownloadTimeoutSecs • Switch	**1E-Explorer-TachyonAgent-GetAgentConfigValues**	14

Instruction text (Readable Payload)	Type	Description	Instruction file name	Version
		• WorkerThreads Please refer to Tachyon client settings.		
What 1E Client Windows settings are configured for historical data collection for the <source> capture source?	Question	Return the 1E Client configuration settings for Tachyon Agent inventory. The 1E Client configuration settings are read to determine if a supplied inventory source is enabled or disabled. Allowable inventory sources are DNS, Process, Software and TCP. Response speed will be affected by the 1E Client setting 'DefaultStaggerRangeSeconds'. Windows devices only. Uses **getInventoryConfig.ps1** script. .Tachyon Activity RecordPlease refer to	**1E-Explorer-TachyonAgent-GetAgentHistoricDataCaptureConfig**	15
What is the criticality of my devices?	Question	Retrieves the criticality of a device.	**1E-Explorer-TachyonAgent-GetCriticality**	4
Get the location of my devices	Question	Gets the location of a device. This instruction retrieves the device static location information.	**1E-Explorer-TachyonAgent-GetLocation**	4
What are the statistics for previously executed instructions?	Question	Returns statistics for previously executed instructions.	**1E-Explorer-TachyonAgent-InstructionStatistics**	11

Instruction text (Readable Payload)	Type	Description	Instruction file name	Version
Trigger client reinstallation for targeted devices using <ClientVersion> supplying switch name of <switch> and a background channel url of <backgroundchannel url>	Action	Triggers 1E Client uninstallation followed by an installation via scheduled task for targeted devices. Will use the existing switch and port information (3.0 and above). Only supported on Windows. Uses installers uploaded to the 1E Client installer page within Configuration under the Settings app. Uses **TachyonAgentReinstallation.ps1** script.	**1E-Explorer-TachyonAgent-ReinstallationOfAgent**	27
Set a 1E Client configuration property <agentconfig> to <agentconfigvalue> for the Tachyon Agent	Action	Set a 1E Client configuration property for the Tachyon Agent. Please note this can and will replace anything found, and can cause the Agent to stop responding. This instruction is for Windows devices only. Uses **setConfig.ps1** script to set the same subset of configuration settings for the Tachyon client as the #UUIDaa6bde5719524cf774d047e5d9ef37e8_id_id1EExplorerTachyonAgentproductpack1EExplorerTachyonAgentGetAgentConfigValues instruction above.	**1E-Explorer-TachyonAgent-SetAgentConfigValue**	14
Set the criticality of my devices to	Action	Sets the criticality of a device.	**1E-Explorer-TachyonAgent-SetCriticality**	4

Instruction text (Readable Payload)	Type	Description	Instruction file name	Version
<criticality>				
Set the location of my devices to <location>	Action	Sets the location of a device. This instructions set the device static location information.	**1E-Explorer-TachyonAgent-SetLocation**	4
Check for 1E Client updates and apply them	Action	Instructs the 1E Client to check for extensibility updates and apply them. Supports Windows, Linux, Solaris and Android.	**1E-Explorer-TachyonAgent-UpdateExtensibility**	11
Trigger 1E Client upgrade to <ClientVersion> for targeted devices	Action	Triggers 1E Client upgrade via scheduled task for targeted devices. Will use the existing switch and port information (3.1 and above). Only supported on windows 7 and above. Uses installers that are uploaded to the 1E Client installer page within Configuration under the Settings app. Note the build numbers must match between the instruction parameters and the version specified in the 1E Client installer page. Uses **TachyonAgentUpgrade.ps1** script.	**1E-Explorer-TachyonAgent-UpgradeAgent**	29

1.11.12.4 1E Inventory product pack

Classic Product Pack used to create the **1E Inventory** instruction set required by the **Tachyon Powered Inventory** feature.

For more details please refer to Tachyon connector.

1.11.12.4.1 Instructions

<table>
<tr><th>Instruction text (ReadablePayload)</th><th>Type</th><th>Description</th><th>Data to Sync category</th><th>Instruction file name</th><th>Version</th></tr>
<tr><td>Which processors are in the device? With a stagger of <limitSecs> seconds.</td><td>Question</td><td>Processor details

Uses Device.GetProcessors method.

Note
Click here to expand details of data collected...

<table><tr><td>Method</td><td>GetProcessors</td></tr><tr><td>Library</td><td>Core</td></tr><tr><td>Action</td><td>Retrieves information about the CPUs plugged in to the motherboard of the device.</td></tr><tr><td>Parameters</td><td>(None)</td></tr><tr><td>Return values</td><td>Vendor (string): The vendor of the processor

Name (string): The vendor-defined name of this processor package

CoreCount (int): The number of cores inside this package

SpeedMhz(int): The clock speed of the processor in its current operating mode</td></tr></table></td><td>Processor</td><td>1E-Inventory-Device-GetProcessors</td><td>3</td></tr>
</table>

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
		From v5.1 onwards these columns also appear : *LogicalCoreCount* (int) : The number of logical cores inside this package *Hyperthreading* (bool): Indicates whether the cores are hyperthreaded, true for yes, false for no.			
	Example	`Device.GetProcessors();`			
	Platforms	• Windows • Linux • MacOS • Solaris Intel • Solaris Sparc			
	Notes	*Name* is the immutable string that the CPU reports to SMBIOS. This often contains the publicly marketed and sold average speed of the CPU, which usually differs to the actual speed of the processor instance. *SpeedMhz* on Windows can change over time for one particular CPU.			

Instruction text (ReadablePayload)	Type	Description		Data to Sync category	Instruction file name	Version
			Modern CPU's can adjust their clock in response to heat and power from moment to moment. This parameter cannot be relied upon for scoping future instruction executions unless some kind of range of values is in the scope to cope with natural speed variance.			
Inventory - what is the summary of file usage since <startDate>? With a stagger of <limitSecs> seconds.	Question	Process Usage data inventory for SLA Uses the **$ProcessUsage_Daily** inventory table, if **Module.Inventory.ProcessUsage.Enabled** setting is true (default) in the 1E Client configuration file. Please refer to 1E Client - Tachyon client settings: Capture source settings. **Note** Click here to expand details of data collected... Windows only. The following table shows fields available in the **$ProcessUsage_Daily** table.		Software Usage	**1E-Inventory-FileUsageSummary**	3

		The Tachyon client captures executable usage; this is from the moment the executable is turned into a process, hence the process usage. The Process Usage data presented is grouped by executable binary, and parallel runs are accumulated in the ExecutionCount, but not in the Duration, where coverage time period is desired instead.			
Inventory - what software is installed? With a stagger of <limitSecs> seconds.	Question	Software inventory for SLA Uses a combination of: • Software.GetInstallations method • Software.GetUserInstallations method • SQL Server registry values **Note** Click here to expand details of data collected...	Installed Software	**1E-Inventory-Software**	3

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
		Method	**GetInstallations**		
		Module	Software		
		Library	Core		
		Action	Gets a list of the installed software available to all users, optionally filtered by product and/or publisher.		
		Parameters	*Product* (string; optional): If specified, search for just this product. *Publisher* (string; optional): If specified, get just this publisher's software.		
		Return values	A table of: • – *Product* (string): The product name. – *Publisher* (string): The publisher of the product. – *Version* (string): The		

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
		version of the product. – *InstallDate* (string): If available, when the product was installed. – *Architecture* (string): Platform architecture of this installation (e.g. x86, x64)			

		Example
		Get all software:
		`Software.GetInstallations();`
		Find and remove all installed instances of Calculator Plus:
		`Software.GetInstallations( Publisher : "Microsoft", Product : "Microsoft Calculator Plus");`
		`evaluate;`
		`Agent.Echo( Message: "Is installed");`
		`Software.Uninstall( Publisher : "Microsoft", Product : "Microsoft Calculator Plus");`			

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version

		To select a specific version, use a SQL WHERE clause:
		`@installs = Software.GetInstallations( Publisher : "Microsoft", Product : "Office Professional");`
		`SELECT DISTINCT * FROM @installs WHERE Version LIKE "16.0%";`			

		Platforms • Windows • Linux • MacOS • Solaris Intel • Solaris Sparc • Android			
		Notes To find additional software installed for specific users, use Software.GetUserInstallations.			
	Method	**GetUserInstallations**			
	Li	Core			

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
	b r a r y				
	A c t i o n	Gets a list of the software installed for specific users, optionally filtered by product and/or publisher.			
	P a r a m e t e r s	*Product* (string; optional): If specified, search for just this product. *Publisher* (string; optional): If specified, get just this publisher's software.			
	R e t u r n v a l u e s	A table of: • – *Architecture* (string): Platform architecture of this installation (e.g. x86, x64) – *InstallDate* (string): If available, when the product was installed.			

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
		– *Product* (string): The product name. – *Publisher* (string): The publisher of the product. – *Sid* (string): The user identifier for whom this software has been installed. – *Username* (string): Friendly representation of the *Sid* - this will only be resolved locally. – *Version* (string): The version of the product.			
	Example	Get all user specific software: `Software.GetUserInstallations();`			
	Platforms	• Windows			

Instruction text (ReadablePayload)	Type	Description	Data to Sync category	Instruction file name	Version
	Notes	• *Sid* resolution may fail as this method will not go over the wire. In this case Username will be NULL. • The file modified and accessed time attributes of the NTUSER.dat directory entries under the %USERPROFILE% folder for each user and service principal might be updated to some time during the execution of this method. This is a side effect of loading and unloading the user hive and is housekeeping performed by Windows, not the 1E Client. This can cause "unused" profiles to appear to be used if the modified times are employed to determine whether a user has logged in, which is not a reliable method of establishing this fact. • This method reads user uninstall registry keys from HKU, but will not load hives. • Installs for this function are retrieved from *HKU:\<SID>\Software\Microsoft\Windows\CurrentVersion\Uninstall*			

<table>
<tr><th>Instruction text (ReadablePayload)</th><th>Type</th><th>Description</th><th>Data to Sync category</th><th>Instruction file name</th><th>Version</th></tr>
<tr><td>Inventory - summary of which users have logged on since <startDate>? With a stagger of <limitSecs> seconds.</td><td>Question</td><td>User data inventory for SLA

Uses the $UserUsage_Daily inventory table, if Module.Inventory.UserUsage.Enabled setting is true (default) in the 1E Client configuration file. Top Console User is also calculated from this table.

Please refer to 1E Client - Tachyon client settings: Capture source settings.

Note

1.11.12.5 1E Nomad product pack

Classic product pack used to create the **1E Nomad** instruction set in Tachyon, required by the following Nomad features:

- Downloads tab on Device views - instructions used to populate details about Content download and other Nomad features
- Nomad Download Pause - instructions used by the CM Admin Console extensions
- Instructions to help with the following Nomad features: Nomad cache, CacheCleaner, Single Site Download, Nomad jobs, NomadBranch service.

1.11.12.5.1 Instructions

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
Nomad cache Nomad jobs	**Get the percentage of content %ContentId% in the local Nomad cache**	Question	Get the percentage of the specified content in the local Nomad cache.	**1E-Nomad-CachedPkgStatus**	8
Nomad cache	**Clean the SCCM and Nomad cache for an application %packageId%**	Action	Cleans the SCCM and Nomad	**1E-Nomad-CleanNomadCacheForApplication**	16

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
CacheCleaner Nomad jobs			cache for an application with the specified package ID. This package ID is the Content ID of the deployment type of the application.		
Nomad cache CacheCleaner Nomad jobs	**Clean the SCCM and Nomad cache for a package %packageId% and %packageVersion%**	Action	Cleans the SCCM and Nomad cache for the package with the specified ID and version.	**1E-Nomad-CleanNomadCacheForPackage**	16
Nomad cache Nomad jobs	**Find the Nomad host that has the greatest percentage of content %ContentId%**	Question	Find the Nomad host that has the greatest percentage of the specified content.	**1E-Nomad-FindBestPkgCache**	8

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
Nomad jobs	**Find the ConfigMgr locations (i.e. on DPs) that have content %ContentId% at version %Version%**	Question	Find the ConfigMgr locations (i.e. on DPs) that have the specified content.	**1E-Nomad-GetCmContentLocations**	8
Nomad jobs	**Get the status of Nomad jobs**	Question	Get the status of Nomad jobs.	**1E-Nomad-NomadJobsStatus**	11
Nomad jobs	**Get the status of Nomad**	Question	Get the status of Nomad.	**1E-Nomad-NomadStatus**	11
Nomad jobs	**Pause any current Nomad job**	Action	Pause any current Nomad job.	**1E-Nomad-PauseCurrentNomadJob**	12
Nomad Download Pause Nomad jobs	**Pause the Nomad job queue for %PauseDurationMinutes% minutes**	Action	Pause Nomad job queue.	**1E-Nomad-PauseNomadJobQueue**	14
Nomad Download Pause Nomad jobs	**Resume the paused Nomad job queue**	Action	Resume paused Nomad job queue.	**1E-Nomad-ResumeNomadJobQueue**	11

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
Nomad jobs	**Resume any paused Nomad job**	Action	Resume any paused Nomad job.	**1E-Nomad-ResumePausedNomadJob**	12
Single Site Download	**Ask SSD site master with %deviceIdType% '%deviceId%' whether any device has more than %percent%% of content %contentId% v%version% with format %format%**	Question	Ask SSD site master whether any device has more than the specified percentage of the specified content.	**1E-Nomad-RunPkgStatusRequest**	9
Single Site Download	**Use SSD to find where at least %percent% percent of content %contentId% v%version% with format %format% is cached with extent %extent% and AllSubnets %allSubnets%, returning up to %maxDevices% devices**	Question	Use Nomad's Single Site Download feature to find where the specified content is cached.	**1E-Nomad-RunSsdQuery**	8
NomadBranch service	**Start the Nomad service**	Action	Start the Nomad service.	**1E-Nomad-StartNomadService**	12
Nomad jobs	**Stop any current Nomad job**	Action	Stop any current	**1E-Nomad-StopCurrentNomadJob**	12

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
			Nomad job.		
NomadBranch service	**Stop the Nomad service**	Action	Stop the Nomad service.	**1E-Nomad-StopNomadService**	12

1.11.12.6 1E Patch Success Product pack

Classic Product Pack used to create the **1E Patch Success** instruction set required by the Patch Success application.

For more details please refer to:

- Configuring Patch Success for steps required to upload this product pack and create set
- Using Patch Success.

1.11.12.6.1 Instructions

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
<action> patch(es) specified by <patchSpec> identifier(s) from <source> source to targeted device(s) Where: • **<action>** is either **Deploy** or **Download only** • **<patchSpec>** is a list of comma separated GUIDs and/or KB numbers (without KB prefix) of patches to be installed • **<source>** is the patch download source: – • **WSUSR** - Microsoft	Action	Deploys a specific patch or patches to targeted devices. **Note** Unlike the other instructions, the **<patchSpec>** parameter in this instruction does not support **all**. You must be specific which KBs you want to deploy. This instruction is used by the **Deploy** and **Download only** buttons, which allow users to	**1E-PatchSuccess-Deploy**	5

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Update via the Internet • **WSUSL** - WSUS • **SCCM** - Configuration Manager • **Default** - the value of **PatchSuccessSource** in the **GlobalSettings** table of the **TachyonMaster** database, as described in Configuring the source for Patch downloads.		deploy selected patches to devices. The **1E Patch Success Actioners** role requires **Actioner** permissions to see the **Deploy** and the **Download only** buttons. See /document/preview/737277#UUID-a92aef8e-bef6-7780-79c9-2eca1aa05429 in the Tachyon SDK.		
Returns patch status from <source> for <patchSpec> identifier(s) Where : • **<source>** is the patch download source, as above • **<patchSpec>** is either **all**, or a list of comma separated GUIDs and/or KB numbers (without KB prefix) of patches to be reported.	Question	Returns patch status for given KB article numbers on targeted devices. The instruction is used by the **Check Status** button, which allow users to check the patch status of the selected patches and represent the results in Explorer for further investigations. The **1E Patch Success Actioners** role requires **Questioner**	**1E-PatchSuccess-Explore**	5

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		permissions to see the **Check Status** button. See /document/preview/737298#UUID-a4b375c7-8e52-116d-0fb5-edff09511079 in the Tachyon SDK.		
Returns patch status from <source> of given<patchSpec> identifier(s) for PatchSuccess consumption Where: • **<source>** is the patch download source, as above • **<patchSpec>** is either **all**, or a list of comma separated GUIDs and/or KB numbers (without KB prefix) of patches to be reported.	Question	Returns patch status for all known patches on targeted devices. Information is based on offline cache. When run, its response data is offloaded direct to the SLA-BI cube. The instruction is used by the **Update Status** button, which allows users to update the dashboard with the status of selected patches, to see for example **Pending reboot** and **Installed** states. The **1E Patch Success Actioners** role requires **Questioner** permissions to see the **Update status** button. See /document/preview/737298#UUID-a4b375c7-8e52-116d-0fb5-edff09511079 in the Tachyon SDK.	**1E-PatchSuccess-Refresh**	5

1.11.12.7 1E Tachyon Platform product pack

Classic Product Pack used to create the **1E Tachyon Platform** instruction set required by the Tachyon Platform verification process.

For more details please refer to Verifying.

1.11.12.7.1 Instructions

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Tachyon Platform verification stage 1	Question	Stage 1 of the Tachyon Platform verification will return all software installed on each 1E Client endpoint. Verification stage 1 is a simple question-type instruction used to verify: • authenticated user is able to access and use Tachyon Explorer • end-to-end communication between the Tachyon system, the **Switch** and Tachyon client.	**1E-TachyonPlatform-VerificationStage1**	19
Tachyon Platform verification stage 2 (all platforms)	Action	Stage 2 of the Tachyon Platform verification will run a PowerShell script to return a subset of the current configuration of the Tachyon client features of 1E Client. Verification Stage 2 is normally expected to be run as a follow-up action for Verification Stage 1. Verification stage 2 is a simple action-type instruction used to verify:	**1E-TachyonPlatform-VerificationStage2**	21

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		• two-factor authentication (if enabled) and approval workflow, which tests email (if enabled) - necessary for action-type instructions • end-to-end communication between the Tachyon system, the **Background Channel** and Tachyon client • the client is able to run PowerShell scripts on Windows OS - many Tachyon instructions and Guaranteed State rules use PowerShell version 3.0 and later • the client is able to run Bash script on non-Windows OS. For details about PowerShell and Bash support please refer to Tachyon scripting requirements. The rate at which Responses are returned to the Tachyon system via the Switch is affected by the 1E Client setting **DefaultStaggerRangeSeconds**. This setting governs a random delay before the instruction downloads the script from the Background Channel. This stagger setting is ignored on Windows OS if Nomad client is enabled - instead only one client per subnet (or site if Nomad SSD		

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		is used) will act as master and download the script from the Background Channel, and peer clients will download the script from the master.		

1.11.12.8 1E Explorer TachyonCore product pack

Classic Product Pack used to create the **1E Explorer TachyonCore** instruction set that includes instructions for Tagging and Quarantine.

Please refer to:

- Creating the Tags instruction set for steps required to upload this product pack and create the **Tags** instruction set
- Tagging client devices for details on setting, deleting, querying and using **tags**
- Tachyon Quarantine for guidance on using the **quarantine** device instructions.

1.11.12.8.1 Instructions

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Add <action> action Windows firewall rule to IP address <ipaddress>	Action	Add a specified action firewall rule to a specified IP address. Windows only.	**1E-Explorer-TachyonCore-AddFirewallRule**	7
What software is installed?	Question	Returns all installed software.	**1E-Explorer-TachyonCore-AllInstalledSoftware**	7
What audio devices are installed?	Question	Returns details of audio devices. Windows only.	**1E-Explorer-TachyonCore-AudioDeviceDetails**	6
What BIOS firmware is installed?	Question	Returns details of BIOS firmware.	**1E-Explorer-TachyonCore-BiosDetails**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
What on-board cache memory is available?	Question	Returns details of the processor's cache memory.	**1E-Explorer-TachyonCore-CacheMemoryDetails**	6
What optical drives are installed?	Question	Returns details of all optical drives.	**1E-Explorer-TachyonCore-CdRomDriveDetails**	6
Change service <servicename> and its dependencies to <state> state	Action	Starts or stops a service and any services that are dependent on it.	**1E-Explorer-TachyonCore-ChangeServiceStateWithDependencies**	6
Does coverage tag <tagname> exist?	Question	Reports the existance of the specified coverage tag	**1E-Explorer-TachyonCore-CheckIfCoverageTagExists**	6
Is coverage tag <tagname> set to <tagvalue>?	Question	Reports whether the defined coverage tag has the specified value	**1E-Explorer-TachyonCore-CheckIfCoverageTagHasGivenValue**	6
Does freeform tag <tagname> exist?	Question	Reports whether the specified freeform tag exists	**1E-Explorer-TachyonCore-CheckIfFreeformTagExists**	6
Is freeform tag <tagname> set to <tagvalue>?	Question	Reports whether the defined freeform tag has the specified value	**1E-Explorer-TachyonCore-CheckIfFreeformTagHasGivenValue**	6
Which devices respond to a check for a simple IoC that evaluates the indicators: <IP_Address> <Ports> <FileSpec> <Domain> <IP_Range> <URL>, gathered since	Question	Check a simple Indicator of Compromise.	**1E-Explorer-TachyonCore-CheckSimpleIoC**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
<Search_Period_days> days ago?				
Flush the DNS cache	Action	Flushes the DNS cache on the machine	**1E-Explorer-TachyonCore-CommandLineFlushDns**	6
Ping <targetmachine> using <ipversion>	Action	Ping a specific IP address	**1E-Explorer-TachyonCore-CommandLinePing**	6
Set service <servicename> startup type to <startuptype> and state to <state>	Action	Changes the startup type and the state of an operating system service	**1E-Explorer-TachyonCore-ControlService**	6
How many coverage tags are there?	Question	Returns the number of coverage tags.	**1E-Explorer-TachyonCore-CountCoverageTags**	6
How many freeform tags are there?	Question	Returns the number of freeform tags.	**1E-Explorer-TachyonCore-CountFreeformTags**	6
Create an empty freeform tag named <tagname>	Action	Creates a freeform tag with an empty value. If this tag already exists, its value will be removed.	**1E-Explorer-TachyonCore-CreateEmptyFreeformTag**	6
Delete all coverage tags	Action	Deletes all coverage tags. This is a high impact instruction and should be used with care.	**1E-Explorer-TachyonCore-DeleteAllCoverageTags**	6
Delete all freeform tags	Action	Deletes all freeform tags. This	**1E-Explorer-TachyonCore-DeleteAllFreeformTags**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		is a high impact instruction and should be used with care.		
Delete coverage tag named <tagname>	Action	Deletes specified coverage tag	**1E-Explorer-TachyonCore-DeleteCoverageTag**	6
Delete file at <path>	Action	Deletes a file with specified path	**1E-Explorer-TachyonCore-DeleteFileByPath**	6
Delete <action> Windows firewall action rule assigned to IP address <ipaddress>	Action	Deletes specified firewall action rule assigned to specified IP address. Windows only.	**1E-Explorer-TachyonCore-DeleteFirewallRule**	6
Delete freeform tag named <tagname>	Action	Deletes specified freeform tag	**1E-Explorer-TachyonCore-DeleteFreeformTag**	6
What device drivers are installed?	Question	Returns details of device drivers.	**1E-Explorer-TachyonCore-DeviceDrivers**	6
Which devices currently have active network connections to <ipAddress>?	Question	Gets all devices that currently have any open TCP connections to the specified IP address. It includes information about processes and ports.	**1E-Explorer-TachyonCore-DevicesConnectedToEndpoint**	6
Which devices are listening on port <port>?	Question	Gets devices listening on a specific network port. It also includes information about	**1E-Explorer-TachyonCore-DevicesListeningOnAPort**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		the listening process.		
Which Windows services are disabled?	Question	Shows count of disabled Windows services.	**1E-Explorer-TachyonCore-DisabledServices**	6
What video adapters are installed?	Question	Returns details of video graphic adapters. Windows only.	**1E-Explorer-TachyonCore-DisplayAdapterDetails**	6
<EnableOrDisable> the Windows firewall for the following profile(s): <profile>	Action	Enable or Disable Windows Advanced Firewall for a given profile. Note that this enables locally, and that GPO will override if set.	**1E-Explorer-TachyonCore-EnableDisableFirewall**	3
What does the WMI query <query> on <namespace> return?	Question	Executes a WMI query and returns result. The query execution will be successfull only if the WMI namespace and class exists. Windows only.	**1E-Explorer-TachyonCore-ExecuteWmiQuery**	6
Which devices have a directory named <directoryname> on a fixed disk?	Question	Finds a directory by name.	**1E-Explorer-TachyonCore-FindDirectoryByName**	6
Which devices have a file named <filename> on a fixed disk?	Question	Finds a file by name.	**1E-Explorer-TachyonCore-FindFileByName**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Which devices have a file of <filesize> bytes with a SHA256 hash of <hash> on a fixed disk?	Question	Finds a file by size and SHA256 hash.	**1E-Explorer-TachyonCore-FindFileBySizeAndHash**	6
What is the file version infomation of <filename> on a fixed disk?	Question	Finds file version, Original Filename, Product Name and Product version of a file you specify	**1E-Explorer-TachyonCore-FindFileVersionInfoByName**	5
What are the coverage tags?	Question	Returns all coverage tag values	**1E-Explorer-TachyonCore-GetAllCoverageTags**	6
What are the freeform tags?	Question	Returns all freeform tag values	**1E-Explorer-TachyonCore-GetAllFreeformTags**	6
What is the value of the coverage tag <tagname>?	Question	Returns value of a specific coverage tag	**1E-Explorer-TachyonCore-GetCoverageTag**	6
How much memory is installed?	Question	Memory details for each installed DIMM.	**1E-Explorer-TachyonCore-GetCurrentInstalledMemoryDetails**	6
What is the current Powershell execution policy?	Question	Returns the Powershell execution policy on the device.	**1E-Explorer-TachyonCore-GetExecutionPolicyPowershellCommandLine**	6
What is the content of <filename>?	Question	Retrieve the content of files matching the given file path search pattern. Wildcard characters and environment	**1E-Explorer-TachyonCore-GetFile**	7

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		variables may be used.		
Which lines of <filename> match the pattern <pattern>?	Question	Retrieves the lines of files matching the given file path search pattern. Wildcard characters and environment variables may be used.	**1E-Explorer-TachyonCore-GetFileByLines**	6
What operating system details exist for <filePath>, optionally computing the hash (<computeHash>)	Question	What details does the operating system have about a particular file	**1E-Explorer-TachyonCore-GetFileDetails**	10
What access permissions exist on <filePath>?	Question	What access permissions exist for a particular file	**1E-Explorer-TachyonCore-GetFilePermissions**	12
What files are in <folder> folder?	Question	Retrieve the files in a specified folder. Windows Only.	**1E-Explorer-TachyonCore-GetFilesInFolder**	6
What files are in <folder> folder, including subfolders?	Question	Retrieve the files in a specified folder and all subfolders. Windows Only.	**1E-Explorer-TachyonCore-GetFilesInFolderRecursively**	6
Which devices have <action> action Windows firewall rule assigned to IP address <ipaddress>?	Question	Gets devices with a specified action firewall rule assigned to a specified IP address. Windows Only.	**1E-Explorer-TachyonCore-GetFirewallRule**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
List <ruleState> firewall rules	Question	Returns firewall rules filtered by state	**1E-Explorer-TachyonCore-GetFirewallRulesFiltered**	3
What is the value of the freeform tag <tagname>?	Question	Returns the value of a specific freeform tag	**1E-Explorer-TachyonCore-GetFreeformTag**	6
What historical inbound connections are recorded?	Question	Retrieves the historical inbound connections recorded on the device	**1E-Explorer-TachyonCore-GetInboundConnectionHistory**	5
What historical inbound mapped drives are recorded?	Question	Retrieves the historical inbound mapped drives recorded on the device	**1E-Explorer-TachyonCore-GetInboundMappedDriveHistory**	5
What shared printers are being used on the machine?	Question	What shared printers are being used on the machine?	**1E-Explorer-TachyonCore-GetInboundPrinters**	5
Which Windows hotfixes are installed?	Question	Returns a list of installed Windows hotfixes.	**1E-Explorer-TachyonCore-GetInstalledWindowsHotfixes**	6
Which IP addresses are assigned to devices?	Question	Gets the IP addresses assigned to devices. Windows Only.	**1E-Explorer-TachyonCore-GetIpAddresses**	6
Who is currently logged in?	Question	Shows a list of all users logged into devices, including interactive and	**1E-Explorer-TachyonCore-GetLoggedInUsers**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		remote desktop sessions.		
What historical outbound connections are recorded?	Question	Retrieves the historical outbound connections recorded on the device	**1E-Explorer-TachyonCore-GetOutboundConnectionHistory**	5
What outbound shared drives usage has been recorded?	Question	Retrieves the historical and currently exposed shared drive usage recorded on the device	**1E-Explorer-TachyonCore-GetOutboundMappedDriveHistory**	5
What printers are shared from the machine?	Question	What printers are shared from the machine?	**1E-Explorer-TachyonCore-GetOutboundPrinters**	4
What processes are running?	Question	Get all running processes.	**1E-Explorer-TachyonCore-GetProcesses**	6
Are my devices quarantined? Warning: Please read the description before use	Question	Queries the quarantine status of the device. Please use with care, and please read the documentation for the quarantine feature before use.	**1E-Explorer-TachyonCore-GetQuarantineStatus**	5
What services are running?	Question	Retrieves all the running services. Windows Only.	**1E-Explorer-TachyonCore-GetServiceInfo**	6
Which Hyper-V virtual machines are running?	Question	Returns details for virtualized Hyper-V	**1E-Explorer-TachyonCore-HyperVGuestDetails**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		guest machines that are currently running. Windows hosts only.		
What memory chips are installed?	Question	Details of RAM chips. Windows Only.	**1E-Explorer-TachyonCore-InstalledMemoryDetails**	6
How many of each operating system versions are installed?	Question	Return a count of all distinct Operating Systems, Version and Virtual platform for each Tachyon-connected device.	**1E-Explorer-TachyonCore-InstalledOS**	6
Which versions of <appname> are installed?	Question	Returns count of all distinct versions of the specified product. Note the value entered does not need to be complete e.g. enter chrome and all products containing chrome will be returned.	**1E-Explorer-TachyonCore-InstalledSoftwareProduct**	7
Which versions of <publisher> <appname> are installed?	Question	Returns count of all distinct versions of the specified publisher and product. Note the values entered do not need to be complete e.g. enter Micro and all publishers	**1E-Explorer-TachyonCore-InstalledSoftwarePublisherProduct**	7

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		containing Micro will be returned.		
What USB devices are installed?	Question	Returns details of installed USB devices. Windows only.	**1E-Explorer-TachyonCore-InstalledUsbDevices**	8
Kill process <processId>	Action	Terminate a single process.	**1E-Explorer-TachyonCore-KillProcess**	6
Kill process(es) with image name matching <exename>	Action	Terminate all instances of a specified executable.	**1E-Explorer-TachyonCore-KillProcesses**	6
How many local groups is <accountName> a member of?	Question	Get the number of local groups each matching account is a member of. Windows Only.	**1E-Explorer-TachyonCore-LocalGroupMemberSummary**	7
Which logical drives are available?	Question	Get details of logical drives, including network drives. Windows Only.	**1E-Explorer-TachyonCore-LogicalDiskDetails**	6
Log off <user>	Action	Logs off %user% from all specified machines. The account should not contain a prefix. The user will be forcibly logged off - unsaved work or documents will be lost. Windows Only.	**1E-Explorer-TachyonCore-LogoffUser**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
How are network adapters configured?	Question	Get the configuration of the network adapters. Windows Only.	**1E-Explorer-TachyonCore-NetworkAdapterConfigurationDetails**	6
Which network adapters are installed?	Question	Gets details of network adapters. Windows Only.	**1E-Explorer-TachyonCore-NetworkAdapterDetails**	6
What processes are listening on which ports?	Question	Gets network listening processes and ports.	**1E-Explorer-TachyonCore-NetworkListeningProcessesAndPorts**	6
What does the nslookup for <address> return?	Question	Performs an nslookup on a specified address and returns the output as a string.	**1E-Explorer-TachyonCore-NslookupCmd**	6
Which hard drives are installed?	Question	Get details of physical disk drives. Windows Only.	**1E-Explorer-TachyonCore-PhysicalDiskDetails**	6
Which plug-and-play devices are installed?	Question	Get details of plug and play devices. Windows Only.	**1E-Explorer-TachyonCore-PlugAndPlayDevices**	6
Which printers are installed?	Question	Get details of installed printers. Windows only.	**1E-Explorer-TachyonCore-PrinterDetails**	6
Which devices are currently running <ProcessName> as local admin?	Question	Finds all devices that currently have the specified process running with local	**1E-Explorer-TachyonCore-ProcessAsLocalAdmin**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		administrator privilages.		
Which processors are installed?	Question	Details of processors installed. Windows Only.	**1E-Explorer-TachyonCore-ProcessorDetails**	6
What processor types are being used?	Question	Gets processor types being used by devices. Windows only.	**1E-Explorer-TachyonCore-ProcessorDetailsByType**	6
Quarantine selected devices. Warning: Please read the description before use	Action	Quarantines the device. The device will only be able to contact Tachyon. CRL checks must be set to soft. Certificate expiry can cause the agent to fail to connect to the switch. If an agent is no longer connected to Tachyon after quarantine, it will remain in quarantine. Please use with care, and please read the documentation for the quarantine feature before use.	**1E-Explorer-TachyonCore-QuarantineDevice**	5
Shutdown and reboot devices in <timeToReboot> seconds	Action	Schedules a reboot in a specified number of seconds. This will	**1E-Explorer-TachyonCore-RebootMachineInXSeconds**	3

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		not prompt for user interaction!		
Refresh the Windows CRL cache	Action	Refreshes the CRL cache by setting the ChainCacheResyncFiletime. This means that windows will attempt to retrieve a CRL the next time it is called upon for verification.	**1E-Explorer-TachyonCore-RefreshCrlCache**	6
Delete registry key <hive>:<subkey> recursively	Action	Delete an entire registry key. Windows Only.	**1E-Explorer-TachyonCore-RegistryDeleteKey**	7
Delete key <subkey> for every user in the HKEY_USERS hive	Action	Delete a specified key for each user in the HKEY_USERS hive. Windows Only.	**1E-Explorer-TachyonCore-RegistryDeleteUserKey**	7
Delete a <value> under <subkey> for every user in the HKEY_USERS hive	Action	Delete a specified registry entry for each user in the HKEY_USERS hive. Windows Only.	**1E-Explorer-TachyonCore-RegistryDeleteUserValues**	7
Delete registry entry <hive> <subkey> <name>	Action	Delete a specified registry entry. Windows Only.	**1E-Explorer-TachyonCore-RegistryDeleteValue**	7
What are all the keys under the registry key <hive> <subkey>?	Question	Get all sub keys for a Registry key. Windows Only.	**1E-Explorer-TachyonCore-RegistryEnumerateKeys**	10

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
What are all the keys under a registry <subkey> for each user in the HKEY_USERS hive?	Question	Get all the keys under a subkey for each user in the HKEY_USERS hive. Windows Only.	**1E-Explorer-TachyonCore-RegistryEnumerateUserKeys**	5
What are all the values under a registry <subkey> for each user in the HKEY_USERS hive?	Question	Get all the values under a subkey for each user in the HKEY_USERS hive. Windows Only.	**1E-Explorer-TachyonCore-RegistryEnumerateUserValues**	7
What are all the values under the registry key <hive> <subkey>?	Question	Get all values for a Registry key. Windows Only.	**1E-Explorer-TachyonCore-RegistryEnumerateValues**	7
What is the value of <value> under <subkey> for each user in the HKEY_USERS hive?	Question	Get a registry value for each user in the HKEY_USERS hive. Windows Only.	**1E-Explorer-TachyonCore-RegistryGetUserValues**	8
What is the value of the registry entry <hive> <subkey> <name>?	Question	Get the value for a Registry entry. Windows Only.	**1E-Explorer-TachyonCore-RegistryGetValue**	7
Which devices have the registry key <hive> <subkey>?	Question	Determine whether a given Registry key exists. Windows Only.	**1E-Explorer-TachyonCore-RegistryKeyExists**	7
Set <name> as <valuetype> to <value> under <subkey> for every user in the HKEY_USERS hive	Action	Set a registry entry for each user in the HKEY_USERS hive. Windows Only.	**1E-Explorer-TachyonCore-RegistrySetUserValues**	7

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Set registry entry <hive> <subkey> <name> to <valuetype> <value>	Action	Set the value for a given Registry entry. Windows Only.	**1E-Explorer-TachyonCore-RegistrySetValue**	7
Which users in the HKEY_USERS hive have <subkey>?	Question	Determine whether a registry key exists for each user in the HKEY_USERS hive. Windows Only.	**1E-Explorer-TachyonCore-RegistryUserKeyExists**	6
Which users in the HKEY_USERS hive have a <value> under <subkey>?	Question	Determine whether a registry entry exists for each user in the HKEY_USERS hive. Windows Only.	**1E-Explorer-TachyonCore-RegistryUserValueExists**	6
Which devices have the registry entry <hive> <subkey> <name>?	Question	Determine whether a given Registry entry exists. Windows Only.	**1E-Explorer-TachyonCore-RegistryValueExists**	7
Which removable drives are installed?	Question	Returns information about removable drives. Windows Only.	**1E-Explorer-TachyonCore-RemovableDiskDetails**	6
Which devices are running <executable>?	Question	Shows machines running a specific executable. Windows Only.	**1E-Explorer-TachyonCore-RunningProcess**	7
Set coverage tag <tagname> to <tagvalue>	Action	Sets a value for a coverage tag on devices. This tag can be used to narrow down	**1E-Explorer-TachyonCore-SetCoverageTag**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		target devices for instructions.		
Set freeform tag <tagname> to <tagvalue>	Action	Sets a value for a freeform tag on devices. This tag and value combination can be arbitrary. This tag cannot be used to narrow down target devices for instructions.	**1E-Explorer-TachyonCore-SetFreeFormTag**	6
Set PowerShell execution policy to <executionPolicy>	Action	Sets the PowerShell execution policy on devices. The new execution policy will be returned after being set.	**1E-Explorer-TachyonCore-SetPowerShellExecutionPolicy**	6
Remove application <appname> published by <publisher>	Action	Removes all versions of the specified application published by the specified publisher, if present.	**1E-Explorer-TachyonCore-UninstallApplicationAllVersions**	6
Remove version <version> of application <appname> published by <publisher>	Action	Removes the specified version of the the specified application published by the specified publisher, if it is present.	**1E-Explorer-TachyonCore-UninstallApplicationSpecificVersion**	6

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Releases selected devices from quarantine. Warning: Please read the description before use	Action	Unquarantines the device. Please use with care, and please read the documentation for the quarantine feature before use.	**1E-Explorer-TachyonCore-UnquarantineDevice**	5
Which unsigned device drivers are installed?	Question	Gets device drivers which are not digitally signed. Windows only.	**1E-Explorer-TachyonCore-UnsignedDeviceDrivers**	6
Which devices is <domainName>\<accountName> currently logged on?	Question	Find all devices on which the given user is currently logged in. Windows Only.	**1E-Explorer-TachyonCore-UserLoggedInDevices**	7
Which Windows updates are pending a reboot?	Question	Gets Windows updates with a count of each device that is pending a reboot for this update to take effect. Windows only.	**1E-Explorer-TachyonCore-WindowsUpdatesPendingReboot**	6

1.11.12.9 MEMCM Client Health integrated product pack

Integrated Product Pack used to create the **MEMCM Client Health** policy.

For more information please refer to Guaranteed State - MEMCM Client Health Policy.

1.11.12.9.1 Overview

Many businesses rely on Microsoft Endpoint Manager Configuration Manager (MEMCM) to deploy software, patches and updates across their company networks. It is crucial that Configuration Manager is working effectively.

The MEMCM Client Health policy monitors Configuration Manager client health and performance. It checks for cache availability, inventory cycles, service availability and Configuration Manager WMI integrity - common causes of Configuration Manager client problems on devices.

The MEMCM Client Health policy replaces the previous SCCM Client Health policy and covers the following:

- Ensure the correct version of the CM client is installed and running and assigned to the correct site
- Ensure the CM client is not stuck in provisioning mode
- Ensure that heartbeat discovery, inventory and state messages are being sent regularly
- Ensures the CM client cache is set to the correct size
- Ensure the CM client log settings are correct
- Ensure the BITS service exists, configured to start up automatically and is running
- Ensure the Windows Time service exists with correct startup settings
- Ensure the Windows Management Instrumentation (WMI) service exists, configured to start automatically and is running
- Ensure WMI is healthy, the core CIMv2 and ccm namespaces and classes exist and that the WMI repository is consistent
- Ensure the Windows Update service exists with correct startup settings, is configured to use the correct source (CM, WSUS or Microsoft Update) and that the service can connect to the source.

Note

This policy is intended for deployment to Windows devices only.

1.11.12.9.1.1Instructions

This product pack contains no instructions.

1.11.12.9.1.2Policies

The following table shows the policies included in the Integrated Product Pack.

Name	Description
MEMCM Client Health	The MEMCM (Microsoft Endpoint Manager - Configuration Manager) Client Health policy ensures that the MEMCM client and surrounding technologies are healthy.

1.11.12.9.1.3Rules

Note

The following table shows the rules included in the above policy. Any parameter values shown in the **Check and Fix fragments**, **Triggers** and **Precondition fragment** columns are

specifically set in the rules when the pack is uploaded. These may be different to the default values shown in the Fragments table. You can modify these if required.

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
MEMCM Client Assignment	Fix	Ensure the client is assigned to the right site. Assign it if it isn't.	1E-GuaranteedState-Check-MEMCM-AssignedSite 1E-GuaranteedState-Fix-MEMCM-SetAssignedSite	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple • 1EClientVersionToCompare=0 • 1EClientVersionDesiredResult=SameOrHigher • DeviceChassisTypeList=% • DeviceCpuTypeList=% • DeviceDomainList=% • DeviceFqdnList=% • DeviceManufacturerList=% • DeviceModelList=% • DeviceRamMBMin=0 • DeviceRamMBMax=2147483647 • DeviceTimeZoneOffsetList= -720;-660;-600;-570;-540;-480; -420;-360;-300;-240;-180;-150; -120;-60;0;60;120;180;240; 270;300;330;345;360;390;

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
MEMCM Client Cache Size	Fix	Ensure the MEMCM client cache is set to the right size. Set it if it isn't.	1E-GuaranteedState-Check-MEMCM-CacheSizeBetween 1E-GuaranteedState-Fix-MEMCM-SetCacheSize	Periodic (24 hours)	
MEMCM Client ClassExists	Check(1)	Ensure the default CCM class exists in WMI.	1E-GuaranteedState-Check-Wmi-ClassExists 1E-GuaranteedState-Fix-MEMCM-InstallClient (1)	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
MEMCM Client ClientProvisioningMode	Fix	Ensure the client is not stuck in provisioning mode. Turn it off if it is.	1E-GuaranteedState-Check-MEMCM-ClientProvisioningMode 1E-GuaranteedState-Fix-MEMCM-SetClientProvisioningMode	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
MEMCM Client DataDiscoveryRecordSent	Check	Ensure that a data discovery record (DDR) is being sent regularly.	1E-GuaranteedState-Check-MEMCM-DataDiscoveryRecordSent	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
MEMCM Client FileCollectionSent	Check	Ensure that file collection is being sent regularly.	1E-GuaranteedState-Check-MEMCM-FileCollectionSent	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
MEMCM Client HardwareInventorySent	Check	Ensure that hardware inventory is being sent regularly.	1E-GuaranteedState-Check-MEMCM-HardwareInventorySent	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
MEMCM Client IDMIFCollectionSent	Check	Ensure that IDMIF collection is being sent regularly.	1E-GuaranteedState-Check-MEMCM-IDMIFCollectionSent	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
MEMCM Client Logging	Check	Ensure the MEMCM client log settings are set to the right values.	1E-GuaranteedState-Check-MEMCM-GlobalLoggingConfiguration	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
MEMCM Client NamespaceExists	Check[(1)]	Ensure the MEMCM (CCM) namespace exists in WMI.	1E-GuaranteedState-Check-Wmi-NamespaceExists 1E-GuaranteedState-Fix-MEMCM-InstallClient [(1)]	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
MEMCM Client SoftwareInventorySent	Check	Ensure that software inventory is being sent regularly.	1E-GuaranteedState-Check-MEMCM-SoftwareInventorySent	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
MEMCM Client StateMessagesSent	Check	Ensure that state messages are being sent regularly.	1E-GuaranteedState-Check-MEMCM-StateMessagesSent	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
MEMCM Client Version	Check[1]	Ensure the right version of the client is installed.	1E-GuaranteedState-Check-Software-Version 1E-GuaranteedState-Fix-MEMCM-InstallClient [1]	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Network IPv4 PrimaryAddressInDNS	Check	Check the FQDN matches DNS by looking up the primary IPv4 address in DNS	1E-GuaranteedState-Check-Network-PrimaryIPv4InDNS	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service BITS DelayedStart	Fix	Ensure that the BITS (Background Intelligent Transfer Service) service is set to Automatic (Delayed Start). Set it if not.	1E-GuaranteedState-Check-Service-StartType 1E-GuaranteedState-Fix-Service-SetStartTypeAutomaticDelayedStart	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service BITS Exists	Check	Ensure that the BITS (Background Intelligent Transfer Service) service exists.	1E-GuaranteedState-Check-Service-Exists	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service BITS Running	Fix	Ensure that the BITS (Background Intelligent	1E-GuaranteedState-Check-Service-State	Service Status	1E-GuaranteedState-Precondition-Multiple

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
		Transfer Service) service is running. Start it if it isn't	1E-GuaranteedState-Fix-Service-Start	Change	
Service ccmexec DelayedStart	Fix	Ensure that the ccmexec (SMS Agent Host) service is set to Automatic (Delayed Start). Set it if not.	1E-GuaranteedState-Check-Service-StartType 1E-GuaranteedState-Fix-Service-SetStartTypeAutomaticDelayedStart	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service ccmexec Exists	Check(1)	Ensure that the ccmexec (SMS Agent Host) service exists.	1E-GuaranteedState-Check-Service-Exists 1E-GuaranteedState-Fix-MEMCM-InstallClient (1)	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service ccmexec Running	Fix	Ensure that the ccmexec (SMS Agent Host) service is running. Start it if it isn't	1E-GuaranteedState-Check-Service-State 1E-GuaranteedState-Fix-Service-Start	Service Status Change	1E-GuaranteedState-Precondition-Multiple
Service W32Time Exists	Check	Ensure that the W32Time (Windows Time) service exists.	1E-GuaranteedState-Check-Service-Exists	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
Service W32Time Manual	Fix	Ensure that the W32Time (Windows Time) service is set to manual. Set it to manual if it's not.	1E-GuaranteedState-Check-Service-StartType 1E-GuaranteedState-Fix-Service-SetStartTypeManual	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service W32Time TriggerStart	Check	Ensure that the W32Time (Windows Time) service is set to trigger start.	1E-GuaranteedState-Check-Service-TriggerStart	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service Winmgmt Automatic	Fix	Ensure that the Winmgmt (Windows Management Instrumentation) service is set to automatic. Set it to automatic if it's not.	1E-GuaranteedState-Check-Service-StartType 1E-GuaranteedState-Fix-Service-SetStartTypeAutomatic	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service Winmgmt Exists	Check	Ensure that the Winmgmt (Windows Management Instrumentation) service exists.	1E-GuaranteedState-Check-Service-Exists	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service Winmgmt Running	Fix	Ensure that the Winmgmt (Windows Management	1E-GuaranteedState-Check-Service-State	Service Status	1E-GuaranteedState-Precondition-Multiple

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
		Instrumentation) service is running. Start it if it isn't	1E-GuaranteedState-Fix-Service-Start	Change	
Service wuauserv Exists	Check[2]	Ensure that the wuauserv (Windows Update) service exists.	1E-GuaranteedState-Check-Service-Exists 1E-GuaranteedState-Fix-WindowsUpdate-ResetWindowsUpdate [2]	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service wuauserv Manual	Fix	Ensure that the wuauserv (Windows Update) service is set to manual. Set it to manual if it's not.	1E-GuaranteedState-Check-Service-StartType 1E-GuaranteedState-Fix-Service-SetStartTypeManual	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
Service wuauserv TriggerStart	Check	Ensure that the wuauserv (Windows Update) service is set to trigger start.	1E-GuaranteedState-Check-Service-TriggerStart	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
WindowsUpdate ConnectionOK	Check	Ensure the connection to Windows Update is OK	1E-GuaranteedState-Check-WindowsUpdate-ConnectionOK	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
WindowsUpdate Source	Check	Ensure the connection to Windows Update is using the right source (Configuration Manager, WSUS, Microsoft Update)	1E-GuaranteedState-Check-WindowsUpdate-Source	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
WMI cimv2 NamespaceExists	Check	Ensure the default (cimv2) namespace exists in WMI.	1E-GuaranteedState-Check-Wmi-NamespaceExists	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
WMI Repository Consistency	Fix	Ensure the WMI repository is consistent. Salvage the repository or (optionally) reset it if inconsistent.	1E-GuaranteedState-Check-Wmi-Repository 1E-GuaranteedState-Fix-Wmi-Repository	Periodic (24 hours)	1E-GuaranteedState-Precondition-Multiple
WMI Win32_ComputerSystem ClassExists	Check	Ensure the default Win32_ComputerSystem class exists in WMI.	1E-GuaranteedState-Check-Wmi-ClassExists	Periodic (60 min)	1E-GuaranteedState-Precondition-Multiple

1.11.12.9.1.4Fragments

Note

The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these fragments, unless you select alternative values.

1.11.12.9.1.4.1 Fragments used in MEMCM Client Health Policy rules

The following fragments are used by the rules defined above in the MEMCM Client Health policy.

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Check-MEMCM-AssignedSite	Check	**Check the CM client has been assigned to site %SiteCode%**	**SiteCode** Check to see if the MEMCM client is assigned to this site code
1E-GuaranteedState-Check-MEMCM-CacheSizeBetween	Check	**Check the CM cache size is between %MinMB% and %MaxMB%**	**MinMB** The cache size should be at least this big (in Megabytes) **MaxMB** The cache size should be at most this big (in

Name	Type	Readable Payload and summary	Parameters
			Megabytes)
1E-GuaranteedState-Check-MEMCM-ClientProvisioningMode	Check	**Check the CM ClientProvisioningMode is set to %TrueFalse%**	**TrueFalse** True represents client provisioning ON, False represents client provisioning OFF
1E-GuaranteedState-Check-MEMCM-DataDiscoveryRecordSent	Check	**Check the CM client has sent a DDR (Data Discovery Record) within the last %Days% days**	**Days** Look for DDRs sent back in this number of days
1E-GuaranteedState-Check-MEMCM-FileColl	Check	**Check the CM client has performed a file collection within the last %Days% days**	**Days** Look for file collection sent back in this number of days

Name	Type	Readable Payload and summary	Parameters
ectionSent			
1E-GuaranteedState-Check-MEMCM-GlobalLoggingConfiguration	Check	**Check the CM client logging is configured with %Loglevel%, %MaxSize%, %MaxHistoryFiles% and %DebugLogging% settings**	**LogLevel** The logging level Valid Values: Verbose, Normal, None **MaxSize** The maximum size (in Bytes) that the MEMCM logs may grow before rolling over **MaxHistoryFiles** The number of incremented log files to accumulate

Name	Type	Readable Payload and summary	Parameters
			before deleting **DebugLogging** True means debug logging should be on, False means it should be off
1E-GuaranteedState-Check-MEMCM-HardwareInventorySent	Check	**Check the CM client has sent hardware inventory within the last %Days% days**	**Days** Look for hardware inventory data sent back in this number of days
1E-GuaranteedState-Check-MEMCM-IDMIFCollectionSent	Check	**Check the CM client has performed an IDMIF collection within the last %Days% days**	**Days** Look for IDMIFs sent back within this number of days

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Check-MEMCM-SoftwareInventorySent	Check	**Check the CM client has sent software inventory within the last %Days% days**	**Days** Look for software inventory data sent back within this number of days
1E-GuaranteedState-Check-MEMCM-StateMessagesSent	Check	**Check the CM client has sent state messages within the last %Days% days**	**Days** Look for state messages sent back within this number of days
1E-GuaranteedState-Check-Network-IPv4-PrimaryAddressInDNS	Check	**Check the Device FQDN matches the value from DNS** Take the primary IP address for the default route and look it up in DNS. Make sure the fqdn from device summary matches the fqdn returned from DNS	
1E-GuaranteedState-	Check	**Check that %ServiceName% service exists**	**Service Name**

Name	Type	Readable Payload and summary	Parameters
Check-Service-Exists			Shortname of the service
1E-GuaranteedState-Check-Service-StartType	Check	**Check that %ServiceName% start type is %StartType%**	**Service Name** Shortname of the service **StartType** The startup setting for the service Valid Values: • Automatic • Automatic (

Name	Type	Readable Payload and summary	Parameters
			DelayedStart) • Boot • Disabled • Manual • System

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Check-Service-State	Check	**Check the %ServiceName% service is in %State% state** For completeness, all valid service states are included. Realistically, however, making a precondition out of transition states like • About To Continue • Pausing • Starting • Stopping isn't a very good idea as a service will only be in that state for a very short time.	**Service Name** Shortname of the service **State**The state the service should be in Valid Values: • AboutToContinue • Pausing • Pa

Name	Type	Readable Payload and summary	Parameters
			used • Running • Starting • Stopping • Stopped
1E-GuaranteedState-	Check	**Check the %ServiceName% service is set to start on a trigger** The actual trigger is not checked or reported	**Service Name** Shortname of

Name	Type	Readable Payload and summary	Parameters
Check-Service-Trigger Start			the service
1E-GuaranteedState-Check-Software-Version	Check	**Check for the existence of %Publisher% %Product% with version %VersionDesiredResult% than %VersionToCompare%** Checks if the specified Publisher and Product is installed and that the version is lower, same or higher than the target (VersionToCompare)	**Publisher** Check for this publisher name **Product** Check for this product name **VersionToCompare** The software product version to use as the comparison DEFAULT: 0 **VersionDesiredResult**The outcome that's

Name	Type	Readable Payload and summary	Parameters
			desired when the software product version is compared to VersionToCompare Valid values: • SameOrLower • Lower • Lower_M

Name	Type	Readable Payload and summary	Parameters
			ajorLower • Lower_SameMajor • Lower_SameMajorM

Name	Type	Readable Payload and summary	Parameters
			inor • Lower_SameMajorMinorRelease • Same • High

Name	Type	Readable Payload and summary	Parameters
			er_SameMajorMinorRelease • Higher_SameMajor

Name	Type	Readable Payload and summary	Parameters
			Minor • Higher_SameMajor • Higher_MajorHigher

Name	Type	Readable Payload and summary	Parameters
			• Higher • SameOrHigher DEFAULT: SameOrHigher
1E-GuaranteedState-Check-WindowsUpdate-ConnectionOK	Check	**Check that the client can connect to the configured Windows Update source**	
1E-GuaranteedState-Check-Windo	Check	**Check Windows Update agent is configured to use %Source% as source** If Source is set to % (Default) this will check each of the sources and pass with the first one that succeeds.	**Source** The windows update source

Name	Type	Readable Payload and summary	Parameters
wsUpdate-Source			(% wildcard accepted) Valid Values: • SCCM(MEMCM) • WSUSL(WSUS-Local) • WSUSR

Name	Type	Readable Payload and summary	Parameters
			(WSUS-Remote) • % DEFAULT: %
1E-GuaranteedState-Check-Wmi-ClassExists	Check	**Check that WMI %Class% exists in %Namespace%**	**Namespace** The WMI namespace to check existence (ROOT\cimv2 for example) **Class**The WMI class that should exist in specified

Name	Type	Readable Payload and summary	Parameters
			namespace
1E-GuaranteedState-Check-Wmi-NamespaceExists	Check	**Check that WMI %Namespace% exists**	**Namespace** The WMI namespace to check existence (ROOT\cimv2 for example)
1E-GuaranteedState-Check-Wmi-Repository	Check	**Check that the WMI repository is consistent** Runs winmgmt.exe /verifyrepository and fails if 'is not consistent' appears in the returned result	
1E-GuaranteedState-Fix-MEMCM-SetAssignedSite	Fix	**Set CM assigned site to %SiteCode%** Namespace: ROOT\CCM Class: SMS_CLIENT Method: SetAssignedSite sSiteCode: %SiteCode%	**SiteCode** Assign the client to this site code
1E-GuaranteedState-Fix-	Fix	**Set CM client cache size to %MaxMB% MB** Com Object: UIResource.UIResourceMgr.GetCacheInfo().TotalSize	**MaxMB** The cache

Name	Type	Readable Payload and summary	Parameters
MEMCM-SetCacheSize			size should be at least this size (in MB) DEFAULT: 5120
1E-GuaranteedState-Fix-MEMCM-SetClientProvisioningMode	Fix	**Set MEMCM client provisioning mode to %TrueFalse%** Namespace: ROOT\CCM Class: SMS_CLIENT Method: SetClientProvisioningMode bEnable: <true/false>	**TrueFalse** *True* sets client provisioning mode to ON *False* sets client provisioning mode to OFF DEFAULT: False Valid Values: True False
1E-GuaranteedState-Fix-	Fix	**Set %ServiceName% service to Automatic start type and confirm change within %Timeout% seconds**	**Service Name**

Name	Type	Readable Payload and summary	Parameters
Service-SetStartTypeAutomatic			The name of the service on which we want to operate **Timeout** The maximum number of seconds to wait for the fix to enforce the correct state before considering it "fixed" or not DEFAULT: 15
1E-GuaranteedState-Fix-Service-SetStartTypeAutomat	Fix	**Set %ServiceName% service to Automatic (Delayed Start) start type and confirm change within %Timeout% seconds**	**Service Name** The name of the service on

Name	Type	Readable Payload and summary	Parameters
icDelayedStart			which we want to operate **Timeout** The maximum number of seconds to wait for the fix to enforce the correct state before considering it "fixed" or not DEFAULT: 15
1E-GuaranteedState-Fix-Service-SetStartTypeManual	Fix	**Set %ServiceName% service to Manual start type and confirm change within %Timeout% seconds**	**Service Name** The name of the service on which we want to operate

Name	Type	Readable Payload and summary	Parameters
			Timeout The maximum number of seconds to wait for the fix to enforce the correct state before considering it "fixed" or not DEFAULT: 15
1E-GuaranteedState-Fix-Service-Start	Fix	**Start %ServiceName% service and confirm as started within %Timeout% seconds**	**Service Name** The name of the service on which we want to operate **Timeout** The maximum number

Name	Type	Readable Payload and summary	Parameters
			of seconds to wait for the fix to enforce the correct state before considering it "fixed" or not DEFAULT: 15
1E-GuaranteedState-Fix-Wmi-Repository	Fix	**Fix the consistency of the WMI Repository and ResetRepository command if %ResetRepository%=True** SALVAGE: winmgmt /salvagerepository RESET: (optional) winmgmt /resetrepository	**ResetRepository** *True* will reset the WMI repository (only if salvage fails) *False* will only try to salvage
1E-GuaranteedState-Precondition-	PreCondition	**Multiple checks using specified parameters %1EClientVersionToCompare% %1EClientVersionDesiredResult% %DeviceChassisTypeList% %DeviceCpuTypeList% %DeviceDomainList% %DeviceFqdnList% %DeviceManufacturerList% %DeviceModelList% %DeviceRamMBMin% %DeviceRamMBMax% %DeviceTimeZoneOffsetList% %DirectoryExists% %DirectoryName% %DnsLookupFqdnList% %FileNameExists% %FileName% %OsTypeList% %OsArchitectureList% %ProcessExists% %ProcessExecutableList% %QuarantineStatus% %RegistryExists% %Regist**	1E Client... **1EClientVersionToCompare**

Name	Type	Readable Payload and summary	Parameters
Multiple		**ryHive% %RegistryKey% %RegistryValue% %RegistryData% %ServiceExists% %ServiceName% %ServiceStartAccountName% %ServiceStartType% %ServiceState% %ServiceTriggerStart% %ServiceType% %SoftwareExists% %SoftwareProduct% %SoftwarePublisher% %SoftwareVersionToCompare% %SoftwareVersionDesiredResult% %WindowsUpdateSource% %WmiNamespace% %WmiClass% %WmiColumn% %WmiWhereClause% %WmiVersionToCompare% %WmiDesiredResult%** Most parameters will be ignored if % is entered so they don't take up any resources trying to lookup a precondition on something that isn't relevant. The default values for the parameters will do this. In other words, if you don't want to search for a precondition on something like a directory, leave it's parameters at their defaults and it will skip the search for that.	The version to use as the comparison DEFAULT: 0 **1EClient Version Desired Result** The outcome that's desired when the 1E Client Version is compared to the passed in version DEFAULT: Same or Higher Device details... **DeviceChassisTypeList**

Name	Type	Readable Payload and summary	Parameters

1.11.12.9.1.4.2 Spare fragments

The following fragments are included in the MEMCM Client Health Integrated Product Pack but are not used in any predefined rules. You can use these in rules that you create or modify in any policy.

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Check-MEMCM-CertificateInStore	Check	**Check that the CM certificate is in the certificate store by looking in the CM client logs located in %**MEMCMLogsDirectory% This checks the ClientIDManagerStartup.log for "Failed to find the certificate in the store" error messages, which indicates the CM client certificate is likely missing.	**MEMCMLogs Directory** The full path to the MEMCM client logs directory (%Environment% variables accepted)
1E-GuaranteedState-Check-MEMCM-ClientCommunication	Check	**Check that the CM client has sent data back within the last %Days% days.** This checks to see if hardware inventory, software inventory, DDRs or IDMIFs have been sent anytime in the past %Days% days.	**Days** Look for client messages sent back in this number of days

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Check-MEMCM-MachinePolicyValid	Check	**Check that the CM client has checked for machine policy with in the last %Days% days**	**Days** Look for machine policy validated within this number of days
1E-GuaranteedState-Check-MEMCM-UserPolicyValid	Check	**Check that the CM client has checked for user policy within the last %Days% days**	**Days** Look for user policy validated within this number of days
1E-GuaranteedState-Fix-MEMCM-InstallClient	Fix	**Install the CM client using CCMSETUP.EXE from %CcmSetupFileUrl% having size %CcmSetupFileSize% and hash %CcmSetupFileHash% with command line options %SourceList%, %MpList%, %RetryMinutes%, %ServiceNoService%, %InstallUninstall%, %Logon%, %ForceReboot%, %BITSPriority%, %DownloadTimeout%, %UsePKICert%, %NoCRLCheck%, %ConfigFile%, %SkipPrereqFileList%, %ForceInstall%, %ExcludeFeaturesList%, %CcmSetupMsiProperties%, %ClientMsiProperties%** This is essentially a front-end for the ccmsetup.exe installation parameters found in Microsoft Documentation. See https://docs.microsoft.com/en-us/configmgr/core/clients/deploy/about-client-installation-properties for more information about the installation parameters.	Expand parameters... **CcmSetupFileUrl**Either the full HTTP or HTTPS URL path to the ccmsetup.exe file on a web server or the relative path to be appended to the Content directory under the background channel URL

Name	Type	Readable Payload and summary	Parameters
			DEFAULT: ccmsetup.exe **CcmSetupFileSize**The size of the ccmsetup.exe file in bytes DEFAULT: 4099328 **CcmSetupFileHash** The SHA256 hash of the ccmsetup.exe file DEFAULT: ab85f58b0cc257d25628384b0ec8fab1f9e15ca2b110a1e425e86e56b47ebde1 **SourceList** A semicolon ; delimited list of download locations for setup media DEFAULT: {none} **MpList** A semicolon ; delimited list

Name	Type	Readable Payload and summary	Parameters
			of management points or cloud management gateway DEFAULT: {none} **RetryMinutes** The retry interval in minutes to retry setup if it fails to download installation files. -1 to ignore this parameter DEFAULT: -1 **ServiceNoService**Tells setup to install as a service or no service DEFAULT: Service Valid Values: Service NoService **InstallUninstall**

Name	Type	Readable Payload and summary	Parameters
			Tell setup to install or uninstall the client DEFAULT: Install Valid Values: Install Uninstall **Logon** If any version of the client is already installed, install will stop DEFAULT: False Valid Values: True False **ForceReboot** Setup should force the client to reboot if necessary to complete installation Valid Values:

Name	Type	Readable Payload and summary	Parameters
			True False **BITSPriority** Download priority when client installation files are downloaded over HTTP connection DEFAULT: Normal Valid Values: Foreground High Normal Low **DownloadTimeout** Length of time in minutes that setup tries to download the installation files before stopping DEFAULT: 1440 **UsePKICert**

Name	Type	Readable Payload and summary	Parameters
			Uses a PKI cert that includes client authentication, if available. If can't find a valid cert, it uses HTTP with self-signed cert. DEFAULT: False Valid Values: True False **NoCRLCheck** Client won't check the cert revocation list when it uses HTTPS with PKI cert DEFAULT: False Valid Values: True False **ConfigFile** The name of a text file that lists client

Name	Type	Readable Payload and summary	Parameters
			installation properties DEFAULT: {none} **SkipPrereqFileList** A semicolon ; delimited list of prerequisite files that will be skipped during install DEFAULT: {none} **ForceInstall** Uninstall any existing client and install a new client DEFAULT: False Valid Values: True False **ExcludeFeaturesList** Do not install the semicolon ; delimited list of features

Name	Type	Readable Payload and summary	Parameters
			(ClientUI is supported) when installing the client DEFAULT: {none} Valid Values: ClientUI **CcmSetupMsiProperties** Properties that modify the installation behavior of ccmsetup.msi DEFAULT: {none} **ClientMsiProperties** Properties that modify the installation behavior of client.msi DEFAULT: {none}
1E-GuaranteedState-Fix-	Fix	**Invoke CM Application manager global evaluation action** Namespace: ROOT\CCM

			converted to the numeric value required by the WMI method.
1E-GuaranteedState-Fix-WindowsUpdate-ResetWindowsUpdate	Fix	**Completely reset Windows Update from scratch (Experimental)** Process mostly inspired by https://gallery.technet.microsoft.com/Reset-WindowsUpdateps1-e0c5eb78 and tweaked a little to be more forceful Process also inspired by https://www.definit.co.uk/2012/02/powershell-recursively-taking-ownership-of-files-and-folders-and-adding-permissions-without-removing-existing-permissions/ **Warning** This is a very destructive and involved process. It should only be used as a last resort to fix a broken Windows Update system. The machine will be somewhat unusable until it is rebooted and should be rebooted right away. Many different and unrelated apps may throw odd and misleading errors until the reboot happens General process: 1. Stop Windows Update Services a. Stop BITS b. Stop wuauserv c. Stop appidsvc d. Stop cryptsvc 2. Remove QMGR Data File 3. Rename the software distribution and CatRoot folders	

Name	Type	Readable Payload and summary	Parameters
		4. Remove the old Windows Update log 5. Reset the Windows Update services to default settings (bits and wuauserv anyway) 6. Re-Register a pile of DLLS related to windows update and surrounding technologies 7. Remove the WSUS client settings from the registry 8. Reset WinSock 9. Delete any-and-all BITS jobs 10. Install the Windows Update Agent (KB2937636) 11. Force discovery 12. Reboot	
1E-GuaranteedState-Precondition-1EClient-Version	PreCondition	**Checks for the existence of the 1E client with version lower, same or higher (%DesiredResults%) than %VersionToCompare%.**	**VersionToCompare** A version number to compare against the installed 1E Client version number. Examples: 5 5.0 5.0.0 5.0.0.745 DEFAULT: 0 **DesiredResults**The outcome

Name	Type	Readable Payload and summary	Parameters
			that's desired when actual version is compared to passed in version. DEFAULT: SameOrHigher Valid values: • SameOrLower • Lower • Lower_MajorLower • Lower_SameMajor • Lower_SameMajorMinor • Lower_SameMajorMinorRelease • Same

Name	Type	Readable Payload and summary	Parameters
			• Higher_SameMajorMinorRelease • Higher_SameMajorMinor • Higher_SameMajor • Higher_MajorHigher • Higher • SameOrHigher
1E-GuaranteedState-Precondition-MEMCM-AssignedSite	Precondition	**Check the CM client is assigned to %SiteCode%**	**SiteCode** Check to see if the MEMCM client is assigned to this site code
1E-GuaranteedState-Precondit	Pre Co	**Check the CM cache size is between %MinMB% and %MaxMB%**	**MinMB** The cache size should be at least this

Name	Type	Readable Payload and summary	Parameters
ion-MEMCM-CacheSizeBetween	ndition		big (in Megabytes) **MaxMB**The cache size should be at most this big (in Megabytes)
1E-GuaranteedState-Precondition-MEMCM-CertificateInStore	PreCondition	**Check the CM certificate is in the certificate store by checking CM log files in %**MEMCMLogsDirectory% This checks the ClientIDManagerStartup.log for "Failed to find the certificate in the store" error messages, which indicates the CM client certificate is likely missing.	**MEMCMLogs Directory** The full path to the MEMCM client logs directory (%Environment% variables accepted)
1E-GuaranteedState-Precondition-MEMCM-ClientCommunication	PreCondition	**Check the CM client has sent data back within the last %Days% days** This checks to see if hardware inventory, software inventory, DDRs or IDMIFs have been sent anytime in the past %Days% days.	**Days** Look for client messages sent back in this number of days
1E-GuaranteedState-Precondition-MEMCM-ClientPro	PreConditi	**Check if the CM ClientProvisioningMode is set to %TrueFalse%**	**TrueFalse** True represents client provisioning ON, False represents client

Name	Type	Readable Payload and summary	Parameters
visioningMode	on		provisioning OFF
1E-GuaranteedState-Precondition-MEMCM-DataDiscoveryRecordSent	PreCondition	**Check the CM client has sent a DDR (Data Discovery Record) within the last %Days% days**	**Days** Look for DDRs sent back in this number of days
1E-GuaranteedState-Precondition-MEMCM-FileCollectionSent	PreCondition	**Check the CM client has performed a file collection within the last %Days% days**	**Days** Look for file collection sent back in this number of days
1E-GuaranteedState-Precondition-MEMCM-GlobalLogginConfiguration	PreCondition	**Check the CM client logging is configured with %Loglevel%, %MaxSize%, %MaxHistoryFiles% and %DebugLogging% settings configuration %LogLevel% %MaxSize% %MaxHistoryFiles% %DebugLogging%**	**LogLevel** The logging level Valid Values: Verbose, Normal, None **MaxSize** The maximum size (in Bytes) that the MEMCM logs may grow

Name	Type	Readable Payload and summary	Parameters
			before rolling over **MaxHistoryFiles** The number of incremented log files to accumulate before deleting **DebugLogging** True means debug logging should be on, False means it should be off
1E-GuaranteedState-Precondition-MEMCM-HardwareInventorySent	PreCondition	**Check the CM client has sent hardware inventory within the last %Days% days**	**Days** Look for hardware inventory data sent back in this number of days
1E-GuaranteedState-Precondition-MEMCM-IDMIFColl	PreConditi	**Check the CM client has performed an IDMIF collection within the last %Days% days**	**Days** Look for IDMIFs sent back within this number of days

Name	Type	Readable Payload and summary	Parameters
ectionSent	on		
1E-GuaranteedState-Precondition-MEMCM-MachinePolicyValid	PreCondition	**Check the CM client has checked for machine policy within the last %Days% days**	**Days** Look for machine policy validated within this number of days
1E-GuaranteedState-Precondition-MEMCM-SoftwareInventorySent	PreCondition	**Check the CM client has sent software inventory within the last %Days% days.**	**Days** Look for software inventory data sent back within this number of days
1E-GuaranteedState-Precondition-MEMCM-StatusMessagesSent	PreCondition	**Check the CM client has sent status messages within the last %Days% days.**	**Days** Look for status messages sent back within this number of days
1E-GuaranteedState-Precondition-MEMCM-	PreConditi	**Check the CM client has checked for user policy within the last %Days% days**	**Days** Look for user policy validated within this

Name	Type	Readable Payload and summary	Parameters
UserPolicyValid	on		number of days
1E-GuaranteedState-Precondition-Process-Exists	PreCondition	**Check the %Executable% process exists (is running)**	**Executable** The name of the executable that should be running
1E-GuaranteedState-Precondition-Service-Exists	PreCondition	**Check the %ServiceName% service exists**	**ServiceName** Shortname of the service
1E-GuaranteedState-Precondition-Software-Exists	PreCondition	**Check for the existence of %Publisher% %Product% with version %VersionDesiredResult% than %VersionToCompare%** Checks if the specified Publisher and Product is installed and that the version is lower, same or higher than the target (VersionToCompare	**Publisher** Check for this publisher name **Product** Check for this product name **VersionToCompare** The software product version to use

Name	Type	Readable Payload and summary	Parameters
			as the comparison DEFAULT: 0 **VersionDesiredResult**The outcome that's desired when the software product version is compared to SoftwareVersionToCompare Valid values: • SameOrLower • Lower • Lower_MajorLower • Lower_SameMajor • Lower_SameMajorMinor • Lower_SameMajorMinor

Name	Type	Readable Payload and summary	Parameters
			Release • Same • Higher_SameMajorMinorRelease • Higher_SameMajorMinor • Higher_SameMajor • Higher_MajorHigher • Higher • SameOrHigher DEFAULT: SameOrHigher
1E-GuaranteedState-Precondition-Windows Update-	PreConditi	**Check that the Windows Update connection is OK**	

Name	Type	Readable Payload and summary	Parameters
ConnectionOK	on		
1E-GuaranteedState-Precondition-Windows Update-Source	PreCondition	**Check that the connection to the %Source% Windows Update source is OK**	**Source** The windows update source (% wildcard accepted) Valid Values: • SCCM (MEMCM) • WSUSL (WSUS-Local) • WSUSR (WSUS-Remote) • % DEFAULT: %
1E-GuaranteedState-Precondition-Windows	PreConditi	**Check that a Windows Update connection is OK for %SourceId%**	**SourceId** The identity of the source of updates. E.g. for a '*SCCM*' source this will be

Name	Type	Readable Payload and summary	Parameters
Update-SourceId	on		the site ID, or for WSUS it will be the URL to WSUS.
1E-GuaranteedState-Precondition-Wmi-ClassColumnVersion	PreCondition	**Check if the value of the WMI attribute defined by %Namespace%, %Class%, %ColumnName% (and optional %WhereClause%) is a version number (e.g. 7.2.5.612) that is lower, higher or the same (defined by %DesiredResult%) as %VersionToCompare%**	**Namespace** The WMI namespace to check existence (ROOT\cimv2 for example) **Class**The WMI class that should exist in specified namespace (ignored if %) **WhereClause** The WHERE clause to use when querying this class (use {none} for no filter) **ColumnName** The column name from querying the class which holds a version string **VersionToCompare**

Name	Type	Readable Payload and summary	Parameters
			The software product version to use as the comparison DEFAULT: 0 **DesiredResult** The outcome that's desired when the software product version is compared to SoftwareVersionToCompare Valid values: • Same OrLower • Lower • Lower_MajorLower • Lower_SameMajor • Lower_SameMajorMinor • Lower_Same

Name	Type	Readable Payload and summary	Parameters
			Major Minor Release • Same • Higher_Same Major Minor Release • Higher_Same Major Minor • Higher_Same Major • Higher_MajorHigher • Higher • SameOrHigher DEFAULT: SameOrHigher
1E-GuaranteedState-Precondition-Wmi-	PreCon	**Check for the existence of WMI %Class% in %NameSpace%**	**Namespace** The WMI namespace to check

Name	Type	Readable Payload and summary	Parameters
ClassExists	dition		existence (ROOT\cimv2 for example) **Class**The WMI class that should exist in specified namespace (ignored if %)
1E-GuaranteedState-Precondition-Wmi-ClassQuery	PreCondition	**Check for any data returned from specified WMI %Class% and %Namespace% using (optional) %WhereClause% and %ColumnList%**	**Namespace** The WMI namespace to check existence (ROOT\cimv2 for example, ignored if %) **Class**The WMI class that should exist in specified namespace (ignored if %) **WhereClause** The WHERE clause to use when querying this class (use {none} for no filter) **ColumnList** A list of columns to

Name	Type	Readable Payload and summary	Parameters
			select from the WMI class (use {all} for all columns)
1E-GuaranteedState-Precondition-Wmi-NamespaceExists	Precondition	**Check for the existence of WMI %Namespace%**	**Namespace** The WMI namespace to check existence (ROOT\cimv2 for example)
1E-GuaranteedState-Precondition-Wmi-RepositoryConsistent	Precondition	**Check that the WMI repository is consistent** Runs winmgmt.exe /verifyrepository and fails if 'is not consistent' appears in the returned result	

1.11.12.9.1.5 Trigger templates

The following table shows the trigger templates included in the Nomad Client Health Integrated Product Pack.

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these templates, unless you select alternative values.

Name	Readable Payload and summary	Parameters
TriggerTemplate-FileChange	**On change of file "<fileName>"** When a file changes (Windows only)	**File Name** • File path of

Name	Readable Payload and summary	Parameters
		file to be monitored, default is null.
TriggerTemplate-IntervalHours	**Every <intervalHours> hours** Periodic (hours)	**Interval Hours** • 0 to 999 hours (approximately 42 days), default interval is 12 hours.
TriggerTemplate-IntervalMinutes	**Every <intervalMinutes> minutes** Periodic (minutes)	**Interval Minutes** • 0 to 99,999 minutes (approximately 69 days), default interval is 30 minutes.
TriggerTemplate-IntervalSeconds	**Every <intervalSeconds> seconds** Periodic (seconds)	**Interval Seconds** • 0 to 999,99

Name	Readable Payload and summary	Parameters
		9 seconds (approximately 11 days), default interval is 3600 seconds (1 hour).
TriggerTemplate-ProcessCrash	**On crash of process "<executable>"** When a process crashes (Windows only) Monitors the Windows Application Event Log for event 1000. Executable is case insensitive but is required to be the whole filename without the folder path, such as unreliableapp.exe A partial string such as unreliableapp will not trigger on a crash of unreliableapp.exe.	**Executable** • Filename of executable to be monitored, default is empty.
TriggerTemplate-ProcessLaunch	**On launch of process "<executable>"** When a process starts (Windows only) Monitors the Windows Security Event Log for event 4688.	**Executable** • File path of executable to be monitored, default is empty.
TriggerTemplate-	**On change of running state of the "<serviceName>" service**	**Service Name**

Name	Readable Payload and summary	Parameters
ServiceStatusChange	When the state of the named Windows service changes You can determine the short name of a service using the PowerShell cmdlet `get-service -DisplayName "Network Location Awareness"` This will return **NlaSvc** in the above example. It is this short name you specify in the <ServiceName> parameter.	• Short name of service - for example Nomad Branch.

TriggerTemplate-WindowsEventLog	**On Windows"<channel>"; event log entry matching "<query>" (debounce for <debounce> seconds)**
	
	When an event log entry is created (Windows only)
	
	A **channel** is an event sink, example standard channel names are Application or Security.
	
	To determine the available event channels execute the following PowerShell command:
	
	`Get-WinEvent -ListLog *`
	
	Or to view the event channels on a remote computer:
	
	`Get-WinEvent -ListLog * -ComputerName <hostname>`
	
	Similarly to view event log entries for a given channel either use Event Viewer or from PowerShell for example:
	
	`Get-EventLog application | where {($_.EntryType -Match "Error") -or ($_.EntryType -Match "Warning")}`
	
	Or:
	
	`[dateTime]$oneWeekAgo = (get-date).addDays(-7)`
	`Get-EventLog -LogName Application -After $oneWeekAgo -computerName . \| ? {$_.EventID -eq 1000}`
		Channel
		• Text string, default null.
		
		Query
		• Text string, default null.
		
		Debounce Time Seconds
		• 0 to 99 seconds, default 0.

Name	Readable Payload and summary	Parameters
	A **query** is used to filter the event log messages for a given channel. Examples can be found at https://docs.microsoft.com/en-us/windows/win32/wes/consuming-events. For example to query all OneNote application crashes error log messages: *[System[(Level=2) and (EventID=1000)]] and *[EventData[Data='onenote.exe']] **Debounce** is a settling period to ensure that in the case of multiple events, only a single event is registered within the space of a given time period.	
TriggerTemplate-WindowsRegistryChange	**On change of registry values in "<hive>\<subkey>" (include subkeys=<includeSubkeys>)** When the value of a Windows registry key changes.	**Hive**, which must be one of: • HKLM (default) • HKCR **Subkey**: free text string, default empty. **Include Sub Keys** : 1/0 default 0.

1.11.12.10 1E Nomad product pack

Classic product pack used to create the **1E Nomad** instruction set in Tachyon, required by the following Nomad features:

- Downloads tab on Device views - instructions used to populate details about Content download and other Nomad features
- Nomad Download Pause - instructions used by the CM Admin Console extensions
- Instructions to help with the following Nomad features: Nomad cache, CacheCleaner, Single Site Download, Nomad jobs, NomadBranch service.

1.11.12.10.1 Nomad Client Health integrated product pack

Integrated Product Pack used to create the **Nomad Client Health** instruction set and **Nomad Client Health** policy.

For more information, please refer to Nomad Client Health Policy.

Nomad is included as part of the 1E Client, and as part of that integration, we offer a Nomad client health compliance policy in Guaranteed State. This verifies common Nomad requirements such as ACP registration, disk availability, firewall exceptions, crash notifications and cache monitoring.

The Nomad client health policy replaces the client health tile in the Nomad dashboard plus additional remediation steps:

- Keeps content distribution services up and running on Nomad clients, so that users are secure and productive
- Ensures Alternative Content Provider (ACP) registration configuration is set
- Maintains optimal disk availability and monitors cache size for storage capacity planning
- Enforces Firewall exceptions.

Note

This policy is intended for deployment to Windows devices only.

1.11.12.10.1.1 Instructions

The following table shows the instructions included in the Integrated Product Pack. Unless already uploaded, the following instructions are added to an Instruction set named: **Nomad Client Health**

Readable Payload	Type	Description	Name	Version
P2P election weight vs criticality	Question	Returns the Nomad peer-to-peer election weight and the criticality of the device. This instruction is useful if you use - and want to correlate - the Nomad feature Sensitive server weighting and the Tachyon feature Using Device Criticality. The P2PElectionWeight registry entry does not exist unless it is explicitly set - for example by a Configuration Manager baseline or Tachyon instruction. If the registry entry does not exist the response will be **Not set**. Similarly, the	**1E-Explorer-NomadClientHealth-ElectionWeightVsCriticality**	3

Readable Payload	Type	Description	Name	Version
		default criticality value assigned to a device is **Undefined**. The following is an extract from Election weighting: Click here to expand... Nomad performs automatic weighting depending on its situation, according to the criteria listed below, and stores the value in memory (not registry). The higher the value, the greater the probability of winning the election. • 61 – the agent is running on a server OS and it is not a domain controller (DC) • 40 – the agent is running on a laptop • 30 – the agent is running on a wireless network • 10 – the agent is running on WinPE • 50 – default If necessary, you can use the P2PElectionWeight registry setting to increase or decrease a Nomad client's probability of being elected a master. The range for this registry value must be between 0 and 99 inclusive. If not set, Nomad uses the values listed above. • The registry key is located at: *HKLM\software\1e\NomadBranch\P2PElectionWeight* To take effect after setting the registry value, the client service must be restarted. This method is not recommended because Nomad is already quite efficient in the way it		

Readable Payload	Type	Description	Name	Version

elects a master and needs very little intervention in this process. However, you may want to reduce the chance of computers with low processing power, or prevent critical servers, becoming a master.

You should also consider the following points before you influence the weighting:

- Use this technique in exceptional circumstances and only after testing has shown that you need to make a particular computer more or less likely to be elected as a master for specific operational reasons.
- Choose the simplest weighting strategy possible - for example, set servers at 90, laptops at 10 and workstations at 50.
- The weighting does not guarantee that the more heavily weighted computers will win the election – they may be turned off or another local peer may have already cached more of the requested content.
- The final weighting value used by the computer during an election may differ from the registry value as Nomad will automatically adjust it depending on the chassis and the network connection used.
- In the event you no longer need the values to be set, you should remove it and restart the service to resume dynamic election weighting.

Setting to 0 is a special case called Sensitive server weighting designed for use on critical

Readable Payload	Type	Description	Name	Version
		servers. The 0 value prevents Nomad from acting as master, and devices with this value will not respond to election requests.		

1.11.12.10.1.2 Policies

The following table shows the policies included in the Nomad Client Health Integrated Product Pack:

Name	Description
Nomad Client Health	The Nomad Client Health policy ensures that the health of the Nomad client is compliant with a reference baseline.

1.11.12.10.1.3 Rules

The following table shows the rules included in the Nomad Client Health Integrated Product Pack:

> **Note**
>
> Any parameter values shown in the table below are specifically set in the rules when the pack is uploaded. These may be different to the default values shown in the Fragments and Trigger templates tables. You can modify these if required.

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
Check Nomad ActiveEfficiency connectivity status	Check	Checks the Nomad agent connectivity to ActiveEfficiency.	1E-GuaranteedState-Nomad-Check-AEConnectivity • No parameters	TriggerTemplate-WindowsRegistryChange • Hive=*HKLM* • *Subkey=Software\1E\Nomad Branch\ActiveEfficiency* • Include Sub keys=0 TriggerTemplate-IntervalHours • intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests • hasCmClient=0 • sccmDp=0

1.11.12.10.1.4 Fragments

The following table shows the fragments included in the Nomad Client Health Integrated Product Pack:

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these fragments, unless you select alternative values.

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-PreCondition-MultiTests	Precondition	**Check if standard conditions apply for Nomad plus optionally: is a ConfigMgr DP (<sccmDp>); has a ConfigMgr client (<hasCmClient>); SMB sharing is enabled (<smbEnabled>)** The precondition passes for all of the following standard tests: • The device is running a version of Windows - Nomad is only supported on Windows operating systems • The device is not running Windows XP - which is no longer supported by Nomad • The *NomadBranch* service is installed, although not necessarily running The precondition also tests for each of the following if it is enabled by changing its parameter from 0 to 1: • **hasCmClient** : The ConfigMgr client is installed • **sccmDp** : The device is a ConfigMgr Distribution Point (DP)	• hasCmClient • sccmDp • sm

Name	Type	Readable Payload and summary	Parameters
		• **smbEnabled** : SMB sharing of Nomad's cache is enabled. If **smbEnabled** test is set in the rule precondition then an additonal test is made to see if the device is a Domain Controller (DC). When installed on a DC Nomad must use its computer account instead of SMSNomadP2P& in order to share its cache. This requires registry value *HKLM\SOFTWARE\1E\NomadBranch\SpecialNetShare* to have its 0x80 bit set. If not set then Nomad does not share its cache on a DC and does not respond to elections. For early adopters, the readable payload of this precondition was: Carries out the specified checks; if any fail (i.e. they are logically AND-ed) then the preconditions fails.	bEnabled Range 0 or 1, defaults=0
1E-GuaranteedState-Nomad-Check-AEConnectivity	Check	**Check whether there is a working connection to ActiveEfficiency** Tests whether the URL given by registry value *HKLM\SOFTWARE\1E\NomadBranch\ActiveEfficiency\PlatformUrl*, if it is not empty, is contactable and returns a 200 code.	None
1E-GuaranteedState-Nomad-Check-AlternateContentProvider	Check	**Check whether Nomad is correctly registered within Microsoft ConfigMgr** Check that the ConfigMgr client's list of ACPs includes an object for Nomad in WMI class *ROOT\ccm\Policy\Machine\RequestedConfig\CCM_DownloadProvider*, with *CLSID* "*25A6160D-4543-495F-975E-32CFBD6F70E0*", *LogicalName* "*NomadBranch*", *V4CompatibleHash* is set, and just "*<Data></Data>*" in *GlobalSettings*.	None
1E-GuaranteedState-Nomad-Fix-AlternateContentProvider	Fix	**Ensures Nomad is correctly registered within Microsoft ConfigMgr** If the same checks as 1E-GuaranteedState-Nomad-Check-AlternateContentProvider are not satisfied, restarts the *NomadBranch* service, waits 10 seconds for Nomad to establish itself as an ACP, then carries out the checks again.	None

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Check-CacheInTemp	Check	**Check whether Nomad's cache is not in a temporary directory** The Nomad cache can sometimes be configured to be in the Windows *Temp* directory (usually *C:\Windows\Temp*) or one of its subdirectories. Since all the contents of the Windows *Temp* directory are considered to be transient and could be deleted at any time, this is not suitable for Nomad's cache which should be a permanent location. The check examines Nomad's *HKLM\SOFTWARE\1E\NomadBranch\LocalCachePath* registry value and verifies that the specified location actually exists. It then gets the *TEMP* environment variable, which, because both the *1E Client* and *NomadBranch* services run as *Local System*, is usually the WIndows *TEMP* directory. If the *LocalCachePath* value is the same as the *TEMP* environment variable, or *LocalCachePath* specifies a subdirectory within it, the check fails.	None
1E-GuaranteedState-Nomad-Check-CrashDumps	Check	**Check whether there have been any crashdump files created by Nomad in last 7 days** Nomad dump files are saved in the same directory as the log file, the parent directory of the *HKLM\SOFTWARE\1E\NomadBranch\LogFileNameLogFileName* registry value. The check looks in here for any files with a "*.dmp*" suffix (ignoring case), and if it finds any examines the modification time (not creation time!) of each, reporting as a failed check any that were modified in the last 7 days. So the check passes if there are no "*.dmp*" files or they are all older than 7 days.	None
1E-GuaranteedState-Nomad-Check-DiskAvailablility	Check	**Checks whether there is sufficient disk space for Nomad** This examines Nomad's *HKLM\SOFTWARE\1E\NomadBranch\PercentAvailableDisk* registry value. (It ignores the older *MaxCacheSizeMB* value which has been superseded by *PercentAvailableDisk*.) If the value is greater than or equal to 80, the check fails because the setting is too high. It then compares the size of the contents of the folder given by *HKLM\SOFTWARE\1E\NomadBranch\LocalCachePath* in the registry, i.e. Nomad's cache, with the free space of the drive on which the folder resides, as reported by WMI's *root\cimv\Win32_LogicalDisk*. The check fails if the percentage	None

Name	Type	Readable Payload and summary	Parameters
		of free space on the drive is less than or equal too *PercentAvailableDisk*.	
1E-GuaranteedState-Nomad-Check-DpLszEnabled	Check	**Check whether web LSZ generation is correctly configured on standalone distribution points** Nomad automatically sets up LSZ file generation on DPs that are ConfigMgr site servers, but extra configuration is required for standalone DPs. The device is a standalone DP if, under registry key *HKLM\SOFTWARE\Microsoft\SMS\Operations Management\SMS Server Role*, the subkey *SMS Distribution Point* exists but *SMS Site Server* does not. If the device is a standalone DP, registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* should have its 16384/0x4000 bit set to turn on web LSZ generation for HTTP/HTTPS enabled clients; if not, the check fails.	None
1E-GuaranteedState-Nomad-Check-DpLszVirtualDirectory	Check	**Check whether the LSZ directory is correctly configured on distribution points** At time of writing there is a bug such that the overall check status is usually "Passed" even when individually reported checks fail. If the device is a standalone DP, the check first verifes that registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* has its 16384/0x4000 bit set. (This bit is not required for a DP on a site server.) Then the *LSZFILES* web site is examined to verify that all these conditions are satisfied: • Anonymous authentication is enabled • Windows authentication is enabled • No SSL • Default document is enabled • Directory browsing is enabled, with Date, Time, Size, Extension and LongDate all available • Content indexing is disabled	None

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Fix-DpLszVirtualDirectory	Fix	**Ensure that the LSZ directory is correctly configured on distribution points** At time of writing there is a bug such that the overall check status is usually "Passed" even when individually reported checks fail. If any of the conditions described above for the corresponding check fragment is not true, the LSZFILES website is reconfigured to set that condition.	None
1E-GuaranteedState-Nomad-Check-FirewallExceptions	Check	**Checks whether firewall exceptions exist for Nomad** First is a check that at least one Windows firewall profile is enabled and that the firewall itself is enabled with either *HKLM\SOFTWARE\Policies\Microsoft\WindowsFirewall\DomainProfile\EnableFirewall* set to 1 or *HKLM\SOFTWARE\Policies\Microsoft\WindowsFirewall\StandardProfile\EnableFirewall* set to 1 in the registry. If no firewall and no firewall profile is enabled then no firewall exceptions are necessary and so there is nothing more to do. Otherwise,the Nomad-related firewall rules are examined. These are the rules named: • *NomadBranch.exe* • *NomadPackageLocatorTcp* • *NomadPackageLocatorUdp* • *PackageStatusRequestTcp* • *PackageStatusRequestUdp* • *NomadBranchPeerHttp* • *NomadBranchPeerHttps* Using the *NomadBranch* service's path of *NomadBranch.exe*, the paths of *NomadPackageLocator.exe* and *PackageStatusRequest.exe* are deduced. Using the *HKLM\SOFTWARE\1E\NomadBranch\P2PEnabled* , *P2P_Port* , *P2PHttpPort* , and *P2PHttpsPort* settings in the registry, the	None

Name	Type	Readable Payload and summary	Parameters
		fragment works out which Nomad features are enabled and hence which firewall rules are required. The firewall rule checks involve: • Whether the rule even exists • That the rule is enabled and not blocked • The local port (which may be a specific one or all) • Which protocol (TCP or UDP) is involved • The path to the associated executable. Rulesfor *NomadBranch.exe* , *NomadPackageLocatorTcp* , *NomadPackageLocatorUdp* , *PackageStatusRequestTcp* and *PackageStatusRequestUdp* must always be correctly defined. *NomadBranchPeerHttp* is only required if the 0x20 bit of *P2P_Enabled* is set, and likewise the 0x40 bit requires *NomadBranchPeerHttps* .	
1E-GuaranteedState-Nomad-Fix-FirewallExceptions	Fix	**Ensures the required firewall exceptions exist for Nomad** This carries out all the checks as described above for 1E-GuaranteedState-Nomad-Check-FirewallExceptions then, for each absent or incorrectly configured rule that is required to support the *P2PEnabled* registry setting,configures that rule.	None
1E-GuaranteedState-Nomad-Check-HashingEnabled	Check	**Check whether hashing is enabled in Nomad** This examines the *HKLM\SOFTWARE\1E\NomadBranch\CompatibilityFlags* registry value. If the host is a ConfigMgr DP the 0x80000 bit should be set ("enable full hash generation for SIS content when an LsZ file is generated on a DP"), otherwise the 0x100000 bit ("abort download on the Nomad client if an LsZ hash mismatch is detected").	None
1E-GuaranteedState-Nomad-	Check	**Checks whether the Nomad share is available** This first checks the firewall settings. If the firewall is enabled then "*File and Printer Sharing*" (i.e. SMB) cannot be disabled. Next the 0x10 bit of registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* is	None

Name	Type	Readable Payload and summary	Parameters
Check-Share		examined to see if the share name is the default "*NomadSHR*" or the hidden "*NomadSHR$*". The share's security descriptor is read and check made that the local "*SMSNomadP2P&*" account has read permission. The share's properties are then verified as follows: • The shared directory is that named by registry value *HKLM\SOFTWARE\1E\NomadBranch\LocalCachePath* • The shared directory also matches the *Path* from WMI's *root\cimv2\Win32_Share* object for the share. • The *Status* of the *root\cimv2\Win32_Share* object is "*OK*". These additional checks are *not* carried out if the host is a server or a custom share is involved: • The maximum number of connections specified by the upper word of *SpecialNetShare* does not exceed the *MaximumAllowed* value of the WMI object. The *Data* value reported back by the check contains the results of the individual checks.	
1E-GuaranteedState-Nomad-Fix-Share	Fix	**Ensures the Nomad share is available** This carries out the checks as in 1E-GuaranteedState-Nomad-Check-Share above, then if any of them fails it restarts the *NomadBranch* service which should recreate the share correctly.	None
1E-GuaranteedState-Nomad-Check-ShareAccount	Check	**Checks whether the Nomad share account is correctly configured** If the machine account is used rather than the default "*SMSNomadP2P&*", as specified by bit 0x80 in registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* , no checks are carried out. A WMI *root\cimv2\Win32_UserAccount* object for the local *SMSNomadP2P&* account must exist and the account cannot be disabled.	None

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Fix-ShareAccount	Fix	**Ensures the Nomad share account is correctly configured** If the checks as described above for 1E-GuaranteedState-Nomad-Check-ShareAccount do not pass, the *NomadBranch* service is restarted to create a local *SMSNomadP2P&* account.	None
1E-GuaranteedState-Nomad-Check-SkpSwiDat	Check	**Check whether skpswi.dat exists on disk** A *skpswi.dat* file in a directory prevents ConfigMgr from falsely detecting that software is installed there during a Software Inventory scan, so Nomad requires one in its cache. Such a file must exist in the directory named by the *HKLM\SOFTWARE\1E\NomadBranch\LocalCachePath* registry value, and it must also be a hidden file.	None
1E-GuaranteedState-Nomad-Fix-SkpSwiDat	Fix	**Ensure skpswi.dat exists on disk** If the directory named by the *HKLM\SOFTWARE\1E\NomadBranch\LocalCachePath*registry value does not contain a "*skpswi.dat*" file, such a file is created and its hidden attribute set.	None
1E-GuaranteedState-Nomad-Check-StartService	Check	**Checks that Nomad is running** The *NomadBranch* service must be in "*Running*" or "*Starting*" state and be configured to start automatically.	None
1E-GuaranteedState-Nomad-Fix-	Fix	**Ensures that Nomad is running** If the *NomadBranch* service is not in "*Running*" or "*Starting*" state and configured to start automatically, it is started and configured to be so.	None

Name	Type	Readable Payload and summary	Parameters
StartService			
1E-GuaranteedState-Nomad-Check-Variant	Check	**Check whether the correct variant of Nomad (that supplied with the 1E Client, not standalone Nomad) is used for the service** This verifies that the parent directory of the executable that the Service Control Manager uses to run the *NomadBranch* service is the *Extensibility* directory of the 1E Client, and hence not, for example, an older standalone version of Nomad.	None

1.11.12.10.1.5 Trigger templates

The following table shows the trigger templates included in the Nomad Client Health Integrated Product Pack.

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these templates, unless you select alternative values.

Name	Readable Payload and summary	Parameters
TriggerTemplate-FileChange	**On change of file "<fileName>"** When a file changes (Windows only)	**File Name** • File path of file to be monitored, default is null.
TriggerTemplate-IntervalHours	**Every <intervalHours> hours** Periodic (hours)	**Interval Hours** • 0 to 999 hours (approximately 42

Name	Readable Payload and summary	Parameters
		days), default interval is 12 hours.
TriggerTemplate - IntervalMinutes	**Every <intervalMinutes> minutes** Periodic (minutes)	**Interval Minutes** • 0 to 99,999 minutes (approximately 69 days), default interval is 30 minutes.
TriggerTemplate -IntervalSeconds	**Every <intervalSeconds> seconds** Periodic (seconds)	**Interval Seconds** • 0 to 999,999 seconds (approximately 11 days), default interval is 3600 seconds (1 hour).

Name	Readable Payload and summary	Parameters
TriggerTemplate - ServiceStatusChange	**On change of running state of the "<serviceName>" service** When the state of the named Windows service changes **Note** You can determine the short name of a service using the PowerShell cmdlet `get-service -DisplayName "Network Location Awareness"` This will return **NlaSvc** in the above example. It is this short name you specify in the <ServiceName> parameter.	**Service Name** • Short name of service - for example Nomad Branch.
TriggerTemplate - WindowsRegistryChange	**On change of registry values in "<hive>\<subkey>" (include subkeys=<includeSubkeys>)** When the value of a Windows registry key changes.	**Hive**, which must be one of: • HKLM (default) • HKCR **Subkey** : free text string, default empty. **Include Sub Keys** : 1/0 default 0.

1.11.12.11 Windows Client Health integrated product pack

Integrated Product Pack used to create the **Windows Client Health** instruction set and **Windows Client Health** policy.

For more information, please refer to Windows Client Health Policy.

1.11.12.11.1 Windows Client Health integrated product pack

Integrated Product Pack used to create the **Windows Client Health** instruction set and **Windows Client Health** policy.

For more information, please refer to Windows Client Health Policy.

Over time Windows devices can develop performance problems related to device or service availability. This policy verifies the available storage capacity on devices, notifies of application crashes, monitors WMI health and service function, and also checks the behavior of core Windows services.

The Windows client health policy covers all of the following:

- Manages Windows devices and service availability performance problems
- Safeguards disk space integrity, ensuring sufficient storage capacity
- Ensures optimum performance of the Configuration Manager client and that WMI is active and integrated
- Notifies of application crashes and remediation assists. Investigates root cause for specific issues.

Note

This policy is intended for deployment to Windows devices only.

1.11.12.11.1.1 Instructions

The following table shows the instructions included in the Integrated Product Pack. Unless already uploaded, the following instructions are added to an Instruction set named:
Windows Client Health

Readable Payload	Type	Description	Name	Version
What applications have crashed?	Question	List application crashes. Returns an aggregated list of applications which have crashed and the number of times each of them crashed, including the application module which caused the crash, and application and module versions. The drill-down shows each device which suffered the crash, the file paths of the faulting application and module, the	**1E-Explorer-WindowsClientHealth-ApplicationCrashes**	3

Readable Payload	Type	Description	Name	Version
		exception code and offset, and the time of the crash.		
What crashes has <ApplicationName> suffered?	Question	List application crashes for a specific application.	**1E-Explorer-WindowsClientHealth-ApplicationCrashesFiltered**	3
What is the content of the Log located at <filepath>?	Question	Retrieve the content of a specified log file.	**1E-Explorer-WindowsClientHealth-GetLogFileContent**	3
Start the WMI service	Action	Start the Windows Management Instrumentation (WMI) service.	**1E-Explorer-WindowsClientHealth-StartWMIService**	3

1.11.12.11.1.2 Policies

The following table shows the policies included in the Integrated Product Pack.

Name	Description
Windows Client Health	The Windows Client Health policy ensures that the health of the Windows operating system is compliant with a reference baseline.

1.11.12.11.1.3 Rules

The following table shows the rules included in the Integrated Product Pack.

> **Note**
>
> Any parameter values shown in the **Check and Fix fragments**, **Triggers** and **Precondition fragment** columns are specifically set in the rules when the pack is uploaded. These may be different to the default values shown in the Windows Client Health Integrated Product Pack - Fragments table. You can modify these if required.

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
Check application	Check	Check that an application	1E-GuaranteedState-WindowsClientHealth-Check-ApplicationCrashes	TriggerTemplate-ProcessCrash	1E-GuaranteedState-General-

1.11.12.11.1.4 Fragments

The following table shows the fragments included in the Integrated Product Pack.

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these fragments, unless you select alternative values.

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-General-PreCondition-InstalledSoftware	Precondition	**Run if <SoftwareTitle> is installed** Uses the Software.GetInstallations to see if SoftwareTitle is installed. **Note** The Software Title parameter can be a partial string such as **SQL Server** which will match on the first SQL Server title that is found installed on the device. **Note** Not used by any policy rules by default.	**SoftwareTitle** • default empty
1E-GuaranteedState-General-PreCondition-MinWindowsVersion	Precondition	**Run if device is Windows <MinimumVersion>** Uses Agent.GetSummary method to get MinimumVersion, and passes if it matches the given parameter. • XP or greater (5.2) - also matches Server 2003 • Vista or greater (6.0) - also matches Server 2008 • 7 or greater (6.1) - also matches Server 2008 R2	**MinimumVersion** • XP or gr

Name	Type	Readable Payload and summary	Parameters
		• 8 or greater (6.2) - also matches Server 2012 • 8.1 or greater (6.3) - also matches Server 2012 R2 • 10 or greater (10.0) - also matches Server 2016 **Note** Not used by any policy rules by default.	• eater • Vistaorgreater • 7orgreater • 8orgreater

Name	Type	Readable Payload and summary	Parameters
			• 8.1 or greater • 10 or greater (default)
1E-GuaranteedState-General-PreCondition-OperatingSystem	Precondition	**Run if operating system is <OsText>** Uses the Agent.GetSummary method to get OsText, and passes if it matches the given parameter. **Note** Not used by any policy rules by default.	**OsText** • Andro

Name	Type	Readable Payload and summary	Parameters
			id • CentOS • Fedora • macOS • RedHat • SUSE • Ubuntu

Name	Type	Readable Payload and summary	Parameters
			• Windows 10 • Windows 7 • Windows 8.1 • WindowsServe

Name	Type	Readable Payload and summary	Parameters
			r2012 • WindowsServer2016 • WindowsVista • Window

Name	Type	Readable Payload and summary	Parameters
			sXP (default empty)
1E-GuaranteedState-General-PreCondition-OSAndSoftware	Precondition	**Run if operating system is <OsText> and <SoftwareTitle> is installed** Uses the Agent.GetSummary method to get OsText. Uses the Software.GetInstallations to see if SoftwareTitle is installed.	**OsText** • seeabove **SoftwareTitle** • default empty
1E-GuaranteedState-General-PreCondition-WindowsDevice	Precondition	**Determine if device is running Windows** Is Operating System type = Windows. Uses the Device.GetSummary method.	No parameters

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-General-Check-ServiceState	Check	**Check that service "<ServiceName>" is <State>** Uses the OperatingSystem.GetServiceInfo method to check the specified service is in the specified state. You specify the service by its short name. **Note** Service names are listed under registry HKLM\CurrentControlSet\Services. You can determine the short name of a service using the PowerShell cmdlet: *`get-service -DisplayName "Network Location Awareness"`* The above example will return **NlaSvc**, whch is the short name you specify in the **<ServiceName>** parameter. Another example is WindDefend, which is the short name of the Microsoft Defender Antivirus Service.	**ServiceName** • default empty **State** • Running • Stopped
1E-GuaranteedState-WindowsClientHealth-Check-ApplicationCrashes	Check	**Check that application <ApplicationName> has not suffered more than <MaxCrashCount> crashes for the last <Days> days** **<Days>** is Days back from now. **<ApplicationName>** is case insensitive but is required to be the filename of the executable, for example unreliableapp.exe (without the path).	**ApplicationName** • defau

Name	Type	Readable Payload and summary	Parameters
		This fragment queries the root\cimv2 WMI space with the query "SELECT * FROM Win32_NTLogEvent WHERE (logfile='Application') AND (type='Error') AND (EventCode=1000) AND (Message LIKE '%name: %ApplicationName%,%')" in order to retrieve the event log entries relating to application crashes for a specific application. If the count of events exceeds the parameter **<MaxCrashCount>** then compliance failure is returned.	lt e m p t y **MaxCrashCount** • d e f a u lt 1 **Days** • d e f a u lt 7
1E-GuaranteedState-WindowsClientHealth-Check-SystemDriveFreeSpace	Check	**Check that system drive has at least <ThresholdGb> Gb of free space** **<ThresholdGb>** is free space in gigabytes. This fragment runs the WMI query "Select DeviceId, FreeSpace from Win32_LogicalDisk" and filters the results to include just the system drive. It then determines whether the reported free space exceeds the **<ThresholdGb>** parameter and returns compliance failure if it does not.	**ThresholdGb** • 0 t o 9 9 9 , n o d e f

Name	Type	Readable Payload and summary	Parameters
			a u lt
1E-GuaranteedState-WindowsClientHealth-Check-WmiBasicHealth	Check	**Check that Windows WMI repository is consistent and can process basic query** This fragment first verifies repository integrity by issuing the command winmgmt /verifyrepository. If this reports that the repository is ok, the WMI query "Select Name from Win32_computerSystem" is issued against the root\cimv2 namespace. If this also succeeds, the fragment returns success, otherwise it returns failure, with the Data column containing one of the following depending on whether the consistent check or the subsequent query failed: • WMI repository is not consistent • WMI repository is consistent but failed to process basic query	No parameters
1E-GuaranteedState-WindowsClientHealth-Fix-StartWMIService	Fix	**Start the WMI service** This fragment uses the OperatingSystem.ControlService method to set the action of the **Winmgmt** (WMI) service to **Start**. It then enumerates running services and if the service is now running, it returns compliance success otherwise failure. The data column in the response always contains the value **winmgmt**.	No parameters

1.11.12.11.1.5 Trigger templates

The following table shows the trigger templates included in the Windows Client Health Integrated Product Pack.

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these templates, unless you select alternative values.

Name	Readable Payload and summary	Parameters
TriggerTemplate-IntervalHours	**Every <intervalHours> hours** Periodic (hours)	**Interval Hours** • 0 to 999 hours (approximately 42 days), default interval is 12 hours.
TriggerTemplate-IntervalMinutes	**Every <intervalMinutes> minutes** Periodic (minutes)	**Interval Minutes** • 0 to 99,999 minutes (approximately 69 days), default interval is 30 minutes.
TriggerTemplate-IntervalSeconds	**Every <intervalSeconds> seconds** Periodic (seconds)	**Interval Seconds** • 0 to 999,999 seconds (approximately 11

Name	Readable Payload and summary	Parameters
		days), default interval is 3600 seconds (1 hour).
TriggerTemplate-ProcessCrash	**On crash of process "<executable>"** When a process crashes (Windows only) Monitors the Windows Application Event Log for event 1000. **Note** Executable is case insensitive but is required to be the whole filename without the folder path, such as unreliableapp.exe A partial string such as unreliableapp will not trigger on a crash of unreliableapp.exe.	**Executable** • Filename of executable to be monitored, default is empty.
TriggerTemplate-ServiceStatusChange	**On change of running state of the "<serviceName>" service** When the state of the named Windows service changes **Note** You can determine the short name of a service using the PowerShell cmdlet `get-service -DisplayName "Network Location Awareness"` This will return **NlaSvc** in the above example. It is this short name you specify in the <ServiceName> parameter.	**Service Name** • Short name of service - for example Nomad Branch.
TriggerTemplate-WindowsEventLog	**On Windows"<channel>"; event log entry matching "<query>" (debounce for <debounce> seconds)** When an event log entry is created (Windows only) **Note** A **channel** is an event sink, example standard channel names are Application or Security.	**Channel** • Text string, default null. **Query**

Name	Readable Payload and summary	Parameters

	To determine the available event channels execute the following PowerShell command:
	`Get-WinEvent -ListLog *`
	Or to view the event channels on a remote computer:
	`Get-WinEvent -ListLog * -ComputerName <hostname>`
	Similarly to view event log entries for a given channel either use Event Viewer or from PowerShell for example:
	`Get-EventLog application | where {($_.EntryType -Match "Error")`
	`-or ($_.EntryType -Match "Warning")}`
	Or:
	`[dateTime]$oneWeekAgo = (get-date).addDays(-7) Get-EventLog -LogName Application`
	`-After $oneWeekAgo -computerName . \| ? {$_.EventID -eq 1000}`
	Note
	A **query** is used to filter the event log messages for a given channel. Examples can be found at https://docs.microsoft.com/en-us/windows/win32/wes/consuming-events.
	For example to query all OneNote application crashes error log messages:
	*[System[(Level=2) and (EventID=1000)]] and *[EventData[Data='onenote.exe']]
	Debounce is a settling period to ensure that in the case of multiple events, only a single event is registered within the space of a given time period.
		• Text string, default null.
		Debounce Time Seconds
		• 0 to 99 seconds, default 0.

TriggerTemplate-WindowsRegistryChange (added in 5.0)	**On change of registry values in "<hive>\<subkey>" (includesubkeys=<includeSubkeys>)** When the value of a Windows registry key changes.	**Hive**, which must be one of: • HKLM (default)

Name	Readable Payload and summary	Parameters
		• HKCR **Subkey** : free text string, default empty. **Include Sub Keys** : 1/0 default 0.

1.11.12.12 Tachyon Core integrated product pack

Reference for the policy objects contained in the Integrated Product Pack: Tachyon Core.

> **Note**
>
> This Integrated Product Pack does not include any Instructions, Policies or Rules. It contains only fragments (preconditions, checks and fixes) and trigger templates. These can be used to create your own custom rules and policies.

1.11.12.12.1 Instructions

No Instructions.

1.11.12.12.2 Policies

No Policies.

1.11.12.12.3 Rules

No Rules.

1.11.12.12.4 Fragments

The following fragments are not currently used in ready-made policies provided by 1E, but you can use them to create custom policies.

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these fragments, unless you select alternative values.

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-General-Check-RegistryValue	Check	**Check that registry key <Hive>\>Subkey>\<Name> has < ValueType> value of "<Value>"** Uses NativeServices.RegistryGetValue method to see if the specified registry entry exists, and compares its value with the specified value. This fragment is intended for Windows only devices.	**Hive** • HKLM (default) • HKCR **Subkey** - default empty **Name** - default empty **Value** - default empty **ValueType** • REG_SZ • REG_DWORD • REG_QWORD • REG_EXPAND_SZ
1E-GuaranteedState-General-Fix-RegistryValue	Fix	**Set registry key <Hive>\<Subkey>\<Name> to <ValueType> value of "<Value>"** Uses NativeServices.RegistrySetValue method to set the specified registry value. This fragment is intended for Windows only devices.	**Hive** • HKLM (default) • HKCR **Subkey** - default empty **Name** - default empty

Name	Type	Readable Payload and summary	Parameters
			Value - default empty **ValueType** • REG_SZ • REG_DWORD • REG_QWORD • REG_EXPAND_SZ
1E-GuaranteedState-General-Check-ServiceState	Check	**Check that service "<ServiceName>" is <State>** Uses Device.GetSummary method to see if the device is running Windows, and OperatingSystem.GetServiceInfo method to see if the specified service is installed, and compares its state with the specified state. ServiceName is the short name of the service. **Note** You can determine the short name of a service using the PowerShell cmdlet `get-service -DisplayName "Network Location Awareness"` This will return **NlaSvc** in the above example. It is this short name you specify in the **<ServiceName>** parameter.	**ServiceName** - default empty **State** • Running • Stopped
1E-GuaranteedState-General-Fix-ServiceState	Fix	**Request service "<serviceName>" to <action>** ServiceName is the short name of the service. Uses OperatingSystem.ControlService method to attempt to set the state of the specified service. The fragment does not change any dependencies (StopDependencies=false). Does not change the startup type.	**ServiceName** - default empty **Action** • Start • Stop

Name	Type	Readable Payload and summary	Parameters
		This fragment is intended for Windows only devices.	• Pause • Resume • Restart

Preconditions included in this pack are documented in the Trigger templates and preconditions reference page.

1.11.12.13 Trigger templates and preconditions reference

Reference for all the precondition fragments and trigger templates available in Integrated Product Packs included in the **Tachyon Platform** zip. These can be used to create your own custom rules and policies.

TriggerTemplate-WindowsEventLog	**On Windows"<channel>"; event log entry matching "<query>" (debounce for <debounce> seconds)** When an event log entry is created (Windows only) **Note**	**Channel** • Text string, defau	• Tachyon Core int

Name	Readable Payload and summary	Parameters	Included in

	A **channel** is an event sink, example standard channel names are Application or Security.
	To determine the available event channels execute the following PowerShell command:
	`Get-WinEvent -ListLog *`
	Or to view the event channels on a remote computer:
	`Get-WinEvent -ListLog * -ComputerName <host name>`
	Similarly to view event log entries for a given channel either use Event Viewer or from PowerShell for example:
	`Get-EventLog application | where {($_.EntryType -Match "Error") -or ($_.EntryType -Match "Warning")}`
	Or:
	`[dateTime]$oneWeekAgo = (get-date).addDays(-7) Get-EventLog -LogName Application -After $oneWeekAgo -computerName . \| ? {$_.EventID -eq 1000}`
	Note
	A **query** is used to filter the event log messages for a given channel. Examples can be found at https://docs.microsoft.com/en-us/windows/win32/wes/consuming-events.
	For example to query all OneNote application crashes error log messages:
	*[System[(Level=2) and (EventID=1000)]] and *[EventData[Data='onenote.exe']]
	Debounce is a settling period to ensure that in the case of multiple events, only a single event is registered within the space of a given time period.
		lt null.

1.11.12.13.2 Precondition fragments

Name	Readable Payload and Description	Parameters	Included in
1E-GuaranteedState-ClientHealth-	**Run if the ConfigMgr client is installed** Uses the Device.GetSummary method to determine if the device is running Windows.	No parameters.	• MEMCM Client

Name	Readable Payload and Description	Parameters	Included in
PreCondition-ConfigMgrClient	Uses the OperatingSystem.GetServiceInfo method to determine if the ConfigMgr client service (ccmexec) is installed, although not necessarily running.		Health Integrated Product Pack
1E-GuaranteedState-General-PreCondition-InstalledSoftware	**Run if <SoftwareTitle> is installed** Uses the Software.GetInstallations to see if SoftwareTitle is installed. **Note** The Software Title parameter can be a partial string such as **SQL Server** which will match on the first SQL Server title that is found installed on the device.	**Software Title** • A product name as it appears in Programs and Features (Add Remove programs - ARP).	• Tachyon Core integrated product pack • Windows Client Health integrated product pack

Name	Readable Payload and Description	Parameters	Included in
1E-GuaranteedState-General-PreCondition-MinWindowsVersion	**Run if device is Windows <MinimumVersion>** Uses Agent.GetSummary method to get MinimumVersion, and passes if it matches the given parameter. • XP or greater (5.2) - also matches Server 2003 • Vista or greater (6.0) - also matches Server 2008 • 7 or greater (6.1) - also matches Server 2008 R2 • 8 or greater (6.2) - also matches Server 2012 • 8.1 or greater (6.3) - also matches Server 2012 R2 • 10 or greater (10.0) - also matches Server 2016	**Minimum Version** • XP or greater • Vista or greater • 7 or greater • 8 or greater • 8.1 or greater • 10 or greater (default)	• Tachyon Core integrated product pack • Windows Client Health integrated product pack
1E-GuaranteedState-General-PreCondition-MinWindowsVersionAndVariant	**Run if device is running <Variant> variant of Windows <MinimumVersion>** Uses the Agent.GetSummary method to get Variant and MinimumVersion, and passes if they match the given parameters. If the text Server is in OsVersionText then it's a Server, otherwise it's a Desktop. • XP/Server 2003 or greater (5.2)	**Minimum Version** • XP/Server 2003 or greater	• Tachyon Core integrated product

Name	Readable Payload and Description	Parameters	Included in
	• Vista/Server 2008 or greater (6.0) • 7/Server 2008 R2 or greater (6.1) • 8/Server 2012 or greater (6.2) • 8.1/Server 2012 R2 or greater (6.3) • 10/Server 2016 or greater (10.0)	• Vista/Server 2008 or greater • 7/Server 2008 R2 or greater • 8/Server 2012 or greater • 8.1/Server 2012 R2 or greater • 10/Server 2016 or greater (default) **Variant** Windows OS variant:	pack

Name	Readable Payload and Description	Parameters	Included in
		• Desktop (default) • Server	
1E-GuaranteedState-General-PreCondition-OperatingSystem	**Run if operating system is <OsText>** Uses the Agent.GetSummary method to get OsText, and passes if it matches the given parameter.	**OsText** • Android • CentOS • Fedora • macOS • Red Hat • SUSE • Ubuntu • Windows • Windows 10 • Windows 7 • Windows 8.1 • Windows	• Tachyon Core integrated product pack • Windows Client Health integrated product pack

Name	Readable Payload and Description	Parameters	Included in
		Server 2012 • Windows Server 2016 • Windows Vista • Windows XP	
1E-GuaranteedState-General-PreCondition-OSAndSoftware	**Run if operating system is <OsText> and <SoftwareTitle> is installed** Uses the Agent.GetSummary method to get OsText. Uses the Software.GetInstallations to see if SoftwareTitle is installed.	**OsText** • See: 1E-Guaranteed State-General-PreCondition-OperatingSystem **SoftwareTitle** • See: 1E-Guaranteed State-General-PreCondition	• Tachyon Core integrated product pack • Windows Client Health integrated pro

Name	Readable Payload and Description	Parameters	Included in
		n-InstalledSoftware	duct pack
1E-GuaranteedState-General-PreCondition-OsTypeAndArchitecture	**Check whether a device has an OS of <OsType > and an architecture of <Architecture>** Passes if the OsType agent enumeration and the Architecture match the given parameters. Uses the Device.GetSummary method.	**OsType** • – –	• Tachyon Core integrated product pack • Windows Endpoint Performance Integrated Product Pack
		–	
		–	

Name	Readable Payload and Description	Parameters	Included in
		–	
		Architecture •	
		–	
		–	
1E-GuaranteedState-General-PreCondition-Service	**Run if <ServiceName> service is installed** Uses the OperatingSystem.GetServiceInfo method to check the specified service is in the specified state. You specify the service by its short name. **Note** Service names are listed under registry HKLM\CurrentControlSet\Services.	**ServiceName** • Short name of the Windows Service, default	• Tachyon Core integrated product

Name	Readable Payload and Description	Parameters	Included in
	You can determine the short name of a service using the PowerShell cmdlet: *get-service -DisplayName "Network Location Awareness"* The above example will return **NlaSvc**, whch is the short name you specify in the **<ServiceName>** parameter. Another example is WindDefend, which is the short name of the Microsoft Defender Antivirus Service.	empty.	pack
1E-GuaranteedState-General-PreCondition-WindowsDevice	**Determine if device is running Windows** Is Operating System type = Windows. Uses the Device.GetSummary method.	No parameters.	• Tachyon Core integrated product pack • Windows Client Health integrated product

Name	Readable Payload and Description	Parameters	Included in
			pack
1E-GuaranteedState-Nomad-PreCondition-MultiTests	**Nomad client passes 3 standard tests plus any /all of the following tests if enabled** The precondition passes for all of the following standard tests: • The device is running a version of Windows - Nomad is only supported on Windows operating systems • The device is not running Windows XP - which is no longer supported by Nomad • The *NomadBranch* service is installed, although not necessarily running The precondition also tests for each of the following if it is enabled by changing its parameter from 0 to 1: • **hasCmClient** : The ConfigMgr client is installed • **sccmDp** : The device is a ConfigMgr Distribution Point (DP) • **smbEnabled** : SMB sharing of Nomad's cache is enabled. If **smbEnabled** test is set in the rule precondition then an additonal test is made to see if the device is a Domain Controller (DC). When installed on a DC Nomad must use its computer account instead of SMSNomadP2P& in order to share its cache. This requires registry value *HKLM\SOFTWARE\1E\NomadBranch\SpecialNetShare* to have its 0x80 bit set. If not set then Nomad does not share its cache on a DC and does not respond to elections.	• **hasCmClient** : 1/0 • **sccmDp** : 1/0 • **smbEnabled** : 1/0 Defaults are 0.	• Nomad Client Health integrated product pack

1.11.13 Tachyon release information

1.11.13.1 Tachyon release information

These notes contain information about Tachyon that you need to have to successfully install and use the product. You should read these release notes and the online documentation for Tachyon thoroughly before using the software.

1.11.13.1.1 New features in Tachyon 8.1

1.11.13.1.1.1 Tachyon 8.1 platform

- New supported platform components:
-
  - Switch now using C++17
  - Platform now using .NET Framework 4.8
- New Tachyon connector: OpenLM connector - in this version, the Inventory (SLA) is the only app capable of viewing this data

1.11.13.1.1.2 Consumer applications for v8.1

- **AppClarity 8.1:**
  - Works with Tachyon Platform 8.1
  - No features or feature changes added in this release, but includes any hotfixes from previous versions.
- **Application Migration 8.1:**
  - Works with Tachyon Platform 8.1
  - No features or feature changes added in this release, but includes any hotfixes from previous versions.
- **Guaranteed State 8.1:**
  - Works with Tachyon Platform 8.1
  - No features or feature changes added in this release, but includes any hotfixes from previous versions..
- **Nomad 8.1:**
  - Works with Tachyon Platform 8.1
  - **Insights on how Nomad enhances user experience** - with the rapid shift to a Work From Anywhere (WFA) workforce and an increased focus on the Digital End-User eXperience, Nomad on Tachyon Platform now provides insights into how it helps to ensure a great user eXperience. With the introduction of Nomad's Bandwidth Protection Reporting, you can now see how Nomad is preventing end-user disruption due to software and update deployments. Bandwidth Protection Reporting will allow you to see the positive impact Nomad is having across the organization, to individual sites, subnets, all the way down to a single client.

- Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.
- **Feature improvements** - as Configuration Manager evolves and new features are released, Nomad on Tachyon Platform is being continuously maintained to ensure it works seamlessly with new releases.
    - Content Distribution service no longer uses SQL Linked Server to connect to Microsoft Endpoint Configuration Manager.

- **Patch Success 8.1:**
    - Works with Tachyon Platform 8.1
    - No features or feature changes added in this release, but includes any hotfixes from previous versions.
- **Tachyon Explorer 8.1:**
    - Works with Tachyon Platform 8.1
    - No features or feature changes added in this release, but includes any hotfixes from previous versions.
- **Tachyon Experience 8.1:**
    - Works with Tachyon Platform 8.1
    - No longer requires SQL Server Analysis Server (SSAS)
    - On the Software page, the **Product**, **Executable**, **Version** and **Architecture** columns have been removed from the table that is displayed after clicking on a particular row. This is because the subsequent table is filtered on the selected Product, Executable, Version and Architecture values and will be the same for every row in the table. The values are displayed anyway in the heading for the page, and the columnscan be added back from the Column picker if needed
    - User Sentiment descriptions now highlight that User Sentiment is processed once a day, rather than real-time.

1.11.13.1.1.3Product Packs for v8.1

- **Classic Product Packs:**
    - 1E-ConfigMgrConsoleExtensions.zip
    - 1E-Experience.zip
    - 1E-Explorer-TachyonAgent.zip (new instruction: 1E-Explorer-Upgrade1EClient8.0macOS, updated instruction: Set1EClientAgentConfig)
    - 1E-Explorer-TachyonCore.zip
    - 1E-Inventory.zip

- 1E-Nomad.zip (new instructions: 1E-Nomad-CacheCleanerDeleteAll, 1E-Nomad-LocationDiscovery, 1E-Nomad-SetWorkRate)
- 1E-Patch-Success.zip
- 1E-Tachyon-Platform.zip (new instruction: 1E-TachyonPlatform-Device-ComparisonData)

- **Integrated Product Packs:**
  - MEMCM Client Health Integrated Product Pack (new preconditions: MEMCM-Client, Network-IPv4-PrimaryAddressInDNS, and some rules modified to use them)
  - NomadClientHealth.zip (minor changes)
  - TachyonCore.zip (minor changes)
  - WindowsClientHealth.zip (minor changes).
- Other Product Packs are available from the Tachyon Exchange: tachyonexchange.1e.com

1.11.13.1.1.4Enhancements in v8.1

- Platform:
  - Updated PowerShell scripts used to create direct-based management groups - see Management Groups page
  - Internal changes to support Tachyon SaaS
  - SCCM inventory connector now supports the Tachyon SaaS DataSync service
  - Support for future consumer applications
- **Tachyon Setup**
  - Support for future consumer applications
- **Tachyon Product Pack deployment tool**
  - No changes.

1.11.13.1.2 Troubleshooting

1.11.13.1.2.1Online help

Tachyon comes with online help that shows you how to install, configure and use the product. Click the following link to view the help:

- Introducing Tachyon

For support queries, please:

- Use https://support.1e.com/ where you can search the KB or submit a support case.
- Contact support@1e.com.

1.11.13.1.2.2Known issues

The current known issues related to the installation and running of Tachyon can be found on the Known issues page.

1.11.13.1.3 Tachyon release history

1.11.13.1.3.1Web Release-8.1 (14-Mar-2022)

1.11.13.1.3.1.1 Tachyon Server 8.1.2.102 - Tachyon Toolkit 8.1.2.102 - 1E Catalog 8.1.2.7 - Software Lifecycle Automation 8.1.2.22 - Business Intelligence 8.1.2.3 - ContentDistribution 8.1.2.59 - AppClarity 8.1.2.3 - ApplicationMigration 8.1.2.21

For new features please refer to the top of the page.

1.11.13.1.3.1.2 Enhancements for v8.1

1.11.13.1.3.1.2.1 Hotfixes rolled up into this release - Server (including Experience, Explorer, and Guaranteed State):

- Q22008 - Policy status is incorrectly updated when rule status events arrive out of order (TFS 244465)
- Q22006 - Experience - Device hyperlink goes missing when view is changed from one saved pre-set to another (TFS 245628)
- Q22004 - Experience - Device pillar view on low resolution screen (TFS 245878)
- Q22002 - Experience - Selecting instances of events does not filter by time (TFS 246428)
- Q22000 - User with permission 'Guaranteed State Policy Assigner' and 'Guaranteed State User' cannot assign policy (TFS 244646)
- Q21998 - Option to delete direct-based Management Groups (TFS 245958)
- Q21996 - Group membership resolution fails for some applications when nested group search is disabled. (TFS 245991)
- Q21902 - Sanitize Server Side Instruction parameters to prevent SQL injection (TFS 246156)
- Q21900 - Explorer - Coverage is being ignored during follow up question/action when additional result filters are applied (TFS 245874)
- Q21898 - Server Side Instructions - The "EvaluatingCondition" workflow state causes responses not to be retrievable (TFS 245352)
- Q21896 - Guaranteed State - Remediation page fails to load any data in large estate (TFS 245349)

1.11.13.1.3.1.2.2 Hotfixes rolled up into this release - SLA:

- Q22110 - Excessive tempdb data usage for ReportTag consolidation step (TFS 249162)
- Q22108 - Incorrect number of devices in Tachyon management group (TFS 246018)
- Q22106 - String or binary data truncated within Management Group data (TFS 247120)
- Q22104 - Machines are showing up in the wrong Management Group (TFS 247888)

- Q22102 - Hash conflict issue in Tachyon connector. (TFS 248544)
- Q22100 - Primary user details are not showing when another connector inventory date is ahead of Tachyon. (TFS 246199)
- Q22098 - Wrong Devices Returned From Management Group Member Retrieval api when Device and Patch consolidation report is in process (TFS 235368)

1.11.13.1.3.1.2.3 Hotfixes rolled up into this release - Catalog:

- Q21948 - Catalog - UpdateService - Base Url extraction algorithm is flawed (TFS 247265)

1.11.13.1.3.1.2.4 Hotfixes rolled up into this release - AppClarity:

- None

1.11.13.1.3.1.2.5 Hotfixes rolled up into this release - Application Migration:

- Q22078 - Direct Membership Based Management Group Support In Task Sequence API. (TFS 250710)

1.11.13.1.3.1.2.6 Hotfixes rolled up into this release - Toolkit

- Q22032 - Incorrect domain suffix is appended to a device name when using Tachyon Instruction Runner (TFS 247012)
- Q21848 - Tachyon Instruction Runner will not run against a collection with a comma in the name (TFS 246056)

1.11.13.1.3.1.2.7 Hotfixes rolled up into this release - Nomad and Content Distribution:

- Q22048 - An unhandled exception is thrown if Content Distribution is installed on a non-English server. (TFS 247999)
- Q22010 - Task sequence does not get synced if an entry of precached task sequence was created before the CMSync (TFS 247742)
- Q21984 - Multiple Task sequences with same name displayed on Nomad dashboard TaskSequence page. (TFS 246962)
- Q21982 - Nomad Sites page on Nomad dashboard displays 0 for “Unknown” category of site. (TFS 246477)
- Q21980 - NomadBranch Admin UI Extensions: "Pre-caching Jobs" view only shows 50 most recent jobs (TFS 246609)
- Q21978 - Device tab displays status as "Partially Downloaded" (TFS 247193)
- Q21976 - Subnet Drawer displays "Partially downloaded" status (TFS 247268)
- Q21974 - Selecting Subnet Drawer of TS content causes exception (TFS 247269)
- Q21972 - Precache jobs report incorrectly as “Partially Downloaded” (TFS 245156)
- Q21856 - Subnets counts on Nomad Site page gets changed by changing time filter. (TFS 245938)
- Q21854 - Subnet Drawers and Site Detail page shows null subnet (TFS 245937)
- Q21852 - Device Details page shows incorrect counts (TFS 245936)
- Q21850 - Content Details page never returns data. (TFS 245939)

1.11.13.1.3.1.2.8 Hotfixes rolled up into this release - Business Intelligence:

- None

1.11.13.1.3.2 Web Release-8.0 (29-Oct-2021)

1.11.13.1.3.2.1 Tachyon Server 8.0.4.237 - Tachyon Toolkit 8.0.4.237 - 1E Catalog 8.0.4.28 - Software Lifecycle Automation 8.0.4.135 - Business Intelligence 8.0.4.10 - ContentDistribution 8.0.4.323 - AppClarity 8.0.4.32 - ApplicationMigration 8.0.4.37

1.11.13.1.3.2.2 Platform v8.0

- Significant changes to **Permissions** (role-based access control)
  - Role name changes, listed in Roles page
  - Some roles can be delegated to users by assignment to Management Groups
  - Re-design of Permissions management
- **Custom properties** have been extended to enable the creation of Management Groups based on device and software tags
  - **Device Tags** (previously called Coverage Tags)
  - **Software Tags** (new in this version)
- **Management Groups** feature improvements make it easier to represent your existing management structure in Tachyon
  - Organize Management Groups into a hierarchy (new in this version)
  - Easily create complex Management Group definitions using the **Management Group Rule Builder** (new in this version)
  - **Additional Rule Attributes** - build Management Group rules based on **Device** and **Software** Tags
- **Software Tags** and **Notes** can be added to each VTVE in Software Inventory.

1.11.13.1.3.2.3 Consumer applications for v8.0

- **AppClarity 8.0:**
  - Works with Tachyon Platform 8.0
  - No features or feature changes added in this release, but includes any hotfixes from previous versions.
- **Application Migration 8.0:**
  - Works with Tachyon Platform 8.0
  - No features or feature changes added in this release, but includes any hotfixes from previous versions.
- **Explorer 8.0:**
  - Works with Tachyon Platform 8.0

- Coverage tags renamed as **Device tags**
- No features or feature changes added in this release, but includes any hotfixes from previous versions.

- **Experience 8.0:**
  - Works with Tachyon Platform 8.0
  - The user interface has been re-organized and provides several new pages and popups:
    - Experience Analytics:
      - The existing Overview, Categories, Stability, Responsiveness, Performance and Sentiment pages are now re-organized under Experience Analytics.
    - Advanced Analytics:
      - **Network**: includes scored and raw metrics for Bytes Sent/Received per Second, Outbound Packets Discarded, Packet Outbound Errors, Active TCP Connections, Network Retransmit Rates, Network Usage Overall, Network Bandwidth Utilization, Wireless Send and Receive Rate, Wireless Transmit Rate.
      - **Boot and Login**: includes scored and raw metrics for Policy Processing, Startup Apps Processing Time, Main Path Boot Time, Post Boot Time.
    - Inventory Management:
      - **Devices page** - displays device-centric metrics including details such as network configuration (IP, Gateway, Connection Type, OS Install Date)
      - **Software page** - displays software products with the software associated metrics and inventory details
      - **Users page** - displays information on the users known to Tachyon via the 1E Client.
    - User Engagements. The existing Surveys feature has been renamed and re-organized under User Engagements and extended
      - **Announcement Feature**: Engage users via announcements and urgent announcements/notifications.
      - User Sentiment Surveys are now called **Sentiment Surveys**.
      - General Purpose Surveys are now called **Info Surveys**.
    - Root Cause Analysis tools - two new popups have been added to the Devices page:
      - **Device comparison**: highlights the differences between two selected devices related to Operating System Details, Hardware Details, Usage Details, Installed Software, Services and Processes

    - **Scatter chart**: Quadrant placement of devices, plots devices on a chart with customizable X and Y axes (align on the grid based on metrics, scores etc.)

- A variety of data types are now available to add as columns in the table views:
    - Score - values that have been processed and normalized by Experience, this may include consolidation and combinations of other data
    - Raw - the unprocessed and un-normalized values retrieved from devices
    - Device Details - information related to devices, such as: IP Address, DHCP Server, Operating System etc.
    - Software Details - information related to software, such as: the Architecture supported by the software
    - Event - event information retrieved from devices, such as: Software uninstall, hang and crash events; Operating System boot and crash events, and many others
- Network related scores have been added to enhance the overall user experience score:
    - **Output queue length** - scores the network transmission backlog, based on the length of the output packet queue
    - **Wireless Signal Quality** - scores the signal quality of the wireless network connection on the device.

- **Guaranteed State 8.0:**
    - Works with Tachyon Platform 8.0
    - No features or feature changes added in this release, but includes any hotfixes from previous versions.
- **Nomad 8.0:**
    - Works with Tachyon Platform 8.0
    - **Integrating Nomad with WakeUp**
    - Enhancements:
        - Task Sequence support for Windows feature updates
        - Automatic grooming of the Content Distribution database
        - Support for Windows Authentication between Background Channel and Content Distribution API
        - Tachyon Setup: Nomad screen has improved authentication options
        - Improving performance of the dashboards
        - API versioning using Tachyon SDK.
- **Patch Success 8.0:**

- Works with Tachyon Platform 8.0
- No features or feature changes added in this release, but includes any hotfixes from previous versions.

1.11.13.1.3.2.4 Product Packs for v8.0

- **Classic Product Packs:**
  - 1E-ConfigMgrConsoleExtensions.zip
  - 1E-Experience.zip
  - 1E-Explorer-TachyonAgent.zip (new instruction: 1E-Explorer-Upgrade1EClient8.0macOS, updated instruction: Set1EClientAgentConfig)
  - 1E-Explorer-TachyonCore.zip
  - 1E-Inventory.zip
  - 1E-Nomad.zip (new instructions: 1E-Nomad-CacheCleanerDeleteAll, 1E-Nomad-LocationDiscovery, 1E-Nomad-SetWorkRate)
  - 1E-Patch-Success.zip
  - 1E-Tachyon-Platform.zip (new instruction: 1E-TachyonPlatform-Device-ComparisonData)
- **Integrated Product Packs:**
  - MEMCM Client Health Integrated Product Pack (new preconditions: MEMCM-Client, Network-IPv4-PrimaryAddressInDNS, and some rules modified to use them)
  - NomadClientHealth.zip (minor changes)
  - TachyonCore.zip (minor changes)
  - WindowsClientHealth.zip (minor changes).
- Other Product Packs are available from the Tachyon Exchange: tachyonexchange.1e.com

1.11.13.1.3.2.5 Enhancements in v8.0

- Platform:
  - Device Deduplication also includes Nomad
  - Ability to set the Experience Cube processing time (ExperienceSync) is also described on the Device Deduplication page.
  - New options for Switch Command Lines
  - AI Powered Auto-curation: Changing the AI Deployment path
- **Tachyon Setup**
  - Hotfix installer supports preconditions
  - Support for **mst** transform files

- Nomad screen has improved authentication options
- Maintenance feature includes support for updating Nomad proxy

- **Tachyon Product Pack deployment tool**
  - Supports alternative credentials.

1.11.13.1.3.2.6 Enhancements for v8.0

1.11.13.1.3.2.6.1 Hotfixes rolled up into this release - Server (including Experience, Explorer, and Guaranteed State):

- Q21760 - Cross Forest without trust DMZ switch trying to bind on manager port on NATed IP which fails and eventually kills the switch (TFS 244306)
- Q21758 - Wrong Devices Returned From Management Group Member Retrieval api when Device and Patch consolidation report is in process (TFS 235368)
- Q21756 - GS - Rules removed from all assigned policies (TFS 244253)
- Q21748 - Switch system health check is failing for some switches (TFS 240529)
- Q21688 - Nomad application - crash on the device details page when device does not exist in Tachyon (TFS 235249)
- Q21686 - Platform - Group membership resolution fails when nested group search is disabled (TFS 234348)
- Q21684 - Experience - What's Changed (last 7 days) - Not enough data to show deltas (TFS 234748)
- Q21682 - Experience - Timeouts occur during SQL partition processing for Experience (TFS 235469)
- Q21680 - Platform - Duplicate devices appear in Tachyon and Nomad dashboards (TFS 229352)
- Q21660 - Platform - Hotfix Utility - throws exception when a patch is applied on workgroup - DMZ Server (TFS 235801)
- Q21626 - Platform - Tachyon Setup.exe--Maintenance--Server Certificate option fails to update binding with selected certificate correctly (TFS 233846)
- Q21624 - Platform - Experience - Timeout errors when inserting offloaded experience data during cube processing (TFS 233425)
- Q21622 - Tachyon - Number of clients connected to switch drops (TFS 233339)
- Q21620 - Platform - Guaranteed State - TachyonResponses-PolicyRule_0 table is unable to manage partitions after it reaches 10 (TFS 234759)
- Q21618 - Background channel unable to load client certificate private keys behind the CNG API (TFS 234777)
- Q21616 - Switch - Erroneous 'Total Sent' counts. (TFS 235011)
- Q21564 - Experience - Experience is keeping master groomed devices for longer than it should (TFS 228555)

- Q21562 - Platform - CSV Export to UNC path should be more constrained (TFS 138387)
- Q21560 - Platform - Change to timing for Experience cube sync (TFS 227857)
- Q21558 - Platform - Instructions not receiving any responses (TFS 226038)
- Q21556 - Platform – Not all Switches come back online after a reboot (TFS 227933)
- Q21554 - Platform – Tachyon Switches went offline (TFS 228930)
- Q21552 - Switch - Number of Online machines differs across Tachyon Explorer (TFS 228154)
- Q21550 - Platform - Some Clients are not responding to Tachyon instructions (TFS 226839)
- Q21548 - Platform - Export All task failing due to SQL login timeout by bcp.exe (TFS 230869)
- Q21546 - Platform - Guaranteed State - Device/Rule History will take a long time to display with large amounts of data (TFS 231327)

1.11.13.1.3.2.6.2 Hotfixes rolled up into this release - SLA:

- Q21762 - Wrong Devices Returned From Management Group Member Retrieval api when Device and Patch consolidation report is in process. (TFS 244355)
- Q21746 - Management Group Sync with Powershell clashing causing empty Management Groups (TFS 241903)
- Q21744 - Management Group Evaluation is taking time in completing a cycle. (TFS 241990)
- Q21742 - Management Group Sync with Powershell clashing causing empty Management Groups. (TFS 241975)
- Q21740 - Clean Sync and Clear Data action failing with foreign key violation error. (TFS 237160)
- Q21738 - Duplicate entries in Management Group instance total. (TFS 241971)
- Q21736 - Correct device info is not picked up in case of device collision when same device is coming from 2 different connectors . (TFS 231155)
- Q21734 - Management Group not showing any device if rule is created on basis of installed software. (TFS 236925)
- Q21732 - OU information is not consolidated correctly in Basic Inventory Consolidation. (TFS 240608)
- Q21730 - IsCMClient value is not populating correctly for a device if device is reported from both Tachyon and CM connector. (TFS 231005)
- Q21728 - No OU information were consolidated for such devices which was reported from a single connector. (TFS 242259)
- Q21658 - Inventory - Clean Sync leaves orphan Attachment IDs in Attachment table. (TFS 235178)
- Q21656 - Inventory - The File Upload connector does not process device data when uploading a file that contains column OSManufacturer (TFS 234923)
- Q21654 - Inventory - Basic Inventory Consolidation takes too much time to complete (TFS 232513)

- Q21652 - SLA - Device and Patch consolidation fails with Arithmetic Overflow error. (TFS 231525)
- Q21650 - Inventory - Device Serial number is null in SLA-Data database (TFS 229622)
- Q21648 - Inventory - WSUS Connector device data is inflating the inventory with stale devices that no longer exist (TFS 228571)
- Q21646 - Inventory - Tempdb filling up causing BIC to fail (TFS 231526)
- Q21644 - Inventory - Tachyon Master device table OS information not correctly handled by BIC (TFS 227957)
- Q21642 - SLA: Tachyon is not properly processing the primary user data from the Tachyon connector (TFS 227750)
- Q21640 - SLA: Software Inventory not being reported correctly due to SCCM having multiple ResourceIDs for the same hostname (TFS 227755)
- Q21638 - SLA: Management Groups contain devices that don't match the rules (TFS 221910)
- Q21636 - SLA: Different usage categories between AppClarity versions (TFS 227142)
- Q21634 - SLA : Failure when editing policy. (TFS 218751)

1.11.13.1.3.2.6.3 Hotfixes rolled up into this release - Catalog:

- None

1.11.13.1.3.2.6.4 Hotfixes rolled up into this release - AppClarity:

- Q21722 - AppClarity - Total counts of Units Reclaimed and savings are dropping on Software Reclaim Summary and Savings pages (TFS 232667)
- Q21720 - AppClarity - Reclaim popup appears incorrectly on large number of devices as installations falls into unused category due to sync issue (TFS 240329)
- Q21718 - AppClarity - Filter not working on 'Price per unit' column on reclaim usage summary page (TFS 217531)
- Q21596 - AppClarity - Reclaimer Popup reappears after user has clicked "remove now" button (TFS 227253)
- Q21594 - AppClarity - Entitlements are not imported correctly for large number of entitlements in TSV file (TFS 234655).

1.11.13.1.3.2.6.5 Hotfixes rolled up into this release - Application Migration:

- Q21570 - AppMigration Role Based Application Set rules (TFS 233385)

1.11.13.1.3.2.6.6 Hotfixes rolled up into this release - Nomad and Content Distribution:

- Q21754 - CM Sync fails to sync content because of null SourceVersion (TFS 241994)
- Q21750 - Nomad clients are unable to communicate with ContentDistribution (TFS 244275)
- Q21702 - An error occurred whilst migrating legacy pre cache data. CM sync failed. (TFS 237645)
- Q21700 - Get Migration Settings TS action sets an incorrect PBAComputerName for restore (TFS 239635)

- Q21698 - Failed to register devices because Ip4SubnetAddr column does not allow nulls. (TFS 232498)
- Q21678 - Duplicate Devices in Tachyon and Nomad dashboards (TFS 229352)
- Q21612 - Support for feature updates in TS (TFS 233798)
- Q21610 - Known Subnets are showing under Unknown as well in Nomad Dashboard (TFS 234520)
- Q21608 - CM sync's failing in CD due to FOREIGN KEY constraint (TFS 234770)
- Q21598 - CM Sync's failing in Content Distribution (TFS 233608)

1.11.13.1.3.2.6.7 Hotfixes rolled up into this release - Business Intelligence:

- None

1.11.13.1.3.3 Web Release-5.2 (28-Apr-2021)

1.11.13.1.3.3.1 Tachyon Server 5.2.5.165 - Tachyon Toolkit 5.2.5.165 - 1E Catalog 2.1.100.28 - Software Lifecycle Automation 5.2.5.160 - Business Intelligence 3.4.5.18 - ContentDistribution 1.0.5.1068 - AppClarity 7.1.105.37 - AppMigration 3.1.105.10

1.11.13.1.3.3.2 Platform v5.2

- **Tachyon Platform:**
  - Support for **Content Distribution** and its **Nomad app**
  - Background Channel provides a reverse proxy (including devicesAuthentication options) to support communication between Nomad clients and Content Distribution
  - User Interface telemetry reports how the user interface is used
  - Device View provides a single page of details about any device with key information from and links to licensed Tachyon consumer applications
  - New feature that synchronously runs instructions on single device, with results briefly cached in memory instead of a database (used by the Device View feature)
- **Inventory application:**
  - Microsoft Office 365 connector - new
  - 24 hours sync cycle for Tachyon connector
  - Direct-based management groups and sample PowerShell scripts
- **Settings application:**
  - System health page - new
  - Deploy button on Consumers page to deploy all policies for all registered consumers, to support consumers that do not have their own Deploy button
- **Tachyon Setup:**
  - Installation of Nomad consumer application

        - ActiveEfficiency is replaced by Content Distribution when upgrading, with database backup, and a redirect provided for legacy Nomad clients
        - Configures the reverse proxy in the Background Channel for new Nomad clients
        - Setup deploys Nomad event policies after successful installation
    - Tachyon Setup's Nomad screen now uses SMS Provider to locate SQL database, and validates CM Site server during installation and upgrade
    - Two-stage automation of Implementing a Tachyon DMZ Server
    - New option for User Interface telemetry on Tachyon Setup's Telemetry screen
    - Support for multiple HTTPS bindings
        - Selection of existing certificate during upgrade when multiple bindings are encountered
        - Option to specify an alternate HTTPS binding on Tachyon Setup's Website configuration screen - required for DMZ Server

1.11.13.1.3.3.3 Consumer applications for v5.2

- **AppClarity 7.1.105:**

  The AppClarity 7.1.105 maintenance release contains a number of bug fixes:

  - Works with Tachyon Platform 5.2
  - No features or feature changes added in this maintenance release.

  The main AppClarity 7.1 release contained the following features:

  - Works with Tachyon 5.1
  - Windows Server OS LDC
    - New license demand for core based licensing of Windows Server OS (calculated with-in Microsoft Core LDC)
    - Compliance calculation is now based on new license demand
  - Support for Currency Conversion
    - When you can set a default currency (other than USD) AppClarity now renders all reporting and financial numbers (or graphs) only in that set currency
  - New UI controlsNew UI controls have been added to improve the usability:
    - Report refresh - ability to refresh reports on individual pages, and the ability to view the status of the last report refresh
    - UI Controls - ability to choose columns as either shown or hidden on individual screens
  - Installation mode change

- AppClarity installer is now included as an app with the Tachyon installer and can be installed and maintained this way
- Hotfixing capability

- Enhancements
  - Entitlement
    - New Active Entitlements Only toggle filter on Entitlement Summary page
    - The ability to export entitlement summary data
  - License Demand
    - Device names are now shown as hyperlinks on LDC reports
  - Compliance
    - Improved logic for rendering installs, and a new "Exempt" status on the compliance detailed table
    - Effective License Position (ELP) displayed for SQL Server components as it is for SQL Server entitlement
  - Reclaim
    - Reclaim product usage screen loading time is optimized for quick page load.

- **Application Migration 3.1.105:**

  Features in the Application Migration 3.1.105 maintenance release:

  - Works with Tachyon Platform 5.2
  - No new features in this maintenance release.

  Features in the main Application Migration 3.1 release:

  - Works with Tachyon 5.1
  - Improvements to upgrade rules to support scenarios where the currently installed software has a later version than the one listed in the upgrade rule - In versions prior to Application Migration 3.1, it was possible that upgrade rules had issues when the application they were trying to upgrade on the client devices were later versions than the ones they were trying to upgrade to. To remedy these unpredictable and unwanted results, now if an upgrade rule tries to downgrade an application then it will be ignored.
  - Application and Package installation success has been improved - this handles scenarios where the administrator has forgotten to check the **Allow this application to be installed from the Install Application task sequence action without being deployed** checkbox, which is a prerequisite for migrating an application. In practice, it was a common error for administrators to overlook this, which - in earlier versions - led to the Task Sequence failing. In Application Migration 3.1, if the administrator forgets to set the

checkbox, a warning is now displayed that lets the administrator continue and Application Migration sets the option automatically.

- Multiple exclusion of applications is now supported from the Installations page.

- **Explorer 5.2:**
  - Works with Tachyon Platform 5.2
  - Devices table and dashboard link through to Device View.
- **Experience 1.3:**
  - Works with Tachyon Platform 5.2
  - Deploy button on Surveys page now only deploys Experience policies
  - Devices page links through to Device View
  - 1E Experience product pack to support Experience features of the Device View
  - Users page "User session reactiveness" column has been renamed to "Application responsiveness"
- **Guaranteed State 1.5:**
  - Works with Tachyon Platform 5.2
  - Deploy button on Policies page now only deploys Guaranteed State policies
  - Integrated Product Packs:
    - MEMCM Client Health Integrated Product Pack (minor changes)
    - NomadClientHealth.zip (minor changes)
    - TachyonCore.zip (minor changes)
    - WindowsClientHealth.zip (minor changes).
  - Other Product Packs are available from the Tachyon Exchange: tachyonexchange.1e.com
- **Nomad 1.0 (New app in 5.2):**
  - Works with Tachyon Platform 5.2
  - **Modernized backend infrastructure** - Nomad requires a back-end server, which was previously the legacy ActiveEfficiency platform, this has been replaced by the Tachyon Platform to provide Single-Site download, Pre-caching and a new Dashboard. For customers moving to Modern Management, Nomad provides visibility and control of Delivery Optimization, which is used by Intune, MS store and MS update.
  - **Leverage the Tachyon Platform and 1E Client** - with the Tachyon Platform you can enable further features including Experience, User Sentiment, Guaranteed State and Patch Success, as well as opening up real-time management to any task by acquiring the appropriate license.

- **Content Distribution** - Content Distribution is a new component of the Tachyon Platform that provides control and visibility on content deployments and delivery in an organization
    - Replaces ActiveEfficiency features, maintaining support during upgrade for legacy Nomad clients (versions earlier than Nomad 7.1 in 1E Client 5.2)
    - Nomad 7.1 clients now connect to Tachyon Response Stack components (Switch and Background Channel) which act as a proxy for Content Distribution, and legacy clients continue to connect directly to Content Distribution.
- **Nomad app** - the user interface for Content Distribution, provides real-time visibility of what content is downloading or available in each location, subnet and client, see how much WAN traffic is being saved overall and each day
    - **Delivery Optimization (DO) Visibility** - visibility of Delivery Optimization downloads and content availability in each location, subnet and device
    - **Delivery Optimization (DO) and Windows Update Agent (WUA) monitoring** - track Windows download or Microsoft Endpoint Configuration Manager deployments on clients being downloaded via Delivery Optimization in real time, their peer to peer downloads efficiency, sources of the downloaded content and see this reported in the Nomad app dashboards
    - **Overview page** - gives a high-level view of the current status of content throughout the entire network
    - **Content page** - provides a Content-centric view of content distributed throughout your network
    - **Task Sequences page** - provides that visibility by grouping the reference content for each Task Sequence into a single view, so you can see which content is cached and which is not
    - **Devices page** - lists all Devices that have sent Nomad device registration events and have sent download events within a selected time period, links through to Device View
    - **Nomad Sites page** - shows how the network is being used for content distribution in different locations
    - **Client Health page** - shows information from two Integrated Product Packs provided with the Tachyon Platform.

- **Patch Success 1.3:**
    - Works with Tachyon Platform 5.2
    - Devices page and Patch Success Overview page link through to Device View
    - Unidentified patch publish dates show 'Not available' instead of 1970-01-01.

1.11.13.1.3.3.4 Product Packs for v5.2

- **Classic Product Packs:**
    - 1E-ConfigMgrConsoleExtensions.zip (minor changes)

- 1E-Experience.zip (**new** pack in 5.2, with instructions to support Device View)
- 1E-Explorer-TachyonAgent.zip (minor changes)
- 1E-Explorer-TachyonCore.zip (minor changes, additional instructions to support Device View)
- 1E-Inventory.zip (1E-Inventory-Device-GetProcessors improved, 1E-PatchSuccess-PatchStatus now only runs on Windows)
- 1E-Nomad.zip (**new** pack in 5.2, previously provided with Nomad, includes additional instructions to support Device View)
- 1E-Patch-Success.zip (minor changes)
- 1E-Tachyon-Platform.zip (minor changes, additional instructions to support Device View).

· **Integrated Product Packs:**

- MEMCM Client Health Integrated Product Pack (minor changes)
- NomadClientHealth.zip (minor changes)
- TachyonCore.zip (minor changes)
- WindowsClientHealth.zip (minor changes).

· Other Product Packs are available from the Tachyon Exchange: tachyonexchange.1e.com

1.11.13.1.3.3.5 Enhancements in v5.2

· Platform:

- Additional details in device online messages "OsLocale" and "OSInstallUtc" visible in Device View
- Support for each consumer independently deploying its own policies
- Support for dynamic Coordinator Module registration
- Switch Performance Counters now support multiple switches
- Switch denial-of-service protection is now set to off by default
- Business Intelligence - credentials no longer stored in encrypted configuration file.
- Support for SCCM2006 and SCCM2010
- Support for Windows Server 2012 R2 dropped

· Inventory application

- Upgrade Improvements
- Handling of unicode char of Vendor in Processor_cr and Device_cr during Catalog sync
- The check has been extended for those Versions which have a long numeric value in the Product_cr and will not insert this kind of records in the 1ECatalog

- Catalog product creation procedure has been modified to not attempt creating “Product” without corresponding "Vendor"
- Check has been extended in case of Windows and Windows Server to include three-part version (10.0.x) in the Auto-curation, which will return the unique colloquial version.

- Tachyon Setup
  - Consumer-specific policy deployment during upgrade/installation
  - Support to patch Tachyon Server successfully in SQL High-Availability Setup
  - Support to disable SQL scan during installation.

1.11.13.1.3.3.6 Enhancements for v5.2

1.11.13.1.3.3.6.1 Hotfixes rolled up into this release - Server (including Experience, Explorer, and Guaranteed State):

- Q21426 - Platform - Guaranteed State policy changes are deployed without using Deploy button. (TFS 226416)
- Q21424 - Platform - Infrastructure log error - StateMachine Initialise failed. Check for wrong XML in the workflow definition. (TFS 221269)
- Q21422 - Platform - Mismatch between number of devices returned for Management Group and the count in the header (TFS 226897)
- Q21420 - Platform - Some Clients are not responding to Tachyon instructions (TFS 226839)
- Q21418 - Platform - Instructions not receiving any responses (TFS 226038)
- Q21404 - Platform - Tachyon Switch crash when logging 'Session raw writes' (TFS 222683)
- Q21342 - Platform - Experience Database growing at a steady pace filling up drive space (TFS 218297)
- Q21340 - Platform - Devices being groomed from Tachyon database when the LastConnUtc being reset to time (zero) (TFS 220090)
- Q21338 - Platform - Management Group membership synchronization from Platform to Experience is failing (TFS 220175)
- Q21326 - Platform - Switch device upload thread stalled waiting for a HTTP response that never comes (TFS 219898)
- Q21322 - Platform - DBNULL errors in Core API log (TFS 218336)
- Q21320 - Platform - Number of clients shown online in console not matching connections (TFS 219164)
- Q21316 - UI - Experience – Metrics hyperlinks do not work in What’s Changed (last 7 days) charts after applying hotfix Q21198 (TFS 218801)
- Q21314 - Platform - Tachyon switch will crash on empty Management groups (TFS 218673)
- Q21312 - Platform - Tachyon may fail to process experience data synchronization and cube processing (TFS 218349)

- Q21310 - Platform – Scheduled UTC time for sync firing off at the wrong local time (TFS 218552)
- Q21276 - Platform – Switch – Switch does not start (TFS 216338)
- Q21274 - Platform - Switch - Tachyon shows 0 devices connected (TFS 211468)
- Q21272 - Platform - Tachyon Switch does not send GS Policy until 1E Client restarts (TFS 217028)
- Q21270 - Platform - Certain localization settings cause no data to appear in the Experience UI (TFS 217171)
- Q21248 - UI - Experience - Experience Numbers don't add up (TFS 214589)
- Q21246 - Platform - Licensing - Tachyon.lic filesize is larger than current limit (TFS 216700)
- Q21244 - Platform - Tachyon Core API is exhausting ephemeral ports while offloading events (TFS 216403)
- Q21242 - Platform - Tachyon Coordinator service seems to get stuck and email notifications are not sent to the Tachyon admin (TFS 212094)
- Q21240 - Platform – Switch - Guaranteed State showing unknown state for certain rules. (TFS 216386)
- Q21212 - Platform - Experience - SQL query fails with uncaught exception when trying to fetch events for selected device (TFS 214865)
- Q21210 - Platform - Cube processing put a lock on UserSurveyPerformanceMetric table (TFS 214436)
- Q21208 - UI - Guaranteed State - Not possible to apply filter when the windows size is not full screen (TFS 213722)
- Q21206 - UI - Guaranteed State - Reports->Devices->View Details link - Not possible to view more than 100 records (scroll bar not available) (TFS 214207)
- Q21204 - UI - Guaranteed State - Unauthorised error message is displayed for Guaranteed State Viewers user (TFS 215201)
- Q21202 - UI - Experience - User Sentiment->Score calculation text indicates no survey is available, even though surveys are present (TFS 212676)
- Q21200 - Platform - Experience - Description for overall experience score doesn't mention user sentiment (TFS 212609)
- Q21198 - Platform - Experience - 'What's changed' chart on the Overview screen doesn't work if you add a filter when you have surveys. (TFS 213260)
- Q21196 - UI - Experience - Devices page - sort order is not indicated when sorting with any column header except FQDN (TFS 212592)
- Q21194 - UI - Experience - UI displays empty screen with 'An error ocurred' if a survey is deleted that's used by a preset. (TFS 213200)
- Q21192 - Platform - Second is not a supported unit for date/time-based visualizations (TFS 213337)
- Q21190 - Platform - Experience - Performance page -> Information icon missing for Network tile (TFS 212737)

- Q21188 - UI - Experience - Sentiment->User Sentiment->View Detailed Data->sorting Matching devices is not working (TFS 212732)
- Q21186 - UI - Experience - Surveys Page -> The selected survey responses cannot be sorted against Date column. (TFS 212678)
- Q21184 - Platform - Experience - Devices page-> Cannot filter events against Description column on selected device event log (TFS 214215)
- Q21182 - Platform - Experience - Users page incorrectly displays/sorts metrics if the name clashes with a 'User Sentiment' survey (TFS 212604)
- Q21180 - UI - Experience - Breakdown By drop down-> Others Filter -> Should not be allowed to drill into (TFS 214859)
- Q21178 - Platform - Guaranteed State - Reports->Devices->View Details link lists the records in ASC order, by default instead of DESC (TFS 214204)
- Q21176 - Platform - Duplicate non-metric survey can be created by Clone Survey action (TFS 215348)
- Q21174 - Platform - Certain regional settings break device performance scoring (TFS 214980)
- Q21164 - AppClarity upgrade is failing due to HTTP request timeout while uploading the ACS file from Portal API to SLA Platform API (TFS 214950)

1.11.13.1.3.3.6.2 Hotfixes rolled up into this release - SLA:

- Q21392 - SLA: Virtual machines categorized into the “Unknown” category (TFS 220815)
- Q21390 - SLA: AppClarity loading individual entitlements takes 50 seconds (TFS 217118)
- Q21344 - SLA : Failure when editing policy. (TFS 218751)
- Q21318 - SLA - SCCM Connector sync fails when a device is reported as having 0 processor cores (TFS 218609)
- Q21157 - SLA: Upgraded schedules can not be edited for some cases (TFS 213456)
- Q21155 - SLA - Data type conversion error occurs during the Basic Inventory Consolidation if the date is older than epoch date (TFS 211476)

1.11.13.1.3.3.6.3 Hotfixes rolled up into this release - Catalog:

- Q21234 - Patch Success doesn't show specific information regarding the Operating System
- Q21168 - SLA - Tachyon Sync Failing (BIC) with Rollback Transaction Error

1.11.13.1.3.3.6.4 Hotfixes rolled up into this release - AppClarity:

- Q21308 - AppClarity - Reclaim action results are not saved for optional reclaim policies on certain products (TFS 211745)
- Q21306 - AppClarity – Missing costs affect calculation of Effective License Position (TFS 193527)
- Q21304 - AppClarity – Perpetual entitlements with future dates are included with 'Active Entitlements Only' filter (TFS 213388)
- Q21302 - AppClarity – Entitlement import increases the Quantity of licenses (TFS 212841)

- Q21300 - AppClarity – Reclaim Usage page does not load in Internet Explorer browser (TFS 208574)
- Q21298 - AppClarity – While creating a New License entitlement, certain characters in the Product SKU field cause an error (TFS 208968)
- Q21296 - AppClarity – A duplicate entitlement is created when an existing entitlement with SKU is edited and saved as draft (TFS 197392)
- Q21294 - AppClarity – Entitlement import incorrectly saves Version as .* (TFS 186415)
- Q21292 - AppClarity – When a Reclaim policy is cancelled, the Provider log does not show "Completed On" time in UTC (TFS 211766)
- Q21290 - AppClarity – The Top 10 Saving Opportunities chart incorrectly filters the Reclaim Usage table (TFS 211166)
- Q21288 - AppClarity – Entitlements created as Colloquial version are converted to DotFormat version (TFS 211159)
- Q21238 - AppClarity – Pagination not working in Entitlements Contracts page (TFS 213990)

1.11.13.1.3.3.6.5 Hotfixes rolled up into this release - Application Migration:

- Q21410 - Broken association API improvement to handle large application migration rules count (TFS 222660)
- Q21286 - Application Migration – allow use of OU Path rule (TFS 213954)

1.11.13.1.3.3.6.6 Hotfixes rolled up into this release - Business Intelligence:

- Q21428 - BI - Cube having a slow refresh time with SQL views (TFS 222048)

1.11.13.1.3.4Web Release-5.1 (03-Sep-2020)

1.11.13.1.3.4.1 Tachyon Server 5.1.0.663 - Tachyon Toolkit 5.1.0.663 - 1E Catalog 2.1.0.140 - Software Lifecycle Automation 5.1.0.755 - Business Intelligence 3.3.0.61 - ActiveEfficiency Server 1.10.100.10 - AppClarity 7.1.0.95 - AppMigration 3.1.0.172

1.11.13.1.3.4.2 Platform v5.1

- **Tachyon:**
  - Improved support for multi-forest and multi-domain Active Directory environments. Multiple domains can be set during setup.
  - Telemetry gathering on Tachyon usage statistics to help with 1E's continued product improvement initiative.
  - Tachyon Portal and emails can be customized with your company logo and branding.
  - Support withdrawn for Internet Explorer 11 and Legacy Microsoft Edge.
  - Switch Performance Counters.
  - Enhancements:
    - RBAC naming has been improved by changing the permissions name from **Instrumentation** to **Infrastructure**.

- Support for Microsoft System Center Configuration Manager CB 2002.
- Tachyon platform instrumentation data is now exposed as Windows Performance Counters.
- Platform installation and deployment has been simplified by eliminating the Tachyon CoreInternal component.

- **Inventory application:**
  - The Inventory application has some additional pages that provide information on your system, as gathered by inventory connectors:
    - The **Software Inventory** section provides **Dashboard**, **Aggregate** and **Product Usage** pages to help you understand the software that is installed in your enterprise
    - The **Hardware** section lets you investigate the virtual machines and physical devices present in your enterprise by using its **Hardware Inventory**, **Virtual Summary** and **Device** pages
  - Export option now available on the **Inventory→Hardware→Hardware Inventory** page.
  - Sync actions for Connectors allow you select which data categories you want to sync, and if you want to run **AI Powered Auto-curation** as part of Basic Inventory Consolidation (BIC) process that runs after each sync.
  - 1E Catalog:
    - Improved hotfix capability.
    - Catalog documentation merged with Tachyon.
- **Settings application:**
  - Tachyon connector optimization - the duration of inventory instructions has been reduced from 7 days to 15 minutes to allow them to be run more frequently
  - Other Connector optimizations:
    - Ability to request selected data when scheduling a sync. For example, Device, Software, User, Patch etc. This has been added to the Tachyon, Configuration Manager and ServiceNow connectors
    - The Device and Patch Consolidation reports have been split from the Basic Inventory Consolidation action. Patch Success users can now just execute the Device and Patch consolidation reports rather than running a complete Basic Inventory Consolidation.
    - AI actions have been decoupled from the Inventory synchronization cycles.
  - A new **Provider log** page has been added that provides the status of Provider related operations
  - **AI Powered Auto-curation** can be turned on or off from the Components page.

- **Intune connector** - device, software and user data can now be retrieved from your Intune infrastructure.

- **Tachyon Setup enhancements:**
  - Maintenance screen Hotfixing feature to upload and apply a 1E Hotfix bundle.
  - Installation of AppClarity 7.1 and Application Migration 3.1 (using their installers).

1.11.13.1.3.4.3 Consumer applications for v5.1

- **AppClarity 7.1:**
  - Windows Server OS LDC
    - New license demand for core based licensing of Windows Server OS (calculated with-in Microsoft Core LDC)
    - Compliance calculation is now based on new license demand
  - Support for Currency Conversion
    - When you can set a default currency (other than USD) AppClarity now renders all reporting and financial numbers (or graphs) only in that set currency
  - New UI controls have been added to improve the usability:
    - Report refresh - ability to refresh reports on individual pages, and the ability to view the status of the last report refresh
    - UI Controls - ability to choose columns as either shown or hidden on individual screens
  - Installation mode change
    - AppClarity installer is now included as an app with the Tachyon installer and can be installed and maintained this way
    - Hotfixing capability
  - Enhancements
    - Entitlement
      - New Active Entitlements Only toggle filter on Entitlement Summary page
      - The ability to export entitlement summary data
    - License Demand
      - Device names are now shown as hyperlinks on LDC reports
    - Compliance
      - Improved logic for rendering installs, and a new "Exempt" status on the compliance detailed table

  - Effective License Position (ELP) displayed for SQL Server components as it is for SQL Server entitlement

- Reclaim
  - Reclaim product usage screen loading time is optimized for quick page load.

- **Application Migration 3.1:**
  - Improvements to upgrade rules to support scenarios where the currently installed software has a later version than the one listed in the upgrade rule - In versions prior to Application Migration 3.1, it was possible that upgrade rules had issues when the application they were trying to upgrade on the client devices were later versions than the ones they were trying to upgrade to. To remedy these unpredictable and unwanted results, now if an upgrade rule tries to downgrade an application then it will be ignored.
  - Application and Package installation success has been improved - this handles scenarios where the administrator has forgotten to check the **Allow this application to be installed from the Install Application task sequence action without being deployed** checkbox, which is a prerequisite for migrating an application. In practice, it was a common error for administrators to overlook this, which - in earlier versions - led to the Task Sequence failing. In Application Migration 3.1, if the administrator forgets to set the checkbox, a warning is now displayed that lets the administrator continue and Application Migration sets the option automatically.
  - Multiple exclusion of applications is now supported from the Installations page.
- **Experience 1.2:**
  - The Tachyon Experience score has been greatly enhanced to include User Sentiment - this means that, not only can you monitor the stability, responsiveness, and performance of the devices on your network to deduce your end-users satisfaction with their IT services, you can send out surveys and incorporate your end-users actual feedback directly into the picture.
    - The Tachyon Experience score displayed on the Overview page includes user sentiment values, please refer to The Scores for more information.
    - The Categories page includes a Sentiment tile showing the current User Sentiment score.
    - The Sentiment page lets you view the User Sentiment score on its own and drill down to view users and monitor their feedback and pain points.
  - End-User Surveys - two types of survey are supported: User Sentiment and General Purpose. User Sentiment Surveys contribute towards the Tachyon Experience score, General Purpose Surveys can be used to ask one-off questions of your end-users and get their feedback on any issue. The Surveys page is where you can create, enable and deploy surveys.
  - A Users page is provided that lets you get information on the end-users on the devices in your network.
  - Customize the Tachyon Experience pages to view the interactive charts you want to focus on - including the display of the results from your User Sentiment surveys on the Sentiment page.

- **Explorer 5.1:**
  - No changes
- **Guaranteed State 1.4:**
  - The workflow on the rule creation page has been improved, so that all the information you need to enter is presented on a single page, making it easier to create rules.
  - Support for digital signing, versioning and licensing of Guaranteed State policy fragments. This requires that upgrading to Tachyon 5.1 has a new license.
- **Patch Success 1.2.104:**
  - No changes to this application for this maintenance release.

1.11.13.1.3.4.4 Product Packs for v5.1

- **Classic Product Packs:**
  - 1E-ConfigMgrConsoleExtensions.zip (minor changes)
  - 1E-Explorer-TachyonAgent.zip (minor changes, new 1E-Explorer-TachyonAgent-Set1EClientAgentConfig)
  - 1E-Explorer-TachyonCore.zip (minor changes)
  - 1E-Inventory.zip (1E-Inventory-Device-GetProcessors improved, 1E-PatchSuccess-PatchStatus now only runs on Windows)
  - 1E-Patch-Success.zip (minor changes)
  - 1E-Tachyon-Platform.zip (minor changes).
- **Integrated Product Packs:**
  - All fragments are now signed, and have InstructionType defined
  - MEMCM Client Health Integrated Product Pack - (**new** improved replacement for *Microsoft SCCM Client Health Integrated Product Pack)*
  - Microsoft SCCM Client Health Integrated Product Pack

    (**removed**)
  - NomadClientHealth.zip (minor changes)
  - TachyonCore.zip (minor changes)
  - WindowsClientHealth.zip (minor changes).
- Other Product Packs are available from the Tachyon Exchange: tachyonexchange.1e.com

1.11.13.1.3.4.5 Enhancements for v5.1

1.11.13.1.3.4.5.1 Hotfixes rolled up into this release - Server:

- Q21118 - Tachyon Clients machines unable to receive instructions (TFS 209695)

- Q21100 - Platform - Coordinator - Delay in sending email causing approval to fail (TFS 198224)
- Q21098 - Platform - Tachyon Instructions - Approvals taking multiple times to get approved whilst email addresses are being resolved (TFS 201850)
- Q21058 - UI - Explorer - Schedule instruction scheduler presents unclear time setting for non UTC sites. (TFS 203430)
- Q21056 - Platform - Tachyon does not resolve group membership correctly (TFS 201849)
- Q21054 - Platform - AD group membership update causes time out in Tachyon portal (TFS 203074)
- Q21052 - Platform - Tachyon unable to perform scheduled sync (TFS 204203)
- Q20994 - Platform - Experience - Tachyon Platform installed against SQL Server Evaluation edition fails to support partitioning (TFS 200801)
- Q20992 - Platform - Configurable authentication dialog before sending action in Explorer (TFS 195947)
- Q20990 - Platform - Experience - UDP Send time, Disk Random AccessTime, Disk Sequential Access time and Registry Write HKLM values are being scored as 0 (TFS 200770)
- Q20988 - UI - Experience - Devices screen needs to report more digits for experience values (TFS 199506)
- Q20986 - Platform - Coordinator is not loading the entire license upon flat license request (TFS 199897)
- Q20984 - Platform - Experience - Memory Hard page faults - scoring is wrong (TFS 199843)

1.11.13.1.3.4.5.2 Hotfixes rolled up into this release - SLA:

- Q21108 - Views have been introduced to view inventory data under 'SLA-Data'database (TFS 208158)
- Q21106 - Mapping between Product and a SCCM package/application didn't persist after clean sync/clear (TFS 210042)
- Q21104 - Tachyon connector sync should not delete the sync schedule if sync fails and retry again in next sync. (TFS 204587)
- Q21102 - Performance improvements in clean sync and clear data actions. (TFS 210045)
- Q21090 - SLA - Management group evaluation and ETL cube processing fail with Arithmetic Overflow error (TFS 206524)
- Q20924 - Clear Data action was clearing the data from SLA Reports (TFS 198458)
- Q20922 - Reclaim API changes to support multiple command lines (TFS 199059)
- Q20920 - Support Disabling Remote Access option in Product (TFS 190817)
- Q20918 - No option was present in Tachyon connector to separate the actions for "Consolidation Reports" from the "Sync Data" action. (TFS 198649)
- Q20916 - Products with special character like "uTorrent" were not getting normalized with Catalog even though match rules existed. (TFS 197516)
- Q20914 - Data disappears on sorting on Product to CM Association Tab (TFS 197878)

- Q20912 - The number of devices in Patch Success was reset and had to repopulate (TFS 194114)
- Q20910 - The new OU Path in Management Group rules is not working correctly with contains (TFS 197293)

1.11.13.1.3.4.5.3 Hotfixes rolled up into this release - 1E Catalog:

- Added "Not Remove" and "Not Patch" condition for SetfolderPermission custom action to support catalog hotfix (TFS 208305)
- Sync is failing in case only TLS 1.2 is enabled on client (TFS 206213)
- Creation of entitlements in AppClarity resulted in merged entitlements for different release of windows server for example, Windows 2019 and 2016 (TFS -204034)
- Deletion of records in case of Incremental Sync from Prediction Results (TFS 203575)
- Performance improvement in AI Engine (TFS 201562)
- XML Wrapper SP for SurrogateKey Feature (TFS 200529)
- Provided grant permission in stored procedure "EntitlementProductversionEditionExpensionMD5_se“ (TFS 200452)
- Handling of Unicode values for vendor in Devices and Processors stored procedures (TFS 199898)

1.11.13.1.3.4.5.4 Hotfixes rolled up into this release - AppClarity:

- Q20962 - Incorrect license demand calculations for VM cluster in case of Oracle LDC (TFS 200689)
- Q20960 - Oracle installations not visible on compliance summary by title & ELP report when product installed on VMs and demand computed on physical clusters (TFS 198809)
- Q20958 - Software can be reclaimed from any device, and will not depend on Device Type anymore, in fact considers only Operating System of device (TFS 200632)
- Q20956 - After upgrade to v7.0, entitlement summary screen and/or license / maintenances screen displays null error (TFS 199952)
- Q20954 - After upgrade, on reclaim usage summary screen, Saving Opportunity graph is crashing due IsLicenseRequired null value error (TFS 199953)
- Q20952 - Multiple Uninstall command lines in a reclaim policy are not supported (TFS 199947)
- Q20950 - Reclaim policy cannot be Save draft/publish as disabled (TFS 199754)
- Q20948 - All software installations under 'License Exemption' management group not exempting from compliance (TFS 199980)
- Q20946 - Display changes for compliance details of LDC products (TFS 199954)

1.11.13.1.3.4.5.5 Hotfixes rolled up into this release - Application Migration:

<None>

1.11.13.1.3.4.5.6 Hotfixes rolled up into this release - Business Intelligence:

- Q21078 - Patch Success - 400 year old patch causes cube process failure

- Q21076 - ETL sync is taking an excessive amount of time to complete

1.11.13.1.3.5 Web Release-5.0 (18-MAR-2020)

1.11.13.1.3.5.1 Tachyon Server 5.0.0.592 - Tachyon Toolkit 5.0.0.592 - 1E Catalog 2.0.0.296 - Software Lifecycle Automation 5.0.0.20 - Business Intelligence 3.2.0.303 - ActiveEfficiency Server 1.10.100.10

1.11.13.1.3.5.2 Platform v5.0

- **Tachyon:**
  - Switch now supports Windows Certificate Store (instead of Switch certificate files)
  - Eventing mechanism allows propagation of live events in real-time from 1E Client to consumers
- **SLA:**
  - Support for Microsoft System Center Configuration Manager CB1910 and Microsoft SQL Server 2019
- **1E Catalog:**
  - Hotfix capability
  - Support for EXE file mapping to multiple products
  - Surrogate keys - used in tracking changes to 1E Catalog - allows for example, details of the original vendor to be retained when a product is acquired by a new vendor
  - Catalog UI should set the "Customer" as submission source instead of "1E" for customer curated data
  - UNSPSC Software Category must be available to user in human-readable format on the SLA UI
  - Changes to support "Latest Version" field in SLA - Extra column will be returned during SLA normalization with Catalog
  - AI Auto-curated entries are not deleted after a sync/resync/upgrade
  - Installer enhancements:
    - AI model file download switch (Installer and DB setting); default off
    - Catalog installer changes to support TLS 1.2 using ADO.NET SQLClient
    - Support for Network Service account
    - Remove sysadmin requirement in installation
    - Custom user entries in Web.config file need to be parsed and added back to the new config file during Catalog upgrade
- **Settings application:**
  - Permissions->Add User search has changed from search-as-you-type to search on demand. This can be done against Users or Groups or Both, by clicking search icon available

  - Provider Configuration->New option called "Test" has been added which is only enabled when SCCM Connector exists. Otherwise the option is disabled, even for Provider Configuration Administrator and Global Administrator. Required for AppMigration/AppClarity

- **Inventory application (new in v5.0):**
  - AI Powered Auto-curation
  - Software Inventory, including aggregation
  - Hardware Inventory, including summaries for devices and virtual hosts
  - Manage associations between inventoried products and Configuration Manager applications and packages
- **Tachyon Setup:**
  - When upgrading from SLA Platform 3.3 its SLA users are migrated to become Tachyon users with no roles assigned
  - Network Service is used for the 1E Catalog Update Service instead of a domain account
  - "Business Intelligence" option to allow independent installation of BI
  - Maintenance page provides Server Certificate option to update certificate bindings, that also provides better troubleshooting experience
  - Installation of new Experience application
  - Option to enable the AI Powered Auto-curation feature
  - Extends db_ddladmin permission on Tachyon Master database, in addition to existing db_datareader and db_datawriter
  - Supports backup of all installed components and their respective databases during upgrade
  - Clickable link to download missing pre-requisite Visual C++ 2013 redistributable
  - The 'License File' step now occurs before "Select components" to validate the allowed components/features in license file

1.11.13.1.3.5.3 Consumer applications for v5.0

- **AppClarity 7.0**(available separately from the 1E Support Portal, not included in Tachyon Setup)
- **Application Migration 3.0**(available separately from the 1E Support Portal, not included in Tachyon Setup)
- **Experience 1.0 (new application in v5.0)**
- **Explorer 5.0:**
  - The Response page has a new option to show raw data when an aggregated instruction is asked
- **Guaranteed State 1.3:**

- Overview dashboard has been rearranged as a result of field feedback
- The term "Policy" has been removed from all the tiles on Overview dashboard
- The Rule type filter does not contain "Event" any longer. Only Check and Fix types are supported
- Cosmetic casing changes - View History now reads "View history" and View Details" now reads "View details"
- The dashboard header statistics have been improved
- Guaranteed State now supports table partitioning (SQL Server feature for better performance)

· **Patch Success 1.2:**

- The Patch and Device details screens now allow Updating of all devices and patches for a given patch or a device respectively
- Performance improvements

1.11.13.1.3.5.4 Product Packs for v5.0

· Product Packs listed below are now included in the Tachyon Platform zip, previously they were in a separate Tachyon Product Packs zip

· Tachyon.ProductPackDeploymentTool.exe
(tool relocated from the Integrated folder to the root folder, so it can be used to upload Classic and Integrated packs, and be started by Tachyon Setup)

· **Classic Product Packs:**

- 1E-ConfigMgrConsoleExtensions.zip (minor changes to instructions)
- 1E-Explorer-TachyonAgent.zip (minor changes to instructions plus **new instructions for location**)
- 1E-Explorer-TachyonCore.zip (minor changes to instructions plus **new instructions for firewalls**)
- 1E-Inventory.zip (**new, renamed from 1E-Inventory-ProductPacks.zip previously included in the SLA installer**)
- 1E-Patch-Success.zip (**updated instructions and renamed zip**)
- 1E-Tachyon-Platform.zip (**renamed zip**)

· **Integrated Product Packs:**

- MSSCCMClientHealth.zip (**1 new rule**)
- NomadClientHealth.zip (minor changes)
- TachyonCore.zip (minor changes)
- WindowsClientHealth.zip (minor changes)

- EndpointPerformance.zip

  (**removed**)

- Other Product Packs are available from the Tachyon Exchange: tachyonexchange.1e.com

1.11.13.1.3.5.5 Enhancements for v5.0

1.11.13.1.3.5.5.1 Hotfixes rolled up into this release - Server:

- Q20709 - Platform - Unable to Stop Tachyon Actions/Questions (TFS 189888)
- Q20652 - Platform - Switch is discarding the policy status message from 1E client if it receives both policy and instruction response from same device on same worker thread (TFS 189178)
- Q20642 - Platform - GS- Overview dashboard is not reflecting the Device and policy rule status change correctly (TFS 188870)
- Q20640 - Platform - Server - Multiseries response visualization has wrong count (TFS 187380)
- Q20638 - Platform - Tachyon Coordinator Service fails to start up successfully (TFS 187750)
- Q20578 - Platform - Management group sync is failing when a MG assigned to Guaranteed state policy is deleted (TFS 184629)
- Q20576 - Platform - Implement solution for switch certificate without device FQDN (TFS 184623)
- Q20552 - Platform - Instruction sent to all devices when Switch fails to download list of targeted devices from Core (TFS 182945)
- Q20550 - Platform - Policy Caching issue on status changes (TFS 178541)
- Q20548 - Platform - GS Policies report displaying compliant devices as unknown incorrectly (TFS 180742)
- Q20546 - Platform - GS - Broken filtering on Policy and rule reports (TFS 180313)
- Q20544 - Platform - Core discards policy-catchups with exceed max length (TFS 182324)
- Q20542 - Platform - GS - Remediations report (and maybe elsewhere) not returning data when orphaned policy data exists (TFS 182338)
- Q20540 - Platform - Cannot deploy an empty policy (TFS 182235)

1.11.13.1.3.5.5.2 Hotfixes rolled up into this release - SLA:

- Q20713 - Generate Report - ETL is taking too long (TFS 192684)
- Q20703 - The Clean Sync box, in the Schedules UI, is showing the opposite setting to the actual setting in the database (TFS 189942)
- Q20701 - Software Reclaim shows Unreported for most of the products (TFS 185935)
- Q20699 - Patch Success does not show all the available Inventory repositories in the dashboards (TFS 190699)
- Q20697 - Consumer installation fails for remote SQL Server and named instance (TFS 175916)

- Q20604 - Web - ETL performance at scale (TFS 180087)
- Q20602 - Patch Success Dashboard is not showing all Endpoint Patch data (TFS 180018)

1.11.13.1.3.5.5.3 Hotfixes rolled up into this release - 1E Catalog:

- Catalog UI: While editing processor match rule only Source Family, Source Model and Source Name field (TFS 182917)
- Catalog Sync/Resync: For fresh Installation there is Error in recreating indexes after Sync (TFS 182597)
- WebUI- Data curated by the client have the submission source = 1E instead of the customer (TFS 178528)
- Site defined records are not getting processed, if they are in the queue table of Staging database (TFS 169408)
- ENABLETLS12=0 shows check marked in installer (TFS 156106)
- Catalog Installer Preference for site defined vendor alias in case duplicate vendor alias exist in catalog (TFS 155362)
- Resync fails to insert site defined [EntitlementProductProductMatchs] (TFS 154327)
- DROPOLDDB=0 enables the Drop old database option in the Database Server installer screen (TFS 154299)
- Resync fails to insert site defined [EntitlementProductSet] (TFS 154193)

1.11.13.1.3.6 Web Release-4.1 (24-JUN-2019)

1.11.13.1.3.6.1 Tachyon Server 4.1.0.169 - Tachyon Toolkit 4.1.0.169 - 1E Catalog 1.2.0.303 - Software Lifecycle Automation 4.1.0.47 - Business Intelligence 3.1.0.51 - ActiveEfficiency Server 1.10.0.62

1.11.13.1.3.6.2 Platform v4.1

- **Tachyon Setup has been expanded to include ActiveEfficiency Server:** this is in order to support the Nomad Dashboard and Nomad download pause features.
- Tachyon Setup has also been extended with the following features:
  - Uninstallation, and also inclusion of MSPs at install-time
  - Re(registration) of applications from Maintenance page
  - Consumer-level workflow override (e.g. for ServiceNow integration)
  - Support for partial upgrades
  - Ability to run Tachyon Product Pack Deployment Tool to upload Product Packs
- Tachyon toolkit consumers are registered automatically during installation
- Improvement on Action processing
- Improvements to Explorer:

  - A new **Instruction Detail** dialog has been added to the **Instruction History** page that shows information on the selected instruction
  - Improvements have been made to the **Device Detail** dialog on the **Devices** page
- Improvements to Guaranteed State
  - The **Rule Status** tile and corresponding drill-downs have been improved
  - Rule editing is now supported
  - A **Device Detail** dialog has been added
  - A **Remediation** report is now available that shows what remediations have been applied
  - The dashboard header statistics have been improved
  - Performance improvements
- Improvements to Patch Success:
  - The **Patch performance** dashboard tile can now be used to interactively filter the page
  - A new **Monitoring** menu has been added that displays the history and responses for the Patch Success instructions
  - Performance improvements
- Support has been confirmed for:
  - Microsoft System Center Configuration Manager CB1902

1.11.13.1.3.6.3 Product Packs for v4.1

- **Classic Product Packs (updated for 4.1):**
  - 1E-ConfigMgrConsoleExtensions.zip
  - 1E-Explorer-TachyonAgent.zip
  - 1E-Explorer-TachyonCore.zip
  - 1E-PatchSuccess.zip
  - 1E-TachyonPlatform.zip
- **Integrated Product Packs (new for 4.1):**
  - EndpointPerformance.zip
  - MSSCCMClientHealth.zip
  - NomadClientHealth.zip
  - TachyonCore.zip
  - WindowsClientHealth.zip

- Tachyon.ProductPackDeploymentTool.exe (new)
- Other Product Packs are available from the Tachyon Exchange: tachyonexchange.1e.com

1.11.13.1.3.6.4 Enhancements for v4.1

1.11.13.1.3.6.4.1 Hotfixes rolled up into this release - Server:

- Q20520 - Platform - Instruction sent to all devices when Switch fails to download list of targeted devices from Core (TFS 182945)
- Q20486 - Tachyon Guaranteed State dashboard is reporting the device compliance status incorrectly as “unknown”. (TFS 176304)
- Q20484 - Tachyon Switch failing to honour the log roll over setting (TFS 178311)
- Q20470 - 1E Tachyon Switch Host service fails to start after upgrading to Tachyon server 4.0 (TFS 175839)

1.11.13.1.4 Tachyon Platform features by release

A list of features of the Tachyon platform and features organized by the release they were implemented in. Links through to the features have been provided for convenience.

1.11.13.1.4.1New features in Tachyon 8.1

1.11.13.1.4.2Tachyon Platform 8.0

1.11.13.1.4.3Tachyon 5.2

1.11.13.1.4.4Tachyon 5.1

1.11.13.1.4.5Tachyon 5.0

1.11.13.1.4.6Tachyon 4.1

1.11.13.2 Tachyon Platform zip

The Tachyon Platform zip file can be downloaded from the 1E Support Portal https://support.1e.com/. Extracting the zip will create a folder structure containing the following, where the files highlighted in bold are required by Tachyon Setup.

- Licenses.txt
- Tachyon Release Information.html
- **Tachyon.Setup.exe**

Please refer to:

- Tachyon Setup, for detailed information about each screen in Tachyon Setup
- Quick Start if you want a brief overview of installing Tachyon.

Warning

Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.

Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.

- Installers**1ECatalog.msi**
- Installers**AppClarity.msi**
- Installers**ApplicationMigration.msi**
- Installers**ContentDistribution.msi**
- Installers**SLA.BI.Installer.msi**
- Installers**SLA.Platform.Installer.msi**
- Installers**TachyonServer.msi**
- Installers\TachyonToolkit.msi

This folder contains **msi installer files** for Tachyon components and applications that will be installed by Tachyon Setup if their prerequisites are met.

- Installers\Apps\Experience**Experience.zip**
- Installers\Apps\Experience**metadata.json**
- Installers\Apps\Explorer**Explorer.zip**
- Installers\Apps\Explorer**metadata.json**
- Installers\Apps\GuaranteedState**GuaranteedState.zip**
- Installers\Apps\GuaranteedState**metadata.json**
- Installers\Apps\Inventory**Inventory.zip**

This folder contains **apps folders** for Tachyon consumer applications that will be installed by Tachyon Setup if their prerequisites are met.

If you do not want to install a Tachyon consumer application, then delete the folder before running Tachyon Setup.

Later, if you need to install the Tachyon consumer application, then you can reinstate the folder and install the app using Tachyon Setup as described in Applications maintenance.

Note

Some consumer applications are installed using their msi instead of an apps folder, for example AppClarity and Application Migration.

- Installers\Apps\Inventory**metadata.json**
- Installers\Apps\Nomad**metadata.json**
- Installers\Apps\Nomad**Nomad.zip**
- Installers\Apps\PatchSuccess**metadata.json**
- Installers\Apps\PatchSuccess**PatchSuccess.zip**
- Installers\Apps\Settings**metadata.json**
- Installers\Apps\Settings**Platform.zip**
- ProductPacks\Newtonsoft.Json.dll
- ProductPacks\Tachyon.ProductPackDeploymentTool.exe
- ProductPacks\Tachyon.ProductPackDeploymentTool.exe.config
- ProductPacks\Tachyon.SDK.Consumer.dll
- ProductPacks\Classic\1E-ConfigMgrConsoleExtensions.zip
- ProductPacks\Classic\1E-Experience.zip
- ProductPacks\Classic\1E-Explorer-TachyonAgent.zip
- ProductPacks\Classic\1E-Explorer-TachyonCore.zip
- ProductPacks\Classic\1E-Inventory.zip
- ProductPacks\Classic\1E-Nomad.zip
- ProductPacks\Classic\1E-Patch-Success.zip

These Product Packs are required to support various Tachyon features, for more detail please refer to Tachyon Product Packs reference.If your license permits, you can use additional Product Packs available from Tachyon Exchange 1E Exchange to meet specific use-cases.

Classic Product Packs	Contain instructions, for use in Explorer and other Tachyon applications. They can be uploaded using the **Tachyon Product Pack deployment tool**, or using **Settings→Instructions→Instruction sets** page in the Tachyon Portal.
Integrated Product Packs	Contain policies, rules and fragments for use by Guaranteed State, and may also include instructions. They can only be uploaded using the

- ProductPacks\Classic\1E-Tachyon-Platform.zip
- ProductPacks\Integrated\MEMCMClientHealth.zip
- ProductPacks\Integrated\NomadClientHealth.zip
- ProductPacks\Integrated\TachyonCore.zip
- ProductPacks\Integrated\WindowsClientHealth.zip

Tachyon Product Pack deployment tool.

Tip

The **Tachyon Product Pack Deployment Tool** can be started independently, or at the end of the **Tachyon Setup** process via the Uploading with the Tachyon Product Pack Deployment Tool screen, where the screen contains a link that launches the tool. The **Tachyon Setup** method of starting the tool is recommended because setup ensures you have the correct permissions to upload the Product Packs.

1.11.14 Glossary

A glossary of Tachyon terminology.

1.11.14.1 Tachyon alphabetical glossary

Term	Definition
1E Client	1E Client provides client features and modules for 1E products including Tachyon. It replaces the Tachyon Agent.
Action	An Action is a specific type of instruction that is sent to client devices which can be used to modify the state of the target device. For example, setting a registry key, killing a process, deleting a file. Whereas a Question is an instruction that requests information from the target device, but does not change its state. Generally an Action needs to undergo an approval process before it is sent.
Agent	Agent is the old name for the client. The Agent has been replaced by the 1E Client which provides client features and modules for 1E products including Tachyon.
All Instructions Approver	This is a Tachyon system role which allows assigned users to approve actions for all Instruction Sets . Users can approve unless the action was requested by themselves.

Term	Definition
All Instructions Questioner	This is a Tachyon system role which allows assigned users to ask questions and view responses for all Instruction Sets; use custom properties.
All Instructions Viewer	This is a Tachyon system role which allows assigned users to view instructions and responses for all Instruction Sets.
Audit information log	The Audit information log page displays audit information related to installation, permissions, instruction set and consumer related operations carried out using the Explorer and Settings applications. See Audit information log page
Historic Data Capture	The old name for Tachyon Activity Record.
Agent Language	The Agent language is an interpretive programming language that is executed by the client in the form of an **instruction payload**. Instructions, and their payload, are based on instruction definitions which are stored in the TachyonMaster database. Definitions are uploaded into the database from the Administrator console by dragging and dropping one or more Instruction Definition files, a Product Pack or ZIP file containing Instruction Definition files. The language, called SCALE, uses Agent modules and methods and is documented in the SDK.
Agent Provider	A plug-in component for the 1E Client which communicates with an external component, such as an operating system facility (for example Windows registry) or a service-provider application (for example Content Distribution). 1E Client modules use Providers to get their work done. Examples: • WMI provider • Registry provider • Nomad provider • BASH provider

Term	Definition
Auto-curation	Auto-curation is a Catalog function and refers to the automated process of creating match rules in 1E Catalog. These match rules are neither created by the customer not by the 1E curation team. The rules are created in the customer's local 1E Catalog copy using automated logic built by 1E.
Background Channel	The Background Channel is a mechanism by which the Tachyon client can download resources via HTTPS without loading the Switch. Since this traffic does not go through the Switch, the client is still able to receive and process instructions instructions while performing these downloads. From v2.0 onwards, the client is able to download resources via Content Distribution. The Background Channel is a web application on the Tachyon Server Website and provides the following: • Stores Tachyon content from the Consumer API in the Background Channel for clients to retrieve • Responds to clients retrieving Tachyon content from the Background Channel See Tachyon Architecture and Communication Ports.
Client module	A plug-in component for the 1E Client which encapsulates business logic. Modules contain Methods, which can be invoked by SCALE. Modules (and their methods) effectively provide a platform independent API. To that end, Modules and their Methods do not (generally) talk about anything platform specific (Windows, Linux, Android etc). Examples: • FileSystem • OperatingSystem • Network • Software
Column filters	Some tables contain a column filter that lets you easily filter the information displayed in the table.**Using column filters**The picture opposite shows an example taken from AppClarity. In our example we

Term	Definition
	want to filter the table to show only those items where the **Edition** contains the text **Prof**.To filter the table on the **Edition** column:Click on the filter iconjust beneath the header row in the **Edition** column.The filter popup is displayed.Now select the operator. In our example this will be **contains**.Then type the text **Prof** into the text field.Click **Apply** and a new filter will be added to the table.The table will be filtered to just those items whose **Edition** contains the text **Prof**.**Adding another filter**You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.**Removing filters**You can remove filters by clicking on the filter close icon at the end of the filter.
Column Picker	**Using column picker**Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.To pick the displayed columns:Click on the Choose columns iconto the right of the header row to view the visible columns.To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.The **Unknown Installs** column is now hidden.To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.The Microsoft Core License Demand page has now been automatically updated with our changes.
Column sorts	Some tables contain column sorts that let you easily re-order the information displayed in the table.**Using column sorts**The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column:Click on the sort iconjust beneath the header row in the **Cost** column.The sort popup is displayed.Now select the sort direction. In our example this will be **Sort descending**.After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon**Clearing the sort**You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.
Configuration Manager Extensions	The Configuration Manager Extensions currently include.

Term	Definition
	• Configuration Manager Agent emergency stop and resume actions • Configuration Manager Agent actions • Client Health Check • Tachyon Run Instruction utility (used by the each of the above right-click actions to request Tachyon to run an instruction) • Tachyon Instruction Runner (a mini UI version of the Tachyon Explorer) This feature is included in the Tachyon Toolkit. Documentation for installing and using the Configuration Manager Extensions will be available soon.
Consumer	A Consumer is any application that connects to and uses the Consumer API. An example is the Explorer application.
Consumer API	The Consumer API is a documented set of API endpoints provided by a web application on the Tachyon Web Server called Consumer. It is referred to as the Consumer API in order to avoid confusion with Tachyon Consumers, which are 'consumers' of the API. The Consumer API is a web application on the Tachyon Server Website, actually named Consumer, and provides the following: • Processes the consumer requests from the Explorer and other Consumers • Publishes Tachyon content to the Background Channel • Forwards requests for instrumentation data from the Explorer to the Tachyon Instrumentation component • Forwards workflow commands from the Explorer to the Tachyon Workflow component See Tachyon Architecture and Communication Ports.
Consumer requests	A Consumer sends requests to the Consumer API.
Coordinator Service	The Coordinator Service has two modules:

Term	Definition
	• Instrumentation module • Workflow module See Tachyon Architecture and Communication Ports.
Coordinator Instrumentation module	The Coordinator Instrumentation module is part of the Coordinator Service on the Tachyon Server which processes instrumentation data from the following components: • Core • Coordinator Workflow module • Switch And responds to requests for instrumentation data from the Consumer API. See Tachyon Architecture and Communication Ports.
Coordinator Workflow module	The Coordinator Workflow module is part of the Coordinator Service on the Tachyon Server that provides the following: • Forwards workflow commands from the Consumer API to the Core • Stores workflow in SQL • Connects to remote SMTP to send emails used in the approval process for actions See Tachyon Architecture and Communication Ports.
Core	The Core is a Tachyon Server web component that does the following: • Forwards workflow commands from the Coordinator workflow module to the Switch • Forwards responses from the Switch to the Responses database (this task requires high throughput) • Generates and sends instrumentation data to the Instrumentation service See Tachyon Architecture and Communication Ports.

Term	Definition
Core Internal	Core Internal is the part of the Core which allows fast internal communication with the Switch using HTTP instead of HTTPS, restricted to the Switch server's local IP Address only. See Tachyon Architecture and Communication Ports.
Custom Role	Tachyon roles that define which Users have access to which Instruction Set. These roles can be modified in the Administration pages by users assigned to the Full Administrator role.
Custom Properties	Full Administrator can manage the custom properties using the Properties page in Explorer. The only custom property type available after installing the Tachyon server is Coverage tags, further types may be added during installation of other Consumers.
Device tags	Device tags can be used when setting the coverage for a particular question so that only client devices with a particular tag name and value get the question. The names and values of Device tags must be pre-configured by a Full Administrator before setting them on a client device using Device tag actions. Device tags can also be queried directly by Device tag questions. Device tags were previously known as Coverage tags. In 1E Client log files, Device tags are also referenced as scopable tags. Please also see Freeform tags.
DNS Name	DNS Name FQDN is the term used in this documentation to represent the name of a Tachyon Server. Typically a Tachyon Server will have only one DNS Name, which will be the CNAME or an (A) Host record that uniquely represents a server's IP Address. 1E normally recommends using an CNAME record. In a Tachyon system, each Tachyon Server will have a DNS Name FQDN. In a single-Switch installation the Switch is on the same server and uses the same DNS Name. When a Response Stack has more than one Switch, each Switch has its own IP Address, so you can choose if the will share

Term	Definition

	the same DNS Name, or if each will have its own DNS Name. The Tachyon Server certificate must have all
	
	`NAME TYPE VALUE`
	`----------`
	`tachyon.acme.com. CNAME tachyon.acme.local.`
	`tachyon.acme.local. CNAME foo.example.com.`
	`foo.example.com. A 192.0.2.23`
	
	`tachyon.acme.com is an Alias record`
	
	`tachyon.acme.local is a CNAME record`
	
	`foo.example.com is a (A) Host record`

Event Subscription	A type of instruction that can be sent to the client. An Event Subscription tells the client to monitor an arbitrary event source for a period of time (defined by the Instruction's TTL), to capture events as they occur and to report them back via the Switch.
Guaranteed State application	The Explorer application is the web portal used by users and administrators. It is an example of a Consumer application. **Note** Explorer can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/explorer/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names. It is a web application on the Tachyon Server Website and provides the following: • Browser connection providing the Explorer and Administration pages • Sends consumer requests to the Consumer API See Tachyon Architecture and Communication Ports.
Filters	There are two kinds of filter: Question filters are used to reduce the responses from the clients; View filters reduce the information displayed in Explorer on the Responses page.

Term	Definition
Freeform tags	Freeform tags may be used to set properties on client devices that can subsequently be used in Freeform tag questions. They cannot be used when defining the coverage for a question. Freeform tags can be set with arbitrary names and values that are defined only when running a Freeform tag action. In Tachyon log files, Freeform tags are also known a non-scopable tags. Please also see Device tags.
FQDN	Fully Qualified Domain Name. This is the complete domain name for a specific IP-connected device, and is unique within the network and unambiguous. The FQDN consists of two parts: the hostname and the domain name. For example tachyon.acme.com.
Full Administrator	This is a Tachyon system role which has the combined rights of all the other system roles.
Group Administrator	This is a Tachyon system role which allows assigned users to create, modify and delete Management groups and modify their membership.
Guaranteed State application	Guaranteed State application is used to ensure endpoint compliance to enterprise IT policies. It is an example of a Consumer application. **Note** Guaranteed State can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/guaranteedstate/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described in DNS Names.
Instruction	Instruction is the generic term used to describe: • Questions • Actions An Instruction is sent to one or more clients, and will yield one or more responses.

Term	Definition
Instruction Definitions	Instruction Definitions are retrieved from the Core by the Switch. They define the type and functionality of the instructions and are used to control the clients to respond in the appropriate way.
Instruction Definition Files	Instruction Definition files are XML format files that contain definitions for Instructions and any associated resources.
Instruction Sets	Instruction Sets provide a way of organizing instructions and setting permissions on those instructions. They can be created, modified and deleted from the Tachyon Administration console.
Instrumentation data	Each of the Tachyon components creates instrumentation data that can be used to display how the Tachyon system is performing.
JSON Provider	This is an internal provider within the Tachyon agent library, used to deserialize and return a JSON string as a data table. Analogous to the Windows specific PowerShell Provider.
Legacy OS	In this documentation, Windows XP, Vista and Windows Server 2003 are referred to as legacy OS. Microsoft has withdrawn support for Windows XP and Windows Server 2003, but 1E includes Vista in this list because it is not significantly used by business organizations. For details of limitations and additional considerations for these OS, please see Supported Platforms.
License file	1E will provide you with a **Tachyon.lic** license file that defines the applications, tools, and features your Tachyon System is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license. • The license must be activated. Once activated, it may be used only by the Tachyon System that activated it. • Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable. • For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk.

Term	Definition
	• For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server. Ensure the following URL is whitelisted: • https://license-v1.1e.com This URL must be accessible from the Tachyon Server during setup and running of Tachyon. The Tachyon license must be validated on a regular basis via internet contact with the 1E license service. The regular validation period is set when the license is requested. For whitelisting purposes, the Tachyon Server (specifically the Coordinator Workflow module in the Master Stack) requires an Internet connection to the 1E license service, as defined in the license file itself. If activation fails, then the system will install but not be usable until activation is completed. **Upgrading** When upgrading, you are recommended to get a new license file and update your whitelist with the new URL. The old URL (https://license.1e.com) is suitable only for 8.0 and earlier. However, if you are upgrading and your license file has the old URL then you should also whitelist the old URL.
License Service	The License Service is hosted in the cloud by 1E, and accessible via an internet connection.
Method	Methods are documented in the SDK.
Normalization	Normalization is a Platform function that refers to the process of finding (or not finding) a match rule in 1E Catalog, then deduplicating and rationalizing the information using Platform logic, and publishing the information on the 1E Catalog UI. Partial Matching for example does not have a match rule in 1E Catalog but it's still normalized and published on the UI using Platform logic.
Patch Success application	Patch Success application is used to report on and ensure successful patching of your enterprise. **Note**

Term	Definition
	Patch Success can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/patchsuccess/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names
Permissions	How the Role-Based Access Control feature assigns Users to Roles, providing access to Instruction Sets and Administration pages.
Persistent Storage	The client stores information in Persistent Storage which it needs each time it starts. For example the last processed instruction. A hash value of each item of information is stored in the registry, which the client uses to ensure it trusts each item. Persistent storage includes a local database that is compressed and encrypted in a way that ensures a very low impact on device performance and security. This database is used to store data for the Tachyon Activity Record feature.
PowerShell Provider	This is a Windows specific internal provider within the Tachyon agent library. It provides functionality to execute powershell.exe from a fixed location (System32\WindowsPowerShell\v1.0) on a PowerShell (.sp1) script and return the result. Some earlier versions of Windows (such as Windows XP) do not support PowerShell.
Product Pack	Product Packs contain instructions or other things which extend the capabilities of Tachyon. Product Packs which are required to support Tachyon features out-of-the-box are provided in the Tachyon Platform zip downloaded from the 1E Support Portal. Other Product Packs are available for download from the 1E Exchange. There are two types of Product Packs described in the following table. **Classic Product Packs** — Classic Product Packs contain instructions (actually Instruction Definition files) for use in Explorer and other Tachyon applications.

Term	Definition
	Classic Product Packs can be uploaded into Tachyon using either of the following methods: • Tachyon Product Pack Deployment Tool - which will upload the instructions in the pack and create an Instruction Set for them based on the name of the zip (with hyphens converted into spaces) • the Tachyon Portal Settings app→ Instructions → Instruction Sets, described in Instructions Menu. This method requires instructions to be organized into Instruction Sets by an Instruction Set Administrator. Settings can also be used to export instructions. Either method requires an Instruction Set Administrator to configure permissions for accessing the instructions.
Integrated Product Packs	Integrated Product Packs contain policies, rules and fragments for use by Guaranteed State, and may also include instructions. If the Integrated Product Pack contains instructions associated with the policies, the tool creates an Instruction Set using the name in its manifest file. Integrated Product Packs are uploaded using the PPDT.
Tachyon Product Pack Deployment Tool	A tool for uploading Classic and Integrated Product Packs. Please see Tachyon Product Pack Deployment Tool.
Providers	Providers can be used by applications to leverage external tools to perform specific operations. For example the reclaim provider enables

Term	Definition
	software to be uninstalled, thereby extending the functionality of the platform to include uninstallation.
Question	In Tachyon a Question is a specific type of instruction that requests information from client devices. The information is returned to Tachyon as responses.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box: Response	The data resulting from a client executing an instruction.
Role-Based Access Control	Also known as RBAC. This is a general term for assigning users to roles which allow them access specific features of Tachyon. Roles can be assigned to AD users and groups added in the Administration Security page. A role can be either of the following: • System role • Custom role
SCALE	The Agent Language.
SDK	The Tachyon SDK describes the following and is available here: /document/preview/736743#UUID-33c212b3-863e-21bc-bc5d-52e41a0492b3 • Agent Language (SCALE) • Agent modules and methods
Securable	Refers to an item that may be secured by Tachyon using RBAC.
Server installation account	This is the account used to run Tachyon Setup (and the MSI installer) when installing or upgrading a Tachyon Server. The account is automatically defined as a Tachyon admin user with limited rights which cannot be edited (called a system principal). The installation account only has sufficient rights to add other users, assign them to roles, and install Tachyon applications. The users and roles created by the

Term	Definition
	installation account are then used for ongoing use and management of Tachyon. If you need the installation account to have additional roles or be a Full Administrator, then the recommended approach is: • First create a role-based AD Security group, and add the installation and other accounts to this group • Then, the installation account: – Logs into Tachyon and navigates to Settings → Permissions → Users and Groups – Creates a new user for the role-based AD Security Group – Assigns the relevant system role(s) to the new user - this can be Full Administrator. When installing a Tachyon Server, the account must be an Active Directory domain account with various rights on the Tachyon Server and the SQL Server instance. For more detail see Tachyon Server Installation Account. For a new installation, only the Server installation account is able to use the Explorer and assign user rights to other users and groups. Once these other users or groups have been assigned, then the Server installation account can be optionally disabled in AD pending future updates and upgrades. The Server installation account is a system principal and cannot be deleted or granted additional rights; it is able to manage additional users and groups, create and edit custom roles, which are then used for ongoing use and management of the system. However, the account may be included in any AD security group assigned to a Tachyon system or custom role.
Server instructions	A special type of instruction, which cannot be run in Explorer. They are for internal use only, run on the server, and used to carry out on-demand or scheduled processing of data across various datasources, such as SQL databases. For example, the Dashboards app uses them to populate tiles and charts with data from the TachyonMaster and Experience databases.

Term	Definition
	They are also called server-side instructions, to differentiate them from client-side instructions which run on client devices.
Settings application	Settings application is used to configure Tachyon system and application settings. It is an example of a Tachyon Consumer application. **Note** Settings can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/platform/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names.
Single-Switch installation	A **single-Switch installation** is a type of single-server installation which has only one Switch. This is the simplest Tachyon Server configuration.
Single-server installation	A **single-server installation** is where all Tachyon Server components are installed on the same Web Server, with one to five Switches, and SQL Server either local or remote. A single-Switch installation is the simplest configuration. More than one Switch requires additional hardware resources. If SQL Server is remote then it is also referred to as a **split-server configuration**. Best performance is achieved using a local SQL Server installation. See Tachyon Architecture and Communication Ports.
SMTP gateway	Systems such as the Tachyon Server connect to the gateway in order to send emails. Also known as SMTP relay.
Switch	The Switch component on the Tachyon Server provides the following: • Sends instructions to and retrieves responses from the clients • Forwards responses to the Core component • Receives workflow commands from the Core component • Retrieves instruction definitions from the Core component • Sends instrumentation data to the Instrumentation component

Term	Definition
	On the Tachyon Server, the Switch Host service is responsible for managing all the local Switches The Switch configuration is stored in the SwitchConfiguration table of the TachyonMaster database. This includes the number of slots and workers used by the Switch which controls the maximum number of devices that can be managed by each Switch. A Switch restart will fail if the Switch failed to de-register itself, therefore the registration entry in the TachyonMaster database will need to be manually removed after troubleshooting. See Tachyon Architecture and Communication Ports.
Switch Host	The Switch Host service • is a Windows service that manages local Switches • automatically starts each Switch and if a Switch stops, the Switch Host analyses the reason and attempt to restart it • has a configuration file contains entries for one or more Switches • has its own log file See Tachyon Architecture and Communication Ports.
System Principal	A system principal is a Tachyon user which cannot be modified in the Administration pages, and is assigned to a system role. The Server installation account is a system principal which is assigned to the Consumer Administrator, Security Administrator and Instruction Set Administrator system roles.
System Role	Tachyon roles which cannot be modified in the Administration pages. Tachyon users can be assigned to these roles. For more information about System and Custom roles, please refer to Roles and Securables. The following are built-in system roles. • All Instructions Actioner • All Instructions Approver • All Instructions Questioner

Term	Definition
	• All Instructions Viewer • Full Administrator • Group Administrator • Guaranteed State Administrator • Guaranteed State Policy Assigner • Guaranteed State User • Installer • Inventory Administrator • Inventory User • Tachyon System
Tachyon Activity Record	This is a client feature, also known as inventory, previously known as Historic Data Capture. This feature captures data from a number of sources on the client device, encrypts and stores in compressed form on the client device. Raw and summarized (aggregated) data is stored and can be queried using instructions. See Tachyon client settings.
Tachyon client	Client features are provided by the 1E Client. The 1E Client includes client features and modules for other 1E products including Tachyon. Tachyon enables rapid response to instructions using the client, which supports the retrieval of information, running actions and device tagging. The client can also be extended to support additional features. The client connects to the Switch and the Background Channel. See Tachyon Architecture and Communication Ports.
Tachyon content	Tachyon content is: • files (such as scripts) associated with a particular instruction via their which the client will download when it performs that instruction.

Term	Definition
	• extensibles (normally in the form of DLLs on Windows), which the client will download when it self-updates. This allows additional client functionality to be deployed. Tachyon content is downloaded on demand via the Background Channel.
1E Exchange	The 1E Exchange is a community platform and library of automation modules (Product Packs) for systems management created by 1E. Our goal for this community is to democratize the development and optimization of automation processes to simplify work. Leveraging SCALE, Tachyon's native language, and the Tachyon Platform we wish to grow into a community that builds powerful modules to serve each other's needs. https://tachyonexchange.1e.com/ You can browse the 1E Exchange but you will need a 1E Support login to download.
Tachyon Instruction Management Studio (TIMS)	This feature is included in the Tachyon Toolkit. TIMS provides a user interface for developing and testing instructions using SCALE. It includes an isolated copy of the 1E Client so that you can develop instructions for that client version, independent of the 1E Client version that may be installed on your computer. By default TIMS and its Tachyon client run under the security context of the user that started it. To use the context of **Local System**, as used by a normal Tachyon client, you can start TIMS using PSexec. More information about TIMS is available in the Tachyon Community on the 1E Support Portal. TIMS should be used to edit and save Instruction Definition files.
Tachyon Instruction Runner	This feature is the graphical user interface part of the Configuration Manager Extensions which is included in the Tachyon Toolkit. It is a mini UI version of Explorer. It is an example of a Tachyon Consumer. It should not to be confused with the Tachyon Run Instruction utility available in the Tachyon Toolkit.

Term	Definition
TachyonMaster database	The SQL Server database which contains: • Configuration details of the Tachyon System • instruction definitions and Instruction Sets • Users (Principals) • Permissions • Roles • Devices • Audit log The configuration files for the following components contain SQL Connection strings for the TachyonMaster database. • Core • Coordinator Workflow module • Consumer API
Tachyon Master Stack	A Tachyon Master Stack is part of a Tachyon System. There is one Tachyon Master Stack that all the Tachyon Response Stacks communicate with. A Tachyon Master Stack contains the following components: • SQL Server instance with TachyonMaster Database (local or remote/split) • Consumer API • Coordinator • Explorer • Authentication • Registration
Tachyon Portal	The Tachyon Portal is the home page for Tachyon applications, which can be reached using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon`

Term	Definition
	where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names. The following buttons appear on all application pages of the Tachyon Portal. The refresh button is used to refresh the contents of the page. The expand button toggles the size of the page inside the browser by hiding or showing the menu and main title bar.
TachyonResponses database	The SQL Server database which contains: • Responses
Tachyon Response Stacks	A Response Stack is part of a Tachyon System. This is where one or more Response Stacks talk back to a single Tachyon Master Stack. Multiple Response Stacks are necessary when additional Switches are required for scale, security or for geographic or other network reasons. Each Switch can handle 50000 devices, so each Response Stack can handle a maximum of 250000 devices. Each Response Stack has the following components: • Switch Host • Switches (up to 5, local or remote/split) • Core • SQL Server instance with Tachyon Responses database (local or remote/split) • Background Channel A Response Stack will typically host Switches and Background Channel using the same DNS Alias.

Term	Definition
Tachyon Role	Tachyon roles are used to implement Role-base access control (RBAC) and assign permissions to users and restrict access to areas of Explorer and ability to use instructions in Instruction Sets .The roles may be system roles or custom roles related to specific Instruction Sets .
Tachyon Run Instruction utility	This command-line utility is included in the Tachyon Toolkit and is targeted at 3rd party integration, and can be used by scripts. It is an example of a Tachyon Consumer. It is used by the Configuration Manager Extensions which is also available in the Tachyon Toolkit. More information about the Tachyon Run Instruction utility is available in the Tachyon Community on the 1E Support Portal.
Tachyon Server	A Tachyon Server is any server on which a Tachyon Server component is installed. The following are Tachyon Server components. • Coordinator service (Instrumentation and Workflow modules) • Switch Host • Switches • Website (including Explorer and Core) A Tachyon Server can have one or more Switches. See also single-server installation and single-Switch installation. See Tachyon Architecture and Communication Ports.
Tachyon Stack	There are two types of Stack: Master Stack and Response Stack. Every Tachyon system has a single **Master Stack**, which provides web services for Tachyon applications. Master Stack components are typically all installed on a single **Master Server**. Tachyon real-time features require **Response Stacks**, which are made up of one or more **Response Servers**. A **DMZ Server** is an example of a Response Server. Each Response Stack has at least one **Background Channel** for sharing resources, and a single **Core** component that supports an associated set of up to five **Switches**. Switches are the primary mechanism for rapidly requesting and retrieving responses from the **clients**. As each Switch can handle up to

Term	Definition
	50,000 devices there is a limit of 250,000 devices per Response Stack. Higher numbers can be achieved if you contact 1E for guidance. Switches may be local or remote to the other components in the Response Stack. **Databases** for Tachyon, Catalog, Content Distribution, Experience, SLA and BI, are installed on SQL Server database instance(s) that may also be local or remote to their respective Master and Response servers. It is also possible for multiple Response Stacks to share the same Responses database. The **Cube** used by Patch Success (SLA-BI) is installed on a local or remote SQL Server Analysis Services (SSAS) instance. For more details about architecture and components, please see Tachyon Architecture. Also see Architectural requirements.
Tachyon System	At the top-most level, a Tachyon System consists of Tachyon Server components, grouped into Tachyon Stacks, and a set of clients that are deployed onto the devices that you want to manage. In addition, a system can have one or more Consumers (the built-in Consumer is Explorer). See Tachyon Architecture and Communication Ports. Tachyon System is also a system role, used by Tachyon for service an equivalent account to perform Tachyon system operations.
Tachyon Toolkit	The Tachyon Toolkit is a collection of the following tools, which can be installed on a Windows computer for use by a User who has appropriate permissions. • Configuration Manager Extensions - this can be installed only on a computer that has already installed a Supported Platforms • Tachyon Instruction Management Studio. • .Tachyon Run Instruction utility The toolkit is available for download from the Tachyon Community in the 1E Support Portal. Documentation for installing and using the Toolkit will be available soon.
Tachyon User	A domain account that is authorized to access Explorer portal and/or the Tachyon Administration pages.

Term	Definition
	Authorization is achieved by adding the AD account or group and assigning it to a role.
Tags	There are two types of tag: coverage tags and freeform tags. In Tachyon log files, these tags are also known a scopable and non-scopable tags.
Two-factor authentication	Also known as 2FA. See Two-factor authentication.
Website	The Tachyon Website hosts the following web applications: Master: • Admin • Consumer - Consumer API • CoreExternal • Platform • Tachyon Response and DMZ: • Background - Background Channel • Core Optional applications on Master: • ContentDistrbution • Experience The Website has an HTTP binding and HTTPS binding. • The HTTP binding uses the server's hostname FQDN as a host header, and is used only by SLA components - please refer to Removing the HTTP binding from the Tachyon website • One or more HTTPS bindings - these use the Tachyon Web Server certificate, the server's DNS Alias as the host name, and has SNI enabled.

Term	Definition
	See Tachyon Architecture and Communication Ports.
Workflow commands	Workflow commands determine how the Coordinator Workflow module processes an instruction, particularly in terms of the permissions required to run the instruction.

1.12 Increasing Azure SQL Server Performance

The latest Azure Ev5 series VMs provides up to three times an increase in remote storage performance compared with previous generations: https://azure.microsoft.com/en-us/blog/increase-remote-storage-performance-with-azure-ebsv5-vms-now-generally-available/.

For larger scale Tachyon environments, achieving the best storage throughput provides the best performance for long running data consolidation operations.

In addition, the latest Ev5 Series VMs support disk busting which provides the ability to boost disk storage IOPS and MB/s performance: https://learn.microsoft.com/en-us/azure/virtual-machines/disk-bursting

On-demand disk bursting in Azure is only available for premium disks of 1TB in size or greater (P30), but by enabling this on SQL data disk(s), allows you to achieve the maximum storage throughput available to the VM on high-intensity operations: https://learn.microsoft.com/en-us/azure/virtual-machines/disks-enable-bursting.

2 1E Client

Here, we describe all aspects of installing and configuring 1E Client.

2.1 Introducing 1E Client

An overview of 1E Client features and modules. The 1E Client provides client functionality for Shopping, WakeUp, Nomad, and Tachyon.

The picture below shows the evolution of the 1E Client from a combination of other 1E Agents.

Note

On non-Windows devices, 1E Client provides only Tachyon client features.

In response to customer demand to reduce the number of agents required, 1E have unified the client functionality for Nomad, PXE Everywhere, Shopping, WakeUp, and Tachyon into a single 1E Client.

On Windows devices, 1E Client provides the following:

- Tachyon client features - see below
- User surveys and notifications, and notification area icon. This is used by Experience to enable User Sentiment and Info Surveys to be presented to end-users.
- Tachyon Telemetry. This information enables 1E to improve its product capabilities and features. It can be configured during Tachyon Setup and information on the data that is sent to 1E is provided in the Tachyon platform documentation.
- Nomad client module - supports content distribution for Configuration Manager and Tachyon
- PXE Everywhere client module - also known as PXE Everywhere Agent - which allows computers to automatically boot up into Windows PE, which then allows a Windows Operating System to be installed
- Shopping client module - supports access to a self-service software portal (which integrates with Configuration Manager) and includes the Windows Servicing Assistant (WSA) to support OS deployment
- WakeUp client module - integrates with Configuration Manager, NightWatchman and/or Nomad.

On non-Windows devices, 1E Client provides only Tachyon client features.

Tachyon client features:

- Real-time response to instructions, which supports the retrieval of information using questions, and running actions
- Tags (freeform and device/coverage)
- Criticality and Location
- 1E Client UI to support the Real-Time Control Center, Announcements, Surveys, and Sentiment features of the Experience application #
- Inventory, including process usage, to support:
  - The Tachyon Activity Record feature
  - The Inventory and other consumer applications.
- Performance metrics features to support the Experience application #
- Policy feature to support consumer applications: Guaranteed State ##, Experience #, and Nomad #
- Modules to support:
  - The Patch Success application #
  - Command and script execution

- Content distribution
- Device criticality
- Manipulation of files and processes
- Manipulation of registry and WMI #
- Security #
- Software uninstallation
- User sessions, including Primary User.

not supported on non-Windows, ## partially supported on non-Windows.

Many features and modules are optionally enabled and configured. The 1E Client can also be extended to support additional features and client modules.

1E Client does not include modules for 1E NightWatchman Agent, which is available as a separate agent. However, NightWatchman Management Center optionally integrates with Tachyon to provide online status of its clients.

On Windows devices, the 1E Client is installed as a Windows service, with a small footprint, with some client modules having their own service if enabled. On non-Windows devices, the 1E Client is installed as a background daemon, also referred to as a service on macOS.

2.1.1 Deployment

The Introducing 1E Client Deployment Assistant can be used with Microsoft System Center Configuration Manager to deploy 1E Client to Windows computers, and also 1E NightWatchman Agent.

1E Client may be deployed independently using alternative software distribution methods.

For further detail, please refer to:

- Deploying 1E Client on Windows
- Deploying 1E Client on macOS
- Deploying 1E Client on Linux
- Deploying 1E Client on Solaris
- Reconfiguring 1E Client
- Verifying

2.1.2 Supported Platforms

All 1E Client features are supported on the following Windows OS:

Windows

- Windows Server 2022

- Windows Server 2019
- Windows Server 2016
- Windows 11 CB 21H2
- Windows 10 CB 21H2
- Windows 10 CB 21H1
- Windows 10 CB 20H2

The zip for 1E Client for Windows is available for download from the 1E Support Portal.

Professional and Enterprise editions are supported for Windows 10 and Wndows 11.

All versions are provided with 32-bit & 64-installers, and can be installed on physical and virtual computers.

> **Note**
>
> This list shows only those OS versions in mainstream support by Microsoft, and therefore supported by 1E, and by 1E Client 8.1.
>
> For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.
>
> Please refer to https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions.

The Tachyon client features of 1E Client are supported on the following non-Windows OS:

macOS

- macOS Monterey 12.0
- macOS Big Sur 11.0
- macOS Catalina 10.15
- macOS Mojave 10.14

Linux

- CentOS Stream 8
- Debian 10.4
- Fedora 34
- Red Hat Enterprise Linux 7.9
- Red Hat Enterprise Linux 8.5
- SUSE Linux Enterprise 15.2
- Ubuntu 18.04

Solaris

- Please use 1E Client 5.2

Other versions of these non-Windows OS should work but have not been tested by 1E.

1E Client packages for other Linux distributions can be requested, including Raspbian for Raspberry Pi.

The 1E Client for Linux supports the following architectures:

- Linux variations on Intel 64-bit platforms

1E Client packages for Linux are included in the non-Windows zip available for download from the 1E Support Portal.

1E Client supports only Tachyon features on non-Windows devices.

1E Client 8.1 is ***not*** available for Solaris, please use 1E Client 5.2 instead.

The 1E Client 5.2 for Solaris supports the following architectures:

- Solaris on Intel 64-bit and SPARC platforms

1E Client 5.2 package for Solaris is included in the non-Windows zip and available for download from the 1E Support Portal.

1E Client supports only Tachyon features on non-Windows devices.

Additional information on Supported Platforms can be found on the Supported Platforms page.

2.1.3 Constraints of Legacy OS

In this documentation, the following are referred to as legacy OS. Below are described some known issues for these OS.

1E does not provide support for 1E products on the following OS unless the OS is explicitly listed as being supported for a specific 1E product or product feature. This is because Microsoft has ended mainstream support for these OS or they are not significantly used by business organizations.

- **Windows XP ***
- **Windows Vista**
- **Windows 7**
- **Windows 8.0**
- **Windows 8.1**
- **Windows Server 2003 ***
- **Windows Server 2008**
- **Windows Server 2008 R2**
- **Windows Server 2012**
- **Windows Server 2012 R2**

Note

1E Client 8.1 and later will not install on Windows XP and Windows Server 2003. Please contact 1E if you intend to continue using any of the other legacy OS. If you experience an issue, then please try replicating the issue on a supported OS.

For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.

2.2 Planning for 1E Client

1E Client is deployed as part of one or more 1E Solutions. You should review documentation for whichever 1E Solutions you are licensed to use, to help you decide which 1E Client features to configure, determined by which server systems are used.

Tip

1E Client contains client features and modules for Tachyon, Shopping/WSA, WakeUp, Nomad and PXE Everywhere clients. You can optionally enable and configure clients during and after installation.

You will need to decide which client features and modules to enable and configure. Unless otherwise stated, modules are only available on Windows computers. Please refer to Supported Platforms for details of supported OS platforms.

All modules including the Tachyon client feature can be optionally enabled during deployment of the 1E Client or after deployment by enabling features in its configuration file.

Feature/module	Description	Infrastructure dependencies
1E Client	This is the main service that determines which features and modules are enabled, including uninstallation of legacy versions of the 1E Client listed below. Please refer to 1E Client settings for details of configurable options.	See Common client requirements.
Tachyon client	Must be enabled on each end-user device to provide Real-time and Inventory features to support the following Tachyon platform applications: Explorer,	Full Tachyon infrastructure,

Feature/module	Description	Infrastructure dependencies
	Experience (including User Sensitivity), Guaranteed State, Patch Success, Application Migration, and AppClarity. Also required to support integration with NightWatchman and Nomad. Supports Windows and non-Windows devices. Please refer to Platform features of the 1E Client for details of configurable options.	including Master and Response Stacks. See infrastructure section in Tachyon platform client requirements.
Nomad client	1E Client module which replaces the NomadBranch client to support Nomad 7.0 and later, as well as Tachyon client's use of the Nomad content download feature. Must be enabled on each end-user device to provide bandwidth-efficient download of content for Tachyon clients, as well as Configuration Manager clients. It is optionally used by PXE Everywhere. Please refer to Content Distribution client settings for details of configurable options.	Tachyon infrastructure, including Master and Response Stacks. See the infrastructure section in Nomad client requirements
PXE Everywhere Agent	1E Client module which replaces the PXE Everywhere Agent to support PXE Everywhere 4.0 and later. Enabled on as may end-user devices as possible to provide a lightweight PXE service that responds to PXE requests on their local subnet. Please refer to /document/preview/647626#UUID-07a4d117-b2a9-8325-0e8e-1d3649997dc4 for details of configurable options.	PXE Everywhere Central must be installed. See the infrastructure section in PXE Everywhere client requirements. You can also configure PXE Everywhere to support environments that use DHCP Snooping.
Shopping client	Must be enabled on each end-user device to support access to the Shopping web portal, and WSA features to support OS rebuilds and upgrades.	Shopping Central website and

Feature/module	Description	Infrastructure dependencies
	Please refer to Shopping client settings for details of configurable options.	Shopping Receiver services are required. See the infrastructure section in Shopping client requirements.
WakeUp client	1E Client module which replaces WakeUp Agent to support WakeUp Server 7.2.500 and later. This version contains hotfixes. Must be enabled on each end-user device to support Wake-on-LAN and Configuration Manager policy refresh. Also integrates with Shopping policy refresh, and with 1E NightWatchman Agent for power management. Please refer to /document/preview/647736#UUID-b588cdab-ae07-3331-ceb1-c8c6ed63aa1e for details of configurable options.	NightWatchman Management Center server and at least one WakeUp Server are required. See the infrastructure section in WakeUp client requirements.

2.2.1 Common client requirements

Prerequisites and dependencies that are common to all client features and modules of the 1E Client.

Tip

1E Client contains client features and modules for Tachyon, Shopping/WSA, WakeUp, Nomad and PXE Everywhere clients. You can optionally enable and configure clients during and after installation.

2.2.1.1 Installation account for Windows

The 1E Client installer installs a service as local system, therefore the installation account for Windows clients must be capable of being elevated in order to run the installer. The simplest way of achieving this is for the account to have full local administrator rights (as a member of the localgroup administrators, either directly or indirectly).

2.2.1.2 Installation account for non-Windows

To install the 1E Client on a non-Windows client the installation account must have privileges to run the **sudo** command.

1E Client supports only Tachyon platform client features on non-Windows devices.

2.2.1.3 Supported Platforms

A list of all the platforms supported by **1E Client**, and the software required to allow **1E Client** to be installed or to work.

2.2.1.3.1 Windows client

Category	Product	Notes
Operating System	• Windows Server 2022 • Windows Server 2019 • Windows Server 2016 • Windows 11 CB 22H2 • Windows 11 CB 21H2 • Windows 10 CB 22H2 • Windows 10 CB 21H2	The zip for 1E Client for Windows is available for download from the support.1e.com/. Professional and Enterprise editions are supported for Windows 10 and Windows 11. All versions are provided with 32-bit & 64-installers, and can be installed on physical and virtual computers. **Note** This list shows only those OS versions in mainstream support by Microsoft, and therefore supported by Tachyon, and by 1E Client 8.1. Please refer to Constraints of Legacy OS regarding the end of mainstream support. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Refer to Support for Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions. For installation guidance on Windows, please refer to Deploying 1E Client on Windows. The following 1E Client features and modules are supported on Windows OS: • Real-time features (for example instructions, experience, interaction)

Category	Product	Notes
		• Nomad client • PXE Everywhere Agent client • Shopping client • Windows Servicing Assistant (WSA) client (workstation OS only, not server OS) • WakeUp client
Runtime libraries	• .NET Framework 4.8 • Visual C++ 2015-2019 Redistributable	.NET Framework is required only for the following features of 1E Client: • The Real-Time Control Center feature of the 1E Client (also known as 1E Client UI and Interaction module) supports Experience Engagements (Announcements and Surveys), and ITSM Support Tickets • Windows Servicing Assistant (WSA) is a feature of the Shopping/WSA client module, which supports OS deployment, upgrades and migrations. **Note** This list shows only those .NET Framework versions in mainstream support by Microsoft, and therefore supported by 1E, and by 1E Client 8.1. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. 1E Client installer includes the Visual C++ 2015-2019 Redistributable package.
Other Windows Software	• Nomad 8.0 (or later) • PowerShell 3.0 (or later)	1E Client provides real-time client features. It also includes the Nomad client module. Real-time client features can optionally use Nomad to download content (feature enabled by default) if the Nomad client module in 1E Client is enabled (module

Category	Product	Notes
		disabled by default) or Nomad 7.0 or later is running. For more details please refer to Nomad client requirements. PowerShell is not a prerequisite for installation of the 1E Client. PowerShell is used by some Tachyon instructions (that have PowerShell commands embedded or scripts that are downloaded) and some of these require PowerShell 3.0 or later.
Microsoft Endpoint Configuration Manager Client	• MECM CB 2211 • MECM CB 2207 • MECM CB 2203 • MECM CB 2111 • MECM CB 2107	The following client features work with these versions of Configuration Manager on Windows computers: • Real-time client - instructions used by Tachyon Configuration Manager Console extensions • Nomad client • PXE Everywhere Agent • Shopping/WSA client • WakeUp client - including Policy Refresh and REFRESHONSUBNETCHANGE features Configuration Manager is not a prerequisite for installation of the 1E Client, and except for above features, the 1E Client, its features and modules, have no dependency on Configuration Manager. Tachyon, Nomad, WakeUp, and Application Migration have Configuration Manager Console extensions which are available separately. **Note** This list shows only those Configuration Manager versions in mainstream support by Microsoft, and therefore supported by 1E, and by 1E Client 8.1.

Category	Product	Notes
		For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Please refer to the Support for the Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions. (Microsoft Endpoint Configuration Manager - MECM - is also known as Configuration Manager, ConfigMgr, Config Man, CM, and SCCM among other names. Version names include 2012 and Current Branch or CB.)

2.2.1.3.2 macOS clients

Category	Product	Notes
Operating System	• macOS Monterey 12.0 • macOS Big Sur 11.6 • macOS Big Sur 11.0 • macOS Catalina 10.15 • macOS Mojave 10.14	Other versions of these non-Windows OS should work but have not been tested by 1E. 1E Client package for macOS is included in the non-Windows zip available for download from the support.1e.com/. **Note** 1E Client for macOS is written for Intel and supported on Apple devices using Intel processors. It is also supported on Apple devices using the M1 chip, provided you have installed Rosetta 2, which is included with Big Sur. 1E Client is a daemon (not an app), therefore, during installation or running it will *not* prompt for Rosetta 2, which does not get installed on-demand. You only need to install Rosetta 2 once, using one of the following commands, but repeating the command will safely reinstall it. The second version of the command requires root permission. Attempting to install on an Intel device will issue a harmless "unrecognized option" usage message.

Category	Product	Notes

		`/usr/sbin/softwareupdate --install-rosetta`
		`/usr/sbin/softwareupdate --install-rosetta --agree-to-license`
		
		For installation guidance, please refer to Deploying 1E Client on macOS.

Other Software	• Bash • Perl • Rosetta 2 (on non-Intel)	Bash and perl are required for installation of 1E Client on all non-Windows OS. Tachyon instructions support the use of Bash scripts on all supported non-Windows OS. To see if an Instruction requires a Bash script, look in its Instruction Definition XML file for Bash script resources defined under the <Resources> tag. Bash is the preferred choice when developing custom instructions for non-Windows OS. There are slight differences between OS implementations of Bash, particularly on the Mac. Therefore, 1E recommends testing custom Bash scripts on each supported OS. Rosetta 2 must be installed before installing 1E Client for macOS on an Apple device using a non-Intel processor such as M1 chip. Please see note above about installing Rosetta 2.

2.2.1.3.3 Linux clients

Category	Product	Notes
Operating System	• CentOS Stream 8 • Debian 10.4 • Fedora 34 • openSUSE Leap 15.2 • Red Hat Enterprise Linux 7.9	Other versions of these non-Windows OS should work but have not been tested by 1E. • 1E Client packages for other Linux distributions can be requested, including Raspberry Pi. • 1E Client for Linux supports Linux variations on Intel 64-bit platforms. • 1E Client packages for Linux are included in the non-Windows zip available for download from support.1e.com/.

Category	Product	Notes
	• Red Hat Enterprise Linux 8.5 • SUSE Linux Enterprise 15.2 • Ubuntu 18.04	• 1E Client supports features on non-Windows devices. For installation guidance on the following OS, please refer to Deploying 1E Client on Linux.
Other Software	• Bash • Perl	Bash and perl are required for installation of 1E Client on all non-Windows OS. Tachyon instructions support the use of Bash scripts on all supported non-Windows OS. To see if an Instruction requires a Bash script, look in its Instruction Definition XML file for Bash script resources defined under the <Resources> tag. Bash is the preferred choice when developing custom instructions for non-Windows OS. There are slight differences between OS implementations of Bash, particularly on the Mac. Therefore, 1E recommends testing custom Bash scripts on each supported OS.

2.2.1.3.4 Solaris clients

Category	Product	Notes
Operating System	• Withdrawn	**Note** 1E Client is no longer available for Solaris, but 1E may reintroduce it, if there is sufficient demand.

2.2.1.4 Feature dependencies

Products and Features with dependencies on the 1E Client.

Supported versions of 1E companion products with features that depend on 1E Client 8.1.

Products and features that depend on 1E Client	Supported versions of companion products	
Tachyon	Tachyon requires the 1E Client (with 1E Client platform features enabled) to be installed on all client computers. This replaces the legacy Tachyon Agent. Tachyon platform features: • Real-time response to instructions, which supports the retrieval of information using questions, and running actions • Tags (freeform and device/coverage) • Criticality and Location • 1E Client UI to support the Real-Time Control Center, Announcements, Surveys, and Sentiment features of the Experience application # • Inventory, including process usage, to support the: – Tachyon Activity Record feature – Inventory and other consumer applications. • Performance metrics features to support the Experience application # • Policy feature to support consumer applications: Guaranteed State ##, Experience #, and Nomad # – Patch Success application # – Command and script execution – Nomad – Device criticality – Manipulation of files and processes	• Tachyon 8.1 • Tachyon 8.0 • Tachyon 5.2 • Tachyon 5.1

Products and features that depend on 1E Client	Supported versions of companion products
	– Manipulation of the registry and WMI # – Security # – Software uninstallation – User sessions, including Primary User. • Modules to support: # not supported on non-Windows, ## partially supported on non-Windows Clients can optionally use the Nomad client module of 1E Client to more efficiently download content.
Nomad	Nomad requires the 1E Client (with Nomad client module enabled) to be installed on all client computers, and on Distribution Points if Configuration Manager is used.	• Nomad 8.1 • Nomad 8.0 • Nomad 7.1
Nomad	Nomad Download Pause is an optional feature of Nomad. It requires the 1E Client (with Nomad client module enabled) to be installed on all client computers, and a Tachyon server infrastructure.	• Tachyon 8.1 • Tachyon 8.0 • Tachyon 5.2 • Tachyon 5.1 • Nomad 8.0 • Nomad 7.1
PXE Everywhere	PXE Everywhere requires the 1E Client (with PXE Everywhere Agent client module enabled) to be installed on all client computers.	• PXE Everywhere 8.1 • PXE Everywhere 8.0

Products and features that depend on 1E Client	Supported versions of companion products
	• PXE Everywhere 4.0
Shopping	Shopping requires the 1E Client (with Shopping client module enabled) to be installed on all client computers. This replaces the legacy Shopping Agent.	• Shopping 6.1 • Shopping 6.0
Shopping	Windows Servicing Assistant (WSA) is an optional feature of Shopping that supports OS Deployment. Please refer to Shopping 6.1 - Preparation: Windows Servicing Assistant (WSA) for WSA features in different versions of 1E Client.	• Nomad 8.1 • Nomad 8.0 • Nomad 7.1 • Shopping 6.1 • Shopping 6.0
WakeUp	WakeUp requires the 1E Client (with WakeUp client module enabled) to be installed on all client computers, and WakeUp Servers. This replaces the WakeUp component of the 1E Agent.	• WakeUp 7.3

Supported versions of 1E companion products that 1E Client 8.1 features depend on.

Products and features that 1E Client depends on	Supported versions of companion products
Tachyon	Tachyon real-time and other features require a full Tachyon infrastructure including a Tachyon Server and a Tachyon license.	• Tachyon 8.1 • Tachyon 8.0 • Tachyon 5.2 • Tachyon 5.1
Nomad	Tachyon platform clients can optionally use Nomad (1E Client with Nomad client features enabled) to provide more efficient downloading of content.	• 1E Client 8.1 (with Nomad client module enabled)

Products and features that 1E Client depends on	Supported versions of companion products
	• 1E Client 8.0 (with Nomad client module enabled) • 1E Client 5.2 (with Nomad client module enabled) • 1E Client 5.1 (with Nomad client module enabled)

2.2.1.5 Firewall ports

1E does not provide a combined diagram showing all components and features. Please refer to the communications reference page for each product:

- Tachyon platform Communication Ports.
- Nomad Communication ports — Diagrams and tables with lists of all the Nomad communication ports.
- PXE Everywhere communication ports — A list of communication ports used by PXE Everywhere. Useful, if needed, for network and device firewalls.
- Shopping communication ports — A diagram and a table with a list of all the Shopping communication ports.
- NightWatchman Enterprise communication ports — Tables with lists of all the NightWatchman Enterprise components and their communication ports.

2.2.1.6 Anti-Virus and Malware

The following should be excluded from scans to prevent file locking and resource deletion.

- 1E log files. See Log files.
- The 1E Client temporary directory. We recommend modifying the TemporaryDirectory 1E Client configuration setting to **%programdata%\1E\Client\Temp** and excluding that directory. See 1E Client settings.

  Note

  TemporaryDirectory must be specified as an absolute path. The directory is not automatically created by 1E Client. It must be created before being set otherwise 1E Client will use its default.

2.2.1.7 Digital signing certificates

On Windows computers, the installation MSIs, executables and DLLs of the 1E software are digitally signed by 1E using the **1E Limited** SHA1 and SHA256 signature certificates.

These signing certificates are issued by the **Symantec Class 3 SHA256 Code Signing CA**, which in turn is issued by the root CA **VeriSign Class 3 Public Primary Certification Authority - G5**.

The SHA1 and SHA256 signature certificates are each countersigned with the same Timestamp signature certificate **Starfield Timestamp Authority - G2**, itself issued by **Starfield Secure Certificate Authority - G2**, in turn issued by the root CA **Starfield Root Certificate Authority – G2**.

The root CA certificates (for signing and countersigning) must exist in the **Third-Party Root Certification Authorities** store (which is replicated in the Trusted Root Certification Authorities store). These root CA certificates are normally automatically provided by Microsoft's Update Root Certificates feature, however for legacy OS computers in a lab environment that are not connected to the Internet, see Common client requirements.

2.2.1.8 Constraints of Legacy OS

1E does not provide support for 1E products on the following OS unless the OS is explicitly listed as being supported for a specific 1E product or product feature. This is because Microsoft has ended mainstream support for these OS or they are not significantly used by business organizations. For details, refer to Supported Platforms

2.2.2 Tachyon platform client requirements

Information that will help you design and plan the implementation of Tachyon in your organization. This includes all the prerequisites and dependencies, which are necessary to install 1E Client with Tachyon platform features enabled.

For a full understanding of Tachyon features and their configuration, please refer to Introducing Tachyon documentation.

Tip

Tachyon platform client features are not required if the 1E Client is being installed only to support PXE Everywhere, Shopping, or WakeUp.

Tachyon platform client features are required if you are using any of the following:

- Experience
- Explorer
- Guaranteed State
- Patch Success
- Nomad - if using Nomad features of the Tachyon platform. Also requires Nomad client to be enabled
- AppClarity - if using Tachyon as an inventory data source
- Application Migration - if using Tachyon as an inventory data source.

2.2.2.1 Public Key Infrastructure

Tachyon features require a PKI and certificates on client devices and servers. Please see below for client requirements, and Certificate requirements for server requirements.

You need to have a PKI in your environment with at least one Issuing CA.

Tachyon requires each Issuing CA has:

- A **Certificate Revocation List** (CRL) **Distribution Point** (CDP) that uses HTTP/S
- This HTTP/S CDP information is included in certificates issued to Tachyon Server and client devices.

PKI notes

If you have an existing PKI and have just added a new CDP to support HTTP/S then you will need to re-issue certificates to your servers and devices.

Tachyon deliberately does not work with self-signed certificates for security reasons. Therefore, Tachyon client or Server cannot be installed on the same server as a Root CA, because its certificate is self-signed.

Tachyon uses TLSv1.2. If your PKI is using SHA512, then please ensure that your environment has relevant updates applied, as described in KB2973337. See Client issues.

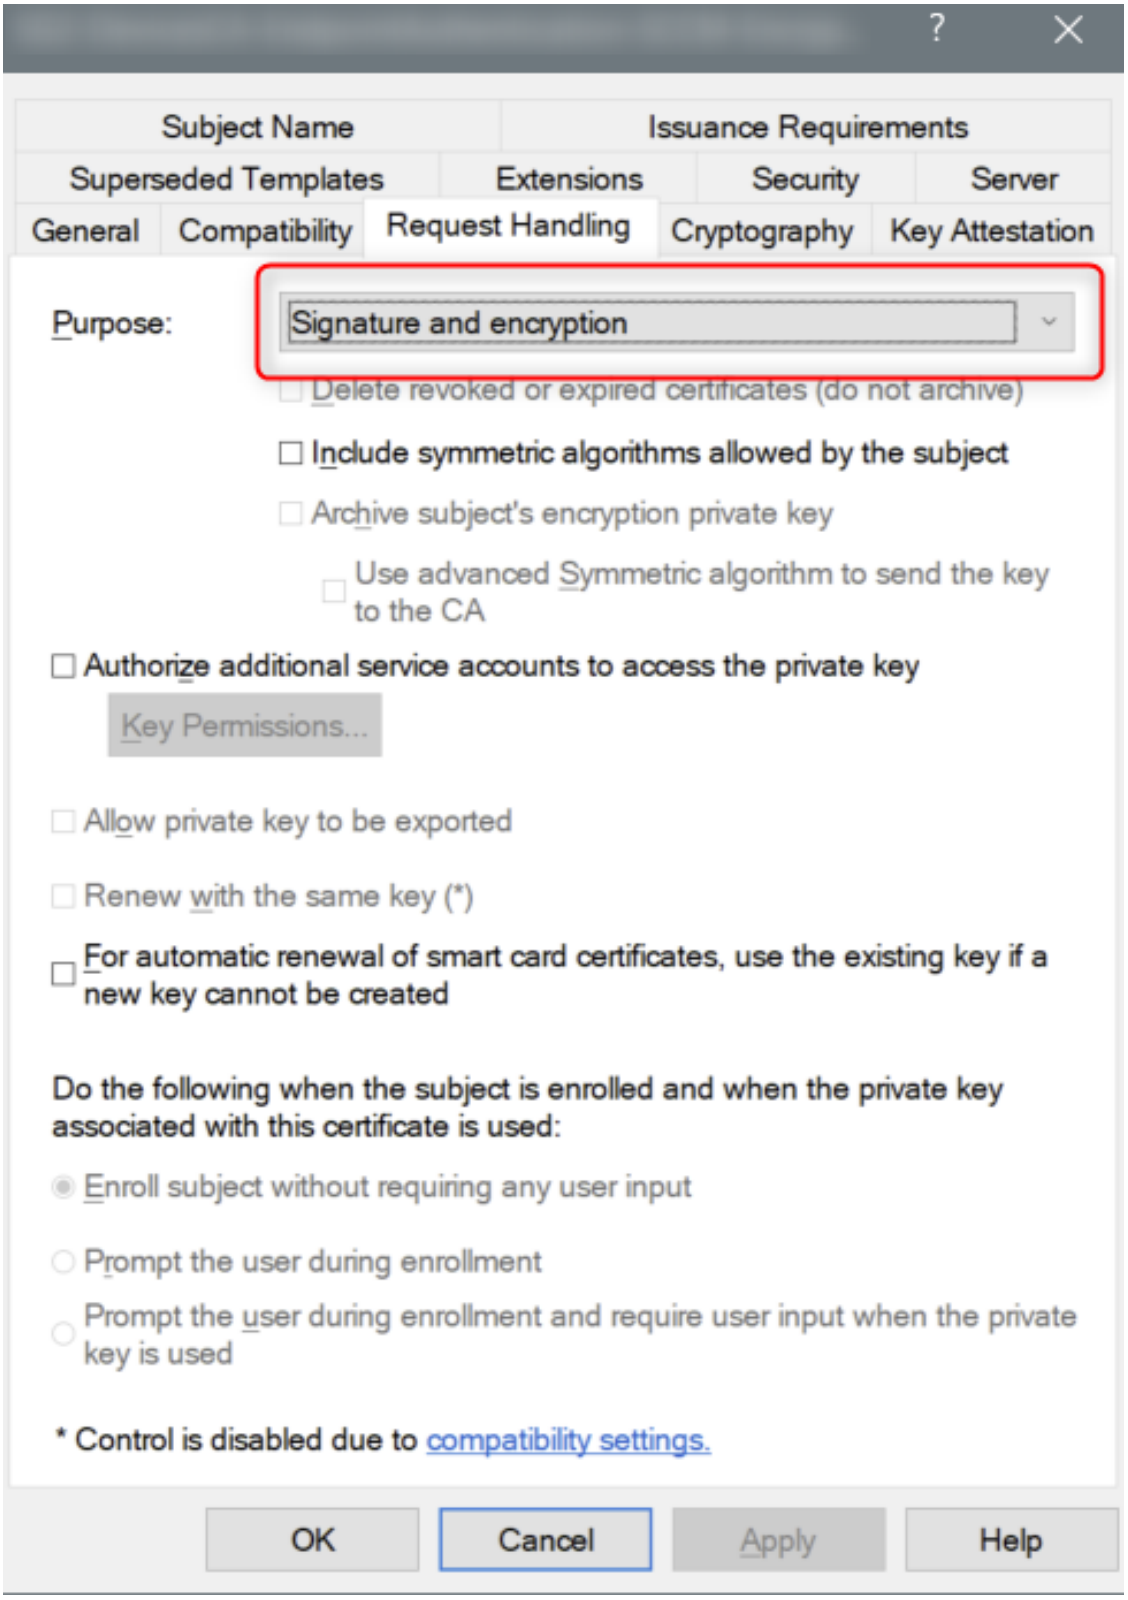
If you want Tachyon to manage legacy OS that Microsoft no longer supports, there may be issues with encrypted certificates described in Common client requirements.

2.2.2.2 Client Certificates

If you have configured Tachyon Server to require client certificates (Client certificates) then each device requires a certificate with the following properties, so the Tachyon platform client can be authenticated by the Tachyon Switch.

Note

The 1E Client requires that the client certificate it presents to the platform has both the **Signature** and **Encryption** request handling options. These options are the defaults if provisioning using a Computer Certificate template from a Microsoft Windows Certificate Authority. If you are using a custom template, or an alternative certificate authority, you should confirm that both these options are enabled.



- Issued by a trusted Certificate Authority (CA):
  - The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the client.

  - If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the client.
  - If either of these CA certificates is different from those used by the Tachyon Web Server, they will need to be exported and imported on the Tachyon Web Server.
  - Most organizations have automated distribution of these CA certificates to clients and servers, using Group Policy for example.
- Has at least the following Enhanced Key Usage:
  - Client Authentication.
- Has at least the following Key Usage:
  - Digital Signature.
  - Key encipherment.
- Has a private key:
  - For workgroup and non-Windows devices, the **private key must be exportable**
- Revocation information is included:
  - References at least one CRL Distribution point that uses HTTP.
- Has a Subject Name of type Common Name (**CN=<computername>**) or Subject Alternative Name (**DNS Name=<computername>**) where <computername> depends on the type of device:
  - On domain-joined Windows PCs this must be the **computername FQDN** of the computer, for example **W701.ACME.LOCAL**.
  - On workgroup Windows PCs and non-Windows devices, this must be the computername of the computer - as returned by the **hostname** command, for example on Windows PC this could be **W701**, and on a Mac this could be **MAC01.local**.

Note

Tachyon clients and Switches use OpenSSL and its validation process to verify certificates.

The client device's certificate is stored differently depending on the type of OS:

- For Windows devices, the certificate is stored in the Windows Local Computer personal certificates store.
- For non-Windows devices, except for the Mac, the client does not use proprietary certificate stores. Instead, the client requires the certificate to exist as a **.pfx** file in the client installation folder structure, refer to Client certificates.
- For macOS, you have a choice of storing the client certificate in the macOS Key Store or using the **.pfx** file approach required by other non-Windows devices, refer to Client certificates.

The following need to be considered when requesting this type of certificate:

- The certificate can be used only on the server it was intended, that has the correct computername FQDN and DNS Alias FQDN.
- It is not possible to use the **Create Certificate Request** method in IIS Manager Server Certificates, because it does not support all the above requirements.
- If you have a Microsoft CA, and a suitable **Web Server** template has been issued and enabled in the **Directory Enrollment Policy**, then it is possible to **Request New Certificate** in the **Certificates (Local Computer)** mmc snap-in and use the **Certificate Enrollment wizard**.
- Many organizations have their own process for submitting a Certificate Signing Request (CSR). Please ensure all the above requirements are specified. Security administrators sometimes have difficulty providing a certificate with one or more Subject Alternative Names (SAN), and it helps to explain these are type DNS.

2.2.2.3 Other infrastructure requirements

In addition to PKI and network requirements, other infrastructure dependencies are:

- **DNS** - each Tachyon Server requires at least one DNS Name
- **Active Directory** - for installation and user accounts and groups; Tachyon supports multi-domain, multi-forest environments that have two-way trusts
- **IIS** - a standard configuration required on each Tachyon Server
- **SQL Server** - databases for Tachyon Master and Response Stacks, 1E Catalog, SLA, BI, Experience and Nomad
- **SQL Analysis Services** - must be installed in multi-dimensional mode, if you are installing Business Intelligence (required by Patch Success)
- **Email** - optional for approval and notification emails, but required if using two-factor authentication (2FA)
- **Internet access** - Master Stack requires access to the 1E license service via the Internet in order to keep the Tachyon license activated, and 1E Catalog requires access to the 1E Catalog Cloud service to download Catalog updates.

These are explained in Planning for Tachyon.

2.2.2.4 Tachyon platform client integration with Nomad

Tachyon platform client integration with Nomad allows clients to make use of Nomad features for more efficient downloading of content from different HTTP sources, including the Tachyon Background Channel. Using this feature needs the following settings enabled, you can do this during the 1E Client installation:

- Nomad client module - enabled (off by default)
- Tachyon integration with Nomad - enabled (on by default).

With the Tachyon integration setting enabled, the client will automatically detect if the Nomad client module is enabled and use it to download content from HTTP sources when requested.

Tachyon use of Nomad works irrespective of whether Nomad is integrated with Microsoft Configuration Manager, or using 1E ActiveEfficiency or Content Distribution features.

The Nomad client is included in 1E Client 8.1 and later requires Tachyon platform with Nomad features enabled. Nomad is the replacement for ActiveEfficiency.

Configuration Manager is not a prerequisite for Tachyon integration with Nomad, but you will need to consider the following:

Configuration Manager client present	You do not need to make any configuration changes to Nomad for it to integrate with Tachyon, other than enable the Nomad client module in the 1E Client, or have a legacy version of the Nomad client installed. Please refer to Introducing Nomad documentation for guidance on designing and deploying Nomad.
Configuration Manager client not present	You must ensure the following bits are enabled in the relevant Nomad installer properties and their corresponding registry values. These are enabled by default in the Nomad client module of the 1E Client, but if you modify the following properties for any other purposes, then you must ensure these bits are set: • CompatibilityFlags bit 1 - enable long hashes • SpecialNetShare bit 13 - enable HTTP(S)

Note

If you have any configuration baselines or other policies that control Nomad settings, then these will need to be reviewed. Review is especially important if you have upgraded from legacy Nomad Branch 6.x where these bits were disabled by default.

2.2.2.5 Tachyon scripting requirements

Tachyon real-time instructions are written in the Tachyon native language SCALE, which is very like SQL but with additional logic, functions, and methods. Scripts can be downloaded when an instruction runs or actual command text is embedded in the instruction. You will very probably want to use scripts in the instructions you download from 1E or instructions you write yourself. Therefore, you must ensure the appropriate scripting environment is present on Agent devices.

Windows Tachyon clients can use PowerShell scripts. Ensure your client devices have an appropriate version of PowerShell installed to support any custom scripts you may develop. See PowerShell on Windows OS.

Non-Windows clients can use bash as their scripting medium. This should be present on all non-Windows client devices.

For more information about SCALE and writing your own instructions, please refer to:

- Installing TIMS

- /document/preview/736871#UUID-66857689-bfb0-8dbc-ae8d-1de40c66fad9
- /document/preview/738566#UUID-88a06651-3aab-3a4b-7c4d-36010c23c8a6.

2.2.2.5.1 PowerShell

PowerShell is used by some instructions (that have PowerShell commands embedded or scripts that are downloaded) and some of these require PowerShell 3.0 or later, although some scripts will support PowerShell 2.0. PowerShell scripts are supported only on Windows OS.

If installing or upgrading PowerShell, it is best to install the latest version available. However, do not expect full forward or backward compatibility between PowerShell versions.

> **Tip**
>
> To determine the version of PowerShell on a computer, start PowerShell (command prompt or ISE) and enter one of the following commands: **$PSVersionTable.PSVersion** or **$PSVersionTable** for more detail.

The table below shows which versions of PowerShell are supported on each OS version and Service Pack, and if it is built-in or needs to be installed.

OS Version	PowerShell Version				Notes
Windows Server 2022				RTM (Notes 12, 13)	Note 4
Windows 11				RTM (built-in)	
Windows Server 2016, 2019, 2022			RTM (Note 9)	RTM (Notes 12, 13)	Note 4
Windows 10			RTM (built-in)	Anniversary Update (built-in)	
Windows Server 2012 R2 *		RTM (built-in)	RTM (Note 9)	RTM (Note 12)	Note 4
Windows 8.1 *		RTM (built-in)	RTM (Note 9)	RTM (Note 12)	

OS Version	PowerShell Version	Notes					
Windows Server 2012 *			RTM (built-in)	RTM (Note 7)	RTM (Note 9)	RTM (Note 12)	Note 4
Windows 8 *			RTM (built-in)				
Windows Server 2008 R2 *		RTM (built-in)	SP1 (Note 6)	SP1 (Note 7)	SP1 (Note 8)	SP1 (Note 10)	Note 4
Windows 7		RTM (built-in)	SP1 (Note 6)	SP1 (Note 7)	SP1 (Note 8)	SP1 (Note 10)	
Windows Server 2008 *	RTM (built-in)		SP1 & SP2 (Note 2)				
Windows Server 2003 *	RTM & SP1	R2 & SP2					Notes 1, 2
Windows Vista *	RTM	SP1 & SP2					Notes 1, 2
Windows XP *	RTM, SP1 & SP2	SP3					Notes 1, 2

* These OS are regarded as legacy OS:

1. PowerShell is not built-in for these OS. These OS do not support 3.0 or later. See Constraints of Legacy OS
2. If PowerShell 1.0 is installed it must be removed in order to install a later version.
3. Support for PowerShell 2.0 is included in PowerShell 3.0 and later.
4. PowerShell is not installed by default on these OS but is an optional feature that should be enabled using Server Manager.
5. PowerShell 2.0 is part of WMF Core package (KB968930) with prerequisite of .NET Framework 3.51 (which includes .NET 2.0 SP1).

6. PowerShell 3.0 is part of WMF 3.0 with prerequisite of .NET Framework 4.0 or later. Refer https://www.microsoft.com/en-us/download/details.aspx?id=34595

7. PowerShell 4.0 is part of WMF 4.0 with prerequisite of .NET Framework 4.5 or later. Refer https://www.microsoft.com/en-us/download/details.aspx?id=40855

8. PowerShell 5.0 is part of WMF 5.0 with prerequisites of .NET Framework 4.5 or later and WMF 4.0. Refer https://www.microsoft.com/en-us/download/details.aspx?id=50395

9. PowerShell 5.0 is part of WMF 5.0 without any other prerequisites. Refer https://www.microsoft.com/en-us/download/details.aspx?id=50395

10. PowerShell 5.1 is part of WMF 5.1 with prerequisites of .NET Framework 4.6 or later, WMF 4.0 and SHA-2 Code Signing. Refer https://msdn.microsoft.com/en-us/powershell/wmf/5.1/install-configure

11. PowerShell 5.1 is part of WMF 5.1 with prerequisites of .NET Framework 4.6 or later and WMF 4.0. Refer https://msdn.microsoft.com/en-us/powershell/wmf/5.1/install-configure

12. PowerShell 5.1 is part of WMF 5.1 with prerequisite of .NET Framework 4.6 or later. Refer https://msdn.microsoft.com/en-us/powershell/wmf/5.1/install-configure

13. In these Server OS, PowerShell 5.1 is referred to as the Desktop Experience. You can use the PowerShell Core version if you prefer.

Please refer tohttps://support.microsoft.com/en-gb/help/17455/lifecycle-faq-net-framework for details of Microsoft support for .NET Framework.

- Support for 4, 4.5, and 4.5.1 ended on January 12, 2016
- Support for 4.5.2, 4.6 and 4.6.1 ended on April 26, 2022

2.2.2.5.2 Bash and Perl

Bash and Perl are required for the installation of all non-Windows 1E Client.

Tachyon instructions support the use of Bash scripts on all supported non-Windows OS.

To see if an Instruction requires a Bash script, look in its Instruction Definition XML file for the Scripting. Run method. Bash is the preferred choice when developing custom Instructions for non-Windows OS.

There are slight differences between OS implementations of Bash, particularly on the Mac. Therefore, 1E recommends testing custom Bash scripts on each supported OS.

2.2.2.6 Requirements for verifying the Tachyon installation

The Verifying page provides detailed steps for verifying a new or upgraded infrastructure, including the first steps for uploading and running instructions. Below is a list of requirements to perform verification testing.

1. Tachyon Server installed.
2. Remote workstation with a Supported Platforms.
3. The name and password for the **server installation account**.

a. The AD account must be enabled.

b. The account may already be assigned to other Tachyon roles either directly or via membership of an AD group role.

4. Two AD User accounts, **Test User 1** and **2**.

   a. Must not be existing Tachyon users because they will be assigned specific roles for the purpose of these tests.

   b. Must have email addresses and be able to read emails.

5. The **1E Tachyon Platform** instruction set with two Verification instructions.

   a. The verification steps describe how to create this instruction set by uploading the Tachyon Platform Product Pack.

   b. You may have already uploaded this Product Pack using the Tachyon Product Pack Deployment Tool, either during Setup or after.

   c. The Tachyon Platform Product Pack is included in the **Tachyon Platform** file that you can download from the 1E Exchange.

6. At least one test device on which the 1E Client will be installed.

7. 1E Client installation source files and configuration details required by your Tachyon implementation.

2.2.2.7 Firewall ports

Please refer to urn:resource:component:647599.

2.2.3 Nomad client requirements

Information that will help you design and plan the implementation of **Nomad** in your organization. This includes all the prerequisites and dependencies, which are necessary to install 1E Client with Nomad client enabled.

> **Tip**
>
> Nomad client features are not required if the 1E Client is being installed only to support Tachyon, Shopping, or WakeUp. However, Nomad can be used to help platform clients download content from the Background Channel and other sources. For more detail, please refer to Tachyon platform client integration with Nomad.

2.2.3.1 Nomad infrastructure dependencies

For a full understanding of Nomad features and their configuration, please refer to Introducing Nomad documentation.

In addition to deploying 1E Client (with Nomad client module enabled) on all computers and on Configuration Manager Distribution Points, the following are also required:

- Nomad tools installed on Configuration Manager sites and SMS Providers

- Nomad Configuration Manager Console extensions on Configuration Manager site servers, any other computer that has the Configuration Manager Console installed.

Nomad can be used for downloading content for platform clients, as well as Configuration Manager clients.

2.2.3.2 Downloading client content and Nomad integration

1E Client downloads content from the Tachyon Background Channel. Content is mainly scripts and other files required by instructions. It also includes client resources such as extensible modules, providers, and other dependencies to maintain the 1E Client. In most cases, client resources are version controlled to prevent repeated downloads. Tachyon instructions always request a download even if they have run an instruction before, unless the content for that instruction has been cached in memory.

You may need to consider the impact on the network if there is a large amount of content included in an instruction. This is more of an operational consideration instead of a design consideration.

Nomad is an optionally licensed component of the 1E Client. It makes software deployment, patching and downloading content more efficient and reduces the impact on the network. It removes the need for remote Distribution Point servers in Microsoft System Center Configuration Manager systems. When Nomad is installed on computers, it automatically elects a peer to download content from a server over the WAN and then peer-shares the content with other PCs at the same location. The downloaded content is cached locally on each PC in case it is needed again.

Tachyon can optionally use Nomad to download content from servers irrespective of whether Nomad is integrated with Configuration Manager or not, and also uses advanced Nomad features.

2.2.3.2.1 Tachyon platform client integration with Nomad disabled

If Nomad integration is not used, the following applies:

- Tachyon platform client waits a randomized stagger period defined by its DefaultStaggerRangeSeconds (refer to #UUID24ef0cf654c33163e98e9dc427464c32_id_Deploying1EClientonWindowsDEFAULTSTAGGERRANGESECONDSDEFAULTSTAGGERRANGESECONDS for details) setting, and then downloads content from the specified **Background Channel**.
- Tachyon platform client retains modules and extensible that it has downloaded but does not retain instruction scripts after they have been run. Any instruction that requires a script or other file will download the latest version each time the instruction is run.

2.2.3.2.2 1E Client integration with Content Distributionenabled

Content Distribution integration is available on Windows PC devices and is enabled by default, but can be disabled during installation of the 1E Client.

With the Content Distribution integration feature enabled, 1E Client will detect if a supported version of Content Distribution is running on the device.

- 1E Client immediately requests Content Distribution to download content from the specified HTTP source, such as the **Background Channel**. Content Distribution behaves in the same way as it does with

Configuration Manager by ensuring the latest version of content is obtained and electing a master to perform the actual download.

- Content Distribution maintains its own cache of downloaded content which avoids the need for repeat downloads over the WAN, and provides content to peers that require the same resources which avoids peer devices having to download over the WAN.
- If the Content Distribution integration feature is enabled, and requested content is not provided within the timeout period, the 1E Client will fall back to downloading directly from the HTTP source. The most likely reason for a timeout is if Content Distribution is busy downloading other content.

To use Content Distribution, there is no special configuration of Tachyon Servers unless you want to use server-based features provided by the Content Distribution and Content Distribution, which requires the reverse proxy feature to be configured on Background Channels.

The Background Channel is a web application on the Tachyon Server which uses HTTPS and default port is 443. The URL for the Background Channel is defined in the 1E Client configuration file and is specified during installation of the 1E Client if Tachyon features are enabled. The 1E Client passes this URL to Content Distribution when it requests content to be downloaded. Instructions can also specify other HTTP sources.

Content Distribution does not need to be configured to use certificates in order to communicate with the Background Channel (the Content Distribution CertIssuer and CertSubject settings are used only with Configuration Manager Distribution Points that are configured to validate device certificates).

The **Nomad Single-Site Download (SSD)** feature, which uses **Content Distribution**, further reduces the impact of downloading content over the WAN.

2.2.3.3 Firewall ports

Refer to Firewall ports.

2.2.4 PXE Everywhere client requirements

Information that will help you design and plan the implementation of **PXE Everywhere** in your organization. This includes all the prerequisites and dependencies, which are necessary to install 1E Client with the PXE Everywhere Agent client module enabled.

For a full understanding of PXE Everywhere features and their configuration, please refer to Introducing PXE Everywhere documentation.

2.2.4.1 PXE Everywhere infrastructure dependencies

PXE Everywhere helps with OS Deployment. The PXE Everywhere Agent is a lightweight PXE service deployed throughout the network, responding to PXE requests on local subnets. Local Agents elect which one will respond to the original PXE request, and communicate with PXE Everywhere Central to determine what to do next, by asking Configuration Manager. If the original PXE client has been assigned a Task Sequence, then the Agent provides the associated boot image to the local PXE client, which can then start the Task Sequence. Boot images will have been previously deployed to Agents, providing the reassurance there will always be a local Agent capable of quickly responding with the relevant boot image. It also means you can deploy a PXE solution

without needing to configure routers to support DHCP forwarding to a central PXE server. Please refer to Introducing PXE Everywhere documentation for more details.

PXE Everywhere does not depend on Nomad but is often used with Nomad, which helps with the distribution of PXE boot images via Configuration Manager, which further reduces the impact of network traffic on the WAN.

Introducing 1E Client Deployment Assistant is the recommended method of using Configuration Manager to deploy 1E Client to client computers. CDA is necessary if you want to include a boot image in the same deployment as the 1E Client.

PXE Everywhere also works in environments that use DHCP Snooping, as described in DHCP Snooping. This requires the following configuration changes:

- Install one or more PXE Everywhere Responders, typically on server OS in the central network - Responders only communicate with Agents, they do not communicate with the PXE Everywhere Central server or with Configuration Manager.
- Authorize the Responders to respond to PXE requests.
- Configure DHCP Relays (IP helpers) on routers to forward DHCP/PXE request packets to the PXE Everywhere Responder(s) in addition to any DHCP Relays you already have configured for the DHCP server(s).
- Configure PXE Everywhere Agents to listen on port 2067 (default) instead of port 67.

2.2.4.2 Firewall ports

Please refer to Communication Ports.

2.2.5 Shopping client requirements

Information that will help you design and plan the implementation of **Shopping** in your organization. This includes all the prerequisites and dependencies, which are necessary to install 1E Client with Shopping client enabled.

For a full understanding of Shopping and WSA features and their configuration please refer to Shopping 6.1 documentation.

> **Tip**
>
> Shopping client features are not required if the 1E Client is being installed only to support Tachyon, Nomad, or WakeUp.

2.2.5.1 Shopping infrastructure dependencies

Please refer to Shopping 6.1 documentation for more details.

Shopping requires an ActiveEfficiency Server, and ActiveEfficiency Scout to import data from Configuration Manager into ActiveEfficiency.

A Shopping solution requires a Shopping Central server on a web server, and a Shopping Receiver installed on each Configuration Manager Site server that has a client reporting to it, and on a CAS if using Shopping for OS Deployment.

2.2.5.2 Loopback feature

If users are using Edge or Metro browsers, then you must enable the loopback feature. This feature implements a mechanism for passing information between the Shopping client, the browser's secure sandboxed environment and the local machine. This mechanism affects these browsers as a whole and is not just restricted for use by Shopping.

> **Note**
>
> Before enabling the loopback feature, check your security policy on enabling loopback and be aware of the implications of allowing access between browsers and the local machine.

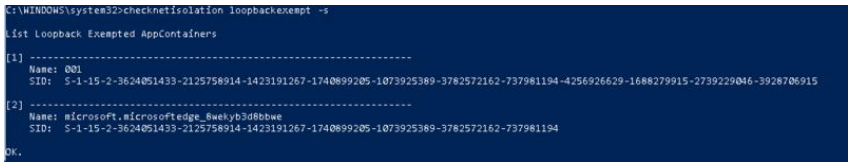
2.2.5.2.1 Checking loopback exemption on Microsoft Edge and Metro Internet Explorer browsers

The following is valid only for Windows 8.1 and Windows 10.

Open a **command-prompt as administrator** on the computer you want to check, then run the following command to verify that loopback exemption was enabled during the installation of the 1E Client.

```
CheckNetIsolation LoopbackExempt -s
```

Output should be:



If either of these items is missing, you can manually add them by executing the following commands. Quotes may be required around the name of the app.

For IE:

```
CheckNetIsolation LoopbackExempt -a -n=windows_ie_ac_001
```

For Edge:

```
CheckNetIsolation LoopbackExempt -a -n=Microsoft.MicrosoftEdge_8wekyb3d8bbwe
```

Removing

The exemption from loopback restrictions can also be removed for all apps installed by using the following command:

```
CheckNetIsolation LoopbackExempt –c
```

More information

For more information from Microsoft about CheckNetIsolation please refer to: https://docs.microsoft.com/en-us/previous-versions/windows/apps/hh780593(v=win.10).

2.2.5.3 Information provided by the Shopping client

The following details are provided by the Shopping client, when a user browses to the Shopping Web Portal, and the website uses the loopback feature to query the local computer.

Attribute	Description	Example
UniqueId	Configuration Manager client GUID	GUID:04804aed-922c-4a4b-9f41-eab6592e7d83
AssignedSite	Configuration Manager client Site code	CM1
MacAddress	Computer's MAC Address	20-68-9D-5B-EB-73
HostName	Computername	1EUKCOL1184
HostDomainName	Computer's NetBIOS Domain Name	1E
OSVersion	OS Version	6.3.9600
OSArchitecture	OS Architecture	64-bit
OSRole	Workstation or Server	1
SccmVersion	Configuration Manager client version	5.00.8239.1203

You can confirm Shopping is able to get these "Probe details" via your browser by going to the Shopping portal and navigating to **Preferences** → **Diagnostics** page, or using the URL **https://<shopping>/Shopping/context**

The diagnostics page also displays the **Timezone** of the browser (as minutes ahead of UTC), and does not display the **SccmVersion**. It also shows Identity details stored in the Shopping database that Shopping has obtained from Active Directory about your user account and machine details.

2.2.5.4 Firewall ports

Please refer to /document/preview/717111#UUID-9c22bc2f-ae28-7668-9b8b-64706f16e1e2.

2.2.6 WakeUp client requirements

Information that will help you design and plan the implementation of **WakeUp client** in your organization. This includes all the prerequisites and dependencies, which are necessary to install 1E Client with WakeUp client enabled.

Tip

WakeUp client features are not required if the 1E Client is being installed only to support Tachyon, Nomad, or Shopping.

2.2.6.1 NightWatchman and WakeUp infrastructure dependencies

For a full understanding of WakeUp and NightWatchman features and their configuration, please refer to NightWatchman Enterprise 7.3 documentation.

If implementing WakeUp, or Nomad integration with WakeUp, then you require at least one WakeUp Server. If you have Configuration Manager, you require a WakeUp Server on each Site server that has clients reporting to it. If you do not have Configuration Manager, you require one or more independent WakeUp Servers.
