> You may remove users if you know they do not require Tachyon permissions. However, they will be re-added the next time the installer is run, and the installation account has permissions to add users.
>
> You may add additional users and groups manually.

Select each of the added Configuration Manager users in turn and check that they have the **Nomad Administrators** role added.

> **Note**
>
> These permissions ensure all current CM **"Full Administrators"** are able to use the **Nomad Download Pause** feature by allowing them to execute the Tachyon instructions. Any other users or groups will need to be manually added to the **Nomad Admins** role.

9.4.4.2.2.2 Confirm the installation in Configuration Manager

On the **Administration Client Settings** page, check the following:

Right-click on **Default Client Settings** and check that a **1E Nomad** sub-menu has been added to the context menu, containing a **Nomad Properties** menu item

On the **Assets and Compliance**→**Device Collections** page, check the following:

Two Nomad related buttons have been added to the **Home** ribbon:

Pause Nomad Downloads

Resume Nomad Downloads

If all these checks have passed, you should have a working installation of the Nomad Download Pause feature.

9.4.4.2.3 Using Nomad Download Pause

9.4.4.2.3.1 Pausing Nomad downloads

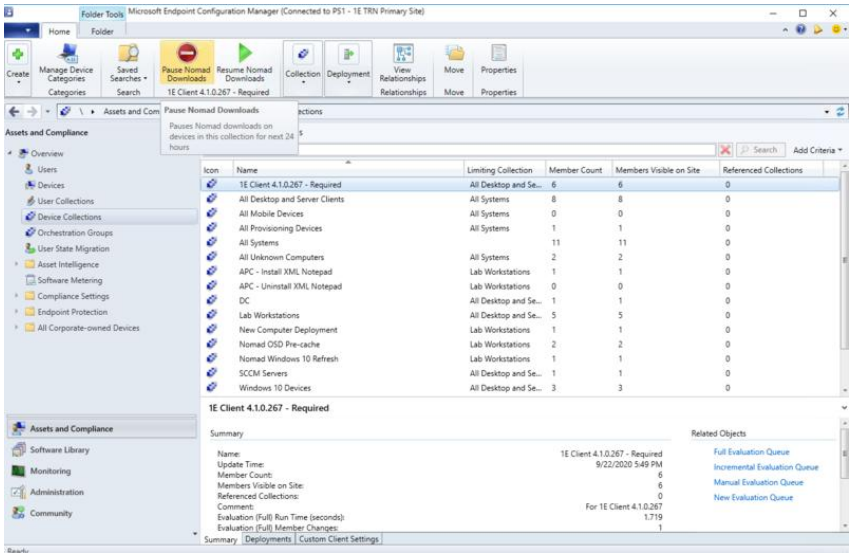
The Nomad Download Pause feature can be applied to a collection of devices. To do this:

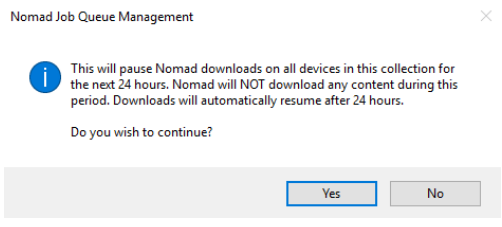
Select the collection you want and click the **Pause Nomad Downloads** button or select the **Pause Nomad Downloads** menu item from the collection's right-click context menu.

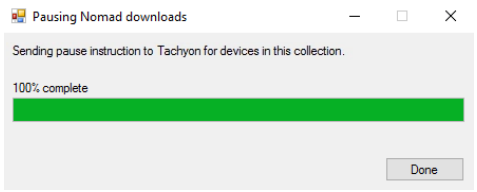
A **Nomad Job Queue Management** dialog will appear asking explaining the consequences of continuing. If you want to continue. Click **Yes** to proceed and **No** to cancel.

If you click **Yes**, a **Pausing Nomad downloads** dialog will appear showing the progress of the process. This should reach 100% with no errors, at this point click **Done** to close the dialog.

When applied, the Nomad downloads on the selected collection will be paused for a period of 24 hours - after which they will resume automatically.







9.4.4.2.3.2 Checking paused collections in Configuration Manager

When a collection has been successfully paused an entry will appear on the **Monitoring→1E Nomad→Paused Collections** page, as shown in the picture opposite.

From here you can view the following information:

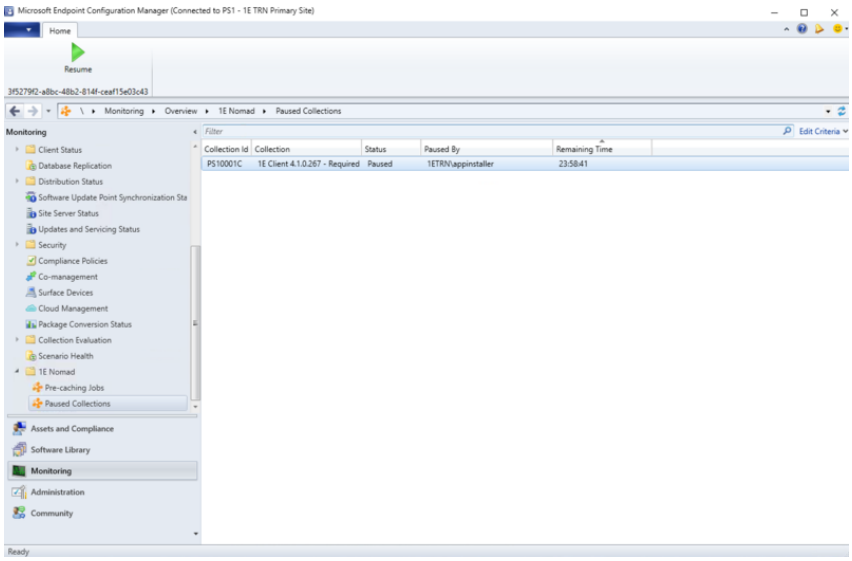
Column	Description
Collection Id	The Configuration Manager ID for the device collection
Collection	The friendly name of the device collection
Status	The current paused status for the collection. The values in this column can show one of two states:

State	Description
Paused	This state indicates that all the devices in the collection have been paused.
Partially Paused	This state indicates that some but not all the devices in the collection have been paused. This may happen if some devices in the collection are currently offline or the pause action is interrupted while Nomad is sending the instruction request to Tachyon.

Remaining Time	This column shows the time remaining for the pause to be in effect. After the stated time the devices in the collection will automatically resume their Nomad job queues.

From this page you can also select to resume the paused collection by clicking on the **Resume** button or by selecting the **Resume** menu item from the collection's right-click context menu.

As soon as the Nomad job queue for the entire collection has been resumed the entry will disappear from the **Monitoring→1E Nomad→Paused Collections** page.



9.4.4.2.3.3 Checking the Pause instruction in Tachyon

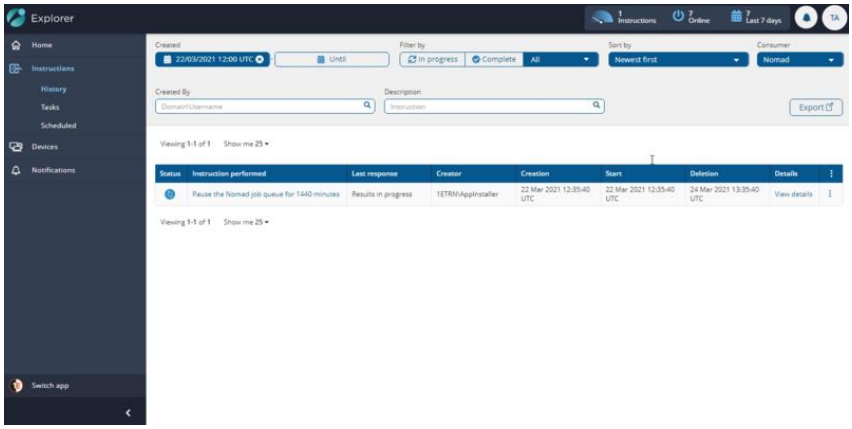
You can check the progress of the pause process by looking at the instruction history in Tachyon:

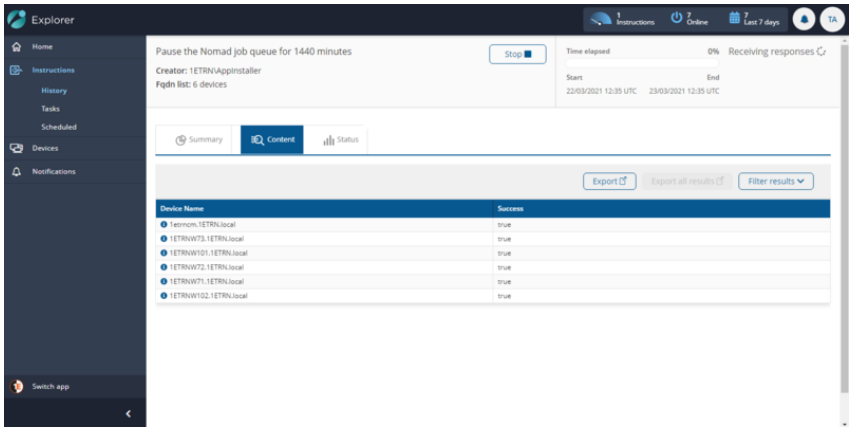
Log onto Tachyon using an account which has full Configuration Manager administrator access.

Navigate to **Explorer→Instructions→History**, in the example shown we have filtered the **Consumer** to only show results related to **Nomad**.

You should see an entry for the **Pause the Nomad job queue for 1440 minutes** instruction.

Clicking on the instruction shows a detailed breakdown of the response from each device in the selected collection.





9.4.4.2.3.4 Resuming Nomad downloads

If you want to resume the Nomad downloads for a collection at any time during the 24 hours, you can

Select the collection you want and click the **Resume Nomad downloads** button.

A **Nomad Job Queue Management** dialog will appear asking explaining the consequences of continuing. If you want to continue. Click **Yes** to proceed and **No** to cancel.

If you click **Yes**, a **Resuming Nomad downloads** dialog will appear showing the progress of the process. This should reach 100% with no errors, at this point click **Done** to close the dialog.

When applied, the Nomad downloads on the selected collection will be immediately resumed from where they left off.

As soon as the Nomad job queue for the collection has been resumed the paused collection entry will also disappear from the **Monitoring 1E Nomad, Paused Collections** page.

9.4.4.2.3.5 Checking the Resume instruction in Tachyon Platform

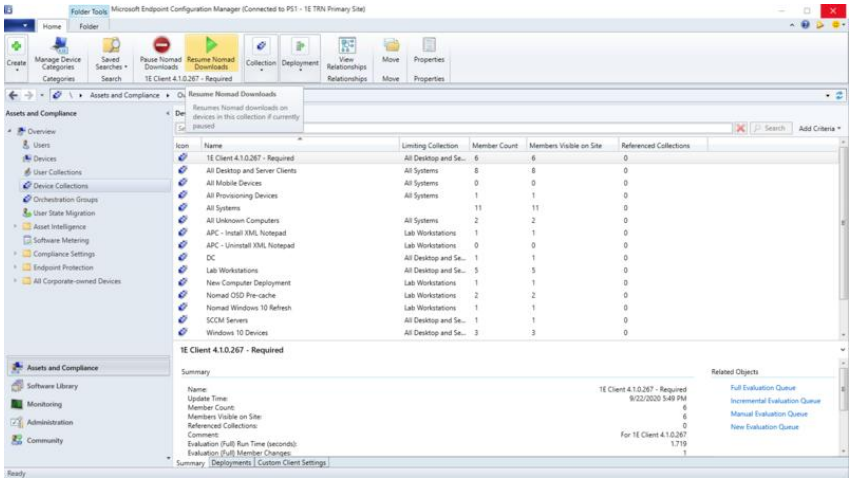
You can check the progress of the resume process by looking at the instruction history in Tachyon, using the same steps as Checking the Pause instruction in Tachyon:

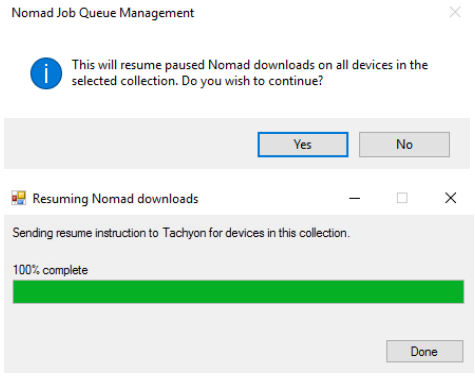
Log onto Tachyon using an account which has full Configuration Manager administrator access.

Navigate to **Explorer→Instructions→History**, in the example shown we have filtered the Consumer to only show results related to Nomad.

You should see an entry for the **Resume the paused Nomad job queue** instruction.

Clicking on the instruction shows a detailed breakdown of the response from each device in the selected collection.





9.4.4.2.4 Troubleshooting

A typical error that can occur during the pause or resume process is if any of the devices in the selected collection do not have the 1E Clients installed. You can fix this by installing the 1E Client on all devices in the collection, refer to Installing the 1E Client for Nomad for details.

9.4.4.2.5 1E-Nomad product pack

This product pack is used to create the **1E Nomad** instruction set required by the Download Pause feature.

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Pause the Nomad job queue for <PauseDurationMinutes> minutes	Action	Pause Nomad job queue. Required by **Nomad Download Pause** feature.	**1E-Nomad-PauseNomadJobQueue.xml**	15
Resume the paused Nomad job queue	Action	Resume paused Nomad job queue. Required by	**1E-Nomad-ResumeNomadJobQueue.xml**	12

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		Nomad Download Pause feature.		

9.4.5 Client Health

The purpose of Client Health is to ensure the success of your Content Distribution deployments.

The Client Health page of the Nomad app shows rule status and device status from two Guaranteed State policies.

Nomad Client Health

MEMCM Client Health.

You can also use Guaranteed State's Windows Client Health policy.

9.4.5.1 Nomad Client Health

Nomad is included as part of the 1E Client, and as part of that integration, we offer a Nomad client health compliance policy in Guaranteed State. This verifies common Nomad requirements such as ACP registration, disk availability, firewall exceptions, crash notifications and cache monitoring.

The Nomad client health policy replaces the client health tile in the Nomad dashboard, plus additional remediation steps:

Keeps content distribution services up and running on Nomad clients, so that users are secure and productive

Ensures Alternative Content Provider (ACP) registration configuration is set

Maintains optimal disk availability and monitors cache size for storage capacity planning

Enforces Firewall exceptions.

For full details, refer to Nomad Client Health Policy.

> **Note**
>
> This policy is intended for deployment to Windows devices only.

9.4.5.2 MEMCM Client Health

Many businesses rely on Microsoft Endpoint Configuration Manager (MECM) to deploy software, patches and updates across their company networks. It is crucial that Configuration Manager is working effectively. Configuration Manager is part of the Microsoft Endpoint Management suite and is often referred to as MEMCM as well as MECM.

The MEMCM Client Health policy monitors Configuration Manager client health and performance. It checks for cache availability, inventory cycles, service availability and Configuration Manager WMI integrity - common causes of Configuration Manager client problems on devices.

The MEMCM Client Health policy replaces the previous SCCM Client Health policy and covers the following:

Ensure the correct version of the CM client is installed and running and assigned to the correct site

Ensure the CM client is not stuck in provisioning mode

Ensure that heartbeat discovery, inventory and state messages are being sent regularly

Ensures the CM client cache is set to the correct size

Ensure the CM client log settings are correct

Ensure the BITS service exists, is configured to start up automatically and is running

Ensure the Windows Time service exists with the correct startup settings

Ensure the Windows Management Instrumentation (WMI) service exists, is configured to start automatically and is running

Ensure WMI is healthy, the core CIMv2 and ccm namespaces and classes exist and that the WMI repository is consistent

Ensure the Windows Update service exists with correct startup settings, is configured to use the correct source (CM, WSUS or Microsoft Update) and that the service can connect to the source.

For full details, refer to MEMCM Client Health Policy.

Note

This policy is intended for deployment to Windows devices only.

9.4.5.3 Windows Client Health

Over time Windows devices can develop performance problems related to device or service availability. This policy verifies the available storage capacity on devices, notifies of application crashes, monitors WMI health and service function, and also checks the behavior of core Windows services.

The Windows client health policy covers all of the following:

Manages Windows devices and service availability performance problems

Safeguards disk space integrity, ensuring sufficient storage capacity

Ensures optimum performance of the Configuration Manager client and that WMI is active and integrated

Notifies of application crashes and remediation assists. Investigates root cause for specific issues.

For full details, refer to Windows Client Health Policy.

Note

This policy is intended for deployment to Windows devices only.

9.5 Troubleshooting

A general methodology for investigating issues as well as identifying key issues and their resolutions.

9.5.1 1E Support contact details

9.5.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

9.5.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers for the US and UK. Just phone the relevant number for your area and use the support code provided with your maintenance contract to get your call routed quickly and efficiently to the correct support group:

US: 1-866-349-4032

UK: 0208 326 3499

9.5.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation:

support@1e.com

9.5.2 The technical support process

Read through the issue pages in the Nomad Troubleshooting section to see if there are any quick resolutions to any problems you may have encountered. After that, if you are still encountering problems, you should create a technical report and then contact the 1E technical support team.

The process of getting the issue to 1E support should be as follows:

Gather all the information relevant to the issue and create a technical report, see heading below.

Maintenance customers contact 1E via the online support portal, using the log-in provided at purchase.

Maintenance customers follow up with emails using their case support number and evaluators contact 1E via the following email address: support@1e.com.

Further follow up via phone to the technical support department at 1E at the following numbers for the US and UK Just phone the relevant number for your area and use your case number and support access code to get your call routed quickly and efficiently to the correct support group:

US: 1-866-349-4032

UK: 0208 326 3499

9.5.2.1 Creating a technical report

To help determine the cause of technical problems Nomad and associated products keep a number of log files that report on the behavior of each component. These can be found under %PROGRAMDATA%\1E\Nomadbranch.

The technical report should also contain the following information:

Version number of Nomad

The OS, version number and patch level of the Tachyon Platform that Nomad is installed on.

You should then email the details of the problem encountered along with the above information to support@1e.com and a technical consultant will contact you to help find a suitable solution.

9.5.3 The technical support process

Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

9.5.3.1 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

9.5.3.1.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

9.5.3.1.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

9.5.3.1.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

9.5.4 Log files

1E needs details of the recorded time when the issue took place. To ensure logs contain relevant details, please try to rerun the steps to replicate the issue. The table below details the log files we require:

The default location for all Nomad logs is the folder *%ALLUSERSPROFILE%\1E*

For issues relating to	Required log files	Location of log files
1E Client	*1E.Client.log* *NomadBranchUninstall-YYY-MM-DDThh_mm_ss_000Z.log*	Default location: %ALLUSERSPROFILE%\1E\Client\
Nomad client	*NomadBranch.log*	Default location: %ALLUSERSPROFILE%\1E\NomadBranch\ Optional location if installed using 1E Client Deployment Assistant (CDA): C:\WINDOWS\CCM\Logs\
OS deployment	*NomadPackageLocator.log* *NBCacheActions.log* All Configuration Manager logs including *SMSTS.log*	The path changes at the different stages of an OS deployment.

For issues relating to	Required log files	Location of log files
Nomad and ContentDistribution integration	*ContentDistribution.log*	%ALLUSERSPROFILE%\1E\ContentDistribution\
Delivery Optimization monitoring and reporting	*NomadBranch.DO.log*	Default location: %ALLUSERSPROFILE%\1E\NomadBranch\ NomadBranch.DO.log is created when Delivery Optimization monitoring and reporting are enabled using the DeliveryOptimizationReportingEnabled registry value.

9.5.5 Known issues

Lists of the current known issues when installing Nomad and using the Nomad features.

9.5.5.1 Installing 1E Client

Issues	Description	Workaround
1E Client installer adds Nomad registry settings even when Nomad module is NOT enabled while installation. If someone deletes those registry settings and enables Nomad module later, Nomad won't function right.	The installer is currently creating the majority of Nomad registry values because the service doesn't create them all and Nomad doesn't tolerate the absence of all the settings that the service doesn't create. If someone deletes those settings and enables Nomad module later, Nomad won't function right.	In such a scenario, we recommend reinstalling the 1E Client with a new set of properties / transform that enables the Nomad module. This will be fixed in a future release of 1E Client.
On Windows XP, 1E.Client.log displays a warning "Unsupported OS	Nomad is not support on Windows XP therefore when 1E Client is installed with Nomad module, the	None.

Issues	Description	Workaround
version. Will not install Nomad." however the very next log lists that "Module 'Nomad' has been installed".	module is not enabled, and the Nomad Branch service is not installed.	
Nomad may be downgraded by active Application deployments in CM, which may cause issues with behaviour of the 1E Client Nomad module.	If there is an active Application deployment in CM of an earlier version of Nomad, clients that have been upgraded with the 1E Client with the Nomad module enabled may be downgraded when the Application Enforcement cycle runs. In this scenario, if the 1E Nomad module is subsequently disabled in the 1E Client, the Nomad service will be removed. This is because once the Nomad module has been enabled, it is not aware nor does it check for older versions. If the Nomad module is subsequently disabled, the service is removed as the Nomad module believes it is not longer required.	To avoid this situation, always define Application Supersedence on the 1E Client Application such that it supersedes any Applications that install previous versions of Nomad (and the 1E Client when introducing new versions of the 1E Client). To resolve this issue should it occur, first address the Application Supersedence to prevent it from recurring. Then run the following command from the 1E Client installation directory on the affected devices. *1E.Client.exe -reconfigure MODULE.NOMAD.ENABLED=false -restart & 1E.Client.exe -reconfigure MODULE.NOMAD.ENABLED=true -restart* This will disable the Nomad module and remove the Nomad service, then re-enable the Nomad module, which will in turn uninstall the earlier version of Nomad and install the Nomad module. The settings defined by the earlier Nomad install will be migrated - these may differ from the settings with which the Nomad module was initially configured with.
1E Nomad Branch and 1E Client Health services may be stopped if upgrading to Nomad 8.0 if previous version of Nomad installer is no	The 1E Client installer stops the 1E Nomad Branch and 1E Client Health services if the Nomad module is enabled. The 1E Client installation completes	In this scenario, to immediately restore Nomad functionality simply start the services. To fix completely you will need to remediate the installer source for the old version of Nomad on the affected client, then run the following command from the

Issues	Description	Workaround
longer in source folder or the Windows Installer cache.	successfully, after which the Nomad module attempts to uninstall the older version of Nomad. The uninstallation fails as Windows Installer cannot find the original source installer. The Nomad module is not enabled and the Nomad and Client Health services remains stopped.	1E Client installation directory to restart the 1EClient service. *1E.Client.exe -restart*
Uninstalling 1E Client doesn't delete Nomad's P2P server certificate.	When P2PEnabled value was set to 79 then NomadBranch server certificate does not get deleted after uninstallation.	
NomadBranch - 1EClient - Creation of Nomad COM object failed with 0x80070424	Install the latest build with Nomad. Creation of Nomad COM object failed with 0x80070424-	Disable the Nomad module and restart the 1E Client service. Enable Nomad again and restart the 1E Client service. Nomad should install successfully.
Nomad users see the 1E Client UI in the device system tray even when the Tachyon module is not enabled.	The 1E Client UI runs despite only the Nomad or Shopping modules being installed, without the Tachyon feature enabled.	None.

9.5.5.2 Working with Nomad

Issues	Description	Workaround
Nomad crashes while downloading an application in original content having source path greater than 290 length.	When the source path of an application is longer than 290 chars and Nomad starts downloading	Use Nomad SECure when a package has source path greater than 255 characters in length. Compressing and/or

Issues	Description	Workaround
	application in original format (that is format 0) then Nomad crashes in between but successfully downloads the content and passes the hash check as well.	encrypting content results in a single file which the possibility of an overly long path.
PBA find will fail if P2PEnabled registry changes on host machine	After PBA capture when data is sent to host over https, pause the task sequence and change the value of P2PEnabled=9 on the host machine. On resuming task sequence would get failed.	None. This is as per design and so is not suggested to change the value of P2PEnabled in between.
Installer log file may not be launched after installation	In Windows Server 2019 when installation was initiated by the Built-in Domain Administrator and "Show the Windows Install log" option was selected after installation then log file does not get launched. However it works with other admin users.	Initiate the installation from elevated command prompt using /l*v properties to generate the log file, for example: *msiexec /i <installer.msi> /l*v <filename.log>*
By default NomadBranchGui is upgraded into Basic mode	If previous version was setup in the Advanced mode and user upgrades it to the latest release then it does not recognize the previous setup mode and so gets upgraded	Reinstall NomadBranchGui.

Issues	Description	Workaround
	into Basic mode by default.	
Nomad is not able to download from CCMTOKENAUTH_SMS_DP_SMSPKG$ co ntent location virtual directory on Distribution Point, which is created when Distribution Point is configured to communicate over HTTPS starting CM CB 1810.	Enhanced HTTP was first introduced in CM1806 as a pre-release feature and it became a standard feature in CM1810. It allows administrators to use secure communication between clients and DP without the need for PKI-generated certificates or a Network Access Account. Nomad currently can't use the new Enhanced HTTP features when downloading from the DP, but it will continue to work when there are still Network Access Accounts available to allow it to authenticate non-Domain joined machines (such as those in WinPE and Workgroup machines).	None. We are working with Microsoft to determine the best approach to enabling download from the Enhanced HTTP virtual directory. You can upvote our request at https://aka.ms/AA63jc3
Nomad download halts for some time if block size is different on a machine acting as a master.	Nomad may not be able to download whole content from the master and stuck in a loop for some time if the master has incomplete content	None.

Issues	Description	Workaround
	and different block size.	
Different block sizes on DP and Clients may leads to RDC failure.	RDC may not work properly if distribution point and client has different block size.	To fix this, have same block size on all Distribution Points and clients.
Nomad would fail to download content when client switches from Intranet to Internet DP having higher content version.	Nomad may fail to download the content when switching from Intranet to Internet DP and Internet DP has higher version of content than required.	None.
Nomad fails to use already precached content in secure format even if same content is requested in original format.	Nomad won't convert the secure format content into the original format on the client side and downloads the content again.	None.
Nomad settings on Configuration Manager client policies don't replicate between CAS and primaries	Nomad settings do not replicate between CAS and Primary site, the user has to manually do settings on both the sites.	Change the settings manually on both sites.
Nomad won't handle SUSPEND by CM when in PauseJobQueue state	When Nomad JobQueue is paused using Download Pause and during the pause if CM sends suspend for a job then Nomad won't honor that instruction and would continue to run that	None.

Issues	Description	Workaround
	job once JobQueue resume.	
NomadBranch GUI does not work when File sharing is connected with Remote machine	When NomadBranch GUI is installed on machine and connected to remote machine then it may not show any download progress and remains in paused state.	None.
NomadAdminUIExtension always give "stopped working" error but installs successfully on Windows Server 2012.	Installing NomadAdminUIExtension on Windows Server 2012 would give error "stopped working" however installs successfully.	Ignore the error message and click OK.
Incorrect protocol status download reported in the *NomadBranch.Log* for SMB downloads in SSD	The *NomadBranch.Log* erroneously logs a SMB download as SM_HTTP over SSD.	Ignore the error message.
The correct installer may not be picked up by the Install 1E Client custom task sequence action if there are multiple installers in the content source for the Nomad package.	The Install 1E Client custom task sequence action randomly selects a Nomad MSI if there are multiple installers in the content source for the Nomad package.	We recommend having only one installer in the Nomad package source.
Job fails if disk space is low when compress/encrypted content is uncompressed.	For compressed/encrypted content, Nomad reserves disk space equivalent to size of compressed/encrypted content only before	None.

Issues	Description	Workaround
	download. When disk space is low the, job will fail when it uncompresses the content in the Configuration Manager cache.	
Status messages are not sent when Nomad runs in WinPE mode.	When Nomad is installed in WinPE and starts downloading packages, send status messages are not sent to CM server as it does not have Configuration Manager client.	None.
Peer-to-peer transfer fails if one of the machine name is longer than 50 characters.	When on a subnet, machine1 has hostname longer than 50 characters with content A, and machine2 requests content A, P2P transfer fails and content will be downloaded from DP.	Do not use hostnames longer than 50 characters. https://support.microsoft.com/en-us/help/909264/naming-conventions-in-active-directory-for-computers-domains-sites-and
Attempting to downgrade nomad using Configuration Manager puts the machine in such a state that any further upgrades would fail.	When a downgrade is attempted using a ConfigMgr job, the rollback doesn't happen cleanly and a few traces are left in the system leading to failure in future upgrades.	To fix this, please contact 1E support.
Log files may contain a large number of error messages if a mixture of encryption	It is possible to configure different installations of Nomad to use different	You should ensure that all the installations of Nomad

Issues	Description	Workaround
methods is used for Nomad communications.	encryption methods. Nomad 6.0 supports two options: the default encryption method and a new FIPs compliant encryption method. The error messages in the log files indicate that Nomad communications are being impacted and the fault should be rectified. This state is liable to occur if hybrid installations are allowed with unsupported versions of Nomad, because encryption is required in Nomad 6.0 owards.	are set to the same encryption method.
Clients may not be able to download content using HTTP/HTTPS from the Distribution Point if the content URL contains hidden segments or double-escape sequences.	This issue is specific to Distribution Points running IIS 7.0 and above and may occur when the requested content URLs contain hidden segments or double-escape sequences. When this happens the client displays HTTP error 404.8 (Hidden Namespace) and 404.11 (Double Escaping) in the NomadBranch.log file while processing the content.	Modify the IIS Request Filtering settings on the DP to allow download of such content. Please refer to Post-installation tasks#installationtasks-IISrequestfiltering.

Issues	Description	Workaround
Using Nomad on multihomed machines results in extraneous network traffic.		Please contact 1E Support for a detailed workaround if you have multihomed machines in your environment.
Disk Full error retries with Configuration Manager Client	If the Nomad job returns with the error Disk Full, the Configuration Manager Advanced Client regards this as a non-fatal error and will retry the deployment on a scheduled basis.	None. This is by design.
Nomad Provider Settings overwrite Third party Provider settings in Task Sequences	When making changes to Nomad Properties for a Task Sequence the settings are written to all the Task Sequence's reference Packages. This does not take into account any third party configurations that may already be in place.	To avoid this you should set Nomad Provider settings for each of the reference Packages individually.
Nomad encounters problems when WebDAV is used to connect to a server.	Use of WebDAV is not supported by Nomad. WebDAV may be present because older versions of Configuration Manager required it, but not any longer.	None. Remove WebDAV from the server.

Issues	Description	Workaround
Uninstalling and reinstalling Nomad results in unverified cached data.	When uninstalling Nomad, cache content is not deleted as files may still be required (for example for Windows Installer repairs). If you subsequently reinstall Nomad on the same machine, Nomad will enumerate the existing cache and will be aware that it has cached content for certain packages. It is not possible to verify that the package content has not been altered in the interim period, therefore these are referred to as zombie packages i.e. they have returned from the dead. The Nomad client will be able to participate in elections for zombie packages, but will only win an election if other machines do not have verified content. This ensures minimum WAN utilization. Prior to execution, package content is verified by Configuration Manager.	To manually force verification of the cache after upgrading Nomad or uninstalling and reinstalling Nomad, please use the command: `NomadBranch.exe -activateall` If you wish to delete cache content, please use the CacheCleaner.exe utility prior to uninstall.
Nomad fails to download the content, which has one or more empty file (of	In this case, Nomad gets stuck in a loop and won't be able to	None.

Issues	Description	Workaround
zero file size), from a cloud distribution point.	download the content from cloud distribution point due to blocks mismatch errors.	

9.5.5.3 Configuration Manager

Issues	Description	Workaround
User cannot go back to Configuration Type page in the Create Nomad Baseline Wizard.	If user moves forward with 'Configure settings using MSI Transform' option then he cannot go back to Configuration Type page in the Create Nomad Baseline Wizard without selecting MSI and MST files. A popup would be displayed with message: *Please use valid MSI and MST files*.	Start again.
The Nomad Content Pause feature is not visible in the Configuration Manager console after upgrading the Nomad Admin UI extensions.	The page: **Installing the Configuration Manager console extensions** was not found. Please check/update the page name used in the 'multiexcerpt-include' macro.	You will need to ensure that this checkbox is checked in the installation wizard or that the **ENABLETACHYONINTG=true** installer property is set on the installer command-line if you want the Nomad Download Pause feature to work.

Issues	Description	Workaround
The Nomad Content Pause feature is not working after installation.	If the site server does not have a local SMS Provider, the Nomad Branch Admin UI Ext installer does not create the Nomad Custom Role, required Instruction set and add the Nomad Core instructions in Tachyon.	The feature requires: Tachyon Platform 8.x installed Uploaded Tachyon instructions Permissions allowing Configuration Manager (CM) administrators to execute the uploaded instructions. These steps should be completed by a user that has Global Admin role in Tachyon, refer to Installing the Nomad app and 1E Content Distribution for details about Tachyon Platform setup, **Nomad Administrator** role and the 1E Nomad product pack. **Upgrading** If you are upgrading Nomad or Tachyon and you have previously installed **Nomad Download Pause** then you can continue using your existing setup, you do not need to do anything further, and you can ignore the information and steps below. However, you are recommended to rename the old instruction set from**Nomad Core Instruction s**to**1E Nomad**to match the name used in the steps below for new installations. The renamed set will retain the permissions you previously configured. Prior to Nomad 7.0.200, you were advised *not* to change the name of the instruction

Issues	Description	Workaround
		set. This was because the **NomadBranchAdminUIExt.msi** installer uploaded the instructions into an instruction set named **Nomad Core Instructions**. From version 7.0.200 onwards, this restriction no longer applies, because the instructions are no longer in the installer, and instead are only available in the **1E-Nomad** product pack. The installation steps below use the Settings app to create the **1E Nomad** instruction set and upload instructions for a new installation. However, if you instead use the **Tachyon Product Pack Deployment Tool** to upload the **1E Nomad** product pack, the tool will create an instruction set called **1E Nomad** and place *new* instructions there. If the instruction set **Nomad Core Instructions** has not been renamed, any *existing* instructions in it will remain or be updated if they are new versions. You may end up with two instruction sets. You can keep both sets, or you can do the following, which will retain the permissions you previously configured: move the new instructions from **1E Nomad** to **Nomad Core Instructions**

Issues	Description	Workaround
		delete the now empty instruction set **1E Nomad** rename the old instruction set from **Nomad Core Instructions** to **1E Nomad** The **1E-Nomad** product pack is provided in the Tachyon Platform download zip, and includes new versions of the same instructions. A list of these instructions is provided below under the heading 1E-Nomad product pack, which include the two instructions required by Nomad Download Pause.
Dynamic packages in Task Sequences sometimes remain in Installing state.	When SMSTSNomad is used to download Dynamic Packages, through using the Set Nomad as Download Program action in a Task Sequence, they may remain in Installing state.	
Download using Nomad during a Task Sequence occasionally reverts to using the default Configuration Manager	When SMSTSNomad is used in a Task Sequence by using the Set Nomad as Download Program action, certain error conditions that would normally be translated to success codes by the list held in the SuccessCodes registry value are instead being returned as failures, thereby causing Configuration Manager to revert to the use of BITS for the transfer when those errors occur.	

Issues	Description	Workaround
download process.		
Task Sequence downloads may failover to using the default Configuration Manager download process if any errors occur during the Nomad download.	Due to a problem in Configuration Manager the Always return success option in the Set Nomad as Download Program action is not working. This means that downloads may failover to using the default Configuration Manager download process.	You will need to regularly check the Nomad logs to check that this is not occurring in order to address any issues that may have arisen.
The Nomad properties dialog in the Configuration Manager console does not save changed values when focus moves to	Where the Nomad Admin UI extensions are installed, in any of the dialogs in the Configuration Manager console where the Nomad properties appear as a tabbed pane (e.g. in the properties of a package), if a Nomad property is modified but the "Apply" button is not clicked before moving to another tab, the value is not saved and reverts to the original value.	Save the values by clicking the "Apply" button before moving to another tab.

Issues	Description	Workaround
another tab.		
An exception may be seen when Nomad Admin UI extensions are upgraded and Task sequence editor is immediately launched.	A rare exception may occur when Nomad Admin UI extensions are upgraded and Task sequence editor is immediately launched.	Launch the Task sequence editor after 30 minutes once the upgrade has completed.
Resume and Pause GUI menu items in CM Console is not available to all users who are Full Admin in CM and assigned to Nomad Admins role in Tachyon.	It happens with users who belong to a security group which is Full Admin in CM. The same users should be able pause and resume from Tachyon Explorer app.	

Issues	Description	Workaround
Offer ID status message attribute is missing in some of the Nomad Status Messages .	The status messages sent by Nomad in case of content download for application and software update deployments, have missing Offer ID attribute.	

9.5.5.4 Multicast

Issues	Description	Workaround
Nomad may not check available disk space in a timely fashion during a Multicast transmission.	If a PC joins the multicast session mid-way through, it immediately starts to cache data locally and is not aware of the Package size. This is by design.	In environments where disk space is critical this issue is mitigated by: Ensuring that machines have enough disk space prior to sending the deployment Deferring the deployment start time to ensure that a Policy refresh has occurred on all the machines. This enables all the machines to start at same time, and they will therefore check for sufficient disk space.
“Slow sockets” log message.	This error message occurs during distributions using multicast if some datagram packets are lost. Some packet loss is to be expected, especially if a network traffic peak occurs, Nomad is designed to fill in the lost data at the end of the distribution. If excessive logging of this error message occurs and the statistics are returning a low percentage of data multicast, your network	

Issues	Description	Workaround
	infrastructure may not be suited to efficient multicast. This can occur if you have an infrastructure with mixed network speeds for example.	
Using MADCAP over very slow links with pre-cached data.	In scenarios with very slow WAN links (i.e. <256kbps) and pre-cached package data, peer copying is used instead of local multicast. If this occurs the following warning message will be displayed in the log file. WARNING: MADCAP_Request for PACKAGE_ID discarded $$<MCastControl><datetime> This happens due to the time taken to get a MADCAP address over the WAN. Package data is still shared at the branch and only copied once over the WAN successfully, however local network traffic will be higher as peer copying is used instead of local multicast.	MADCAP performance can be improved by specifying the MADCAP server IP address in the Nomad *MULTICASTMADCAPSCOPE* registry value.
Multicast continues after deployment has expired.	If the deployment expires during a multicast transmission, the transmission will continue.	
Multicast is not supported on FAT file systems.	Nomad with Multicast is not currently supported on FAT file systems. This may be addressed in a later version, pending customer feedback.	None.

9.5.5.5 SMSNomad.exe as a program command-line

Issues	Description	Workaround
Using “Start in” Configuration Manager Program property.	SMSNomad.exe assumes the working folder is the Distribution Point. If a “start in” location is specified as an Configuration Manager Program property then	

Issues	Description	Workaround
	SMSNomad.exe is unable to locate the package source and fails to distribute software.	

9.5.5.6 Single-Site Downloads

Issues	Description	Workaround
Nomad registers with ActiveEfficiency platform using network interface other than primary interface on multihomed machines.	On multihomed machines Nomad may register with a network interface other than the primary network interface. This may result in the machine becoming unavailable for single site download to other machines in the same site since it has registered itself with a network interface other than the intended one.	

9.5.5.7 Nomad Pre-caching

Issues	Description	Workaround
Download may fail for Pre-caching jobs that are setup for content that is still being distributed to distribution points	Download may fail for Pre-caching jobs that are setup for content that is still being distributed to distribution points.	It is always advisable to setup Pre-caching jobs for content that has been successfully distributed to distribution points.

9.5.5.8 Office 365 updates

Issue	Description	Workaround
Office 365 download does not resume and fails when Nomadbranch service is restarted or when machines resume from a restart or shutdown.	A single Office 365 installation leads to multiple Nomad jobs which follows following this sequence: *- Begin Job .. - End Job - Wait For Next Job - Begin Job .. - End Job - Wait For Next Job ....* If the Nomad service is restarted while waiting for the next job, there is no persisted job (if there is , it picks it up from the WMI). If the Nomad service is restarted	

Issue	Description	Workaround
	between Begin and End, it should pick the persisted job on startup.	
NightWatchman may be able to shutdown the machine when an Office 365 job is running.	Office 365 updates comes as a collection of multiple jobs. When a job completes and another is yet to start, there is small time gap. During this gap, In between the job, ByteRange job manager queue is empty. If at this time, "Nomadbranch -canshutdown" is triggered, it will return "TRUE".	
Corrupt Content is downloaded successfully, transferred to Office 365 cache and update installation succeeds	As Nomad doesn't receive hashes to validate downloaded contents so user can get the corrupted contents downloaded.	
ClickToRun stuck in Cancelling Job.. and further install request from Software centre does not triggers any Office Job	ClickToRun is part of Microsoft office 365 and sometimes it stuck while cancelling a job. Also, each new job is provided and handed over to Nomad by ClickToRun. So if ClickToRun is stuck then user won't be able to proceed further.	
While Running cachecleaner command, user faces "Error: CreateInstance-IUIResourceMgr <FAILED> - Class not registered".	It is caused by UIResource.dll getting unregistered. So workaround is to run the following command(Administrator user context): "regsvr32 UIResource.dll"	
NomadBranch switches "Activateall" and "Activate=(Content ID)" fails to verify Office 365 content in Nomad Cache.	Office 365 Cache is activated on Nomad service start up. So if, Manually copied some (Valid) data in Nomad Cache, Service needs restart to activate data. - Activate cmd does not impacts office cache.	
Nomad Office Job keeps on going even after reserve space got full.	This is happening in a particular scenario and is related to the case when a full file is being downloaded by Nomad office 365 job. As for full file download, the	

Issue	Description	Workaround
	information about content size is not with Nomad so it keeps on downloading.	
Nomad Cache refused to clear cache on Peer when other client downloading it from P2P.	The behavior is that the ByteRanges content might or might not get deleted depending on whether it's content is being accessed at that point in time or not. If it does get deleted, the Peer move next available peer and if not then move to DP for downloading.	
Intermittent issue: Non office job is not cancelling with command line properly.	This issue is a randomly occurring one and sometimes when user tries to cancel a job using nomad command line(Nomadbranch -cancel) then sometimes(randomly) the job is not cancelled.	User can rerun the command or in rare case restart the nomadbranch service and then rerun the Cancellation command.
Office 365 Update might fail if during download of Office 365 update SMSAgent service is restarted.	Office 365 Update might fail if during download of Office 365 update SMSAgent service is restarted. When download of failed job is re-initiated from Software Center the job download fails. Again ClickToRun being stuck in cancelling is causing this issue.	
Office 365 Update will sometimes fail if during download of Office 365 update requests a file which does not exist or folder reference does not exist.	This issue is specific to "Office 365 Client Update - Current channel(1609-4)" update. Here it is observed that wrong path is being generated in manifest file from Office 365 which results in update failure due to resources not found. All updates prior to this update were generating correct content path in the manifest file but this specific(Latest update by the time of writing this information) the content path is wrong in manifest file. Also this issue is not limited to Nomad alone but even the	

Issue	Description	Workaround
	CM software center triggered and CM managed update download is also failing.	
Nomad failed to delete cache with Percent Available disk space value.	This issue has two parts to it: Only one content is deleted to reserve the space and not all, whereas it should delete all to make sure percentavailabledisk is 10%. dummyAutoDelete gets added to cache and 1 byte is reserved for it. So when you again run, it won't' even delete one content.	
Nomad office updates doesn't support failover to BITS.	Nomad is not supporting "Failover to BITS" scenario in this release.	

9.5.5.9 Tachyon Platform

Issue	Description	Workaround

9.5.5.10 Content Distribution and Nomad app

Issue	Description	Workaround
After setting a new pre-set, a user cannot switch between the default columns and the columns chosen in the new pre-set.	Users have an option to select columns to be displayed in the list at different places in the Nomad Application. When using the Nomad application, the user may want to choose which columns they want to see in the detail tables. This provides consistency with other Tachyon applications. After setting a new pre-set, a user cannot switch between the default columns and the columns chosen in the new pre-set. There is no option to go	The workaround would be to either create a default preset or again refresh the browser.

Issue	Description	Workaround
	back to the default view unless by refreshing the browser.	
Task Sequence Details page - multiple registration entry for a single device.	Content shows multiple registration entries for a single device.	
Devices Page - Arrow keys are not giving hint "Expand" for main Pages while it is giving hint "Expand" for other chart and items.	When a user opens the Nomad app, for example the Devices page and they move the mouse cursor to the double arrow expand button in the right hand top corner of the page, there is no 'Expand' hint shown. If the mourse cursor is moved to other page tiles like Content Type, then the 'Expand' hint is then displayed.	
Installation/Upgrade - Installation/Upgrade fails when .mdf file already exists on the database server.	Case 1: When ActiveEfficiency (AE) is upgraded to ContentDistribution (CD). The AE DB got renamed to CD DB but its .mdf and .ldf files didn't get renamed. If an uninstall of CD is tried, and then the AE install is tried again, the attempt fails. Case 2: When CD was uninstalled and the existing CD DB is renamed. When the CD install is tried again, the attemt fails.	
Nomad App - Page expansion is not being retained on Details Pages of Overview, Contents, Task Sequences and Network locations pages.	Open Nomad App Dashboard > Click on Expand arrow key (present in right side top corner), now click on Devices Tab, then: Open Contents Tab > Click on Expand arrow key to expand page now click on any contents from list	

Issue	Description	Workaround
	Open Task Sequence page > Click on Expand arrow key to expand page now click on any TS from list Click on Network Location > Click on Expand arrow key to expand page now click on any Site from list. Only devices details page is retains the page expansion , rest of the pages do not retain the page expansion.	
NomadBranch - SMSNomad could not register to CDC when content is downloaded is a from peer share.	Create a share on peer machine, place some content on it. Uninstall nomad from there. On a peer machine, download content using standalone cmdline - smsnomad.exe --pp="\\W2004-32\MyNomadCache" --s --prestage The contents gets downloaded but logs some error regarding Content Distribution Consumer reporting failure. It should get reported to Content Distribution Consumer.	
Preset configuration - Unnecessary spacing on scrolling bookmark bar.	If a user creates multiple bookmarks and then scrolls back and forth, there is some extra spacing on scrolling.	
Content page - Missing scrollbar in bookmark preset window.	If a user creates multiple bookmarks, and then opens manage preset, there is no scrollbar. There should be a scrollbar in the preset window itself than using the application's/browser's scrollbar.	
Network location page - Nomad Application - In subnet drawer, Even if no record was available user can also select other	A user accesses the Nomad Application, then navigates to the Network Location	

Issue	Description	Workaround
options of no. of records on the page e.g. 100, 250	page and verifies the subnet drawer window. Even if no record was available, a user can also select other options for the no. of records on the page e.g. 100, 250-	
Nomad Application - In preset window, selected filters values are not identical to ones displayed on the page.	Go to any page where the Preset window is applicable e.g. Contents page and apply all the available filters. Click on the bookmark icon to open the Preset window. Then verify values under selected filters.	
Content - When any Software Update is downloaded from WUMU, on the dashboard, the size of the content is showing 0 Bytes.	When any Software Update is downloaded from WUMU, on the dashboard, the size of the content is showing 0 Bytes.	
Nomad Application - Content Distributiondoes not display contents details downloaded from sources other than Configuration Manager and Delivery Optimization.	If a share is created on a peer machine, and some content is placed on it, then uninstall nomad from there. Then on a peer machine, content is downloaded using a standalone cmdline. The 1EClient reports the content but Content Distribution does not display it.	
Nomad Application - Nomad App - New Preset - no option to go back to the default view unless by refreshing the browser.	When a user uses the new preset feature on: Content Task Sequences Devices Nomad Sites.	The workaround would be to either create a default preset or again refresh the browser.

Issue	Description	Workaround
	After they select a few columns, there is no option to go back to the default view unless they refresh the browser.	
Nomad Application - Labels used for the filters disappear on resizing the window.	When the application window is resized, the labels used for the Technology and Time period filters disappear.	
Nomad did not raise package deletion event (using -PkgVer=*) and throws an error.	If a version 1 package is download on client-1 device. The package is updated. And then version 2 is downloaded on client 2. When version 1 is deleted from client 1 using cmdline - cachecleaner.exe -DeletePkg=CAS0007A -PkgVer=* Nomad fails to raise the event for the deleted package.	
RBAC - Configuration Manager (CM) Ext - Even after an error message, the paused job was removed from the CM console	When a collection is already paused for the download and a user only has read permission. In the Configuration Manager console, go to Monitoring > 1E Nomad > Paused Collections And the user tries to resume the existing paused job. An error popup is displayed, but the paused job disappears. Note: A user has to revisit the page to see the existing job.	
1EClient installer - Platform features are working even if "Enable 1E Platform features"	If the 1E Client is installed with Nomad and "Enable 1E Platform features" checkbox is unselected.	

Issue	Description	Workaround
was not selected during installation.	After the installation completes, verify Content Registration, DO Reporting, SSD etc. The 1E Client was still able to use every feature of the Tachyon Platform.	
NomadBranch - Shows incorrect processor details.	Verify NomadBranch log file for the correct OS version and details.	
Content state is not getting updated by CDsync if 0 version of the same content is reported in between.	A downloaded event generated for SMSNomad download reports content version 0, which later gets deleted when cdssync run. But on the server side, the package remains in a cancelled state. Its state did not change although the client has 100% content in its cache. Content Distribution sync is unable to generate an event to correct its state.	
Download event gets generated for content version 0 if version is not provided in smsnomad cmdline.	Content downloads successfully and the corresponding event is generated for content version 0. The event should be generated for the correct version.	

Peer-Backup Assistant

Issue	Description	Workaround
Client does not participate in PBA Polling when two clients with the same name exist in two different domains.	If a client machine with same hostname name exists in two different domains, during PBA Polling the client does not participate.	

9.5.5.11 Nomad elections

Issue	Description	Workaround
Peer replying first in election is elected as Master irrespective of start-up time.	When None of the replying peer is current Master for Given Package and all the replying peers have same weight-age, also all the peers have 100% content for the given package. During download for the given package Elections is triggered and Peer replying first in election is elected as Master irrespective of start-up time of Nomad service	
Nomad shows incorrect logging indicating connection limit is over.	When there network disconnection during P2P download over http(s), sometimes incorrect logging appears indicating connection limit is over.	
Elections don't correctly honour uptime.	When election weight is same on all peers and one of the peer has greater uptime than everybody else then Nomad may not elect the machine with better uptime as master.	
In some cases high election weight peer loses election despite same content percentage.	When all the peers have almost same content percent then sometimes peer with higher election weight does not win elections.	

9.5.5.12 Nomad and Windows Servicing Assistant

Windows Servicing Assistant (WSA) is a feature of the 1E Client (with Shopping client enabled).

Issue	Description	Workaround
WSA deployment may restore data, which was captured by a different user.	When Replace capture WSA deployment is executed on source machine multiple times, different Nomad PBA Hosts can be honored to capture USMT data each time. During replace restore, target machine can restore any captured USMT data. Nomad PBA doesn't have a notion of version.	

Issue	Description	Workaround
TS execution fails as Content is not located in Nomad Cache if Nomad Cache was configured on Custom Drive.	If Nomad Cache is configured on the Custom drive then TS execution will fail as content will be searched in the default Nomad location.	
WSA Wizard might requests USB drive even when there is enough disk space.	Even though there is enough disk space on users workstation WSA Wizard might request for USB drive.	
PBA POLL / FIND fails during WSA TS execution.	If potential PBA host found during WSA prepareness, goes offline during Task Sequence execution, the TS can fail. Enabling HA can reduce the chances of such failures.	

9.5.6 Basic Nomad behavior in a simple environment

In order to understand how Nomad behaves in a simple environment, we have provided some examples. All the scenarios use the illustrated network setup, likely scenarios are:

Normal use

Master switched-off during upload

Common uplink broken

Distribution Point modified after initial advert download.

These scenarios are presented in a tabular format where time is represented going down the column and each row in the table marks a significant event. The columns in the table show the events that have taken place for each device.

9.5.6.1 Normal use

This illustration shows Nomad working as expected with no errors encountered during the transmission of a package. It shows a new **ADV00001** advertisement, being sent containing the **PKG00001** package:

Step	Device A	Device B	Device C
1	Start state ON	Start state ON	Start state OFF

Step	Device A	Device B	Device C
2	Receives new ADV00001 advert		
3	Starts Nomad		
4	Initiates election for PKG00001		
5	No replies so starts downloading from DP		
6		Receives new ADV00001 advert	
7		Starts Nomad	
8		Initiates election for PKG00001	
9	Reply to PKG00001 20% complete		
10		A wins election	
11		Updates local cache from A Copies blocks from A until caught up then back off (P2PbackoffSecs) before catching up again.	C is switched on
12	Each 5 minute period, A initiates an election and is re-elected as master		
13			Receives new ADV00001 advert
14			Starts Nomad
15			Initiates election for PKG00001

Step	Device A	Device B	Device C
16			Starts update local cache from A
17	A completes download and broadcasts **Done**		
18	Waits for peers to finish caching	Signals to A that cache is being copied	Signal to A that cache is being copied
19		Loads package	
20	Broadcast **Done**	Returns status for ADV00001	
21	Wait for peers to finish caching		
22			Signals to A that cache is being copied
23			Loads package
24			Returns status for ADV00001 advert
25	Loads package		
26	Returns status for ADV00001 advert		

9.5.6.2 Master switched-off during upload

This illustration shows how three devices running **Nomad** interact to elect a new master when the existing one becomes unavailable. It starts when a new advertisement, ADV00001, is sent containing package, PKG00001.

Step	Device A	Device B	Device C
1	Start state ON	Start state ON	Start state OFF
2	Receives new ADV00001 advert		
3	Starts Nomad		
4	Initiates election for PKG00001		
5	No replies so starts downloading from DP		
6		Receives new Advert ADV00001	
7		Starts Nomad	
8		Initiates election for PKG00001	
9	Replies to PKG00001 20% complete		
10		A wins election	
11		Updates local cache from A Copies blocks from A until caught up then back off (P2PbackoffSecs) before catching up again.	C is switched on
12	Each 5 minute period, A initiates an election and is re-elected as master		
13			Receives new ADV00001 advert
14			Starts Nomad

Step	Device A	Device B	Device C
15			Initiates election for PKG00001
16			Starts update local cache from A
17	A Switched Off		
18		B is partway through copying a block of data and returns an error	C is in a wait state and notices nothing yet
19		B initiates an election (loss of connection)	
20		B wins election and now takes over copying from the DP	C now caches from B
21	A Switched On		
22	Configuration Manager restarts package and Nomad		
23	A initiates an election (start up)		
24		B wins Election (% complete)	
25	A now caching from B		
26		B completes download and broadcasts **Done**	
27	Signals to B that cache is being copied	Wait for peers to finish caching	Signals to B that cache is being copied
28	Loads package		Loads package

Step	Device A	Device B	Device C
29	Returns status for ADV00001 advert		Returns status for ADV00001 advert
30		Loads package	
31		Returns status to for ADV00001 advert	

9.5.6.3 Common uplink broken

This illustration shows how **Nomad** deals with the situation where the WAN to the DP becomes unavailable and is later restored. It starts when a new ADV00001 advertisement has been sent containing the PKG00001 package.

Step	Device A	Device B	Device C
1	Start state ON	Start state ON	Start state ON
2	Receives new ADV00001 advert	Receives new ADV00001 advert	Receives new ADV00001 advert
3	Starts Nomad	Starts Nomad	Starts Nomad
4	Initiates election for PKG00001	Initiates election for PKG00001	Initiates election for PKG00001
5	A wins election and starts downloading from DP		
6		Updates local cache from A	Updates local cache from A
7	Each 5 minute period, A initiates an election and is re-elected as master		
WAN link broken			
8	Error detected – causing election to take place	Catch up with A	Catch up with A

Step	Device A	Device B	Device C
		After 3 periods of no progress, reverts to looking at DP link.	After 3 periods of no progress, reverts to looking at DP link.
9	A switched off		
WAN link restored			
10		B notices that WAN is restored and forces an election	
11		B is elected master	
12			Starts caching from B

9.5.6.4 Distribution Point modified after initial advert download

This illustration shows how the **Nomad** executable and service deals with the situation where the DP is modified after a master device has added the package to its cache. It starts with a new advertisement, ADV00001, is sent containing package, PKG00001 and the administrator then modifies the DP share.

Step	Device A	Device B	Device C
1	A has already cached package		
Admin Modifies the DP Shares			
2		Receives new ADV00001 advert	
3		Starts Nomad	
4		Initiates election for PKG00001	
5	Replies to PKG00001 100% complete		

Step	Device A	Device B	Device C
6		A wins election	
7		Whole package is loaded from A using original file list	
8		B notices that file list from A is older than DP last write time. B creates file list direct from DP and elects itself master	
9		B is now master and wins elections due to later file list	
10		Any file which does not exist or has been modified is now deleted and reloaded from the DP	
11			C caches from B as it has a more up-to-date file list
12	A is still running the old software and will continue to do so until it receives a new advert causing it to update		

9.5.7 Resolving common issues

The most common issues are listed below.

9.5.7.1 Communication issues

Nomad provides two types of encryption. By default, standard encryption uses a 40-bit RC2 algorithm, or you can enable advanced encryption which is compliant with FIPS. The advanced encryption is available for use in high-security environments where restrictions on encrypted algorithm types are enforced. These two methods are incompatible, so you must ensure that all installations of 1E Client are using the same encryption method.

9.5.7.2 Nomad firewall settings

By default, Nomad uses port 1779 to communicate during the election process for determining the master on a subnet. This port is opened during the 1E Client installation, however further action may be required in environments which use alternative firewalls, other than the native Windows Firewall.

> **Note**
>
> If you change the default port, ensure all Nomad clients are communicating on the same port.

9.5.7.2.1 P2P HTTP(S) firewall settings

If you're using HTTP or HTTPS as the protocol for P2P content transfer, then you'll also have to ensure there are firewall exceptions for TCP port(s) specified in settings P2PHttpPort or P2PHttpsPort.

> **Note**
>
> Please note that Nomad service automatically tries to add required firewall exceptions on startup. So if you experience firewall problems, most times it may be enough to simply restart Nomad service, and it'll add the missing exceptions.

9.5.7.3 File and print sharing

HTTP/S is the recommended protocol for peer sharing as well as download from servers. If this is not suitable then clients can use the default SMB, which requires the Windows **File and Printer Sharing Services** to be enabled.

If **File and Printer Sharing Services** is not available then Nomad can be configured to use HTTP or HTTPS.

For more detail about these and other access methods, please refer to Nomad cache.

9.5.7.4 Package version changes

Nomad has significant built-in logic to ensure that package version updates are handled and recoverable. However in complex environments with many package version changes happening whilst software distributions are in progress, unexpected behavior may occur. To increase software distribution success, ensure the following:

Minimize unnecessary package version updates

Avoid package version updates when active advertisements are running for that package

Wait until all distribution points have been updated prior to advertising

If failures occur, update the distribution points and re-advertise.

9.5.7.5 Cannot enable Nomad for a Configuration Manager client package (in the Configuration Manager Console)

The built-in Configuration Manager client package in Configuration Manager is locked, and therefore does not allow any modifications to be made to the package. In this instance, it is good practice to duplicate the existing client package for use with Nomad (for example, in OSD task sequences).

9.5.7.6 Verifying the speed or bandwidth utilization of a recent Nomad download

If you have the Nomad Download GUI already installed on the computer, you can use it to monitor the current download job in Nomad.

To review the download speeds of a recent Nomad download, open the NomadBranch.log file and locate the log entries related to the download job, taking specific interest of the *blk/s* values, as shown in the log extract below:

```
Remote_http   0100007F 9000 "Content_fe7d375d-c77c-4776-88e7-232b9d2ee65d_Cache
\Command_Monitor_x64.msi" blk=85 (blk/s=6)
Remote_http   0100007F 9000 "Content_fe7d375d-c77c-4776-88e7-232b9d2ee65d_Cache
\Command_Monitor_x64.msi" blk=88 (blk/s=3)
Remote_http   0100007F 9000 "Content_fe7d375d-c77c-4776-88e7-232b9d2ee65d_Cache
\Command_Monitor_x64.msi" blk=95 (blk/s=7)
PkgCacheStatusSet Content_fe7d375d-c77c-4776-88e7-232b9d2ee65d(1) Format:0 12.5
53%
Remote_http   0100007F 9000 "Content_fe7d375d-c77c-4776-88e7-232b9d2ee65d_Cache
\Command_Monitor_x64.msi" blk=99 (blk/s=4)
Remote_http   0100007F 9000 "Content_fe7d375d-c77c-4776-88e7-232b9d2ee65d_Cache
\Command_Monitor_x64.msi" blk=105 (blk/s=6)
Remote_http   0100007F 9000 "Content_fe7d375d-c77c-4776-88e7-232b9d2ee65d_Cache
\Command_Monitor_x64.msi" blk=108 (blk/s=3)
```

The *blk/s* refers to the number of blocks downloaded per second. The default block size is 131072 bytes (128KB), so *blk/s=6* equates to 786,432 bytes per second (or 768 KB/s). The block size can be changed by modifying the registry BlockSize.

9.5.8 Resolving content integrity (hash checks) issues

When an LSZ request is made and the request contains a hash, Nomad on DP computes a corresponding hash for the content on its disk. If the computed hash does not match the hash sent by the client, the content is considered corrupted and if it matches, the content is considered good, (see the example N*omadBranch.Log*below).

9.5.8.1 Download process

The process for the download is:

Clients retrieve this LSZ and check it for any errors.

If they evaluate an error (N*omadBranch.Log*shown opposite), they quit the download immediately.

If not, the download proceeds normally.

9.5.8.2 Set CompatibilityFlags on the DP and client

We also need to make sure that we have CompatibilityFlags set correctly on the DP and client respectively as follows:

Bit	Description
0x80000	The bit is enabled by default. Setting this bit enables full hash generation for SIS content when an LsZ file is generated on a DP. If this is not enabled, SIS content is trusted, and corrupted content may be downloaded.
0x100000	The bit is enabled by default. Setting this bit would abort download on a Nomad client if an LsZ hash mismatch is detected. If this is not set, when a Nomad client detects a hash mismatch it will re-request LsZ generation on the DP then try again, and get stuck in a loop if the SIS content is corrupt.

9.5.9 Reducing election notifications in Nomad log

By default, when an election occurs, all Nomad clients log the responses from every other client on the same subnet. In large subnets, this can result in the NomadBranch.log filling up and rolling over. This causes important entries getting missed and makes troubleshooting difficult.

9.5.9.1 Using MaxElectionResponseLogging to manage election notifications

You can turn off election response logging, or limit the number of responses logged for each election using theMaxElectionResponseLogging registry value. By default, the registry value will not be present and so all the election repliesare logged. If it's created (as a REG_DWORD value) and set to zero then no election replies willare logged. When using this option it may be useful to log some election responses to confirm the election process works.To do this, create theMaxElectionResponseLoggingregistry value and set it to themaximumnumber of responses you want logged for each election.

9.5.9.1.1 MaxElectionResponseLogging example

For example, you can create the MaxElectionResponseLogging REG_DWORD value and set it to 10.When there's an election request for package ABC0012D, there may be 350 responses received and processed, but only 10 of those responses will get logged on each client.Doing this, will keep logging to a reasonable amount and keep the logs helpful for troubleshooting.

Note

The value of MaxElectionResponseLogging specifies the number of election replies to be logged per election request.

As an example, if MaxElectionResponseLogging = 5 and there are two election requests for the same package at different times, a maximum of 5 election responses will be logged for each election (up to 10 election replies in total). If there are two concurrent election requests for the same package, the number of maximum election replies logged may vary from 5 to 10.

In general, if MaxElectionResponseLogging = *n* and if there are *m* concurrent election requests for the same package, the number of maximum election replies logged may vary from *n* to *m***n*.

Note

This option can be defined during installation of the 1E Client using the installer property MODULE.NOMAD.MAXELECTIONRESPONSELOGGING.

9.5.10 Resolving hard link issues

A hard link is the file system representation of a file by which more than one path references a single file in the same volume.

9.5.10.1 Using hard links

To create a hard link, use the *CreateHardLink* function. Any changes to that file are instantly visible to applications that access it through the hard links that reference it. However, the directory entry size and attribute information is updated only for the link through which the change was made.

Note

The attributes on the file are reflected in every hard link to that file, and changes to that file's attributes propagate to all the hard links.

If you reset the *READONLY* attribute on a hard link to delete that particular hard link, and there are multiple hard links to the actual file, you will need to reset the *READONLY* bit on the file from one of the remaining hard links to bring the file and all remaining hard links back to the *READONLY* state.

For example, in a system where C: and D: are local drives and Z: is a network drive mapped to *\\fred\share*, the following references are permitted as a hard link:

C:\dira\ethel.txt linked to C:\dirb\dirc\lucy.txt

D:\dir1\tinker.txt to D:\dir2\dirx\bell.txt

C:\diry\bob.bak linked to C:\dir2\mina.txt

However, these are not:

C:\dira linked to C:\dirb

C:\dira\ethel.txt linked to D:\dirb\lucy.txt

C:\dira\ethel.txt linked to Z:\dirb\lucy.txt

9.5.10.2 Deleting hard links

To delete a hard link, use the *DeleteFile* function. You can delete hard links in any order regardless of the order in which they are created.

9.5.10.3 Further considerations

When troubleshooting hard link problems, consider the following:

Consideration	Notes
Antivirus software	Security software and antivirus can block access to the file when you create a hard link so make sure it is not blocked by them.
Security policy	Your security policy should not be blocking hard links.
Insufficient Disk space	Make sure the drive has sufficient space to download the content.
Permissions	Check the permissions on the drive and folder of the source and target.
Configuration Manager	Configuration Manager did not create the folder for the hard link or it deleted it after the hard link failure – you can verify that in the *CAS.Log* and *NomadBranch.Log* Configuration Manager CAS created the folder (such as 2f) in the *ccmcache* folder but deleted for whatever reason, i.e. content was not hashed successfully by Configuration Manager client.

9.5.11 Resolving Nomad peer election issues

There can be multiple reasons why an elected master is disqualified from elections and therefore unable to provide content to a requesting client, for example different Nomad registry settings on client and master, or network issues (such as the client firewall not being configured correctly).

9.5.11.1 Things to check

As part of your troubleshooting process, you can:

Ensure the version of Nomad running is same on all peers.

Ensure the Nomad client settings are correctly matched – for example if you have configured the registry SpecialNetShare to hide the Nomad Share, make sure other clients use the same settings, otherwise the clients won't be able to do a P2P download successfully. Ensure your OSD Task Sequences have the same settings, such as the Install and Configure Nomad in WinPE step.

Ensure client firewalls are configured correctly. Even though Nomad self-configures the Windows Firewall, you may have Group Policy settings that override the local settings. If you have another firewall installed, such as McAfee HIPS or Symantec Endpoint Protection, you will need to configure those settings for Nomad.Check network access, refer to the relevant online help for further information.

Review the following KB article for a scenario where User Rights have prevented Nomad from working correctly, and the suggested solution:https://1eportal.force.com/articles/Info/KB000001596

Check if the peer downloading content from an elected master has disqualified the master because there is no download progress after multiple retries.

9.5.11.2 Remediation

A master that is disqualified for a package remains in the disqualified state for an hour and does not respond to election requests for that package. If any peer holds an election after an hour, the disqualified master participates in the election.

If an elected master is disqualified 6 times, then it enters into a **too many disqualifies** mode and stops responding to election requests for that package. P2PEnabled and SpecialNetShare registry settings should be checked on the disqualified master, to see if they are different from the peer that has disqualified the master. The **1E Nomad Branch** service must be restarted on the master if we want it to act as a peer and participate in the elections.

9.5.12 Resolving Peer Backup Assistant (PBA) issues

Considerations to resolve Peer Backup Assistant (PBA) issues.

9.5.12.1 The state of the Nomad log when PBA is working

The following examples illustrate the state of the Nomad log when PBA is working.

9.5.12.1.1 Peer Backup Assistant: Provision Nomad PBA Data Store

PBA process typically starts with provisioning the Nomad data store to find the OSDStateStorePath variable to let the task sequence know where to store and retrieve user state data. This step is initiated for an election within the subnet or query through AE(SSD PBA) for the site. The task sequence executes:

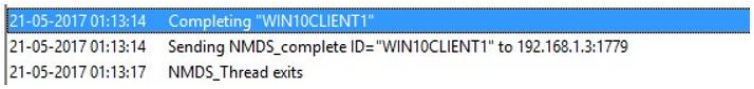
```
NomadPackageLocator.exe -NMDS_POLL,%ComputerName%,100
```

The snippet below from *Nomadbranch.Log* shows the process of NMDS polling and accepting the offer from machine SCCM-PRI.

9.5.12.1.2 Peer Backup Assistant: Close Nomad PBA Data Store

This step closes any existing connections it establishes with its peers to store content. The command it executes for the task sequence to complete the NMDS process is:

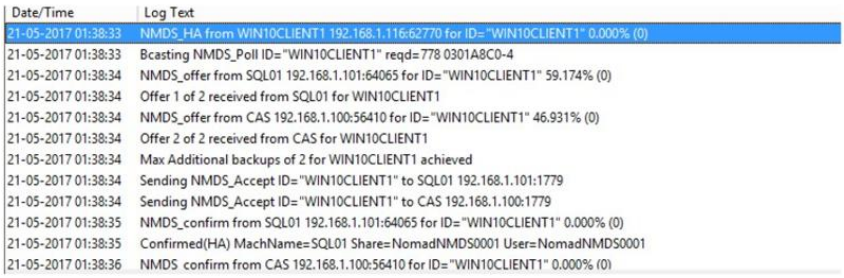
```
NomadPackageLocator.exe -NMDS_COMPLETE,%PBAComputerName%
```



9.5.12.1.3 Peer Backup Assistant: Nomad PBA Data Store High Availability

This step is used to replicate multiple copies in other data stores for high availability. This is helpful to prevent any data loss should the primary data store becomes unavailable or gets corrupted. The command it executes from the task sequence is:

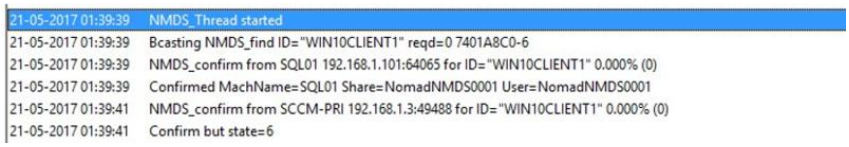
```
NomadPackageLocator.exe -NMDS_HA,1,2,1
```



9.5.12.1.4 Peer Backup Assistant: Locate Existing Nomad PBA Data Store

This step locates an existing data store to restore content. The command it executes from the task sequence is:

```
NomadPackageLocator.exe -NMDS_FIND,%PBAComputerName%
```



9.5.12.1.5 Peer Backup Assistant: Release Nomad PBA Data Store

Finally, this step releases and deletes any existing data store it uses. The command it executes from the task sequence is:

```
NomadPackageLocator.exe -NMDS_DELETE,%PBAComputerName%
```

Once all the data has been successfully copied back and is no longer required, it can be removed from the host. If this step is not used, the data is automatically deleted after a prescribed time.

9.5.12.2 Further considerations

If you see this error in the smsts.log:

```
Failed to run the action: Peer Backup Assistant: Locate Existing Nomad PB
A Data Store.
Incorrect function. (Error: 00000001; Source: Windows)
```

– it is a generic error message with no further information available. The PBA Step, Peer Backup Assistant: Locate Existing Nomad PBA Data Store is used to find Nomad data store to host PBA data.

If you see this error in the Nomadbranch log on PBA peer machines:

```
06-12-2017 12:14:00 NMDS_Thread started NMDS_PC532488 13560 (0x34F8)
06-12-2017 12:14:00 WARNING: latency>10 =15 - NMDS_Poll CommsRx 7828 (0x1
E94)
06-12-2017 12:14:00 Protocol requested: HTTP OR SMB NMDS_PC532488 13560 (
0x34F8)
06-12-2017 12:14:00 Insufficient allocation - Requested=1000 AlreadyAlloc
ated=0 MaxNMDSMega=5120 MaxAllocRequest=200 NMDS_PC532488 13560 (0x34F8)
06-12-2017 12:14:00 NMDS_Thread exits NMDS_PC532488 13560 (0x34F8)
```

In background, this command runs when this step is initiated:

```
NomadPackageLocator.exe -NMDS_POLL,%ComputerName%,100
```

Once the command is initiated, PBA clients broadcast in the subnet to find a suitable PBA store. PBA peers get these broadcast messages in their subnet and respond. However, in some cases where the PBA client finds no peers, it is likely a result of one of these:

Peers are NOT enabled to host PBA store

PBA is enabled but insufficient disk allocated

Allocated space is NOT sufficient to host data store.

If any task sequence steps fails on a PBA step:, check the following:

Is PBA enabled on peer machines? To verify it, you would need to ensure that value of registry value MaximumMegaByte at location Software\1E\NomadBranch\NMDS\ is **not** zero. If it is 0, it means that the machine is not allowed to host any data and will reject all PBA requests.

If PBA is enabled, ensure that the maximum allocation request by each client is configured with optimum space to host PBA data. To configure it, you will need to modify the registry value MaxAllocRequest at location Software\1E\NomadBranch\NMDS\.

For example, if original value is set at 200MB but the space requested by the client to store user state data is 250MB, it will fail. Typically, you can set MaxAllocRequest to be less than or equal to

MaximumMegaByte value. The difference between two is that with MaximumMegaByte, the client is configured to host Maximum data for all PBA clients, whereas with MaxAllocRequest, it is configured to host Maximum data which can be allocated to each client.

For example, if MaximumMegaByte=5120 and MaxAllocRequest=2560, the PBA host can store the user state data of two machines simultaneously where each client can store data up to 2560MB and total space allocated is 5120MB.

9.5.13 Resolving peer copy over HTTP or HTTPS issues

Nomad peer-to-peer content transfer uses SMB by default, which requires File and Print services to be enabled in order for it to share the content. For better security Nomad can be configured to use HTTP or HTTPS for peer-to-peer content transfer, removing the requirement for file shares. When Nomad is configured to use HTTP/S, if Peer Backup Assistant is enabled it will also use HTTP/S.

9.5.13.1 How it works

On start up, the Nomad service starts, the HTTP server logs a list of URLs it listens to, see the picture opposite.

```
1/25/2017 7:45:05 PM    Starting Http(P2P) Server
1/25/2017 7:45:05 PM    Http Initialized
1/25/2017 7:45:05 PM    Http Create Request Queue: 'Nomad'
1/25/2017 7:45:05 PM    listening for http requests on 'Http://*:5080/Nomad/Cache'
1/25/2017 7:45:05 PM    listening for http requests on 'Https://*:5443/Nomad/Cache'
1/25/2017 7:45:05 PM    listening for http requests on 'Http://*:5080/Nomad/Store'
1/25/2017 7:45:05 PM    listening for http requests on 'Https://*:5443/Nomad/Store'
```

When any Nomad client wants to download content, it does an election and identifies a device which has content in its cache (the Master device).

During the elections, the protocols supported by a client are not shared. Based on the local client's configuration, it chooses the protocol to use for downloading content from master. The example opposite illustrates the the connection to PC1 device using HTTPS protocol.

```
1/25/2017 6:24:55 PM    MyElection done - Winner is "PC1"  Best Offer is "" W=50 =0
1/25/2017 6:24:55 PM    Transfer Master has changed - now "PC1"
1/25/2017 6:24:55 PM    Nomad Branch event Evt_MasterChanged : PC1 for S0100015(18)
1/25/2017 6:24:55 PM    Connection::SetDownloadSource = Peer
1/25/2017 6:24:55 PM    RANDOM=558 users=0 delay=558 attempt=1
1/25/2017 6:24:56 PM    AttemptConnection "PC1"
1/25/2017 6:24:56 PM    Standard P2P Https connecting to master Https://PC1:5443/Nomad/Cache as "PC1\SMSNomadP2P&"
1/25/2017 6:25:07 PM    Adding credentials
1/25/2017 6:25:09 PM    Peer Connected OK
```

When a Nomad client is configured to use multiple protocols, the order of preference is HTTPS, HTTP followed by SMB. When files are downloaded, the logging is prefixed **P2P_http** to differentiate it from an SMB download. Both HTTP and HTTPS will use the same prefix.

```
1/25/2017 6:25:09 PM    P2P_http    0100007F A080 "S0100015_Cache\1.txt" blk=1 (blk/s=1) 0(0)
1/25/2017 6:25:09 PM    PkgCacheStatusSet S0100015(18) Format:0 1.431%
1/25/2017 6:25:10 PM    P2P_http    0100007F A000 "S0100015_Cache\NomadBranch.log" blk=309 (blk/s=308) 998000(3AF6C04)
1/25/2017 6:25:11 PM    P2P_http    0100007F A000 "S0100015_Cache\NomadBranch.log" blk=759 (blk/s=450) 17A8000(3AF6C04)
1/25/2017 6:25:12 PM    P2P_http    0100007F A000 "S0100015_Cache\NomadBranch.log" blk=1209 (blk/s=450) 25B8000(3AF6C04)
1/25/2017 6:25:13 PM    P2P_http    0100007F A000 "S0100015_Cache\NomadBranch.log" blk=1699 (blk/s=490) 3508000(3AF6C04)
```

9.5.13.2 Common error conditions

HTTP/HTTPS specific failures are most likely to occur when connecting to master, common errors you may encounter are shown opposite.

Error Code	Reason	Comments
0x00002efd and 0x00004CF	HTTP(S) is **not enabled** on master or HTTP(S) server on master is listening on **different port**	In the below log snippet, HTTP(S) wasn't enabled on PC1. *AttemptConnection "PC1"* *Standard P2P Https connecting to master Https://PC1:5443/Nomad/Cache as "PC1\SMSNomadP2P&"* *Send request failed https://PC1:5443 Nomad/Cache - FormatMessage failed with 0x0000013d for error code 0x00002efd* *Failed to connect to Https://PC1:5443/Nomad/Cache: The network location cannot be reached (0x000004CF)* *Failed to connect: The network location cannot be reached (0x000004CF)* *GetLstFromPeer: Connect ERROR - The network location cannot be reached* *GetLstFromPeer: failed - The network location cannot be reached* *Inside CopyLoopWait CopyError: The network location cannot be reached* *Unexpected Network Error The network location cannot be reached(1231)*
0x00002f8f and 0x000000A	Invalid Certificate on master	Any certificate issue would cause the download to fail with 0x00002f8f(Security Error). And current logging doesn't indicate the root cause of failure. On any security errors, one should check the following on master • Expiry date. • Subjects - should contain hostname (and fqdn). • Issuer should be trusted via the trust chain on the peer machine. • SSL Binding - Refer to above section to verify whether binding is existing for configured HTTPS port. In below log snippet, agent couldn't connect to PC1 because it had certificate issued by unknown CA. *AttemptConnection "PC1"* *Standard P2P Https connecting to master Https://PC1:5443/Nomad/Cache as "PC1\SMSNomadP2P&"* *Send request failed https://PC1:5443 Nomad/Cache - FormatMessage failed with 0x0000013d for error code 0x00002f8f* *Failed to connect to Https://PC1:5443/Nomad/Cache: The environment is incorrect (0x000000A)* *Failed to connect: The environment is incorrect (0x000000A)* *GetLstFromPeer: Connect ERROR - The environment is incorrect* *GetLstFromPeer: failed - The environment is incorrect* *Inside CopyLoopWait CopyError: The environment is incorrect* *Unexpected Network Error The environment is incorrect(10)* *CopyLoopWait: 5000 The environment is incorrect (0x000000A)*

9.5.13.3 Raising a support ticket

When you raise a support case with 1E for P2P HTTP/HTTPS file transfer issues, remember to attach the necessary log files (see below) and identify the Package ID, Deployment date and time for it.

C:\ProgramData\1E\NomadBranch\Logs\NomadBranch.log

C:\Windows\CCM\Logs\CAS.log

C:\Windows\CCM\Logs\CTM.log

9.5.14 Resolving Remote Differential Compression (RDC) issues

Remote Differential Compression (RDC) is sometimes known as binary differential replication or binary deltas but is more commonly known as remote differential compression (RDC) integration, for details refer to https://docs.microsoft.com/en-us/previous-versions/windows/desktop/rdc/about-remote-differential-compression.

For details about how Nomad integrates with RDC refer to Remote differential compression (RDC) integration.

9.5.14.1 Considerations when working with RDC

Considerations when working with Remote Differential Compression (RDC) issues:

Consideration	Notes
Configuration Manager 2012	On Configuration Manager 2012, RDC will not be used for Applications. This is because an Application's content version always remains at 1, only the content revision gets updated with a new content ID and hence RDC for Applications will not occur. This is not a limitation of Nomad, but simply the way the Application model is implemented in Configuration Manager 2012.
LSZ generation	The NomadBranch service skips RDC calculations while generating LSZ of a package for which LSZ of version n-1 has not been generated earlier or if the LSZgen request is for the first version of the package. Nomad only performs binary differential replication (BDR) for packages that are 1 version different (N-1) from the cached version. If the content is at version 3 and the client retrieving content has version 1 in cache, the client will retrieve the entire package. This sounds like a big caveat, but chances are that when Nomad goes to get the content there will be a peer in the local site that has it already, so the package will not be transferred across the WAN link. Also, if the device doesn't have the N-1 version and another device in the site does have the N-1 version, that content will be retrieved from the peer and only the delta content will be retrieved from the DP. In the event that it did have to traverse the WAN, Nomad will never step on your business traffic. For more information refer to http://www.1e.com/blogs/2014/09/01/nomad-and-binary-differential-replication/
Elected master on a subnet	RDC is between the DP and the elected master only in a subnet. The remaining devices or peers in the subnet will copy all the blocks of files modified in the package using normal P2P or local multicast. RDC_alt copy takes place when the elected master does not have the previous version of the package but another device on the subnet has it. The elected master can still do RDC file copy by copying the required blocks using RDC_alt copy from the other device on the subnet.
Packages over 125MB in size	Nomad automatically performs BDR functionality for packages over 125MB in size. Packages smaller than this do not benefit from BDR.

9.5.14.2 The state of the NomadBranch log when things are working

The state of the NomadBranch log when things are working as illustrated by the client and DP logs.

9.5.14.2.1 Client log

The Nomad client has to download version 50 of the package and it has set RDC previous version to 49 which must be present in order for RDC to work:

```
05-12-2016 18:27:24       WARNING: stale ELD P010051E(49)           Copy_P01005

9.5.14.4 Considerations when resolving RDC issues

When resolving RDC issues, you should:

Ensure that RDC installed on the site server and on any Branch Distribution Points (BDP), the Nomad client does not need RDC on it

Select the Binary Differential Replication checkbox in the properties of any package for which you want to use BDR

Ensure that the RDC content are one version different from the cached version

Ensure that the content size is more than 125 MB, packages smaller than this do not benefit from BDR

Check where the SMSSIG$ folder is on the DP and compare it with the path in the Nomad registry setting HKLM\Softwares\1E\Nomad\SigsFolder. If it is not set, Nomad assumes that signature files location as C:\SMSSIG$, if it exists.

9.5.15 Resolving slow content transfer issues

If you encounter slow content transfers, we recommend you consider the following:

Consideration	Notes
WAN accelerators	WAN accelerators can sometimes interfere with Nomad bandwidth utilization calculations making Nomad to back-off unnecessarily.
Cisco routers	Network devices such as Cisco routers may have HTTP/HTTPS packet inspection rules turned on by default, which may also interfere with Nomad bandwidth utilization calculations and cause Nomad to back-off unnecessarily.
Network optimization or caching devices	Do you have network optimization or caching devices? If so, work with your Network team to determine the configuration.
Local connected network devices	Ensure that all local connected network devices such data switches, network adapters, are using 1Gpbs links.
Network adapter device drivers	We also recommended that network adapter on clients are using the latest device drivers.
Antivirus solutions	Antivirus solutions might be scanning content as it is being transferred through Nomad. It might be necessary to add an exclusion to the SCCMContentLib folders in the Configuration Manager Distribution Points as well as the Nomad and Configuration Manager client cache folders.
Blocksize	The default blocksize for Nomad 7.0 (and later) is 128KB. The default for earlier versions is 32KB. Every block needs to be authenticated, which may

Consideration	Notes
	add to the content transfer time. Please refer to BlockSize page for more information.
Nomad work rate	Ensure that the Nomad work rate (the proportion of available bandwidth) is not set too low. The default Nomad work rate is 80 and this should work fine in most environments.
P2PEnable	Avoiding configuring Nomad P2PEnable registry value to 6 – Connectionless Server and Client expect Nomad enable OSD task sequences. Connectionless is considerably slower than SMB and HTTP/HTTPS therefore it is not a recommended setting except when there is a business requirement that all Nomad peer-to-peer communications must use connectionless.
Outdated hardware	Nomad peers performance bottlenecks such as CPU, Memory and Disk I/O. Outdated hardware might not provide the best transfer performance when large content such as a Windows image file is being transferred to local Nomad peers.

9.5.16 Resolving SoftwareUpdate metadata validation

Updating the contents of an object in Configuration Manager usually results in a version change (or a new object is created). However, with SoftwareUpdates, the contents could be updated without any change in its ID or version (which always remains at 1). Such changes to content without versioning would cause issues in peer-to-peer (P2P) sharing, because peers could serve stale content. To cope with changes like this, an additional validation has been introduced for software updates, ensuring clients download the latest content.

This additional validation ensures Nomad downloads content as the Configuration Manager client expects. With software updates the metadata of its files is available in the Configuration Manager client's WMI, and is compared against the details in LSZ. If there is a mismatch, the client tells the peers to delete the stale content from their cache and the client retries the download. If the client was downloading from a DP, a message is sent to Nomad on that DP and the LSZ is recreated is using the latest content. Once a client has downloaded the LSZ with the expected metadata, the rest of the download logic continues as expected.

9.5.16.1 How it works

File metadata is obtained from the 'DownloadInfoEx2' class in CM's WMI and as a part of the validation process, the name and hash of every file is compared against those in the LSZ. In the following example, the hashes are SHA1.

Note

The file hashes currently in the LSZ are of SHA2. LSZ generation is updated to put in SHA1 hashes for software updates.

Sample metadata in WMI:

```
<Content ContentId="c54879c8-215e-413f-afbf-a701afa2d637" Version="1">
<FileContent Name="18362.30.190401-1528.19h1_release_svc_refresh_CLIENTBUSINESS
_VOL_x86FRE_en-us.esd" Hash="1F01343ACDE39AE567FF520F9FC51DC2F9507305" HashAlgo
rithm="SHA1" Size="2345415546"/> <FileContent Name="WindowsUpdateBox.exe" Hash=
"A215D07C5B28BA2270D9E2F54FB51C1010777762" HashAlgorithm="SHA1" Size="19524440"
/>
</Content>
```

If the metadata in the LSZ does not match, the LSZ is deleted and the download is retried and downloading of stale LSZ is avoided in the next attempt. If the client is downloading from a Distribution Point (DP), an LSZGen request is sent with a force option, so the existing LSZ file on the DP is deleted and generated again using the latest content, this means that any changes to content after the initial LSZ generation is accounted for.

If the client was downloading from a peer, then a "Validate Metadata" message is broadcast to peers. When peers receive the message, clients will validate the LSZ metadata in their cache using the 'MetadataHash' included in the message. If there is no match, clients delete the entire content from their cache. This means that when the original download is retried, any clients with stale content will not take part in elections. If there are any SSD/LocalSSD peers included, they are informed individually with a similar message.

The 'MetadataHash' used for validation is a hash of details of every file in the content. It is an SHA2 hash, calculated using Name&Hash of each file sorted alphabetically using their hashes (there is no specific reason for choosing hashes as the sort criteria, using the name also would work the same way).

9.5.16.2 Configuration

These changes apply when the *0x40000000* flag is enabled in CompatibilityFlags.

Note

This bit must be added to CompatibilityFlags for this to work, it is not set by default.

Before applying the *0x40000000* flag, consider that:

This validation may not work for updates deployed before this fix, because file hashes in LSZ for existing packages would be of SHA2, which is different from CM client's metadata

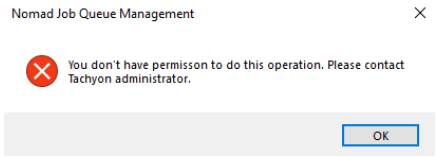
Because older clients will ignore the validation msg, the fix should be deployed on all clients

Clients will not take explicit action (For example, to disqualify) if a peer does not act on the validation msg, (But it may happen automatically, due to the resilience in an existing P2P implementation).

9.5.17 Resolving Configuration Manager Pre-caching and Nomad Pause error

If you have Nomad installed, and you select either **1E Nomad→Pre-caching** or **1E Nomad→Paused Collections** nodes in the **Monitoring** space of the Configuration Manager console, you may see the message opposite.

For a Nomad Administrator to manage Configuration Manager collections, for example to create, view and delete pre-cached and paused collections, the Nomad Administrator role will need to include the appropriate permissions. Refer to Adding Configuration Manager permissions for how to add the required permissions.



9.5.17.1 Adding Configuration Manager permissions

If you have a single AD security group for your Configuration Manager administrators, you should assign it as a member of the **Nomad Administrator** group. This allows them to use the Nomad app, view and delete pre-cache and paused collections, and use Guaranteed State features if installed.

However, if you have decided to use different roles for Nomad app and Guaranteed State features, then you can assign the same or different AD security groups to the **Nomad Administrator** and **Guaranteed State User** roles.

For more information about these features, please refer to Nomad app overview, Nomad Pre-caching, Nomad Download Pause, and the Client Health page.

The example opposite shows a Universal group called CM_Admins of which our Configuration Manager administrator account is a member.

Note

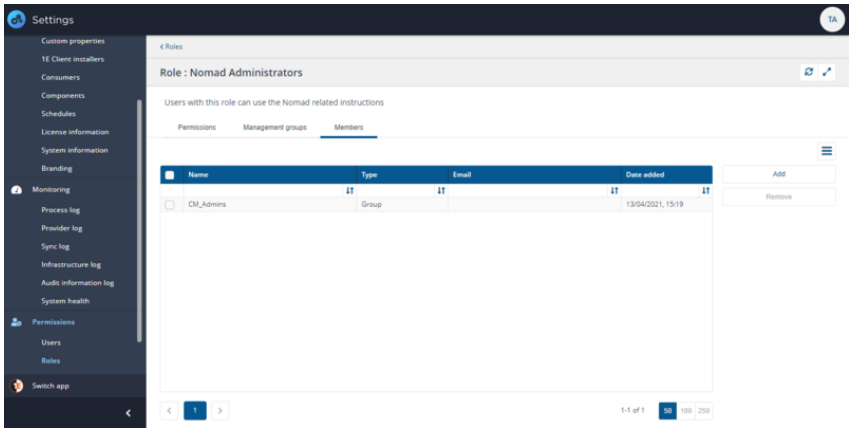
Active Directory security groups are strongly recommended for role-based access control (RBAC) but are not mandatory. AD security groups can be assigned to Tachyon roles after installation, they are not required during installation. They are added as Tachyon users and configured in the same way as AD user accounts.

A Tachyon user can therefore be a domain user account or a security group. Groups are not mandatory because users can be assigned to roles and managed within Tachyon instead of AD, or a combination.

Note

For details about how to use the **Settings** app to configure Tachyon system and application settings, refer to Tachyon Platform 8.0 - Using Settings.

For details about configuring Tachyon users, roles and management groups, refer to Tachyon Platform 8.0 - Permissions Menu.



9.6 Reference

All the Nomad related tables of information, such as supported platforms, communications ports etc.

9.6.1 Content Distribution Web API

Resource representations that are supported by the Content Distribution API for third party use.

9.6.1.1 Example scripts

ContentDistribution currently provides two example scripts:

Script	Description
Active Directory Single Site Script	Fetches site and subnet data from Active Directory and stores it in the ContentDistribution database as device tags using the Web API.
Custom Single Site script	Adds custom site and subnet data to the ContentDistribution database using the ActiveEfficiency Web API.

9.6.1.2 Supported resources

The following resource representations are supported by the Content Distribution Web API for third party use.

9.6.1.2.1 Devices

This is the primary resource representing hardware being discovered for example, desktops, servers or laptops. The following HTTP URI's and methods are supported for this resource:

URI	Method	Description
http://<server>/ActiveEfficiency/discovery/devices	GET	Retrieves a list of devices.
http://<server>/ActiveEfficiency/discovery/devices/{device id}	GET	Retrieves the single device by the id provided in the url.
http://<server>/ActiveEfficiency/discovery/devices	PUT	Adds or updates a single device.

Note

DELETE is not supported.

A device resource has the following properties:

Name	Type	Mandatory	Description
Id	unique identifier	No	A unique identifier that is assigned to the resource by the server. Needed to uniquely identify a device resource.
Identities	IList<DeviceIdentityResource>	No	A list of identities that the device is known by in other systems.
Fqdn	string	Yes	The FQDN of the device.
DomainName	string	No	The NetBIOS name of the domain (or the domain suffix for non Windows devices)

Name	Type	Mandatory	Description
NetbiosName	string	No	The NetBIOS name of the device (or host name for non Windows devices).
Type	int	No	0: Unknown 1: Desktop 2: Laptop 3: Server
CreatedBy	string	No	The name of the client creating the resource. Currently not mandatory, but will change.
CreatedTimestamp	DateTime	No	The time in UTC when the web service created the resource
ModifiedTimestamp	DateTime	No	The last time in UTC when the resource was modified.

A device identity resource has the following properties:

Name	Type	Mandatory	Description
Source	string	Yes	Name of the identity.
Identity	string	Yes	Value of the identity. This is always represented as a string even if the external source represents it as another type (integer, GUID etc.)
AssignedUtc	DateTime	No	The date/time that the external system assigned this identity to the device.

9.6.1.2.2 Device Tags

A device tag represents a name-value pair that defines a certain attribute of the device. These attributes may extend the identity of the device or may be used in defining query based collections of devices. The following HTTP URI's and methods are supported for this resource:

Uri	Method	Description
http://<server>/ActiveEfficiency/discovery/devices/{device id}/tags	GET	Retrieves a list of tags for the device specified
http://<server>/ActiveEfficiency/discovery/devices/{device id}/tags/{category}	GET	Retrieves a list of tags for the device and category specified
http://<server>/ActiveEfficiency/discovery/devices/{device id}/tags/{category}/{name}	GET	Retrieves a list of tags for the device, category and name specified
http://<server>/ActiveEfficiency/discovery/devices/{device id}/tags/{category}/{name}/{index}	GET	Retrieves a single tag for the device, category, name and index specified
http://<server>/ActiveEfficiency/discovery/devices/{device id}/tags	POST	Adds a single device tag to the list of device tags, returning the created resource. Device tags are identified

Uri	Method	Description
		by category, name and index - they do not have an explicit id. If tag with the same category, name and index already exists, the value and the modified date get updated.

DELETE is not supported.

The device tag resource has the following public properties:

Name	Type	Mandatory	Description
Category	string	Yes	The category (namespace) for the tag. The category and name uniquely identify the resource. Category is mandatory. It must not be null, empty or only whitespace.
Name	string	Yes	The tag name. Name is mandatory. It must not be null, empty or only whitespace.
StringValue	string	Yes	The value represented as a string.
Type	int	Yes	Must be 0 (string), or 1 (date/time). If date/time, value must be in universal sortable format (http://msdn.microsoft.com/en-us/library/az4se3k1.aspx)
CreatedBy	string	No	The name of the client creating the resource. Currently not mandatory, but will change.

Name	Type	Mandatory	Description
CreatedTimestamp	string	No	The UTC time when the web service created the resource.
ModifiedTimestamp	string	No	The last UTC time when the resource was modified.

9.6.1.2.3 Location

These location resources are used by Nomad to identify subnets contained within the same site. These are pre-populated by some out-of-band method (e.g. PowerShell script). They are not directly consumed by Nomad (the web service determines which Content Delivery resources to return based on the contents of the location section of its database).

URI	Method	Description
http://<server>/ActiveEfficiency/locations/	POST	Adds a single location resource (returns its unique identifier).
http://<server>/ActiveEfficiency/locations/{id}/	GET	Returns a specific location resource using its unique identifier.
http://<server>/ActiveEfficiency/locations/	GET	Returns a listing of all location resources.
http://<server>/ActiveEfficiency/locations/{id}	DELETE	Removes a single location record using its unique identifier.
http://<server>/ActiveEfficiency/locations/	DELETE	Removes all location records.

Location resources have the following public properties:

Name	Type	Mandatory	Description
Id	GUID	Yes	Unique identifier for this location (auto-generated).
Site	string	Yes	Name of Site that this Location belongs to. Arbitrary and used to find related Subnets.

Name	Type	Mandatory	Description
Subnet	string	Yes	Subnet (for example, "10.0.10.0/24")

9.6.1.2.4 Pre-cached jobs

These content distribution job resources are used to manage pre-cached jobs and retrieve download notifications:

URI	Method	Description
http://<server>/ActiveEfficiency/ContentDistributionJobs/	POST	Creates, view and delete pre-cached jobs.
http://<server>/ActiveEfficiency/ContentDownloadNotifications/{id}/	GET	Retrieves download notifications

Content distribution job resources have the following public properties:

Name	Type	Mandatory	Description
Id	unique identifier	No	Identifier for the resource.
DeviceFqdns	Array of strings	Yes	List of device FQDNs
ContentItems	Array of content items	Yes	List of contents. Must include the ID and version of the content.
UserData	XML	No	Additional details about job.

Content download notifications have the following public properties:

Name	Type	Mandatory	Description
ContentId	string	Yes	Identifier for the content.
Version	string	Yes	Version of the content.

Name	Type	Mandatory	Description
Hash	string	No	SHA-256 hash to verify integrity of files inside content

9.6.1.2.5 Managing large amounts of data

ODATA is an open standard that allows clients to consume data feeds in an open format and was designed for this purpose. The web service supports ODATA so that the clients can ask for pages of data. Assuming that the web service contains 1000 devices, the following are examples of how ODATA helps us:

9.6.1.2.5.1 Without ODATA

Without ODATA, the following url returns 1000 devices in one go; no good if the client limits the buffer size:

```
http://<server>/ActiveEfficiency/devices [GET] ;
```

returns 1000 devices in one go

9.6.1.2.5.2 With ODATA

ODATA supports the keyword **top** and **skip** which allows you to implement the following loop:

```
http://<server>/ActiveEfficiency/devices?$top=100&$skip=0;
```

returns the first 100 devices

```
http://<server>/ActiveEfficiency/devices?$top=100&$skip=100;
```

returns the next 100 devices

```
http://<server>/ActiveEfficiency/devices?$top=100&$skip=200;
```

returns the next 100 devices and so on.

9.6.2 Nomad app

The Nomad app provides visibility of content distribution activity and cache status for content distributed by both Nomad and Delivery Optimization. This includes Configuration Manager content distributed with Nomad and Software Updates content distributed with either Nomad or Delivery Optimization.

The Nomad app **Overview** page gives a high-level view of the current status of content throughout the entire network. By default, the view will show activity and status for both Nomad and Delivery Optimization. These defaults can be modified using the **Technology** filter (to show Nomad or DO activity only) and the **Time period** filter. You can use the Nomad app, powered by the Tachyon Platform, to get a visual snapshot of download activity in your environment.

The Nomad app provides visibility of content distribution activity and cache status for content distributed by both Nomad and Delivery Optimization and consists of the pages listed in this table:

Nomad page	Description
Overview page	Provides a visual snapshot of download activity.
Content page	Lists unique contents synced from MEMCM, including applications, packages and software updates.
Task Sequences page	Lists configured task sequences.
Devices page	Lists every device registered to Nomad.
Nomad Sites page	Primarily designed to show how the network is being used for content distribution in different locations.
Client Health page	Primarily designed to show related data from Using Guaranteed State.

The first version includes Configuration Manager content distributed with Nomad and Software Updates content distributed with either Nomad or Delivery Optimization. Future releases will include Intune and Microsoft Store content distributed with Delivery Optimization as well as other content, such as VMWare Workspace One and 1E Tachyon content distributed with Nomad.

The Nomad app will be available after you install the Tachyon Platform and can be accessed using the Tachyon DNS Alias FQDN. For example:

https://tachyon.acme.local/Tachyon

Although not a requirement for generally using Nomad, Tachyon Platform must be installed and available before you can use certain Nomad features.

The following Nomad features use Content Distribution and require Tachyon Platform and Tachyon features of 1E Client to be enabled:

Nomad app provides visibility of content distribution activity

Single Site Download (SSD)

Single Site Peer Backup Assistant (SSPBA)

High Availability Peer Backup Assistant (HAPBA)

Get Migration Settings task sequence action used to manage computer associations

Nomad Pre-caching

Nomad Download Pause.

Note

Nomad versions prior to Nomad 7.1 used ActiveEfficiency to support similar features. Tachyon platform previously included ActiveEfficiency.

The following features were provided in versions of Nomad older than Nomad 7.1:

1E Client Health - now provided by the Guaranteed State feature of the Tachyon Platform

Nomad Dashboard - now provided by Nomad app feature of the Tachyon Platform.

These features require the full deployment of the Tachyon Platform infrastructure, including Master and Response Stacks, with an optional DMZ Server for Internet based clients.

Tachyon Platform is installed using Tachyon Setup, which should also be used to install the following components, included in the Tachyon Platform download zip.

Nomad app - this consumer application replaces the legacy Nomad Dashboard

Content Distribution - this web service is required by the Nomad app, and replaces the legacy ActiveEfficiency Server.

Please refer to:

Requirements for prerequisites

Introducing Tachyon for details about the Tachyon Platform and other optional applications and features.

9.6.2.1 Overview page

9.6.2.1.1 Explaining content versions

In Configuration Manager (CM), the content associated with a Package or Application Deployment Type may be updated by an administrator. In the case of Packages, CM increases the Package Version property, and for Application Deployment Types, CM generates a new Content ID for the Deployment Type.

The Nomad Overview page displays summarized distribution data for a selected period. The displayed data shows all downloads and download activity for all versions of content for that period. For example, if a device downloaded Package A version 1 a month ago and later downloaded version 2 of the same Package, the Overview page would reflect both downloads.

In this version it has not been possible to reflect previous versions in the **Content Titles** summary in the top status bar, or in the **Content Titles Count by Content Type** and **Download Volume by Content Type** tiles. These will only represent download activity for the latest version of content. This may result in apparent 'loss' of data (e.g. a reduction in the number of content titles or download volume) when content for an existing Package or Application is updated in CM, as these metrics will only include download activity for the latest version. This will be addressed in a later version of Nomad.

> **Note**
>
> Other pages in the app, such as the Content page, only show the latest version of any given **Content Title**. Those pages concern the current state of things (e.g. where content is available) because only the latest version is usable by CM deployments. As a result, showing older versions would be misleading for users.

The **Overview** page gives a brief snapshot of download activity. The page has multiple tiles showing:

Content Titles by Content type

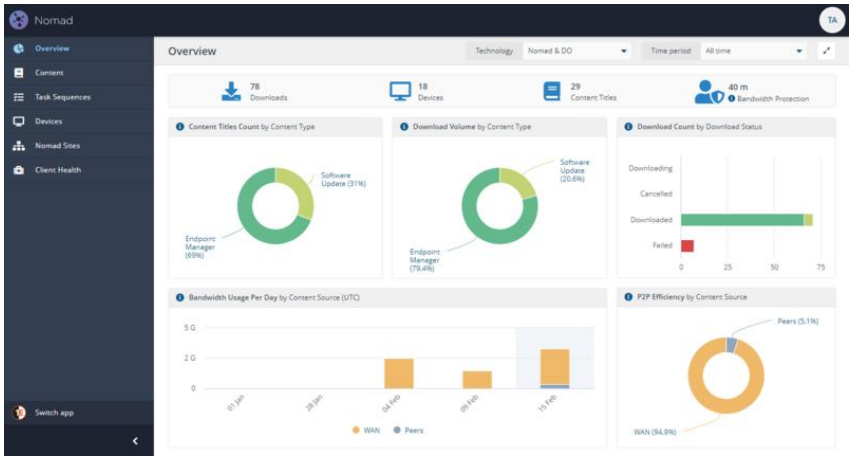
Download Volume by Content Type

Download Count by Download Status

Bandwidth Usage Per Day by Content Source (UTC)

P2P Efficiency by Content Source (Peer to Peer - P2P).

The results can further be narrowed down by using the **Technology** and **Time period** filters on the page.



9.6.2.1.2 Navigation and Filtering

By default, the view shows activity and status for all time and will show activity and status for both Nomad and Delivery Optimization. These defaults can be modified using the **Technology** filter and the **Time period** filter.

> **Note**
>
> Each content tile can be expanded using the **Expand** button on the top right-hand corner of each tile.

9.6.2.1.2.1 Time period filter

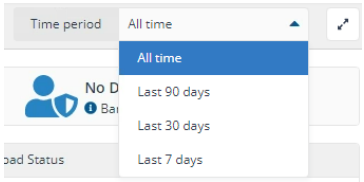
Using the **Time period**filter at the top of the page, you can narrow down the results by date. You can choose from the following options:

Last 90 days

Last 30 days (Default)

Last 7 days.

> **Note**
>
> If these filters are applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.1.2.2 *Technology filter*

You can use the **Technology** filter to differentiate between downloads through Nomad or Delivery Optimization (DO).

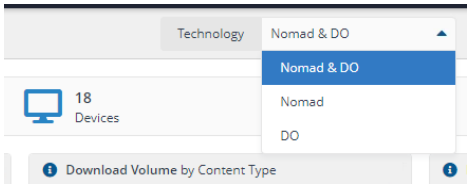
The following options are available:

Nomad & DO (Default)

Nomad

DO.

> **Note**
>
> If this filter is applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.1.3 Top status bar

The status bar along the top of the page shows high-level statistics for the currently selected **Technology** (Nomad or DO) and **Time period**. The bar is shown on the Overview page and includes four icons, **Downloads**, **Devices**, **Content Titles** and **Bandwidth Protection**.

Item	Description	Icon
Downloads	Downloads reflect the total number of content downloads. This includes both Delivery Optimization (DO) and Nomad downloads. The results can be filtered on the **Time period** and **Technology** filters and display the total number of downloads of any version of content that occurred in the selected period. A download counts as any download activity for a given Content Title on a given device. For example, if there are 10 content titles downloaded by 50 devices, the total count of download instances would be 500.	

Item	Description	Icon
	For CM Applications, each Application Deployment Type counts as a separate Content Title. Clicking on this icon navigates to the **Content** page filtered to show **Content Titles** reporting download activity within the selected **Time period**.	
Devices	Displays the total number of devices that have reported download activity for any content version in the selected **Time period**, including: Packages Applications Updates from Configuration Manager. Clicking this icon navigates to the **Devices** view, filtered to show devices where download activity was reported within the selected **Time period**.	
Content Titles	Displays the total number of unique **Content Titles** where download activity of the latest version of the content titleis reportedin the selected**Time period.** For CM content, a**Content Title**is a single Application or Package. Clicking on this icon navigates to the Content view filtered to show the **Content Titles** that have reported download activity within the selected**Time period.** **Note** Applications in CM may have many Deployment Types. This summary counts an Application as a single Content Title.When viewing the Content view, Content Titles for CM Applications are further identified with the Deployment Type thatwas downloaded. So, the total number of Content Titles identified on the top status bar may be lower than the corresponding list of Content Titles on the Content page. This is because the Content page reports download activity for individual Deployment Types of CM Applications.	

Item	Description	Icon
Bandwidth Protection	Displays the total time that Nomad backed off when downloading content to protect end-user bandwidth. **Bandwidth Protection** allows Nomad to adjust the speed of ongoing downloads to save bandwidth for other business use. Bandwidth Protection ensures Nomad doesn't consume excess bandwidth and hinder other business activity.It does that by tracking the download time of data packets. If the time increases, it slows itself down (backing off) by sleeping for a few moments before downloading another packet.	

9.6.2.1.4 Content tiles

Content tiles display statistics for content download activity in the following panes:

Content Titles Count by Content Type

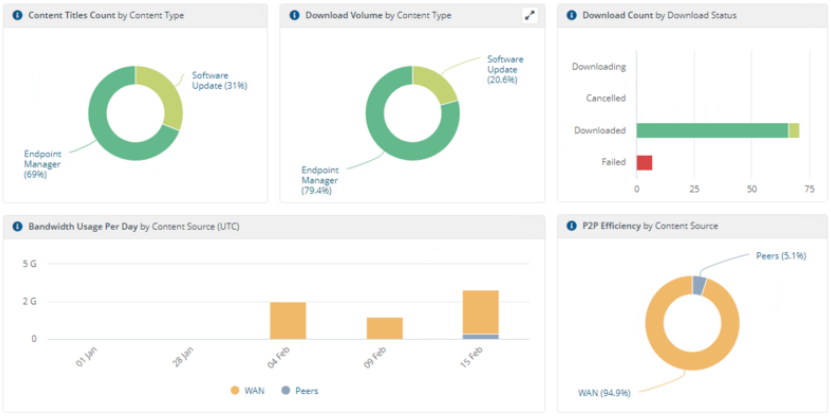
Download Volume by Content Type

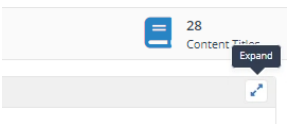
Download Count by Download Status

P2P Efficiency by Content Source

Bandwidth Usage Per Day by Content Source UTC.

> **Note**
>
> Each content tile can be expanded using the **Expand** button on the top right-hand corner of each tile.





9.6.2.1.4.1 Content Titles Count by Content Type

The **Content Title Count by Content Type** tile shows the total number of unique **Content Titles** for where there is download activity reported for the latest version of the content within the selected **Time period**.

The data is grouped by **Content Type** and displayed as a donut chart. The app currently reports on two **Content Types**:

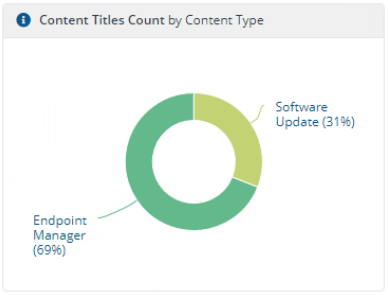
Endpoint Manager - CM applications and packages that are not delivered by DO

Software Update - includes any Microsoft Software Updates deployed through CM or Windows Update.

> **Note**
>
> Applications in CM may have multiple **Deployment Types**. This tile counts an Application as a single **Content Title**. When viewing the **Content view**, **Content Titles** for CM Applications are further identified with the **Deployment Type** that was downloaded.
>
> As a result, the total number of **Content Titles** identified on the top status bar may be lower than the corresponding list of Content Titles on the Content page (which reports download activity for individual **Deployment Types** of CM Applications).

Hovering over a **Content Type** segment of the chart displays the count of **Content Titles** of that type, also represented as a percentage of all **Content Titles**.

Clicking on a **Content Type** segment of the chart will navigate to the **Content** view, filtered to show related **Content Titles**.



9.6.2.1.4.2 Download Volume by Content Type

The **Download Volume by Content Type** tile shows the cumulative volume of content of the latest version of content downloaded by all devices within the selected **Time period**. The data is grouped by **Content Type** and displayed as a donut chart.

The chart enables you to see the effect that different types of content have on your network, in terms of the volume of data associated with them. It shows the percentage of packages and software updates by volume for:

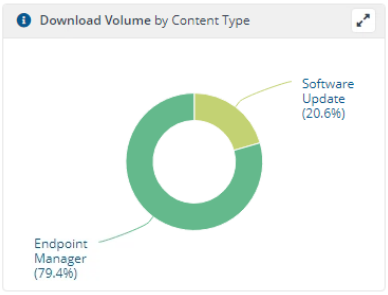
Endpoint Manager - CM applications and packages that are not delivered by DO

Software Update - content that can be delivered by Nomad, or DO if you're using Windows Update directly.

For example, if a single content title is 100MB and it is downloaded by 100 devices, the cumulative **Download Volume** reported for that particular **Content Title** would be 10,000MB. The chart shows the cumulative volume for all **Content Titles** on all devices, grouped by **Content Type**.

Hovering over a **Content Type** segment of the chart displays the total volume of downloaded content of that type. This is also shown as a percentage of total volume of downloaded content.

Clicking on a **Content Type** segment of the chart navigates to the **Content** view, filtered to show **Content Titles** of the selected segment.



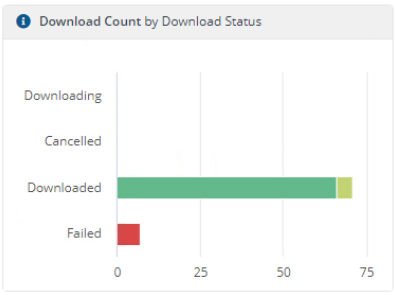
9.6.2.1.4.3 Download Count by Download Status

The **Download Count by Download Status** tile shows the status of download activity within the selected **Time period**, displayed as a bar chart by:

Status	Description
Downloading	Number of downloads currently in progress, where a download has been reported as started but has not yet reported complete, failed or cancelled.
Cancelled	Number of downloads whose last reported status was **Cancelled**, downloads may be cancelled by the user, or by the system, for example if the system is shut down or higher priority downloads are queued.
Downloaded	Number of successful downloads, if the downloaded content is still cached on a given device, it's represented by the dark green part of the Downloaded bar labelled **(Downloaded (Cached)** when you hover over it. If the downloaded content was subsequently deleted from the cache on a given device, it's represented in the light green part of the **Downloaded** bar labelled **(Downloaded (Deleted)** when you hover over it.
Failed	Number of downloads whose last reported status was **Failed**.

Hovering over any of the bars displays the number of downloads in the selected download state.

Clicking on any of the bars navigates to the **Content** view, filtered to include **Content Titles** where one or more devices is in the selected download state.



9.6.2.1.4.4 Bandwidth Usage Per Day by Content Source (UTC)

The **Bandwidth Usage Per Day by Content Source (UTC)** tile represents daily download activity throughout the entire network during the selected **Time period**.

A column is displayed for each day when there was download activity. Each column indicates the volume of content downloaded over the WAN (in orange) or from peers (in grey). Hovering over a segment of the column will display the volume of content downloaded on that day.

This view demonstrates the value that Nomad and Delivery Optimization are providing through reduced WAN traffic. If the majority of content is being downloaded over the WAN, it could indicate that peers are simply not available (e.g. users working from home) or it could be an indication that Nomad or Delivery Optimization are not correctly configured to optimize content from peers.

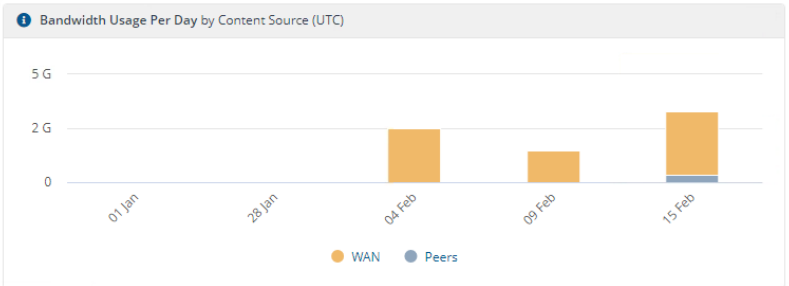
The columns on this chart are not clickable, they are for data visualization only and do not navigate to another view of the data.

> **Tip**
>
> On the Overview page, when you select the **All Time** filter, the **Bandwidth Usage Per Day by Content Source (UTC)** graph displays a maximum 365 days of data.

> **Note**
>
> This chart only displays content that was downloaded over the network either from a peer or from the source (e.g. a CM Distribution Point), if a device:

Requests content that is already in its cache, it will not be represented in this chart

Only has some content in its cache and downloads the remainder of the content from peers or the source, the content that was downloaded will be shown.



9.6.2.1.4.5 P2P Efficiency by Content Source

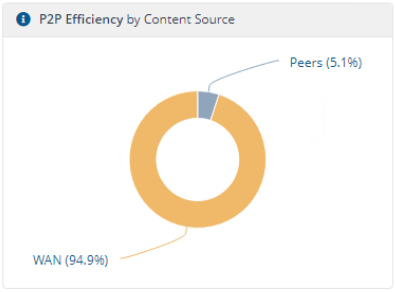
The **P2P Efficiency by Content Source** tile represents the overall peer-to-peer efficiency across the entire network during the selected **Time period**.

The data is grouped by source (Peers and WAN) and displayed as a donut chart showing the volume of content downloaded from peers (in grey) and from the source over the WAN (in orange). This gives an indication of the overall value of Nomad and Delivery Optimization across your organization.

Ideally, more content will be downloaded from peers than from the source over the WAN, which saves network bandwidth. Where this is not the case, it could be due to many users working remotely without any local peers, or it could be due to configuration settings on the client that are not optimized for peer-to-peer caching and availability.

This chart is not clickable, it is summary data visualization only and does not navigate to another view of the data.

> **Note**
>
> In this chart, the volume of content downloaded from peers includes any content requested by a device during the selected **Time period** and was already in the cache at the time (i.e. 'already cached' is represented as content obtained from a peer). If the content was downloaded from a peer or over the WAN during the selected **Time period**, it will be represented accordingly.



9.6.2.2 Content page

The Content page provides a Content-centric view of content distributed throughout your network. It shows all Content Titles where there has been download activity for the latest version of that content within the selected Time period.

> **Note**
>
> The Content page shows you where your content is. As a result, this page does not include downloads of older versions of Configuration Manager (CM) Packages and Application Deployment Types, they are no longer relevant as they can't be used by any CM deployments.
>
> For example, if a device downloads Package A version 1, then Package A gets updated to version 2 but not yet downloaded by the device, the Content Title will not be seen as downloaded on that device. If the device then downloads the latest version then it will be represented against that Content Title.

Software Updates and CM Packages are each represented in a single row. CM Applications are represented as one row per Deployment Type, where the**Content Titles**comprise the Application Name with the Deployment Type name appended.

For example, you can see this with the **1E Client 5.2.3.146** application in the picture opposite, which has three Deployment Types - **1E Client x64 -Server Install**, **1E Client x86** and **1E Client x64**.

On the **Overview** page, a CM Application is counted as a single **Content Title** regardless of how many Deployment Types it contains.

Note

Download activity and Configuration Manager data synchronization

The Nomad client uses Events (a feature of the Tachyon Platform) to update the Nomad app with the latest status of a download. Events are currently not processed and represented in the app unless the **Content Title** is known, except for these tiles:

Bandwidth Usage Per Day by Content Source (UTC)

P2P Efficiency by Content Source.

Events generated for Nomad downloads (i.e. CM Applications, Packages and Software Updates downloaded by Nomad) only identify the content ID, not the content title. The content title is determined through the CM sync that Content Distribution performs periodically. By default, this runs every 30 minutes, and is configured in the following location on your Tachyon Platform server:

C:\Program Files\1E\ContentDistribution\Web\WebService\AppSettings.json

The CM Sync currently synchronizes the following **Content Titles**:

Content for which there have been any download events

Reference content in any Task Sequence

Content for which a pre-cache job has been created.

This means that in many cases, events for new CM deployments will not be represented in the app until the first CM sync after the first events for that content are reported.

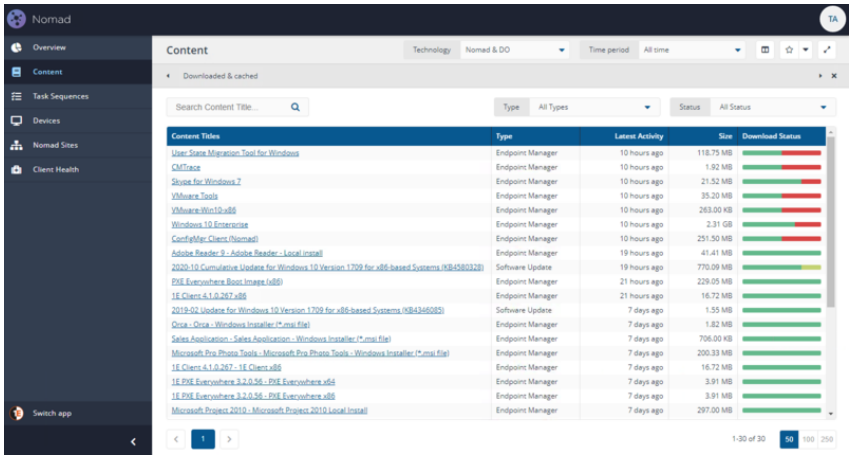
Events generated for software updates downloaded by DO include the **Content Title** in the event as this is determined at the client. These events are represented immediately in the Nomad app.

The table includes the following columns:

Column	Description
Content Title	Content title.

Column	Description
	For CM Packages, this is the Package name For CM Applications, this is a combination of the Application name and Deployment Type name For Software Updates, this is the title of the Software Update as defined in the Microsoft Update catalog (this is collected from the client, not the Microsoft Catalog).
Type	Currently, either **Endpoint Manager** or **Software Update**.
Latest Activity	Date and time of the latest event for the content title.
Size	Size of the CM Package, CM Application Deployment Type or Software Update.
Download Status	Represents the current status of the content across all devices, that have reported events for this Content Title within the selected **Time period**. This can include the following status: **Downloading** **Cancelled** **Downloaded** **Downloaded (Cached)** **Downloaded (Deleted)** **Failed.** Clicking on a **Content Title** navigates to the **Content Detail** page for that **Content Title**. **Note** If a download is **Cancelled** before completing and the partial content is then deleted from the cache on the device, the reported status for that **Content Title** will remain **Cancelled**. **Downloaded (Deleted)** only applies to **Content Titles** that completed download and were subsequently deleted. There is currently no status for Cancelled (Deleted).

Column	Description
	Hovering over the **Download Status** bar displays the count of downloads in each state. The bar is for information only and is not clickable (It will not navigate to a filtered list of devices).



9.6.2.2.1 Navigation and Filtering

You can navigate to the Content page from the Overview page, in which case the Content page will be filtered with the filter selections and the element you clicked on (e.g. a **Content Type** segment in the **Content Titles by Content Type** chart).

If you navigate directly to the Content page from the left-hand navigation menu, the Content page will show all **Content Titles** by default. You can filter **Content Titles** using the filters at the top of the page:

Technology

Time period

Type

Status.

These filters are kept for the current browser session as you navigate your way around the app.

> **Note**
>
> **Content Titles** are sorted by latest activity, so you always see the most recent content activity at the top of the list. You can use the **Search Content Title...** box to search for a specific Content Title.

9.6.2.2.1.1 Technology filter

You can use the **Technology** filter to differentiate between downloads through Nomad or Delivery Optimization (DO).

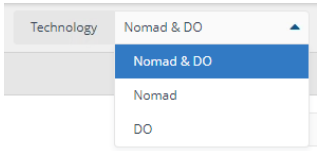
The following options are available:

Nomad & DO (Default)

Nomad

DO.

> **Note**
>
> If this filter is applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.2.1.2 Time period filter

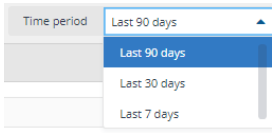
Using the **Time period**filter at the top of the page, you can narrow down the results by date. You can choose from the following options:

Last 90 days

Last 30 days (Default)

Last 7 days.

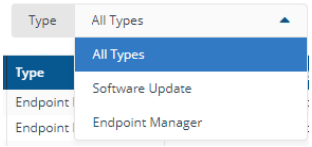
> **Note**
>
> If these filters are applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.2.1.3 Type

Using the **Type** filter, you can filter results by either:

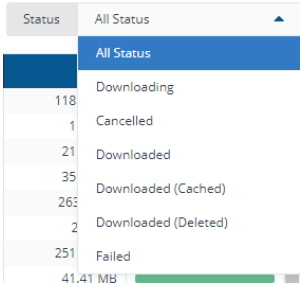
Type	Description
All Types	Default.
Software Update	Content that can be delivered by Nomad, or Delivery Optimization (DO if you're using Windows Update directly.
Endpoint Manager	Configuration Manager applications and packages that are not delivered by DO.



9.6.2.2.1.4 Status

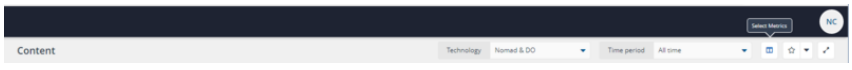
Using the Status filter, you can filter results by download status:

Status	Description
Downloading	Number of downloads currently in progress, where a download has been reported as started but has not yet reported complete, failed or cancelled.
Cancelled	Number of downloads whose last reported status was **Cancelled**, downloads may be cancelled by the user, or by the system, for example if the system is shut down or higher priority downloads are queued.
Downloaded	Number of successful downloads.
Downloaded (Cached)	Downloaded content cached on a given device.
(Downloaded (Deleted)	Downloaded content was subsequently deleted from the cache on a given device.
Failed	Number of downloads whose last reported status was **Failed**.



9.6.2.2.1.5 Select Columns

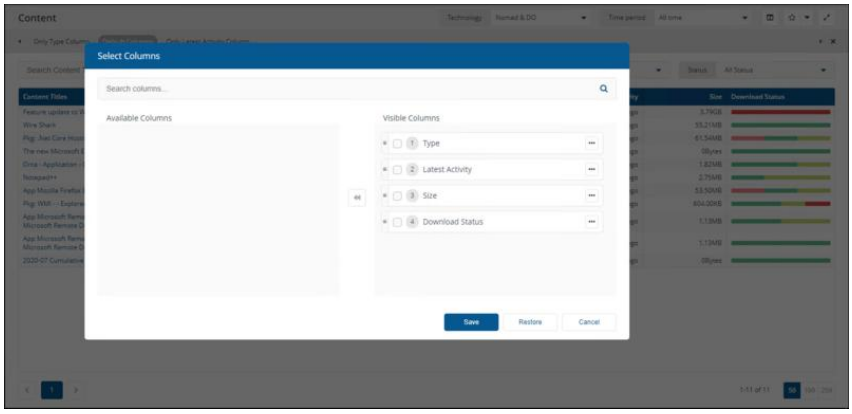
You can select the columns to be displayed by clicking on the **Select Columns** option. You can add, remove or re-order the columns in the **Visible Columns** section.



When you click on the **Select columns** control, it opens a pop-up displaying every column on the current screen, the controls are:

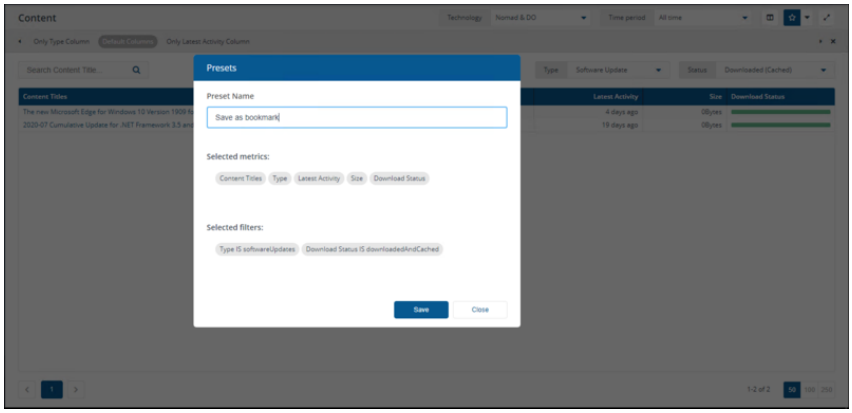
Control	Explanation
Available Columns	Columns, which are by default hidden from display on screen. You can still include any of them to display on screen.
Visible Columns	Displays the list of columns displayed on screen.
Arrow buttons	To move up or move down, exclude or include any column, clicking on the ellipsis displays these additional controls.
Drag and drop	You can drag and drop columns to change how they are displayed.
Exclude columns	Exclude column button allows you to select columns to exclude from the current display.

Clicking **Save** on the **Select Columns** screen saves the layout for the current browser session. Clicking **Restore** returns the columns to the default selection.

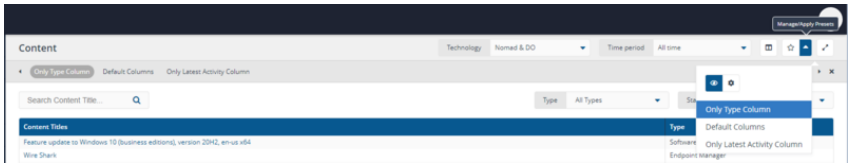


After selecting the columns and any other configurations on the page, you can set them as a preset, so you can select them again after your current browser session.

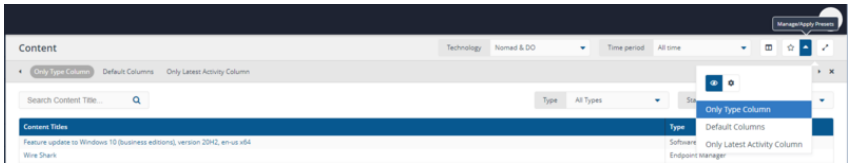
You can save a view as a preset by clicking on the star icon, doing this presents the screen shown opposite. Clicking **Save** adds the view to the list of preset list.



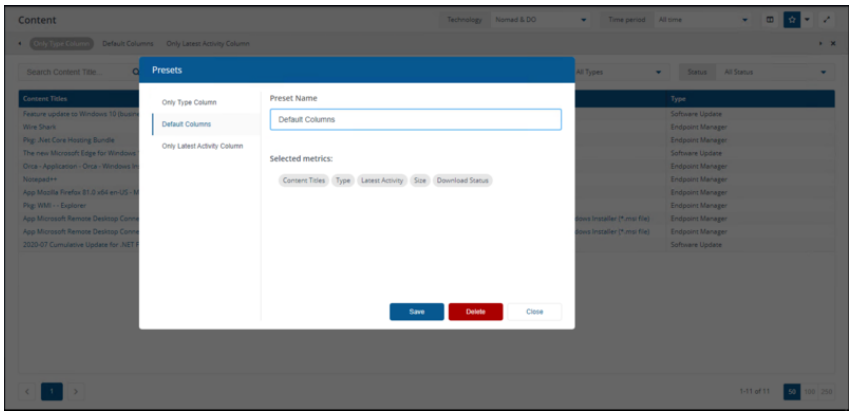
You can apply any saved preset later, either from the list of configured presets or from the bookmark bar of the configured presets when you click **Manage/Apply Presets**.



In this example, the preset **Only Latest Activity Column** is selected.



You can also manage (rename or delete) your saved **Presets**.



9.6.2.2.2 Content details

The Content detail page is displayed when you click on a content title anywhere in the app. It includes a **Summary** tab and a **Devices** tab.

> **Note**
>
> The Content detail page does not 'inherit' the **Time period** filter from other pages. It represents all available data for the selected **Content Title**. As a result, if you have set

the **Time period** filter on the **Content** page to, for example, **Last 7 days**, you may see different results on the content details page.

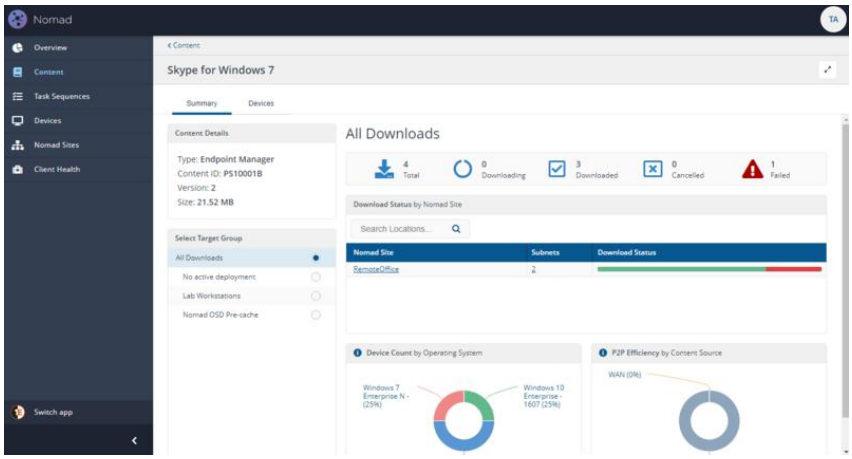
9.6.2.2.2.1 Summary tab

The Summary tab shows summary information about the selected content title.

9.6.2.2.2.1.1 Top status Bar

The top status bar displays the following high-level statistics:

Status	Description
Total	Displays the number of downloads for the latest version of the selected **Content Title**. If the **Content Title** is a CM Application, this number represents the total number of downloads of all of that Application's Deployment Types.
Downloading	Displays the number of devices that are currently downloading the latest version of the **Content Title**.
Downloaded	Displays the number of downloads of the latest version of the **Content Title** that have completed successfully.
Cancelled	Displays the number of downloads of the latest version of the **Content Title** whose latest state was **Cancelled**.
Failed	Displays the number of downloads of the latest version of the **Content Title** whose latest state was **Failed**.



9.6.2.2.2.1.2 Side Panels

On the left side of the page, there are two panels:

Content Details

Select Target Group.

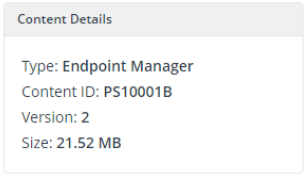
9.6.2.2.2.1.3 Content Details

Displays the content **Type** and the **Size** of the content for:

CM Packages, the size represents the total size of the Package content

CM Applications, the **Size** represents the total size of all Deployment Types

Software Updates, the size represents the total size of the update reported by the update metadata.



9.6.2.2.2.1.4 Select Target Group

Allows the details on the main page to be filtered based on the target group. By default, the main details page shows data for **All Downloads** of the Content Title. In this panel, below**All Downloads**is a list of every Collection in CM that the content has been either deployed or pre-cached to.

You use the **Select Target Group** filter in the following scenarios

To view the status of a specific CM deployment

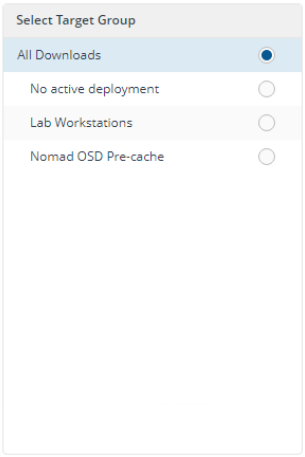
To view the status of a specific Nomad Pre-cache Job.

> **Note**
>
> Although currently this only lists CM Collections, the term Target Group is used in the app as in future the target may be a CM Collection, an Azure AD group (for Intune applications), a Tachyon Management Group or perhaps another type of target group entirely used by other management systems.

There are different options for Endpoint Manager (Configuration Manager) and for the Software Update Content Type:

Content Type	Option	Description
Endpoint Manager (Configuration Manager)	**All Downloads**	(default) shows data for all downloads.
No active deployments	Shows data for downloads that occurred, but no longer have an active deployment (for	

Content Type	Option	Description
	example where a Deployment was deleted).	
Collections	A list of **Collections** that are either the target of an active deployment of the Content Title. Or are the target of a Nomad Pre-cache job.	
Software Update	**All Downloads**	(default) shows data for all downloads
On Demand	Shows downloads initiated through Windows Update on the device.	
No active deployments	Shows data for downloads that occurred, but no longer have an active deployment (for example where a Deployment was deleted).	
Collections	A list of **Collections** that are the target of an active deployment of the Content Title.	



9.6.2.2.2.1.5 Download Status by Nomad Site

Using the **Download Status by Nomad Site** tile you can see in which locations (Nomad Single Site Download (SSD) sites) the content title has been downloaded and is available.

The table shows the status of the selected **Content Title** in each Nomad Site. A Nomad Site corresponds to Nomad Single Site Download site. Customers that have implemented SSD and upgraded ActiveEfficiency to Content Distribution will see their defined SSD locations displayed as Nomad Sites on this tile. Any subnets that are not included in a Nomad SSD Site definition will be represented in a site named **Unknown**. If no SSD sites have been defined, all subnets will be included in the **Unknown** site.

The table displays the following columns:

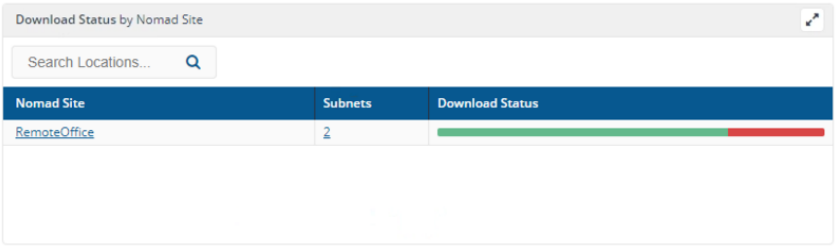
Column	Description
Nomad Site	The Nomad (SSD) site name.
Subnets	The count of subnets included in the Nomad site. Clicking on the number opens a 'drawer' that shows the download status for each subnet in the site. You can click on the subnet in this drawer to view the devices in that subnet that have reported download activity for the Content Title.
Download Status	A bar representing the current status of the content across all devices in the Nomad Site. This can include the following statuses: Downloading Downloaded (Cached) Downloaded (Deleted) Cancelled Failed Unknown. **Note** The **Unknown** status is only displayed if a Target Group has been selected. It indicates the members of the Target Group for which no status for the selected Content Title has been reported.

Hovering over the **Download Status** bar displays the count of downloads in each state. The bar is for information only and is not clickable (i.e. it will not navigate to a filtered list of devices in the various states).

Clicking on a **Nomad Site** navigates to the **Devices** tab, filtered to display devices in the selected **Nomad Site**.

Note

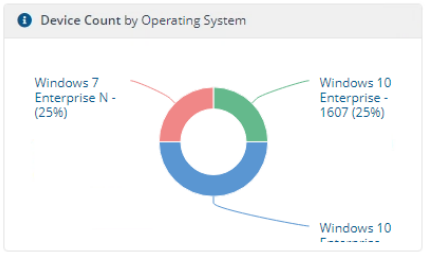
You can use the **Search Locations...** box to search for a specific Nomad Sites.



9.6.2.2.2.1.6 Device Count by Operating system

The **Device Count by Operating System** represents the devices that have downloaded the selected Content Title grouped by Operating System and version and displayed as a donut chart. Delivery Optimization is a Windows 10 feature, but the feature continues to develop with new features and configuration options available in different versions. This data point can help to identify differences across Windows 10 versions.

Clicking on any segment of the chart navigates to the **Devices** tab, filtered to show the devices running the selected OS version.

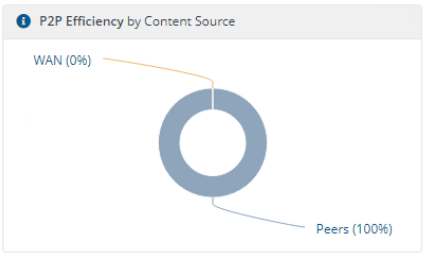


9.6.2.2.2.1.7 P2P Efficiency by Content Source

The **P2P Efficiency by Content Source** tile represents the overall peer-to-peer efficiency across the entire network for the selected Content Title. The data is grouped by source (**Peers** and **WAN**) and displayed as a donut chart showing the volume of content downloaded from peers (in grey) and from the source over the WAN (in orange).

Ideally, more content will be downloaded from peers than from the source over the WAN, thereby saving network bandwidth. Where this is not the case, it could be due to many users working remotely without any local peers, or it could be due to configuration settings on the client that are not optimized for peer-to-peer caching and availability. It may also be worth considering pre-caching the Content Title in more locations to improve the availability of the content on peers in each location.

Clicking either segment in this chart will navigate to the **Devices** tab filtered to show the devices that downloaded the selected Content Title from **Peers** or **WAN**, according to the segment that you clicked on.



9.6.2.2.2.2 Devices tab

The **Devices** tab in the Content detail page lists the devices that have reported download activity or cache status for the selected Content Title.

This tab is displayed when you click a Nomad Site or a segment on the**Device Count by Operating system**or**P2P Efficiency by Content Source**charts on the**Content Detail** summary tab, filtered according to the item clicked on.

Alternatively you can select the tab to view all devices that have reported download activity for the content title. Use the**Search Devices...**box to search for a specific device.

> **Note**
>
> The list can be further organized using the filters:

Source - (Peers or WAN)

Status:

Downloading

Downloaded (Cached)

Downloaded (Deleted)

Cancelled

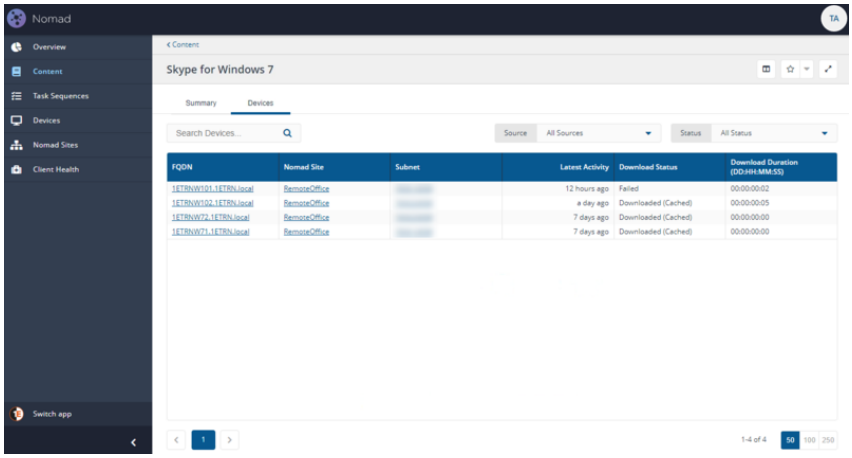
Failed

Unknown.

The table of Devices displays the following columns and from this list, you can click on an FQDN to view details of the specific device on the Devices page.

Column	Description
FQDN	Fully Qualified Domain Name.
Nomad Site	The Nomad SSD Site that the device is currently in, based on the device's latest device registration.
Subnet	The subnet the device is currently in, based on the device's latest device registration.

Column	Description
Latest Activity	Indication of how long ago the latest download activity for the selected Content Title occurred on this device.
Download Status	Status of the selected Content Title on this device, one of: Downloading Downloaded (Cached) Downloaded (Deleted) Cancelled Failed.
Download Duration (DD:HH:MM:SS)	The amount of time it took to download the content.



9.6.2.3 Task Sequences page

Configuration Manager (CM) Task Sequences typically use multiple Packages and Applications, called Reference Content. Those packages and applications may be distributed in their own right, or may be distributed through one or more Task Sequence. As an administrator, you want to know where the content that the Task Sequence requires has been cached.

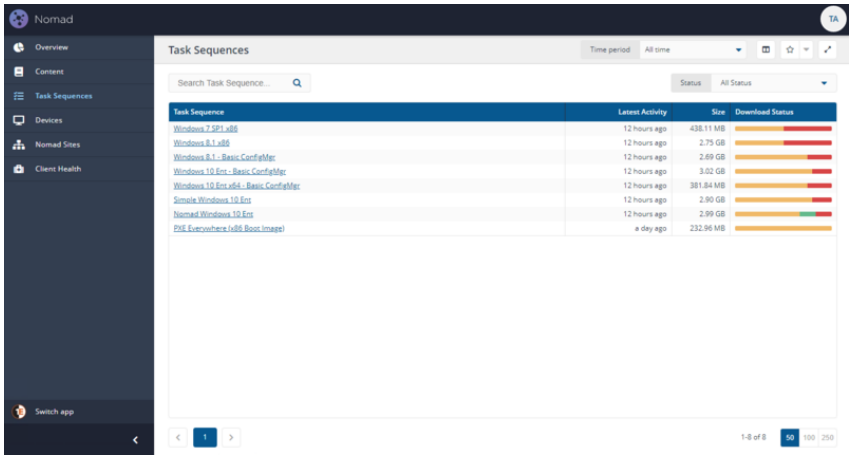
For example, you might pre-cache a Task Sequence (which will pre-cache all reference content) ahead of deploying it to devices, and you want to confirm that pre-caching has been successful before starting the deployment. The Task Sequences page provides that visibility by grouping the reference content for each Task Sequence into a single view, so you can see which content is cached and which is not. The Task Sequences table shows all Task Sequences that were defined in CM when the last CM sync ran.

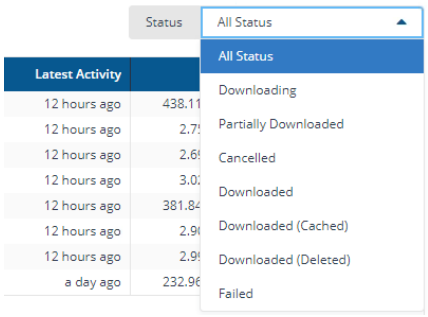
The**Task Sequences**list has the following columns:

Column	Description
Task Sequence	The name of the Task Sequence.
Latest Activity	How long ago the most recent download activity occurred for any reference content in the Task Sequence.
Size	The total size of all reference content in the Task Sequence.
Download Status	A bar representing the overall status of the Task Sequence content across devices. The status of the overall Task Sequence (all referenced content) on a device will be reported as follows, in order of priority.

Status	Description
Downloading	Represents devices that are currently downloading one referenced content.
Partially Downloaded	Represents devices that have completed download one or more referenced content.
Cancelled	Represents devices that cancelled the download of any of the referenced content. When viewing a Task Sequence as a whole, **Cancelled** status is prioritised over **Partially Downloaded**. For example if a device has successfully downloaded some content but one or more reference contents were cancelled, the overall status of the Task Sequence will be **Cancelled**.
Downloaded	Represents devices that have completed download of all referenced content.
Downloaded (Cached)	Represents devices that have completed download of all referenced content.
Downloaded (Deleted)	Represents devices that had previously downloaded all referenced content, which has subsequently all been deleted from the cache.
Failed	Represents devices that failed to download any of the referenced content. When viewing a Task

Column	Description
	Sequence as a whole, **Failed** status is prioritised over **Cancelled** and **Partially Downloaded**. For example, if a device has successfully downloaded some content, cancelled other content and failed to download one content, the overall status for the Task Sequence will be Failed.





9.6.2.3.1 Navigation and filtering

You can use the **Search Task Sequence...** box to filter the list to show Task Sequences based on your chosen criteria. Clicking on a Task Sequence name takes you to the Task Sequence**Details**page.

9.6.2.3.1.1 Time period filter

You can use the **Time period** filter to filter out older activity. For example, selecting Last 30 days will only show Task Sequences for which there has been download activity for any of its reference content in the last 30 days.

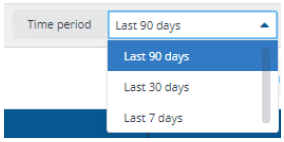
Using the **Time period**filter at the top of the page, you can narrow down the results by date. You can choose from the following options:

Last 90 days

Last 30 days (Default)

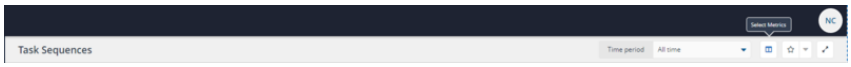
Last 7 days.

> **Note**
>
> If these filters are applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.3.1.2 Select Columns

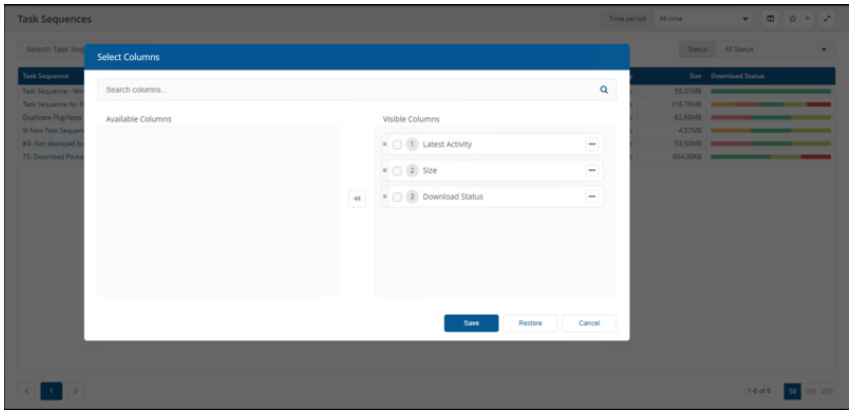
You can select the columns you want displayed by clicking on the **Select Columns** option. From the **Available Columns** and **Visible Columns**, you can add, remove or re-order the columns.



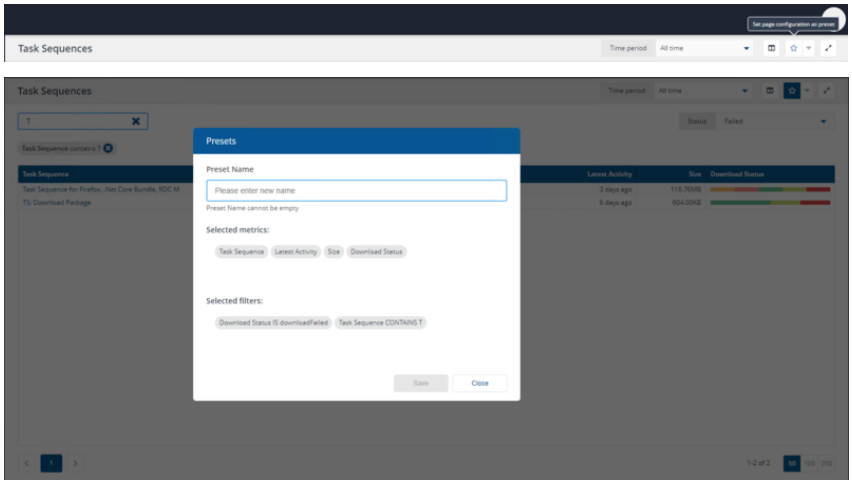
When you click on the **Select columns** control it opens a popup displaying every column on the current screen, the controls are:

Control	Explanation
Available Columns	Columns which are by default hidden from display on screen. You can still include any of them to display on screen.
Visible Columns	Displays the list of columns displayed on screen.
Arrow buttons	To move up or move down, exclude or include any column, clicking on the ellipsis displays these additional controls. <image detail goes here>
Drag and drop	You can drag and drop columns to change how they are displayed.
Exclude columns	Exclude column button allows you to select columns to exclude from the current display.

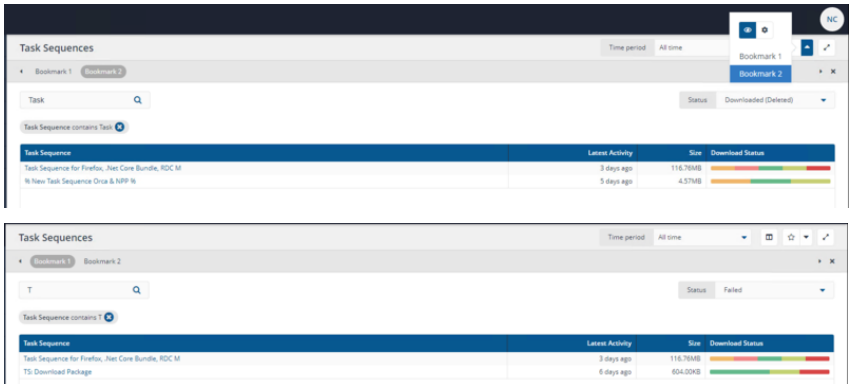
Clicking **Save** on the **Select Columns** screen saves the layout for the current browser session.



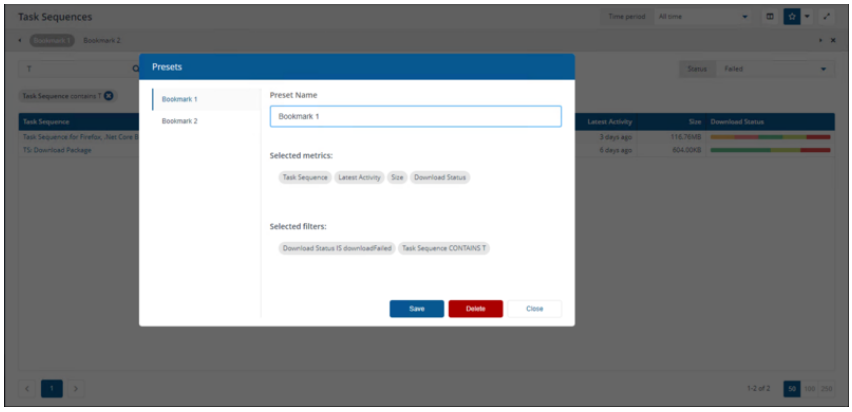
After selecting the columns and other configurations done on the page, you can set it as a preset to be selected further.



You can apply any preset later either from the list of configured presets or from the bookmark bar of the configured presets.



You can also manage (rename or delete) your saved **Presets**.



9.6.2.3.2 Task Sequence details page

The Task Sequence detail page is displayed when you click on a task sequence title on the **Task Sequence** page. It includes a **Summary** tab and a **Devices** tab.

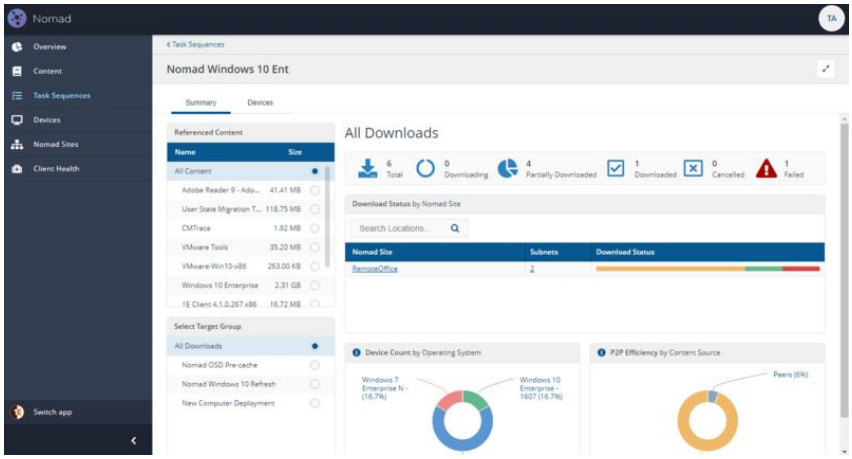
9.6.2.3.2.1 Summary tab

The Summary tab shows summary information about the selected task sequence.

9.6.2.3.2.1.1 Top status Bar

The top status bar displays the following statistics of the selected Task Sequence:

Status	Description
Total	Displays the number of downloads for the latest version of the selected **Content Title**. If the **Content Title** is a CM Application, this number represents the total number of downloads of all of that Application's Deployment Types.
Downloading	Displays the number of devices that are currently downloading the latest version of the **Content Title**.
Partially Downloaded	Displays the number of downloads of the latest version of the **Content Title** that have partially completed.
Downloaded	Displays the number of downloads of the latest version of the **Content Title** that have completed successfully.
Cancelled	
Failed	Displays the number of downloads of the latest version of the **Content Title** whose latest state was **Failed**.



9.6.2.3.2.1.2 Side Panels

On the left side of the page, there are two panels:

Referenced Contents

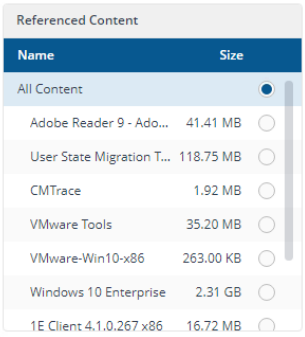
Select Target Group.

9.6.2.3.2.1.2.1 Referenced Contents

Displays the Application or Package **Name** and the **Size** of the content for:

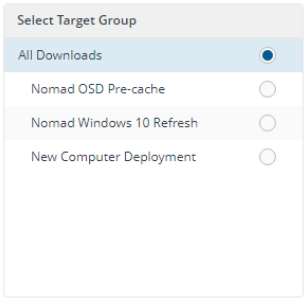
CM Packages, the size represents the total size of the Package content

CM Applications, the **Size** represents the total size of all Deployment Types.



9.6.2.3.2.1.2.2 Select Target Group

Allows the details on the main page to be filtered based on the target group. By default, the main details page shows data for **All Downloads** of the Content Title.



9.6.2.3.2.1.3 Download Status by Nomad Site

Using the **Download Status by Nomad Site** tile you can see in which locations (Nomad Single Site Download (SSD) sites) the content title has been downloaded and is available.

The table shows the status of the selected **Content Title** in each Nomad Site. A Nomad Site corresponds to Nomad Single Site Download site. Customers that have implemented SSD and upgraded ActiveEfficiency to Content Distribution will see their defined SSD locations displayed as Nomad Sites on this tile. Any subnets that are not included in a Nomad SSD Site definition will be represented in a site named **Unknown**. If no SSD sites have been defined, all subnets will be included in the **Unknown** site.

The table displays the following columns:

Column	Description
Nomad Site	The Nomad (SSD) site name.
Subnets	The count of subnets included in the Nomad site. Clicking on the number opens a 'drawer' that shows the download status for each subnet in the site. You can click on the subnet in this drawer to view the devices in that subnet that have reported download activity for the Content Title.
Download Status	A bar representing the current status of the content across all devices in the Nomad Site. This can include the following statuses: Downloading Downloaded (Cached) Downloaded (Deleted) Cancelled Failed Unknown.

Note

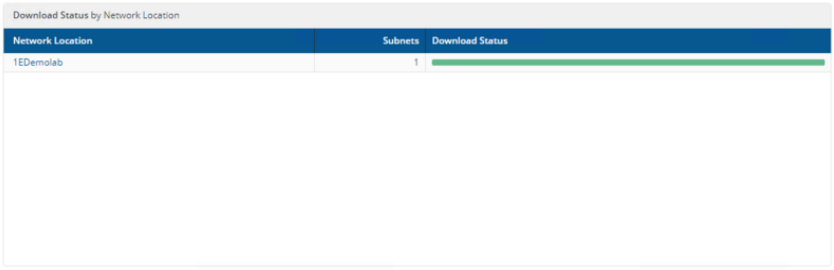
Column	Description
	The **Unknown** status is only displayed if a Target Group has been selected. It indicates the members of the Target Group for which no status for the selected Content Title has been reported.

Hovering over the **Download Status** bar displays the count of downloads in each state. The bar is for information only and is not clickable (i.e. it will not navigate to a filtered list of devices in the various states).

Clicking on a **Nomad Site** navigates to the **Devices** tab, filtered to display devices in the selected **Nomad Site**.

Note

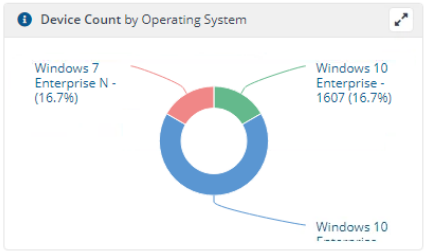
You can use the **Search Locations...** box to search for a specific Nomad Sites.



9.6.2.3.2.1.4 Device Count by Operating system

The **Device Count by Operating System** represents the devices that have downloaded the selected Content Title grouped by Operating System and version and displayed as a donut chart. Delivery Optimization is a Windows 10 feature, but the feature continues to develop with new features and configuration options available in different versions. This data point can help to identify differences across Windows 10 versions.

Clicking on any segment of the chart navigates to the **Devices** tab, filtered to show the devices running the selected OS version.

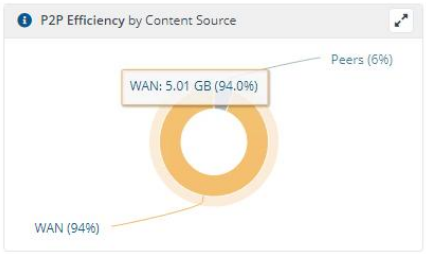


9.6.2.3.2.1.5 P2P Efficiency by Content Source

The **P2P Efficiency by Content Source** tile represents the overall peer-to-peer efficiency across the entire network for the selected Content Title. The data is grouped by source (**Peers** and **WAN**) and displayed as a donut chart showing the volume of content downloaded from peers (in grey) and from the source over the WAN (in orange).

Ideally, more content will be downloaded from peers than from the source over the WAN, thereby saving network bandwidth. Where this is not the case, it could be due to many users working remotely without any local peers, or it could be due to configuration settings on the client that are not optimized for peer-to-peer caching and availability. It may also be worth considering pre-caching the Content Title in more locations to improve the availability of the content on peers in each location.

Clicking either segment in this chart will navigate to the **Devices** tab filtered to show the devices that downloaded the selected Content Title from **Peers** or **WAN**, according to the segment that you clicked on.



9.6.2.3.2.2 Devices tab

The **Devices** tab in the Task Sequence detail page lists the devices that have reported download activity or cache status for content referenced in the selected Task Sequence.

This tab is displayed when you click a **Nomad Site** or a segment on the **Device Count by Operating system** or **P2P Efficiency by Content Source** charts on the Task Sequence summary tab, filtered according to the item clicked.

Alternatively, you can select the tab to view all devices that have reported download activity for content referenced in the Task Sequence.

Alternatively you can select the tab to view all devices that have reported download activity for the content title. Use the**Search Devices...**box to search for a specific device.

> **Note**
>
> The list can be further organized using the filters:

Source - (Peers or WAN)

Status:

Downloading

Downloaded (Cached)

Downloaded (Deleted)

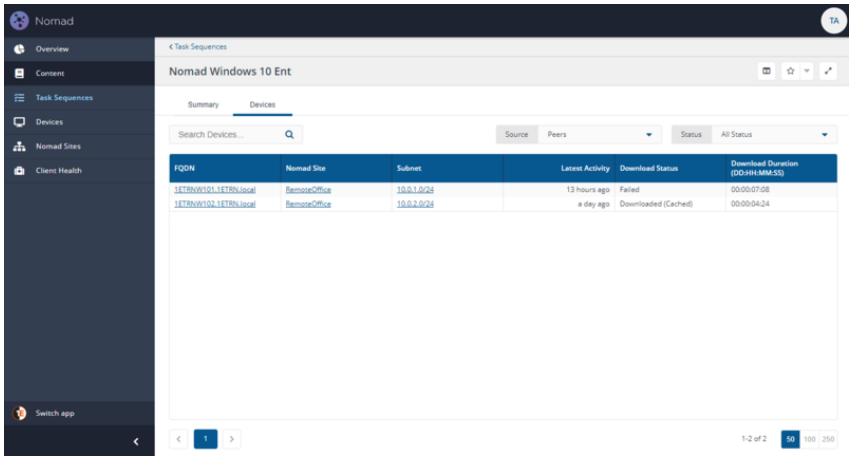
Cancelled

Failed

Unknown.

The table of Devices displays the following columns and from this list, you can click on an FQDN to view details of the specific device on the Devices page.

Column	Description
FQDN	Fully Qualified Domain Name.
Nomad Site	The Nomad SSD Site that the device is currently in, based on the device's latest device registration.
Subnet	The subnet the device is currently in, based on the device's latest device registration.
Latest Activity	Indication of how long ago the latest download activity for the selected Content Title occurred on this device.
Download Status	Status of the selected Content Title on this device, one of: Downloading Downloaded (Cached) Downloaded (Deleted) Cancelled Failed.
Download Duration (DD:HH:MM:SS)	The amount of time it took to download the content.



9.6.2.4 Devices page

The **Devices** page lists all Devices that have sent Nomad device registration events and have sent download events within the selected **Time period**.

9.6.2.4.1 Navigation and filtering

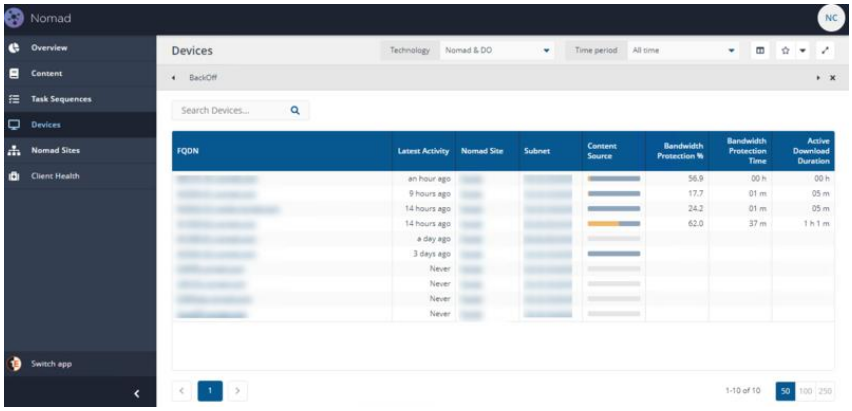
Devices are listed in order of **Latest Activity**, devices with the most recent activity are at the top of the list. The **Time period** filter is 'inherited' if it has been previously set on another page in the same browser session. If the **Time period** is set to **All time**, devices that have registered (i.e. they are running Nomad) but have not sent any download activity will appear at the bottom of the list and **Latest Activity** will show **Never** in the **Latest Activity** column.

In addition to the **Time period** filter, you can use the **Technology** filter to show devices that have download activity from Nomad, Delivery Optimization (DO) or both (default).

The **Devices** list has the following columns:

Column	Description
FQDN	Fully Qualified Domain Name.
Latest Activity	Indication of how long ago the latest download activity occurred on this device.
Nomad Site	The Nomad SSD Site that the device is currently in based on the last adapter registration event.
Subnet	The subnet that the device is currently in based on the last adapter registration event.
Content Source	A bar representing the volume of content this device has downloaded from a peer (in grey) vs from a source over the WAN (in orange).
Bandwidth Protection %	Bandwidth Protection shown as a percentage of downloads This is the result of the **Bandwidth Protection Time** column dived by the **Active Download Duration** and multiplied by 100.
Bandwidth Protection Time	Duration the client backed off from downloading to save download bandwidth. **Note** This metric is not visible by default, you can select it using **Select Columns**
Active Download Duration	Duration for which client actively downloaded the content, this excludes interruptions while downloading, for example because of network issues.

Column	Description
	Note This metric is not visible by default, you can select it using **Select Columns**.

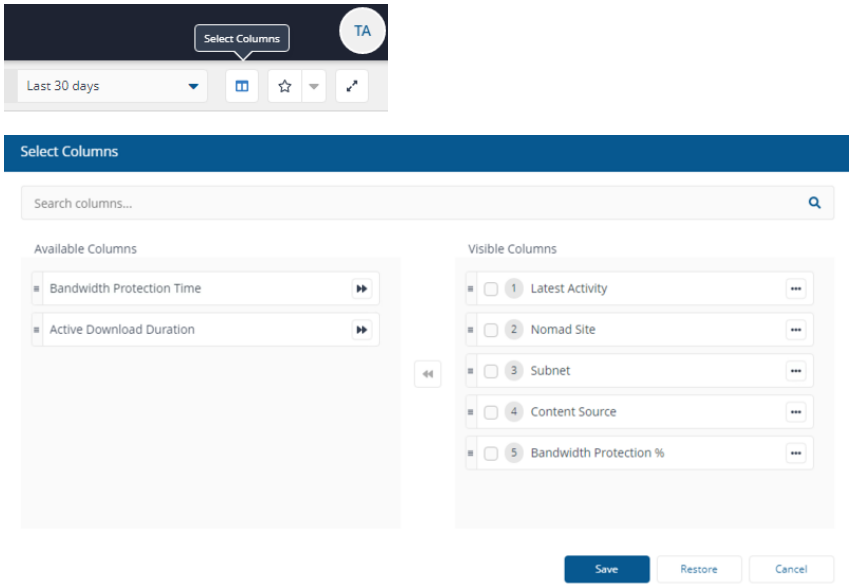


9.6.2.4.1.1 Select Columns

On the pages where you can pick the displayed columns, you'll see the following **Select Columns** control.

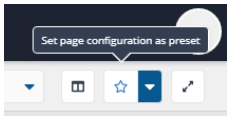
When you click on the **Select columns**control it opens a popup displaying the columns shown on the current screen and any additional columns you can select, the controls are:

Control	Explanation
Available Columns	Columns, which are by default hidden from display on screen. You can still include any of them to display on screen.
Visible Columns	Displays the list of columns displayed on screen. Mandatory Columns cannot be excluded, the selection controls for these items are disabled. They can still be moved up or down.
Arrow buttons	To move up or move down, exclude or include any column, clicking on the ellipsis displays these additional controls.
Drag and drop	You can drag and drop columns to change how they are displayed.
Exclude columns	Exclude column button allows you to select columns to exclude from the current display.

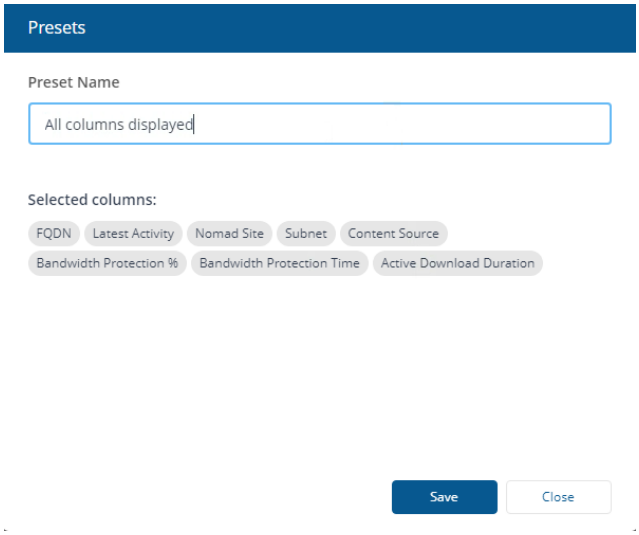


9.6.2.4.1.2 Set page configuration as preset

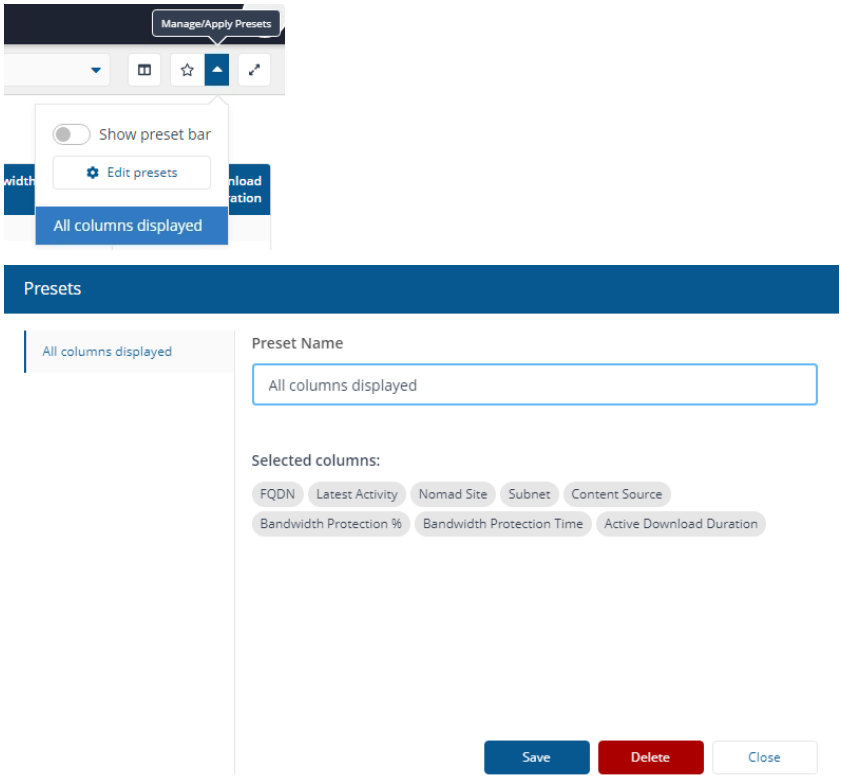
If you have amended the displayed columns using the **Choose columns** control, you can then save the view as a preset which will be available later.



Clicking **Set page configuration as preset** displays the **Presets** popup. Here, you can give the view a name, in the shown example this is called **All columns displayed** as we have chosen to display every available column.



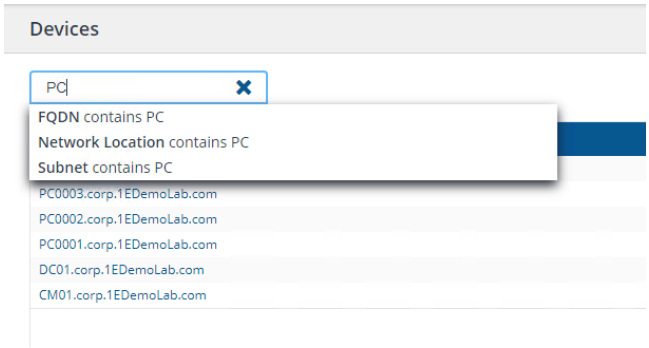
Once saved, you can select your saved views using the **Manage/Apply Presets** control or edit them by clicking **Edit presets**.



9.6.2.4.1.3 Search

You can use the **Search Devices...** box to search for a specific device by **FQDN**, **Network Site** or **Subnet**.

When you start typing into the search box, a list will appear as indicated below, allowing you to select which column (**FQDN**, **Network Site** or **Subnet**) that the search term should be applied to.



9.6.2.4.1.4 Time period filter

Using the **Time period**filter at the top of the page, you can narrow down the results by date. You can choose from the following options:

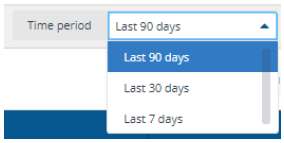
Last 90 days

Last 30 days (Default)

Last 7 days.

Note

If these filters are applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.4.1.5 Technology filter

You can use the **Technology** filter to differentiate between downloads through Nomad or Delivery Optimization (DO).

The following options are available:

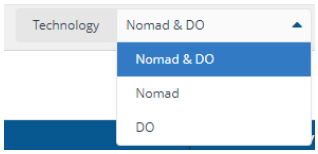
Nomad & DO (Default)

Nomad

DO.

Note

If this filter is applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.4.2 The Device view Downloads tab

The **Device view** is a common view used throughout Tachyon to present details of a device from multiple Tachyon Platform applications.

The default view in the Nomad devices view is **Downloads**. The remaining tabs display information corresponding to an app, feature or data set implemented in Tachyon, other tabs are visible if an app has been installed and licensed, and the user has permissions to use the app, refer to Additional Device View Tabs for detail. Clicking on one of the links in the **FQDN** column of the **Devices** page displays the Device view for the selected device. The aim of the Device view is to provide a combined overview of all the information known about a device, along with the ability to retrieve information about the device in real-time. When displaying the Device view from a Nomad page, the view defaults to the **Downloads** tab. The **Downloads** tab contains information derived from and useful for using Nomad.

In addition, the Summary banner displays a quick summary of the information provided in the various tabs displayed in the Device View. It can be viewed by toggling the **Summary banner** switch to on, refer to Summary banner for details.

Note

The **Time period** filter does not apply to detail pages. As a result, if you have set the**Time period**filter on the**Devices** page to, for example,**Last 7 days**, you may see different results on the detail page for a device.

Note

The details shown on the Downloads and other tabs rely on access to the associated app, but also Instruction Sets used by the Tachyon Platform. >To view details in the Downloads tab for the Nomad app you'll need to load the 1E Nomad product pack. For more details, refer to Installing the Nomad app - 1E Nomad product pack.

9.6.2.4.2.1 Downloads tab

The**Downloads**tab has three items:

Summary

Content

Nomad Configuration.

The Downloads tab presents download activity and status for the device. Whenever you click on an FQDN on any of the Nomad dashboard pages, the Device details page will be displayed with the **Downloads** tab selected.

9.6.2.4.2.1.1 Summary

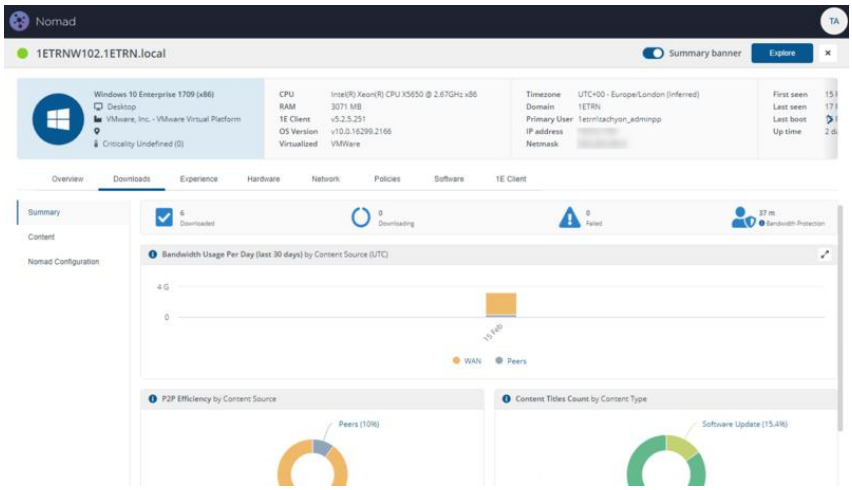
Summary has four panels:

Status bar

Bandwidth Usage Per Day by Content Source (UTC)

P2P Efficiency by Content Source

Content Titles Count by Content Type.



9.6.2.4.2.1.1.1 Status bar

The status bar along the top shows high-level download statistics for this device:

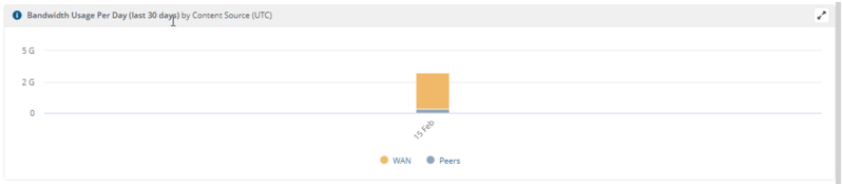
Column	Description
Downloaded	Number of completed downloads on this device.
Downloading	Number of downloads that are actively in progress on this device.
Failed	Number of downloads on devices that are currently in the site, whose latest status is failed.
Bandwidth Protection	Bandwidth Protection allows Nomad to adjust the speed of ongoing downloads to save bandwidth for other business use. Bandwidth Protection ensures Nomad doesn't consume excess bandwidth and hinder other business activity.

Clicking on any of these icons will navigate to the**Content**view of the**Device detail**tab, filtered according to the clicked icon.

9.6.2.4.2.1.1.2 Bandwidth Usage Per Day by Content Source (UTC)

The **Bandwidth Usage Per Day by Content Source (UTC)** tile represents daily download activity on this device for the last 30 days. A column is displayed for each day when there was download activity. Each column indicates the volume of content that was downloaded over the WAN (in orange) or from peers (in grey).

Hovering over a segment of the column displays the volume of content downloaded on that day, demonstrating the value that Nomad and Delivery Optimization are providing through reduced WAN traffic. If the majority of content is being downloaded over the WAN, it could indicate that peers are simply not available (e.g. this device is being used from home) or it could be an indication that Nomad or Delivery Optimization are not correctly configured to optimize content from peers.

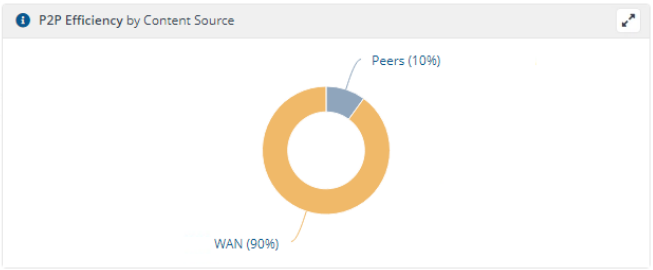


9.6.2.4.2.1.1.3 P2P Efficiency by Content Source

The **P2P Efficiency by Content Source** tile represents the overall peer-to-peer efficiency on this device. The data is grouped by source (**Peers** and **WAN**) and displayed as a donut chart showing the volume of content downloaded from peers (in grey) and from the source over the WAN (in orange).

The chart gives an indication of the overall value of Nomad and Delivery Optimization on this device. Ideally, more content will be downloaded from peers than from the source over the WAN, thereby saving network bandwidth. Where this is not the case, it could be due to remote working (where there are no peers available), or it could be due to configuration settings on the client that are not optimized for peer-to-peer caching and availability.

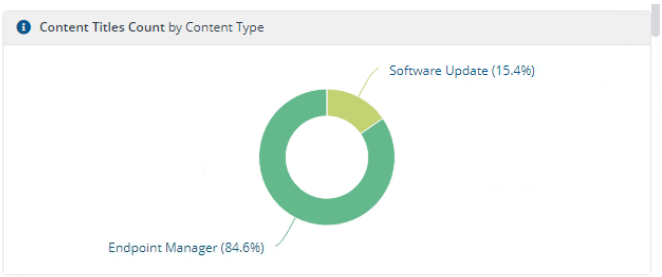
Clicking on a segment in this chart will navigate to the **Content** view for this device, filtered to show content that was downloaded from the selected source (Peer or WAN).



9.6.2.4.2.1.1.4 Content Titles Count by Content Type

The **Content Titles Count by Content Type** chart gives an indication of the number of **Endpoint Manager** applications and **Software Update** this device has downloaded.

Clicking on a segment in this chart will navigate to the **Content** view for this device, filtered by the selected Content Type.



9.6.2.4.2.1.2 Content

The **Content** panel shows the status of content downloaded on the device:

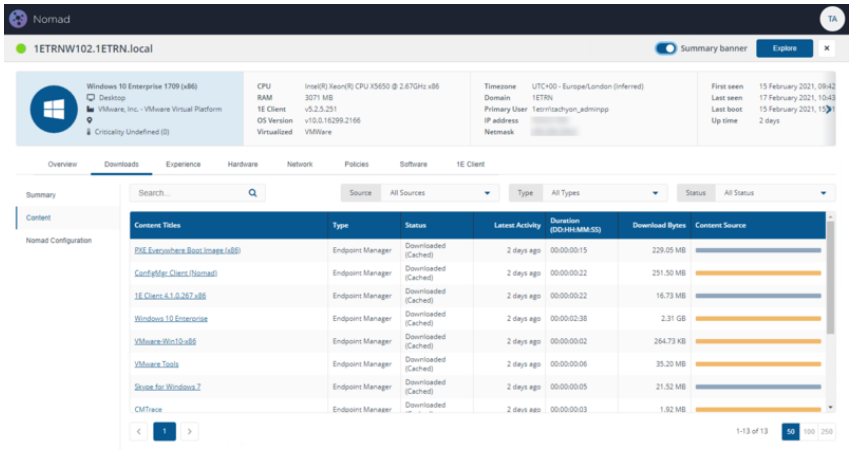
Column	Description
Content Titles	Content title, for: CM Packages, this is the Package name CM Applications, this is a combination of the Application name and Deployment Type name Software Updates, this is the title of the Software Update as defined in the Microsoft Update catalog (this is collected from the client, not the Microsoft Catalog).

Column	Description
Type	Currently, either Endpoint Manager or Software Update.
Status	Current status of the content on this device. This can include the following statuses. **Downloading** **Downloaded (Cached)** - downloaded and has not subsequently reported deletion **Downloaded (Deleted)** - downloaded but has subsequently been deleted from the cache **Cancelled** **Failed.**
Latest Activity	Date and time of the latest event for the content title on this device.
Duration	The time taken to download the content.
Download Bytes	Amount of bytes of the content actually downloaded by the device. In some cases, especially with Software Updates, only deltas or byte ranges will be downloaded rather than the entire source content.
Content Source	A bar indicating the proportion of the content that was downloaded over the WAN or from peers.

Note

The **Time period** filter does not apply to detail pages.

As a result, if you have set the **Time period** filter on the **Devices** page to, for example, **Last 7 days**, you may see different results on the detail page for a device.



9.6.2.4.2.1.3 Navigation and filtering

There are four ways you can filter viewable content:

Search...

Sources

Types

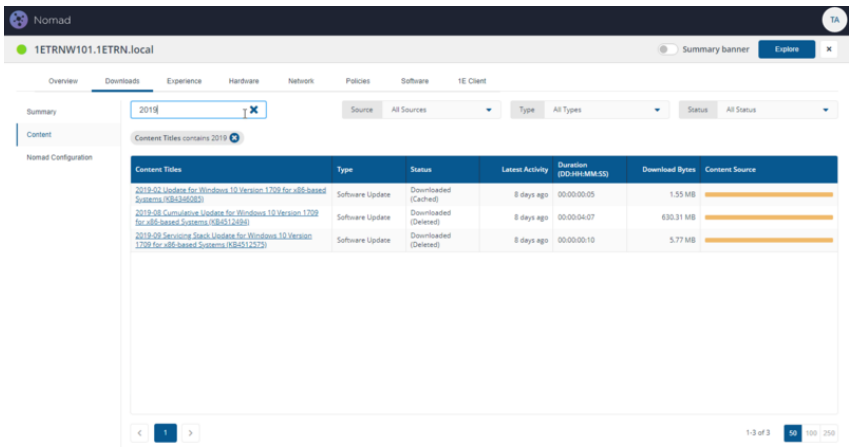
Status.

9.6.2.4.2.1.3.1 Search...

Use the search box at the top left of the page to filter by specific criteria, for example in the picture opposite the default view has been filtered by Content Titles containing 2019 in their title.

Note

Navigating away from this view resets the table to its default view.



9.6.2.4.2.1.3.2 Filters

Filter the table using these options:

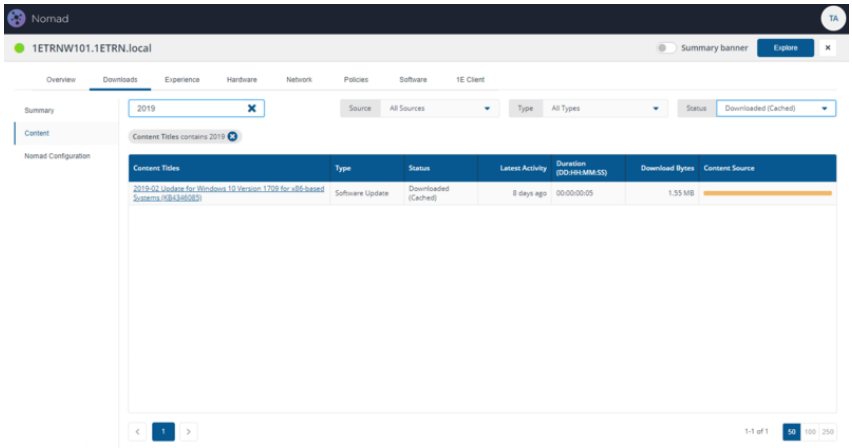
Source

Type

Status.

Filter	Options	Description
Source	**All Sources** (default)	Shows content that was downloaded from either the WAN or peers.
WAN	Shows content that was partially or fully downloaded over the WAN.	
Peers	Shows content that was partially or fully downloaded from peers.	
Type	**All Types** (default)	Shows Endpoint Manager and Software Update content.
Software Update	Shows only Software Update content.	
Endpoint Manager	Shows only Endpoint Manager content.	
Status	**All Status** (default)	Shows all content for which any download activity has been reported.
Downloading	Shows all content for which the latest reported status was downloading.	
Cancelled	Shows all content for which the latest reported status was cancelled.	
Downloaded (Cached)	Shows all content for which the latest reported status was Downloaded and has not subsequently reported deletion.	

Filter	Options	Description
Downloaded (Deleted)	Shows all content which completed downloading but has subsequently been deleted from the cache.	
Failed	Shows all content for which the latest reported status was Failed.	
Downloaded	Shows all content that has been downloaded (either still cached or deleted).	



9.6.2.4.2.1.4 Nomad Configuration

Shows the **1E Nomad Branch Settings** for the selected device. You can use this to check a device's Nomad registry entries if the device is not behaving as expected.

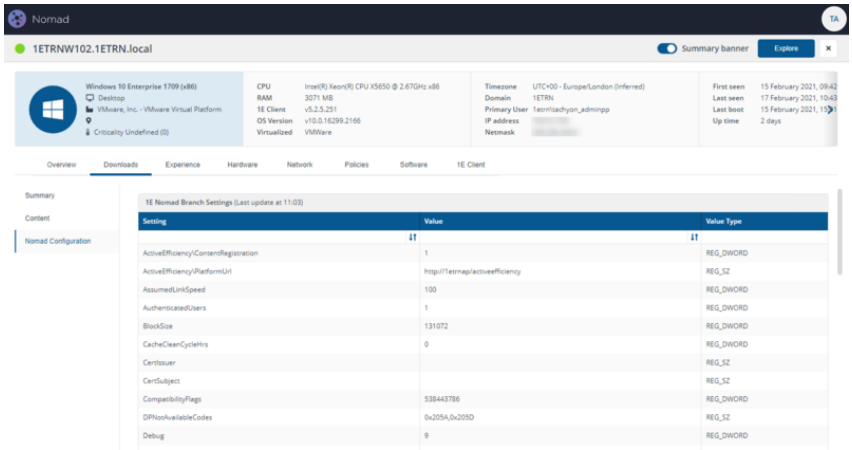
The registry details presented are gathered by the **1E-Nomad-NomadBranchSettings** instruction of the 1E Nomad product pack.

Classic product pack used to create the **1E Nomad** instruction set in Tachyon, required by the following Nomad features:

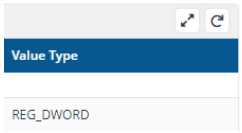
Downloads tab on Device views - instructions used to populate details about Content download and other Nomad features

Nomad Download Pause - instructions used by the CM Admin Console extensions

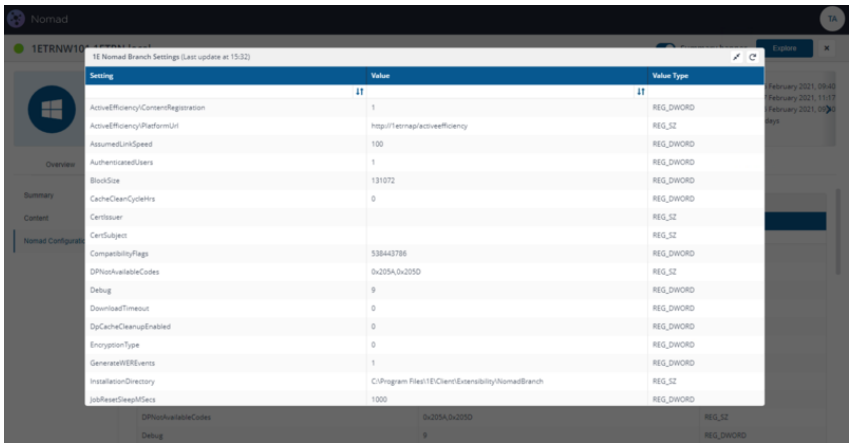
Instructions to help with the following Nomad features: Nomad cache, CacheCleaner, Single Site Download, Nomad jobs, NomadBranch service.



The **1E Nomad Branch Settings** panel is expandable. Moving your mouse over the panel reveals an **Expand** button on the top left of the panel and a refresh button. Clicking the refresh button, re-runs the **1E-Nomad-NomadBranchSettings** instruction.



A full list of Nomad registry values by feature are available on the Nomad registry values page. Registry values for NomadBranch are located in: *HKLM\Software\1E\NomadBranch*



9.6.2.4.3 Summary banner

The Summary banner displays a quick summary of the information provided in the various tabs displayed in the Device View. It can be viewed by toggling the **Summary banner** switch to on.

The following picture shows the Summary banner displayed for a particular device.

The following table describes the information provided in the Summary banner.

<table>
<tr><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td></td><td>Shows details equivalent to the following tiles:
<table>
<tr><th>Tab</th><th>Panel</th><th>Column</th><th>Tile</th><th>Description</th><th>Example</th></tr>
<tr><td>Overview</td><td>Details</td><td>Hardware and Operating System</td><td>Operating System</td><td>Version</td><td>Windows 10 Pro 20H2 (x86)</td></tr>
<tr><td>Hardware and Operating System</td><td>Hardware</td><td>Device Type</td><td>Desktop</td><td></td><td></td></tr>
<tr><td>Hardware and Operating System</td><td>Hardware</td><td>Manufacturer</td><td>VMware, Inc</td><td></td><td></td></tr>
<tr><td>Hardware and Operating System</td><td>Hardware</td><td>Model</td><td>VMWare Virtual Platform</td><td></td><td></td></tr>
<tr><td>Identification</td><td>Location</td><td>Location</td><td></td><td></td><td></td></tr>
<tr><td>Identification</td><td>Identification</td><td>Criticality</td><td>Undefined (0)</td><td></td><td></td></tr>
</table>
Shows details equivalent to the following tiles:
<table>
<tr><th>Tab</th><th>Panel</th><th>Column</th><th>Tile</th><th>Description</th><th>Example</th></tr>
<tr><td>Overview</td><td>Details</td><td>Hardware and</td><td>Hardware</td><td>CPU Type</td><td>Intel(R) Xeon(R) CPU X5650</td></tr>
</table></td><td>Data from Tachyon Master (the latest online status message)</td></tr>
</table>

Panel	Description				Data source
		Operating System		@2.67GHz x86	
Hardware and Operating System	Hardware	RAM	3071 MB		
Identification	Identification	1E Client	v5.2.5.251		
Hardware and Operating System	Operating System	Version	v10.0.19042.746		
Hardware and Operating System	Operating System	Virtual/Physical	VMWare		

Shows details equivalent to the following tiles:

Tab	Panel	Column	Tile	Description	Example
Overview	Details	Identification	Location	Timezone	UTC+00 - Europe/London (Inferred)
Identification	Identification	Domain	1ETRN		
Connectivity and Activity	Activity	User	1ETRN\Administrator		

Panel	Description					Data source
	Connectivity and Activity	Connectivity	Local IP Address	10.0.1.3/24		
					Netmask	255.255.255.0

Shows details equivalent to the following tiles:

Tab	Panel	Column	Tile	Description	Example
Overview	Details	Connectivity and Activity	Connectivity	First Connected	22 March 2021, 12:17 UTC
Connectivity and Activity	Connectivity	Last Connected	27 April 2021, 09:23 UTC		
Connectivity and Activity	Activity	Last Boot	18 March 2021, 12:24 UTC		
				Up time	a month

Shows details equivalent to the following tiles:

Tab	Panel	Column	Tile	Description	Example
Overview	Details	Identification	Grouping	Mgmt. Groups	All Devices All Win10 Workstations Servers.

9.6.2.4.4 Additional Device View tabs

In addition to the **Downloads** tab, there are a series of tabs, each corresponding to an app, feature or data set implemented in Tachyon.

The **Overview** and **1E Client** tabs are always present in the **Device View**. Other tabs are visible if an app has been installed and is licensed.

Each tab has one or more panels with tiles populated with data from various sources, some by instructions that are run instantly, with results cached for 3 minutes. An appropriate error message is displayed instead of a tile in the following circumstances:

If the device is offline, as indicated by the color of the icon in the top left

The user does not have at least Viewer permission to view use the license the tab or panel

The user does not have questioner permission to run the instruction

An instruction has not been uploaded.

The The Device View tabs and panels page lists the names of tabs and their panels, and a description of each tile indicating how the tile is populated.

9.6.2.4.5 Navigation and filtering

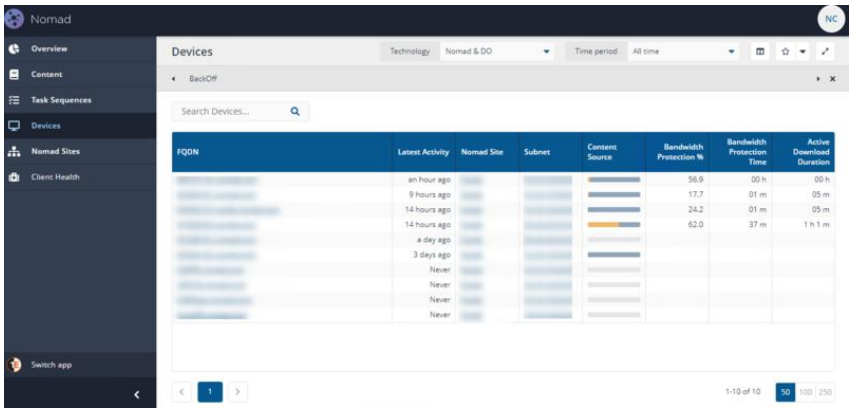
Devices are listed in order of **Latest Activity**, devices with the most recent activity are at the top of the list. The **Time period** filter is 'inherited' if it has been previously set on another page in the same browser session. If the **Time period** is set to **All time**, devices that have registered (i.e. they are running Nomad) but have not sent any download activity will appear at the bottom of the list and **Latest Activity** will show **Never** in the **Latest Activity** column.

In addition to the **Time period** filter, you can use the **Technology** filter to show devices that have download activity from Nomad, Delivery Optimization (DO) or both (default).

The**Devices**list has the following columns:

Column	Description
FQDN	Fully Qualified Domain Name.
Latest Activity	Indication of how long ago the latest download activity occurred on this device.
Nomad Site	The Nomad SSD Site that the device is currently in based on the last adapter registration event.
Subnet	The subnet that the device is currently in based on the last adapter registration event.

Column	Description
Content Source	A bar representing the volume of content this device has downloaded from a peer (in grey) vs from a source over the WAN (in orange).
Bandwidth Protection %	Bandwidth Protection shown as a percentage of downloads This is the result of the **Bandwidth Protection Time** column dived by the **Active Download Duration** and multiplied by 100.
Bandwidth Protection Time	Duration the client backed off from downloading to save download bandwidth. **Note** This metric is not visible by default, you can select it using**Select Columns**
Active Download Duration	Duration for which client actively downloaded the content, this excludes interruptions while downloading, for example because of network issues. **Note** This metric is not visible by default, you can select it using **Select Columns**.

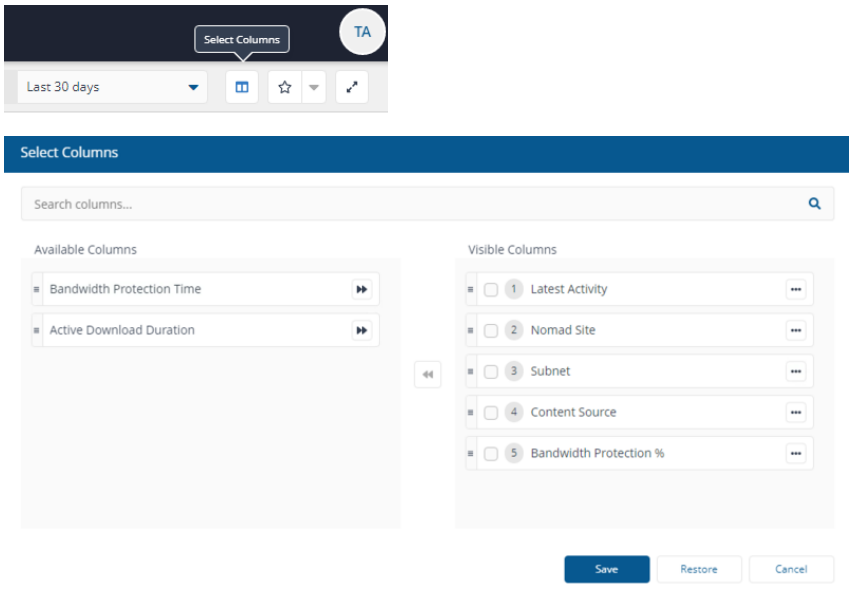


9.6.2.4.5.1 Select Columns

On the pages where you can pick the displayed columns, you'll see the following **Select Columns** control.

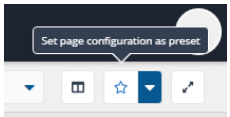
When you click on the **Select columns**control it opens a popup displaying the columns shown on the current screen and any additional columns you can select, the controls are:

Control	Explanation
Available Columns	Columns, which are by default hidden from display on screen. You can still include any of them to display on screen.
Visible Columns	Displays the list of columns displayed on screen. Mandatory Columns cannot be excluded, the selection controls for these items are disabled. They can still be moved up or down.
Arrow buttons	To move up or move down, exclude or include any column, clicking on the ellipsis displays these additional controls.
Drag and drop	You can drag and drop columns to change how they are displayed.
Exclude columns	Exclude column button allows you to select columns to exclude from the current display.

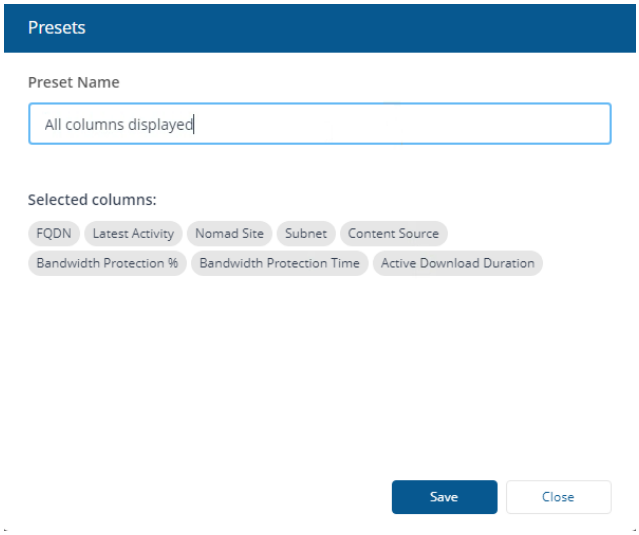


9.6.2.4.5.2 Set page configuration as preset

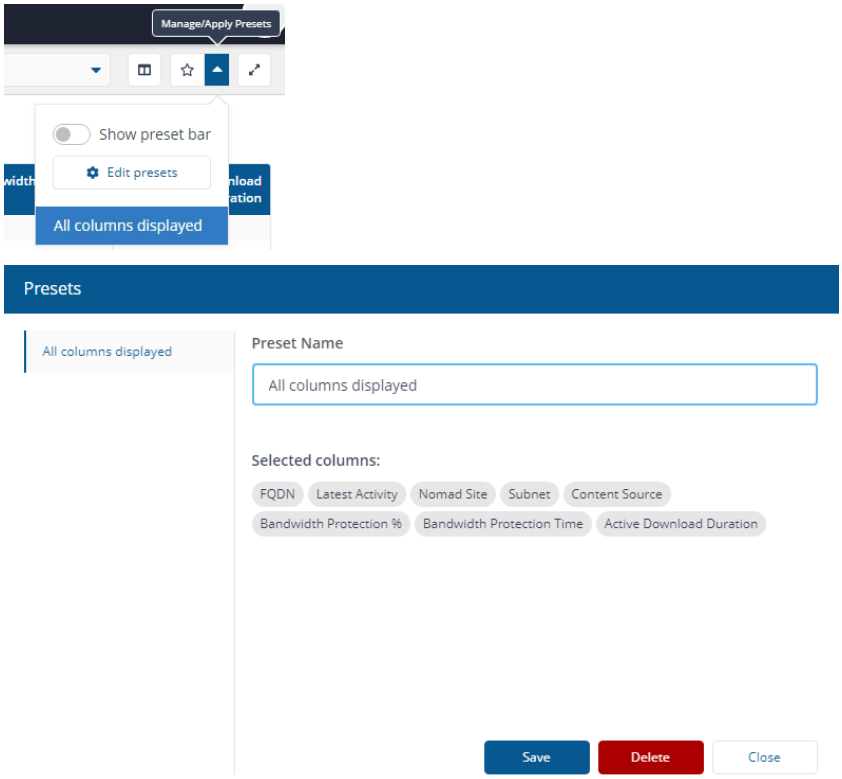
If you have amended the displayed columns using the **Choose columns** control, you can then save the view as a preset which will be available later.



Clicking **Set page configuration as preset** displays the **Presets** popup. Here, you can give the view a name, in the shown example this is called **All columns displayed** as we have chosen to display every available column.



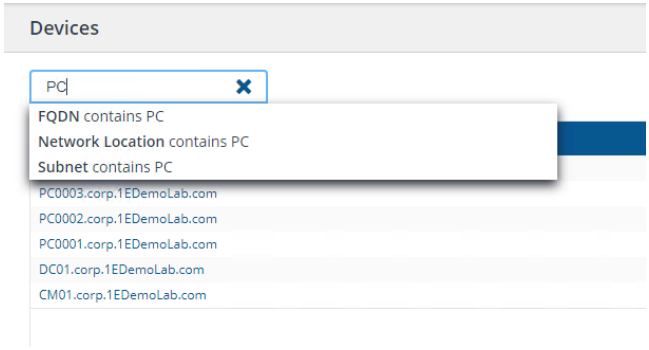
Once saved, you can select your saved views using the **Manage/Apply Presets** control or edit them by clicking **Edit presets**.



9.6.2.4.5.3 Search

You can use the **Search Devices...** box to search for a specific device by **FQDN**, **Network Site** or **Subnet**.

When you start typing into the search box, a list will appear as indicated below, allowing you to select which column (**FQDN**, **Network Site** or **Subnet**) that the search term should be applied to.



9.6.2.4.5.4 Time period filter

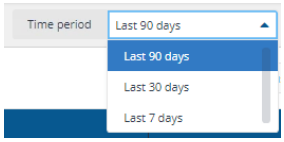
Using the **Time period**filter at the top of the page, you can narrow down the results by date. You can choose from the following options:

Last 90 days

Last 30 days (Default)

Last 7 days.

> **Note**
>
> If these filters are applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.4.5.5 Technology filter

You can use the **Technology** filter to differentiate between downloads through Nomad or Delivery Optimization (DO).

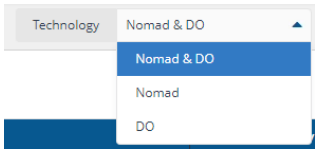
The following options are available:

Nomad & DO (Default)

Nomad

DO.

> **Note**
>
> If this filter is applied to any app page, it is reflected on all other pages in the Nomad App.



9.6.2.4.6 The Device view Downloads tab

The **Device view** is a common view used throughout Tachyon to present details of a device from multiple Tachyon Platform applications.

The default view in the Nomad devices view is **Downloads**. The remaining tabs display information corresponding to an app, feature or data set implemented in Tachyon, other tabs are visible if an app has been installed and licensed, and the user has permissions to use the app, refer to Additional Device View Tabs for detail. Clicking on one of the links in the **FQDN** column of the **Devices** page displays the Device view for the selected device. The aim of the Device view is to provide a combined overview of all the information known about a device, along with the ability to retrieve information about the device in real-time. When displaying the Device view from a Nomad page, the view defaults to the **Downloads** tab. The **Downloads** tab contains information derived from and useful for using Nomad.

In addition, the Summary banner displays a quick summary of the information provided in the various tabs displayed in the Device View. It can be viewed by toggling the **Summary banner** switch to on, refer to Summary banner for details.

> **Note**
>
> The **Time period** filter does not apply to detail pages. As a result, if you have set the**Time period**filter on the**Devices** page to, for example,**Last 7 days**, you may see different results on the detail page for a device.

> **Note**
>
> The details shown on the Downloads and other tabs rely on access to the associated app, but also Instruction Sets used by the Tachyon Platform. >To view details in the Downloads tab for the Nomad app you'll need to load the 1E Nomad product pack. For more details, refer to Installing the Nomad app - 1E Nomad product pack.

9.6.2.4.6.1 Downloads tab

The**Downloads**tab has three items:

Summary

Content

Nomad Configuration.

The Downloads tab presents download activity and status for the device. Whenever you click on an FQDN on any of the Nomad dashboard pages, the Device details page will be displayed with the **Downloads** tab selected.

9.6.2.4.6.1.1 Summary

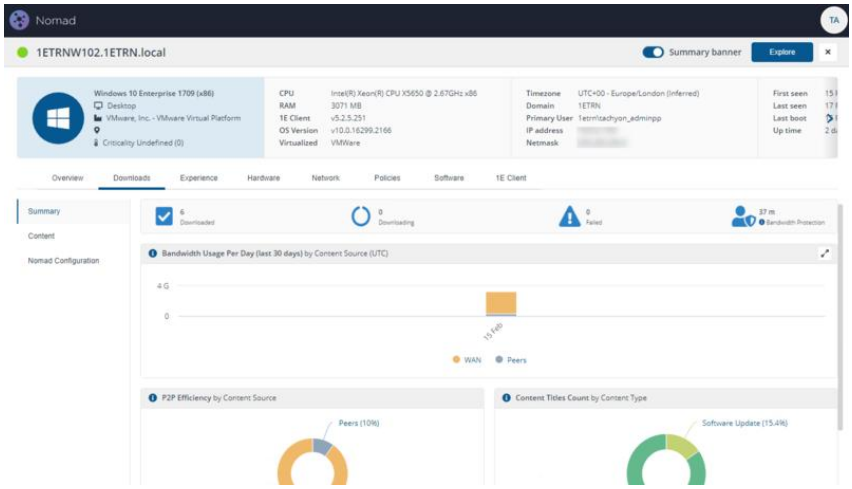
Summary has four panels:

Status bar

Bandwidth Usage Per Day by Content Source (UTC)

P2P Efficiency by Content Source

Content Titles Count by Content Type.



9.6.2.4.6.1.1.1 Status bar

The status bar along the top shows high-level download statistics for this device:

Column	Description
Downloaded	Number of completed downloads on this device.
Downloading	Number of downloads that are actively in progress on this device.
Failed	Number of downloads on devices that are currently in the site, whose latest status is failed.
Bandwidth Protection	Bandwidth Protection allows Nomad to adjust the speed of ongoing downloads to save bandwidth for other business use. Bandwidth Protection ensures Nomad doesn't consume excess bandwidth and hinder other business activity.

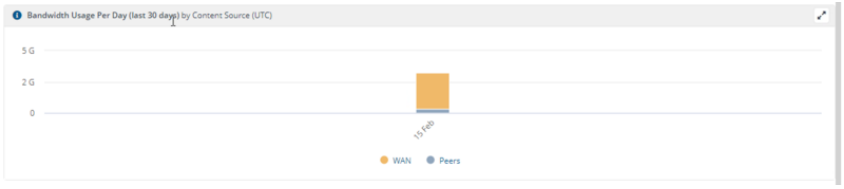
Clicking on any of these icons will navigate to the**Content**view of the**Device detail**tab, filtered according to the clicked icon.

9.6.2.4.6.1.1.2 Bandwidth Usage Per Day by Content Source (UTC)

The **Bandwidth Usage Per Day by Content Source (UTC)** tile represents daily download activity on this device for the last 30 days. A column is displayed for each day when there was download activity. Each column indicates the volume of content that was downloaded over the WAN (in orange) or from peers (in grey).

Hovering over a segment of the column displays the volume of content downloaded on that day, demonstrating the value that Nomad and Delivery Optimization are providing through reduced WAN traffic. If the majority of

content is being downloaded over the WAN, it could indicate that peers are simply not available (e.g. this device is being used from home) or it could be an indication that Nomad or Delivery Optimization are not correctly configured to optimize content from peers.

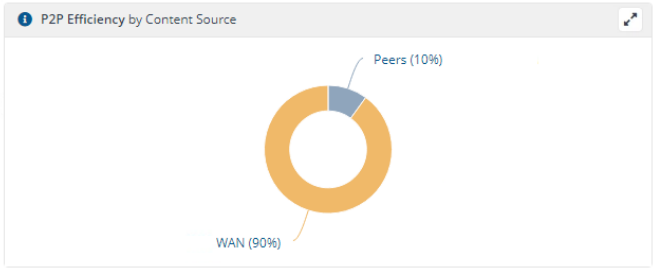


9.6.2.4.6.1.1.3 P2P Efficiency by Content Source

The **P2P Efficiency by Content Source** tile represents the overall peer-to-peer efficiency on this device. The data is grouped by source (**Peers** and **WAN**) and displayed as a donut chart showing the volume of content downloaded from peers (in grey) and from the source over the WAN (in orange).

The chart gives an indication of the overall value of Nomad and Delivery Optimization on this device. Ideally, more content will be downloaded from peers than from the source over the WAN, thereby saving network bandwidth. Where this is not the case, it could be due to remote working (where there are no peers available), or it could be due to configuration settings on the client that are not optimized for peer-to-peer caching and availability.

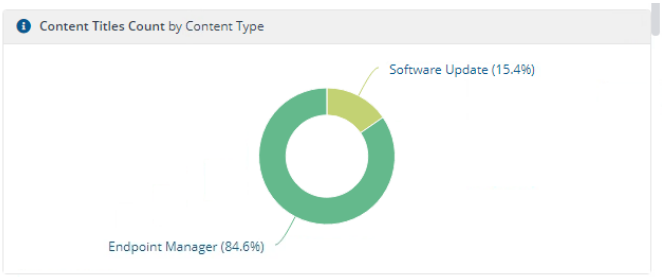
Clicking on a segment in this chart will navigate to the **Content** view for this device, filtered to show content that was downloaded from the selected source (Peer or WAN).



9.6.2.4.6.1.1.4 Content Titles Count by Content Type

The **Content Titles Count by Content Type** chart gives an indication of the number of **Endpoint Manager** applications and **Software Update** this device has downloaded.

Clicking on a segment in this chart will navigate to the **Content** view for this device, filtered by the selected Content Type.



9.6.2.4.6.1.2 Content

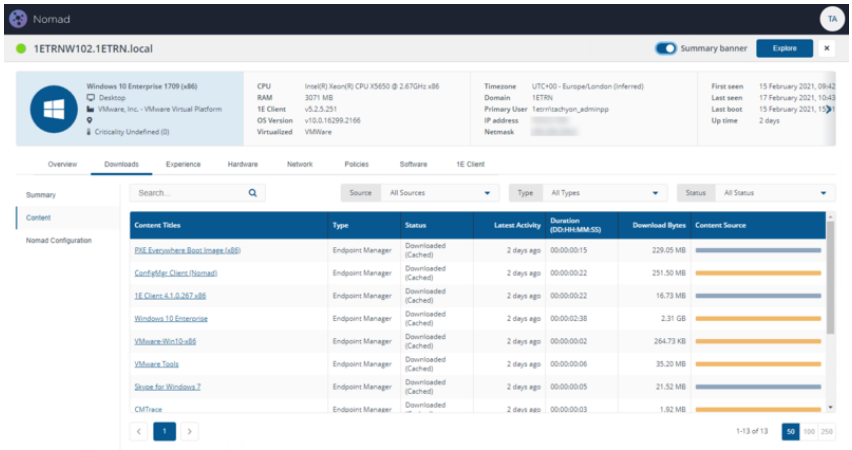
The **Content** panel shows the status of content downloaded on the device:

Column	Description
Content Titles	Content title, for: CM Packages, this is the Package name CM Applications, this is a combination of the Application name and Deployment Type name Software Updates, this is the title of the Software Update as defined in the Microsoft Update catalog (this is collected from the client, not the Microsoft Catalog).
Type	Currently, either Endpoint Manager or Software Update.
Status	Current status of the content on this device. This can include the following statuses. **Downloading** **Downloaded (Cached)** - downloaded and has not subsequently reported deletion **Downloaded (Deleted)** - downloaded but has subsequently been deleted from the cache **Cancelled** **Failed.**
Latest Activity	Date and time of the latest event for the content title on this device.
Duration	The time taken to download the content.
Download Bytes	Amount of bytes of the content actually downloaded by the device. In some cases, especially with Software Updates, only deltas or byte ranges will be downloaded rather than the entire source content.
Content Source	A bar indicating the proportion of the content that was downloaded over the WAN or from peers.

Note

The **Time period** filter does not apply to detail pages.

As a result, if you have set the **Time period** filter on the **Devices** page to, for example, **Last 7 days**, you may see different results on the detail page for a device.



9.6.2.4.6.1.3 Navigation and filtering

There are four ways you can filter viewable content:

Search...

Sources

Types

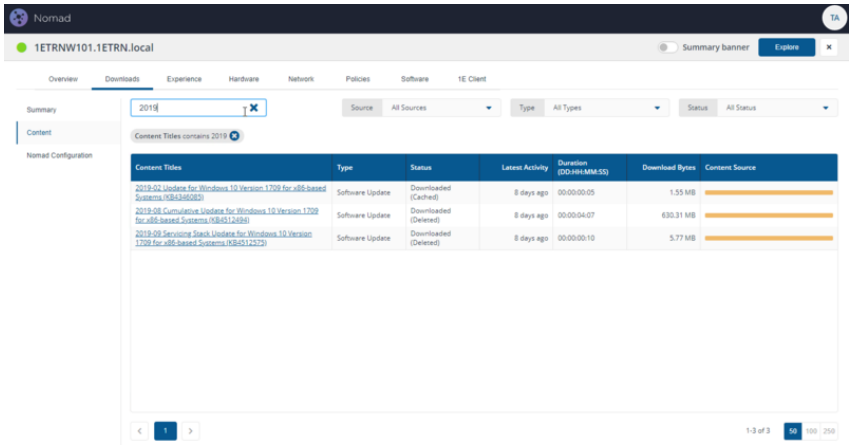
Status.

9.6.2.4.6.1.3.1 Search...

Use the search box at the top left of the page to filter by specific criteria, for example in the picture opposite the default view has been filtered by Content Titles containing 2019 in their title.

Note

Navigating away from this view resets the table to its default view.



9.6.2.4.6.1.3.2 Filters

Filter the table using these options:

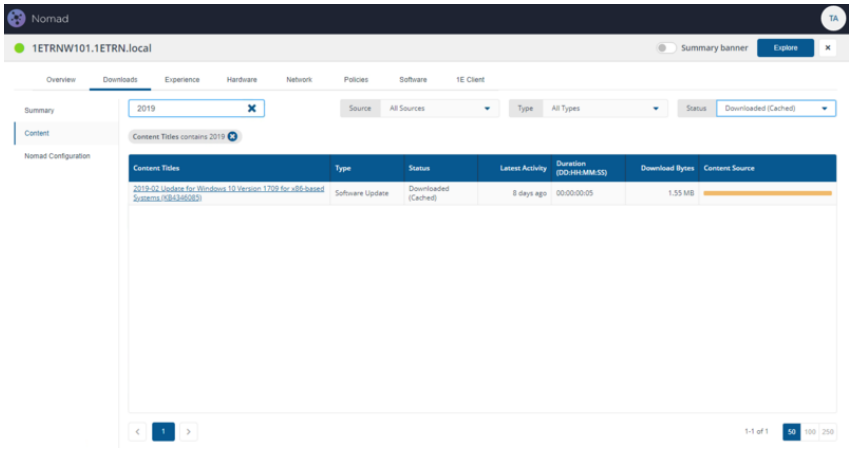
Source

Type

Status.

Filter	Options	Description
Source	**All Sources** (default)	Shows content that was downloaded from either the WAN or peers.
WAN	Shows content that was partially or fully downloaded over the WAN.	
Peers	Shows content that was partially or fully downloaded from peers.	
Type	**All Types** (default)	Shows Endpoint Manager and Software Update content.
Software Update	Shows only Software Update content.	
Endpoint Manager	Shows only Endpoint Manager content.	
Status	**All Status** (default)	Shows all content for which any download

Filter	Options	Description
		activity has been reported.
Downloading	Shows all content for which the latest reported status was downloading.	
Cancelled	Shows all content for which the latest reported status was cancelled.	
Downloaded (Cached)	Shows all content for which the latest reported status was Downloaded and has not subsequently reported deletion.	
Downloaded (Deleted)	Shows all content which completed downloading but has subsequently been deleted from the cache.	
Failed	Shows all content for which the latest reported status was Failed.	
Downloaded	Shows all content that has been downloaded (either still cached or deleted).	



9.6.2.4.6.1.4 Nomad Configuration

Shows the **1E Nomad Branch Settings** for the selected device. You can use this to check a device's Nomad registry entries if the device is not behaving as expected.

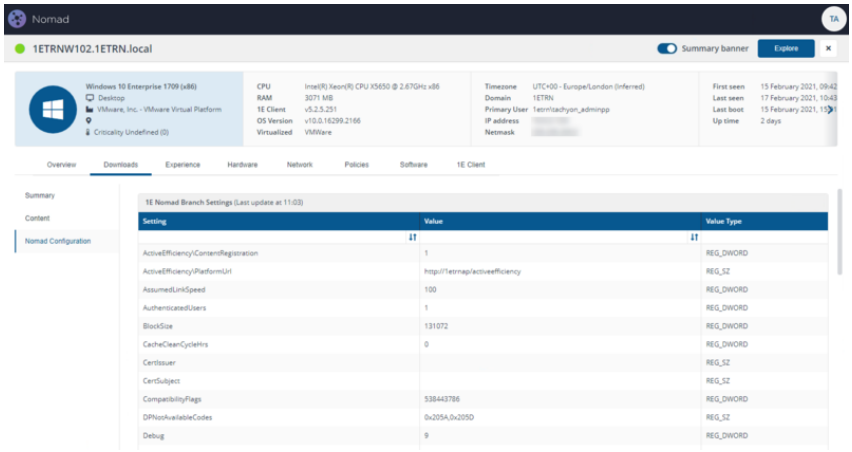
The registry details presented are gathered by the **1E-Nomad-NomadBranchSettings** instruction of the 1E Nomad product pack.

Classic product pack used to create the **1E Nomad** instruction set in Tachyon, required by the following Nomad features:

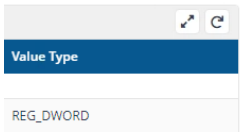
Downloads tab on Device views - instructions used to populate details about Content download and other Nomad features

Nomad Download Pause - instructions used by the CM Admin Console extensions

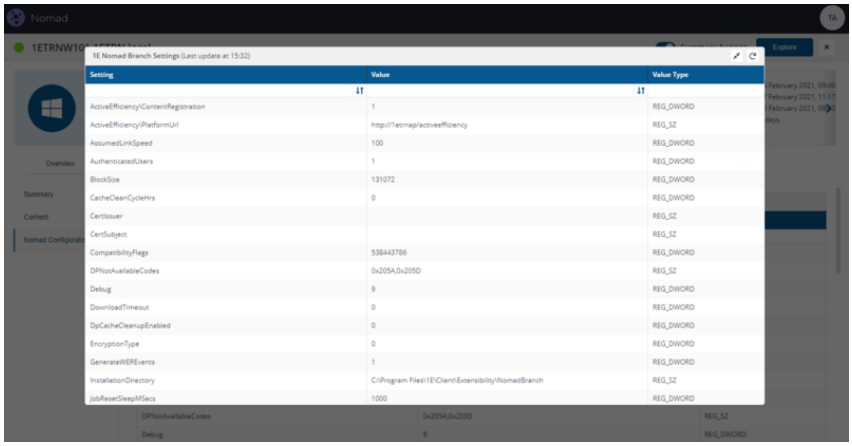
Instructions to help with the following Nomad features: Nomad cache, CacheCleaner, Single Site Download, Nomad jobs, NomadBranch service.



The **1E Nomad Branch Settings** panel is expandable. Moving your mouse over the panel reveals an **Expand** button on the top left of the panel and a refresh button. Clicking the refresh button, re-runs the **1E-Nomad-NomadBranchSettings** instruction.



A full list of Nomad registry values by feature are available on the Nomad registry values page. Registry values for NomadBranch are located in: *HKLM\Software\1E\NomadBranch*



9.6.2.4.7 Summary banner

The Summary banner displays a quick summary of the information provided in the various tabs displayed in the Device View. It can be viewed by toggling the **Summary banner** switch to on.

The following picture shows the Summary banner displayed for a particular device.

The following table describes the information provided in the Summary banner.

<table>
<tr><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td></td><td>Shows details equivalent to the following tiles:
<table>
<tr><th>Tab</th><th>Panel</th><th>Column</th><th>Tile</th><th>Description</th><th>Example</th></tr>
<tr><td>Overview</td><td>Details</td><td>Hardware and Operating System</td><td>Operating System</td><td>Version</td><td>Windows 10 Pro 20H2 (x86)</td></tr>

<tr><td>Hardware and Operating System</td><td>Hardware</td><td>Model</td><td>VMWare Virtual Platform</td><td></td><td></td></tr>
<tr><td>Identification</td><td>Location</td><td>Location</td><td></td><td></td><td></td></tr>
<tr><td>Identification</td><td>Identification</td><td>Criticality</td><td>Undefined (0)</td><td></td><td></td></tr>
</table></td><td>Data from Tachyon Master (the latest online status message)</td></tr>
</table>

Panel	Description	Data source

Shows details equivalent to the following tiles:

Tab	Panel	Column	Tile	Description	Example
Overview	Details	Hardware and Operating System	Hardware	CPU Type	Intel(R) Xeon(R) CPU X5650 @2.67GHz x86
Hardware and Operating System	Hardware	RAM	3071 MB		
Identification	Identification	1E Client	v5.2.5.251		
Hardware and Operating System	Operating System	Version	v10.0.19042.746		
Hardware and Operating System	Operating System	Virtual/Physical	VMWare		

Shows details equivalent to the following tiles:

Tab	Panel	Column	Tile	Description	Example
Overview	Details	Identification	Location	Timezone	UTC+00 - Europe/London (Inferred)

Panel	Description					Data source
	Identification	Identification	Domain	1ETRN		
	Connectivity and Activity	Activity	User	1ETRN\Administrator		
	Connectivity and Activity	Connectivity	Local IP Address	10.0.1.3/24		
					Netmask	255.255.255.0

Shows details equivalent to the following tiles:

Tab	Panel	Column	Tile	Description	Example
Overview	Details	Connectivity and Activity	Connectivity	First Connected	22 March 2021, 12:17 UTC
Connectivity and Activity	Connectivity	Last Connected	27 April 2021, 09:23 UTC		
Connectivity and Activity	Activity	Last Boot	18 March 2021, 12:24 UTC		
				Up time	a month

Shows details equivalent to the following tiles:

Panel	Description	Data source

Tab	Panel	Column	Tile	Description	Example
Overview	Details	Identification	Grouping	Mgmt. Groups	All Devices All Win10 Workstations Servers.

9.6.2.4.8 Additional Device View tabs

In addition to the **Downloads** tab, there are a series of tabs, each corresponding to an app, feature or data set implemented in Tachyon.

The **Overview** and **1E Client** tabs are always present in the **Device View**. Other tabs are visible if an app has been installed and is licensed.

Each tab has one or more panels with tiles populated with data from various sources, some by instructions that are run instantly, with results cached for 3 minutes. An appropriate error message is displayed instead of a tile in the following circumstances:

If the device is offline, as indicated by the color of the icon in the top left

The user does not have at least Viewer permission to view use the license the tab or panel

The user does not have questioner permission to run the instruction

An instruction has not been uploaded.

The The Device View tabs and panels page lists the names of tabs and their panels, and a description of each tile indicating how the tile is populated.

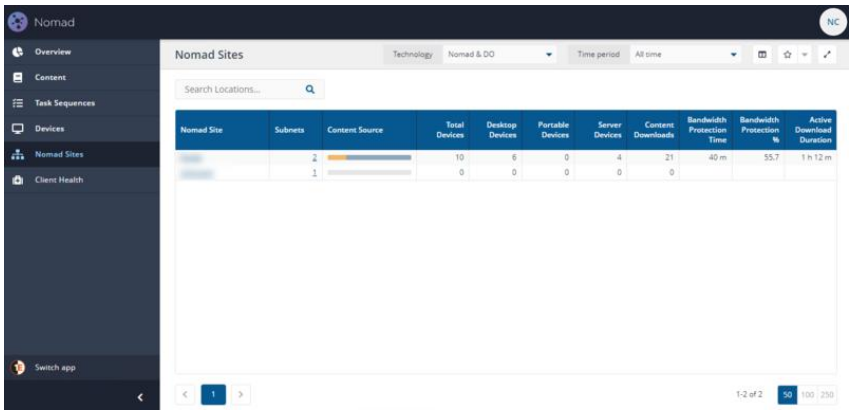
9.6.2.5 Nomad Sites page

The Nomad Sites page is primarily designed to show how the network is being used for content distribution in different locations. It focuses on the volume of content downloaded from peers vs over the WAN, rather than the status of specific Content titles in a given site. You can see what content is available by looking at the Content tab for that site.

> **Note**
>
> A Nomad Site corresponds to Nomad Single Site Download (SSD) site. Customers that have implemented SSD and upgraded ActiveEfficiency to the Nomad app and Content Distribution will see their defined SSD locations displayed as **Nomad Sites** in the app.
>
> Any subnets that are not included in a Nomad SSD Site definition will be represented in a site named **Unknown**. If no SSD sites have been defined, all subnets will be included in the 'Unknown' site.

9.6.2.5.1 Navigation and filtering

By default, the table lists **Nomad Sites** from which download activity has been reported within the selected **Time period**. These defaults can be modified using the **Technology** filter (to show Nomad or DO activity only) and the **Time period** filter.



The **Network Sites** page has the following columns, displayed by default in the order shown in the table.

Column	Description
Nomad Site	The name of the site as defined in the Content Distribution database. Nomad sites are typically defined using a script that imports site definition from another source, such as Active Directory Sites and Subnets, in which case the site name will be derived from that original source (e.g. AD Site Name).
Subnets	The count of subnets included in the Nomad site. Clicking on the number opens a 'drawer' that shows the peer-to-peer efficiency for each subnet in the site. Clicking on the subnet in this drawer shows the devices in that subnet reporting download activity within the selected **Time period**.
Content Source	A bar representing the volume of content downloaded in that site from **peers** (gray) and from the **WAN** (orange) within the selected **Time period**.
Bandwidth Protection Time	Duration the client backed off from downloading to save download bandwidth.
Bandwidth Protection %	Bandwidth Protection shown as a percentage of downloads.

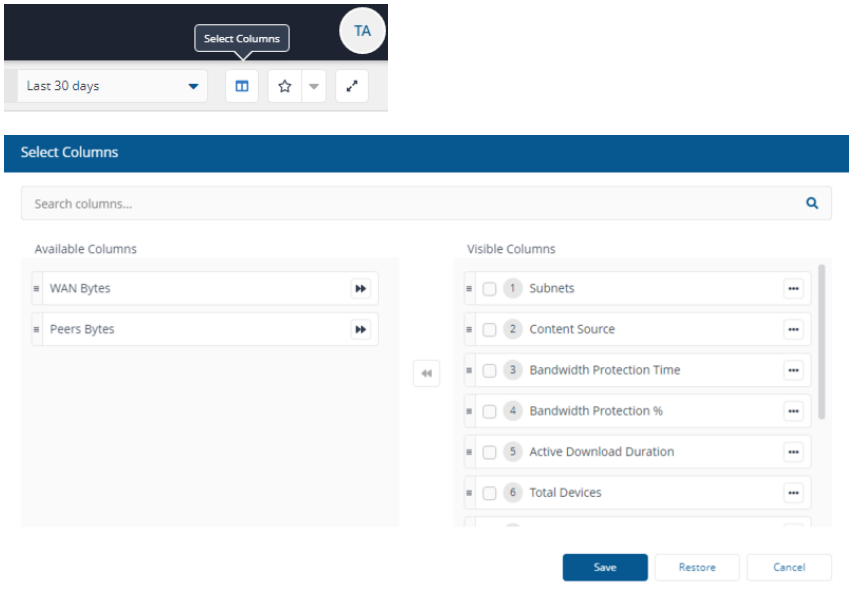
Column	Description
	This is the result of the **Bandwidth Protection Time** column dived by the **Active Download Duration** and multiplied by 100.
Active Download Duration	Duration for which client actively downloaded the content, this excludes any kind of interruption while downloading, for example network issues.
Total Devices	Representing the number of devices in the site that have reported download activity within the selected **Time period**.
Desktop Devices	A subset of Total Devices that are desktop devices (based on chassis type) and therefore most likely 'fixed' to the site.
Portable Devices	A subset of Total Devices that are portable devices (based on chassis type) and therefore may move from site to site.
Server Devices	A subset of Total Devices that are running a Server Operating System and therefore most likely 'fixed' to the site.
Content Downloads	Representing the total number of downloads at the site for which activity has been reported within the selected **Time period**.
WAN Bytes	Representing the total volume of content that has been downloaded by devices in that site from the WAN. The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column. **Note** This metric is not visible by default, you can select it using **Select Columns**.
Peers Bytes	Representing the total volume of content that has been downloaded by devices in that site from peers. The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column. **Note** This metric is not visible by default, you can select it using **Select Columns**.

9.6.2.5.1.1 Select Columns

On the pages where you can pick the displayed columns, you'll see the following **Select Columns** control.

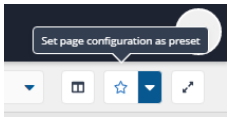
When you click on the **Select columns**control it opens a popup displaying the columns shown on the current screen and any additional columns you can select, the controls are:

Control	Explanation
Available Columns	Columns, which are by default hidden from display on screen. You can still include any of them to display on screen.
Visible Columns	Displays the list of columns displayed on screen. Mandatory Columns cannot be excluded, the selection controls for these items are disabled. They can still be moved up or down.
Arrow buttons	To move up or move down, exclude or include any column, clicking on the ellipsis displays these additional controls.
Drag and drop	You can drag and drop columns to change how they are displayed.
Exclude columns	Exclude column button allows you to select columns to exclude from the current display.

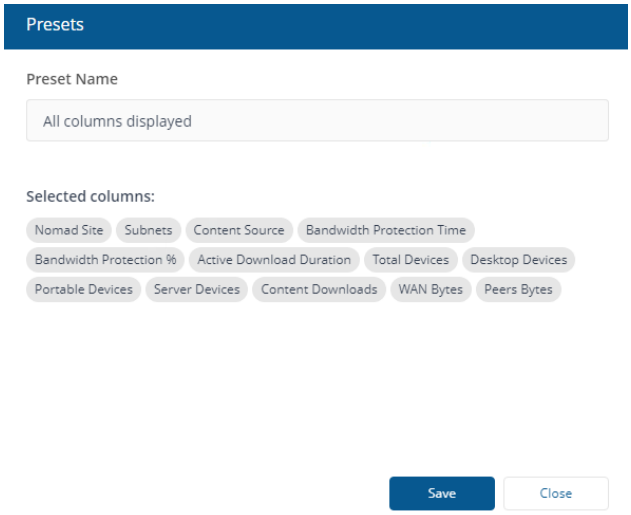


9.6.2.5.1.2 Set page configuration as preset

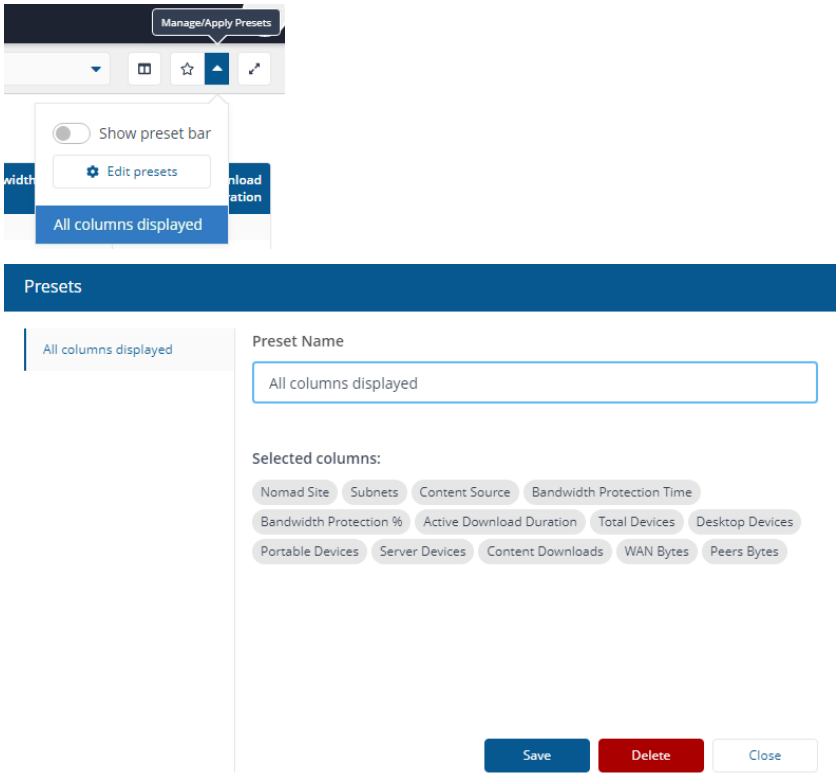
If you have amended the displayed columns using the **Choose columns** control, you can then save the view as a preset which will be available later.



Clicking **Set page configuration as preset** displays the **Presets** popup. Here, you can give the view a name, in the shown example this is called **All columns displayed** as we have chosen to display every available column.



Once saved, you can select your saved views using the **Manage/Apply Presets** control or edit them by clicking **Edit presets**.



9.6.2.5.1.3 Technology filter

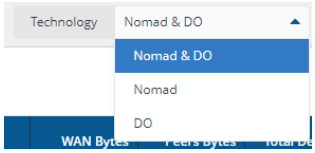
You can use the technology filter to differentiate between downloads through Nomad or Delivery Optimization (DO).

The following options are available:

Nomad & DO (Default)

Nomad

DO.



Note

If this filter is applied to any page, it is reflected on all other pages in the Nomad App.

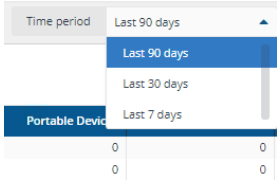
9.6.2.5.1.4 Time period filter

Using the **Time period**filter at the top of the page, you can narrow down the results by date. You can choose from the following options:

Last 90 days

Last 30 days (Default)

Last 7 days.



Note

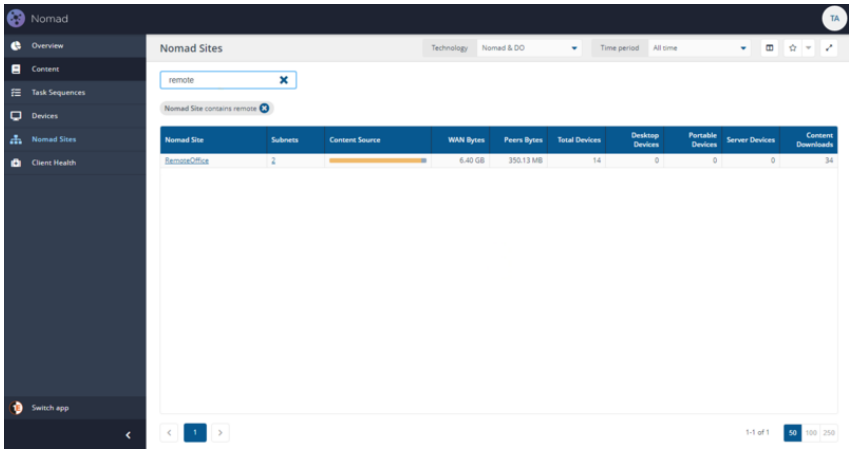
If these filters are applied to any app page, it is reflected on all other pages in the Nomad App.

9.6.2.5.1.5 Search...

Use the search box at the top left of the page to filter by specific criteria, for example in the picture opposite the default view has been filtered by Network Sites containing remote in their title.

Note

Navigating away from this view resets the table to its default view.

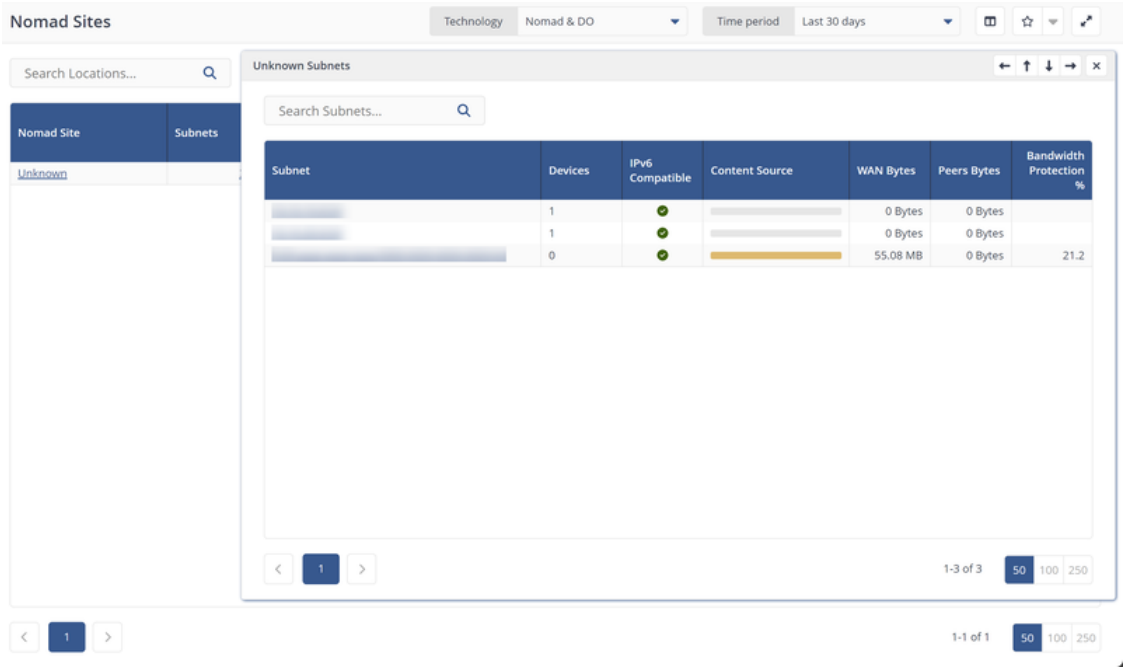


9.6.2.5.1.6 Subnets drawer

A drawer that opens up when you click on **Subnets**, **Content Source**, **WAN Bytes** etc. except **Network Location**. It shows a list of all Subnets falling under that location, with the following purpose:

Column	Description
Subnet	Subnet address (Clicking on this column takes you to the Network Location details page with selection based on this subnet).
Devices	Count of devices under this subnet.
Content Source	Percentage of downloads by WAN or Peers and content size. Hovering your mouse over the Content Source bar shows the percentage and download size per Content Type.
WAN Bytes	Representing the total volume of content that has been downloaded by devices in that site from the WAN. The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column.
Peers Bytes	Representing the total volume of content that has been downloaded by devices in that site from the Peers. The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column.
Bandwidth Protection %	Bandwidth Protection shown as a percentage of downloads.

Column	Description
	This is the result of the **Bandwidth Protection Time** column dived by the **Active Download Duration** andmultiplied by 100.

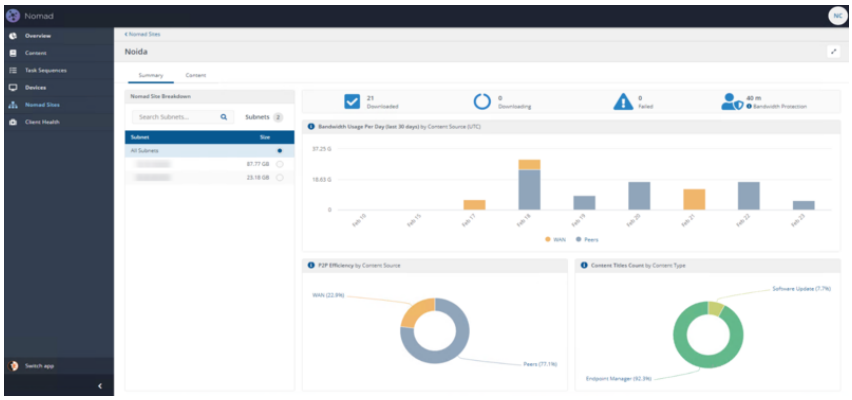


9.6.2.5.2 Nomad Site details

Clicking a **Nomad Site** takes you to the Nomad Site details page and shows information for a specific site. It includes two tabs:

Summary: Summary information about the site.

Content: All content downloaded in a Network Location.



9.6.2.5.2.1 Summary tab

The Summary tab shows summary information about the site.

9.6.2.5.2.1.1 Top Status Bar

The top status bar shows high-level statistics similar to the one on the Overview page:

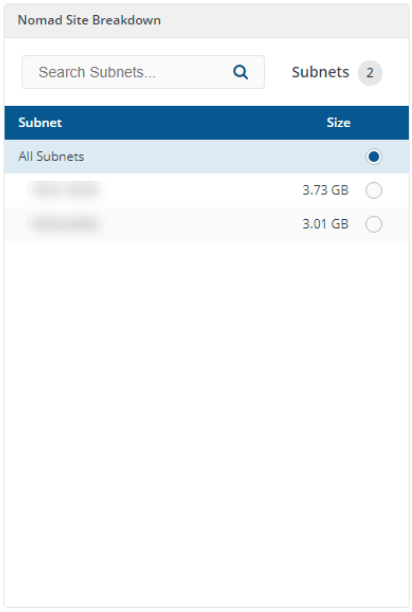
Status	Description
Total	Number of downloads on devices that are currently in the site.
Downloading	Number of downloads currently in progress in the site.
Downloaded	Number of downloads on devices that are currently in the site that have successfully completed.
Cancelled	Number of downloads on devices that are currently in the site, whose latest status was Cancelled.
Bandwidth Protection	Bandwidth Protection allows Nomad to adjust the speed of ongoing downloads to save bandwidth for other business use. Bandwidth Protection ensures Nomad doesn't consume excess bandwidth and hinder other business activity. **Note** When viewing individual Nomad sites, all data is displayed on the details page, irrespective of any time duration filter you have set on the **Nomad Sites** page. As a result, if you have set the **Time period** filter on the **Nomad Sites** page to, for example, **Last 7 days**, you may see a different result for all data except **Bandwidth Usage Per Day (Last 30 days) by Content Source (UTC)**, which displays data only for the previous 30 days.

Clicking on any of the icons will take you to the Content tab filtered according to the clicked status icon.

9.6.2.5.2.1.2 Subnet Side Panel

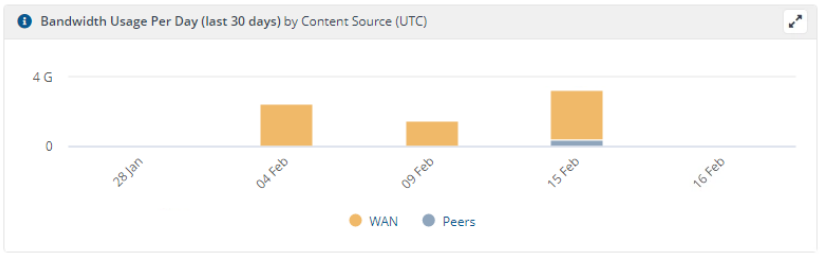
The Subnet list in the left panel shows every subnet in the selected site. By default, the page shows aggregated data for the entire site. You can filter page to examine a specific subnet within the site.

Panel item	Description
Search Subnets...	In large sites you can search for a subnet using the search box.
Subnets	The total number of subnets in the site is shown in the Subnets 'badge'. in our example the total number is **3**.
Subnet	A list of subnet detected for that Network Site.
Size	The **Size** column in this list indicates the total volume of content downloaded in that subnet.



9.6.2.5.2.1.3 Bandwidth Usage Per Day (Last 30 days) by Content Source (UTC)

The **Bandwidth Usage Per Day (Last 30 days) by Content Source (UTC)** tile represents daily download activity in this site over the last 30 days.



A column is displayed for each day where download activity was reported from devices that were in the site on that day. If a device moves into another site, this chart will still show content that it downloaded while it was in this site.

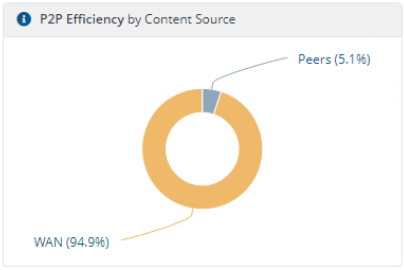
Each column indicates the volume of content that was downloaded over the **WAN** (in orange) or from **Peers** (in grey). Hovering over a segment of the column displays the volume of content downloaded on that day.

This view demonstrates the value that Nomad and Delivery Optimization provide through reduced WAN traffic. If the majority of content is being downloaded over the WAN, it could indicate that peers are simply not available (e.g. users working from home) or it could be an indication that Nomad or Delivery Optimization are not correctly configured to optimize content from peers.

> **Note**
>
> The columns on this chart are not clickable - they are for data visualization only and do not navigate to another view of the data.

9.6.2.5.2.1.4 P2P Efficiency by Content Source

The **P2P Efficiency by Content Source** tile represents the overall peer-to-peer efficiency across the site.



The data is grouped by source (**Peers** and **WAN**) and displayed as a donut chart showing the volume of content downloaded from **Peers** (in grey) and from the source over the **WAN** (in orange).

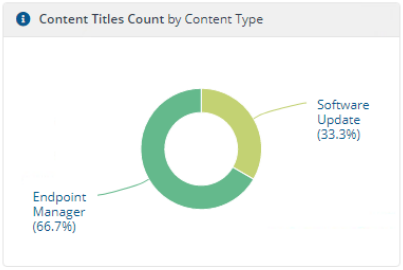
This gives an indication of the overall value of Nomad and Delivery Optimization within the site. Ideally, more content will be downloaded from peers than from the source over the WAN, thereby saving network bandwidth.

Where this is not the case, it could be due to many users working remotely without any local peers, or it could be due to configuration settings on the client that are not optimized for peer-to-peer caching and availability.

> **Note**
>
> Clicking on the chart navigates to the **Content** tab filtered by either **Peers** or **WAN**, for that subnet.

9.6.2.5.2.1.5 Content Titles Count by Content Type

The **Content Title Count by Content Type** tile shows the total number of unique Content Titles where there is download activity reported for the latest version of the content within the site. The data is grouped by **Content Type**.



The app reports on two Content Types:

Endpoint Manager - in this release this includes CM Applications and Packages.

Software Updates - includes any Microsoft Software Updates deployed through CM or Windows Update.

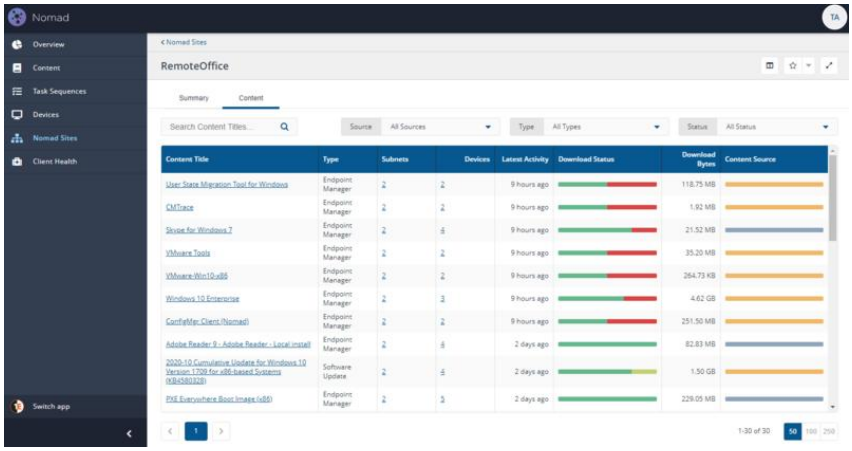
In a future release these will be expanded to include other content types such as Endpoint Manager Intune applications, Microsoft Store apps.

Hovering over a **Content Type** segment of the chart displays the count of Content Titles of that type, also represented as a percentage of all Content Titles.

> **Note**
>
> Clicking on a **Content Type** segment of the chart will navigate to the Content tab, filtered to show Content Titles of the selected segment.

9.6.2.5.2.2 Content tab

A table showing all content downloaded in a Network Location and optionally filtered on the Subnet selected from the **Summary** tab.



Columns	Description
Content Title	Name of the content (Clicking on this column takes you to the details of the content).
Type	Type of content.

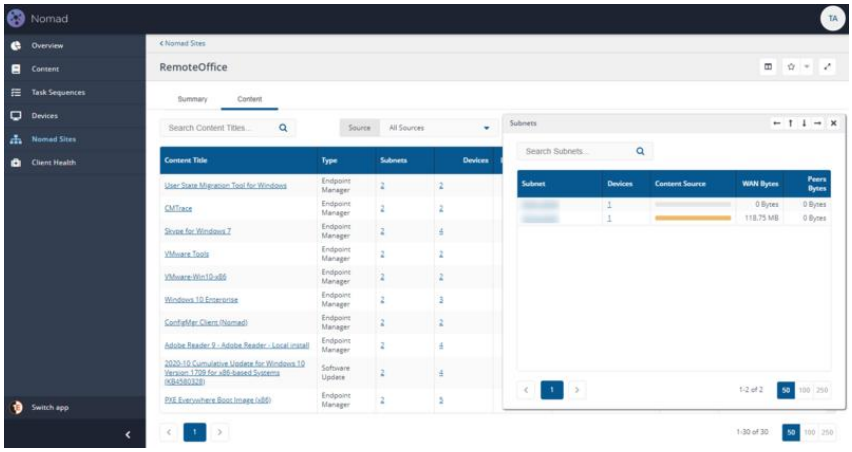
Columns	Description
Subnets	Count of subnets this content is downloaded to (Clicking on this column opens a drawer that expands on the list of subnets).
Devices	Count of devices this content is downloaded to (Clicking on this column opens a drawer that expands on the list of devices).
Latest Activity	Time when most recent activity happened.
Download Status	Flexible chart showing distribution of download statuses.
Download Bytes	Representing the total size of downloads for this content for this Location and Subnet. The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column.
Content Source	Same chart as on Main page but for this Content only.

9.6.2.5.2.2.1 Subnet draw

A drawer that opens up when you click on the subnets count. It shows a list of all subnets falling under that location and have downloaded the specified content, with the following functionality:

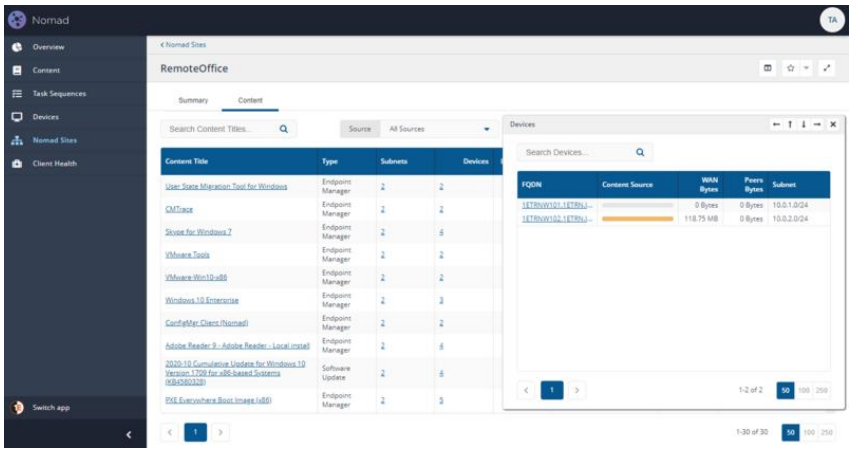
Columns	Description
Subnet	Takes you to Devices drawer with filter on this subnet.
Devices	Number of devices in this subnet, clicking it will take you to Devices drawer with filter on this subnet.
Content Source	A flex bar chart showing distribution across WAN and Peers.
WAN Bytes	Representing the total size of downloads for this content for this Location and Subnet. The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column.
Peers Bytes	Representing the total size of downloads for this content for this Location and Subnet.

Columns	Description
	The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column.



9.6.2.5.2.2.2 Devices drawer

A drawer that opens up when you click on the device count. It shows a list of all devices falling under that location and have downloaded the specified content.



Columns	Description
FQDN	FQDN of the device (Clicking on it will take you to the device details).
Content Source	A flex bar chart showing distribution across WAN and Peers.
WAN Bytes	Representing the total size of downloads for this content for this Location and Subnet.

Columns	Description
	The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column.
Peers Bytes	Representing the total size of downloads for this content for this Location and Subnet. The number is represented in units of Bytes, KB, MB or GB as appropriate to fit in the column.

9.6.2.6 Client Health page

The Client Health page shows information from two Integrated Product Packs provided with the Tachyon Platform:

MEMCM Client Health Policy

Nomad Client Health Policy.

These Integrated Product Packs are represented on the Client Health page by two sets of panels that can be explored in the Rules and Devices pages in Introducing Guaranteed State.

9.6.2.6.1 Introduction to Guaranteed State concepts

Guaranteed State allows you to easily check and enforce device state. Device state can represent just about anything you'd like to be set in a certain way for a collection of devices. Once you have imported an Integrated Product Pack you can configure and deploy policies to manage various device attributes. For example:

Registry keys

Services

Config Manager metrics such as client cache usage

Disk free space

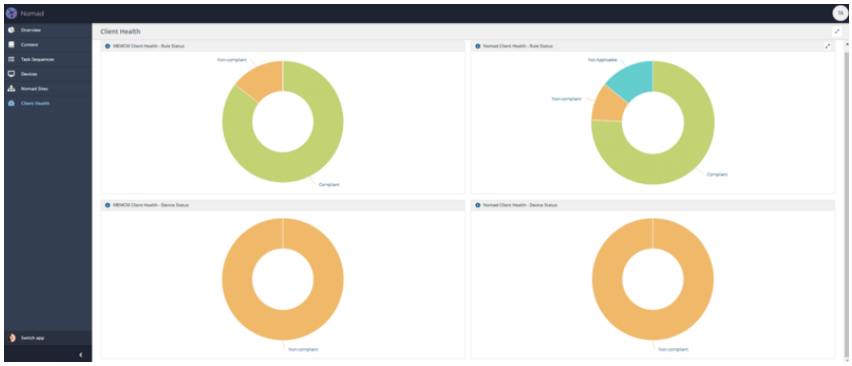
WMI namespaces and classes.

Before using Guaranteed State you need to upload some policies (with their rules, triggers and preconditions). Please refer to Installing the Nomad app and 1E Content Distribution - 1E Nomad product packs for details about Nomad feature-related Product Packs.

Product Packs are required to support various features of Nomad**:**

Classic Product Packs - contain instructions, for use in Explorer and other Tachyon applications

Integrated Product Packs - contain policies, rules and fragments for use by Guaranteed State, and may also include instructions.



The state of devices where Guaranteed State policies have been deployed is represented in this form.

The user has the ability to drill down into the percentage of failures for each group of device states. For example, where the meaning of device states and their precedence is as follows:

State	Description
Unknown	The device has yet to receive, evaluate or report back on its compliance state for at least one rule.
Error	The device has failed to evaluate at least one deployed rule. For example a device may report 97% of deployed rules as **Not Applicable**, but since 3% of the deployed rules reported as Error this means the whole Device State is marked as **Error**.
Not Applicable	At least one rule deployed to the device is not applicable. For example, this would occur if a Windows-specific rule was deployed to a non-Windows device.
Non-compliant	At least one rule deployed to the device failed compliance checks. For example in the example above 86% of policy rules are compliant for the high-lighted device, but since 8% of the rules are Non-compliant the state of the whole device is marked as Non-compliant.
Compliant	The device passed compliance checks for every deployed policy rule.

The drill down navigates to the **Devices** report filtered on the selected **Device State** such as **Noncompliant**.

The Device State panel is shown on the Guaranteed State Overview page.

Refer to Guaranteed State Overview page page for details about other Guaranteed State Dashboard charts.

9.6.2.6.2 MEMCM Client Health Policy

Many businesses rely on Microsoft Endpoint Manager Configuration Manager (MEMCM) to deploy software, patches and updates across their company networks. It is crucial that Configuration Manager is working effectively.

The MEMCM Client Health policy monitors Configuration Manager client health and performance. It checks for cache availability, inventory cycles, service availability and Configuration Manager WMI integrity - common causes of Configuration Manager client problems on devices.

The MEMCM Client Health policy replaces the previous SCCM Client Health policy and covers the following:

Ensure the correct version of the CM client is installed and running and assigned to the correct site

Ensure the CM client is not stuck in provisioning mode

Ensure that heartbeat discovery, inventory and state messages are being sent regularly

Ensures the CM client cache is set to the correct size

Ensure the CM client log settings are correct

Ensure the BITS service exists, configured to start up automatically and is running

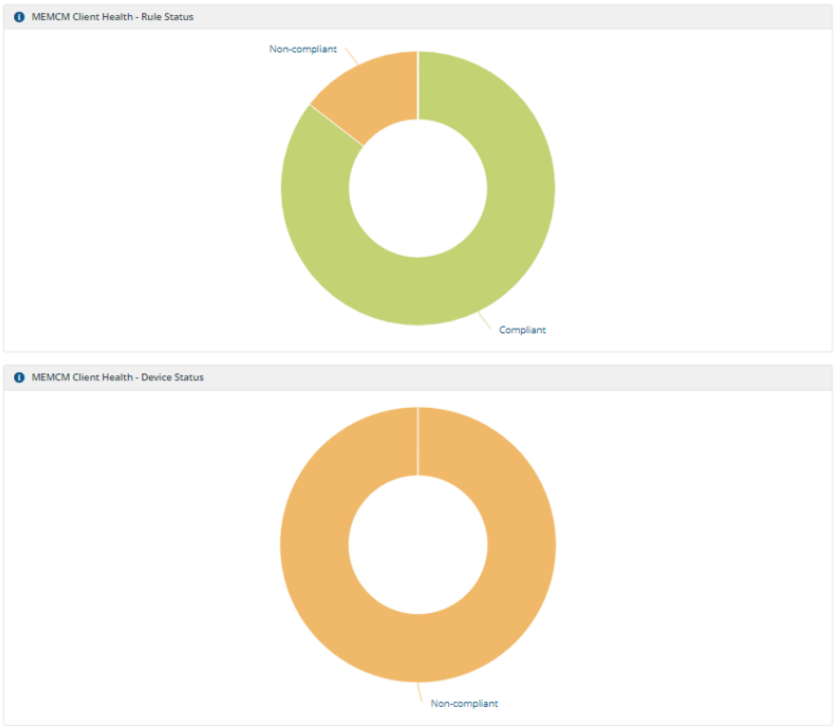
Ensure the Windows Time service exists with correct startup settings

Ensure the Windows Management Instrumentation (WMI) service exists, configured to start automatically and is running

Ensure WMI is healthy, the core CIMv2 and ccm namespaces and classes exist and that the WMI repository is consistent

Ensure the Windows Update service exists with correct startup settings, is configured to use the correct source (CM, WSUS or Microsoft Update) and that the service can connect to the source

> **Note**
>
> This policy is intended for deployment to Windows devices only.



9.6.2.6.2.1 MEMCM Client Health Rule Status example

A user has the ability to drill down into a segment, for example, to examine exactly which policy rules reported failures across all the devices for which it was deployed.

In our example, a member of the Nomad Administrator role wants to investigate why **Policy Rule Status** is showing as **Non-compliant** for 14.5% of the 16 assigned rules.

By clicking on the **Non-compliant** segment they open the Guaranteed State app on the **Rules** page which displays the associated rules, in this case these are:

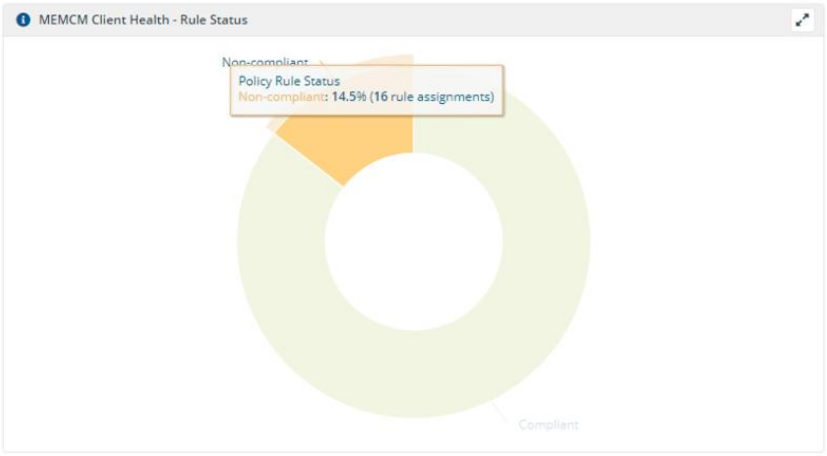
MEMCM Client FileCollectionSent

MEMCM Client IDMIFCollectionSent

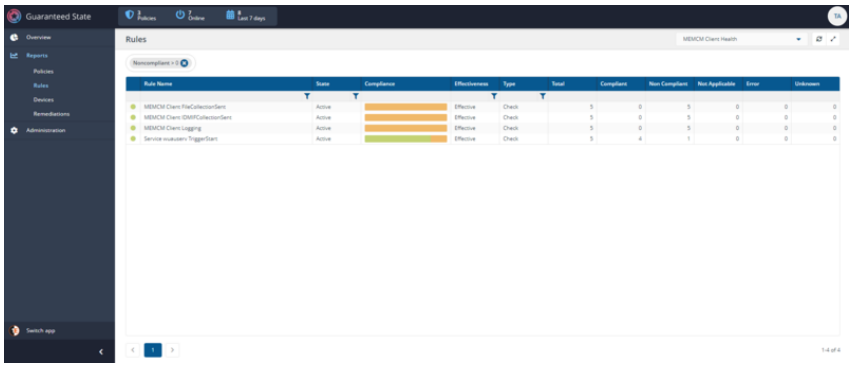
MEMCM Client Logging

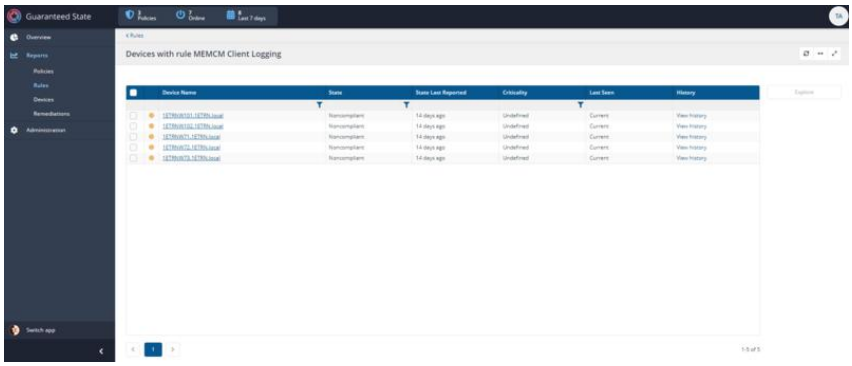
Service wuauserv TriggerStart.

You can reference a table showing the policies included in the **MEMCM Client Health Integrated Product Pack** at /document/preview/761891#UUID-54dc3ca7-e7a9-e8df-752b-d5229270d4a0.



In the Compliance column the Nomad Administrator sees there are no compliant computers for the Configuration Manager Client rules. From this point, they can click on the Compliance color bar for the Configuration Manager Client Logging Rule Name, and expose the individual devices affected.

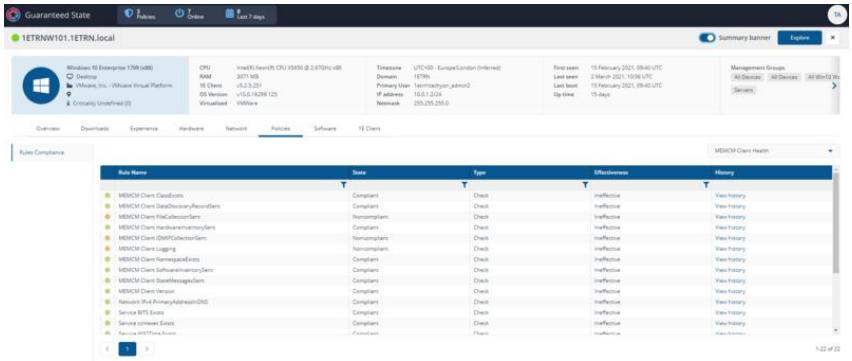




To assist troubleshooting the Nomad Administrator can click on a device name to see its Device View. This is the same view you can see in the Devices Page - Nomad Configuration in the Nomad app, but here it is focused on the Polices tab as the focus is in the Guaranteed State app, filtered on the **Configuration Manager Client Health** policy.

Note

Clicking the Device Status navigates to the **Devices** page in the Guaranteed State app filtered based on the chart segment clicked on. From the filtered **Devices** page, you can then explore an individual Device View as shown in the picture opposite.



9.6.2.6.3 Nomad Client Health Policy

Nomad is included as part of the 1E Client, and as part of that integration, we offer a Nomad client health compliance policy in Guaranteed State. This verifies common Nomad requirements such as ACP registration, disk availability, firewall exceptions, crash notifications and cache monitoring.

The Nomad client health policy replaces the client health tile in the Nomad dashboard plus additional remediation steps:

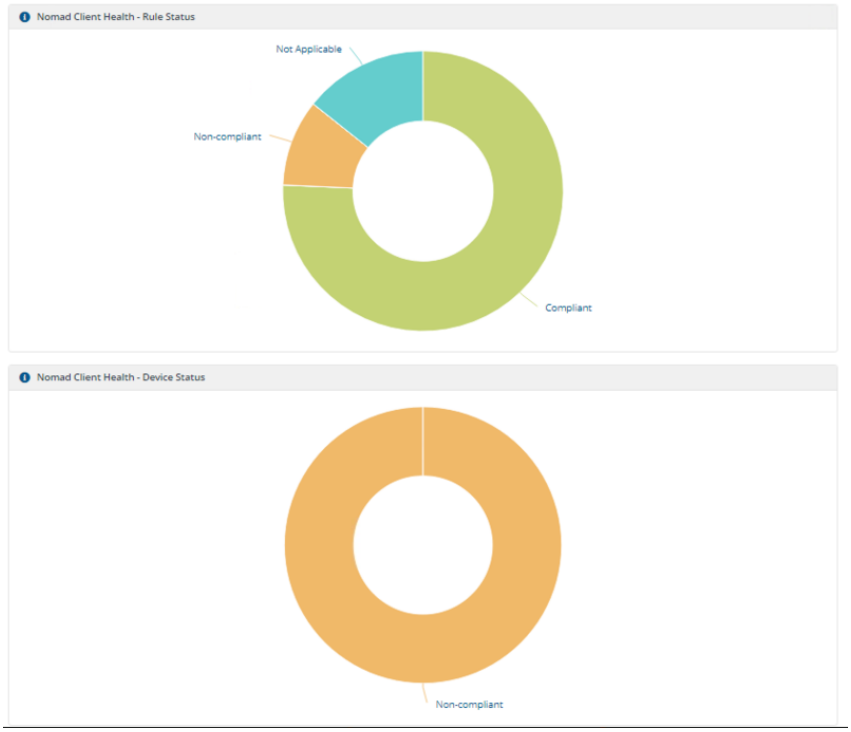
Keeps content distribution services up and running on Nomad clients, so that users are secure and productive

Ensures Alternative Content Provider (ACP) registration configuration is set

Maintains optimal disk availability and monitors cache size for storage capacity planning

Enforces Firewall exceptions.

> **Note**
>
> This policy is intended for deployment to Windows devices only.



9.6.2.6.3.1 Nomad Client Health Rule Status example

A user has the ability to drill down into a segment, for example, to examine exactly which policy rules reported failures across all the devices for which it was deployed.

In our example, a member of the Nomad Administrator role wants to investigate why **Policy Rule Status** is showing as **Not Applicable** for 14.3% of the 10 assigned rules.

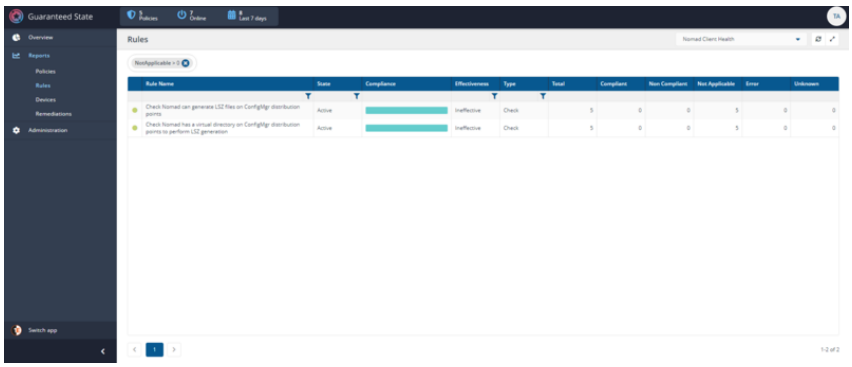
By clicking on the **Not Applicable** segment they open the Guaranteed State app on the **Rules** page which displays the associated rules, in this case these are:

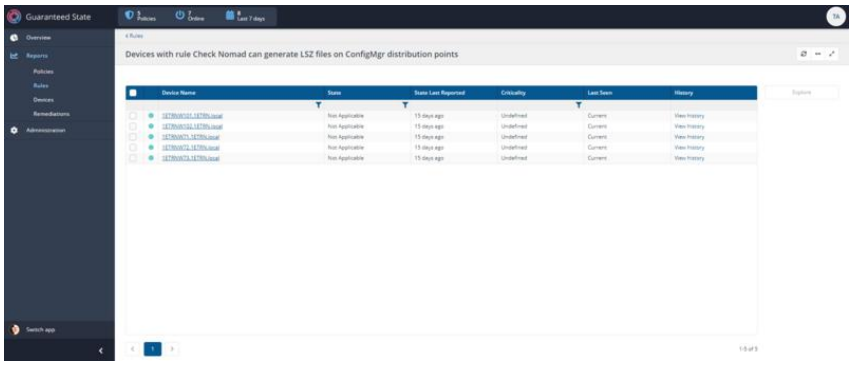
Check Nomad can generate LSZ files on ConfigMgr distribution points

Check Nomad has a virtual directory on ConfigMgr distribution points to perform LSZ generation.

You can reference a table showing the policies included in the **Nomad Client Health Integrated Product Pack** at /document/preview/761891#UUID-54dc3ca7-e7a9-e8df-752b-d5229270d4a0.

In the Compliance column the Nomad Administrator sees there are no compliant computers for the two Check Nomad rules. From this point they can click on the Compliance colour bar for the Check Nomad can generate LSZ files on ConfigMgr distribution points **Rule Name**, and expose the individual devices affected.

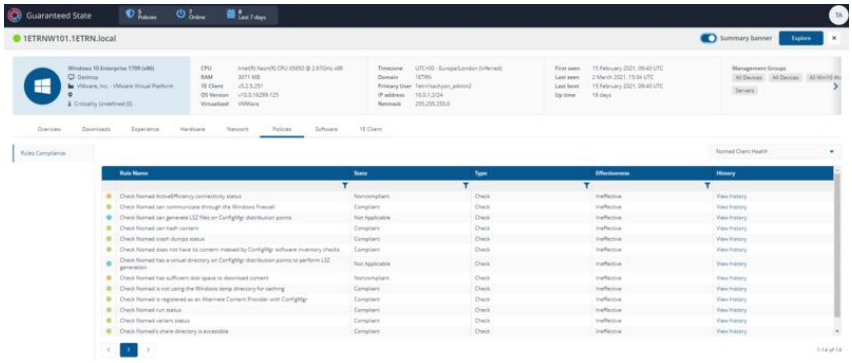




To assist troubleshooting the Nomad Administrator can click on a device name to see its Device View. This is the same view you can see in the Devices Page - Nomad Configuration in the Nomad app, but here it is focused on the Polices tab as the focus is in the Guaranteed State app filtered on the **Nomad Client Health** policy.

Note

Clicking the Device Status navigates to the **Devices** page in the Guaranteed State app filtered based on the chart segment clicked on. From the filtered **Devices** page, you can then explore an individual Device View as shown in the picture opposite.



9.6.2.6.4 Integrated Product Packs overview

Integrated Product Packs are Zip files containing Guaranteed State policies, but can also contain instructions (as an alternative to classic Product Packs which can only contain instructions).

You can upload these Zip files into Tachyon using the Tachyon Product Pack deployment tool, please refer to Uploading Integrated Product Packs for details.

1E provides a number of ready-made policies which are described on the Integrated Product Packs pages:

MEMCM Client Health Policy

Nomad Client Health Policy

Windows Client Health Policy

Tachyon Core Utilities.

These pages include lists of instructions, policies, rules, fragments (preconditions, checks, and fixes), and trigger templates. The lists have links to more detailed information about each pack in the Tachyon Product Packs reference.

You can also create your own policies using rules, fragments, and triggers from other Integrated Product Packs, for example, the Tachyon Core Integrated Product Pack.

9.6.3 Nomad tools

Tools that can help troubleshoot or configure Nomad.

Please also refer to Nomad command-line switches.

For Nomad OSD Tools, please refer to Installing Nomad Branch Tools.

9.6.3.1 Nomad Download Monitor

The Nomad Download Monitor tool (also known as NomadBranchGUI) is useful for administrators for troubleshooting downloads as they view the status of downloads on local and remote Nomad client devices.

Please refer to Installing the Nomad download monitor for details of how to install Download monitor in either **basic** or **advanced** mode.

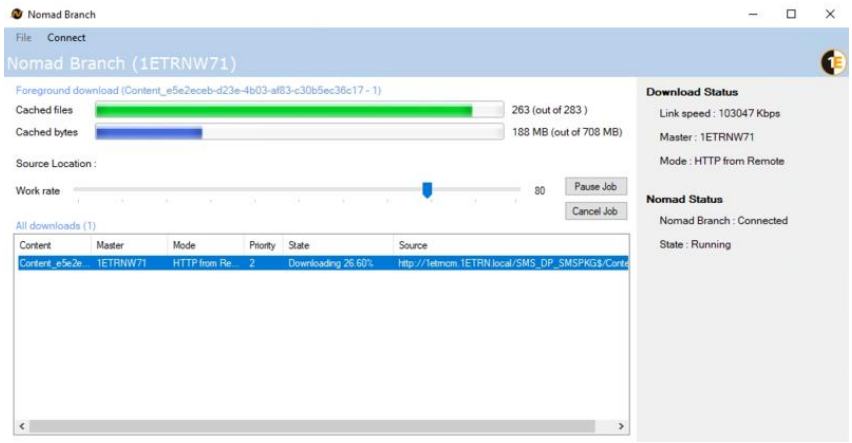
Mode	Description
Basic	You will only see progress bars in the UI. Useful for those who only need to see the status of the downloads.
Advanced	You will see an extended UI – useful for administrators to troubleshooting downloads as they can connect to remote devices to view the status of the downloads, provided they have sufficient Remote Activation DCOM permissions. By default, the Download Monitor connects to the local machine.

During a download, the NomadBranch dialog, provides you with feedback on its activities and lets you manage the impact of the download on the network link by giving you the opportunity to pause, resume or cancel it.

9.6.3.1.1 Feedback and actions

Feedback and actions	Description
Package ID	Name of the download package.
Cached files	The cached files progress bar shows the percentage of the total number of files in the package that have been downloaded. In this example, approximately a 92% of the files in the package have been downloaded. The figures at the end of the progress bar show this is exactly 263 files out of 283.
Cached bytes	The cached bytes progress bar shows the percentage of the total number of bytes in the package that have been downloaded. In this example, approximately a 26% of the total package has been downloaded. The figures at the end of the progress bar show this is exactly 188 MB out of 708 MB.
Source location	This field identifies the source of the download. In this example, the package is being downloaded using HTTP from the share, SMS_DP_SMSPKG$ For more details, refer to Peer copy over HTTP or HTTPS and PermittedLSZShares.
Work rate	The work rate slider determines the percentage of available bandwidth to use for the download. The default work rate is 80%.

Feedback and actions	Description
	For example, if you drag the slider all the way to the left (1%), it improves network availability as Nomad uses only 1% of the available bandwidth, but the drawback is that it increases the duration of the download. You can configure intra-day work rates (using MaxWorkRates) for the client to maximize the use of available bandwidth over the course of a day. Work rates only apply to transfers from a DP not to P2P transfers within a LAN, hence, it does not apply to Single Site Download (SSD) downloads.
Pause Job	Pauses a download in the queue or resumes it.
Cancel Job	Cancels a download in the queue.



9.6.3.1.2 Identifying the download to be monitored

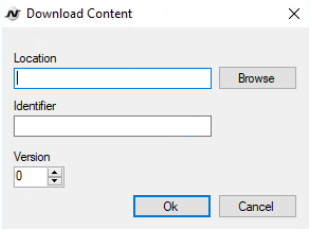
It is possible to kick off a standalone download from the **File→Download** menu. You must specify the parameters listed below in the dialog.

> **Note**
>
> We do not recommend this feature being used in any scenario other than by an Administrator during software evaluation or for troubleshooting purposes.

Download Content UI:

Parameter	Description
Location	The directory where the file is to be downloaded to. Click the **Browse** button to choose a location.

Parameter	Description
Identifier	The unique package ID for the download.
Version	The version for the package to be downloaded.

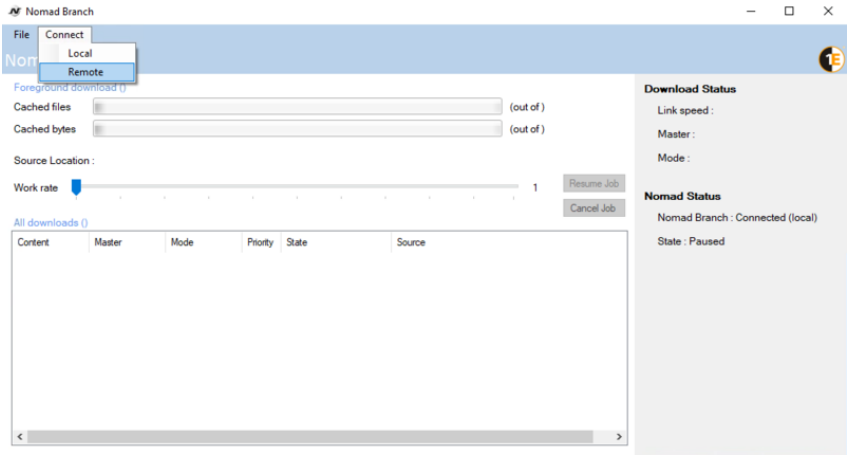


9.6.3.1.3 Connecting to a remote machine

You can only connect to a remote device if the **Download Monitor** on the client you are using has been installed in **Advanced** mode if it was installed in **Basic** mode, you can alter its behavior, for details refer to Installing the Nomad download monitor - Changing the behavior of the monitor.

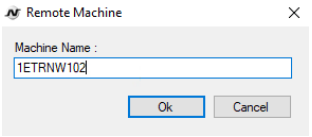
To connect to a remote device, on the system tray, double-click the **Download monitor** icon.

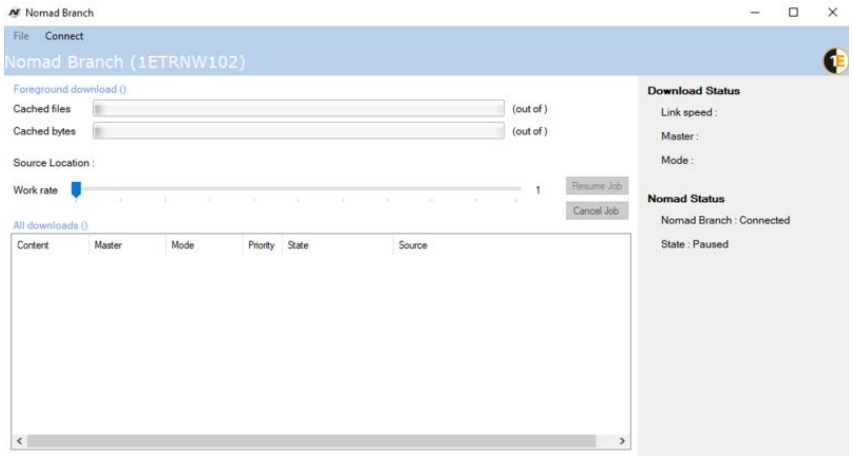
In the NomadBranch dialog, click **Connect** and choose **Remote**.



In the **Remote Machine** dialog, type the name of the machine you want to connect to, in our example this is **1ETRNW102**, alternatively, you can use its IP address. Click **OK**.

To disconnect from the remote device, click **Connect** and choose **Local**.





9.6.3.2 Nomad Baseline wizard

The Nomad Baseline wizard is used to create a Configuration Manager (CM) Baseline from the Configuration Manager console for settings related to Nomad. Baselines are used in Configuration Manager (CM) to help manage compliance settings. There are a number of reasons why you would create baselines for Nomad but specific examples include:

Using separate baselines to configure different settings for client machines and DP Servers

Defining baselines with specific settings to be applied to devices in a particular site or collection

Create different baselines to enable or disable Nomad features on devices in particular collections.

The Nomad Baseline wizard is accessible from the CM console and makes it easy to define Nomad related baselines. The files created by the wizard include a new Baseline and an associated Configuration Item that contains all the registry settings and rules used to apply Nomad registry settings.

Note

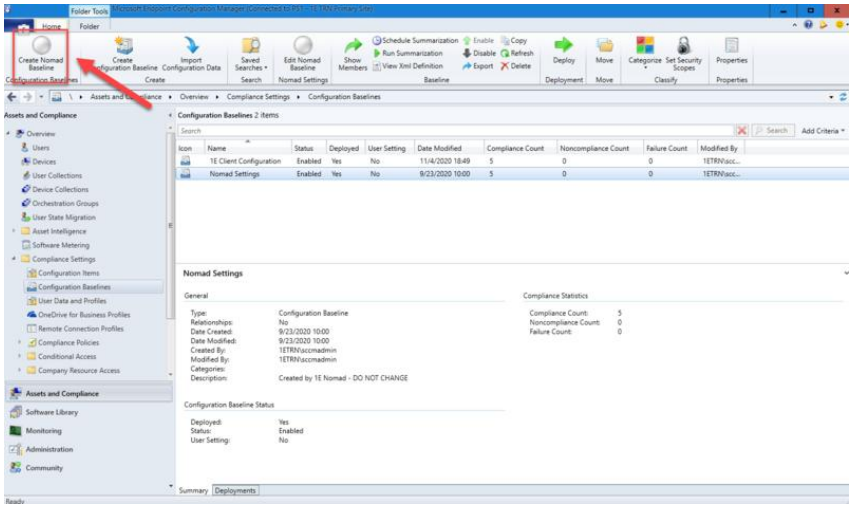
The user can choose whether to remediate or just monitor these values when deploying a particular baseline.

If the baseline is deployed just for monitoring, any non-compliance of the settings on CM clients will be reported as warnings to the server.

The evaluation or remediation of these settings depends on the interval selected in the baseline deployment.

9.6.3.2.1 Running the Nomad Baseline wizard

You can launch the Nomad Baseline wizard by clicking on the **Create Nomad Baseline** button in the **Configuration Manager→Assets and Compliance→Configuration Baselines** space.

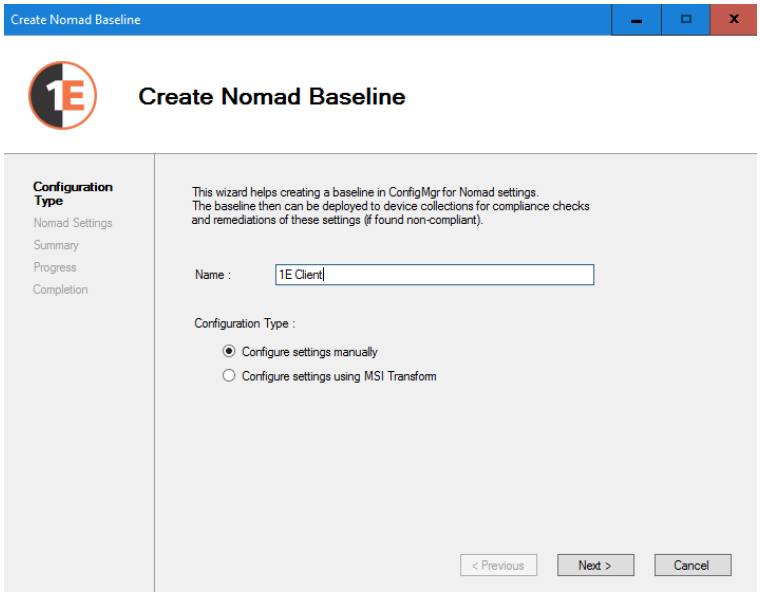


9.6.3.2.1.1 Configuration Type

The first screen of the wizard lets you define the name of the baseline and how the baseline will be populated.

You have two choices for **Configuration Type**:

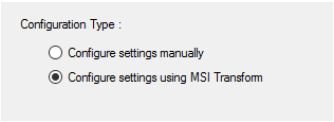
Option	Description
Configure settings manually	Select this option to populate the baseline from scratch using the screens in the wizard.
Configure settings using MSI Transform	Select this option to pre-populate the screens in the wizard by importing Nomad MSI and MST files. When this option is selected a new screen appears called **Import MST**. Before using this option you will need to have configured an MST file and have the associated Nomad installer file to hand.



9.6.3.2.1.2 Import MST

Note

This screen is only displayed if you selected the **Configure settings using MSI Transform** option on the **Configuration Type** screen.

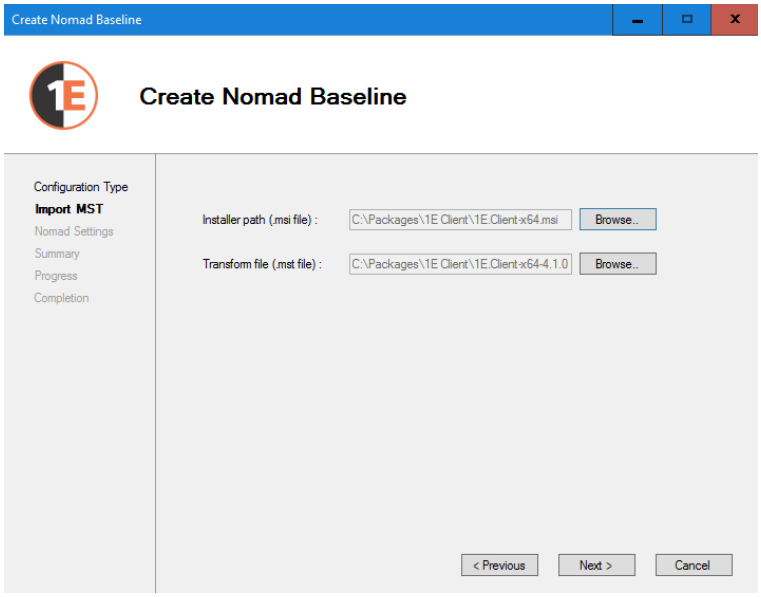


Click **Browse...** to the installer MSI file and the corresponding MST file for your chosen package.

By clicking **Next**, the wizard extracts the registry differences between the MSI and MST file and adds any corresponding rows to the **Nomad Settings** views.

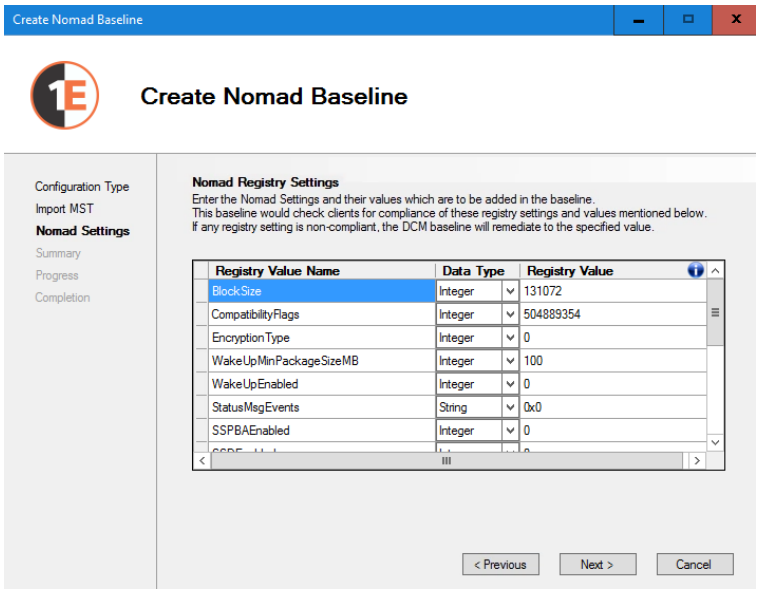
Note

Only the registry changes seen in the MST file are imported any other changes in the MST are ignored.

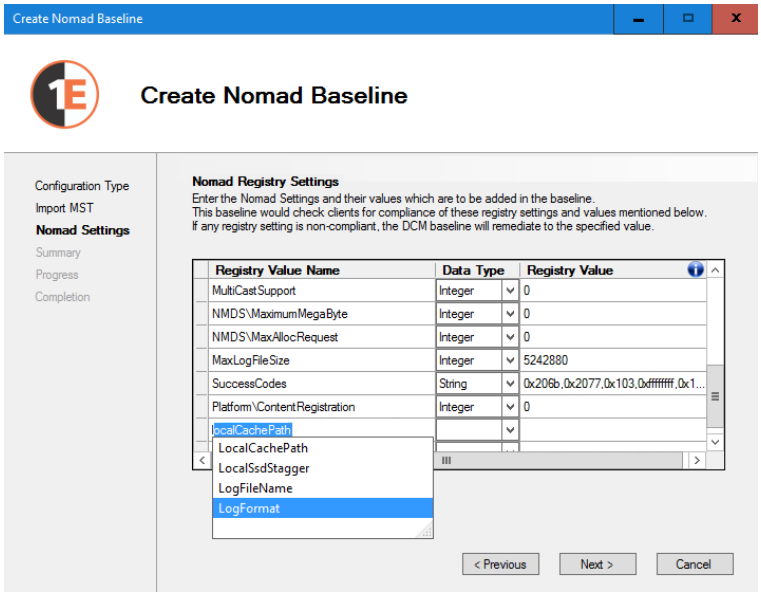


9.6.3.2.1.3 Nomad Settings

The **Nomad Settings** screen where the Nomad Registry Settings can be entered and edited.



To add a registry entry Type into the **Registry Value Name** field. The wizard provides suggestions for auto-completing the entry.



For integer values you can also enter hex numbers preceded by **0x**.

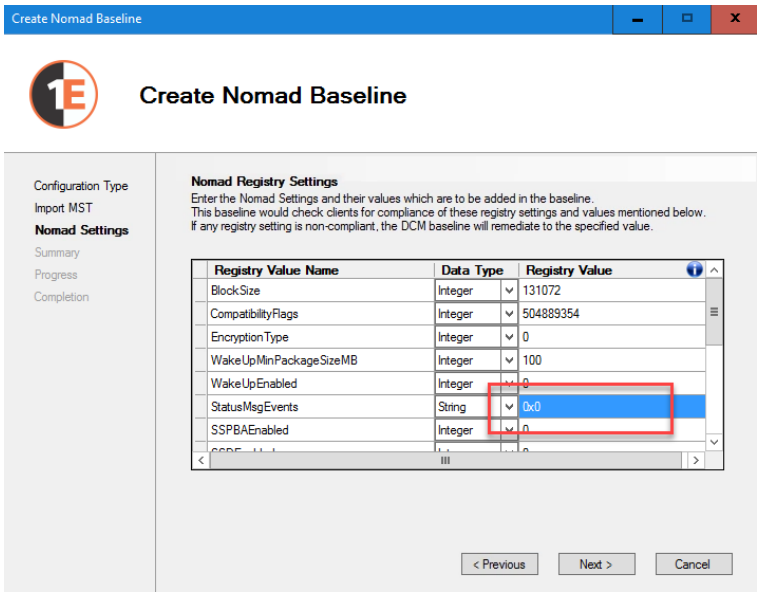
The **Nomad Settings** screen is validated by clicking the **Next** button.

The validations are:

Empty values not allowed

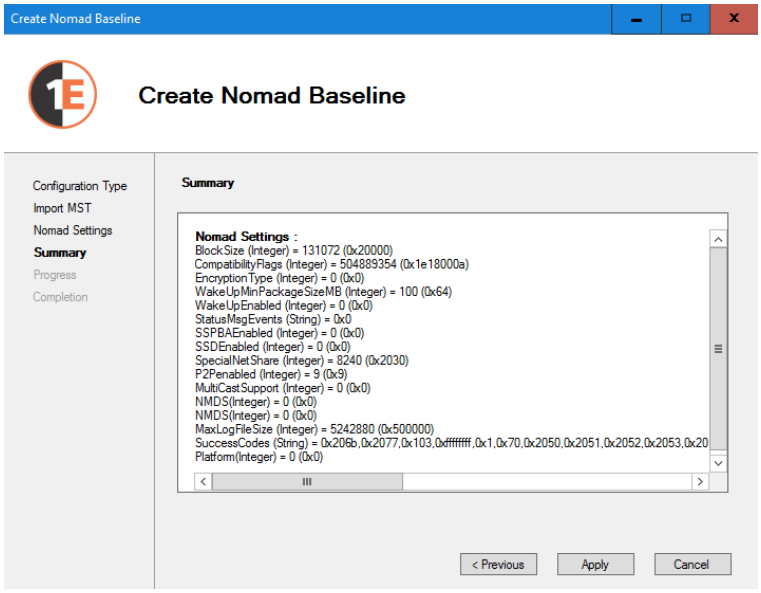
Duplicate Nomad registry settings are not allowed

When the data type is specified as an integer - only numbers (in decimal and hexadecimal format) are allowed.



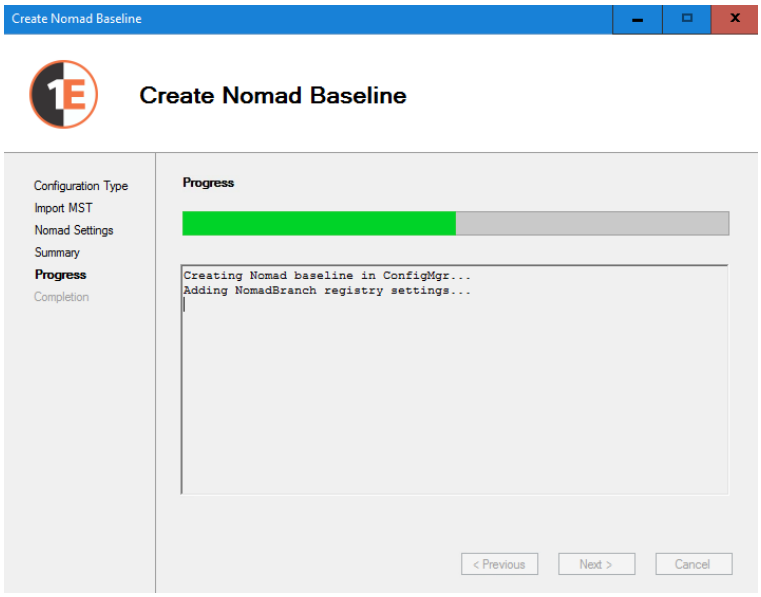
9.6.3.2.1.4 Summary

The **Summary** screen shows all the settings entered on the previous screens and lets you do a final review before clicking **Apply**.



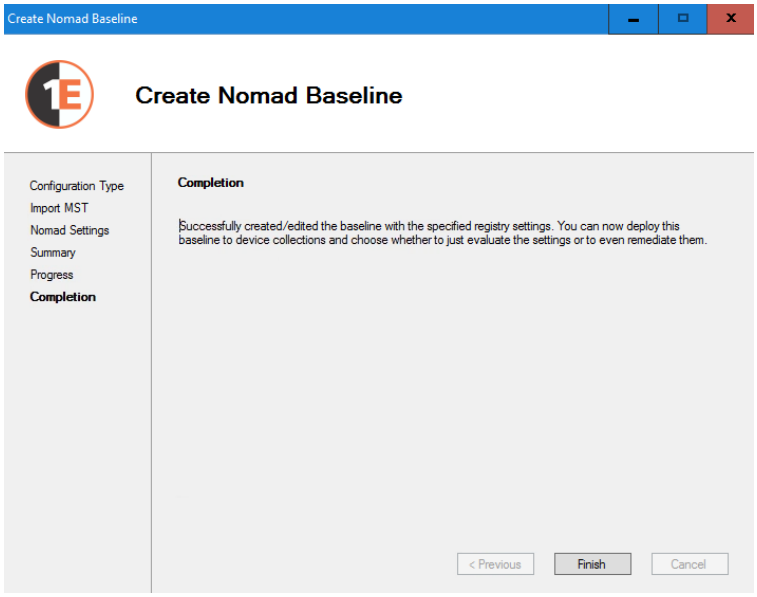
9.6.3.2.1.5 Progress

After clicking **Apply**, the wizard creates the Nomad Baseline in CM. This screen shows the current progress of the installation.



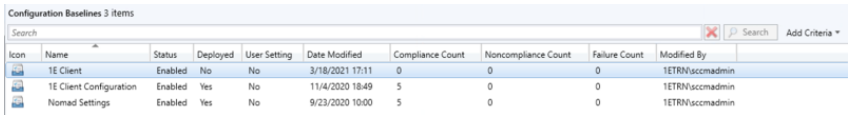
9.6.3.2.1.6 Completion

When the wizard successfully completes, you can deploy the baseline to CM device collections and choose whether to evaluate the settings or also remediate them.

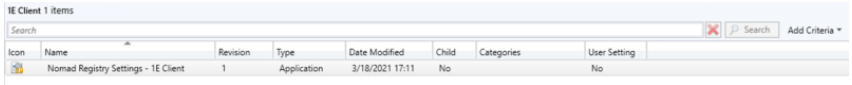


9.6.3.2.2 Nomad Baselines created in the Configuration Manager Configuration Baselines view

After clicking **Apply** on the **Summary** screen a baseline will be created with the settings made in the wizard.



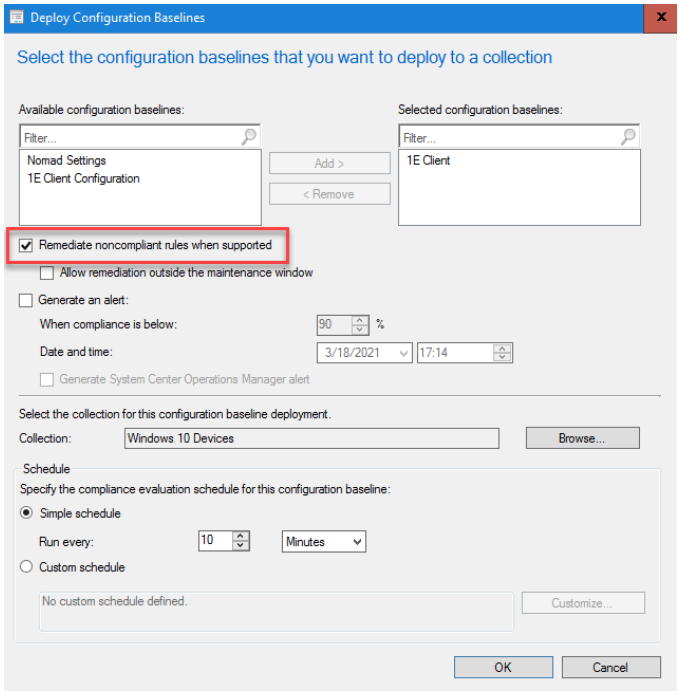
The created baseline will also contain a Configuration Item that defines the registry values and rules that determine what the baseline will remediate.



9.6.3.2.3 Deploying the baseline

The baseline created by the Nomad Baseline Wizard can be deployed to a device collection from the Configuration Manager console.

When the **Deploy Configuration Baselines** dialog is displayed you should check the **Remediate noncompliant rules when supported** checkbox if you want to remediate any values in the Nomad registry that vary from the baseline.



9.6.3.3 CacheCleaner

The downloaded content in the Nomad cache consume disk space, therefore management of the cache is critical. Because files may be re-used and distributed to other devices on the same subnet or site, the simple solution of deleting the files as soon as they have finished downloading and executing is not sufficient. Instead, Nomad has a cache cleaner utility that automatically but intelligently maintains control over the cache's disk usage.

Nomad cache is used in a number of deployment scenarios, for example scenarios and how you can monitor those deployments using the Nomad app refer to:

Deploying software with Configuration Manager

Deploying software in large networks

Deploying updates for Office 365

Using Nomad with Operating System Deployment OSD.

9.6.3.3.1 Cache clean cycle versus CacheCleaner

There are two ways to clean the cache:

The cache clean cycle - which runs automatically on a cycle and clears the unused content from the cache as a preference (default off).

The CacheCleaner and its cache cleaner rules - which is either run by Nomad during an active download or manually from the command-line.

CacheCleaner can be run when required in addition to the automated cache clean cycle, for example when reserving space for new contents to be downloaded by manually running it from

the command-line. CacheCleaner deletes content based on its priority and doesn't check its last usage date. So it is possible that content which is lower in priority but has been recently used, or is used regularly (like WIM files), may also get deleted when CacheCleaner runs. This mechanism therefore acts more as an emergency option to free up disk space but may result in the deletion of content that is likely to be used (which must then be downloaded again when needed). The cache clean cycle helps to maintain the low profile of the Nomad cache by removing content that is less likely to be used.

Both cache clean cycle and CacheCleaner methods are described in detail in:

Cleaning the cache using the cache clean cycle

Cleaning the cache using CacheCleaner.

9.6.3.3.2 Cleaning the cache using the cache clean cycle

The automated cache clean cycle runs automatically on a regular configurable interval. Nomad was designed to cache content that Configuration Manager has requested or that has been pre-cached using Content Distribution. Because of this the content accumulated in the Nomad Cache can become quite extensive, with a large degree of it no longer relevant or useful. For example, a Windows software update which has been superseded by a newer update is no longer relevant or useful and can be safely removed. The cache clean cycle helps to manage the Nomad cache, remove aged and irrelevant content and minimize its impact on the host machine.

The cache clean cycle is turned off by default, so the registry entries must be set before it will start to regularly clean the cache.

9.6.3.3.2.1 Configuration options

This option is configured by setting the following registry values or installer properties:

Registry Value	Default Value	Installer Property	Description
CacheCleanCycleHrs	0 (turned off)	CACHECLEANCYCLEHRS	The first automatic cache clean runs randomly between 10 to 60 mins of service start up. Subsequent cache clean cycles run after the number of hours specified. 0 means feature turned off. No cache cleaning cycle would run. Changing this registry entry performs an internal restart.

Registry Value	Default Value	Installer Property	Description
			The minimum value is 4. The maximum value is 168 (Once a week)
CacheCleanSubnetLookup	1 (turned on)	CACHECLEANSUBNETLOOKUP	Before deleting content, Nomad checks if it is on any other client in the same subnet, and will only delete local content if the same is present on at least one other client on the same subnet. To disable subnet lookup, set the value to 0. Its value can be 0 or 1. The default value is 1, subnet lookup is enabled. New setting introduced in 8.0.
MaxCacheDays	0 (turned off)	MAXCACHEDAYS	Set to delete application or package content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only application or package content that have triggered elections recently will be kept in the cache. 0 means that application and package content will not be deleted automatically when the cache cleaner runs.

Registry Value	Default Value	Installer Property	Description
MaxCacheDaysThreshold	0 (turned off)	MAXCACHEDAYSTHRESHOLD	This is the maximum number of days content is present on a client. If it's not zero, then content will be deleted without any other checks once it reaches the threshold. If the threshold has a value greater than zero and less than 30, Nomad uses the threshold of 30 days and creates an associated log. Default value is 0. New setting introduced in 8.0.
MaxPreCacheDays	0 (turned off)	MAXPRECACHEDAYS	Set to delete pre-cached content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only pre-cached content that has triggered elections recently will be kept in the cache. 0 means that pre-cached content will not be deleted automatically when the cache cleaner runs.
MaxSUCacheDays	0 (turned off)	MAXSUCACHEDAYS	Set to delete software updates that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs.

Registry Value	Default Value	Installer Property	Description
			This ensures that only software updates that have triggered elections recently will be kept in the cache. 0 means that software updates will not be deleted automatically when the cache cleaner runs.
DpCacheCleanupEnabled	0 (turned off)	DPCACHECLEANUPENABLED	Deletes all LSZ files in a Distribution Point (DP) cache whose content is no longer distributed, that is not present in ContentLib. To enable DP Cache Cleaner, set the value of registry to 1 (any value except for 0 enables this feature).

9.6.3.3.2.2 Cache clean cycle delete conditions

When the cache clean cycle runs, it will check the type of each content and the last election date associated with it. There are four main types of content, and these will be marked for deletion if the following delete conditions are true:

Content type	Delete condition
Pre-cached	last election date + MaxPreCacheDays > cache clean cycle run date
Application or package	last election date + MaxCacheDays > cache clean cycle run date
Office 365 update byte-range	last election date + MaxSUCacheDays > cache clean cycle run date
Software updates related to SMSTSNomad jobs	

The cache clean cycle will then also check the following, for all content other than Office 365 update byte-ranges:

The content should be present on at least one of the Nomad subnet peers with an equal or a higher percentage of content

The network has broadcasts enabled

If both of these conditions are also true, the content will be deleted.

9.6.3.3.2.3 Caveats

The following points describe various caveats related to the way that the cache clean cycle works:

If pre-cache content is deleted by the cache clean cycle, but the corresponding pre-caching job still exists, Content Distribution will send the download notification again to the client

> **Note**
>
> If your Nomad policy is to not delete pre-caching jobs, you should turn off deletion of pre-cached content by setting the MaxPreCacheDays registry value to 0.

Application upgrades and uninstallation via Software Center require content to be present on the machines (the current version is required for uninstallation and the previous version is required for upgrade scenarios). If the content has been deleted by the cache clean cycle, the content would be downloaded again at uninstall or upgrade time. Because of the way that the cache clean cycle delete conditions are applied Nomad retains one copy of the content per subnet, so even if such a download request comes the content would be downloaded from a Nomad peer and not a DP

ByteRange content is not checked to be present on subnet peers

Cache optimization does not work for content that is to be activated later on

Cache optimization does work on Sensitive Servers.

9.6.3.3.3 Cleaning the cache using CacheCleaner

To maintain the cache Nomad uses a set of basic rules that lets you decide the cache's effect on overall disk usage and performs automatic cleaning when necessary. When a job is advertised, automatic cache cleaning could occur under the following circumstances:

If the percentage of available disk space is less than the PercentAvailableDisk setting after downloading an incoming package, according to its download package size, automatic cache cleaning is initiated before the download takes place

Nomad then assesses how much space could be cleared by deleting cache folders that are eligible for deletion. A cache folder is deemed eligible for deletion if its cache priority value is lower than or equal to the cache priority value of the incoming package. The cache priority value is set on the Nomad command-line using the pc argument, or set in the Nomad properties page when using Configuration Manager. By default, if no value is specified, packages have a cache priority of 1

If the assessment determines there would still not be sufficient space available: no deletion will take place, the download is aborted and an error logged, which may be one of:

Insufficient disk or cache space available to download the Program...

Insufficient cache space available to achieve a Max Cache Size of X

If the assessment determines there would be sufficient space available in the cache: the folders are deleted in order according to their cache priority until the required disk space is available.

9.6.3.3.3.1 Cache cleaner and Configuration Manager

When Nomad is used with Configuration Manager the cache cleaner will also:

Purge linked contents from the Configuration Manager cache

Purge older versions from the Configuration Manager cache before downloading the content for a newer version.

The cache cleaner mechanism also works with the priority job control to ensure that suspended lower priority job caches are not cleaned to make way for the higher priority job unless absolutely necessary.

9.6.3.3.3.2 Command-line switches

CacheCleaner is an executable that can be used to explicitly purge the Nomad cache. By default, the Nomad cache is not purged unless there is an active download. In most cases, available disk space is not really an issue, but there may be circumstances where you may want to manage the cache to keep the disk usage overhead to a minimum. Please refer to Cache management for further information about managing the cache.

It is installed as part of Nomad and the format of the command-line is:

```
CacheCleaner.exe -switch
```

Where *switch* is one of the following (case sensitive):

Switch name	Default value	Range	Description
-CachePriority	1	1-9	Only cache contents with a priority equal to or lower than the *CachePriority* are purged. Used in conjunction with *Pkgsize*to emulate the behavior of the cache cleaner when an actual package is being downloaded.
-Debug			Sets the debug level for *CacheCleaner* and it can be passed on the command-line. If it is not, the value from Nomad registry is used. If Debug is already defined, using this argument adds to the logging level.
-Deleteall			Deletes all cache content where the priority is less than or equal to the value for Force. If the

Switch name	Default value	Range	Description
			command-line does not include *Force*, then *Deleteall* deletes all cache content where the priority is 1. Works in conjunction with the *Force* .

-DeletePkg			The ID of the package or content to be deleted from the cache. The value must be set to the PackageID or ContentID string that identifies the content to be deleted. Must be used in conjunction with *PkgVer* .
			
			`-DeletePkg=PRI0000A -PkgVer=*`
			
			`-DeletePkg=Content_9b9ccd56-9fbf-4587-98e7-725fcfa8e70f -PkgVer=*`

-Force			Content whose cache priority is less than or equal to the *CachePriority* value are purged. Used in conjunction with the *Deleteall* and *MaxCacheAge*.
-MaxCacheAge		1-1461	The maximum number of days before the contents of a cache is purged. If set, *CacheCleaner* deletes cache contents which are older than this value. This argument is ignored if *DeletePkg* and *Deleteall* is used on the command-line. If the command-line includes *Force* , all caches with a priority less than or equal to *CachePriority* will have their content purged. If *CachePriority* is not included on the command-line, all caches with a priority=1 will have their content purged.
-PercentAvailableDisk	10	1-99	Deletes the lowest cache priority content until the set percentage of available disk is available.
-Pkgsize			Only caches with a priority equal to or lower than the *CachePriority* value will have their contents purged. Used in conjunction with *CachePriority* to emulate the behavior of the cache cleaner when an actual package is being downloaded.

Switch name	Default value	Range	Description

			Determine the space to be cleared when running *cachecleaner.exe* with *PercentAvailableDisk* . The *PkgSize* value is by default specified in bytes but can be set to MB by appending MB to the value.
			
			For example, the following are equivalent:
			
			`-Pkgsize=1048576`
			`-Pkgsize=1MB`

-PkgVer			Identifies the content version to be deleted and must be used in conjunction with *DeletePkg* . Deletes content from both the Nomad and Configuration Manager client caches that corresponds to the version number and the Package ID (or Content ID). The special value -PkgVer=* may be used when the user is unsure of the specific version of the package in the cache. **Note** Setting -PkgVer=* will delete any version of the content with the ID specified in the DeletePkg argument from the Nomad cache only – it will not delete from the Configuration Manager client cache. **Note** If you want to remove A*pplication or Software Updates content*, then the -PkgVer will usually need to be set to "1".

Note

If the Nomad cache is deleted while another client is accessing it, the other client will recover by downloading directly from the DP. This is by design and ensures recovery occurs in order to complete a successful download.

9.6.3.3.3.3 CacheCleaner examples

In the following examples, there is no requirement to specify the path to CacheCleaner.exe because the path to Nomad executables is set in the PATH environment variable:

Example	Description
Set the cache cleaner to run as a Configuration Manager program.	You can set the cache cleaner to run as a Configuration Manager program and advertise it to all Nomad systems in a single operation. You can also schedule this as a regular housekeeping job, ensuring that the cache is kept under control automatically. To purge the cache when the total free disk space is at 20% run: `CacheCleaner.exe –PercentAvailableDisk=20`
Ensure that content in the cache is not kept for more than 30 day.	To ensure that content in the cache is not kept for more than 30 days, run: `CacheCleaner.exe –MaxCacheAge=30`
Delete a particular package and version.	To delete a particular package and version, run: `CacheCleaner.exe –DeletePkg=L0A00001 –PkgVer=1`
Purge the contents of a cache with a priority of 3 or lower.	To purge the contents of a cache with a priority of 3 or lower, run: `CacheCleaner.exe –DeleteAll -Force=3`
Purge the contents of a cache with a particular priority and size.	To purge the contents of a cache with a particular priority and size, run: `CacheCleaner.exe –PkgSize=10485760 –CachePriority=6`

9.6.4 Nomad OS Deployment task sequence actions

Nomad support for Configuration Manager OS Deployment.

Nomad task sequence actions are described in greater detail in the following pages.

9.6.4.1 1E Nomad task sequence actions

Please click on a link for more information about a custom task sequence action and its configuration.

9.6.4.1.1 Additional task sequence actions

Below is an additional standard action required by 1E OSD task sequences, that does not exist (yet) out-of-box action when **Nomad OSD Tools** is installed.

9.6.4.1.1.1 Reset Nomad Cache

Ensures the Nomad cache is located on the correct partition. This action is necessary after repartitioning the disk.

You must manually create this step using **Add > General > Run Command Line**.

Parameter	Value
Name	Reset Nomad Cache
Command line	cmd /c md %SMSTSLocalDataDrive%\ProgramData\1E\NomadBranch && cmd /c reg add HKLM\Software\1E\NomadBranch /v LocalCachePath /d %SMSTSLocalDataDrive%\ProgramData\1E\NomadBranch\ /t REG_SZ /f

9.6.4.1.2 Set Nomad as Download Program

Sets *SMSTSNomad.exe* as the download program during a task sequence. This is accomplished by setting the *SMSTSDownLoadProgram* task sequence variable to *SMSTSNomad.exe*.

This custom action is available in the 1E Nomad task sequence actions.

> **Note**
>
> We recommend that this is the first action to be run in the task sequence.

SMSTSNomad.exe supports the use of Configuration Manager's **OSDDownloadContent.exe** directly from a Run Command Line step in a Task Sequence, as well as the previously supported **Download Package Content Native** Configuration Manager Task Sequence Step. No additional configuration is required to make this work. NomadBranch.exe supports SMSTSNomad.exe.

Nomad leverages the Configuration Manager SMSTSDownloadProgram task sequence variable. When this variable is set to the path to an executable, the task sequence engine calls the executable whenever it has to download some content. For this to work effectively, Nomad uses SMSTSNomad.exe.

To avoid the overhead of having to manually set the SMSTSDownloadProgram variable to SMSTSNomad.exe in your task sequence, use the custom task sequence action Set Nomad as Download Program. The following are the content types that are supported by SMSTSNomad.exe:

Packages

OS Images

Boot Images

Applications

Driver packages

Drivers (via Auto apply drivers TS action).

Action	Notes
When run, this task:	This task sequence action:
Sets *SMSTSNomad.exe* as the download program for the duration of the task sequence.	Recommended as the first action to run in the task sequence so that any content required during all the subsequent actions uses Nomad as the download provider.

9.6.4.1.2.1 Configurable parameters

Parameter	Default value	Description
Name	Set Nomad as Download Program.	The name for the custom task sequence action.
Description	Action to set Nomad as Download Program.	The description for the custom task sequence action.
Always return success	Checked.	Checking this option will set Nomad to return a success even when a download fails. This is useful to prevent failing over to BITS.
Allow downloads from cloud distribution points	Not checked.	Checking this option allows Nomad to download content from cloud DPs. Please refer to the notes below about the limitations of this feature.

9.6.4.1.2.2 Allow downloads from cloud distribution points

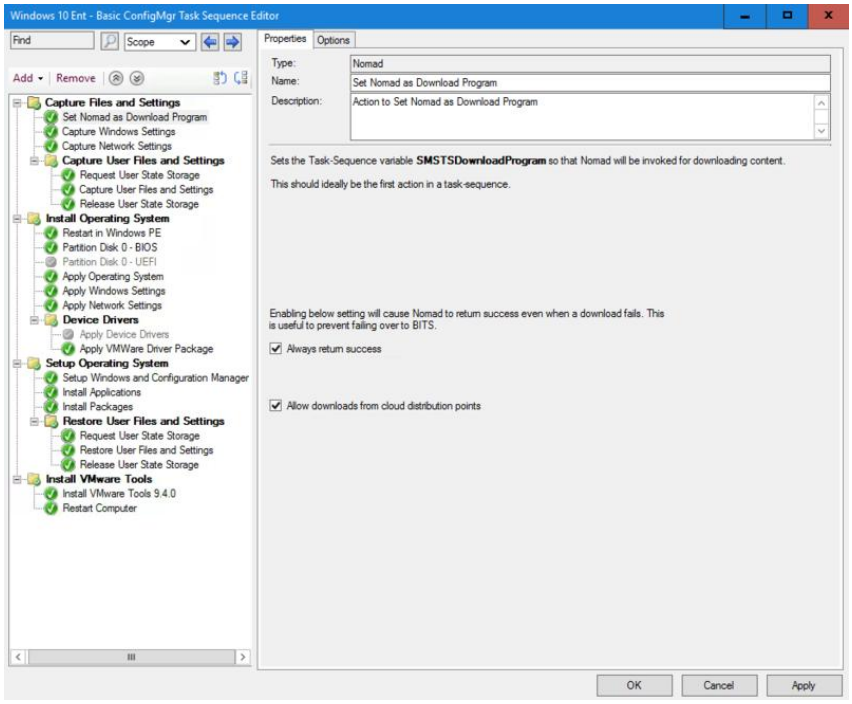
This feature was introduced in Nomad 8.1 to allow them to work around a limitation in Configuration Manager where downloading content from the cloud is not officially supported for third-parties. The feature also works in WinPE.

This feature is not supported on clients older than Nomad 8,1, where the step will fail with error 42. If you have older clients, then you should:

On the **Set Nomad as Download Program** step, enable the option **Continue on Error.** This will allow the step to work as required, except older clients will not download from a cloud DP.

Add a new custom step immediately after, called **Validate Nomad as Download Program**, that runs the following command line, and includes **Success codes 0 3010 42**. This will fail for any other return codes, and ensure any errors reported by Nomad 8.1 clients will stop the Task Sequence as normal.

```
cmd /c exit %_SMSTSLastActionRetCode%
```



9.6.4.1.3 Create Nomad Application Policy

Creates a Nomad application policy and is used in a task sequence during the provisioning phase prior to any applications being installed. It uses the NomadPackageLocator.exe command-line switches tool to enable Nomad to be used as an Alternative Download Provider during provisioning. When the application policy is no longer required it can be removed using the Delete Nomad Application Policy action.

This custom action is available in the **1E Nomad task sequence actions**.

Actions	Notes
When run, this task: Creates the Nomad application policy and enables subsequent application downloads to use Nomad as an alternative download provider.	This task sequence action: Only applies to OSD task sequences and must be run during the Setup Operating Systems phase specifically after the Setup Windows and Configuration Manager action of the task sequence prior to any applications being installed.

9.6.4.1.3.1 Configurable parameters

Parameter	Default value	Description
Name	Create Nomad Application Policy.	Name for the custom task sequence action.
Description	Action to create Nomad Application policy.	Description for the custom task sequence action.

9.6.4.1.4 Delete Nomad Application Policy

Deletes a Nomad application policy previously created using the Create Nomad Application Policy action. It uses the NomadPackageLocator.exe command-line switches tool to remove the previously created Nomad application policy.

This custom action is available in the **1E Nomad task sequence actions**.

Actions	Notes
When run, this task:	This task sequence action:
Deletes the Nomad application policy	Only applies to OSD task sequences and should be run during the Setup Operating System phase of the task sequence after all applications have been installed.

9.6.4.1.4.1 Configurable parameters

Parameter	Default value	Description
Name	Deletes Nomad Application Policy.	Name for the custom task sequence action.
Description	Action to delete Nomad Application policy.	Description for the custom task sequence action.

9.6.4.1.5 Install and Configure Nomad in WinPE

Installs and configures Nomad in WinPE. Typically, to support the use of pre-staged content.

This custom action is available in the **1E Nomad task sequence actions**.

Actions	Notes
When run, this task:	This task sequence action:

Actions	Notes
Creates the Nomad registry values and sets the parameters passed from the task sequence action.	Is specifically for use in WinPE and requires *NomadBranch.exe*, *SMSNomad.exe* and *SNOttfps.dll* to be added to the WinPE image (the *NomadBranchTools.msi* in Configuration Manager does this automatically).
Disables the firewall in the WinPE environment if set in the task sequence action.	Must be set as one of the tasks following Restart in Windows PE and before Apply Operating System.
Self-installs Nomad.	
Configures registry COM.	
Enables multicast if set in the task sequence action.	
Starts the Nomad service.	

9.6.4.1.5.1 Configurable parameters

Parameter	Default value	Description
Name	Install and Configure Nomad in WinPE	Name for the custom task sequence action.
Description	Action to Install and configure Nomad in WinPE	Description for the custom task sequence action.
Workrate	80	Sets the work rate. This is the proportion of available (free) bandwidth to use.
P2P Port	1779	Port used to broadcast election messages.
SpecialNetShare	8224 (0x2020)	Must be an integer. See more SpecialNetShare for more information.

Parameter	Default value	Description
P2PEnabled	9	Must be an integer. See P2PEnabled for more information.
P2P Http port	5080	This option is only available if HTTP P2P has been enabled in P2PEnabled. It defines the port used for Nomad P2P communication over HTTP and must be the same value used on all Nomad clients.
P2P Https port	5443	This option is only available if HTTPS P2P has been enabled in P2PEnabled. It defines the port used for Nomad P2P communication over HTTPS and must be the same value used on all Nomad clients.
Use PKI cert for client auth	Disabled (unchecked)	Enables certificate-based client authentication, which requires a PKI-issued certificate. Selecting this option sets bit 0x2 of P2PSslSettings.
Use PKI cert for server auth	Disabled (unchecked)	Configures Nomad to use a PKI certificate for server authentication when HTTPS P2P is enabled (bit 0x40 set in P2PEnabled). If this option is not checked and bit 0x40 in P2PEnabled is set, Nomad will use a self-signed certificate for server authentication.
Compatibility Flags	0x210000A	Must be an integer. See CompatibilityFlags for more information.
Log file size	10485760 (10MB)	Sets the maximum size for the Nomad log file.
MADCAP scope		MADCAP scope for multicast. Either a scope name, or of the form *<MADCAP_ServerIP>,<MADCAP_Scope_IP>,<TTL>* or *<MADCAP_ServerIP>, <MADCAP_Scope_IP>*. See MultiCastMADCAPScope for more information.
Multicast TTL		Optional multicast time to live. See MultiCastMADCAPScope for more information.
Disable firewall	Enabled by default.	Disables the Windows PE firewall so that NomadPackageLocator and Nomad can communicate with other peers on the local network.

Parameter	Default value	Description
Use FIPS Encryption	Disabled (unchecked)	Sets EncryptionType to 0x1 (FIPS compliant encryption). This must be the same on all Nomad clients.
Enable Single Site Download	Disabled (unchecked)	Enables the SSD feature. For Nomad running in WinPE, sets the SSDEnabled registry value to 0x1 so that SSD is enabled, but the device will be set to just retrieve downloads via SSD and not to put themselves forward to provide content.
Max. machines from 1E Platform	10	The maximum number of devices (i.e. machines) with the content (package, application or software update) that Nomad can retrieve from Content Distribution in one call. The maximum value is 20.
1E Platform Background Channel URL List	""	This is a list of URL containing each of the Tachyon Platform Background Channels in your organization, and is normally the same list as used by your 1E Client devices. Please refer to #UUID4b0c8700283e161c08696047Occ47bc0_id_TachyonclientsettingsBackgroundChannelUrl. **Note** Nomad clients connect to Content Distribution via Tachyon Switches and a proxy feature of Background Channel.

9.6.4.1.5.2 Non-Configurable settings

Setting	Default value	Description
P2PElectionWeight	10	Helps determine the outcome of Nomad elections. The higher the value, the more chances the device has to win the election.
EncryptionType	0	Determines the type of encryption used by Nomad for communications between Nomad peers.
DPNotAvailableCodes	0x205A, 0x205D	This registry entry contains a comma-separated list of return codes, see Nomad return codes for a list of the possible ones. If Nomad encounters one of these during download, it will attempt a retry from an alternative DP. It gets the list of possible DPs from Configuration Manager. The two return

Setting	Default value	Description
		codes set as default are the only ones that are applicable to DP availability: 0x205A – in valid special package path (set using *--pp*) 0x205D – DP path not found Under normal circumstances, you would not change this from the default value. You may want to not allow failover to an alternative DP altogether, in which case you would set the value to " " in the registry. Or you may only want to fail over if the DP path was not found, in which case you would set the value to 0x205D only.

9.6.4.1.6 Save Nomad Cache

Saves the Nomad cache either in WinPE or a full Microsoft Windows operating system. It copies, links or moves previously downloaded content to the protected task sequence runtime folder so that it is not deleted by the standard **Apply Operating System** task sequence action.

> **Note**
>
> When used in WinPE the Install and Configure Nomad in WinPE action must be run first.

This custom action is available in the **1E Nomad task sequence actions**.

Actions	Notes
When run, this task: Locates the Nomad cache on the local drive. Deletes the Configuration Manager cache if the Wipe CCM Cache checkbox is checked in the task sequence action Properties.	This task sequence action: Must be performed after the last Pre-stage Content Using Nomad typically before the Apply Operating System action and, or prior to booting into WinPE if performing an OS refresh. Save Nomad Cache does the following: **Save Nomad Cache** preserves the Nomad log files long with the contents of the Nomad cache. They are restored again after the OS has been deployed when **Restore Nomad Cache** runs. **Save Nomad Cache** also appends a time stamp to the name of the Nomad log files to prevent any possibility of name conflicts during the subsequent **Restore Nomad Cache** step. **Save Nomad Cache** only copies/moves the downloaded content. Specifically it only copies folders that end with the _Cache suffix

Actions	Notes
	that contain the downloaded packages and any associated .LSZ or .LST files. All other content is left behind. This minimizes any chance of name conflicts during the subsequent **Restore Nomad Cache** step. The first time it runs, **Save Nomad Cache** modifies the active Nomad cache location to point into the SMSTaskSequence protected directory. Any subsequent downloads with then go directly into the protected location, removing the need for any further Save Cache Action steps.

9.6.4.1.6.1 Configurable parameters

Parameter	Default value	Description
Name	Save Nomad Cache	The name for the custom task sequence action.
Description	Action to save Nomad cache prior to cleaning the disk	The description for the custom task sequence action.
Operation	Move	May be set to one of Copy, Move and either copies the cache contents to the new location, moves the cache contents to the new location or links the new location to the existing cache location.
Wipe CCM Cache	Enabled by default.	When checked, it sets the action to delete the Configuration Manager cache. **Note** Only works if Configuration Manager is using default locations for the CCM Cache.

Note

The Alternate Cache Path parameter was only required when using redirect, and since redirect is now deprecated the parameter has been withdrawn.

9.6.4.1.7 Restore Nomad Cache

Restores the Nomad cache in the new Operating System during provisioning after the 1E Client has been installed with the Nomad module enabled. This action only needs to be included in the task

sequence if Save Nomad Cache is run prior to applying the new Operating System. Refer to Stage 1E Client Package and Install 1E Client for details on how to install the 1E Client in the task sequence.

This custom action is available in the **1E Nomad task sequence actions**.

Actions	Notes
When run, this task: Reads the Nomad cache location from the registry. Activates all packages in the cache if the **Activate All** Content checkbox is checked in the custom task sequence action properties. By default, this checkbox is unchecked.	This task sequence action: The 1E Client must be installed with the Nomad module enabled prior to executing the **Restore Nomad Cache** action when the **Activate All** option is enabled.

9.6.4.1.7.1 Configurable parameters

Parameter	Default value	Description
Name	Restore Nomad Cache.	Name for the custom task sequence action.
Description	Action to restore Nomad cache post operating system deployment.	Description for the custom task sequence action.
Operation	Link	May be set to one of Copy, Move or Link and either copies, moves or links the *%SMSTSMDataPath%\NomadBranch*location to the existing cache location. **Note** For Link, only a hard link is supported so the Nomad cache and *%_SMSTSMDataPath%* must be in the same file system.
Activate All Content	Disabled by default.	If this option is enabled, Nomad validates all content in the Nomad cache and may take some time to complete. The 1E Client must be installed prior to executing the Restore Nomad Cache step when this option is enabled. Activating the content requires the 1E Nomad Branch service to be running, so when

Parameter	Default value	Description
		this option is selected the step will check every 10 seconds until the service is available. If it does not start within 10 minutes, the step will fail. Without the **-ActivateAll** option selected, Nomad validates content as it's needed, and so speeds up the OSD process. Any non-activated content will not be available to other computers. It's possible to run **NomadBranch.exe -ActivateAll** as a command-line as a separate thread (so the actual OSD task sequence executes as fast as possible).

Note

The Alternate Cache Path parameter is no longer required as Nomad will read the cache location stored in the Nomad registry (and since we recommend applying this step after Nomad has been installed in the new OS, any alternative path to the default will automatically be picked up and used).

9.6.4.1.8 Get Migration Settings

Provides support for optional encryption in Nomad PBA, and Provides computer association details in 1E Application Migration. Used in computer **Replace** and **Refresh** (Wipe and Load destructive and non-destructive) scenarios, it is configured to run under either the capture phase or the restore phase, depending on the scenario.

Note

It is independent of 1E Nomad PBA task sequence actions but is designed to be used in conjunction with them.

This custom action is available in the **1E Nomad task sequence actions**.

	When run, this task: Provides an encryption key to the task sequence action by querying Configuration Manager for a computer association or by generating one itself. Makes the name of the source machine available during a restore by relying on its name stored in the computer association. The end result of successful execution is the following three variables are set: OSDStateEncryptDecryptKey PBAComputerName
Actions	SourceComputerName
Context	Get Migration Settings integrates with Nomad Peer BackUp Assistant (PBA), providing a cryptographic key that can be used to secure captured user data stored on a PBA host. For WSA type deployments, it is also possible for user data to be encrypted and stored onto USB media, if PBA is not available. Step behaviour will depend on user requirements and deployment scenario. Before describing the operation of Get Migration Settings fully, a brief explanation of the different deployment scenarios in which the step operates is provided. *Replace Scenarios* This is where the user is being migrated to new or replacement hardware. A computer association in ConfigMgr is a native object that defines the logical relationship between the old and new computer. When the computer association is created in the site, an encryption key is automatically created and stored in the site database. In this scenario, the step will attempt to identify the appropriate computer association in order to obtain the key. For non-WSA type deployments, the presence of a valid computer association is mandatory and the step will fail if it is not found. WSA deployments also allow users to enter the name of the new computer at the time the Assistant runs, forgoing the need for the pre-provisioned computer association. *Wipe and Load* A Wipe and Load can be destructive (disk reformat and data loss) and non-destructive (file level wipe of the disk where areas of the file system can be preserved). Wipe and Load non-destructive user state capture utilizes file system hard links and therefore does not require external storage or data encryption.

	When run, this task: Provides an encryption key to the task sequence action by querying Configuration Manager for a computer association or by generating one itself. Makes the name of the source machine available during a restore by relying on its name stored in the computer association. The end result of successful execution is the following three variables are set: OSDStateEncryptDecryptKey PBAComputerName
Actions	SourceComputerName

Wipe and Load destructive requires user data is saved off onto another device (Nomad PBA) or external device before reformat of the disk (USB media can be used as an alternative to Nomad PBA when using WSA). For this scenario, a ConfigMgr Computer Association is not used. Get Migration Settings will itself generate a unique encryption key based upon the ConfigMgr client identifier and AES 256 hashing algorithm. The key is stored in the task sequence environment for access during capture and restore in the native variable **OSDStateEncryptDecryptKey.**

Operation

Get Migration Settings is designed to support both the **Replace** and **Refresh** (Wipe and Load) deployment scenarios. The step's behaviour is different depending on deployment scenario. The step, by default will assume a **Replace** scenario. In order to operate for **Refresh** (Wipe and Load), the task sequence variable **DEPLOYMENTTYPE = REFRESH**, must be set prior to executing the step.

As well as provisioning the USMT encryption key, the step is also responsible for instantiating TS variables **SourceComputerName** and **PBAComputerName**. During the restore process, the source machine name is used to identify the location of captured user data if using Nomad PBA (PBAComputerName) as well as resolving the list of applications to install as defined by 1E Application Migration (SourceComputerName).

By default, the step will attempt to provide a key for encryption of captured user data.

> **Note**
>
> The method of generating an encryption key depends on the deployment scenario, summarized in the following table.

When run, this task:

Provides an encryption key to the task sequence action by querying Configuration Manager for a computer association or by generating one itself.

Makes the name of the source machine available during a restore by relying on its name stored in the computer association.

The end result of successful execution is the following three variables are set:

OSDStateEncryptDecryptKey

PBAComputerName

Actions SourceComputerName

Customers that do not wish to use a **ConfigMgr Computer Association** in key provisioning have the option of using **Get Migration Settings** to generate the key instead.

Customers that do not require encryption are able to disable key provisioning by setting the TS variable **1EDisableUSMTEncryption = True** prior to running the step. In this case, the step's only function is in providing the source machine name for 1E Application Migration.

OS Deployment type	ConfigMgr Computer Association	Get Migration Settings
Replace Capture/Restore	✔	
WSA-Replace Capture/Restore	✔	✔
Wipe and Load Non-Destructive	n/a	
Wipe and Load Destructive		✔
WSA-Wipe and Load Destructive		✔

All WSA type deployments require Nomad 6.3.200 and above.

Task sequence position

When run, this task:

Provides an encryption key to the task sequence action by querying Configuration Manager for a computer association or by generating one itself.

Makes the name of the source machine available during a restore by relying on its name stored in the computer association.

The end result of successful execution is the following three variables are set:

OSDStateEncryptDecryptKey

PBAComputerName

Actions SourceComputerName

The table below indicates the use of the step for different deployment scenarios. The Get Migration Settings step can operate in one of 2 modes: **Capture** and **Restore**. Mode is set in the step UI.

In **Capture** mode, the step is inserted prior to the **Capture User Files and Settings** step, and will typically reside in the **Capture User Files and Settings** group. This is used for **Replace Capture** and **Wipe and Load** task sequences.

In **Restore** mode, the step is inserted prior to the **Restore User Files and Settings** step, and will typically reside in the **Restore User Files and Settings** group. This is only used for a **Replace Restore** type task sequence. It is not required for **Wipe and Load** task sequences.

For**Wipe and Load Non-Destructive** task sequences, the step does not provision an encryption key as file system hard-links are used negating any requirement for secure storage, in this case the step will only set the **SourceComputerName** variable for use in 1E Application Migration.

OS Deployment type (WSA and Non-WSA)	**Get Migration Settings**	
Replace Capture/Restore	✔	✔
Wipe and Load Destructive (Refresh OS)	✔	
Wipe and Load Non-Destructive (Refresh OS)	✔ (No encryption	

	When run, this task: Provides an encryption key to the task sequence action by querying Configuration Manager for a computer association or by generating one itself. Makes the name of the source machine available during a restore by relying on its name stored in the computer association. The end result of successful execution is the following three variables are set: OSDStateEncryptDecryptKey PBAComputerName	
Actions	SourceComputerName	
		key provisioned)
	In-place Upgrade	n/a

Key recovery

If you need to recover the key generated by the step (perhaps your Wipe and Load Destructive or Replace Restore TS failed before restoring the user data) you can do so using the command line tool **1eUsmtKeyGen.exe.** This tool is part of Installing Nomad Branch Tools and is installed at location <ProgramFiles>\Microsoft Configuration Manager\AdminConsole\bin\NomadBranchAdminUIExt. It can be called via the Windows Console as shown below:

It takes the Configuration Manager client guid of the source machine as an argument and generates the exact key that would have been generated during the TS. To know the Configuration Manager client guid of any computer, please consult the 'SMS_Unique_Identifier0' column in the view 'dbo.v_R_System' of the config manager database.

While entering the argument, please remember that:

If the client guid contains the prefix "GUID:" it MUST be included (see above screenshot).

The case of the argument does not matter; two arguments differing only in case result in the same key being generated.

When run, this task:

Provides an encryption key to the task sequence action by querying Configuration Manager for a computer association or by generating one itself.

Makes the name of the source machine available during a restore by relying on its name stored in the computer association.

The end result of successful execution is the following three variables are set:

OSDStateEncryptDecryptKey

PBAComputerName

Actions

SourceComputerName

It should be the client guid of the source computer, i.e. the machine from where the user state is being migrated, not that of the destination computer where the state is being migrated to.

The generated key will be printed in base64 format on the Windows Console. You can copy it and use it as is with the usmt "/key" option to recover the user data.

Associated variables

Variable	Description
OSDStateEncryptDecryptKey	Native variable that hosts the key used to secure captured user data.
PBAComputerName	Name of the computer on which user data was captured.
SourceComputerName	Name of the computer for which the Application Migration list is obtained. Usually the same as PBAComputer.
1EDisableUSMTEncryption	If true, then an encryption key is not provisioned.
DeploymentType	If set to Refresh, then an encryption key is not provisioned.

	When run, this task: Provides an encryption key to the task sequence action by querying Configuration Manager for a computer association or by generating one itself. Makes the name of the source machine available during a restore by relying on its name stored in the computer association. The end result of successful execution is the following three variables are set: OSDStateEncryptDecryptKey PBAComputerName SourceComputerName		
Actions			
Configurable parameters	Parameter	Default value	Description
	Name	Get Migration Settings.	Name for the custom task sequence action.
	Description	Action to get encryption key for user state and name of the source computer if needed.	Description for the custom task sequence action.
	Capture user state		Used during the state capture phase.
	Restore user state		Used during the state restore phase.
Notes	Get Migration Settings contacts Content Distribution via the proxy feature of the Tachyon Background Channel. It gets the URL for the Background Channel from the Nomad registry PlatformURL setting, which is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the **1E.Client.conf** file).		

9.6.4.1.9 Stage 1E Client Package

Downloads the 1E Client package ready for installation by the Install 1E Client Task Sequence step. It's typically executed in Windows PE and must be included before the Install 1E Client step in the task sequence.

This custom action is available in the **1E Nomad task sequence actions**.

Actions	Notes
When run, this task: Downloads the 1E Client package and sets the path in the task sequence *NomadInstallPath* variable.	This task sequence action must: Only be run in the provisioning phase just before Setup Windows and ConfigMgr task sequences Refer to a Nomad package containing a single .msi (1E.Client-x64.msi/1E.Client-x86.msi), which is run on the client, the package can also contain a single Windows Installer Transform (.mst file) and a single Windows Installer Patch (.msp file) that will be applied when the Install 1E Client step is executed.

9.6.4.1.9.1 Configurable parameters

Parameter	Default value	Description
Name	Stage 1E Client Package	Name for the custom task sequence step
Description	Action to stage the 1E Client package for installation in the new OS.	Description for the custom task sequence step.
1E Client Package	n\a	Name of the 1E Client package.

9.6.4.1.10 Install 1E Client

Installs the 1E Client. The Stage 1E Client Package step must be to be included before this step in the Task Sequence. The 1E Client installer and any Transform or Patch that should be applied during installation must be included in the 1E Client Package referenced in the Stage 1E Client Package step.

> **Note**
>
> You must include a **Restart Computer** step after the **Install 1E Client** step. This is because the client installation adds the Nomad binaries folder to the system path, but because the Task Sequence (running as system) is already running it must be restarted to pick up the system path change. Subsequent steps in the Task Sequence that use Nomad will fail if this reboot is not included.

This custom action is available in the **1E Nomad task sequence actions**.

Actions	Notes
When run, this task: Reads the *NomadinstallPath* task sequence variable (Set by the Stage 1E Client Package action) for the location of the installer and installs the 1E Client If an *.mst* file is found in the root of the package, it adds the transform automatically with the installation. If multiple *.mst* files are present in the root of the package, the TRANSFORMS installer property referencing the *.mst* file must be added in the command-line otherwise this step fails If an .msp file (patch) is found in the root of the package, it will be applied during installation of the 1E Client.	This task sequence action: Waits for the 1E Nomad Branch service to start. It checks every 15 seconds until a configurable timeout expires (default 10 mins). Once the Nomad service is found running, the step completes successfully. If the timeout is reached without the Nomad service running, the step fails. There are two TS variables to manage this behavior: **EnableNomadStartUpChecks** - Default is true. If set to false then the step does not wait for the Nomad service to come up after 1E Client installation. This should only be set to false when the **Install 1E Client** action is not enable the Nomad client module. **NomadStartUpChecksTimeout** - Default is 10. Defines the number of minutes the step will wait for the Nomad service to start. If you notice the Nomad service taking longer than 10 minutes to be fully up and running in your environment, you can increase this value. The accepted ranges of this variable, is 10 to 60. If the specified value is not in range, it's set to a default 10 minutes. **Note** From Nomad 7.0.200, the **Install 1E Client** action supports installing a 1E Client patch. To do this: Include the patch in the 1E Client package referenced in the Stage 1E Client Package Step Ensure there's only one MSP file, the latest cumulative 1E Client hotfix, included in the package source If there's an MSP present in the package when the Install 1E Client setup runs, it will be installed. To implement these changes, you must include the hotfix MSP in the 1E Client

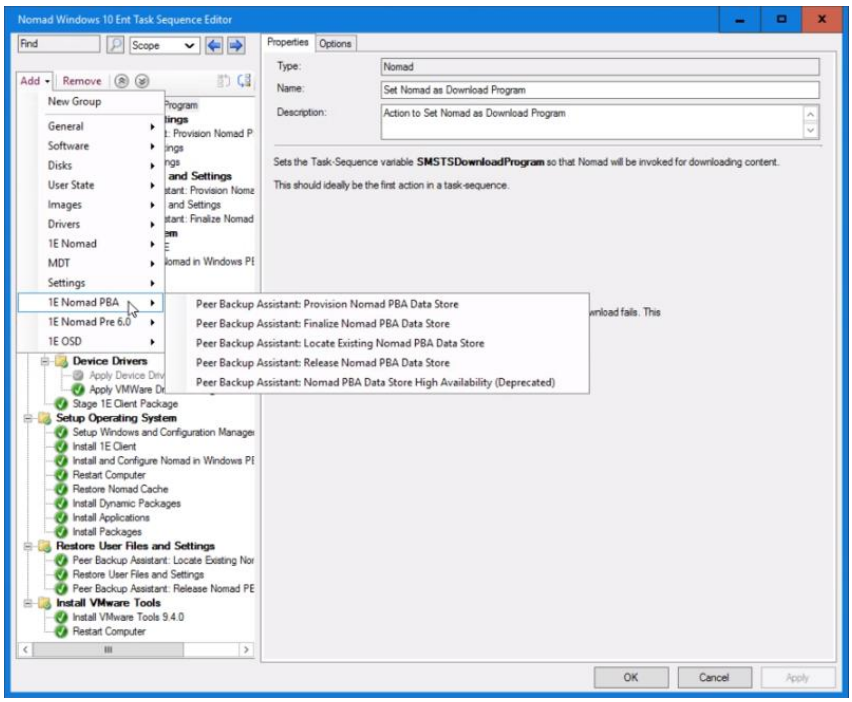
Actions	Notes
	package referenced in the Stage 1E Client Package step in your Task Sequences.

9.6.4.1.10.1 Configurable parameters

Parameter	Default value	Description
Name	Install 1E Client	Name for the custom task sequence step.
Description	Action to install 1E Client in the new OS.	Description of the custom task sequence step.
Additional installation commands		Additional installation parameters.

9.6.4.2 1E Nomad PBA task sequence actions

Please click on a link for more information about a custom task sequence action and its configuration.



9.6.4.2.1 Peer Backup Assistant: Provision Nomad PBA Data Store

Provisions a PBA data store prior to saving user state using USMT. It is the first step of the Peer backup assistance sequence (**USMT Capture User State** follows).

Note

PBA supports the use of multiple backup data stores, for more details see High-Availability Peer Backup Assistant. If the task sequence variable form of the Cache space parameter is used (see below) then the variable referenced must be set before running this action.

This custom action is available in the **1E Nomad PBA task sequence actions**.

Actions	Notes
This task: Polls Nomad peers enabled for PBA to find one with a data store where the user state may be saved. The peer that responds with the largest percentage of available disk is selected. Sets the following task sequence variables for subsequent actions: *PBAComputerName*: a label used to refer to the cache in following Nomad actions *PBAHostComputerName*: Host name of the data store machine. *OSDStateStorePath*: tells USMT where to save user state to then retrieve it from, i.e. the location of the Nomad cache *NMDS_REMOTE*: set to the same value as *OSDStateStorePath*. This is not required, but it is available for backwards compatibility.	This task sequence action: Is the first action in the saving phase of user state migration Must be followed by **USMT Capture User State** action **Note** If the task sequence variable *1EWSA_USMTSizeInMB* is set, the step will use its assigned value when polling.

9.6.4.2.1.1 Configurable parameters

Parameter	Default value	Description
Name	Peer Backup Assistant: Provision Nomad PBA Data Store	Name for the custom task sequence action.
Description	Action to find a PBA data store for saving user state	Description for the custom task sequence action.

Parameter	Default value	Description
Use Nomad's size estimation	Disabled by default.	If enabled, the estimation is passed to NMDS_POLL.
Static cache space	100	Estimated cache space in MB required to store the user state. This can either be a number, the default being 100, or the name of a task sequence variable holding the value delimited by '%', e.g. " *%USMTEstimate%*.

9.6.4.2.2 Peer Backup Assistant: Finalize Nomad PBA Data Store

Closes the connection to the PBA data store after user state is saved with **USMT Capture User State**.

> **Note**
>
> This step replaces the Peer Backup Assistant: Close Nomad PBA Data Store (deprecated) and the Peer Backup Assistant: High Availability (deprecated) steps. You can continue using the deprecated steps if you have already deployed them, but you cannot modify them. Going forward, we recommend you migrate to this new task sequence step.

This custom action is available in the **1E Nomad PBA task sequence actions** .

Actions	When run, this task: Closes the connection to the PBA data store after the user state is saved with **USMT Capture User State**. Optionally, stores user state data locally if there is enough disk space.
Context	This task sequence action: Must be run after the **Provision Nomad PBA Data Store** and **USMT Capture User State** actions.
Associated variables	n/a

Configurable parameters

Parameter	Default value	Description
Name	Peer Backup Assistant: Finalize	Name for the custom task sequence action.

When run, this task:

Closes the connection to the PBA data store after the user state is saved with **USMT Capture User State**.

Actions	Optionally, stores user state data locally if there is enough disk space.		
	Nomad PBA Data Store		
	Description	Action to close the connection to the Nomad PBA data store after saving the user state.	Description for the custom task sequence action.
	Enable HA	False	Enable high availability. **Note** If the task sequence variable 1EDisablePBA_HA = True, then High Availability is disabled. This variable is automatically set for Remote WSA deployments.
	Minimum	1	The minimum number of PBA data store backups. The number of data stores must be available when PBA-HA starts the backup, else if fails. Must be between 1 and 6 Must be equal to or greater than the Synchronous value.
	Maximum	1	The maximum number of PBA data store backups. Must be between 1 and 6.
	Synchronous	1	The number of successful backups to create before moving on to the next task sequence action.

	When run, this task: Closes the connection to the PBA data store after the user state is saved with **USMT Capture User State**.
Actions	Optionally, stores user state data locally if there is enough disk space.
	Must be between 1 and the value in Maximum. You can set the value to 0, but we do not recommend it as it causes the next task sequence to execute immediately with no guarantee of a successful backup.

9.6.4.2.3 Peer Backup Assistant: Locate Existing Nomad PBA Data Store

Finds saved user data, prior to restoring user state using the **USMT Restore User State** action.

> **Note**
>
> The Peer Backup Assistant: Close Nomad PBS Data Store and (usually) OS refresh or OS install on bare-metal actions must be run first. If saving user data was run as a separate task, insert an action in the current task sequence that sets the *PBAComputerName* TS variable to the same value that is set in the saving task sequence. This identifies the Nomad cache in the network where the user data is saved.

This custom action is available in the **1E Nomad PBA task sequence actions** .

Actions	Notes
When run, this task: Finds the PBA enabled Nomad peer on which the user state migration data has been cached. Sets these task sequence variables for subsequent steps: *OSDStateStorePath*: Tells USMT where to restore user state from, i.e. the location of the Nomad cache. *NMDS_REMOTE*: Set to the same value as *OSDStateStorePath*. This is not required, but it is available for backwards compatibility.	This task sequence action: The first action in the restoring phase of user state migration.

9.6.4.2.3.1 Configurable parameters

Parameter	Default value	Description
Name	Peer Backup Assistant: Locate Existing Nomad PBA Data Store.	Name for the custom task sequence action.
Description	Action to locate cached data prior to restoring user state.	Description for the custom task sequence action.

9.6.4.2.4 Peer Backup Assistant: Release Nomad PBA Data Store

Releases saved user data in the Nomad cache, after restoring user state with **USMT Restore User State**.

> **Note**
>
> The **USMT Restore User State** action must have been run successfully.

This custom action is available in the **1E Nomad PBA task sequence actions** .

Actions	Tasks
When run, this task: Deletes the cached user state data from the PBA enabled Nomad peer. Sets the following task sequence variables for subsequent actions: *PBAComputerName*: A label used to refer to the cache in following Nomad actions.	This task sequence action: Is the final action in the restoring phase of user state migration Is not essential because the cache is deleted by Nomad automatically after 7 days (default configuration).

9.6.4.2.4.1 Configurable parameters

Parameter	Default value	Description
Name	Peer Backup Assistant: Release Nomad PBA Data Store.	Name for the custom task sequence action.
Description	Action to release the Nomad PBA data store after restoring user state.	Description for the custom task sequence action.

9.6.4.2.5 Peer Backup Assistant: Close Nomad PBA Data Store (deprecated)

> **Note**

> This step has been replaced by Peer Backup Assistant: Finalize Nomad PBA Data Store. Existing deployments will still work, but you cannot modify them. Going forward, we recommend using its replacement.

This step closes the connection after user state is saved by **USMT Capture User State**. ThePeer Backup Assistant: Provision Nomad PBA Data Store and **USMT Capture User State** actions must have been run.

Actions	Notes
When run, this task: Sends a completion message to the Nomad peer to indicate that the user state migration data has been cached. Sets the following task sequence variables for subsequent actions: *PBAComputerName*: A label used to refer to the cache in following Nomad actions.	This task sequence action: Is the final action in the saving phase of user state migration.

9.6.4.2.5.1 Configurable parameters

Parameter	Default value	Description
Name	Peer Backup Assistant: Close Nomad PBA Data Store.	Name for the custom task sequence action.
Description	Action to close the PBA data store connection after saving user state.	Description for the custom task sequence action.

9.6.4.2.6 Peer Backup Assistant: High Availability (deprecated)

> **Note**
>
> This step is deprecated, and you should use the Peer Backup Assistant: Finalize Nomad PBA Data Store instead. Existing deployments will still work, but you cannot modify them. Going forward, we recommend using its replacement.

This step stores additional backup copies of the PBA data store, after the primary data store has been created with Peer Backup Assistant: Provision Nomad PBA Data Store and after the USMT data has been saved andc losed with Peer Backup Assistant: Close Nomad PBA Data Store (deprecated).

The following actions must have been run successfully:

Peer Backup Assistant: Provision Nomad PBA Data Store

USMT Save User State

Peer Backup Assistant: Close Nomad PBA Data Store (deprecated).

This custom action is available in the **1E Nomad PBA task sequence actions** .

Actions	Notes
When run, this task: Polls Nomad peers enabled for PBA to find the required number of data stores where the user state may be saved. Backs up the primary data store on each Nomad peer after locating the PBA data stores.	This task sequence: Must have the minimum and maximum number of PBA data stored to create defined Must have the number of synchronous backups that must be completed successfully defined before continuing with the next action in the task sequence. The remainder of the additional backups are performed asynchronously while the other task sequence actions are running.

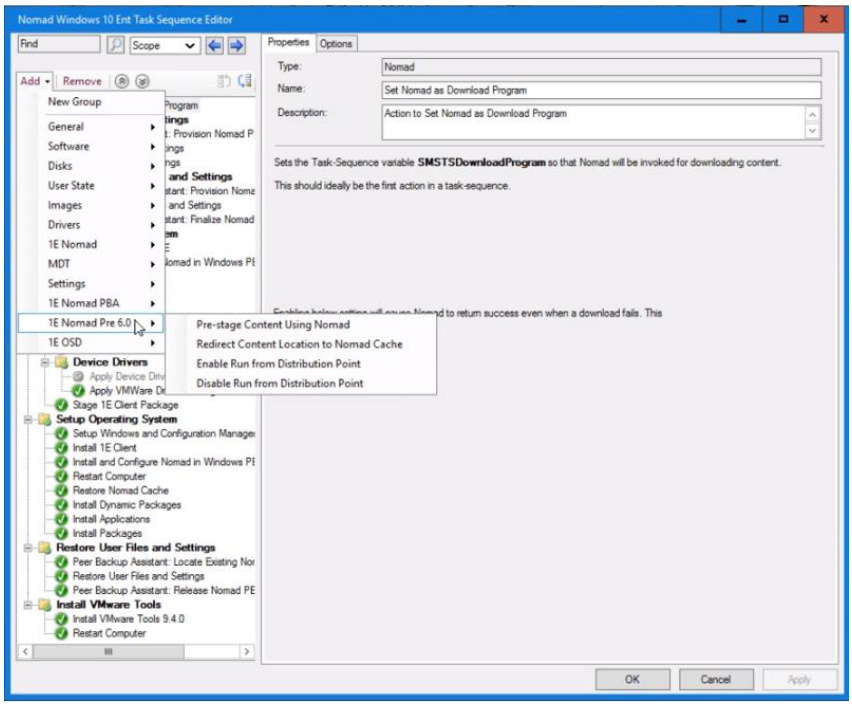
9.6.4.2.6.1 Configurable parameters

Parameter	Default value	Description
Name	Peer Backup Assistant: High Availability.	Name for the custom task sequence step.
Description	Action to find additional PBA data stores for saving user state.	Description for the custom task sequence action.
Minimum	1	The minimum number of PBA data store backups. Must be at least 1 and not greater than 6. The specified number (minimum) of data stores must be available when PBA-HA starts backing up the data. If the minimum number of data stores will not respond, then the PBA-HA task sequence step will fail. **Note** The minimum should be greater than or equal to the Synchronous value. If the minimum number is less than the Synchronous value, the task sequence may fail even though the minimum number of backups have been done.

Parameter	Default value	Description
Maximum	1	The maximum number of PBA data store backups. Must be at least equal to the minimum and not greater than 6.
Synchronous	1	The number of backups that must be performed successfully before moving onto the next action in the task sequence. Must be 0 or more and not greater than the value set for the maximum. **Note** It is possible, but not recommended, to set this value to 0. If this is done, the next action in the task sequence will start immediately, but there will be no guarantee that any backups have been successful.

9.6.4.3 1E Nomad Pre 6.0 task sequence actions

Please click on a link for more information about a custom task sequence action and its configuration.



9.6.4.3.1 Pre-stage Content Using Nomad

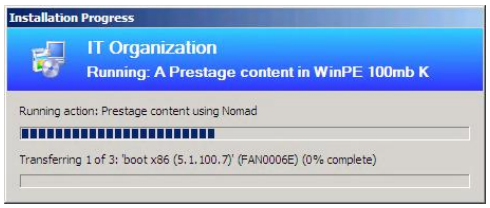
Pre-stages content using Nomad, either in WinPE or a full Microsoft Windows operating system. It uses the NomadPackageLocator tool to locate any locally available copies of content, as set in the

References in the custom task sequence action properties. If no local copies are available, it will download the content from the DP and store it locally. It then configures the Task Sequence to use this locally stored content.

We recommend, when using the **Pre-stage Content Using Nomad** step, that the content is downloaded to the local branch and the task sequence is pointed to the Nomad cache that contains it. When using Redirect Content Location to the Nomad Cache (deprecated) this is a requirement as it cannot make use of all the Nomad download functionality.

Use **Pre-Stage content Using Nomad** in preference to **Redirect Content Location to the Nomad Cache (deprecated)** to make use of all the Nomad features. Use the **Redirect Content Location to the Nomad Cache (deprecated)** if you want to have exactly the same *NomadPackageLocator* functionality provided in earlier releases of Nomad.

While **Pre-stage content Using Nomad** is running, a progress bar is displayed on the Installation Progress dialog on the target machine:



Note

When used in WinPE, the Install and Configure Nomad in WinPE action must be run first.

This custom action is available in the **1E Nomad Pre 6.0 task sequence actions**.

Actions	Notes
When run, this task: Uses NomadPackageLocator.exe command-line switches to locate locally available copies of the content, as set in References in the custom task sequence action properties. If no local copies are available, it will download the content from the DP and store it locally. Updates the task sequence to use the locally downloaded content. If the Require Nomad checkbox is checked in the action properties, fail the task sequence step if the *NomadPackageLocator* download fails. If the Show error checkbox is checked in the action properties, display the error dialog if the *NomadPackageLocator* download fails.	The following points should be taken into account when using this task sequence action: Prior to using any of the content downloaded using the Pre-stage content Using Nomad task sequence action, you must run the Save Nomad Cache task sequence action.

Actions	Notes
If the Use Multicast checkbox is checked in the action properties, *NomadPackageLocator* will invoke *NomadBranch* with multicast enabled. If the All references checkbox is checked in the action properties, all referenced content will be selected.	

9.6.4.3.1.1 Configurable parameters

Parameter	Default value	Description
Name	Pre-stage Content Using Nomad.	The name for the custom task sequence action.
Description	Action to pre-stage content in WinPE using Nomad.	Sets the description for the custom task sequence action.
Require Nomad	Enabled by default.	When this checkbox is checked, it sets a requirement for another Nomad client on the same subnet to have the content, if this is not the case the task sequence step will fail. When this checkbox is not checked the task sequence will attempt to continue without using Nomad if there is no Nomad client on the same subnet with the content.
Show error dialog	Disabled by default.	When this checkbox is checked, an error dialog is displayed to the Configuration Manager administrator when the *NomadPackageLocator* download fails.
Use HTTP	Enabled by default.	When this checkbox is checked, *NomadPackageLocator* uses the HTTP location for the content if it is not available locally. **Note** In Configuration Manager 2012, if this option is not enabled when using this task sequence step, all selected packages must be copied to the SMB share on the DP using the Data Access > Copy the content in this package to a package share on distribution points option in the properties of each package, otherwise the download fails.

Parameter	Default value	Description
Use Multicast	Disabled by default.	When this checkbox is checked, *NomadPackageLocator* invokes *NomadBranch* with multicast enabled.
All references	Disabled by default.	When this checkbox is checked, all referenced content is selected (and any added subsequently to the task sequence will be automatically selected). When it is unchecked, all referenced content is deselected.
References	This field is pre-filled with all content set for downloading in the task sequence.	This field is pre-filled with all content set for downloading in the task sequence. Checking the checkbox next to each item will set the use of *NomadPackageLocator* for that content. **Note** There is a limit of 255 characters on a task sequence action's command line. If this was exceeded because there are many selected references, a popup dialogue will appear saying so when the Apply or OK button is pressed. Either reduce the number of references by creating more, separate, task sequences to pre-stage content, or select the **All references** checkbox which will use a wildcard for the references.

9.6.4.3.2 Redirect Content Location to the Nomad Cache (deprecated)

Note

This action is deprecated and is currently provided for backwards compatibility only, Use **Pre-stage Content Using Nomad** instead.

This custom task sequence action redirects the task sequence's content location to the Nomad cache on another host. Used in either WinPE or a full Microsoft Windows Operating System, it used the Nomad NomadPackageLocatortool to locate the content on a Nomad cache on the local subnet.

The *NomadPackageLocator* program sends out a Nomad package status request for each of the packages listed in the OSD task sequence it is running within. If any of the content is available on other Nomad clients on the local subnet, it updates the path variables in the task sequence to point at the folder location (usually located in the local or remote Nomad cache folder). If not, the default path (i.e. the path to the distribution point) is left intact.

Both the Redirect Content Location to Nomad Cache and Pre-stage Content Using Nomad rely on the fact that the content has been downloaded to the local branch and point the task sequence to the Nomad cache that

contains the content. Use Pre-stage Content Using Nomad in preference to Redirect Content Location to Nomad Cache to make use of all the Nomad features. Use the Redirect Content Location to Nomad Cache if you require exactly the same *NomadPackageLocator* functionality provided in earlier releases of Nomad.

Note

When used in WinPE, the Install and Configure Nomad in WinPE action must be run first.

This custom action is available in the **1E Nomad Pre 6.0 task sequence actions**.

Actions	Notes
When run, this task: Locates the Nomad cache on the local subnet. Updates the task sequence to use local subnet content. If the Require nomad checkbox is checked in the action properties, fail the task sequence step if the *NomadPackageLocator* download fails. If the Show error dialog is checked in the action properties, display the error dialog if the *NomadPackageLocator* download fails. If the All references checkbox is checked in the action properties, all referenced content will be selected.	This task sequence action: Is typically performed prior to the apply operating system action but may be used multiple times throughout the task sequence, particularly during the provisioning phase.

9.6.4.3.2.1 Configurable parameters

Parameter	Default value	Description
Name	Redirect Content Location to Nomad Cache.	Name for the custom task sequence action.
Description	Action to redirect content location to Nomad cache.	Description for the custom task sequence action.
Require Nomad	Enabled by default.	When this checkbox is checked, the task sequence action fails if the *NomadPackageLocator* download fails. If this is not checked, the task sequence attempts to download the

Parameter	Default value	Description
		content by other means if the *NomadPackageLocator* download fails.
Failover to DP(s)	Disabled by default.	When this option is checked, the content download can failover to downloading from the DPs if the *NomadPackageLocator* fails to find the content cached on the local subnet.
Show error dialog	Disabled by default.	When this checkbox is checked, an error dialog is to the Configuration Manager administrator if the *NomadPackageLocator* download fails.
Force Nomad client	Blank by default.	Set the name for a specific Nomad client whose cache you want to use. This prevents *NomadPackageLocator* from polling for a Nomad client whose cache contains the content.
Nomad share name	Blank by default.	Should only be used if the Nomad clients where OSD content has been pre-cached are configured with the Hidden Nomad share option set to 0x10. See SpecialNetShare for more information. When the pre-cache Nomad client is set to use the hidden share, set the value to *NomadSHR$*.
Multicast scope		Should only be set if you want the *NomadPackageLocator* requests to span subnets when trying to locate a package. In this instance, the request is will be multicast and the scope must be set here. **Note** This will only work if the network has been configured to allow multicast across subnets.
All references	Disabled by default.	When this checkbox is checked, all referenced content will be selected (and any added subsequently to the task sequence will be automatically selected too). When it is unchecked, all referenced content will be deselected.
References	Pre-filled with all content set for	Pre-filled with all content set for downloading in the task sequence. Checking the checkbox next to each item will set the use of *NomadPackageLocator* for that content.

Parameter	Default value	Description
	downloading in the Task Sequence.	**Note** There is a limit of 255 characters on a task sequence action's command line. If this was exceeded because there are many selected references, a popup dialogue will appear saying so when the Apply or OK button is pressed. Either reduce the number of references by creating more, separate, task sequences to redirect content, or select the All references checkbox which will use a wildcard for the references.

9.6.4.3.3 Enable Run from Distribution Point

Used in the following instances:

In conjunction with the pre-stage content using Nomad action to avoid making a local copy of the Nomad share.

It is used during the provisioning phase, prior to any package being installed, to enable classic packages to run from the DP. This is so that *SMSNomad.exe* can be used as an alternative download provider during OSD.

When the **Run from distribution point** property is no longer required, remove it using the Disable Run from Distribution Point custom task sequence.

This custom action is available in the **1E Nomad Pre 6.0 task sequence actions**.

Actions	Notes
When run, this task:	This task sequence action:
Sets the task sequence to run from the DP.	Only applies to OSD task sequences and should be run prior to installing classic packages using the SMSNomad.exe command Can be run anywhere in the task sequence after the Restart in Windows PE action, that would be used as part of a Refresh OS Deployment task sequence Must have the Copy the content in this package to a package share on distribution points option enabled for classic packages that are set to Run from the DP.

9.6.4.3.3.1 Configurable parameters

Parameter	Default value	Description
Name	Enable Run from DP.	The name for the custom task sequence step.
Description	Action to Enable Run from the DP.	The description for the custom task sequence action.

9.6.4.3.4 Disable Run from Distribution Point

Reverts the task sequence variables that were set using the Enable Run from Distribution Point custom task sequence action back to their default values.

This custom action is available in the **1E Nomad Pre 6.0 task sequence actions**.

Actions	Notes
When run, this task:	This task sequence action:
Sets the task sequence to download on-demand.	Only applies to OSD task sequences after installing all classic packages using the *SMSNomad.exe* command and only if the Enable Run from Distribution Point had previously been run.

9.6.4.3.4.1 Configurable Parameters

Parameter	Default value	Description
Name	Disable Run from the DP.	The name for the custom task sequence step.
Description	Action to Disable Run from Distribution Point.	Description for the custom task sequence step.

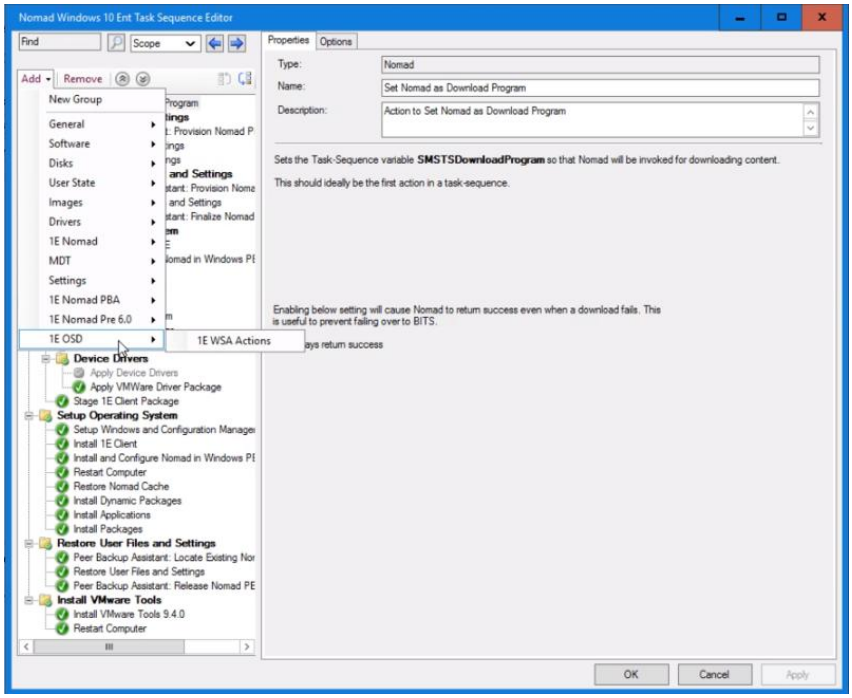
9.6.4.41E OSD task sequence actions

Depending on the 1E OSD Tools that you have installed, you may also see custom task sequence actions for:

BIOS TO UEFI 1.4 - 1E OSD task sequence actions

1E task sequence actions.

Please click on a link below for more information about a custom task sequence action and its configuration.



9.6.4.4.1 1E WSA Actions

The 1E WSA Actions action is an essential component of the WSA deployment task sequence. Its position and configuration within the task sequence is critical to ensuring the task sequence completes successfully. The action performs one or more of the following functions depending on the selection made when configuring the step:

Initialize

Refresh Content Location

Switch between online and offline content

Finalize.

This custom action is available in the **1E OSD task sequence actions**.

Actions	Notes
1E WSA Actions (Initialize)	**Initialize** step should be placed at the very beginning of the task sequence. If the checkbox for **Initialize** is enabled, then all other checkboxes must be disabled. Using the Shopping URL provided, the step will attempt to obtain a WSA order record for the localhost.

Actions	Notes
 Contacts the Shopping server and attempts to identify a valid WSA order record for the host.	Only orders in the "TS Running" state are considered. If a valid WSA order is found, the step will download the order attributes and populate the task sequence environment. The many order attributes dictate the behavior of the task sequence. For instance, they indicate if USB media is required, they provide the credentials for the WiFi and VPN connections to be made and indicate if Application Migration is required. If the step cannot contact the Shopping server it will fail. Once the attributes have been obtained, if these indicate that USB media is required, and it has not been detected, then it will notify the user for the USB media.
1E WSA Actions (Refresh Content Location)  Ensures task sequence referenced content paths, defined in the current task sequence environment, are refreshed and always valid.	**Refresh Content Locations** step should be placed after any step that repartitions a disk. The checkboxes for **Refresh Content Locations** and **Switch between online and offline c ontent** can be both enabled at the same time. Under certain circumstances, a deployment may require the use of USB media for content or user data storage. In the case of content, the environment must reflect the correct local file system path before allowing the task sequence to attempt access. Operations such a restart of the host, re-partition of the disk and installation of the new OS may impact the validity of existing paths.

Actions	Notes
	The step updates the paths if required ensuring access to the content is maintained for the running task sequence.
1E WSA Actions (Switch between online and offline content)  Switches the task sequence between online and offline mode, based upon prevailing network connectivity, and attempts to establish a network connection when building over WiFi.	**Switch between online and offline c ontent** step should be placed... The checkboxes for **Refresh Content Locations** and **Switch between online and offline c ontent** can be both enabled at the same time. If network connectivity is unavailable, and the step is running in WinPE, then the step will configure the task sequence to run in offline media mode. Offline mode requires _SMSTSMediaType is set to FullMedia and the content locations defined in the task sequence environment are set to local file system paths. When in the full OS, the step will configure the task sequence to run in online mode by setting _SMSTSMediaType to BootMedia if it has been previously set to FullMedia. The step will also attempt to establish a network connection if the deployment is being performed over a WiFi connection.
1E WSA Actions (Finalize)	**Finalize** step should be positioned as the last step in the task sequence. If the checkbox for **Finalize** is enabled, then all other checkboxes must be disabled.

Actions	Notes
 Performs WSA finalization tasks once the main body of the task sequence has completed.	The step will perform cleanup operations at the end of the task sequence. *USB Cleanup* If USB media was required to complete the deployment, then the step may be required to remove all content stored on the device. Cleanup is based upon the setting made in the WSA deployment published in Shopping. **Note** Content stored on the USB device will always be restored to the local Nomad cache in the new OS. For any captured user data, this will always be removed from the device if the USMT restore succeeded. *Task Sequence status* The step will record the outcome of the task sequence in the registry: **Software\1E\WSA\TSExecutionHistory\TaskSequenceId** For zero touch restores, the step will also update the order status in Shopping to indicate that the order is closed.

Configurable Parameters

Parameter	Default Value	Description
Name	WSA Actions	Name for the custom task sequence action.

Parameter	Default Value	Description
Description	Action to configure Windows Servicing Assistant environment	Description for the custom task sequence action.
Initialize	Checked	Used to initialize the deployment.
Shopping URL		Specifies the URL of the Shopping server.
Refresh Content Locations	Unchecked	Used to maintain access to cached content.
Switch between online and offline content	Unchecked	Used to ensure the task sequence continues to function when connectivity to the ConfigMgr site is unavailable.
Finalize	Unchecked	Used to clean up the deployment.

9.6.4.5 Peer Backup Assistant - PBA

The Peer Backup Assistant (PBA) feature enables files and settings data to be backed-up to a peer device so that they can be maintained when the device is being migrated to a new Operating System. Using PBA, you can avoid the cost of State Migration Point servers to hold the backup data, as peer devices can be used to provide this storage. The risk of losing user data through the migration process is also greatly reduced in the process.

Note

Please note the:

Nomad PBA Task Sequence steps are not designed for use with offline USMT or WinPE

-NMDS_POLL command-line option for the NomadPackageLocator.exe tool cannot be used in WinPE

-NMDS_<command> command-line options for NomadBranch.exe have not been tested in WinPE, so their behavior may be unpredictable in that environment.

9.6.4.5.1 An overview of PBA

There are two types of devices involved in the PBA feature:

PBA hosts – devices running Nomad that have been configured to host a data store

PBA clients – devices running Nomad that ask for PBA data stores by broadcasting a request on the local subnet for suitable hosts. Local PBA hosts respond to these requests and the winner is chosen according to its suitability.

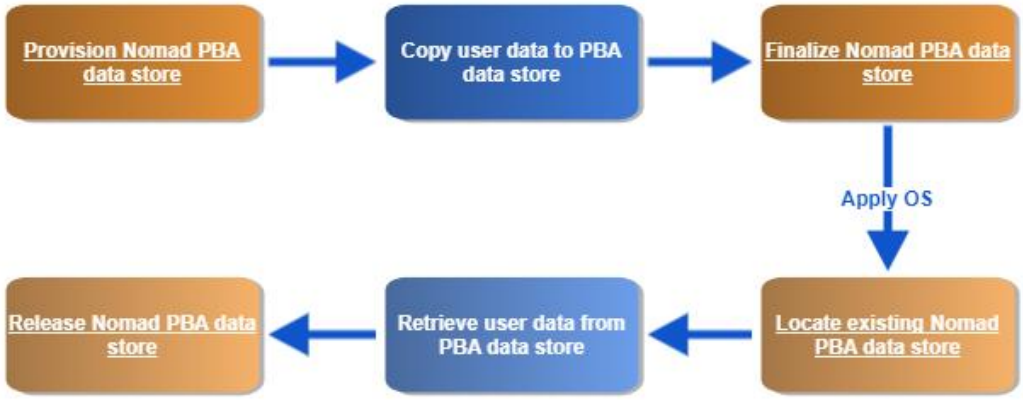
The host aspect is disabled by default but can be enabled by a Nomad administrator, whereas the client aspect is always available.

The PBA feature is implemented in the Configuration Manager OS deployment process using custom Task Sequence steps that complement the built-in Capture User State and Restore User State steps. This completely automates the migration of user data and settings using available storage on peers during an OS refresh or device replacement.

The initial step in the process initiates a local election to request the required amount of storage space from peers. Peers that are configured to act as PBA Hosts will respond to this election if they match the administrator-defined criteria (Is there enough disk space on a system to store the data? Are there other connections already in place? Are disk quotas enforced?) to store the User State Migration Tool (USMT) data.

The requesting system will then evaluate the responses and select the best candidate. The selected host then reserves the storage space. When the Capture User State step has completed, PBA transfers the migration data to the selected host, where it is stored ready to be restored later in the Task Sequence. Data can be encrypted using the built-in encryption capability of the User State Migration Tool in the Capture User State step. At this stage, Nomad can transfer copies of the data to other peers (High Availability feature) to increase the availability of the data should any of the hosts go offline before the data has been restored.

The OS deployment proceeds until the state restore phase takes place, at which point PBA locates the backed-up data using a broadcast query, restores the data to the device and deletes it from the host. The diagram below illustrates the PBA task sequence actions (in orange) and the data flow (in blue). If for any reason the restore step is not executed or fails, the migration data will remain available on the host(s) for 7 days (configurable), after which it will be deleted.



9.6.4.5.2 Single Site PBA

9.6.4.5.3 Single Site PBA

Peer Backup Assistant (PBA) enables Nomad clients to use local storage on peers to temporarily store user state data during an OS deployment, removing the need for Configuration Manager State Migration Points. By default, it uses network broadcasts to identify peers with available storage on the local subnet. Single Site Peer Backup Assistant (SSPBA) uses Single Site Download (SSD) features to enable Nomad to use storage available on PBA hosts in adjacent subnets. This enables you to:

Designate appropriate devices to provide the Nomad PBA data store for all devices on the site, not just the local subnet

Avoid the issue where clients on particular subnets do not have sufficient disk space to offer the role of a Nomad PBA data store.

To set up SSPBA, you need to ensure the following:

Tachyon Platform 5.2 or later is installed and running successfully

The Content Distribution database is populated with information about sites and their associated subnets

9.6.4.5.3.1 High-level overview of how to enable SSD

The following information applies to both new and existing installations of Nomad:

Make sure that Tachyon Platform is installed in your environment and is used as a content location metadata repository, for more information refer to Introducing Tachyon

Within Content Distribution, populate the SSD sites and subnet information. A sample PowerShell script called **PostADSitesandSubnets.ps1** is included in the Nomad installation files, which reads sites and subnets from AD

Nomad captures a list of background channels from the 1E Client in the BackgroundChannelUrl and uses the first working URL as the PlatformURL by appending /Proxy/ContentDistribution/ if this PlatformURL is unreachable it attempts to connect to the next BackgroundChannelUrl, for details about BackgroundChannelUrl refer to Nomad architecture

Enable SSD on all Nomad agents, by modifying **HKLM\Software\1E\NomadBranch\SSDEnabled** to 3, this enables SSD for both "Provide" and "Consume" modes, specifically Nomad will provide content to other peers and consume content from other peers

If you already have Nomad installed and are only now enabling SSD, then ensure **HKLM\Software\1E\NomadBranch\Platform\ContentRegistration** is set to 1, in other words, Nomad will register downloaded content with Content Distribution, this is automatically enabled for new installations of Nomad and SSD.

> **Tip**
>
> If you have clients on networks where broadcasts are disabled (for example wireless) then enable local SSD by setting SSDEnabled=7. Also set ContentProviderOnWifi=1.

9.6.4.5.3.2 Building a subnet profile in Content Distribution

For Content Distribution to build a subnet profile for SSD and the peer backup assistant feature, Nomad must communicate with its web service. When the Nomad service starts, it connects and registers the hosting device by name with Content Distribution, which returns a device ID in the form of a GUID that enables it to uniquely identify the Nomad client and its default subnet. If it is unable to communicate with Content Distribution, it retries every 5 minutes until it succeeds (as long as SSD is enabled). An attempt to communicate with Content Distribution is also made prior to a package download to register its status.

Please refer to Enabling SSD in WinPE to make use of Nomad SSD in OS Deployment.

The following points should be noted:

On a multi-NIC host, only one NIC gets registered, and a wired interface takes precedence over a wireless interface during registration

If Nomad fails initially to register an adapter, it retries every 5 minutes (for as long as SSD is enabled) until it succeeds

Wireless adapters can be configured to act as SSD content providers and consumers. Use the ContentProviderOnWiFi registry setting to do this

If the initial device registration was successful when the Nomad service started, but Content Distribution later becomes unavailable, when Nomad subsequently downloads and caches a package it will not be able to register the package with Content Distribution (see below for details). Nomad does not re-attempt package registration, so Content Distribution will not know that this particular Nomad host has the package.

9.6.4.5.3.3 Example PowerShell scripts

You can get information about sites and subnets from AD, or by other means. Example PowerShell scripts can be used for retrieving information about sites and their associated subnets from the AD and updating the Content Distribution database.

Example Active Directory Single Site script — Sample script that scans the Active Directory (AD) environment for all sites and subnets and stores the information in the Content Distribution locations table.

Example Single Site script — Sample script that provides two functions to update sites and subnets in the Content Distribution locations table: DeleteAllLocations and AddLocation().

Example Location Discovery script — Sample script to enable and disable the location discovery feature, along with the option to run it and load site, subnet and information in Content Distribution.

Content Distribution purge configuration script — Sample script to view or update Purge Configuration in the Content Distribution Service defined in the ContentDistribution PurgeSettings table if it is configured.

9.6.4.5.3.4 Enabling SSPBA

SSPBA can be enabled at install time using the MODULE.NOMAD.SSPBAENABLED installer property. Post-installation SSPBA can be enabled by setting the following registry values:

Update the SSPBAEnabled registry value to 1.

Update the SSDEnabled registry value to 0x3 to enable Content Distribution integration required for this feature to work.

When SSPBA is enabled, PBA will initially attempt to find suitable PBA data stores on the local subnet. If it does not find one, it will send the request to neighboring subnets using the information held in Content Distribution.

9.6.4.5.4 High Availability PBA (HAPBA)

High Availability PBA is implemented with the custom finalize Nomad PBA store task sequence action and requires no configuration of the underlying Nomad system, for details refer to Peer Backup Assistant: Finalize Nomad PBA Data Store.

HAPBA ensures that USMT data is stored and made available on multiple devices during the migration process to minimize risk and maximize success. Implementing HAPBA enables you to save USMT data:

In multiple locations (up to a maximum of 6) to help mitigate risk during migration

Without the need to regenerate it using the USMT save action.

Backups can be created synchronously or asynchronously. The administrator can set a value in the task sequence action that specifies the number of backups that must be successfully implemented synchronously before the task sequence continues; the remainder of the backups will be performed asynchronously while the other task sequence actions are running. This helps you manage the balance between enabling the task sequence to run promptly while ensuring sufficient backups are in place to maximize the chances of success.

HAPBA also works with SSPBA to enable the backups to reside on devices local to the site but external to the subnet of the device being migrated.

> **Note**
>
> If the task sequence variable **1EDisablePBA_HA** = True, then High Availability is disabled. This variable is automatically set for Remote WSA deployments.

9.6.4.5.5 Configuring PBA hosts

To configure a suitable Nomad client in the local branch to be a potential Peer Backup Assistant (PBA) host:

Under the *NomadBranch\NMDS* registry key, update the *MaximumMegaByte* registry value to the maximum combined size of the caches you want the PBA host to support. The default value is *0* which means that Nomad client will not reply to PBA requests.

Modify other PBA NMDS registry values to suit your environment and usage.

You can configure a number of devices in a branch to be PBA hosts for scalability.

9.6.4.5.6 Using PBA with HTTP and HTTPS P2P

By default, Nomad uses Windows file shares to share content and PBA storage with peers over SMB. You can configure Nomad to use HTTP or HTTPS to avoid the use of file shares and SMB, for details refer to Peer copy over HTTP or HTTPS. When Nomad is configured to use Peer copy over HTTP or HTTPS, a file share is not created. In this scenario the storage is exposed to peers through the HTTP server implemented in Nomad for sharing its cache. A local user account is created to secure access to the migration data store through Windows authentication.

9.6.4.5.6.1 Certificate-based Client Authentication

When Nomad is configured to use HTTPS for peer-to-peer communication, you can optionally enable Certificate-basedAuthentication. In this scenario a local user account is not created. Access to the user state store is authenticated using a client certificate.

9.6.4.5.7 Using PBA with Configuration Manager task sequences

To integrate PBA into a Configuration Manager migration task sequence for a device targeted to get a new OS:

Choose Nomad's estimation or provide a static estimate to reserve a minimum amount of disk space for user data retrieved with the User State Migration Tool (USMT) on the target device. USMT is a Microsoft command-line utility program that integrates with Configuration Manager task sequences to transfer user files and settings between devices. For suggestions of how to estimate the migration store size see Microsoft's article on estimating migration store size.

Use the provision Nomad PBA data store task sequence action to provision a data store with the name of the device being migrated and the estimated size of the USMT data. It broadcasts a request on the local subnet, and any of the locally configured PBA hosts will respond if they have the estimated space available in their PBA store. The task sequence also stores the location of the winning PBA host and share using the *%NMDS_REMOTE%* variable into the *OSDStateStorePath* task sequence variable.

Backup the USMT data to the stored share, using the USMT Capture User State task sequence action.

Use the finalize Nomad PBA data store task sequence action to close the data store. This tells the PBA host that the copy is completed and disconnects from it.

For increased availability, create extra copies of the backed-up USMT data using HA features of the finalize Nomad PBA data store task sequence action.

Migrate the target device to the new OS.

Use the locate existing Nomad PBA data store task sequence action to locate an existing data store with the name of the device being migrated. This finds the PBA host that holds the named data store on the local subnet and creates a connection to it for retrieving the data.

Restore the USMT data from the data store on the located PBA host, using the USMT Restore User State task sequence action.

Use the release Nomad PBA data store task sequence action to release the data store with the name of the device being migrated.

9.6.4.5.7.1 PBA NMDS commands

The PBA task sequence actions use some underlying *NomadBranch.exe* command-line arguments to implement their actions which are invoked using a *NomadPackageLocator.exe* wrapper to set task sequence variables that *NomadBranch.exe* relies on. So of the two Command-Line Interfaces, *NomadPackageLocator.exe* is the preferred and safer interface to use.

> **Note**
>
> We recommend that you implement PBA using the custom PBA Task Sequence steps described above. For reference, the table below identifies commands executed by these steps.

Task sequence step	NomadBranch command-line arguments
Peer backup assistant – provision Nomad PBA data store	NMDS_POLL
Peer backup assistant – close Nomad PBA data store	NMDS_COMPLETE
Peer backup assistant – high-availability	NMDS_HA
Peer backup assistant – locate existing Nomad PBA data store	NMDS_FIND
Peer backup assistant – release Nomad PBA data store	NMDS_DELETE

In addition to these commands, the following registry values can be updated in *HKLM\Software\1E\NomadBranch\NMDS* to define the behavior of PBA on the devices that are to be used as hosts for PBA data stores. These registry values are only required on PBA hosts where the data store resides and not on PBA clients requesting the store.

9.6.4.5.7.2 Enabling NMDS

The *MaximumMegaByte* registry value is set to 0 by default which means the Nomad clients will not reply to PBA requests.

To enable a Nomad client to be a PBA host:

On the host, update the *MaximumMegaByte* registry value to the maximum amount of space in MB that can be used for all the PBA data stores combined.

Restart the *NomadBranch* service.

9.6.4.5.7.3 Disabling NMDS

To disable PBA:

Update the *MaximumMegaByte* registry value to *0*.

Restart the *NomadBranch* service.

9.6.4.5.7.4 NMDS registry values

The following registry values relate to PBA and are set in *HKLM\Software\1E\NomadBranch\NMDS*:

CachePath

EnforceQuotas

MaxAllocRequest

MaxConcurrency

MaximumMegaByte

PostCompleteTimeoutHours

PreCompleteTimeoutHours.

9.6.4.5.7.5 Nomad installer command-line arguments

The following installer arguments can be set on the Nomad installer command-line to configure NMDS:

MODULE.NOMAD.ENFORCEQUOTAS

MODULE.NOMAD.MAXALLOCREQUEST

MODULE.NOMAD.MAXCONCURRENCY

MODULE.NOMAD.MAXIMUMMEGABYTE

MODULE.NOMAD.POSTCOMPLETETIMEOUTHOURS

MODULE.NOMAD.PRECOMPLETETIMEOUTHOURS

9.6.4.5.7.6 Using PBA from a client

The following illustrates the high-level order that the PBA process is initialized, used and completed during Task Sequence execution.

Run the NMDS_POLL command from the PBA client that requires a network share to store its data. This requests a named PBA share on the local subnet. The locally configured PBA hosts will hold an election to decide the PBA host for this request.

Copy files to the network share created on the winning PBA host.

Run the NMDS_COMPLETE command from the PBA client that requested the share. This tells the PBA host that the copy to the named share is been completed and disconnects from it.

Optionally, create extra backups by running NMDS_HA.

Perform the OS refresh.

Run the NMDS_FIND command from the PBA client that requested the share. This locates the PBA host that holds the named share on the local subnet.

Copy files from its share.

Run the NMDS_DELETE command from the PBA client that requested the share. This deletes the named share from the PBA host.

For details on the *NomadBranch.exe* commands refer to NomadBranch.exe command-line switches. *NomadPackageLocator.exe* can also accept the PBA NMDS commands, but it invokes *NomadBranch.exe* to do the work.

9.6.4.5.8 Secondary PBA backup data store

Note

Support for this configuration is deprecated and is currently provided for backwards compatibility only. The PBA task sequence dialogs do not support this option, therefore some scripting would be required to achieve the same functionality.

Please use High Availability (HAPBA) instead.

Note

Please note the:

Nomad PBA Task Sequence steps are not designed for use with offline USMT or WinPE

-NMDS_POLL command-line option for the NomadPackageLocator.exe tool cannot be used in WinPE

-NMDS_<command> command-line options for NomadBranch.exe have not been tested in WinPE, so their behavior may be unpredictable in that environment.

The implementation of the secondary cache uses an optional third parameter available in the NMDS_POLL command:

```
NomadBranch.exe -NMDS_POLL,<name>,<size>[,<ignore_offer>]
```

Where *<ignore_offer>* is used to specify the name of a NMDS host that already has the user data cached. Thus, when *NMDS_POLL* is run a second time with the same *<name>* and *<size>* values as on the first call, it effectively allows a second NMDS host to offer its services as a cache. In this way user state can be saved to two caches, for increased resilience. On restore, the first cache that responds to the *NMDS_FIND* request will be the one used.

A typical task sequence to use this feature looks something like this:

...

(First save)

Peer Backup Assistant: Provision Nomad PBA Data Store (which runs NomadPackageLocator.exe -NMDS_POLL,%COMPUTERNAME%,<cache_space_in_MB> behind the scenes)

Capture User State (using USMT)

Peer Backup Assistant: Close Nomad PBA Data Store.

...

(Second save)

Run Command Line action to execute a script that will extract the hostname of the NMDS host used for the first save and set an environment variable, e.g. *PBAFirstHost*.

The value to be used can be extracted from the *OSDStateStorePath* environment variable set by the "Provision" step in the first save.

The *OSDStateStorePath* value is of the form "*hostname**sharename*", and *PBAFirstHost* should be set to the *hostname* part. See example scripts below.

Run Command Line action to execute "*NomadPackageLocator.exe -NMDS_POLL,%COMPUTERNAME%,<cache_space_in_MB>,%PBAFirstHost%*". This replaces the Peer Backup Assistant: Provision Nomad PBA Data Store step used in the First save.

> Note that using *NomadPackageLocator.exe* rather than *NomadBranch.exe* additionally sets key environment variables, specifically *OSDStateStorePath*.

Capture User State (using USMT), again

Peer Backup Assistant: Close Nomad PBA Data Store (again).

...

(After applying or refreshing O/S, restore user state in the usual PBA way)

Peer Backup Assistant: Locate Existing Nomad PBA Data Store (One of the caches will be selected.)

Restore User State (USMT)

Peer Backup Assistant: Release Nomad PBA Data Store.

...

> **Note**
>
> Only one *NMDS_DELETE*call, invoked by the Release Nomad PBA Data Store action will have any effect, and it will delete the cache on only one host (the one that responded to the Locate Existing Nomad PBA Data Store request). The other cache will expire automatically after 7 days (default setting), but this may be a problem if space is tight on the Nomad cache hosts.
>
> To get round the problem, append these actions to the task sequence above:

Peer Backup Assistant: Locate Existing Nomad PBA Data Store (This will find the second cache, now that the first has been deleted.)

Peer Backup Assistant: Release Nomad PBA Data Store (To delete the second cache).

9.6.4.5.8.1 Example scripts

Here are two example scripts to implement PBA secondary backup data store:

9.6.4.5.8.1.1 VBS

```
Option Explicit
Dim oTSEnv, arrTemp
Set oTSEnv = CreateObject("Microsoft.SMS.TSEnvironment")
'Get Hostname from OSDStateStorePath
arrTemp = Split(oTSEnv("OSDStateStorePath"),"\")
'Set PBAFirstHost Variable
oTSEnv("PBAFirstHost") = arrTemp(2)
```

9.6.4.5.8.1.2 Powershell

```
$tsenv = New-Object -COMObject Microsoft.SMS.TSEnvironment
#Get Hostname from OSDStateStorePath
$arrTemp = $tsenv.value("OSDStateStorePath").Split("\")
```

```
#Set PBAFirstHost Variable
$tsenv.value("PBAFirstHost") = $arrTemp[2]
```

9.6.5 Supported Platforms

A list of all the platforms supported by Nomad, and the software required to allow Nomad to be installed or to work.

9.6.5.1 Tachyon Platform

Although not a requirement for generally using Nomad, the Tachyon Platform must be installed and available before you can use certain features.

The following features use Content Distribution and require Tachyon platform and platform features of Nomad to be enabled:

Nomad app provides visibility of content distribution activity.

Single Site Download (SSD) (SSD).

Single Site Peer Backup Assistant - SSPBA (SSPBA).

High Availability PBA (HAPBA) (HAPBA).

Get Migration Settings task sequence action used to manage computer associations.

Nomad Pre-caching.

Nomad Download Pause.

> **Note**
>
> Nomad versions prior to Nomad 7.1 used ActiveEfficiency to support similar features. Tachyon platform previously included ActiveEfficiency.

The following features were provided in versions older than Nomad 7.1

1E Client Health - now provided by the Guaranteed State feature of the platform.

Nomad Dashboard - now provided by Nomad app feature of the platform.

For everything you need to know about getting the platform installed and running in your network, please refer to Planning for Tachyon.

Refer to Server software for Tachyon server requirements and information that will help you design and plan the implementation of Tachyon in your organization.

9.6.5.2 Nomad Administration Tools

Category	Product	Notes
Windows OS	OS versions supported by	

Category	Product	Notes
	Configuration Manager versions are listed below.	
Microsoft Endpoint Manager Configuration Manager	MECM CB 2203 MECM CB 2111 MECM CB 2107 MECM CB 2103 MECM CB 2010	1E maintains a testing cycle for our products relative to the Current Branch release cycle. Please refer to Microsoft Rapid-Release Cycle on https://support.1e.com/ for the latest information on future releases of CM Current Branch, and any advisories related to these releases. **Note** When using CB 1910, be sure to apply Hotfix rollup KB4537079 or later to sites. Prior to this update, there is an issue that prevents Alternate Content Providers downloading certain types of content referenced in Task Sequences. **Note** Microsoft, and therefore 1E, no longer support CB1706. If you are running CB1706 and find that NomadAdminUI is not working as expected, we recommend you apply KB4036267 to address the issue. For each Configuration Manager site server where you intend to administer task sequence packages to use Tachyon as the alternate download provider, you need to ensure that: The Configuration Manager Admin Console must be installed on the site server – as is the case in a default Configuration Manager installation. This is a prerequisite for installing the Admin Console GUI extensions, which must be installed on the site server before installing on any remote Configuration Manager console. Ensure you meet the prerequisites for Configuration Manager if you are using the **BIOS to UEFI** feature: BIOS TO UEFI 1.4 - Requirements.

Category	Product	Notes
		Note If these conditions are not met, the Tachyon settings for task sequences will not be created correctly. This is the case even if you install a remote Configuration Manager Admin Console with the Nomad Admin Console GUI extension, except for Nomad Branch Tools, which are required to be installed on Configuration Manager Site Server only.
Runtime libraries	Visual C++ 2013 Redistributable ASP.NET Core Framework 3.1 .NET Framework 4.8	**Note** .NET Framework is required for the **Admin Console GUI extensions**, the **Download Monitor**, and **NomadBranch GUI**. It is not a requirement for other features of Nomad.
Antivirus	Nomad is able to work with Antivirus systems provided they have certain exclusions configured.	It is likely that performance will be impaired by antivirus programs. To mitigate this, we have detailed suggested antivirus exclusions you can implement. Please refer to Nomad post-installation tasks.

Nomad client

The 1E Client (with Nomad client enabled) must be installed on client devices and Configuration Manager Distribution Points.

Category	Product	Notes
Windows OS	Windows Server 2022	The zip for 1E Client for Windows is available for download from the 1E Exchange.
	Windows Server 2019	Professional and Enterprise editions are supported for Windows 10 and Wndows 11.
	Windows Server 2016	All versions are provided with 32-bit & 64-installers, and can be installed on physical and virtual computers.

Category	Product	Notes
	Windows 11 CB 21H2 Windows 10 CB 21H2 Windows 10 CB 21H1 Windows 10 CB 20H2	**Note** This list shows only those OS versions in mainstream support by Microsoft, and therefore supported by Tachyon, and by 1E Client 8.1. Please refer to Constraints of Legacy OS regarding the end of mainstream support. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Refer to Support for Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions. For Windows Server 2016 Core Server installations: Only 64-bit versions are supported Distribution Points on this OS do not support PXE or Multicast. For installation guidance on Windows, please refer to Deploying 1E Client on Windows. Nomad and Nomad Multicast require MSXML6 to communicate with the Configuration Manager client. This is present in all the supported versions of Windows (with the required service packs). Peer copy over HTTP or HTTPS is the recommended method of peer sharing content.
Runtime libraries	.NET Framework 4.8	.NET Framework is required only for the following features of 1E Client:

Category	Product	Notes
	.NET Framework 4.7.2 .NET Framework 4.7.1 .NET Framework 4.7 .NET Framework 4.6.2 .NET Framework 4.6.1 .NET Framework 4.6	The Real-Time Control Center feature of the 1E Client (also known as 1E Client UI and Interaction module) supports Experience Engagements (Announcements and Surveys), and ITSM Support Tickets Windows Servicing Assistant (WSA) feature of the Shopping client module, which supports OS deployment, upgrades and migrations. **Note** This list is automatically updated to show only those .NET Framework versions in mainstream support by Microsoft, and therefore supported by 1E, and by Tachyon 8.1. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.
Other Windows Software	Visual C++ 2013 Redistributable Nomad 7.0 (or later) PowerShell 3.0 (or later)	1E Client installer includes the redistributable package for Visual C++ 2013. 1E Client provides client features. It also includes the Nomad client module which replaces the legacy branch client. Tachyon client features can optionally use Nomad to download content (feature enabled by default) if the Nomad client module in is enabled (module disabled by default) or Nomad Branch 7.0 or later is running. PowerShell is not a prerequisite for the installation of the 1E Client. PowerShell is used by some Tachyon instructions (that have PowerShell commands embedded or scripts that are downloaded) and some of these require PowerShell 3.0 or later. For more details, please refer to Downloading client content and Nomad integration.

Category	Product	Notes
Microsoft Endpoint Manager Configuration Manager Client	MECM CB 2203 MECM CB 2111 MECM CB 2107 MECM CB 2103 MECM CB 2010	**Note** This list is automatically updated to show only those Configuration Manager versions in mainstream support by Microsoft, and therefore supported by 1E, and by Nomad 8.1. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Please refer to the Support for Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions. 1E maintains a testing cycle for our products relative to the Current Branch release cycle. Please refer to Microsoft Rapid-Release Cycle on https://support.1e.com/ for the latest information on future releases of CM Current Branch, and any advisories related to these releases. **Note** When using CB 1910, be sure to apply Hotfix rollup KB4537079 or later to sites. Prior to this update, there is an issue that prevents Alternate Content Providers downloading certain types of content referenced in Task Sequences. **Note** If IIS filtering is enabled on Distribution Points, you may encounter problems during downloads if certain types of content are present in the download. Please refer to IIS Request Filtering.

Category	Product	Notes
		(Microsoft Endpoint Configuration Manager is also known as Configuration Manager, ConfigMgr, Config Man, CM and SCCM among other names. Version names include 2012 and Current Branch or CB.)
Antivirus	Nomad is able to work with Antivirus systems provided they have certain exclusions configured.	It is likely that Tachyon performance will be impaired by antivirus programs. To mitigate this, we have detailed suggested antivirus exclusions you can implement. Please refer to Nomad post-installation tasks.

9.6.5.3 Legacy OS constraints

In this documentation, the following are referred to as legacy OS. Below are described some known issues for these OS.

1E does not provide support for 1E products on the following OS unless the OS is explicitly listed as being supported for a specific 1E product or product feature. This is because Microsoft has ended mainstream support for these OS or they are not significantly used by business organizations.

Windows XP *	**Windows Server 2003 ***
Windows Vista	**Windows Server 2008**
Windows 7	**Windows Server 2008 R2**
Windows 8.0	**Windows Server 2012**
Windows 8.1	**Windows Server 2012 R2**

> **Note**
>
> 1E Client 8.1 and later will not install on Windows XP and Windows Server 2003. Please contact 1E if you intend to continue using any of the other legacy OS. If you experience an issue, then please try replicating the issue on a supported OS.

For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.

9.6.5.3.1 PowerShell limitations

PowerShell version 3.0 (required by some Tachyon instructions) is not supported on Windows XP, Vista and Server 2003. However, PowerShell 2.0 is supported on the following OS versions:

Windows XP SP3

Vista SP1 & SP2

Windows Server 2003 R2 & SP2.

9.6.5.3.2 Certificate limitations - SHA2

Like most software vendors, 1E software requires the OS to support SHA2. If your organization has a PKI configured to use SHA2 256 or higher encryption, then your legacy OS may have already been updated to support it.

Windows XP and Server 2003 require an update as described in **KB968730.** Microsoft no longer provides this hotfix as a download. You must contact Microsoft Support if you need it

Windows 7 and Server 2008 R2 require an update as described in **KB3033929**. This update is not available for Vista and Server 2008

Windows 8, 8.1, Server 2012, Server 2012 R2 and later OS already support SHA2.

9.6.5.3.3 Certificate limitations - encrypted certificate requests

Windows XP and Server 2003 are unable to encrypt certificate requests, whereas later OS are able to support higher more secure RPC authentication levels. If you are using a Microsoft CA and expect these clients to request (enrol) certificates then the CA must have its IF_ENFORCEENCRYPTICERTREQUEST flag disabled. It is disabled by default on Windows 2003 and 2008 CA, but is enabled by default on Windows 2012 CA.

To determine which InterfaceFlags are set, execute the following command on the CA server:

```
certutil -getreg CA\InterfaceFlags
```

If the following is specified then it means the flag is enabled.

```
IF_ENFORCEENCRYPTICERTREQUEST -- 200 (512)
```

To disable the encrypt certificate requests flag, execute the following commands on the CA server:

```
certutil -setreg CA\InterfaceFlags -IF_ENFORCEENCRYPTICERTREQUEST
sc stop certsvc
  sc start certsvc
```

9.6.5.3.4 Certificate limitations - signing certificates missing

On Windows computers, the installation MSI files, and binary executable and DLL files of 1E software are digitally signed. The 1E code signing certificate uses a timestamping certificate as its countersignature. 1E occasionally changes its code signing certificate, and uses it for new releases and patches for older versions, as shown in the table(s) below.

Root Certificate Authorities are implicitly trusted to validate certificates, and their certificates must be correctly installed to do this. Your computers should already have the necessary **root CA** certificates installed, however this may have been prevented by your organization's security policies, or inability to connect to the Internet, or they are legacy OS. In general this is not an issue because by default Windows allows software to be installed and run without validation, although you may see a warning or experience a delay. However, you *must* have relevant CA certificates installed if you are using 1E Client (which self-validates its own files), or your organization has applied more secure polices (for example UAC, AppLocker or SmartScreen).

Typical reasons for issues with signing certificate are:

If your organization has disabled **Automatic Root Certificates Update** then you must ensure the relevant **root CA** certificates are correctly installed on each computer

If computers do not have access to the Internet then you must ensure the relevant **root and issuing CA** certificates are correctly installed on each computer, numbered in the table(s) below.

The signature algorithm of the 1E code signing certificate is SHA256RSA. In most cases, the file digest algorithm of an authenticode signature is SHA256, and the countersignature is a RFC3161 compliant timestamp. The exception is on legacy OS (Windows XP, Vista, Server 2003 and Server 2008) which require the file digest algorithm of an authenticode signature to be SHA1, and a legacy countersignature.

The table below applies to software and hotfixes released in 2020.

2020	**Signing certificate**	**Timestamping certificates**
Certificate	1E Limited	TIMESTAMP-SHA256-2019-10-15 ***and*** DigiCert Timestamp Responder
Issuing CA	**DigiCert EV Code Signing CA (SHA2)** Thumbprint: 60ee3fc53d4bdfd1697ae5beae1cab1c0f3ad4e3	**DigiCert SHA2 Assured ID Timestamping CA** Thumbprint: 3ba63a6e4841355772debef9cdcf4d5af353a297 ***and*** **DigiCert Assured ID CA-1** Thumbprint: 19a09b5a36f4dd99727df783c17a51231a56c117
Root CA	**DigiCert High Assurance EV Root CA** Thumbprint: 5fb7ee0633e259dbad0c4c9ae6d38f1a61c7dc25	**DigiCert Assured ID Root CA** Thumbprint: 0563b8630d62d75abbc8ab1e4bdfb5a899b24d43

This is described in Digital signing certificates. To verify if you affected by this issue see 1E Digital Signing Certificates.

9.6.5.3.5 Certificate limitations - expired root certificates

Ensure that your Root CA Certificates are up-to-date on clients and servers. The **Automatic Root Certificates Update** feature is enabled by default, but its configuration may have been changed or restricted by Group Policy **Turn off Automatic Root Certificates Update**.

If this GPO is enabled, then you will see *DisableRootAutoUpdate = 1 (dword)* in *HKLM\Software\Policies\Microsoft\SystemCertificates\AuthRoot.*

9.6.6 1E Companion Products

A list of the feature dependencies between Nomad and other 1E companion products.

This page describes the dependencies to and from Nomad in regard to certain features that are implemented across companion 1E products. To view the general platform related dependencies for Nomad please refer to Supported Platforms.

9.6.6.1 1E companion products that Nomad depends on

Supported versions of 1E companion products that Nomad features depend on.

Products and features that Nomad depends on	Supported versions of companion products	
Tachyon Platform	Nomad Download Pause feature is an optional feature of Nomad and requires a full Tachyon infrastructure.	Nomad 7.0.200 Nomad 7.0.100 Nomad 7.0 Nomad 7.1 Nomad 8.0 Nomad 8.1

9.6.6.2 1E companion products that depend on Nomad

Supported versions of 1E companion products with features that depend on Nomad.

For products that depend on the 1E Client, please refer to 1E Companion Products that depend on 1E Client 8.0.

Products and features that depend on Nomad	Supported versions of companion products	
Tachyon Platform	Tachyon clients can optionally use Nomad (1E Client with Nomad client features enabled) to provide more efficient downloading of content.	1E Client 5.1 (with Nomad client enabled) 1E Client 5.0 (with Nomad client enabled) 1E Client 4.1 (with Nomad client enabled).

9.6.7 Communication ports

Diagrams and tables with all the external Nomad communication ports. Useful, if needed, for network and device firewalls.

9.6.7.1 Networking

Due to the nature of how proxy servers can be implemented, some of which can be quite complex, you may need to consult your networking specialist to see if exceptions need to be added to enable Nomad's peer-copy over HTTP or HTTPS.

The following are the ports used by Nomad client on clients and on Distribution Points. The table does not include Configuration Manager communications, which can be found here: https://docs.microsoft.com/en-us/sccm/core/plan-design/hierarchy/communications-between-endpoints.

Ports	Notes	Configurable
UDP 1779	Default port Nomad uses for listening to elections to determine the master on a subnet, control traffic and for content transfer if you have Connectionless enabled. A firewall exception must exist for this port. Nomad will create one automatically for Windows firewall, but not for other firewall software.	Yes, during installation.
TCP 80 (HTTP) or	Used when the Nomad master requests LSZ files from Nomad running on the DP and when the	No, for communications with CM components. Nomad service on startup reads the configured ports from CM

Ports	Notes	Configurable
TCP 443 (HTTPS)	Nomad master downloads content using Nomad as provider. Communications depend on how the DP is configured. Configuration Manager is configured to use either HTTP or HTTPS. If Nomad clients and Content Distribution are configured to use HTTP/S, Nomad clients using SSD register and query for content.	client registry and uses the same for LSZ generation. Yes, for communications with Tachyon Platform using Nomad's PlatformURL setting.
TCP 5080 (HTTP) or TCP 5443 (HTTPS)	Default HTTP port to use for peer copy. If you are using a custom port, ensure that all agents use the same custom port. From Nomad 6.2, peer copy can be enabled over HTTP (default 5080) or HTTPS (default 5443). You can customize the ports for this feature in the host registry but a change to the default impacts Nomad's peer backup assistant which is used to capture user data on remote peers during OS deployments.	Yes, during installation.
TCP 139 (SMB) and TCP 445 (SMB over TCP)	Required only if SMB is enabled. Used for peer-to-peer content transfer between the Nomad master and Nomad peers. Communications depend on how the DP is configured. That is HTTP, HTTPS, SMB or SMB over TCP. For Configuration Manager the default is HTTP or HTTPS. Windows Firewall automatically adds the exception when you enable **File and Print Sharing** but you may have to do this manually if you are using a different firewall product.	No. SMB ports cannot be configured.
TCP 137 (SMB) and TCP 139 (SMB)	Required only if SMB is enabled. Used by SMB for data transfer and related communications. It is used to resolve NetBIOS names during a transfer. UDP NetBIOS name query packets are sent to this port.	No. SMB ports cannot be configured.

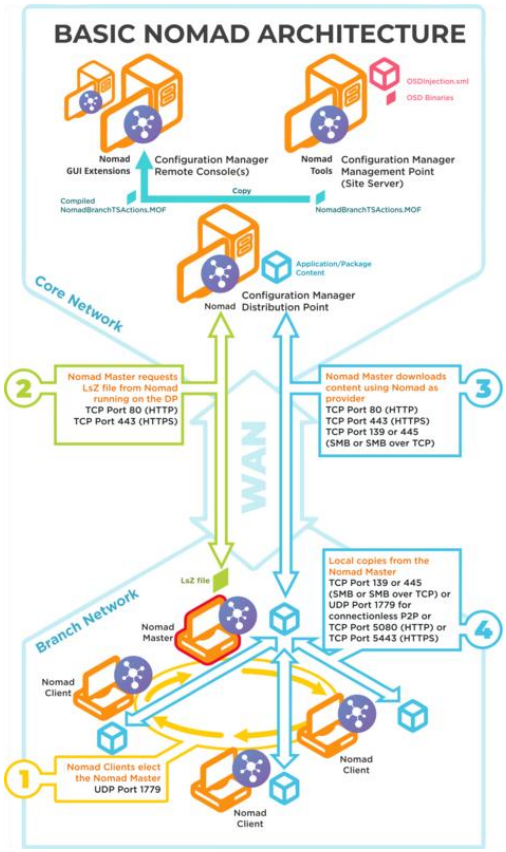
Ports	Notes	Configurable
	Windows Firewall automatically adds the exception when you enable **File and Print Sharing** but you may have to do this manually if you are using a different firewall product.	

Nomad can use ephemeral ports (not discussed here). Ephemeral or high ports can either be UDP or TCP depending on the protocols used and are used to send information out. In a typical client-server communication, these are ports opened by the client on its own machine in order to send something to the server and they are closed as soon as the transmission is done, hence the term ephemeral. From a security perspective, it is not an issue.

Most firewalls will allow outgoing communications by default so in all likelihood, you will not need to do any firewall configuration. However, if your firewall blocks these outbound communications, consult the documentation for your firewall on how to enable these types of communications.

9.6.7.2 Basic Nomad architecture

Click image to enlarge.

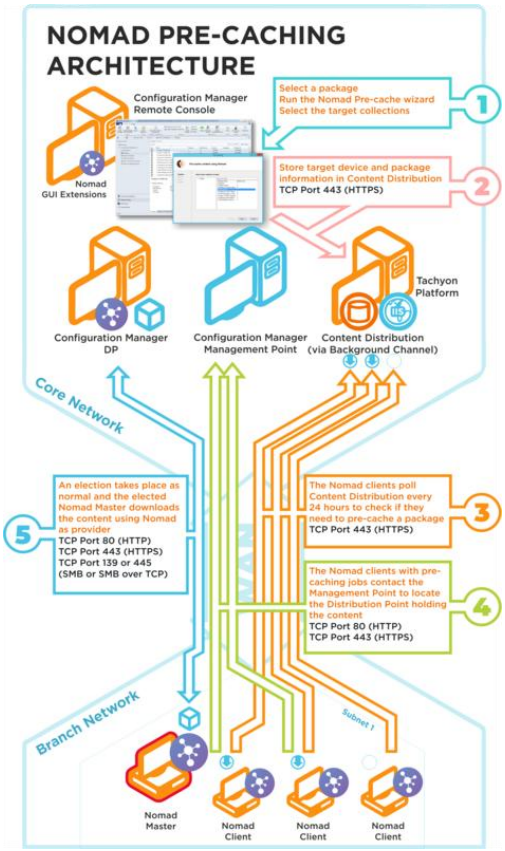


Ports	Notes
UDP 1779	**Step 1** By default, Nomad uses UDP Port 1779 to communicate during the election process for determining the master on a subnet. The Nomad installer will automatically add *NomadBranch.exe*,*NomadPackageLocator.exe* and *PackageStatusRequest.exe* to the list of excepted programs in the native Windows Firewall. The default value for the port may be changed at install time using the MODULE.NOMAD.P2PPORT installer property or post-installation by changing the P2P_Port registry value. If you change the default port, you must ensure all Nomad clients communicate using the same port. The Nomad port (by default UPD Port 1779) must be open on all wireless access points to facilitate Nomad peer-to-peer communications. Not all vendors enable this port by default, please refer to the specific device vendor's documentation for details on how to enable ports on each WAP device.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 2** Nomad Master requests LSZ file from Nomad running on the DP.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 3** Nomad Master downloads content using Nomad as provider. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager the default setting is HTTP or HTTPS.
TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 4** Local copies from the Nomad master. The recommended way to facilitate Nomad cache access is to enable Windows File and Print Sharing. If this is not feasible on your network environment you can configure Nomad to use

Ports	Notes
UDP 1779 (used for connectionless P2P) TCP 5080 (HTTP) TCP 5443 (HTTPS)	different means to access network shares, see Nomad cache for more details on configuring this option. Connections may use one of the following: SMB SMB over TCP Connectionless P2P HTTP HTTPS

9.6.7.3 Nomad pre-caching architecture and ports

Click image to enlarge.

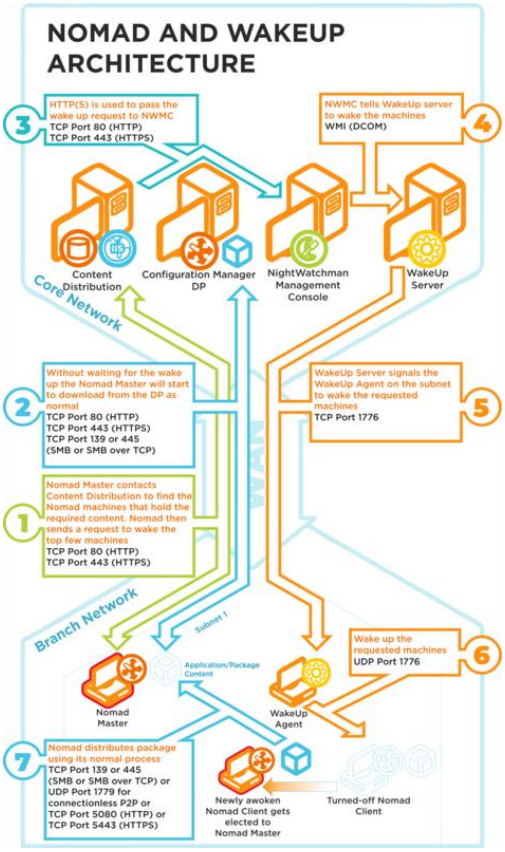


The Nomad pre-caching uses the following ports in its communications. If a site server is configured to use custom ports, pre-caching will use those ports to communicate with a management or distribution points. To ensure high-availability, pre-caching falls back to next available site server if it fails to communicate with a management or distribution point.

Ports	Description
N/A	**Step 1** Choose a package and run the Nomad pre-caching wizard, selecting the target device collection. This step does not require any port configuration but the Nomad Configuration Manager console extensions must be installed in the Configuration Manager Console.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 2** The Nomad pre-caching wizard stores the target device and package information in Tachyon.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 3** The Nomad clients, where the pre-cache feature has been enabled, poll Tachyon every 24 hours to see if they need to pre-cache some content. This takes the form of pre-caching notifications that tell the Nomad clients they need to process a download job to fetch the specified content.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 4** The Nomad clients, with pre-caching notifications, contact the Management Point to locate the Distribution Point that holds the content. This may use HTTP or HTTPS depending on how the Management Point is configured.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 5** A Nomad Master election takes place and the elected master processes the job by downloading the pre-cache content using Nomad as provider. This is then distributed locally to the Nomad peers that also require the pre-cached content. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager the default setting is either HTTP or HTTPS.

9.6.7.4 Nomad and WakeUp integration architecture and ports

Click image to enlarge.

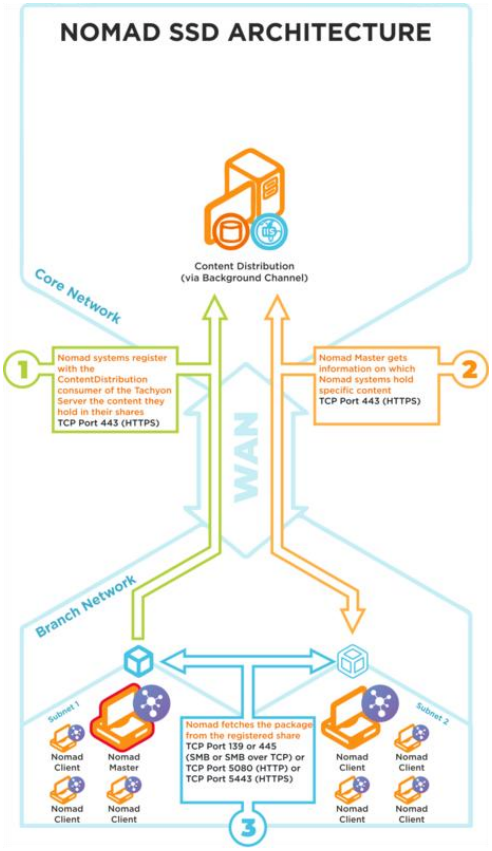


Ports	Description
TCP 80 (HTTP)	**Step 1**
TCP 443 (HTTPS)	Nomad Master contacts Content Distribution and gets a list of Nomad devices that hold the content it requires. Nomad sends a request to wake the top 5 devices on the list. Refer to WakeUpBatchSize for details about how you can set the maximum number of machines to wake up in a single call.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 2** Without waiting for any devices to be awoken, the Nomad master starts to download content from the DP. This communication depends on how the DP is configured. It may be one of the following: HTTP

Ports	Description
	HTTPS SMB SMB over TCP For Configuration Manager, the default setting is HTTP or HTTPS.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 3** Content Distribution posts the wake message from Nomad to the NightWatchman Management Center Web API.
WMI (DCOM)	**Step 4** NightWatchman Management Center tells the WakeUp server to wake the requested devices.
TCP 1776	**Step 5** WakeUp Server signals the WakeUp Agent on the appropriate subnet to wake the requested devices.
UDP 1776	**Step 6** The WakeUp agent on the subnet sends a wakeup request to the requested devices.
TCP 139 (SMB) TCP 445 (SMB over TCP) UDP 1779 (connectionless P2P)	**Step 7** As part of its standard behavior, Nomad holds regular elections (every 5 minutes) to determine the most appropriate master. If a device is found (i.e. one that has been recently awoken) that holds more of the required content, it stops downloading from the DP and fetches the content from the new device's cache. This may be via SMB or via connectionless P2P, depending on the configuration of Nomad.

9.6.7.5 Nomad SSD architecture and ports

Click image to enlarge.



Nomad SSD uses the following ports in its communications:

Ports	Notes
TCP 80 (HTTP)	**Step 1**
TCP 443 (HTTPS)	Nomad systems on the branch site register in Content Distribution the content they hold in their shares
TCP 80 (HTTP)	**Step 2**
TCP 443 (HTTPS)	Nomad Masters get information on which Nomad systems hold specific content
TCP 80 (HTTP)	**Step 3**
TCP 443 (HTTPS)	Nomad Master fetches a package from the registered Nomad share on a neighboring subnet
TCP 139 (SMB)	
TCP 445 (SMB over TCP)	

We recommend that the latest version of Tachyon Platform is installed to support this feature, please refer to Requirements for more details.

9.6.8 Log files

Names and locations of log files created by Nomad.

9.6.8.1 Nomad logs

The default location for all Nomad logs is the folder *%ALLUSERSPROFILE%\1E*

For issues relating to	Required log files	Location of log files
1E Client	*1E.Client.log* *NomadBranchUninstall-YYY-MM-DDThh_mm_ss_000Z.log*	Default location: %ALLUSERSPROFILE%\1E\Client\
Nomad client	*NomadBranch.log*	Default location: %ALLUSERSPROFILE%\1E\NomadBranch\ Optional location if installed using 1E Client Deployment Assistant (CDA): C:\WINDOWS\CCM\Logs\
OS deployment	*NomadPackageLocator.log* *NBCacheActions.log* All Configuration Manager logs including *SMSTS.log*	The path changes at the different stages of an OS deployment.
Nomad and ContentDistribution integration	*ContentDistribution.log*	%ALLUSERSPROFILE%\1E\ContentDistribution\
Delivery Optimization monitoring and reporting	*NomadBranch.DO.log*	Default location: %ALLUSERSPROFILE%\1E\NomadBranch\ NomadBranch.DO.log is created when Delivery Optimization monitoring and reporting are enabled using the

For issues relating to	Required log files	Location of log files
		DeliveryOptimizationReportingEnabled registry value.

9.6.8.1.1 Logging Levels

The table below describes the logging levels which are configurable for server components.

Value	Description
Error	Only outputs errors. An error is a serious problem, typically requiring operator intervention of some sort to restore full functionality.
Warn	Outputs errors and warnings. A warning indicates a potential problem, where the system can nonetheless function without intervention.
Info	Outputs general information in addition to errors and warnings. This is the default.
Debug	Outputs debugging information in addition to all the previous levels.

Warning

Logging levels should only be changed from **info** only if requested by 1E Support and reset to **info** after investigation is complete.

Tip

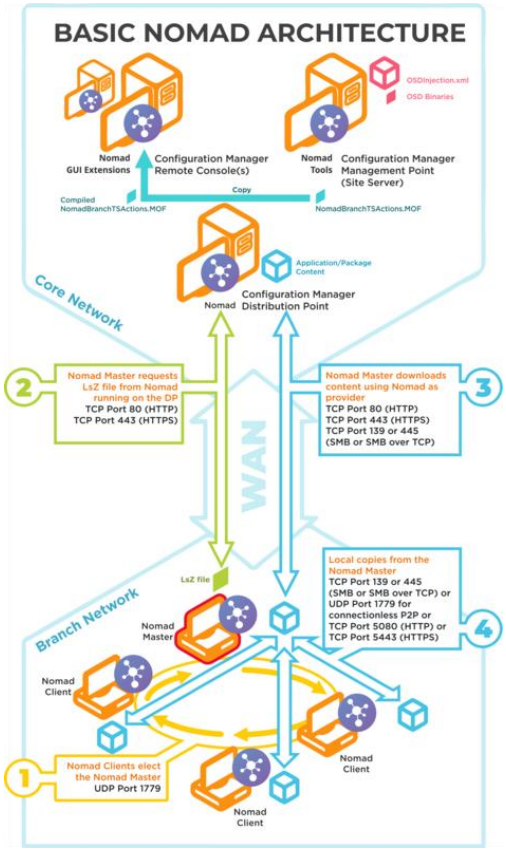
The method of configuring logging levels uses the above text values, where -log=0 is the default to mean the same as `-log=info`.

9.6.9 Nomad architecture

A description of Nomad and its components and how they connect. The page provides a brief overview of each feature and links to other pages with more detail.

9.6.9.1 Basic Nomad architecture

Click image to enlarge.

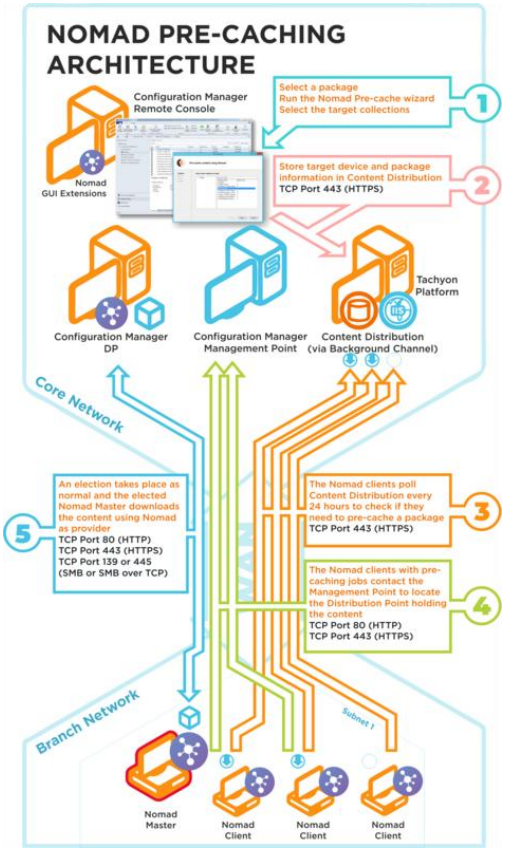


Ports	Notes
UDP 1779	**Step 1** By default, Nomad uses UDP Port 1779 to communicate during the election process for determining the master on a subnet. The Nomad installer will automatically add *NomadBranch.exe*,*NomadPackageLocator.exe* and *PackageStatusRequest.exe* to the list of excepted programs in the native Windows Firewall. The default value for the port may be changed at install time using the MODULE.NOMAD.P2PPORT installer property or post-installation by changing the P2P_Port registry value. If you change the default port, you must ensure all Nomad clients communicate using the same port. The Nomad port (by default UPD Port 1779) must be open on all wireless access points to facilitate Nomad peer-to-peer communications. Not all vendors enable this port by default, please refer to the specific device vendor's documentation for details on how to enable ports on each WAP device.
TCP 80 (HTTP)	**Step 2**

Ports	Notes
TCP 443 (HTTPS)	Nomad Master requests LSZ file from Nomad running on the DP.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 3** Nomad Master downloads content using Nomad as provider. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager the default setting is HTTP or HTTPS.
TCP 139 (SMB) TCP 445 (SMB over TCP) UDP 1779 (used for connectionless P2P) TCP 5080 (HTTP) TCP 5443 (HTTPS)	**Step 4** Local copies from the Nomad master. The recommended way to facilitate Nomad cache access is to enable Windows File and Print Sharing. If this is not feasible on your network environment you can configure Nomad to use different means to access network shares, see Nomad cache for more details on configuring this option. Connections may use one of the following: SMB SMB over TCP Connectionless P2P HTTP HTTPS

9.6.9.2 Nomad pre-caching architecture and ports

Click image to enlarge.



The Nomad pre-caching uses the following ports in its communications. If a site server is configured to use custom ports, pre-caching will use those ports to communicate with a management or distribution points. To ensure high-availability, pre-caching falls back to next available site server if it fails to communicate with a management or distribution point.

Ports	Description
N/A	**Step 1** Choose a package and run the Nomad pre-caching wizard, selecting the target device collection. This step does not require any port configuration but the Nomad Configuration Manager console extensions must be installed in the Configuration Manager Console.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 2** The Nomad pre-caching wizard stores the target device and package information in Tachyon.
TCP 80 (HTTP)	**Step 3** The Nomad clients, where the pre-cache feature has been enabled, poll Tachyon every 24 hours to see if they need to pre-cache some content. This takes the form

Ports	Description
TCP 443 (HTTPS)	of pre-caching notifications that tell the Nomad clients they need to process a download job to fetch the specified content.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 4** The Nomad clients, with pre-caching notifications, contact the Management Point to locate the Distribution Point that holds the content. This may use HTTP or HTTPS depending on how the Management Point is configured.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 5** A Nomad Master election takes place and the elected master processes the job by downloading the pre-cache content using Nomad as provider. This is then distributed locally to the Nomad peers that also require the pre-cached content. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager the default setting is either HTTP or HTTPS.

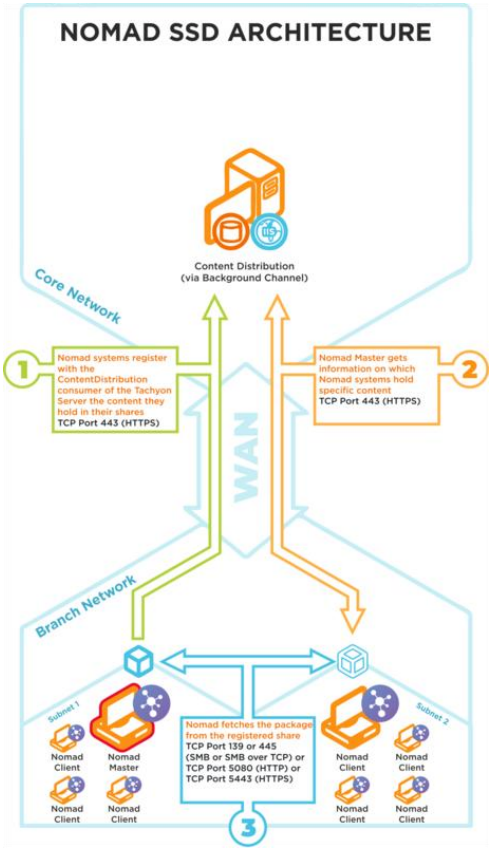
9.6.9.3 Nomad and 1E WakeUp integration architecture and ports

Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.

The wake up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution and a NightWatchman infrastructure. The feature is enabled during installation of NightWatchman Management Center. Please refer to Nomad Preparation for requirements.

9.6.9.4 Nomad SSD architecture and ports

Click image to enlarge.



Nomad SSD uses the following ports in its communications:

Ports	Notes
TCP 80 (HTTP)	**Step 1**
TCP 443 (HTTPS)	Nomad systems on the branch site register in Content Distribution the content they hold in their shares
TCP 80 (HTTP)	**Step 2**
TCP 443 (HTTPS)	Nomad Masters get information on which Nomad systems hold specific content
TCP 80 (HTTP)	**Step 3**
TCP 443 (HTTPS)	Nomad Master fetches a package from the registered Nomad share on a neighboring subnet
TCP 139 (SMB)	
TCP 445 (SMB over TCP)	

We recommend that the latest version of Tachyon Platform is installed to support this feature, please refer to Requirements for more details.

9.6.10 Nomad command-line switches

Nomad accepts configuration changes that can be specified on the command-line. The command-line options for Nomad should be denoted using double dashes (--) or double slashes (//) to distinguish them from the main install command-line.

For Configuration Manager additional Nomad options for controlling the Nomad Provider are denoted using double plusses (++).

The references for the command-line switches for both the Nomad executable files are given under the following links.

SMSNomad.exe command-line switches

NomadBranch.exe command-line switches

The references for the command-line switches for Nomad utilities are given under the following links:

NomadPackageLocator.exe command-line switches

TSEnv2 command-line switches

CacheCleaner.exe command-line switches

9.6.10.1 SMSNomad.exe command-line switches

This executable does not normally need to be run on a command-line, but details are provided here for reference purposes. SMSNomad.exe is normally installed as part of Nomad and configured using Configuration Manager Admin console extensions. It is also available in Nomad OSD tools in order to include in WinPE images so that Nomad can be used in OS Deployments.

Please refer to Distributing software with Nomad and Configuration Manager: Nomad tab for different types of content and Installing Nomad Branch Tools for a step-by-step guide to installing Nomad Branch Tools, which contains the Nomad Configuration Manager console extensions and Nomad OSD tools.

The format of the Nomad command-line is as follows:

```
SMSNomad.exe [switches] InstallCommandLine
```

Where InstallCommandLine is the command-line required for the target installation. For example:

```
SMSNomad.exe --wr=20 setup.exe
SMSNomad.exe msiexec.exe /i install.msi /qn
```

> **Note**
>
> The double dash is required to distinguish the Nomad command-line switches from the Configuration Manager command-line switches.

The following table shows the Nomad command-line switches and their description:

Switch	Default value	Description
--//		Use this option to enable the use of double slash arguments in the target command-line (required by *cscript.exe)*. For example, the following command-line sets *cscript* to not display its logo while running: `smsnomad.exe --// cscript.exe //Nologo`
--contentid		The content identifier.
--cp		Supported in dd-alone mode only. `--cp=CachePath` Can be used to override the cache path (destination directory) of the download. This does not support peer sharing. As the new CachePath location is not shared, peer machines will not be able to copy from this cache. This feature is suitable for protecting bandwidth when downloading to single devices. This value is set for the duration of the program. **Note** When modifying the cache path using cp the relocated cache will not be cleaned out by the cache cleaner.
--debug	9	The debug level. This value is set in the registry and is retained. 1 – minimal logging 9 – registry changes 25 – increased logging. Should only be used if requested by 1E support.
--hash		The hash for the package to download and used to verify the integrity of the package on the DP. `--hash=PackageHash`
--hf		Stands for hash first. If the package is partially available in the local cache, causes a hash check to run on it. If the hash check passes, the cached package is used and no download occurs. Since hash check runs by default on fully downloaded packages, this switch is relevant only for partially downloaded content.

Switch	Default value	Description
--inst		Causes SMSNomad to quit immediately after downloading the package, instead of waiting for the package command line to finish.
--mc		Specifies that this package may be multicast if required. If multicast is not licensed, a warning is logged and the standard peer-to-peer functionality used. This value is set for the duration of the program.
--p2p		Turns peer-to-peer communications off for the duration of the current package transfer.
--pc	1	Priority for keeping the cache. Use values between 1 (the lowest priority) and 9 (the highest priority). If 0 is specified, then the default 1 is used.
--pkgid		Package identifier for the package to download. `--pkgid=PackageID`
--pp		Sets *PackagePath* to be the directory containing the source files to be downloaded prior to installation. This value is set for the duration of the program. Supported in standalone mode only. `--pp=PackagePath` **Note** This option is required in standalone mode.
--prestage		This option enables Nomad to download a package without the need to run any executable in the package. Supported in standalone mode only. It replaces the need for a dummy program command-line, for example: "`cmd.exe /c echo nothing`"
--s		This standalone mode option should be used when running Nomad independently of Configuration Manager. The *--pp* package path option is mandatory if this option is used. This value is set for the duration of the program.
--s2		As above, however, if the package is already cached, unlike *--s*, *--s*2 will re-run the target command line.

Switch	Default value	Description
--timeout		Duration (in seconds) after which the download will time out. `--timeout=seconds`
--ver		Version of the package to download. `--ver=PackageVersion`
--wr	80	The work rate. This is the proportion of available (i.e., free) bandwidth. The range is 1 to 100, although it is not a simple percentage. This value is set for the duration of the program. If using intraday work rates and the *--wr* switch only, then the lower of the two values is used. For more details on intraday work rates. Please refer to MaxWorkRates for more details about intraday work rates.
--wro		Override the intraday work rate. When *--wro* and *--wr* are combined on the Nomad command-line then the value for the *--wr* switch will be used in preference to the intraday work rate set in the registry. If only the *--wro* switch is used, then any intraday value is overridden with a default maximum of 80%. Please refer to MaxWorkRates for more details about intraday work rates.

9.6.10.2 NomadBranch.exe command-line switches

Peer Backup Assistant (NMDS) switches

This executable does not normally need to be run on a command-line, but details are provided here for reference purposes.

It is normally installed as part of Nomad and configured using Configuration Manager Admin console extensions. Please refer to Nomad tab for different types of content. It is also available in Nomad OSD tools in order to include in WinPE images so that Nomad can be used in OS Deployments. Please refer to Installing Nomad Branch Tools.

The format of the Nomad service command-line is as follows:

```
NomadBranch.exe [switches]
```

Note

In contrast to the SMSNomad executable command-line switches, the service uses single dashes before the arguments.

Nomad service switches

Switch	Description
-cancel	Stops the current Nomad content download job immediately, which then exits with an error condition. This is intended for use by an administrator when a problem has occurred and a running job is taking an excessively long time.
-debug	Sets the debug level for the NomadBranch service where typical values are: 1=general logging, 31=maximum logging. The value is set in the registry and retained. The default is 1.
-start	Starts the *NomadBranch.exe* service.
-stop	Stops the *NomadBranch.exe* service.
-activate	Forces verification of specific content in Nomad cache. `-activate=<content_ID>`
-activateall	Forces verification of all content in Nomad cache.
-cdssync	Forces re-registration of all content with Content Distribution platform.

9.6.10.2.1 Peer Backup Assistant (NMDS) switches

NMDS commands can only be used within a Configuration Manager task sequence and must be wrapped by calling NomadPackageLocator.exe, for details refer to NomadPackageLocator.exe command-line switches. NMDS functionality requires setting and making use of task sequence variables, which is not directly supported via the *NomadBranch.exe* command. We recommend you first try the predefined Nomad custom task sequence actions available from the Configuration Manager console and failing that, use the equivalent NomadPackageLocator commands. Only use *NomadBranch.exe* NMDS commands as a last resort – they are minimally documented below for completeness.

Switch	Description
–NMDS_POLL	The NMDS_POLL argument is available on either the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service command-line. When run, it places a request for a network share and size associated with it. It must only be used within a task sequence.

Switch	Description
–NMDS_COMPLETE	The NMDS_COMPLETE argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. It indicates that all user data has been copied to the PBA share and the connection can be closed. When run, it disconnects from its associated share and fixes its contents for the duration defined in the Nomad PostCompleteTimeoutHours registry value on the device where the share is hosted. It is only for use within a task sequence.
–NMDS_HA	The NMDS_HA argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. It creates additional backup copies of the user data that has been copied to the PBA share, so it must be run after the share has been closed using NMDS_COMPLETE. It is only for use within a task sequence.
–NMDS_FIND	The NMDS_FIND argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. When run, it locates and connects to the share associated with it. It is only for use in a task sequence.
–NMDS_DELETE	The NMDS_DELETE argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. When run, it deletes the share, contents and user associated with the shared cache. It is only for use in a task sequence.

9.6.10.2.2 NMDS_COMPLETE

Note

Please note the:

Nomad PBA Task Sequence steps are not designed for use with offline USMT or WinPE

-NMDS_POLL command-line option for the NomadPackageLocator.exe tool cannot be used in WinPE

-NMDS_<command> command-line options for NomadBranch.exe have not been tested in WinPE, so their behavior may be unpredictable in that environment.

The NMDS_COMPLETE argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. It indicates that all user data has been copied to the PBA share and the connection can be closed. When run, it disconnects from its associated share and fixes its contents for the duration defined in the Nomad PostCompleteTimeoutHours registry value on the device where the share is hosted. It is only for use within a task sequence.

It takes the following format:

NomadPackageLocator.exe -NMDS_COMPLETE,<name>

or

NomadBranch.exe -NMDS_COMPLETE,<name>

Using the following parameter:

Parameter	Description
<name>	Used to identify the shared cache and must be the same as the one used in the NMDS_POLL argument that initially requested the share. This may be up to 40 characters, consisting of 0-9 and A-Z characters and is case-insensitive.

9.6.10.2.2.1 Locating the share

Once completed, you can locate the share with the NMDS_FIND argument; this should be done within PostCompleteTimeoutHours, which defaults to 7 days.

9.6.10.2.2.2 Task sequence environment variables

NMDS_COMPLETE uses the following task sequence environment variables:

Name	Use
%PBAComputerName%	Its value should be used for the *<name>* parameter.

9.6.10.2.3 NMDS_DELETE

Note

Please note the:

Nomad PBA Task Sequence steps are not designed for use with offline USMT or WinPE

-NMDS_POLL command-line option for the NomadPackageLocator.exe tool cannot be used in WinPE

-NMDS_<command> command-line options for NomadBranch.exe have not been tested in WinPE, so their behavior may be unpredictable in that environment.

The NMDS_DELETE argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. When run, it deletes the share, contents and user associated with the shared cache. It is only for use in a task sequence.

It takes the following format:

NomadPackageLocator.exe -NMDS_DELETE,<name>

or

NomadBranch.exe -NMDS_DELETE,<name>

Using the following parameter:

Parameter	Description
<name>	Used to identify the shared cache and should be the same as the one used in the NMDS_POLL argument that initially requested the share, i.e. the value of task sequence variable %PBAComputerName%. This may be up to 40 characters, consisting of 0-9 and A-Z characters, and is case-insensitive.

Note

If you have run NMDS_COMPLETE, run NMDS_FIND prior to NMDS_DELETE otherwise errors will be generated.

NMDS_DELETE is not essential because a share is automatically deleted after a period of time determined in PostCompleteTimeoutHours, but it is good practice to use it in order to release resources.

9.6.10.2.3.1 Task sequence environment variables

NMDS_DELETE does not use any task sequence environment variables.

9.6.10.2.4 NMDS_FIND

Note

Please note the:

Nomad PBA Task Sequence steps are not designed for use with offline USMT or WinPE

-NMDS_POLL command-line option for the NomadPackageLocator.exe tool cannot be used in WinPE

-NMDS_<command> command-line options for NomadBranch.exe have not been tested in WinPE, so their behavior may be unpredictable in that environment.

The NMDS_FIND argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. When run, it locates and connects to the share associated with it. It is only for use in a task sequence.

It takes the following format:

```
NomadPackageLocator.exe -NMDS_FIND,<name>
```

or

```
NomadBranch.exe -NMDS_FIND,<name>
```

Using the following parameter:

Parameter	Description
<name>	Used to identify the shared cache and must be the same as the one used in the NMDS_POLL argument that initially requested the share, i.e. usually the value of the %PBAComputerName% of the task sequence variable. This may be up to 40 characters, consisting of 0-9 and A-Z characters, and is case-insensitive.

9.6.10.2.4.1 Storing the result

This is not necessary if NomadPackageLocator.exe is used.

The details for the located share can be set into a variable %NMDS_REMOTE% using the TSEnv2.exe function. For example, the following argument locates the shared cache for acme1234 and sets the %NMDS_REMOTE% with the details of the located share.

```
cmd /c "NomadBranch.exe -NMDS_FIND,acme1234 | TSEnv2.exe -"
```

However, NomadPackageLocator.exe sets up task sequence environment variables automatically. The equivalent of the above argument is:

```
cmd /c "NomadPackageLocator.exe -NMDS_FIND,acme1234"
```

9.6.10.2.4.2 Deleting the share and contents

Once you have finished using the items in the share, issue the NMDS_DELETE argument to delete its contents and associated share.

9.6.10.2.4.3 Task sequence environment variables

NMDS_FIND uses the following task sequence environment variables:

Name	Use
%OSDStateStorePath%	Set to the path to the share that USMT should use for restoring migrated data.
%NMDS_REMOTE%	Set to the same value as %OSDStateStorePath%. This is deprecated, and is included for reference.

9.6.10.2.5 NMDS_HA

Note

Please note the:

Nomad PBA Task Sequence steps are not designed for use with offline USMT or WinPE

-NMDS_POLL command-line option for the NomadPackageLocator.exe tool cannot be used in WinPE

-NMDS_<command> command-line options for NomadBranch.exe have not been tested in WinPE, so their behavior may be unpredictable in that environment.

The NMDS_HA argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. It creates additional backup copies of the user data that has been copied to the PBA share, so it must be run after the share has been closed using NMDS_COMPLETE. It is only for use within a task sequence.

> **Note**
>
> If configuring PBA command lines manually and using NomadPackageLocator.exe (NOT NomadBranch.exe) to run within a task sequence environment, if the task sequence variable 1EDisablePBA_HA = True, then High Availability is disabled. This variable is automatically set for Remote WSA deployments. If using NomadBranch.exe in the command line, the variable is ignored.

It takes the following format:

```
NomadPackageLocator.exe -NMDS_HA,<min_backups>,<max_backups>,<synchronous_backups>
```

or

```
 NomadBranch.exe -NMDS_HA,<name>,<store_host>,<min_backups>,<max_backups>,<synchronous_backups>
```

Using the following parameters:

Parameter	Description
<name>	Used to identify the shared cache and must be the same as the one used in the NMDS_POLL argument that initially requested the share. The version *NomadPackageLocator.exe* gets this from task sequence environment variable *%PBAComputerName%*.
<store_host>	The name of the host where the primary copy of the user data is stored. The version *NomadPackageLocator.exe* derives this from task sequence environment variable *%OSDStateStorePath%*.
<min_backups>	The minimum number of hosts to attempt to back up the user data to. Nomad will verify that this number of hosts respond to the request, although actual copying of the user data to them all may fail. This must be at least 1 and cannot be more than the maximum number of backups. If fewer than this number of backups is successful, the task sequence step fails.
<max_backups>	The maximum number of backups to attempt. The upper limit is 6.

Parameter	Description
<synchronous_backups>	The number of synchronous backups, i.e. the number of backups for which to wait before moving on to the next action in the task sequence, to ensure that at least this quantity of backups has been successful. If any backups remain they will be run in the background in parallel with the rest of the task sequence. The value can be less than the minimum number of backups but not more than the maximum. 0 is allowed but is not advisable as there is no guarantee that any backup is successful.

The output from the NomadBranch.exe version, if successful, is a comma-separated list of the host names of the extra data stores. With *NomadPackageLocator.exe* the task sequence environment variable *%PBAHAHosts%* is set to contain the list of host names.

9.6.10.2.5.1 Task Sequence environment variables

NMDS_HA uses the following task sequence environment variables:

Name	Use
%PBAComputerName%	Used as the cache ID
%OSDStateStorePath%	The full path of the share where the user data is stored. The hostname part is used to get the name of the host where the primary copy of the user data has been stored.
%PBAHAHosts%	Set to a comma-separated list of the names of the hosts with the backup copies.

9.6.10.2.6 NMDS_POLL

Note

Please note the:

Nomad PBA Task Sequence steps are not designed for use with offline USMT or WinPE

-NMDS_POLL command-line option for the NomadPackageLocator.exe tool cannot be used in WinPE

-NMDS_<command> command-line options for NomadBranch.exe have not been tested in WinPE, so their behavior may be unpredictable in that environment.

The NMDS_POLL argument is available on either the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service command-line. When run, it places a request for a network share and size associated with it. It must only be used within a task sequence.

Note

If configuring PBA command lines manually and using NomadPackageLocator.exe (NOT NomadBranch.exe) to run within a task sequence environment, if the task sequence variable 1EWSA_USMTSizeInMB is set, then the value assigned to this variable is used in the poll. This variable is as part of WSA deployments if user folder backup has been enabled. If using NomadBranch.exe in the command line, the variable is ignored.

It takes the following format:

```
NomadPackageLocator.exe -NMDS_POLL,<name>,<size>
```

or

```
NomadBranch.exe -NMDS_POLL,<name>,<size>[,<ignore_offer>]
```

Using the following parameters:

Parameter	Description
<name>	Used to identify the shared cache and must be used in the rest of the PBA NMDS commands. This may be up to 40 characters, consisting of 0-9 and A-Z characters, and is case-insensitive. Subsequent calls to NMDS_POLL with the same name will return the same share details as the first call.
<size>	The number of Megabytes required for the shared cache.
<ignore_offer>	Used to specify the name of a PBA host that already has the user data cached. When NMDS_POLL is run a *second* time with the same <name> and <size> values as on the first call, it effectively allows a second PBA host to offer its services as a cache. In this way user state can be saved to two caches, for increased resilience. On restore, the first cache that responds to the NMDS_FIND request will be the one used.

9.6.10.2.6.1 Requesting a cache

When NMDS_POLL is run, the Nomad machines on the local subnet responds to the request under the following conditions:

PBA is enabled on the machine

The machine has sufficient PBA allocation to cope with the requested share size

The machine has sufficient disk space to cope with the requested share size, A machine with less than 5% available disk space cannot respond to PBA requests.

The machine has spare available connections for the share

Domain controllers cannot be used for PBA data sharing. All the machines that satisfy these conditions will respond and the requesting machine picks the host that has the largest percentage of available disk space.

9.6.10.2.6.2 Creating the cache

The winning machine creates a share and user to service the request. The share and user is maintained until:

Prior to running NMDS_COMPLETE, the timeout set in the Nomad PreCompleteTimeoutHours registry value has been reached. This defaults to 3 hours.

After running NMDS_COMPLETE, the timeout set in the Nomad PostCompleteTimeoutHours registry value has been reached. This defaults to 7 days.

The NMDS_DELETE command is issued for the <name> set in the NMDS_POLL command.

When these conditions are met, the share, contents and associated user is deleted.

> **Note**
>
> When Nomad is configured to use Peer copy over HTTP or HTTPS a file share is not created. In this scenario the storage is exposed to peers through the HTTP server implemented in Nomad for sharing its cache. A local user account is created to secure access to the migration data store through Windows authentication.
>
> When Nomad is configured to use Certificate-based Client Authentication, a local user account is not created. Access to the user state store is authenticated using a client certificate.

9.6.10.2.6.3 Storing the result

This is not necessary if *NomadPackageLocator.exe* is used.

If *NomadBranch.exe* is used, the details for the winning share can be set into a variable %NMDS_REMOTE% using the *TSEnv2.exe* function. When integrating with an OSD task sequence, the *%NMDS_REMOTE%* must be used to transfer the details to the *OSDStateStorePath* task sequence variable, otherwise the user data will not be stored on the NMDS host.

For example, the following command creates a shared cache called acme1234 with 10 Mb of disk space and sets the *%NMDS_REMOTE%* with the details of the created share.

```
cmd /c "NomadBranch.exe -NMDS_POLL,acme1234,10 | TSEnv2.exe -"
```

However, *NomadPackageLocator.exe* sets up task sequence environment variables automatically. The equivalent of the above command is simply:

```
cmd /c "NomadPackageLocator.exe -NMDS_POLL,acme1234,10"
```

9.6.10.2.6.4 Fixing the contents and disconnecting

Once created, the share will only be kept for 3 hours. When you have finished copying items to the share, issue the NMDS_COMPLETE command to disconnect from it and fix the contents for 7 days. The defaults for the pre- and post- complete timeouts are configured using the Nomad

PreCompleteTimeoutHours and PostCompleteTimeoutHours registry values on the machine where the share is being hosted.

9.6.10.2.6.5 Task sequence environment variables

NMDS_POLL uses the following task sequence environment variables:

Name	Use
%PBAComputerName%	Set to the value of the *<name>* parameter
%OSDStateStorePath%	Set to the path to the share that USMT should use for storing migrated data.
%NMDS_REMOTE%	Set to the same value as *%OSDStateStorePath%*. This is deprecated and is included for reference.

9.6.10.3 NomadPackageLocator.exe command-line switches

NomadPackageLocator.exe is used by the Nomad custom task sequence actions, we recommend that these are used to perform the appropriate functions in preference to the command-line, but details are provided here for reference purposes.

It is installed as part of Nomad. It is also available in Nomad OSD tools in order to include in WinPE images so that Nomad can be used in OS Deployments. Please refer to Installing Nomad Branch Tools.

The format of the NomadPackageLocator command-line is:

```
NomadPackageLocator.exe [options]
```

9.6.10.3.1 Nomad Package Locator general command-line switches

The following table describes the general NomadPackageLocator.exe command-line switches:

Switch	Default value	Description
Debug		Enables extra logging.
FailOverToDP		Points to the distribution point if the required package cannot be found pre-cached in any local Nomad clients.
ForceNomadMachine		Name of a specific Nomad client whose cache you want to use. This prevents *NomadPackageLocator* from polling for a Nomad client whose cache contains the content.

Switch	Default value	Description
HideErrorDialog		Suppresses error messages during the image deployment task sequence for packages that cannot be located in a Nomad cache.
HTTP		Uses HTTP to download content if it is not available on the local subnet.
Port	1779	Sets the communications port.
RemoveHttpLocations		If used on the *NomadPackageLocator.exe* command-line, the HTTP locations will be cleared from the task sequence, ensuring that the content is downloaded from Nomad peers on the local subnet.
RequireNomad		If used on the *NomadPackageLocator.exe* command-line, Nomad is used for the referenced packages. If the Nomad Package Locator fails to locate all the referenced packages, it generated an error, which is used to terminate the task sequence.
Timeout	3	Maximum wait time (in seconds) between messages. Applies to each package listed in the TS environment.

9.6.10.3.2 Nomad Package Locator NMDS command-line switches

The NMDS command are used by the Nomad Peer Backup Assistant (PBA) feature. These commands invoke *NomadBranch.exe* to do most of the work, however *NomadPackageLocator.exe* is the recommended command-line interface to use because it uses and sets crucial task sequence variables.

All of the NMDS commands have corresponding custom task sequence action dialogs, and these should be used in preference to creating command line actions.

Switch	Default value	Description
NMDS_COMPLETE		The NMDS_COMPLETE argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. It indicates that all user data has been copied to the PBA share and the connection can be closed. When

Switch	Default value	Description
		run, it disconnects from its associated share and fixes its contents for the duration defined in the Nomad PostCompleteTimeoutHours registry value on the device where the share is hosted. It is only for use within a task sequence.
NMDS_DELETE		The NMDS_DELETE argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. When run, it deletes the share, contents and user associated with the shared cache. It is only for use in a task sequence.
NMDS_FIND		The NMDS_FIND argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. When run, it locates and connects to the share associated with it. It is only for use in a task sequence.
NMDS_HA		The NMDS_HA argument is available on the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service argument-line. It creates additional backup copies of the user data that has been copied to the PBA share, so it must be run after the share has been closed using NMDS_COMPLETE. It is only for use within a task sequence.
NMDS_POLL		The NMDS_POLL argument is available on either the *NomadPackageLocator.exe* (recommended) or *NomadBranch.exe* service command-line. When run, it places a request for a network share and size associated with it. It must only be used within a task sequence.

9.6.10.4 TSEnv2 command-line switches

TSEnv2 is an executable that can be used primarily to set or change task sequence environment variables, including "readonly" variables, those starting with an underscore, which cannot be changed with ConfigMgr's tsenv.exe tool. It also has other related functions, some of which can be performed by the NomadPackageLocator tool, refer to NomadPackageLocator.exe command-line switches for details.

TSEnv2 is installed as part of Nomad and is available with the Nomad OSD tools, so it can be included in WinPE images allowing Nomad to be used in OS Deployments, refer to Installing Nomad Branch Tools for details.

The command-line format is:

```
TSEnv2.exe [switch]
```

Where *switch* is one of the switches in the table below.

Note

There is no '-' or '/' before the switch.

Switch	Description
dump [file]	Write a binary dump of the TS variables to a file. If no file name is given, the default is *C:\tsenv2.out*.
find name	Test whether the specified variable exists and has a non-empty value. If so, the return code is *0*, otherwise it is *0x80070490 (2147943568)* which corresponds to *ELEMENT_NOT_FOUND*.
get name	Get the name of the specified variable and output it in the form.*name=value* The return code is *0* if the variable exists and has a non-empty value, otherwise it is *0x80070490 (2147943568)* which corresponds to *ELEMENT_NOT_FOUND*.
get_b64 name	Like *get* but also decodes the variable if it is in base-64 format. (Encoded values start with "eJ".) **Note** If the resulting data is not valid text and cannot be written as such, *TSEnv2* creates a binary dump file and specifies the path in its output.
get_b64z name	Like *get* but also decodes the variable if it is in base-64 format (encoded values start with "eJ") and uncompresses the result. **Note** If the resulting data is not valid text and cannot be written as such, *TSEnv2* creates a binary dump file and specifies the path in its output.
list	Outputs every variable in the form *name=value* with one name-value pair per line.
listblk	Like *list* but uses a different block-based technique. The result is always be the same.
listx	Like *list* but base-64 encoded variables (encoded values start with "eJ") are also decoded and uncompressed.
set name=value	Creates or changes the named variable using the specified value. Values up to 2954 characters are supported. If the value contains embedded whitespace or quote characters, enclose the entire *name=value* text in quotes and double the

Switch	Description
	quote characters, for example: *TSEnv2.exe set "embedded=some text and a couple of ""quotes"""* will result in setting variable *embedded* to *some text and a couple of "quotes"* **Note** Task sequence variables that start with an underscore ("_") are intended to be read-only. These may still be changed using, *TSEnv2* but exercise caution when changing values.

9.6.10.5 CacheCleaner.exe command-line switches

CacheCleaner is an executable that can be used to explicitly purge the Nomad cache. By default, the Nomad cache is not purged unless there is an active download. In most cases, available disk space is not really an issue, but there may be circumstances where you may want to manage the cache to keep the disk usage overhead to a minimum. Please refer to Cache management for further information about managing the cache.

It is installed as part of Nomad and the format of the command-line is:

```
CacheCleaner.exe -switch
```

Where *switch* is one of the following (case sensitive):

Switch name	Default value	Range	Description
-CachePriority	1	1-9	Only cache contents with a priority equal to or lower than the *CachePriority* are purged. Used in conjunction with *Pkgsize* to emulate the behavior of the cache cleaner when an actual package is being downloaded.
-Debug			Sets the debug level for *CacheCleaner* and it can be passed on the command-line. If it is not, the value from Nomad registry is used. If Debug is already defined, using this argument adds to the logging level.
-Deleteall			Deletes all cache content where the priority is less than or equal to the value for Force. If the command-line does not include *Force* , then *Deleteall* deletes all cache content where the priority is 1. Works in conjunction with the *Force* .

Switch name	Default value	Range	Description

-DeletePkg			The ID of the package or content to be deleted from the cache. The value must be set to the PackageID or ContentID string that identifies the content to be deleted. Must be used in conjunction with *PkgVer*.
			
			`-DeletePkg=PRI0000A -PkgVer=*`
			
			`-DeletePkg=Content_9b9ccd56-9fbf-4587-98e7-725fcfa8e70f -PkgVer=*`

-Force			Content whose cache priority is less than or equal to the *CachePriority* value are purged. Used in conjunction with the *Deleteall* and *MaxCacheAge*.
-MaxCacheAge		1-1461	The maximum number of days before the contents of a cache is purged. If set, *CacheCleaner* deletes cache contents which are older than this value. This argument is ignored if *DeletePkg* and *Deleteall* is used on the command-line. If the command-line includes *Force*, all caches with a priority less than or equal to *CachePriority* will have their content purged. If *CachePriority* is not included on the command-line, all caches with a priority=1 will have their content purged.
-PercentAvailableDisk	10	1-99	Deletes the lowest cache priority content until the set percentage of available disk is available.
-Pkgsize			Only caches with a priority equal to or lower than the *CachePriority* value will have their contents purged. Used in conjunction with *CachePriority* to emulate the behavior of the cache cleaner when an actual package is being downloaded. Determine the space to be cleared when running *cachecleaner.exe* with *PercentAvailableDisk*. The *PkgSize* value is by default specified in bytes but can be set to MB by appending MB to the value.

Switch name	Default value	Range	Description

			For example, the following are equivalent:
			
			`-Pkgsize=1048576`
			`-Pkgsize=1MB`

-PkgVer			Identifies the content version to be deleted and must be used in conjunction with *DeletePkg*. Deletes content from both the Nomad and Configuration Manager client caches that corresponds to the version number and the Package ID (or Content ID). The special value -PkgVer=* may be used when the user is unsure of the specific version of the package in the cache. **Note** Setting -PkgVer=* will delete any version of the content with the ID specified in the DeletePkg argument from the Nomad cache only – it will not delete from the Configuration Manager client cache. **Note** If you want to remove A*pplication or Software Updates content*, then the -PkgVer will usually need to be set to "1".

Note

If the Nomad cache is deleted while another client is accessing it, the other client will recover by downloading directly from the DP. This is by design and ensures recovery occurs in order to complete a successful download.

9.6.10.5.1 CacheCleaner examples

In the following examples, there is no requirement to specify the path to CacheCleaner.exe because the path to Nomad executables is set in the PATH environment variable:

Example	Description
Set the cache cleaner to run as a Configuration Manager program.	You can set the cache cleaner to run as a Configuration Manager program and advertise it to all Nomad systems in a single operation. You can also schedule this as a regular housekeeping job, ensuring that the cache is kept under control automatically. To purge the cache when the total free disk space is at 20% run: `CacheCleaner.exe –PercentAvailableDisk=20`
Ensure that content in the cache is not kept for more than 30 day.	To ensure that content in the cache is not kept for more than 30 days, run: `CacheCleaner.exe –MaxCacheAge=30`
Delete a particular package and version.	To delete a particular package and version, run: `CacheCleaner.exe –DeletePkg=L0A00001 –PkgVer=1`
Purge the contents of a cache with a priority of 3 or lower.	To purge the contents of a cache with a priority of 3 or lower, run: `CacheCleaner.exe –DeleteAll -Force=3`
Purge the contents of a cache with a particular priority and size.	To purge the contents of a cache with a particular priority and size, run: `CacheCleaner.exe –PkgSize=10485760 –CachePriority=6`

9.6.11 Nomad installer properties

Subject-oriented lists of Nomad installer properties. There are two Nomad installers that have usable installer properties: **1E.Client-x64.msi** (and its x86 version) and **NomadBranchAdminUIExt.msi**.

9.6.11.1 1E Client installer properties for the Nomad client module

The following headings describe the Nomad client installer properties associated with each particular area of functionality available in Nomad:

> **Note**
>
> You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.
>
> Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

9.6.11.1.1 Nomad client installation settings

Nomad client installation settings exist in the 1E Client configuration file, and not in the registry. They can be specified during installation of the 1E Client as Windows installer properties, and therefore must be specified in upper-case. Settings that exist in the 1E Client configuration file can be mixed-case, and can be reconfigured after installation using 1E Client command-line parameters.

Module.Nomad.Enabled

9.6.11.1.2 Basic Nomad configuration

MODULE.NOMAD.COMPATIBILITYFLAGS, MODULE.NOMAD.DEBUG, MODULE.NOMAD.GENERATEWEREVENTS, MODULE.NOMAD.LOGNAME, MODULE.NOMAD.LOGPATH, MODULE.NOMAD.MAXLOGSIZE, MODULE.NOMAD.P2PENABLED, MODULE.NOMAD.MAXSTUCKCOUNT, MODULE.NOMAD.P2PDISQUALIFYMAXNUMPEERS, MODULE.NOMAD.P2PDISQUALIFYMAXWINDOWMINS, MODULE.NOMAD.P2PPORT, MODULE.NOMAD.P2PHTTPPORT, MODULE.NOMAD.P2PHTTPSPORT, MODULE.NOMAD.SPECIALNETSHARE

9.6.11.1.3 Peer backup assistant

The following properties relate to the PBA functionality:

MODULE.NOMAD.CACHEPATH, MODULE.NOMAD.ENFORCEQUOTAS, MODULE.NOMAD.HAACKTIMEOUTMINS, MODULE.NOMAD.MAXALLOCREQUEST, MODULE.NOMAD.MAXCONCURRENCY, MODULE.NOMAD.MAXIMUMMEGABYTE, MODULE.NOMAD.POSTCOMPLETETIMEOUTHOURS, MODULE.NOMAD.PRECOMPLETETIMEOUTHOURS, MODULE.NOMAD.SSPBAENABLED

9.6.11.1.4 Connection and download

The following installer properties relate to configuring the connection Nomad uses to download packages:

MODULE.NOMAD.BLOCKSIZE, MODULE.NOMAD.DOWNLOADTIMEOUT, MODULE.NOMAD.MAXPACKAGEFAST, MODULE.NOMAD.MAXPACKAGERAS, MODULE.NOMAD.MAXPACKAGESLOW, MODULE.NOMAD.PERMITUNCACHED, MODULE.NOMAD.WLANBLIPSECS, MODULE.NOMAD.WLANPROFILELIST

9.6.11.1.5 Nomad cache

MODULE.NOMAD.AUTHENTICATEDUSERS, MODULE.NOMAD.CACHECLEANCYCLEHRS, MODULE.NOMAD.MAXCACHEDAYS, MODULE.NOMAD.MAXCACHESIZEMB, MODULE.NOMAD.MAXPRECACHEDAYS, MODULE.NOMAD.MAXSUCACHEDAYS, MODULE.NOMAD.NOHARDLINK, MODULE.NOMAD.NOMADINHIBITEDADSITES, MODULE.NOMAD.NOMADINHIBITEDSUBNETS, MODULE.NOMAD.PERCENTAVAILABLEDISK

9.6.11.1.6 Internet facing client

MODULE.NOMAD.CERTISSUER, MODULE.NOMAD.CERTSUBJECT

9.6.11.1.7 Distribution point related

MODULE.NOMAD.DPNOTAVAILABLECODES, MODULE.NOMAD.PERMITTEDLSZSHARES, MODULE.NOMAD.RECYCLEDPDELAY, MODULE.NOMAD.SIGSFOLDER

9.6.11.1.8 Status messages

MODULE.NOMAD.MAXSTATUSFREQUENCY, MODULE.NOMAD.STATUSMSGEVENTS

9.6.11.1.9 Single site download and Nomad pre-caching features

Common: MODULE.NOMAD.CONTENTREGISTRATION, MODULE.NOMAD.MAXDEVICESFROMAE, MODULE.NOMAD.PLATFORMURL

SSD: MODULE.NOMAD.SSDENABLED

9.6.11.1.10Multicast

MODULE.NOMAD.MADCAPSCOPE, MODULE.NOMAD.MAXPACKETSPERSECOND, MODULE.NOMAD.MULTICASTSUPPORT

9.6.11.2 NomadBranchAdminUIExt installer properties

There is only one value that is of use in the NomadBranchAdminUIExt registry that defines the location of the Tachyon Platform Server for use with the Nomad Pre-caching feature: PlatformURL

9.6.11.3 Nomad client alphabetic installer properties

The following table shows the supported installer properties for the Nomad client module of the 1E Client.

> **Note**
>
> Each installer property listed below has a link to its corresponding registry value page.

9.6.11.3.1 Nomad client settings

> **Note**
>
> You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.
>
> Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.
>
> Settings that have numeric values must be set using decimal integers, unless otherwise specified.

Installer property	Description
Module.Nomad.Enabled	Set this property to **true** to enable the Nomad client module. The default value is **false**.

Installer property	Description
	Note If enabled, when the 1E Client starts, it will attempt to automatically remove any previous installations of Nomad Branch. This setting does not have an associated Nomad registry entry and is stored in the 1E Client configuration file.
MODULE.NOMAD.AUTHENTICATEDUSERS	Determines which of the built-in security groups is granted read-only permissions to the Nomad cache.

Registry value	Default value	Notes
AuthenticatedUsers	1	Grants read-only access to the Nomad cache as follows: 0 – Everyone built-in security group and the *SMSNomadP2P&* Nomad share account. This is the least restrictive option and is not valid with HTTP or HTTPS protocol and is treated as 2 (only the *SMSNomadP2P&* Nomad share account) 1 – Authenticated Users built-in security group and the *SMSNomadP2P&* Nomad share account 2 – Only the *SMSNomadP2P&* Nomad share account. This account has also been added to NTFS permission settings. Unauthorised HTTP requests to access the caches are met with a 403 status code. The Nomad share has more information about share permissions and NTFS security. The difference between Authenticated Users and Everyone depends on the OS version, but in general Everyone includes Authenticated Users plus Guest.

Installer property	Description
MODULE.NOMAD.BLOCKSIZE	Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder. Click here to expand... Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder. **Note** Any change to this value requires a manual service restart before it can take effect. #### *9.6.11.3.1.1 BlockSize* Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder. **Note** Any change to this value requires a manual service restart before it can take effect.

Registry value	Default value	Notes	Installer property
BlockSize	131072(128KB)	Must be between 4096(4KB) to 4194304(4MB) inclusive. The default block size is 128KB The maximum block size is 4MB Multicast environments can only use the default block size. If you define a larger value for multicast environments, Nomad	MODULE.NOMAD.BLOCKSIZE

Installer property	Description
	automatically resets it to the default. Clients use the block size defined in the registry and ignore the values from the LSZ

The Dynamic Block Size (DBS) feature increases block size on high-bandwidth links to get maximum efficiency, and reduces it on low-bandwidth links to reduce the impact. Using DBS, Nomad is able to automatically decide the appropriate block size for a given link bandwidth and also adjust it as needed during the download if the link conditions change. As a result, Nomad is far more efficient and faster on all types of connection bandwidths while retaining its minimal impact on other link traffic.

Note

DBS is enabled or disabled by configuring Bit 25 in the CompatibilityFlags registry. Setting Bit 25 disables DBS and clearing Bit 25 enables DBS.

In Nomad 7.0 onwards, the DBS feature is turned off by default for new installations, and not changed for upgrades.

Prior to v6.3 the default value of BlockSize registry setting was 32KB (0x8000). From v6.3 onwards the default is 128KB (0x20000).

The installer automatically sets this to 128KB for both fresh installs and upgrades from previous versions. The only exceptions to this are:

It will use the specified value if the BLOCKSIZE property is used in the installation command line or in a MST transform, when doing a fresh install or upgrade

It will retain the previous value of BLOCKSIZE if it was set to anything other than 32KB (the older default), when doing an upgrade.

Registry value	Default value	Notes
BlockSize	131072(128KB)	Must be between 4096(4KB) to 4194304(4MB) inclusive.

Installer property	Description
	The default block size is 128KB The maximum block size is 4MB Multicast environments can only use the default block size. If you define a larger value for multicast environments, Nomad automatically resets it to the default. Clients use the block size defined in the registry and ignore the values from the LSZ
	The Dynamic Block Size (DBS) feature increases block size on high-bandwidth links to get maximum efficiency, and reduces it on low-bandwidth links to reduce the impact. The only exceptions to this are: It will use the specified value if the BLOCKSIZE property is used in the installation command line or in a MST transform, when doing a fresh install or upgrade It will retain the previous value of BLOCKSIZE if it was set to anything other than 32KB (the older default), when doing an upgrade.
MODULE.NOMAD.CACHECLEANCYCLEHRS	Determines the number of hours between automatically running the Nomad cache cleaner. Click here to expand...

Installer property	Description

Determines the number of hours between automatically running the Nomad cache cleaner.

Registry value	Default value	Notes
CacheCleanCycleHrs	0 (turned off)	The first automatic cache clean runs randomly between 10 to 60 mins of service start up. Subsequent cache clean cycles run after the number of hours specified. 0 means feature turned off. No cache cleaning cycle would run. Changing this registry entry performs an internal restart. The minimum value is 4. The maximum value is 168 (Once a week) Please refer to Cache management for details about other cache management settings.

MODULE.NOMAD.CACHECLEANSUBNETLOOKUP

If enabled, sets the cache clean subnet lookup.

Click here to expand...

If enabled, sets the cache clean subnet lookup.

Registry value	Type	Default value	Notes
CacheCleanSubnetLookup	REG_DWORD	1	Before deleting content, Nomad checks if it is on any other client in the same subnet, and will only delete local content if the same is present on at least one other client on the same subnet.

Installer property	Description
	To disable subnet lookup, set the value to 0. Its value can be 0 or 1. The default value is 1, subnet lookup is enabled. New setting introduced in 8.0. Please refer to Cache management for details about other cache management settings.
MODULE.NOMAD.CACHEPATH	Determines the value of : NomadBranch\LocalCachePath - the location of local Nomad package cache Click here to expand LocalCachePath... The location of local Nomad package cache.

Registry value	Default value	Notes
LocalCachePath	%ALLUSERSPROFILE%\1E\NomadBranch\	There are two registry values called LocalCachePath that are used by Nomad. The LocalCachePath REG_SZ registry value under the HKLM\Software\1E\NomadBranch key sets the path to the local Nomad package cache. The LocalCachePath REG_SZ registry value under the HKLM\Software\1E\NomadBranch\NMDS key sets the path to the PBA package cache.

Installer property	Description
	The path is created if it does not exist. If the drive letter does not exist, and it is not possible to create the specified path, *%TEMP%* is used. Default values are dependent on OS. **Known issue fixed in latest accumulated hotfix** The value for the installer property CACHEPATH requires a trailing backslash \. When Nomad is installed on a DP this location is also used for the LSZFiles vDir folder. If LocalCachePath does not contain a trailing backslash, then: the LSZFILES folder is incorrectly created (LocalCachePathLSZFILES instead of LocalCachePath\LSZFILES) IIS vDIR points to wrong folder (LocalCachePathLSZFILES instead of LocalCachePath\LSZFILES) LSZGEN fails because it is attempting to store LSZ files to non-existent path (LocalCachePath\LSZFILES) PBA cache is also derived from the same installer property MODULE.NOMAD.CACHEPATH, but it is stored in the registry value> CachePath in the NomadBranch\NMDS registry key.

Installer property	Description
	NomadBranch\NMDS\CachePath - the location of the base peer backup assistant (PBS) share where user data is copied to Click here to expand CachePath... This value holds the location of the base peer backup assistant (PBS) share where user data is copied to. Registry value: CachePath Default value: <NomadCachePath>\NMDS Notes: This REG_SZ registry value is found under the PBA registry key NomadBranch\NMDS. This parameter relies on the folder it points to as being configured as a share. In normal circumstances, this should not be modified from the default value. The MODULE.NOMAD.CACHEPATH installer property also used to configure the location of the Nomad cache, which is stored in the registry value LocalCachePath. The location of the PBA cache is derived from the MODULE.NOMAD.CACHEPATH property, and is stored in the registry value CachePath in the NomadBranch\NMDS registry key.
MODULE.NOMAD.CACHESTATESYNCINTERVALMINUTES	Ensures the cache state of a device held on ContentDistribution is in sync with locally held data. This setting controls the **Content Registration Sync Cycle** feature.

Installer property	Description

Registry value	Default value	Notes
CacheStateSyncIntervalMinutes	1440 (1day)	Range: from 60 to 525600 (1Year).

The **Content Registration Sync Cycle** is available in the following versions of 1E Client, where the Nomad client registers pending and failed content registrations with ActiveEfficiency or Tachyon Platform. Please refer to Single Site Download: Improved resilience of content registration.

Nomad 8.0 in 1E Client 5.2 - uses Content Distribution in Tachyon Platform

Nomad 7.1 in 1E Client 5.2 - uses Content Distribution in Tachyon Platform

Nomad 7.0.200 in 1E Client 5.1 - uses ActiveEfficiency

Nomad 7.0.100 in 1E Client 5.0 - uses ActiveEfficiency

Nomad 7.0 in 1E Client 4.1 - uses ActiveEfficiency

MODULE.NOMAD.CERTISSUER

Defines one or more certificate issuers that Nomad will use to select the appropriate PKI certificate for the:

Configuration Manager (CM) client authentication certificate - used when downloading over HTTPS from Distribution Points and when communicating with Management Points during pre-caching

Nomad Server Authentication certificate - used to share content between peers over HTTPS

Client Authentication certificate - used for certificate-based client authentication when sharing content between peers over HTTPS.

In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without needing to specify CertIssuer (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details). You should use CertIssuer if the CM client is not using PKI certificates and there are multiple Client Authentication certificates issued by different Certificate Authorities in the store, and if there is a chance some of those certificates may not be trusted by other peers or CM site systems.

Click here to expand...

Installer property	Description

Defines one or more certificate issuers that Nomad will use to select the appropriate PKI certificate for the:

Configuration Manager (CM) client authentication certificate - used when downloading over HTTPS from Distribution Points and when communicating with Management Points during pre-caching

Nomad Server Authentication certificate - used to share content between peers over HTTPS

Client Authentication certificate - used for certificate-based client authentication when sharing content between peers over HTTPS.

In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without needing to specify CertIssuer (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details). You should use CertIssuer if the CM client is not using PKI certificates and there are multiple Client Authentication certificates issued by different Certificate Authorities in the store, and if there is a chance some of those certificates may not be trusted by other peers or CM site systems.

Registry value	Default value	Notes
CertIssuer	" "	Set this value to the name of the certificate issuer (Certificate Authority (CA)) that Nomad should use to select the appropriate PKI certificate. A case-insensitive substring-within-a-string match is performed. If you have multiple CAs you can specify a: Common sub-string (e.g. "CORPCA" would work for certificates issued by CORPCA1 or CORPCA2) Comma-separated list of certificate issuers (both exact names or substrings are acceptable values). For example, "DigiCert,Thawte,Verisign" would work for certificates issued by DigiCert, DigiCert EV, Thawte or Verisign. If you are only using HTTPS for downloading from an HTTPS DP (That is, not using HTTPS for peer-to-peer

Installer property	Description
	data transfer) you can leave this blank and set CertSubject instead.
MODULE.NOMAD.CERTSUBJECT	Defines one or more certificate subject names that Nomad uses to select the appropriate PKI certificate for authentication with Configuration Manager (CM) site systems configured to use HTTPS. It does not affect certificate selection for client authentication certificates used for peer-to-peer authentication or for selection of server authentication certificates. In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without the need to specify CertSubject (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details). Click here to expand... Defines one or more certificate subject names that Nomad uses to select the appropriate PKI certificate for authentication with Configuration Manager (CM) site systems configured to use HTTPS. It does not affect certificate selection for client authentication certificates used for peer-to-peer authentication or for selection of server authentication certificates. In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without the need to specify CertSubject (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details).

Registry value	Default value	Notes
CertSubject	" "	For downloads over HTTPS from the Distribution Point, set either the CertIssuer or CertSubject registry values. Set this value to the subject name of the certificate that Nomad should use to select the appropriate PKI certificate. The match has the following properties: case-insensitive a substring search is done, so if the text is set to ACME it will return certificates where ACME appears anywhere in the certificate's subject.

Installer property	Description
	If you have multiple valid subject names you can specify a: Common sub-string, for example "contoso.com" would work for certificates that have contoso.com anywhere in the subject name Comma-separated list of subject names or sub-strings, for example, you can specify multiple subject domain suffixes, for example "contoso.com,abc.in". For the installer property, configure either MODULE.NOMAD.CERTISSUER or MODULE.NOMAD.CERTSUBJECTinstaller properties for HTTPS downloads.
MODULE.NOMAD.COMPATIBILITYFLAGS	Determines different compatibility settings which relate to specific customer related functionality and should not generally be changed from the default value under normal conditions, unless advised.The installer property must be set to sum of the integer values for the required bits. For example, to disable hash value checking (1) and DelegatedLSZ checks and errors (131072), run *`msiexec /i 1E.Client-x64.msi MODULE.NOMAD.COMPATIBILITYFLAGS=131073 [other properties] /qn`* on the installer command-line. Click here to expand... Determines different compatibility settings which relate to specific customer related functionality and should not generally be changed from the default value under normal conditions, unless advised.

Registry value	Default value	Notes
CompatibilityFlags	0x1E18000A (504889354)	For Nomad in full OS, the registry value is set to the sum of the values for the required bits. CompatibilityFlags REG

Installer property	Description
	The default value combines the following settings: *Bit 1 - 0x00000002* - Enable longer values for hashes *Bit 3 - 0x00000008* - Fix wrong IPs in election messages *Bit 19 - 0x00080000* - Enable full hash generation for SIS content on DPs *Bit 20 - 0x00100000* - Abort download on the Nomad client if an LsZ has mismatch is detected *Bit 25 - 0x02000000* - Turn off Dynamic Block Size *Bit 26 - 0x04000000* - Enable download of Windows 10 Express File Updates *Bit 27 - 0x08000000* - Enable download of Software Updates (including Windows 10 feature updates) from Microsoft Update - see note *Bit 28 - 0x10000000* - Enable support for byte-range downloads (e.g. Office 365 or delta content for updates) from Microsoft Update - see note First bit is bit 0. The default in binary is: 0001 1110 0001 1000 0000 0000 0000 1010 **Support for downloading updates from Microsoft Update** Setting bits 27 and/or 28 will enable Nomad to download content from Microsoft Update if the update has been deployed with Configuration Manager and the option

Installer property	Description
	If software updates are not available on distribution point in current, neighbor or site boundary, download content from Microsoft Update has been enabled on the Download Settings tab of the deployment. Nomad will not be used to download updates from Microsoft Update if the update is requested outside of a Configuration Manager Software Update Deployment (e.g. when using Windows Update for Business). **Note** Prior to 1E Client 4.1 (Nomad 7.0) the default was 0x00180000 (1572864): *Bit 19 - 0x00080000* - Enable full hash generation for SIS content on DPs *Bit 20 - 0x00100000* - Abort download on the Nomad client if an LsZ has mismatch is detected
0x00100002 (1048578)	For the task sequence action **Install and configure Nomad in Windows PE**, the registry value is set to the sum of the values for the required bits.  The default value combines the following settings:

Installer property	Description
	Bit 1 - 0x00000002 - Enable longer values for hashes *Bit 20 - 0x00100000* - Abort download on the Nomad client if an LsZ has mismatch is detected **Note** *Bit 1 - 0x00000002* (Enable longer values for hashes) is mandatory. The installer property must be set to sum of the values for the required bits, and given in decimal notation. For example, the following installer command-line uses: *Default- 0x1E18000A* *Bit 0 - 0x00000001* - Never check hashes of downloaded content *Bit 17 - 0x00020000* - Disable DelegatedLSZ checks and errors *Sum - 0x1E1A000B* (505020427) `> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.COMPATIBILITY`

Installer property	Description

```
FLAGS=505020427 [ot
her properties] /qn
```

Bit	Hex	Decimal	Description
0	*0x0001*	1	Never check hashes of downloaded content.
1	*0x0002*	2	Enable longer values for hashes. This value is auto-enabled when the Configuration Manager client is detected. You must manually configure this setting on any DP that does not have the Configuration Manager client installed. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this was disabled (0) by default.
2	*0x0004*	4	Calculate CRCs as files are downloading.
3	*0x0008*	8	Fix wrong IPs in election messages. On multi-homed machines sometimes the IP from a wrong adapter can get sent in the election messages resulting in peers failing to connect to the master. Enabling this flag causes Nomad to correct such IPs at the time when messages are received and thus prevent master connectivity issues.
4	*0x0010*	16	Determines compatibility with Nomad v3.x caches. Set this option once all Nomad v3.x installations have been upgraded.
5	*0x0020*	32	Disable all RDC data generation.

Installer property	Description			
	6	*0x0040*	64	Keep Packages that failed the CRC test during P2P or download from DP.
	7	*0x0080*	128	Prevent computers using wireless connections from becoming fill-in multicast masters.
	8	*0x0100*	256	Include LinkLocal IPv4 addresses.
	9	*0x0200*	512	Include LinkLocal IPv6 addresses.
	11	*0x0800*	2048	RESERVED
	12	*0x1000*	4096	Do not automatically jump from HTTP to HTTPS during download from DP.
	13	*0x2000*	8192	Always use HTTPS. (Use this setting when Configuration Manager is configured to use HTTPS-only communication for downloading content from Distribution Points)
	14	*0x4000*	16384	RESERVED
	15	*0x8000*	32768	RESERVED
	16	*0x00010000*	65536	RESERVED (this flag is no longer used; previously this flag disabled a workaround for the issue described in Nomad post-installation tasks: IIS request filtering)
	17	*0x00020000*	131072	Disable DelegatedLSZ checks and errors.
	18	*0x00040000*	262144	Disable partial download when App-V streaming, i.e. download entire application.
	19	*0x00080000*	524288	Enable full hash generation for SIS content when an LsZ file is generated on a DP. If this is not enabled, SIS content is trusted,

Installer property	Description			
				and corrupted content may be downloaded. Enabled by default.
	20	*0x00100000*	1048576	Abort download on the Nomad client if an LsZ hash mismatch is detected. If this is not set, when a Nomad client detects a hash mismatch it will re-request LsZ generation on the DP then try again, and get stuck in a loop if the SIS content is corrupt. Must be set on clients if Bit 19 is set on DPs. Enabled by default.
	25	*0x02000000*	33554432	Turn off Dynamic Block Size. This flag is set by default, which means Dynamic Block Size is disabled by default. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this bit was off, meaning **Dynamic Block Size** was enabled by default.
	26	*0x04000000*	67108864	Enable download of Windows 10 Express update files. Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20144 for NomadBranch 6.3.201.
	27	*0x08000000*	134217728	Enable download of full file software updates from Microsoft Update when deployed through Configuration Manager. Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20246 for NomadBranch 6.3.201.
	28	*0x10000000*	268435456	Enable download of byte-range software updates (e.g. Express updates, O365

Installer property	Description			
				updates) from Microsoft Update when deployed through Configuration Manager. Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20246 for NomadBranch 6.3.201.
	30	*0x40000000*	1073741824	Enable SoftwareUpdate metadata validation. This is not enabled by default. It can be used to resolve rare issues related to SoftwareUpdates where the contents could be updated without any change in its ID or version. Please refer to Resolving SoftwareUpdate metadata validation for more details. **Note** This is a new setting in 1E Client 5.1 (Nomad 7.0.200).
MODULE.NOMAD.CONTENTPROVIDERONWIFI	Determines whether a device on a WLAN can become content provider. By default, only devices connected to a LAN can become content providers when using Single Site Download (SSD). **Note** This setting is only applicable to SSD and has no effect on P2P content transfers on the local subnet. Click here to expand... Determines whether a device on a WLAN can become content provider. By default, only devices connected to a LAN can become content providers when using Single Site Download (SSD). **Note** This setting is only applicable to SSD and has no effect on P2P content transfers on the local subnet.			

Installer property	Description

Registry value	Default value	Notes
ContentProviderOnWifi	0	Values are: 0 – Only devices connected to a LAN can be content providers 1 – Devices connected to any network (including WLANs) can be content providers

MODULE.NOMAD.CONTENTREGISTRATION

Determines if content in Nomad's cache (packages, applications, software updates, boot images, etc.) is registered with Content Distribution. Content registration is necessary if a host is to be available as a Single Site Download (SSD) provider or can be woken up if a Nomad peer requires the content locally.

Click here to expand...

Determines if content in Nomad's cache (packages, applications, software updates, boot images, etc.) is registered with Content Distribution. Content registration is necessary if a host is to be available as a Single Site Download (SSD) provider or can be woken up if a Nomad peer requires the content locally.

Registry value	Default value	Notes
Platform\ContentRegistration	0	To enable content registration, update the value to 1 – it is found under the Platform\ContentDistribution To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED is specified during installation, the

Installer property	Description
	registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for SSDEnabled and ContentRegistration, in addition to enabling the Tachyon client. The ContentDistribution registry setting is found under the Platform key. Nomad app provides visibility of content distribution activity Single Site Download (SSD) Single Site Peer Backup Assistant (SSPBA) High Availability Peer Backup Assistant (HAPBA) Get Migration Settings task sequence action used to manage computer associations Nomad Pre-caching Nomad Download Pause. In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the 1EClient.conf file).

Installer property	Description
MODULE.NOMAD.DEBUG	The level of messages logged in the Nomad logs for debugging purposes. The installer property must be set to sum of the integer values for the required bits. For example, to set all three supported debug levels, run: *`msiexec /i 1E.Client-x64.msi MODULE.NOMAD.DEBUG=25 [other properties] /qn`* on the installer command-line. Click here to expand... The level of messages logged in the Nomad logs for debugging purposes.

Registry value	Default value	Notes
Debug	0x09 (9)	See the table below for customer supported values. The default is a combination of *`0x01`* (Minimal logging) and *`0x08`* (Registry changes). For example, to set maximum debugging, set bit 0, 3 and 4, which is a value of 0x19 hexadecimal or 25 decimal. Values on the installer command-line must be provided in decimal. So to set maximum debugging you would use the following installer command-line: `> msiexec /i 1E.Client-x64.msi DEBUG=25 [other properties] /qn`

Bit	Hex	Decimal	Description
0	0x01	1	Minimal logging.
1	0x02	2	RESERVED
2	0x04	4	RESERVED
3	0x08	8	Registry changes.
4	0x10	16	Additional debugging (should only be used if requested by 1E support).

Installer property	Description
MODULE.NOMAD.DOREPORTINGENABLED	Enables Delivery Optimization monitoring and reporting if ContentRegistration is enabled. Click here to expand... Enables Delivery Optimization monitoring and reporting if ContentRegistration is enabled. Registry value: DeliveryOptimizationReportingEnabled Default value: 0 Notes: Enables monitoring of Delivery Optimization downloads and reporting them to Tachyon Platform (ContentDistribution). Delivery Optimization monitoring and reporting is only supported in versions of Windows Server 2019 and Windows 10 Version 1909 onwards. When it is enabled, DO download events get written to .etl files in the Nomad cache folder, for example: NomadDo-20210325-182415.etl. And aggregated information about the downloads gets writtern to sqlite files **Do.db** and **DoDownloadMonitor.db** in LocalDb folder inside Nomad cache folder.

Installer property	Description
MODULE.NOMAD.DOWNLOADTIMEOUT	Sets the timeout in seconds after which a job will be cancelled if the download has not been successful. Click here to expand... Sets the timeout in seconds after which a job will be cancelled if the download has not been successful. Registry value: DownloadTimeout Default value: 0 Notes: This parameter is associated with the distribution point resilience feature and is used in conjunction with the *RecycleDPDelay* registry value. If a value greater than zero is set, the download timeout will either use this or the Configuration Manager setting depending on which is the smaller value. When the timeout is reached, the job package download is cancelled and a success is sent to the Configuration Manager client with the *ERROR_MAXDURATION* timeout error sent as the package status message. The default is to use the Configuration Manager setting (28 days by default).
MODULE.NOMAD.DPCACHECLEANUPENABLED	Delete all obsolete LSZ files on the DP where the associated content is no longer present in ContentLib. Click here to expand... Delete all obsolete LSZ files on the DP where the associated content is no longer present in ContentLib.

Installer property	Description

Registry value	Default value	Notes
DpCacheCleanupEnabled	0 (turned off)	This entry controls the cached LSZ files cleaning feature. When turned on, this feature deletes all LSZ files in a Distribution Point (DP) cache where the associated content is not present in ContentLib. The following table describes the values this entry may be set to: Value: 0 — The feature is turned off. This is the default. Value: 1 (or greater) — The feature is turned on. Please refer to Cache management for details about other cache management settings.

MODULE.NOMAD.DPNOTAVAILABLECODES

Determines which error codes will cause Nomad to retry a download using an alternative distribution point.

For example, the following would set Nomad to the default value on the 1E Client installer command-line:`> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.DPNOTAVAILABLECODES="0x205A,0x205D" [other properties] /qn`

Click here to expand...

Determines which error codes will cause Nomad to retry a download using an alternative distribution point.

Installer property	Description			
	Registry value	Default value	Notes	
	DPNotAvailableCodes	0x205A, 0x205D	This registry entry contains a comma-separated list of return codes, see Nomad return codes for a list of the possible ones. If Nomad encounters one of these during download it will attempt a retry from an alternative DP. It gets the list of possible DPs from Configuration Manager. The two return codes set as default are the only ones that are applicable to DP availability: 0x205A – in valid special package path (set using *--pp*) 0x205D – DP path not found Under normal circumstances, you would not change this from the default value. You may want to not allow failover to an alternative DP altogether, in which case you would set the value to " " in the registry. Or you may only want to failover if the DP path was not found, in which case you would set the value to 0x205D only. This installer property should be set to a string containing the comma-separated hex values. For example the following sets Nomad to failover to the next DP only when the DP path was not found: *> msiexec /i 1E.Client-x64.msi DPNOTAVAILABLECODES="0x205D" [other properties] /qn*	
MODULE.NOMAD.ENFORCEQUOTAS	Determines whether Windows Disk Quotas (if configured) are enforced on the PBA share defined inCachePath. Click here to expand...			

Installer property	Description

Determines whether Windows Disk Quotas (if configured) are enforced on the PBA share defined in CachePath.

Registry value	Default value	Notes
EnforceQuotas	0x0 (0)	Enables quotas to be enforced but requires Windows Disk Quotas to be configured. If the size specified in the NMDS_POLL request causes the quota to be exceeded, the request fails and you get disk full error. This registry value is found under the PBA registry key NomadBranch\NMDS.

MODULE.NOMAD.GENERATEWEREVENTS

Determines whether Windows Error Reporting memory dumps should be sent to Microsoft Winqual.

Click here to expand...

Determines whether Windows Error Reporting memory dumps should be sent to Microsoft Winqual.

Registry value	Default value	Notes
GenerateWEREvents	1	If enabled and if Nomad experiences an unexpected failure, a dialog is displayed prompting the user to send the debug information to Winqual which is forwarded to 1E for continued quality improvements. Values are: 0 disables this feature 1 enables this feature

MODULE.NOMAD.HAACKTIMEOUTMINS

The time-out period in minutes for the Peer Backup Assistant - High Availability (deprecated) (PBA-HA) task sequence action. If a machine running this action does not receive an acknowledgement message within this period from the PBA host performing the additional backups, the action will fail.

Click here to expand...

Installer property	Description

The time-out period in minutes for the Peer Backup Assistant - High Availability (deprecated) (PBA-HA) task sequence action. If a machine running this action does not receive an acknowledgement message within this period from the PBA host performing the additional backups, the action will fail.

Registry value	Default value	Notes
HAACKTimeoutMins	20	Applies to synchronized backups only. The PBA tost sends the acknowledgement messages back to the machine running the task sequence approximately every 5% of the synchronized copy. This registry value is found under the PBA registry key NomadBranch\NMDS.

MODULE.NOMAD.LOCALSSDSTAGGER

Sets the site SSD query stagger duration (seconds).

Click here to expand...

Sets the site SSD query stagger duration (seconds).

Deployments to large numbers of clients (30,000 or more) generate significant network traffic from 1E Client to Content Distribution that may result in IIS 503 Overload errors on the server, causing content registrations and SSD requests to fail. LocalSsdStagger allows an elected subnet master to wait for a random configurable time before making a local SSD request. All peers in the subnet participating in the election would also synchronize and wait for the same time before copying from master machine.

Registry value	Type	Default value	Notes
LocalSsdStagger	REG_DWORD	5	Sets the local SSD query stagger duration in seconds. The stagger is 0 (disabled) by default. The maximum value that can configured is 600 seconds (10 minutes).

Installer property	Description
	There is no SSD staggering in WinPE. Local SSD happens when only when network broadcast is disabled. **Note** Please consult 1E before changing this value. This setting works in conjunction with SiteSsdStagger.
MODULE.NOMAD.LOGNAME	Name of the Nomad log file. This value is preserved upon upgrade. This property is combined with MODULE.NOMAD.LOGPATH to create registry value LogFileName. The default value is *NomadBranch.log*
MODULE.NOMAD.LOGPATH	Location of the Nomad log file. The path will be created if it does not exist. This value is preserved upon upgrade. Default values are dependent on OS. This property is combined with MODULE.NOMAD.LOGNAME to create the registry value LogFileName. The default location is: *%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles*
MODULE.NOMAD.MADCAPSCOPE	The MADCAP scope for multicast. Click here to expand... The MADCAP scope for multicast. **Warning** The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes
MultiCastMADCAPScope	SMSNomad	Values may be set using either of the formats in the table below.

Installer property	Description

Format	Description
<ScopeName>	*<ScopeName>* is the name of a scope defined in the DHCP (if you are using the Microsoft implementation of MADCAP). Use this format if you have multiple MADCAP servers. This method uses the time to live settings for the scope.
<MADCAP_ServerIP> *<MADCAP_Scope_IP>* *<TTL>*	*<MADCAP_ServerIP>* is the IP address of a specific MADCAP server *<MADCAP_ScopeIP>* is the starting IP address for a MADCAP scope defined in the DHCP (if you are using the Microsoft implementation of MADCAP) *<TTL>* is the time to live for the multicast packets **Note** Using a TTL greater than 1 is not recommended unless you have ensured that multicast traffic cannot leak back upstream through any intervening routers. The valid range for TTL is a number between 1 and 255 Nomad is also capable of performing control multicast without a MADCAP server installation on the network. In order to use this feature, the *<MADCAP_ServerIP>* must be set to *0.0.0.0*. For example, the following supports MADCAP server not being present, with a scope of *239.0.9.0* and a time to live of *3*. `0.0.0.0,239.0.9.0,3`

MODULE.NOMAD.MAXALLOCREQUEST	Sets the maximum amount of space in MB that can be requested by each PBA client. Click here to expand...

Installer property	Description

Sets the maximum amount of space in MB that can be requested by each PBA client.

Registry value	Default value	Notes
MaxAllocRequest	0xC8 (200)	Located under the PBA registry key NomadBranch\NMDS.

MODULE.NOMAD.MAXCACHEDAYS

When the Nomad cache cleaner runs, delete any application or package content that last triggered Nomad elections before the specified number of days ago.

Click here to expand...

When the Nomad cache cleaner runs, delete any application or package content that last triggered Nomad elections before the specified number of days ago.

Registry value	Default value	Notes
MaxCacheDays	0 (turned off)	Set to delete application or package content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only application or package content that have triggered elections recently will be kept in the cache. 0 means that application and package content will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.

MODULE.NOMAD.MAXCA

This is the maximum number of days content is present on a client.

Click here to expand...

<table>
<tr><th>Installer property</th><th>Description</th></tr>
<tr><td>CHEDAYSTHRESHOLD</td><td>This is the maximum number of days content is present on a client.
<table>
<tr><th>Registry value</th><th>Type</th><th>Default value</th><th>Notes</th></tr>
<tr><td>MaxCacheDaysThreshold</td><td>REG_DWORD</td><td>0</td><td>This is the maximum number of days content is present on a client. If it's not zero, then content will be deleted without any other checks once it reaches the threshold. If the threshold has a value greater than zero and less than 30, Nomad uses the threshold of 30 days and creates an associated log.

Default value is 0.

New setting introduced in 8.0.

Please refer to Cache management for details about other cache management settings.</td></tr>
</table></td></tr>
<tr><td>MODULE.NOMAD.MAXCACHESIZEMB</td><td>Provided for backward compatibility only – use PercentAvailableDisk instead. The value (in bytes) for the maximum size the cache is allowed to grow to, before automatic cache cleaning takes place.

Click here to expand...

Provided for backward compatibility only – use PercentAvailableDisk instead. The value (in bytes) for the maximum size the cache is allowed to grow to, before automatic cache cleaning takes place.</td></tr>
</table>

Installer property	Description

Registry value	Default value	Notes
MaxCacheSizeMB	0	There is no maximum value for this property. This method for determining the maximum size of the cache is an alternative to PercentAvailableDisk: If PercentAvailableDisk has a value greater than zero set its method will be used to control the cache size. If MaxCacheSizeMB is set to a value greater than zero and PercentAvailableDisk is set to zero thenMaxCacheSizeMB will be used as the method for determining the maximum size of the Nomad cache.

MODULE.NOMAD.MAXCONCURRENCY

Sets the maximum number of concurrent PBA sessions that may be in use on the host.

Click here to expand...

Sets the maximum number of concurrent PBA sessions that may be in use on the host.

Registry value	Default value	Notes
MaxConcurrency	0x3 (3)	Located under the PBA registry key NomadBranch\NMDS.

MODULE.NOMAD.MAXDEVICESFROMAE

The maximum number of devices with the content that Nomad can retrieve from Content Distribution in one call.

Click here to expand...

The maximum number of devices with the content that Nomad can retrieve from Content Distribution in one call.

Installer property	Description

Registry value	Default value	Notes
MaxDevicesFromAE	10	The maximum number of devices (i.e. machines) with the content (package, application or software update) that Nomad can retrieve from Content Distribution in one call. The maximum value is 20.

MODULE.NOMAD.MAXELECTIONRESPONSELOGGING

Defines the number of election responses Nomad will write to the log for a given election.

Click here to expand...

Defines the number of election responses Nomad will write to the log for a given election.

Registry value	Default value	Notes
MaxElectionResponseLogging	By default this REG_DWORD value is not present and all election responses are logged.	Add this REG_DWORD value and set it to the number of responses that Nomad should log for any given election. Setting the value to 0 effectively turns off logging of any election responses.

Note

The value of MaxElectionResponseLogging specifies the number of election replies to be logged per election request. As an example, if MaxElectionResponseLogging = 5 and there are two election requests for the same package at different times, a maximum of 5 election responses will be logged for each elections (up to 10 election replies in total). If there are two concurrent election requests for the same package, the number of maximum election replies logged may vary from 5 to 10. In general, if MaxElectionResponseLogging = *n* and if there are *m* concurrent election requests for the same package, the number of maximum election replies logged may vary from *n* to *m***n*.

Installer property	Description
MODULE.NOMAD.MAXIMUMMEGABYTE	The maximum amount of space (in MB) that can be used for all the PBA shares combined on the host. Click here to expand... The maximum amount of space (in MB) that can be used for all the PBA shares combined on the host. Registry value: MaximumMegaByte Default value: 0 Notes: A non-zero value enables PBA share. This registry value is located under the PBA registry key NomadBranch\NMDS.
MODULE.NOMAD.MAXLOGSIZE	The maximum size (in bytes) of the Nomad log file. Default is 5MB. Click here to expand... The maximum size (in bytes) of the Nomad log file. Default is 5MB. Registry value: MaxLogFileSize Default value: 5242880 Notes: When the log file reaches this size, it is renamed with a *.LO_* extension and a new *.LOG* file is created. The *.LO* file is overwritten each time. **Note** The default has been increased from 1048576 (1MB) to 5242880 (5MB) for Nomad 7.0 onwards (1E Client 4.1). **Note** The installer property name is different to the registry name.
MODULE.NOMAD.MAXPACKAGEFAST	The maximum size (in bytes) of a package that Nomad attempts to cache on a Fast LAN (>500 kbps) connection. Click here to expand...

Installer property	Description
	The maximum size (in bytes) of a package that Nomad attempts to cache on a Fast LAN (>500 kbps) connection. Registry value: MaxPackageSizeFastLAN Default value: 0 Notes: Works in conjunction with the RunUncachedPermittedFastLAN registry value. **Note** The installer property name is different to the registry name.
MODULE.NOMAD.MAXPACKAGERAS	The maximum size (in bytes) of a package that Nomad will attempt to cache on a RAS (<55 kbps) connection. Click here to expand... The maximum size (in bytes) of a package that Nomad will attempt to cache on a RAS (<55 kbps) connection. Registry value: MaxPackageSizeRAS Default value: 0 Notes: **Note** The installer property name is different to the registry name.
MODULE.NOMAD.MAXPACKAGESLOW	Maximum size (in bytes) of a package that Nomad attempts to cache on a Slow LAN (55-500 kbps) connection. Click here to expand... Maximum size (in bytes) of a package that Nomad attempts to cache on a Slow LAN (55-500 kbps) connection.

Installer property	Description

Registry value	Default value	Notes
MaxPackageSizeSlowLAN	0	**Note** The installer property name is different to the registry name.

MODULE.NOMAD.MAXPACKETSPERSECOND

The maximum rate at which multicast packets are sent.

Click here to expand...

The maximum rate at which multicast packets are sent.

Warning

The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes
MaxPacketsPerSecond	800	Modify this value with caution. If packets are sent too fast, machines will drop packets and multicast will not be effective - too slow and multicast works, but slowly. The default value is indicative of how this should be set.

MODULE.NOMAD.MAXPRECACHEDAYS

When the Nomad cache cleaner runs, delete any pre-cached content that last triggered Nomad elections before the specified number of days ago.

Click here to expand...

When the Nomad cache cleaner runs, delete any pre-cached content that last triggered Nomad elections before the specified number of days ago.

Installer property	Description

Registry value	Default value	Notes
MaxPreCacheDays	0 (turned off)	Set to delete pre-cached content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only pre-cached content that has triggered elections recently will be kept in the cache. 0 means that pre-cached content will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.

MODULE.NOMAD.MAXSTATUSFREQUENCY

he minimum interval (in seconds) between sending transfer progress status messages, thereby governing the overall maximum frequency for sending the messages.

Click here to expand...

he minimum interval (in seconds) between sending transfer progress status messages, thereby governing the overall maximum frequency for sending the messages.

Registry value	Default value	Notes
MaxStatusFrequency	3600	Works in conjunction with the ++sm setting on the Nomad properties tab and the StatusMsgEvents registry values.

MODULE.NOMAD.MAXSTUCKCOUNT

Registry value to hold an integer determining the number of times Nomad attempts to copy content and gets stuck before aborting.

Click here to expand...

Installer property	Description

Registry value to hold an integer determining the number of times Nomad attempts to copy content and gets stuck before aborting.

If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this.

Registry value	Default value	Notes
MaxStuckCount	100	The number of times Nomad attempts to copy content after failure (such as network outages, incomplete LSZ files, hash mismatches, election issues, connecting with peers) before it aborts the operation. The range is 3 to 1000, but if the value is less than 3 or greater than 1000, it sets to the default of 100. **Warning** The MaxStuckCount value is an internal NomadBranch registry value. You should not change this value unless advised by 1E.

Do not use unless advised by 1E.

MODULE.NOMAD.MAXSUCACHEDAYS

When the Nomad cache cleaner runs, delete any software updates that last triggered Nomad elections before the specified number of days ago.

Click here to expand...

When the Nomad cache cleaner runs, delete any software updates that last triggered Nomad elections before the specified number of days ago.

Registry value	Default value	Notes
MaxSUCacheDays	0 (turned off)	Set to delete software updates that last triggered Nomad elections before the

Installer property	Description
	specified number of days from the date the cache cleaner runs. This ensures that only software updates that have triggered elections recently will be kept in the cache. 0 means that software updates will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.
MODULE.NOMAD.MULTICASTSUPPORT	The behavior of local multicast. Click here to expand... The behavior of local multicast. **Warning** The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes
MulticastSupport	0x0 (0)	All machines in a single branch must be configured using the same value for this parameter. If you are not using multicast, deploy the Nomad branch agent with the MULTICASTSUPPORT property set to 0 to reduce the noise in Nomad logs. Prior to Nomad 7.0 multicast was enabled (0x1) by default. Now it is disabled (0x0) by default.

Installer property	Description

Bit	Hex	Decimal	Description
	0x0	0	**No Multicast**– disables the feature.
0	0x1	1	**Data Only Multicast** – choose this for a standard Nomad multicast. Data refers to the content of the downloaded package. Nomad control communications are broadcast as normal on the local subnet. Select this option for standard functionality.
1	0x2	2	**Control Only Multicast** – control information refers to the communications between Nomad enabled machines, especially for elections. This may be used if there is more than one subnet in a single location to enable a single Nomad master to be elected for all the subnets.
	0x3	3	**Control and Data Multicast** – data and control information is multicast. Select this option if a branch has multiple subnets connected by high speed routers.

MODULE.NOMAD.NOHARDLINK

Determines whether hard links are used between the Nomad cache and the Configuration Manager cache.

Click here to expand...

Determines whether hard links are used between the Nomad cache and the Configuration Manager cache.

Registry value	Default value	Notes
NoHardlink	0	Values are:

Installer property	Description
	0 – hard links are used. The Nomad cache will link to the Configuration Manager cache so only a single copy of a package is held locally. 1 – hard links are not used and results in the content being double-cached For more detail about the Nomad Cache please refer to Nomad cache.
MODULE.NOMAD.NOMADINHIBITEDADSITES	Prevents Nomad from calling an election when it is connected to a specified AD site, meaning that each Nomad client on the listed AD sites will automatically become a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content. Click here to expand... Prevents Nomad from calling an election when it is connected to a specified AD site, meaning that each Nomad client on the listed AD sites will automatically become a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content.

Registry value	Default value	Notes
NomadInhibitedADSites	(empty)	A comma-separated list for each AD site to be inhibited. Useful for sites with: a local DP a VPN without isolation For example, to inhibit three AD sites called site1, site2 and site3: `site1,site2,site3` Please refer to Design Considerations: Inhibiting subnets and sites.

Installer property	Description
MODULE.NOMAD.NOMAD	Prevents Nomad from calling an election when it is connected to a specified IP subnet, meaning that each Nomad client on the IP subnet automatically

Installer property	Description
INHIBITEDSUBNETS	becomes a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content. Click here to expand... Prevents Nomad from calling an election when it is connected to a specified IP subnet, meaning that each Nomad client on the IP subnet automatically becomes a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content. Registry value: NomadInhibitedSubnets Default value: (empty) Notes: A comma-separated list of each subnet to be inhibited in CIDR notation. Useful for sites with either of the following: a local DP a VPN without isolation For example, to isolate two subnets: `10.2.0.0/16,192.168.9.0/24` Please refer to Design Considerations: Inhibiting subnets and sites.
MODULE.NOMAD.P2PDISQUALIFYMAXNUMPEERS	Defines the max number of devices which a device will disqualify during a peer-to-peer copy. Click here to expand... Defines the max number of devices which a device will disqualify during a peer-to-peer copy. If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this. Registry value: P2PDisqualifyMaxNumPeers Default value: 5 Notes: A device does not further disqualify a peer if it has disqualified

Installer property	Description
	P2PDisqualifyMaxNumPeers number of peers within last P2PDisqualifyMaxWindowMins minutes. **Warning** The P2PDisqualifyMaxNumPeers value is an internal NomadBranch registry value. You should not change this value unless advised by 1E. Do not use unless advised by 1E.
MODULE.NOMAD.P2PDISQUALIFYMAXWINDOWMINS	Defines the max number of minutes within which a device will disqualify a peer during a peer-to-peer copy. Click here to expand... Defines the max number of minutes within which a device will disqualify a peer during a peer-to-peer copy. If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this.

Registry value	Default value	Notes
P2PDisqualifyMaxWindowMins	60	A device does not further disqualify a peer if it has disqualified P2PDisqualifyMaxNumPeers number of peers within last P2PDisqualifyMaxWindowMins minutes. **Warning** The P2PDisqualifyMaxWindowMins value is an internal NomadBranch registry value. You should not

Installer property	Description
	change this value unless advised by 1E. Do not use unless advised by 1E.
MODULE.NOMAD.P2PENABLED	Determines how the Nomad cache is accessed. Please refer to Nomad cache for more details. The installer property must be set to sum of the integer values for the required bits. For example, the following would set Nomad to use connectionless P2P on the 1E Client installer command-line: *> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.P2PENABLED=6 [other properties] /qn* Click here to expand... Determines how the Nomad cache is accessed. Please refer to Nomad cache for more details.

Registry value	Default value	Notes
P2PEnabled	9	The default (Hex 0x0009) configures P2P to use SMB and Net Literal Names. You can set more than one option at the same time by combining the bit values. See the table below for details. **Note** We recommend restarting the Nomad Branch service when you modify this parameter.

Bit	Hex	Decimal	Notes
0	0x0001	1	(Default) Use the SMB protocol to share its own cache, and create the NomadSHR file share upon the start of the Nomad service, unless the CustomShare option has been enabled in SpecialNetShare. When

Installer property	Description			
				P2PEnabled is set in addition to Bit 5 (use HTTP) or Bit 6 (use HTTPS), Nomad will attempt to use HTTPS/HTTP and will fall-back to SMB if HTTPS/HTTP is unavailable on other peers. To disable SMB P2P, set this bit to 0.
		1	0x0002	2	Enable connectionless P2P server.
		2	0x0004	4	Enable connectionless P2P client.
		3	0x0008	8	(Default) Use Net Literal Names when connecting to P2P shares. This causes Nomad to use the Nomad master's IP address when connecting to the share and is recommended when running wirelessly.
		4	0x0010	16	Use FQDN when connecting to P2P shares. Recommended when using a multi-forest environment where computers from different forests may be present in the same subnet. This requires that reverse lookup for IP addresses is correctly configured and running. If this is not available Nomad will revert to using the IP address for connecting to the P2P shares.
		5	0x0020	32	Use the HTTP protocol to share its own cache and access other caches.
		6	0x0040	64	Use the HTTPS protocol to share its own cache and access other caches.
MODULE.NOMAD.P2PHTTPPORT	The HTTP port to use for peer copy. Click here to expand... The HTTP port to use for peer copy.				

Installer property	Description

Registry value	Default value	Notes
P2PHttpPort	5080	Default HTTP port to use for peer copy. If you are using a custom port, ensure that all agents use the same custom port.

MODULE.NOMAD.P2PHTTPSPORT

The HTTPS port to use for peer copy.

Click here to expand...

Registry value	Default value	Notes
P2PHttpsPort	5443	Default HTTPS port to use for peer copy. If you are using a custom port, ensure that all agents use the same custom port.

MODULE.NOMAD.P2PPORT

Port used to broadcast election messages, for connectionless cache access and package status broadcasts.

Click here to expand...

Port used to broadcast election messages, for connectionless cache access and package status broadcasts.

Registry value	Default value	Notes
P2P_Port	1779	

MODULE.NOMAD.P2PSSLSETTINGS

Defines server and client authentication options when using HTTPS for P2P content transfer (i.e. P2PEnabled 0x60 option is set).

Click here to expand...

Defines server and client authentication options when using HTTPS for P2P content transfer (i.e. P2PEnabled 0x60 option is set).

Installer property	Description

Registry value	Default value	Notes
P2PSslSettings	0	The default value (0) configures Nomad to use a self-signed certificate for server authentication and disables certificate-based client authentication. P2PSslSettings is a numeric value where, when represented in binary, each bit represents a configurable option as defined in the table below. You can combine these options to derive the required value, for example setting P2PSslSettings to 3 (0x1 + 0x2) configures Nomad to use a PKI certificate for server authentication and also enables certificate-based authentication. These options are only applicable if the HTTPS protocol has been enabled in the P2PEnabled setting. If you are using PKI certificates you must deploy the certificates to all clients before enabling this option. Refer to Peer copy over HTTP or HTTPS for further details on using HTTPS and associated authentication.

Bit	Hex	Decimal	Notes
0	0x0001	1	If not set (0), use self-signed certificate for server (Master) authentication If set (1), use PKI certificate for server (Master) authentication
1	0x0002	2	Enables certificate-based client authentication (Requires a PKI client authentication certificate)

Note

Installer property	Description
	If this option is enabled and the Configuration Manager client is using self-signed client authentication certificates (or Nomad is being used outside of CM), you should specify CertIssuer to ensure Nomad uses the intended certificate.
MODULE.NOMAD.PERCENTAVAILABLEDISK	The limit on the Nomad cache. Specified as a percentage of the available disk space, it controls the automatic cache cleaning to ensure that the cache does not grow to a size whereby the percentage of available disk space is less than this value. Click here to expand... The limit on the Nomad cache. Specified as a percentage of the available disk space, it controls the automatic cache cleaning to ensure that the cache does not grow to a size whereby the percentage of available disk space is less than this value.

Registry value	Default value	Notes
PercentAvailableDisk	10	By default, the cache will not grow such that less that #UUID146b7586a8d378aba88bc74a4d10ae9110 % of total disk space is available. The maximum value is 80. The cache will not grow beyond 20% of the total available disk space. This method for determining the maximum size of the cache is provided as an alternative to MaxCacheSizeMB: If PercentAvailableDisk is greater than zero, its method is used to control the cache size IfMaxCacheSizeMB is greater than zero and PercentAvailableDisk is zero, then MaxCacheSizeMB is used as the method for determining the maximum size of the Nomad cache.

Installer property	Description
MODULE.NOMAD.PERMITTEDLSZSHARES	Restricts Nomad LSZ file generation requests to a list of permitted package source locations. Click here to expand... Restricts Nomad LSZ file generation requests to a list of permitted package source locations.

Registry value	Default value	Notes
PermittedLSZShares	SMSPKG*$ SMS_DP_SMSPKG*$	A list of comma-separated package source locations. Enables increased security and is only used by the Nomad client installed on a distribution point. Nomad LSZ file generation requests will only be completed if the content location is listed. If you are using additional package source locations, you must manually add these to this registry value. *PermittedLSZShares* can incorporate wildcard characters to provide flexible naming convention support. If you leave the registry value blank, security checks on package source locations are not carried out. **Note** When Configuration Manager (specifically Distribution Point servers) is configured to use HTTPS only, you must also add *NOCERT_SMS_DP_SMSPKG*$* and CCMTOKENAUTH_SMS_DP_SMSPKG*$ to the PermittedLSZShares registry value.

Installer property	Description
MODULE.NOMAD.PERMITUNCACHED	Determines where the download package is run from under certain conditions. Click here to expand... Determines where the download package is run from under certain conditions.

Registry value	Default value	Notes
RunUncachedPermittedFastLAN	0	Works in conjunction with MaxPackageSizeFastLAN (which needs to contain a value value greater than zero). Values are: 0 – do not run package from the distribution point. 1 – run package directly from the distribution point if there is either insufficient disk space to create the cache, or the maximum package threshold is exceeded but the connection is fast (>500kbps). To ensure that the un-cached mode works correctly, set the Program Environment Properties to include the Drive mode/Require drive letter option.

MODULE.NOMAD.PLATFORMURL	The URL of the Tachyon Platform, specifically the Tachyon Background Channel, which provides a reverse proxy for the Content Distribution component of Tachyon Platform. Usually of the form *https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/* Click here to expand... **Note**

Installer property	Description

Platform features are now enabled by using the BackgroundChannelUrl instead of PlatformURL.

The URL of the Tachyon Platform, specifically the Tachyon Background Channel, which provides a reverse proxy for the Content Distribution component of Tachyon Platform. Usually of the form *https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/*

Registry value	Default value	Notes
PlatformURL	(empty)	Located under the following registry keys, depending on the component. For *NomadBranch*, it is found under *HKLM\Software\1E\NomadBranch\Platform* For *NomadBranchAdminUIExt* on 64-bit machines, it is found under *HKLM\Software\Wow6432Node\1E\NomadAdminUI\Platform* For *NomadBranchAdminUIExt* on 32-bit machines, it is found under *HKLM\Software\1E\NomadAdminUI\Platform* **Warning** Do not configure this registry setting, it is automatically configured on service startup. To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED is specified during installation, the registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for SSDEnabled and ContentRegistration, in addition to enabling the Tachyon client. The

Installer property	Description
	ContentDistribution registry setting is found under the Platform key. Nomad app provides visibility of content distribution activity Single Site Download (SSD) Single Site Peer Backup Assistant (SSPBA) High Availability Peer Backup Assistant (HAPBA) Get Migration Settings task sequence action used to manage computer associations Nomad Pre-caching Nomad Download Pause. In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the 1EClient.conf file).
MODULE.NOMAD.POSTCOMPLETETIMEOUTHOURS	The duration (in hours) after which the PBA share is deleted from the host. Click here to expand... The duration (in hours) after which the PBA share is deleted from the host.

Registry value	Default value	Notes
PostCompleteTimeoutHours	0xA8 (168)	Only applies to a PBA share after the NMDS_COMPLETE command has been run for it, otherwise the PreCompleteTimeoutHours value will apply. The intention is that an incomplete share will only be available for a short period of time,

Installer property	Description
	defined in PreCompleteTimeoutHours. Once the NMDS_COMPLETE command is sent, it will be fixed for this longer time. When the share is deleted the folder and associated user will be removed. This registry value is found under the PBA registry key NomadBranch\NMDS.
MODULE.NOMAD.PRECACHEPOLLBATCHSIZE	The number of notifications a client processes in one pre-cache poll cycle. Click here to expand... The number of notifications a client processes in one pre-cache poll cycle. Registry value: PrecachePollBatchSize Default value: 20 Notes: Range is 1 to 500. If the value is greater than 500, it defaults to 500. If you set the value to 0, it defaults to 20.
MODULE.NOMAD.PRECACHEPOLLMINUTES	The interval (in minutes) between Nomad polling Content Distribution for new pre-cache jobs. Click here to expand... The interval (in minutes) between Nomad polling Content Distribution for new pre-cache jobs. Registry value: PrecachePollMinutes Default value: 0x5A0 (1440) Notes: Nomad clients normally start their polling cycle when the service starts-up, with a random delay to minimize the possibility of concurrent polls from different clients.

Installer property	Description
	The range is 60 - 525600 (1 year). 0 disables polling
MODULE.NOMAD.PRECOMPLETETIMEOUTHOURS	The duration (in hours) after which PBA share is deleted from the host. Click here to expand... The duration (in hours) after which PBA share is deleted from the host.

Registry value	Default value	Notes
PreCompleteTimeoutHours	0x3 (3)	Located under the PBA registry key NomadBranch\NMDS, it only applies to a PBA share after the NMDS_POLL command has been run, but not the NMDS_COMPLETE command. The intention is that an incomplete share will only be available for a short period of time. When the share is deleted the folder and associated user is removed.

Installer property	Description
MODULE.NOMAD.RECYCLEDPDELAY	The delay (in seconds) before restarting retries from the first DP after the whole list of available DPs have been tried. Click here to expand... The delay (in seconds) before restarting retries from the first DP after the whole list of available DPs have been tried.

Registry value	Default value	Notes
RecycleDPDelay	600	It is associated with the distribution point resilience feature and is used in conjunction with DownloadTimeout. The default equates to 10 minutes.

Installer property	Description
MODULE.NOMAD.RANDOMIZEREMOTEPATHS	Allows you to enable and disable the remote paths randomization for CM and pre-cache jobs. Click here to expand... Allows you to enable and disable the remote paths randomization for CM and pre-cache jobs. When Nomad begins content download, its content is pulled from the same distribution point by every client. For example, If a site has four Distribution Points (DP), the first one in the list is always used for downloading. In a very large environment, this can put an unnecessary load on a single DP. Using**RandomizeRemotePaths**Nomad can randomize the content location list.

Registry value	Type	Default value	Notes
RandomizeRemotePaths	REG_DWORD	0	By default, RandomizeRemotePaths is not present in the Nomad registry hive. To change the value, you need to create it and set your desired value. You can enable and disable the remote paths randomization for either Configuration Manager (CM) or pre-cache jobs using the following bits:

Bit	Hex	Decimal	Notes
0	0x0001	1	Enable remote paths randomization for CM jobs.

Installer property	Description				
		1	0x0002	2	Enable remote paths randomization for Pre-cache jobs.

MODULE.NOMAD.SIGSFOLDER

The path to the Configuration Manager signature files.

Click here to expand...

The path to the Configuration Manager signature files.

Registry value	Default value	Notes
SigsFolder	C:\SMSSIG$	Relates to RDC integration and must point to the folder where the signature files are held for Configuration Manager. Wildcards are not allowed. For example: `E:\SMSSIG$` When it is not set, Nomad assumes that signature files location as *`C:\SMSSIG$`*, if it exists.

MODULE.NOMAD.SITESSDSTAGGER

Sets the site SSD query stagger duration (seconds).

Click here to expand...

Sets the site SSD query stagger duration (seconds).

Deployments to large numbers of clients (30,000 or more) generate significant network traffic from 1E Clients to ContentDistribution that may result in IIS 503 Overload errors on the server, causing content registrations and SSD requests to fail. SiteSsdStagger allows an elected subnet master to wait for a random configurable time before making a site SSD request. All peers in the subnet participating in the election would also synchronize and wait for the same time before copying from master machine.

Installer property	Description

Registry value	Type	Default value	Notes
SiteSsdStagger	REG_DWORD	0	Sets the site SSD query stagger duration in seconds. The stagger is 0 (disabled) by default. The maximum value that can configured is 300 seconds (5 minutes). There is no SSD staggering in WinPE. Site SSD happens when broadcast is enabled or if local SSD is enabled and it does not return any devices from ActiveEfficiency. **Note** Please consult 1E before changing this value. This setting works in conjunction with LocalSsdStagger.

MODULE.NOMAD.SITESSDMINPACKAGESIZEKB

Allows you to configure a minimum content size before making an SSD request.

Click here to expand...

Allows you to configure a minimum content size before making an SSD request.

Registry value	Type	Default value	Notes
SiteSSDMinPackageSizeKB	REG_DWORD	0	The default value is 0 which can be changed after installation when it will be an installer property. There is no lower limit for this key, upper limit

Installer property	Description
	is 10240. If the registry value is greater than 10240, the agent will only consider 10240 and will log a warning. Size of content is first taken from Job data, if that's not available it's taken from the LST file, if it's not present there, this key is ignored and an SSD request is made irrespective of size. **Note** This check is for site SSD, not for local SSD.
MODULE.NOMAD.SPECIALNETSHARE	Sets various special feature options related to the Nomad share. The installer property must be set to sum of the integer values for the required bits. For example, to use the computer$ account for access to the Nomad share, and have custom share permissions, you would set the value for the SpecialNetShare registry entry to 129 (0x81 hex). This is shown in the following 1E Client installer command-line: `> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.SPECIALNETSHARE=129 [other properties] /qn` Click here to expand... Sets various special feature options related to the Nomad share.

Registry value	Default value	Notes
SpecialNetShare	0x2060 (8288)	You can set more than one option at the same time by combining the bit values. For example, to have custom share permissions and use the machine account for access to the Nomad share,

Installer property	Description
	set the value for SpecialNetShare to 129 (decimal value 1+128 or 0x0081 hex). See The Nomad share for more detail on configuration and security. The default value in different versions has changed, based on feedback. Upgrading does not change the value unless explicitly set. **Nomad version** / **Default in MSI** Nomad 8.0 (1E Client 8.0): 0x2060 (8288) Bit 5: Disables broadcast of download statistics Bit 6: Enable Nomad FanOut Bit 13: Use HTTP/S or SMB Nomad 7.1 (1E Client 5.2) Nomad 7.0 (1E Client 4.1 to 5.1): 0x2020 (8224) Bit 5: Disables broadcast of download statistics Bit 13: Use HTTP/S or SMB Nomad 6.x: 0x0000 (0) No special features enabled. The default used in all versions of Client Deployment Assistant (and earlier Endpoint Agent Installer) is 0x2070 (8304): Bit 4: Enable Nomad hidden share as NomadSHR$ Bit 5: Disables broadcast of download statistics

Installer property	Description

Bit 6: Enable Nomad FanOut

Bit 13: Use HTTP/S or SMB

Bit	Hex	Decimal	Description
	0x0000	0	No special features enabled.
0	0x0001	1	Custom Share Permissions: Administrators configure and manage custom share permissions. The service doesn't create the *NomadSHR* share on start-up, leaving the administrator to manually create it and set the permissions. It is also not deleted when the service stops and therefore existing share permissions are preserved.
1	0x0002	2	Enables support for IPv6: If the network supports both IPv6 and IPv4, enable support for both – set bit 1 but not bit 2.
2	0x0004	4	Disables support for IPv4: If the network supports only IPv6, disable IPv4 and set both bit 1 and bit 2.
3	0x0008	8	RESERVED
4	0x0010	16	The Nomad share is hidden and named *NomadSHR$*. When using a hidden share, all Nomad installations must be configured to use this option. See The Nomad share for more detail on configuration and security.
5	0x0020	32	Disables broadcast of download statistics. By default, this is disabled. If enabled, Nomad broadcasts download statistics to all peers when a download is complete.

Note

Installer property	Description			
				Prior to 1E Client 4.1 (Nomad 7.0) this was enabled (0) by default, now it is disabled (1) by default.
	6	0x0040	64	Enables Nomad FanOut.
	7	0x0080	128	The machine account is used when connecting to a peer client. The SMSNomadP2P& account is not created. Please refer to The Nomad share: Use Machine Account. **Note** Will not work if peers exist in untrusted domains or workgroups.
	8	0x0100	256	RESERVED
	9	0x0200	512	RESERVED
	10	0x0400	1024	RESERVED
	11	0x0800	2048	RESERVED
	12	0x1000	4096	RESERVED (deprecated)
	13	0x2000	8192	Use HTTP/S or SMB. Ensure that this is set if Nomad integration is used by Tachyon. HTTP/S is automatically used if CM client is detected. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this was disabled (0) by default, now it is enabled (1) by default. This setting should be enabled in baseline or other policies.
	14	0x4000	16384	Web LSZ generation: enables the Nomad client on Configuration Manager standalone DPs to handle LSZ file generation requests coming from HTTP/HTTPS enabled clients.

Installer property	Description			
				Used when Nomad clients are configured with either of the following enabled: Bit13 (0x2000) – Use HTTP/S or SMB Bit 15 (0x8000) – Use HTTP/S only, not SMB When enabled, the Nomad distribution point client creates a virtual folder called *LSZFILES*. The permissions for this are copied from the Configuration Manager *SMS_DP_SMSPKGX$* share. By default, access to the LSZFILES folder requires SSL to be enabled. This is the case for Internet facing scenarios where local client access certificates will ensure authentication. If you are using HTTP instead of HTTPS, manually disable SSL on the LSZFILES web folder in order for the Nomad LSZ file generation process to work. Only needs to be enabled when using HTTP or HTTPS on standalone DPs; it is not required on site server DPs because Nomad automatically configures Web LSZ generation on them.
	15	0x8000	32768	Use HTTP/S only, not SMB: enables the Nomad client to download content using HTTPS or HTTP depending on the content location provided by Configuration Manager or Tachyon. The Nomad client will not use SMB to download content when this is enabled.
MODULE.NOMAD.SSDENABLED	Enables Single Site Download (SSD). The installer property must be set to sum of the integer values for the required bits. For example, the following will turn the complete SSD functionality on. `> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.SSDENABLED=3 [other properties] /qn` Click here to expand... Enables Single Site Download (SSD).			

Installer property	Description		
	Registry value	Default value	Notes
	SSDEnabled	0	You can set more than one option at the same time by combining the bit values. For example, to enable clients to fetch downloads using SSD and provide them to peers, set the value to 3 (decimal value 1+2 or 0x3). To enable clients to fetch downloads using site and local SSD and provide them to peers, set the value to 7. To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED is specified during installation, the registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for SSDEnabled and ContentRegistration, in addition to enabling the Tachyon client. The ContentDistribution registry setting is found under the Platform key. Nomad app provides visibility of content distribution activity Single Site Download (SSD) Single Site Peer Backup Assistant (SSPBA) High Availability Peer Backup Assistant (HAPBA) Get Migration Settings task sequence action used to manage computer associations Nomad Pre-caching Nomad Download Pause.

Installer property	Description
	In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the 1EClient.conf file). If your network is running over a WLAN or have devices on a wireless network you want to be content providers, set ContentProviderOnWifi=1.

Bit	Hex	Decimal	Description
	0x0	0	SSD is disabled, the Nomad client takes no part in the SSD on the site.
0	0x1	1	SSD is enabled and the Nomad client fetches downloads using SSD. This setting on its own (without provider mode set) should be used with sensitive server weighting. Provider mode is where a peer gets content from another peer but cannot serve it (it cannot act as a master).
1	0x2	2	SSD is enabled and the Nomad client provides downloads to peers. Enabling this bit causes Nomad to register content with Content Distribution. In practice, this is unlikely to be used on its own. This is automatically disabled for WinPE installations (because cached content is only temporary).
2	0x4	4	Local SSD is enabled and the Nomad client fetches downloads from a local client (also known as a subnet peer master - the term used for local devices which have content but cannot be located during the normal election process because network broadcasts have been disabled) within the subnet.

Installer property	Description
	The local SSD feature was introduced to supplement site SSD for clients on networks such as wireless where broadcasts are disabled, to prevent each client becoming its own master and downloading direct from the DP. In a SSD enabled environment, a master queries Content Distribution to get a list of devices on other subnets within the site that have content. With local SSD enabled, the master also queries for devices having content within local subnet. If any local peers with content are available, then the master downloads from them, otherwise it attempts to download from Site peers (other subnets in the site), and if the master still cannot find any peers, it downloads the content direct from the DP. In version 7.0 and later, a master skips using local SSD if it sees broadcast messages from peers. This means clients in mixed network environments can be configured with the same SSDEnabled setting (with Local SSD enabled) and clients can move seamlessly between networks. When on a wireless network (where broadcasts are typically disabled) local SSD can be used. On LAN networks (where broadcasts are typically allowed) local SSD would be skipped because a master is elected and sees broadcast activity from peers. This setting should only be used if networks have broadcasts being disabled (for example wireless networks) and clients are forced to download from the DP as they can't participate in an election. Local SSD requires that a peer on the local subnet be configured to provide downloads to peers, that is at least one client on the subnet must be configured with Bit 1 enabled. To maintain consistency with typical Nomad peer sharing behavior where local SSD is not required, configure all clients with *SSDEnabled=7*. You'll also want to set ContentProviderOnWifi=1. When enabled, the elected master:

Installer property	Description
	Queries Content Distribution to get a list of local devices having the content. Queries each of those devices to check if they are available and have the content. The list is ordered by percentage of content the device holds. Repeats the same process for devices on other subnets (existing SSD feature). Stores a list of subnets as well as site devices in memory. Cycles through the list in the following order: Subnet peer master (fetched from list of local devices from Content Distribution) Site master DP. To distinguish between a master derived from Content Distribution and an election, the log records: *`Connection::SetDownloadSource = SubnetPeer`* (an elected peer) instead of *`Connection::SetDownloadSource = Peer`* (an SSD peer master).
MODULE.NOMAD.SSPBAENABLED	Enables the use of Single Site functionality for PBA data stores. See Single Site peer backup assistant for more details. Click here to expand... Enables the use of Single Site functionality for PBA data stores. See Single Site peer backup assistant for more details.

Registry value	Default value	Notes
SSPBAEnabled	0	Has a dependency on the Tachyon Platform PlatformURL. Values are:

Installer property	Description
	0 – disables single-site integration with ContentDistribution 1 – enables single-site integration with ContentDistribution
MODULE.NOMAD.STATUSMSGEVENTS	Determines which Nomad events are reported using Configuration Manager status messages. Click here to expand... Determines which Nomad events are reported using Configuration Manager status messages. Registry value: StatusMsgEvents Default value: 0x0 Notes: Nomad can send status messages through Configuration Manager based on specific download events which appear in its deployment status. They are provided mainly for advanced troubleshooting purposes, or for custom reporting solutions. From v7.1 onwards, they are no longer required for the Nomad Dashboard which now gets its status events directly via the Platform Content Distribution feature. However, you may have custom reporting in Configuration Manger that also use these messages, and you can configure this setting accordingly for this purpose. These messages are controlled by the StatusMsgEvents registry value. This is a *REG_SZ* string data type and the format of the parameter must be a 64-bit value. Status messages are only sent when there is an active deployment. **Warning** Status message events should be used with caution as they could impact your Configuration Manager environment

Installer property	Description
	when scaled up to tens of thousands of machines. For example, to set the request started, request completed, started copy and master changed events, update the StatusMsgEvents registry value to *0x80002060*. 0x0000000001 – SNO_EVT_START 0x0000000002 – SNO_EVT_STOP 0x0000000004 – SNO_EVT_ERROR 0x0000000008 – SNO_EVT_PAUSED 0x0000000010 – SNO_EVT_RESUMED 0x0000000020 – SNO_EVT_REQUEST_STARTED 0x0000000040 – SNO_EVT_REQUEST_COMPLETED 0x0000000080 – SNO_EVT_SERVICE_RESET 0x0000000100 – SNO_EVT_STARTED_CACHE_MANAGEMENT 0x0000000200 – SNO_EVT_FINISHED_CACHE_MANAGEMENT 0x0000000400 – SNO_EVT_STARTED_HASHCHECK 0x0000000800 – SNO_EVT_FINISHED_HASHCHECK 0x0000001000 – SNO_EVT_ELECTION_REQUEST 0x0000002000 – SNO_EVT_MASTER_CHANGED 0x0000004000 – SNO_EVT_FILLIN_MASTER_CHANGED 0x0000008000 – SNO_EVT_MCAST_CENTRALSCHED

Installer property	Description
	0x0000010000 – SNO_EVT_MCAST_ERROR 0x0000020000 – SNO_EVT_MCAST_COMPLETE 0x0000040000 – SNO_EVT_SCHEDULER 0x0000080000 – SNO_EVT_STARTED_TX_CENTRALMCAST 0x0000100000 – SNO_EVT_STOPPED_TX_CENTRALMCAST 0x0000200000 – SNO_EVT_STARTED_TX_ACTIVEMCAST 0x0000400000 – SNO_EVT_STOPPED_TX_ACTIVEMCAST 0x0000800000 – SNO_EVT_STARTED_TX_FILLINMCAST 0x0001000000 – SNO_EVT_STOPPED_TX_FILLINMCAST 0x0002000000 – SNO_EVT_STARTED_RX_CENTRALMCAST 0x0004000000 – SNO_EVT_STOPPED_RX_CENTRALMCAST 0x0008000000 – SNO_EVT_STARTED_RX_ACTIVEMCAST 0x0010000000 – SNO_EVT_STOPPED_RX_ACTIVEMCAST 0x0020000000 – SNO_EVT_STARTED_RX_FILLINMCAST 0x0040000000 – SNO_EVT_STOPPED_RX_FILLINMCAST 0x0080000000 – SNO_EVT_STARTED_COPY 0x0100000000 – SNO_EVT_STOPPED_COPY

Installer property	Description
	0x0200000000 – SNO_EVT_WORKRATE_CHANGED 0x0400000000 – SNO_EVT_WRONG_PKG_VERSION 0x0800000000 – SNO_EVT_INFORMATIONAL 0x1000000000 – SNO_EVT_FINALSTATS (see notes below) 0x2000000000 – SNO_EVT_WAIT 0x4000000000 – SNO_EVT_MAX_EVENTID **SNO_EVT_FINALSTATS notes** For success reporting, this message provides feedback on the status of the download. For example, it can show how much data was received using multicast as opposed to peer-to-peer copying. Turning this message on creates an extra status message per machine for each deployment. The format of the status message is: `Evt_FinalStats MD100067 1 170 59195038 170 59195038 0 59195038 0 0` Configuration Manager status messages are made up of insertion strings. The strings for the final stats event are: InstrStr0 – Nomad event string (internal reference) – N/A InstrStr1 – Package Id and Package version – MD100067 1 InstrStr2 – Total number of files in package – 170

Installer property	Description			
		InstrStr3	Total number of package bytes	59195038
		InstrStr4	Number of files which are cached	170
		InstrStr5	Bytes which are cached	59195038
		InstrStr6	Bytes coped from a peer agent (P2P)	0
		InstrStr7	Bytes copied from the DP	59195038
		InstrStr8	Bytes received via local multicast	0
		InstrStr9	Bytes received from a central multicast	0
	If the package is already cached and is re-deployed with an unchanged package version, the final stats message will not be re-sent.			
MODULE.NOMAD.SUCCESSCODES	A list of Nomad return codes that are translated as success to the Content Transfer Manager (CTM) component of the Configuration Manager client. Click here to expand... A list of Nomad return codes that are translated as success to the Content Transfer Manager (CTM) component of the Configuration Manager client.			

Registry value	Default	Notes
SuccessCodes	0x206b, 0x2077, 0x103, 0xffffffff, 0x1,	This REG_SZ value contains a comma-delimited list of possible Nomad return codes that should be treated as a success and thereby prevent Configuration Manager from

Installer property	Description		
		0x70, 0x2050, 0x2051, 0x2052, 0x2053, 0x2054,0x2055, 0x2056, 0x2057, 0x2058, 0x205a, 0x205b, 0x205c, 0x205d, 0x205e, 0x2060, 0x2061,0x2062, 0x2063, 0x2064, 0x2065, 0x2066, 0x2067, 0x2068, 0x2069, 0x209A	attempting to download the content itself or use another Alternate Content Provider (ACP). Any code returned by Nomad that is not on the list will be treated as a failure and trigger the Configuration Manager client to attempt to download the content using alternate means. Nomad also sends a status message to the Configuration Manager site containing its return code. Strictly speaking the Nomad return codes are actually internal status codes, Nomad will only ever return success or failure to the Content Transfer Manager (CTM) component of the Configuration Manager client. When CTM receives a success it passes control to the ExecMgr component of the Configuration Manager client, which attempts to execute the deployment. ExecMgr will fail if Nomad did not download the content and make it available in the Configuration Manager cache. In this case, ExecMgr sends a status message (e.g. failed deployment) back to the Configuration Manager site. If Nomad generates a return code that is not in the list, it passes a fail to the CTM component which causes the Configuration Manager client to try downloading the content itself using BITS, or use another Alternate Content Provider (ACP). This process may itself succeed or fail depending on the conditions that resulted in the original Nomad return code, and may have an undesirable impact on the network. **Note** The special code 0x9999 can be added to the list, or used on its own, to cause Nomad to always return a success to CTM. As a

Installer property	Description

consequence this code is also known as "prevent failover to BITS".

Note

The SuccessCodes list need not be modified under normal circumstances, other than to add or remove the 0x9999 code.

The following table shows the possible Nomad return codes that can be set in the list:

Note

This list is subject to change with each release of Nomad, and provided for reference only.

Return Code	Description	
-1	0xFFFFFFFF	Reserved.
1	0x0001	Reserved.
112	0x0070	Insufficient disk space to create the cache.
259	0x0103	Reserved.
8272	0x2050	The download has been suspended by APM.
8273	0x2051	The user has cancelled this download.
8274	0x2052	Invalid command line.

Installer property	Description			
		8275	0x2053	Command-line execution failure.
		8276	0x2054	Internal Error.
		8277	0x2055	The package exceeds the threshold for a RAS connection.
		8278	0x2056	The package exceeds the threshold for a Slow LAN connection.
		8279	0x2057	The package exceeds the threshold for a Fast LAN connection.
		8280	0x2058	Reserved.
		8281	0x2059	Unknown transport. Returned when an attempt is made to download a Software Update from an Internet location (like Microsoft Updates).
		8282	0x205A	Invalid special package path (set using --pp).
		8283	0x205B	Incorrect file hash.
		8284	0x205C	Exited due to a kill request.
		8285	0x205D	DP path not found.
		8286	0x205E	The MaxBusyBackOff consecutive event

Installer property	Description			
				threshold has been exceeded.
		8287	0x205F	The service has stopped.
		8288	0x2060	The advertisement has expired.
		8289	0x2061	Reserved.
		8290	0x2062	This is an unlicensed version of Nomad.
		8291	0x2063	Invalid alternate cache path (set using --cp).
		8292	0x2064	No Configuration Manager job data found in WMI.
		8293	0x2065	Incorrect package hash.
		8294	0x2066	MaxDuration or execution runtime for this program has been exceeded.
		8295	0x2067	Reserved.
		8296	0x2068	Incorrect package version.
		8297	0x2069	Obsolete package version.

Installer property	Description			
		8298	0x206A	The BlockSize has been changed during download.
		8299	0x206B	The "no progress" re-check threshold has been exceeded.
		8300	0x206C	The parent process has terminated.
		8301	0x206D	Duplicate download for the package.
		8302	0x206E	The service was reset. This will occur if certain configuration parameters are changed during a download e.g. NomadInhibitedSubnets
		8303	0x206F	Nomad inhibited.
		8311	0x2077	Internal error LST incomplete.
		8346	0x209A	Client certificate missing. Nomad is configured to use certificate-based client authentication but was unable to find an appropriate certificate.

Installer property	Description
MODULE.NOMAD.SUPPORTWPAD	Provides support for Web Proxy Auto-Discovery Protocol (WPAD). Click here to expand... Provides support for Web Proxy Auto-Discovery Protocol (WPAD). Nomad always uses System level proxy if it has been set, irrespective of what SupportWPAD has been set to. SupportWPAD was introduced in v7.1 and when disabled it does not change the default behavior, which is: If system level proxy is set then use it, otherwise access directly without proxy. When SupportWPAD is enabled in Nomad, the behavior is: If system level proxy is set then use it and do not try WPAD If system level proxy is not set then fetch automatic proxy using WPAD and use it If system level proxy is not set and failed to get automatic proxy using WPAD then try access directly without proxy. **How to know if a system level proxy has been set** `netsh winhttp show proxy` Registry value: SupportWPAD Default value: 0 Notes: By default, the WPAD feature is disabled. To enable WPAD in Nomad, add registry key 'SupportWPAD' and set it to 1 at registry path HKLM/Software/1E/NomadBranch To enable or disable the WPAD feature in Nomad: Disable WPAD set SupportWPAD = 0 Enable WPAD set SupportWPAD= 1 (or non-zero value).
MODULE.NOMAD.USEFIPS	This installer property sets the Nomad EncryptionType registry entry.

Installer property	Description
	Determines the type of encryption used by Nomad to encrypt its communications between Nomad peers. Click here to expand... Determines the type of encryption used by Nomad to encrypt its communications between Nomad peers. Registry value: EncryptionType Default value: 0x0 (0) Notes: Value are: 0 – standard Nomad encryption 1 – FIPS encryption
MODULE.NOMAD.WAKEUPBATCHSIZE	The maximum number of machines to wake up in a single call. Click here to expand... The maximum number of machines to wake up in a single call. **Warning** Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution. The wake-up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for the subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution, and a NightWatchman infrastructure. The feature is enabled during the installation of the NightWatchman Management Center. Please refer to Introducing Nomad for requirements.

Installer property	Description

Registry value	Default value	Notes
WakeUpBatchSize	10	Sets the maximum number of machines to wake up in one call, for subnet and site separately. (So up to twice this number of requests is sent in total if WakeUp is enabled for both subnet and site.) The next batch is launched, if necessary, after a re-election (usually a periodic election). The value cannot be greater than MaxDevicesFromAE, and hence itself cannot be more than 20.

MODULE.NOMAD.WAKEUPENABLED

Enables WakeUp integration, see Integrating Nomad with WakeUp for more details.

Click here to expand...

Enables WakeUp integration, see Integrating Nomad with WakeUp for more details.

Warning

Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.

The wake-up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for the subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution, and a NightWatchman infrastructure. The feature is enabled during the installation of the NightWatchman Management Center. Please refer toIntroducing Nomad for requirements.

Installer property	Description

Registry value	Default value	Notes
WakeUpEnabled	0	Determines the status of the WakeUp integration. If configured by the installer, it is disabled (0) by default. If integration is enabled, Nomad attempts to wake up dormant hosts that are known to have the requested content in their caches. The integration has a dependency on the PlatformURL. To enable integration post-installation, for normal usage, set both bits 0 and 1 (0x3)

Bit	Hex	Decimal	Description
	0x0	0	Disables WakeUp integration.
0	0x1	1	Enables WakeUp integration only for the local subnet.
1	0x2	2	Enables WakeUp integration only for the site.
	0x3	3	Enables WakeUp integration for the site and the local subnet.

MODULE.NOMAD.WAKEUPMINPACKAGESIZEMB

The minimum size of content (in megabytes) that will cause a request for a wakeup. See Integrating Nomad with WakeUp for more details.

Click here to expand...

The minimum size of content (in megabytes) that will cause a request for a wakeup. See Integrating Nomad with WakeUp for more details.

Warning

Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode).

Installer property	Description

However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.

The wake-up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for the subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution, and a NightWatchman infrastructure. The feature is enabled during the installation of the NightWatchman Management Center. Please refer toIntroducing Nomad for requirements.

Registry value	Default value	Notes
WakeUpMinPackageSizeMB	1024	Any content below this size is downloaded from the DP as downloads from the DP for files this size will likely complete before any wakeups will have had a chance to finish. The value can be 0, in which case wakeups will always be attempted. For example, if it is set to 512 and size of the content downloaded is 500 MB, a wake-up request (to site or subnet) is not be sent. Similarly, if size of the content is 600 MB, then wake-up requests (to site and subnet, determined by WakeupEnabled) is be sent. **Note** For standalone downloads (using SMSNomad.exe) and under WinPE, there has no effect as the size of the content cannot easily be determined. Wake-up requests are always sent in these instances.

Installer property	Description
MODULE.NOMAD.WLANBLIPSECS	The duration for temporarily disabling a wireless connection when a wired LAN connection becomes available, to provide time for the OS and Nomad to switch to the LAN connection. This is useful for OS versions and drivers that do not automatically switch to a preferred wired connection. Click here to expand... The duration for temporarily disabling a wireless connection when a wired LAN connection becomes available, to provide time for the OS and Nomad to switch to the LAN connection. This is useful for OS versions and drivers that do not automatically switch to a preferred wired connection. Registry value: WLanBlipSecs Default value: 0 Notes: The value must be 20 seconds or more. Nomad provides extra stability by managing a machine's network connections as they move between a wireless and a wired LAN. Depending on the OS version or other factors, once an SMB or HTTP session is running on a wireless connection, it will remain on wireless even when a wired LAN becomes available. Nomad uses **WLanBlipSecs** to temporarily drop a wireless connection when it detects a wired LAN connection, to give time for the OS and Nomad to automatically switch to the LAN connection. For example, if a Nomad master was initiated when a machine was on a wireless connection and a wired connection subsequently became available, Nomad disables the wireless adapter for a long enough period to enable a switchover to the wired connection. As a result of this, the IP address and the share path will change and peers will log error messages until each peer re-establishes its connection to the master and the new share location. This feature is turned off by default. **Note** Other applications may be affected when switching from wireless to wired connection. Irrespective of the **WLanBlipSecs** setting, you can also control which service set identifier (SSID) Nomad connects to by managing a list. To do this, update the NomadBranch WLanProfileList registry value with a comma-delimited list of SSIDs or use the wildcard (*) character for any SSID. Examples:

Installer property	Description
	`WLanProfileList REG_SZ WIFIGAP,GUEST` `WLanProfileList REG_SZ *`
MODULE.NOMAD.WLANPROFILELIST	A list of wireless SSIDs to enable switching from wireless to wired LAN connections. Click here to expand... A list of wireless SSIDs to enable switching from wireless to wired LAN connections. Registry value: WLanProfileList; Default value: ; Notes: A comma-delimited list of wireless SSIDs (* for any all) which enables Nomad to switch form wireless to a wired LAN connection when it becomes available.

9.6.12 Nomad registry values

The two Nomad components that have registry values are NomadBranch and NomadBranchAdminUIExt, grouped below under feature headings.

9.6.12.1 NomadBranch registry values

The NomadBranch registry values can be changed to alter some of the default installation values for Nomad. Before you make any registry updates, ensure you make a backup of the registry. The following headings show the Nomad registry entries related to a particular functional area.

Clicking on a registry value's link will take you to its definition page, which has more details including its Windows installer property.

Note

Registry values for NomadBranch are located in *HKLM\Software\1E\NomadBranch*

9.6.12.1.1 Basic Nomad configuration

CompatibilityFlags, Debug, GenerateWEREvents, InstallationDirectory, LogFileName, MaxLogFileSize, MaxStuckCount, P2PDisqualifyMaxNumPeers, P2PDisqualifyMaxWindowMins, P2PElectionWeight, P2Penabled, P2P_Port, SpecialNetShare, SuccessCodes

9.6.12.1.2 Peer Backup Assistant (PBA)

CachePath, EnforceQuotas, HAACKTimeoutMins, MaxAllocRequest, MaxConcurrency, MaximumMegaByte, PostCompleteTimeoutHours, PreCompleteTimeoutHours, SSPBAEnabled

9.6.12.1.3 Connection and downloads

DownloadTimeout, MaxAllowedLinkSpeed, MaxBusyBackOffSecs, MaxPackageSizeFastLAN, MaxPackageSizeRAS, MaxPackageSizeSlowLAN, MaxWorkRates, NomadNeverUseSubnets, RunUncachedPermittedFastLAN, WLanBlipSecs, WLanProfilesList

9.6.12.1.4 Nomad cache

AuthenticatedUsers, CacheCleanCycleHrs, MaxCacheDays, MaxCacheSizeMB, MaxPreCacheDays, MaxSUCacheDays, NoHardlink, NomadInhibitedADSites, NomadInhibitedSubnets, PercentAvailableDisk

9.6.12.1.5 Certificates, HTTPS and Internet-facing clients

CertIssuer, CertSubject

9.6.12.1.6 Distribution Point server related

DPNotAvailableCodes, PermittedLSZShares, RecycleDPDelay, SigsFolder

9.6.12.1.7 Status messages

MaxStatusFrequency, StatusMsgEvents

9.6.12.1.8 FanOut

ExtraReplyDelayMs, SpecialNetShare

9.6.12.1.9 Single Site Download (SSD)

ActiveEfficiency\PlatformURL, ContentRegSyncBatchSz, ContentRegSyncCycleHrs, ContentRegSyncReqDelay, LocalSsdStagger, NoSsdReqOnInhibitedSubnets, PercentDelayedContentReg, SiteSsdStagger, SSDEnabled, SSPBAEnabled, CacheStateSyncIntervalMinutes

9.6.12.1.10 Multicast

CentralMCastExtraDelayMins, MaxPacketsPerSecond, MultiCastMADCAPScope, MulticastSupport

9.6.12.1.11 WakeUp

MaxDevicesFromAE, WakeUpBatchSize, WakeUpEnabled, WakeUpMinPackageSizeMB

> **Note**
>
> If you make changes to the registry values, we recommend you restart the Nomad service – changes to P2P_Port, P2PEnabled, NomadInhibitedSubnets and NomadInhibitedADSites will not take effect until the service is restarted.

9.6.12.2 NomadBranchAdminUIExt registry categories

For 64-bit machines running the Configuration Manager console, the registry values for NomadBranchAdminUIExt are under: *HKLM\Software\Wow6432Node\1E\NomadAdminUI\Platform*

For 32-bit machines running the Configuration Manager console, the registry values for NomadBranchAdminUIExt are under: *HKLM\Software\1E\NomadAdminUI\Platform*

9.6.12.2.1 Nomad pre-caching

There is only one value that is of use in the NomadBranchAdminUIExt registry that defines the location of Content Distribution Server for use with the Nomad Pre-caching feature: PlatformURL

9.6.12.3 Alphabetic NomadBranch registry values

The following table shows the supported NomadBranch registry value and any associated installer properties. Installer properties must be upper-case and those that use numeric values must be set using decimal integers on the command-line.

Registry value	Description
Platform\PlatformURL	The URL of the Tachyon Platform, specifically the Tachyon Background Channel, which provides a reverse proxy for the Content Distribution component of Tachyon Platform. Usually of the form *https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/*
Platform\ContentRegistration	Determines if content in Nomad's cache (packages, applications, software updates, boot images, etc.) is registered with Content Distribution. Content registration is necessary if a host is to be available as a Single Site Download (SSD) provider or can be woken up if a Nomad peer requires the content locally.
Platform\ContentProviderOnWifi	Determines whether a device on a WLAN can become content provider. By default, only devices connected to a LAN can become content providers when using Single Site Download (SSD). **Note** This setting is only applicable to SSD and has no effect on P2P content transfers on the local subnet.
AssumedLinkSpeed	**Warning** AssumedLinkSpeed is obsolete. Its value may exist in the Nomad registry but it is not used. Instead Nomad now

Registry value	Description
	relies on the actual content being downloaded to gauge link speed.
AuthenticatedUsers	Determines which of the built-in security groups is granted read-only permissions to the Nomad cache.
BlockSize	Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder.
CacheCleanCycleHrs	Determines the number of hours between automatically running the Nomad cache cleaner.
CacheCleanSubnetLookup	If enabled, sets the cache clean subnet lookup.
CentralMCastExtraDelayMins	An integer value that sets the delay for receiving Central Multicast. Normally you would not need to set this value.
CertIssuer	Defines one or more certificate issuers that Nomad will use to select the appropriate PKI certificate for the: Configuration Manager (CM) client authentication certificate - used when downloading over HTTPS from Distribution Points and when communicating with Management Points during pre-caching Nomad Server Authentication certificate - used to share content between peers over HTTPS Client Authentication certificate - used for certificate-based client authentication when sharing content between peers over HTTPS. In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without needing to specify CertIssuer (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details). You should use CertIssuer if the CM client is not using PKI certificates and there are multiple Client Authentication certificates issued by different Certificate Authorities in the store, and if there is a chance some of those certificates may not be trusted by other peers or CM site systems.
CertSubject	Defines one or more certificate subject names that Nomad uses to select the appropriate PKI certificate for authentication with Configuration Manager (CM) site systems configured to use HTTPS. It does not affect certificate selection for client

Registry value	Description
	authentication certificates used for peer-to-peer authentication or for selection of server authentication certificates. In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without the need to specify CertSubject (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details).
CompatibilityFlags	Determines different compatibility settings which relate to specific customer related functionality and should not generally be changed from the default value under normal conditions, unless advised.
ContentRegSyncCycleHrs	**Warning** ContentRegSyncCycleHrs is obsolete. Its value may exist in the Nomad registry, but it is not used. Instead, please refer to CacheStateSyncIntervalMinutes.
ContentRegSyncReqDelay	**Warning** ContentRegSyncReqDelay is obsolete. Its value may exist in the Nomad registry, but it is not used. Instead, please refer to CacheStateSyncIntervalMinutes.
ContentRegSyncBatchSz	**Warning** ContentRegSyncBatchSz is obsolete. Its value may exist in the Nomad registry, but it is not used. Instead, please refer to CacheStateSyncIntervalMinutes.
Debug	The level of messages logged in the Nomad logs for debugging purposes.
DebugDynamicBlock	The level of messages related to the Dynamic Block Size (DBS) feature logged in the Nomad logs for debugging purposes.
DeliveryOptimizationReportingEnabled	Enables Delivery Optimization monitoring and reporting if ContentRegistration is enabled.
DownloadTimeout	Sets the timeout in seconds after which a job will be cancelled if the download has not been successful.

Registry value	Description
DPNotAvailableCodes	Determines which error codes will cause Nomad to retry a download using an alternative distribution point.
DpCacheCleanupEnabled	Delete all obsolete LSZ files on the DP where the associated content is no longer present in ContentLib.
ContentProviderOnWifi	Determines whether a device on a WLAN can become content provider. By default, only devices connected to a LAN can become content providers when using Single Site Download (SSD). **Note** This setting is only applicable to SSD and has no effect on P2P content transfers on the local subnet.
EncryptionType	Determines the type of encryption used by Nomad to encrypt its communications between Nomad peers.
GenerateWEREvents	Determines whether Windows Error Reporting memory dumps should be sent to Microsoft Winqual.
InstallationDirectory	The installation directory for Nomad.
LocalCachePath	The location of local Nomad package cache.
LogFileName	The path and filename of the Nomad log file.
MaxAllowedLinkSpeed	(Optional setting) If set, defines the maximum possible link speed in bits per second.
MaxBusyBackOffSecs	The maximum duration (in seconds) that Nomad backs-off between blocks of data.
MaxCacheDays	When the Nomad cache cleaner runs, delete any application or package content that last triggered Nomad elections before the specified number of days ago.
MaxCacheDaysThreshold	This is the maximum number of days content is present on a client.

Registry value	Description
MaxCacheSizeMB	Provided for backward compatibility only – use PercentAvailableDisk instead. The value (in bytes) for the maximum size the cache is allowed to grow to, before automatic cache cleaning takes place.
MaxDevicesFromAE	The maximum number of devices with the content that Nomad can retrieve from Content Distribution in one call.
MaxElectionResponseLogging	Defines the number of election responses Nomad will write to the log for a given election.
MaxLogFileSize	The maximum size (in bytes) of the Nomad log file. Default is 5MB.
MaxPackageSizeFastLAN	The maximum size (in bytes) of a package that Nomad attempts to cache on a Fast LAN (>500 kbps) connection.
MaxPackageSizeRAS	The maximum size (in bytes) of a package that Nomad will attempt to cache on a RAS (<55 kbps) connection.
MaxPackageSizeSlowLAN	Maximum size (in bytes) of a package that Nomad attempts to cache on a Slow LAN (55-500 kbps) connection.
MaxPacketsPerSecond	The maximum rate at which multicast packets are sent.
MaxPreCacheDays	When the Nomad cache cleaner runs, delete any pre-cached content that last triggered Nomad elections before the specified number of days ago.
MaxStatusFrequency	he minimum interval (in seconds) between sending transfer progress status messages, thereby governing the overall maximum frequency for sending the messages.
MaxStuckCount	Registry value to hold an integer determining the number of times Nomad attempts to copy content and gets stuck before aborting.
MaxSUCacheDays	When the Nomad cache cleaner runs, delete any software updates that last triggered Nomad elections before the specified number of days ago.

Registry value	Description
MaxWorkRates	MaxWorkRates is a registry key, that must be created, to hold registry values for each day of the week (Day0 to Day6) where the hourly maximums for the variable work rates are set.
MultiCastMADCAPScope	The MADCAP scope for multicast.
MulticastSupport	The behavior of local multicast.
NMDS\CachePath	This value holds the location of the base peer backup assistant (PBS) share where user data is copied to.
NMDS\EnforceQuotas	Determines whether Windows Disk Quotas (if configured) are enforced on the PBA share defined in CachePath.
NMDS\ExtraReplyDelayMs	Time by which PBA peer reply window should be extended to avoid network spikes.
NMDS\HAACKTimeoutMins	The time-out period in minutes for the Peer Backup Assistant - High Availability (PBA-HA) task sequence action. If a machine running this action does not receive an acknowledgement message within this period from the PBA host performing the additional backups, the action will fail.
NMDS\MaxAllocRequest	Sets the maximum amount of space in MB that can be requested by each PBA client.
NMDS\MaxConcurrency	Sets the maximum number of concurrent PBA sessions that may be in use on the host.
NMDS\MaximumMegaByte	The maximum amount of space (in MB) that can be used for all the PBA shares combined on the host.
NMDS\PostCompleteTimeoutHours	The duration (in hours) after which the PBA share is deleted from the host.
NMDS\PreCompleteTimeoutHours	The duration (in hours) after which PBA share is deleted from the host.
NoHardlink	Determines whether hard links are used between the Nomad cache and the Configuration Manager cache.

Registry value	Description
NomadInhibitedADSites	Prevents Nomad from calling an election when it is connected to a specified AD site, meaning that each Nomad client on the listed AD sites will automatically become a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content.
NomadInhibitedSubnets	Prevents Nomad from calling an election when it is connected to a specified IP subnet, meaning that each Nomad client on the IP subnet automatically becomes a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content.
NomadNeverUseSubnets	Prevents Nomad from using specific network adaptors based on the IP subnet. For example, this can be used to exclude Server backup subnets.
P2PClientCertWaitPeriodMins	Defines the number of minutes that Nomad waits from the start time of the download job for a valid client authentication certificate before failing the download job.
P2PDisqualifyMaxNumPeers	Defines the max number of devices which a device will disqualify during a peer-to-peer copy.
P2PDisqualifyMaxWindowMins	Defines the max number of minutes within which a device will disqualify a peer during a peer-to-peer copy.
P2PElectionWeight	Determines the outcome of Nomad elections.
P2PEnabled	Determines how the Nomad cache is accessed. Please refer to Nomad cache for more details.
P2PHttpPort	The HTTP port to use for peer copy.
P2PHttpsPort	The HTTPS port to use for peer copy.
P2P_Port	Port used to broadcast election messages, for connectionless cache access and package status broadcasts.
P2PSslSettings	Defines server and client authentication options when using HTTPS for P2P content transfer (i.e. P2PEnabled 0x60 option is set).

Registry value	Description
PercentAvailableDisk	The limit on the Nomad cache. Specified as a percentage of the available disk space, it controls the automatic cache cleaning to ensure that the cache does not grow to a size whereby the percentage of available disk space is less than this value.
PercentDelayedContentReg	**Warning** PercentDelayedContentReg is obsolete. Its value may exist in the Nomad registry, but it is not used. Instead, **Content Registration Sync Cycle** is now used, please refer to CacheStateSyncIntervalMinutes.
PermittedLSZShares	Restricts Nomad LSZ file generation requests to a list of permitted package source locations.
PrecachePollBatchSize	The number of notifications a client processes in one pre-cache poll cycle.
PrecachePollMinutes	The interval (in minutes) between Nomad polling Content Distribution for new pre-cache jobs.
RecycleDPDelay	The delay (in seconds) before restarting retries from the first DP after the whole list of available DPs have been tried.
RunUncachedPermittedFastLAN	Determines where the download package is run from under certain conditions.
SigsFolder	The path to the Configuration Manager signature files.
SpecialNetShare	Sets various special feature options related to the Nomad share.
SSDEnabled	Enables Single Site Download (SSD).
SSPBAEnabled	Enables the use of Single Site functionality for PBA data stores. See Single Site peer backup assistant for more details.
StatusMsgEvents	Determines which Nomad events are reported using Configuration Manager status messages.

Registry value	Description
SuccessCodes	A list of Nomad return codes that are translated as success to the Content Transfer Manager (CTM) component of the Configuration Manager client.
SupportWPAD	Provides support for Web Proxy Auto-Discovery Protocol (WPAD).
WakeUpBatchSize	The maximum number of machines to wake up in a single call.
WakeUpEnabled	Enables WakeUp integration, see Integrating Nomad with WakeUp for more details.
WakeUpMinPackageSizeMB	The minimum size of content (in megabytes) that will cause a request for a wakeup. See Integrating Nomad with WakeUp for more details.
WLanBlipSecs	The duration for temporarily disabling a wireless connection when a wired LAN connection becomes available, to provide time for the OS and Nomad to switch to the LAN connection. This is useful for OS versions and drivers that do not automatically switch to a preferred wired connection.
WLanProfileList	A list of wireless SSIDs to enable switching from wireless to wired LAN connections.

9.6.12.3.1 AssumedLinkSpeed

Warning

AssumedLinkSpeed is obsolete. Its value may exist in the Nomad registry but it is not used. Instead Nomad now relies on the actual content being downloaded to gauge link speed.

Value (in bits per second) to for the link speed calculations at the beginning of a download. This value should only be modified if requested by 1E support.

Registry value	Default value	Notes	Installer property
AssumedLinkSpeed	100	If set to 0, an unreliable IPv4 ping test is performed to gauge the bandwidth of the WAN link before starting a download. By default, the value is set to	n/a

Registry value	Default value	Notes	Installer property
		100 so as to disable the ICMP test and calculate the end-to-end bandwidth based on actual data blocks	

9.6.12.3.2 AuthenticatedUsers

Determines which of the built-in security groups is granted read-only permissions to the Nomad cache.

Registry value	Default value	Notes	Installer property
AuthenticatedUsers	1	Grants read-only access to the Nomad cache as follows: 0 – Everyone built-in security group and the *SMSNomadP2P&* Nomad share account. This is the least restrictive option and is not valid with HTTP or HTTPS protocol and is treated as 2 (only the *SMSNomadP2P&* Nomad share account) 1 – Authenticated Users built-in security group and the *SMSNomadP2P&* Nomad share account 2 – Only the *SMSNomadP2P&* Nomad share account. This account has also been added to NTFS permission settings. Unauthorised HTTP requests to access the	MODULE.NOMAD.AUTHENTICATEDUSERS

Registry value	Default value	Notes	Installer property
		caches are met with a 403 status code. The Nomad share has more information about share permissions and NTFS security. The difference between Authenticated Users and Everyone depends on the OS version, but in general Everyone includes Authenticated Users plus Guest.	

9.6.12.3.3 BlockSize

Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder.

Note

Any change to this value requires a manual service restart before it can take effect.

Registry value	Default value	Notes	Installer property
BlockSize	131072(128KB)	Must be between 4096(4KB) to 4194304(4MB) inclusive. The default block size is 128KB The maximum block size is 4MB Multicast environments can only use the default block size. If you define a larger value for multicast environments, Nomad automatically resets it to the default. Clients use the block size defined in the registry and ignore the values from the LSZ	MODULE.NOMAD.BLOCKSIZE

The Dynamic Block Size (DBS) feature increases block size on high-bandwidth links to get maximum efficiency, and reduces it on low-bandwidth links to reduce the impact. Using DBS, Nomad is able to automatically decide the appropriate block size for a given link bandwidth and also adjust it as needed during the download if the link conditions change. As a result, Nomad is far more efficient and faster on all types of connection bandwidths while retaining its minimal impact on other link traffic.

Note

DBS is enabled or disabled by configuring Bit 25 in the CompatibilityFlags registry. Setting Bit 25 disables DBS and clearing Bit 25 enables DBS.

In Nomad 7.0 onwards, the DBS feature is turned off by default for new installations, and not changed for upgrades.

Prior to v6.3 the default value of BlockSize registry setting was 32KB (0x8000). From v6.3 onwards the default is 128KB (0x20000).

The installer automatically sets this to 128KB for both fresh installs and upgrades from previous versions. The only exceptions to this are:

It will use the specified value if the BLOCKSIZE property is used in the installation command line or in a MST transform, when doing a fresh install or upgrade

It will retain the previous value of BLOCKSIZE if it was set to anything other than 32KB (the older default), when doing an upgrade.

9.6.12.3.4 CacheCleanCycleHrs

Determines the number of hours between automatically running the Nomad cache cleaner.

Registry value	Default value	Notes	Installer property
CacheCleanCycleHrs	0 (turned off)	The first automatic cache clean runs randomly between 10 to 60 mins of service start up. Subsequent cache clean cycles run after the number of hours specified. 0 means feature turned off. No cache cleaning cycle would run. Changing this registry entry performs an internal restart.	MODULE.NOMAD.CACHECLEANCYCLEHRS

Registry value	Default value	Notes	Installer property
		The minimum value is 4. The maximum value is 168 (Once a week) Please refer to Cache management for details about other cache management settings.	

9.6.12.3.5 CacheCleanSubnetLookup

If enabled, sets the cache clean subnet lookup.

Registry value	Type	Default value	Notes	Installer property
CacheCleanSubnetLookup	REG_DWORD	1	Before deleting content, Nomad checks if it is on any other client in the same subnet, and will only delete local content if the same is present on at least one other client on the same subnet.	MODULE.NOMAD.CACHECLEANSUBNETLOOKUP

Registry value	Type	Default value	Notes	Installer property
			To disable subnet lookup, set the value to 0. Its value can be 0 or 1. The default value is 1, subnet lookup is enabled. New setting introduced in 8.0. Please refer to Cache management for details about other cache management settings.	

9.6.12.3.6 CachePath

This value holds the location of the base peer backup assistant (PBS) share where user data is copied to.

Registry value	Default value	Notes	Installer property
NMDS\CachePath	<NomadCachePath>\NMDS	This REG_SZ registry value is found under the PBA registry key NomadBranch\NMDS. This parameter relies on the folder it points to as being configured as a share. In normal circumstances, this should not be modified from the default value. The MODULE.NOMAD.CACHEPATH installer property also used to configure the location of the Nomad cache, which is stored in the registry value LocalCachePath. The location of the PBA cache is derived from the MODULE.NOMAD.CACHEPATH property, and is stored in the registry value CachePath in the NomadBranch\NMDS registry key.	MODULE.NOMAD.CACHEPATH

9.6.12.3.7 CacheStateSyncIntervalMinutes

Ensures the cache state of a device held on ContentDistribution is in sync with locally held data. This setting controls the **Content Registration Sync Cycle** feature.

Registry value	Default value	Notes	Installer property
CacheStateSyncIntervalMinutes	1440 (1day)	Range: from 60 to 525600	MODULE.NOMAD.CACHESTATESYNCINTERVALMINUTES

Registry value	Default value	Notes	Installer property
		(1Year).	

The **Content Registration Sync Cycle** is available in the following versions of 1E Client, where the Nomad client registers pending and failed content registrations with ActiveEfficiency or Tachyon Platform. Please refer to Single Site Download: Improved resilience of content registration.

Nomad 8.0 in 1E Client 5.2 - uses Content Distribution in Tachyon Platform

Nomad 7.1 in 1E Client 5.2 - uses Content Distribution in Tachyon Platform

Nomad 7.0.200 in 1E Client 5.1 - uses ActiveEfficiency

Nomad 7.0.100 in 1E Client 5.0 - uses ActiveEfficiency

Nomad 7.0 in 1E Client 4.1 - uses ActiveEfficiency

9.6.12.3.8 CentralMCastExtraDelayMins

An integer value that sets the delay for receiving Central Multicast. Normally you would not need to set this value.

> **Warning**
>
> The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes	Installer property
CentralMCastExtraDelayMins	n\a	This registry value does not exist until a successful central multicast has run. If problems occur during the multicast and the message and you get a Too late for Central Multicast message in the local Nomad client logs, increase the value.	None

9.6.12.3.9 CertIssuer

Defines one or more certificate issuers that Nomad will use to select the appropriate PKI certificate for the:

Configuration Manager (CM) client authentication certificate - used when downloading over HTTPS from Distribution Points and when communicating with Management Points during pre-caching

Nomad Server Authentication certificate - used to share content between peers over HTTPS

Client Authentication certificate - used for certificate-based client authentication when sharing content between peers over HTTPS.

In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without needing to specify CertIssuer (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details). You should use CertIssuer if the CM client is not using PKI certificates and there are multiple Client Authentication certificates issued by different Certificate Authorities in the store, and if there is a chance some of those certificates may not be trusted by other peers or CM site systems.

Registry value	Default value	Notes	Installer property
CertIssuer	" "	Set this value to the name of the certificate issuer (Certificate Authority (CA)) that Nomad should use to select the appropriate PKI certificate. A case-insensitive substring-within-a-string match is performed. If you have multiple CAs you can specify a: Common sub-string (e.g. "CORPCA" would work for certificates issued by CORPCA1 or CORPCA2) Comma-separated list of certificate issuers (both exact names or substrings are acceptable values). For example, "DigiCert,Thawte,Verisign" would work for certificates issued by DigiCert, DigiCert EV, Thawte or Verisign. If you are only using HTTPS for downloading from an HTTPS DP (That is, not using HTTPS for peer-to-peer data transfer) you can leave this blank and set CertSubject instead.	MODULE.NOMAD.CERTISSUER

9.6.12.3.10 CertSubject

Defines one or more certificate subject names that Nomad uses to select the appropriate PKI certificate for authentication with Configuration Manager (CM) site systems configured to use HTTPS. It does not affect certificate selection for client authentication certificates used for peer-to-peer authentication or for selection of server authentication certificates.

In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without the need to specify CertSubject (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details).

Registry value	Default value	Notes	Installer property
CertSubject	" "	For downloads over HTTPS from the Distribution Point, set either the CertIssuer or CertSubject registry values. Set this value to the subject name of the certificate that Nomad should use to select the appropriate PKI certificate. The match has the following properties: case-insensitive a substring search is done, so if the text is set to ACME it will return certificates where ACME appears anywhere in the certificate's subject. If you have multiple valid subject names you can specify a: Common sub-string, for example "contoso.com" would work for certificates that have contoso.com anywhere in the subject name Comma-separated list of subject names or sub-strings, for example, you can specify multiple subject domain suffixes, for example "contoso.com,abc.in". For the installer property, configure either MODULE.NOMAD.CERTISSUER or MODULE.NOMAD.CERTSUBJECTinstaller properties for HTTPS downloads.	MODULE.NOMAD.CERTSUBJECT

9.6.12.3.11 CompatibilityFlags

Determines different compatibility settings which relate to specific customer related functionality and should not generally be changed from the default value under normal conditions, unless advised.

Registry value	Default value	Notes	Installer property
CompatibilityFlags	0x1E18000A (504889354)	For Nomad in full OS, the REG_DWORD registry value is set to the sum of the values for the required bits. The default value combines the following settings: *Bit 1 - 0x00000002* - Enable longer values for hashes *Bit 3 - 0x00000008* - Fix wrong IPs in election messages *Bit 19 - 0x00080000* - Enable full hash generation for SIS content on DPs *Bit 20 - 0x00100000* - Abort download on the Nomad client if an LsZ has mismatch is detected *Bit 25 - 0x02000000* - Turn off Dynamic Block Size *Bit 26 - 0x04000000* - Enable download of Windows 10 Express File Updates *Bit 27 - 0x08000000* - Enable download of Software Updates (including Windows 10 feature updates) from Microsoft Update - see note *Bit 28 - 0x10000000* - Enable support for byte-range downloads (e.g. Office 365 or delta content for updates) from Microsoft Update - see note First bit is bit 0. The default in binary is: 0001 1110 0001 1000 0000 0000 0000 1010 **Support for downloading updates from Microsoft Update** Setting bits 27 and/or 28 will enable Nomad to download content from Microsoft Update if the update has been deployed with Configuration Manager and the option **If software updates are not available on distribution point in current, neighbor or site boundary, download content from Microsoft Update** has been enabled on the	MODULE.NOMAD.COMPATIBILITYFLAGS

Registry value	Default value	Notes	Installer property
		Download Settings tab of the deployment. Nomad will not be used to download updates from Microsoft Update if the update is requested outside of a Configuration Manager Software Update Deployment (e.g. when using Windows Update for Business). **Note** Prior to 1E Client 4.1 (Nomad 7.0) the default was 0x00180000 (1572864): *Bit 19 - 0x00080000* - Enable full hash generation for SIS content on DPs *Bit 20 - 0x00100000* - Abort download on the Nomad client if an LsZ has mismatch is detected	
0x00100002 (1048578)	For the task sequence action **Install and configure Nomad in Windows PE**, the registry value is set to the sum of the values for the required bits. The default value combines the following settings: *Bit 1 - 0x00000002* - Enable longer values for hashes *Bit 20 - 0x00100000* -		

Registry value	Default value	Notes	Installer property
	Abort download on the Nomad client if an LsZ has mismatch is detected **Note** *Bit 1 - 0x00000002* (Enable longer values for hashes) is mandatory. The installer property must be set to sum of the values for the required bits, and given in decimal notation. For example, the following installer command-line uses: *Default- 0x1E18000A* *Bit 0 - 0x00000001* -		

Registry value	Default value	Notes	Installer property
	Never check hashes of downloaded content *Bit 17 - 0x00020000* - Disable DelegatedLSZ checks and errors *Sum - 0x1E1A000B* (505020427) `> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.COMPATIBILITYFLAGS=505020427 [other properties] /qn`		

Bit	Hex	Decimal	Description
0	*0x0001*	1	Never check hashes of downloaded content.
1	*0x0002*	2	Enable longer values for hashes. This value is auto-enabled when the Configuration Manager client is detected. You must manually configure this setting on any DP that does not have the Configuration Manager client installed. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this was disabled (0) by default.
2	*0x0004*	4	Calculate CRCs as files are downloading.

Bit	Hex	Decimal	Description
3	*0x0008*	8	Fix wrong IPs in election messages. On multi-homed machines sometimes the IP from a wrong adapter can get sent in the election messages resulting in peers failing to connect to the master. Enabling this flag causes Nomad to correct such IPs at the time when messages are received and thus prevent master connectivity issues.
4	*0x0010*	16	Determines compatibility with Nomad v3.x caches. Set this option once all Nomad v3.x installations have been upgraded.
5	*0x0020*	32	Disable all RDC data generation.
6	*0x0040*	64	Keep Packages that failed the CRC test during P2P or download from DP.
7	*0x0080*	128	Prevent computers using wireless connections from becoming fill-in multicast masters.
8	*0x0100*	256	Include LinkLocal IPv4 addresses.
9	*0x0200*	512	Include LinkLocal IPv6 addresses.
11	*0x0800*	2048	RESERVED
12	*0x1000*	4096	Do not automatically jump from HTTP to HTTPS during download from DP.
13	*0x2000*	8192	Always use HTTPS. (Use this setting when Configuration Manager is configured to use HTTPS-only communication for downloading content from Distribution Points)
14	*0x4000*	16384	RESERVED
15	*0x8000*	32768	RESERVED
16	*0x00010000*	65536	RESERVED (this flag is no longer used; previously this flag disabled a workaround for the issue described in Nomad post-installation tasks: IIS request filtering)

Bit	Hex	Decimal	Description
17	*0x00020000*	131072	Disable DelegatedLSZ checks and errors.
18	*0x00040000*	262144	Disable partial download when App-V streaming, i.e. download entire application.
19	*0x00080000*	524288	Enable full hash generation for SIS content when an LsZ file is generated on a DP. If this is not enabled, SIS content is trusted, and corrupted content may be downloaded. Enabled by default.
20	*0x00100000*	1048576	Abort download on the Nomad client if an LsZ hash mismatch is detected. If this is not set, when a Nomad client detects a hash mismatch it will re-request LsZ generation on the DP then try again, and get stuck in a loop if the SIS content is corrupt. Must be set on clients if Bit 19 is set on DPs. Enabled by default.
25	*0x02000000*	33554432	Turn off Dynamic Block Size. This flag is set by default, which means Dynamic Block Size is disabled by default. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this bit was off, meaning **Dynamic Block Size** was enabled by default.
26	*0x04000000*	67108864	Enable download of Windows 10 Express update files. Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20144 for NomadBranch 6.3.201.
27	*0x08000000*	134217728	Enable download of full file software updates from Microsoft Update when deployed through Configuration Manager (see Support for downloading updates from Microsoft Update). Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20246 for NomadBranch 6.3.201.

Bit	Hex	Decimal	Description
28	*0x10000000*	268435456	Enable download of byte-range software updates (e.g. Express updates, O365 updates) from Microsoft Update when deployed through Configuration Manager >(see Support for downloading updates from Microsoft Update). Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20246 for NomadBranch 6.3.201.
30	*0x40000000*	1073741824	Enable SoftwareUpdate metadata validation. This is not enabled by default. It can be used to resolve rare issues related to SoftwareUpdates where the contents could be updated without any change in its ID or version. Please refer to Resolving SoftwareUpdate metadata validation for more details. **Note** This is a new setting in 1E Client 5.1 (Nomad 7.0.200).

9.6.12.3.12 ContentProviderOnWifi

Determines whether a device on a WLAN can become content provider. By default, only devices connected to a LAN can become content providers when using Single Site Download (SSD).

Note

This setting is only applicable to SSD and has no effect on P2P content transfers on the local subnet.

Registry value	Default value	Notes	Installer property
Platform\ ContentProviderOnWifi	0	Values are: 0 – Only devices connected to a LAN can be content providers 1 – Devices connected to any network (including	MODULE.NOMAD.CONTENTPROVIDERONWIFI

Registry value	Default value	Notes	Installer property
		WLANs) can be content providers	

9.6.12.3.13 ContentRegistration

Determines if content in Nomad's cache (packages, applications, software updates, boot images, etc.) is registered with Content Distribution. Content registration is necessary if a host is to be available as a Single Site Download (SSD) provider or can be woken up if a Nomad peer requires the content locally.

Registry value	Default value	Notes	Installer property
Platform\ ContentRegistration	0	To enable content registration, update the value to 1 – it is found under the Platform\ContentDistribution To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED is specified during installation, the registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for	MODULE.NOMAD.CONTENTREGISTRATION

Registry value	Default value	Notes	Installer property
		SSDEnabled and ContentRegistration, in addition to enabling the Tachyon client. The ContentDistribution registry setting is found under the Platform key. Nomad app provides visibility of content distribution activity Single Site Download (SSD) Single Site Peer Backup Assistant (SSPBA) High Availability Peer Backup Assistant (HAPBA) Get Migration Settings task sequence action used to manage computer associations Nomad Pre-caching Nomad Download Pause. In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon	

Registry value	Default value	Notes	Installer property
		client is using (stored in the 1EClient.conf file).	

9.6.12.3.14 ContentRegSyncBatchSz

Warning

ContentRegSyncBatchSz is obsolete. Its value may exist in the Nomad registry, but it is not used. Instead, please refer to CacheStateSyncIntervalMinutes.

The **Content Registration Sync Cycle** is available in Nomad 7.0 (1E Client 4.1) which registers pending and failed content registrations with ActiveEfficiency. Please refer to Single-site download: Improved resilience of content registration.

Registry value	Type	Default value	Notes	Installer property
ContentRegSyncBatchSz	REG_DWORD	30	Number of content registrations that will be attempted in each content registration cycle. Range: from 5 to 100 registrations per run.	none

9.6.12.3.15 ContentRegSyncCycleHrs

Warning

ContentRegSyncCycleHrs is obsolete. Its value may exist in the Nomad registry, but it is not used. Instead, please refer to CacheStateSyncIntervalMinutes.

The **Content Registration Sync Cycle** is available in Nomad 7.0 (1E Client 4.1) which registers pending and failed content registrations with Content Distribution. Please refer to Single Site Download: Improved resilience of content registration.

Registry value	Type	Default value	Notes	Installer property
ContentRegSyncCycleHrs	REG_DWORD	24	A periodic cycle that does pending content registrations.The value specifies	none

Registry value	Type	Default value	Notes	Installer property
			the periodic run of the cycle in HOURS. Setting it to 0 means the feature is turned off and Nomad will not run the content registration sync cycle. Range: from 4 hours to 168 hours (1 week). When this registry value is set to **non-zero** the feature is enabled, and Nomad sets the following two registry values: ContentRegSyncReqDelay is set to 1000 millisecs ContentRegSyncBatchSz is set to 30	

9.6.12.3.16 ContentRegSyncReqDelay

Warning

ContentRegSyncReqDelay is obsolete. Its value may exist in the Nomad registry, but it is not used. Instead, please refer to CacheStateSyncIntervalMinutes.

The **Content Registration Sync Cycle** is available in Nomad 7.0 (1E Client 4.1) which registers pending and failed content registrations with Content Distribution. Please refer to Single Site Download: Improved resilience of content registration.

Registry value	Type	Default value	Notes	Installer property
ContentRegSyncReqDelay	REG_DWORD	1000	Delay, in milliseconds, between successive content registration API calls to Content Distribution. Range: from 100 milliseconds to 60000 milliseconds (1 minute).	none

9.6.12.3.17 Debug

The level of messages logged in the Nomad logs for debugging purposes.

Registry value	Default value	Notes	Installer property
Debug	0x09 (9)	See the table below for customer supported values. The default is a combination of *0x01* (Minimal logging) and *0x08* (Registry changes). For example, to set maximum debugging, set bit 0, 3 and 4, which is a value of 0x19 hexadecimal or 25 decimal. Values on the installer command-line must be provided in decimal. So to set maximum debugging you would use the following installer command-line: `> msiexec /i 1E.Client-x64.msi DEBUG=25 [other properties] /qn` Bit / Hex / Decimal / Description 0 / 0x01 / 1 / Minimal logging. 1 / 0x02 / 2 / RESERVED 2 / 0x04 / 4 / RESERVED 3 / 0x08 / 8 / Registry changes. 4 / 0x10 / 16 / Additional debugging (should only be used if requested by 1E support).	MODULE.NOMAD.DEBUG

9.6.12.3.18 DebugDynamicBlock

The level of messages related to the Dynamic Block Size (DBS) feature logged in the Nomad logs for debugging purposes.

> **Note**
>
> This DWORD registry value does not exist by default and must be created under HKLM\SOFTWARE\1E\NomadBranch if you want to enable debugging for the DBS feature.

<table>
<tr><th>Registry value</th><th>Default value</th><th>Notes</th><th>Installer property</th></tr>
<tr><td>DebugDynamicBlock</td><td>The value does not exist by default. This is the equivalent of 0x0 where DBS logging is off.</td><td>This may take one of the following values:
<table><tr><th>Bit</th><th>Hex</th><th>Decimal</th><th>Description</th></tr><tr><td></td><td>0x0</td><td>0</td><td>Turns DBS logging off. This is also the default where the DebugDynamicBlock value does not exist.
Note
To maximize performance DebugDynamicBlock should not be created or if it exists it should be set to 0. You only need to change this setting if you are actively debugging the use of the DBS feature.</td></tr><tr><td>0</td><td>0x01</td><td>1</td><td>Normal log level where changes in block size as DBS ramps up and down are logged.</td></tr><tr><td>1</td><td>0x02</td><td>2</td><td>Verbose log level where various DBS parameters are logged such as: the time taken to download a block, speed and delta.</td></tr></table></td><td>None</td></tr>
</table>

9.6.12.3.19 DeliveryOptimizationReportingEnabled

Enables Delivery Optimization monitoring and reporting if ContentRegistration is enabled.

Registry value	Default value	Notes	Installer property
DeliveryOptimizationReportingEnabled	0	Enables monitoring of Delivery Optimization downloads and reporting them to Tachyon Platform (ContentDistribution). Delivery Optimization monitoring and reporting is only supported in versions of Windows Server 2019 and Windows 10 Version 1909 onwards. When it is enabled, DO download events get written to .etl files in the Nomad cache folder, for example: NomadDo-20210325-182415.etl. And aggregated information about the downloads gets writtern to sqlite files **Do.db** and **DoDownloadMonitor.db** in LocalDb folder inside Nomad cache folder.	MODULE.NOMAD.DOREPORTINGENABLED

9.6.12.3.20 DownloadTimeout

Sets the timeout in seconds after which a job will be cancelled if the download has not been successful.

Registry value	Default value	Notes	Installer property
DownloadTimeout	0	This parameter is associated with the distribution point resilience feature and is used in conjunction with the *RecycleDPDelay* registry value. If a value greater than zero is set, the download timeout will either use this or the Configuration Manager setting depending on which is the smaller value. When the timeout is reached, the job package download is cancelled and a success is sent to the Configuration Manager client with the *ERROR_MAXDURATION* timeout error sent as the package status message. The default is to use the Configuration Manager setting (28 days by default).	MODULE.NOMAD.DOWNLOADTIMEOUT

9.6.12.3.21 DpCacheCleanupEnabled

Delete all obsolete LSZ files on the DP where the associated content is no longer present in ContentLib.

<table>
<tr><th>Registry value</th><th>Default value</th><th>Notes</th><th>Installer property</th></tr>
<tr><td>DpCacheCleanupEnabled</td><td>0 (turned off)</td><td>This entry controls the cached LSZ files cleaning feature. When turned on, this feature deletes all LSZ files in a Distribution Point (DP) cache where the associated content is not present in ContentLib.

The following table describes the values this entry may be set to:

<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>The feature is turned off. This is the default.</td></tr><tr><td>1 (or greater)</td><td>The feature is turned on.</td></tr></table>
Please refer to Cache management for details about other cache management settings.</td><td>MODULE.NOMAD.DPCACHECLEANUPENABLED</td></tr>
</table>

9.6.12.3.22 DPNotAvailableCodes

Determines which error codes will cause Nomad to retry a download using an alternative distribution point.

Registry value	Default value	Notes	Installer property
DPNotAvailableCodes	0x205A, 0x205D	This registry entry contains a comma-separated list of return codes, see Nomad return codes for a list of the possible ones. If Nomad encounters one of these during download it will attempt a retry from an alternative DP. It gets the list of possible DPs from Configuration Manager. The two return codes set as default are the only ones that are applicable to DP availability: 0x205A – in valid special package path (set using *--pp*) 0x205D – DP path not found Under normal circumstances, you would not change this from the default value. You may want to not allow failover to an alternative DP altogether, in which case you would set the value to " " in the registry. Or you may only want to failover if the DP path was not found, in which case you would set the value to 0x205D only. This installer property should be set to a string containing the comma-separated hex values. For example the following sets Nomad to failover to the next DP only	MODULE.NOMAD.DPNOTAVAILABLECODES

Registry value	Default value	Notes	Installer property
		when the DP path was not found: `> msiexec /i 1E.Client-x64.msi DPNOTAVAILABLECODES="0x205D" [other properties] /qn`	

9.6.12.3.23 EncryptionType

Determines the type of encryption used by Nomad to encrypt its communications between Nomad peers.

Registry value	Default value	Notes	Installer property
EncryptionType	0x0 (0)	Value are: 0 – standard Nomad encryption 1 – FIPS encryption	MODULE.NOMAD.USEFIPS

9.6.12.3.24 EnforceQuotas

Determines whether Windows Disk Quotas (if configured) are enforced on the PBA share defined inCachePath.

Registry value	Default value	Notes	Installer property
NMDS\ EnforceQuotas	0x0 (0)	Enables quotas to be enforced but requires Windows Disk Quotas to be configured. If the size specified in the NMDS_POLL request causes the quota to be exceeded, the request fails and you get disk full error. This registry value is found under the PBA registry key NomadBranch\NMDS.	MODULE.NOMAD.ENFORCEQUOTAS

9.6.12.3.25 ExtraReplyDelayMs

Time by which PBA peer reply window should be extended to avoid network spikes.

When a machine sends a PBA message like POLL all peers do not reply at the same time. They spread their replies out across a time window. This is done to avoid network spikes such as ARP or UDP storms. The default reply window size of 100ms is mostly enough, but sometimes proves inadequate especially in large subnets. In such cases the window can be extended by the number of milliseconds specified in this registry setting.

Registry value	Default value	Notes	Installer property
NMDS\ ExtraReplyDelayMs	0x0 (0)	Located under the PBA registry key NomadBranch\NMDS. Maximum allowed value is 5000	None

9.6.12.3.26 GenerateWEREvents

Determines whether Windows Error Reporting memory dumps should be sent to Microsoft Winqual.

Registry value	Default value	Notes	Installer property
GenerateWEREvents	1	If enabled and if Nomad experiences an unexpected failure, a dialog is displayed prompting the user to send the debug information to Winqual which is forwarded to 1E for continued quality improvements. Values are: 0 disables this feature 1 enables this feature	MODULE.NOMAD.GENERATEWEREVENTS

9.6.12.3.27 HAACKTimeoutMins

The time-out period in minutes for the Peer Backup Assistant - High Availability (PBA-HA) task sequence action. If a machine running this action does not receive an acknowledgement message within this period from the PBA host performing the additional backups, the action will fail.

Registry value	Default value	Notes	Installer property
NMDS\ HAACKTimeoutMins	20	Applies to synchronized backups only. The PBA tost sends the acknowledgement messages back to the machine running the task sequence approximately every 5% of the synchronized copy. This registry value is found under the PBA registry key NomadBranch\NMDS.	MODULE.NOMAD.HAACKTIMEOUTMINS

9.6.12.3.28 InstallationDirectory

The installation directory for Nomad.

Registry value	Default value	Notes	Installer property
InstallationDirectory	%PROGRAMFILES%\1E\Client\Extensibility\NomadBranch	This registry value must not be modified. It records the locations of Nomad client executables, and is derived from the installation location of the 1E Client.	1E Client settings: INSTALLDIR

9.6.12.3.29 KnownMobileDevices

Note

This feature is retired. We are currently working on a new feature to replace this which will be made available in a future release.

Mobile device connections known to Nomad. When a device running the Nomad client uses a mobile connection whose identifier appears on this list, it will only receive packages that have the --mobok command-line switch set.

Registry value	Default value	Notes	Installer property
KnownMobileDevices	VNClite*,Vodafone*	A list of mobile devices restricting the delivery of packages to only those that contain the *--mobok* command-line switch.	MODULE.NOMAD.KNOWNMOBILEDEVICES

9.6.12.3.30 LocalCachePath

The location of local Nomad package cache.

Registry value	Default value	Notes	Installer property
LocalCachePath	%ALLUSERSPROFILE%\1E\NomadBranch\	There are two registry values called LocalCachePath that are used by Nomad. The LocalCachePath REG_SZ registry value under the HKLM\Software\1E\NomadBranch key sets the path to the local Nomad package cache.	MODULE.NOMAD.CACHEPATH

Registry value	Default value	Notes	Installer property
		The LocalCachePath REG_SZ registry value under the HKLM\Software\1E\NomadBranch\NMDS key sets the path to the PBA package cache. The path is created if it does not exist. If the drive letter does not exist, and it is not possible to create the specified path, *%TEMP%* is used. Default values are dependent on OS. **Known issue fixed in latest accumulated hotfix** The value for the installer property CACHEPATH requires a trailing backslash \. When Nomad is installed on a DP this location is also used for the LSZFiles vDir folder. If LocalCachePath does not contain a trailing backslash, then: the LSZFILES folder is incorrectly created (LocalCachePathLSZFILES instead of LocalCachePath\LSZFILES) IIS vDIR points to wrong folder (LocalCachePathLSZFILES instead of LocalCachePath\LSZFILES) LSZGEN fails because it is attempting to store LSZ files to non-existent path (LocalCachePath\LSZFILES)	

Registry value	Default value	Notes	Installer property
		PBA cache is also derived from the same installer property MODULE.NOMAD.CACHEPATH, but it is stored in the registry value> CachePath in the NomadBranch\NMDS registry key.	

9.6.12.3.31 LocalSsdStagger

Sets the site SSD query stagger duration (seconds).

Deployments to large numbers of clients (30,000 or more) generate significant network traffic from 1E Client to Content Distribution that may result in IIS 503 Overload errors on the server, causing content registrations and SSD requests to fail. LocalSsdStagger allows an elected subnet master to wait for a random configurable time before making a local SSD request. All peers in the subnet participating in the election would also synchronize and wait for the same time before copying from master machine.

Registry value	Type	Default value	Notes	Installer property
LocalSsdStagger	REG_DWORD	5	Sets the local SSD query stagger duration in seconds. The stagger is 0 (disabled) by default. The maximum value that can configured is 600 seconds (10 minutes). There is no SSD staggering in WinPE. Local SSD happens when only when network	MODULE.NOMAD.LOCALSSDSTAGGER

Registry value	Type	Default value	Notes	Installer property
			broadcast is disabled. **Note** Please consult 1E before changing this value. This setting works in conjunction with SiteSsdStagger.	

9.6.12.3.32 LogFileName

The path and filename of the Nomad log file.

For details of log files for 1E Client and other Nomad features, please refer to Log files.

Registry value	Default value	Notes	Installer property
LogFileName	%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles\NomadBranch.log	The location and name of the Nomad log and preserved when you upgrade Nomad. **Note** If Nomad is installed using 1E Client Deployment Assistant (CDA) (previously 1E Endpoint Agent Installation Solution Accelerator (EAISA) and Endpoint Agent Installer (EAI)).	Based on a combination of the MODULE.NOMAD.LOGPATH and MODULE.NOMAD.LOGNAME installer properties.

Registry value	Default value	Notes	Installer property
		You might find the log file in: *C:\WINDOWS\CCM\Logs\NomadBranch.Log*	

9.6.12.3.33 MaxAllocRequest

Sets the maximum amount of space in MB that can be requested by each PBA client.

Registry value	Default value	Notes	Installer property
NMDS\MaxAllocRequest	0xC8 (200)	Located under the PBA registry key NomadBranch\NMDS.	MODULE.NOMAD.MAXALLOCREQUEST

9.6.12.3.34 MaxAllowedLinkSpeed

(Optional setting) If set, defines the maximum possible link speed in bits per second.

Registry value	Default value	Notes	Installer property
MaxAllowedLinkSpeed	0	If greater than 0, a fixed cap method is implemented where Nomad's bandwidth usage cannot exceed the set value. This is useful for lines that have burst mode which affects the initial automatic bandwidth calculations. The minimum value is 0 which sets Nomad to use its calculated bandwidth value. The maximum effective value is the total capacity of the link in question.	None

9.6.12.3.35 MaxBusyBackOffSecs

The maximum duration (in seconds) that Nomad backs-off between blocks of data.

Registry value	Default value	Notes	Installer property
MaxBusyBackOffSecs	20	Governs Nomad's multicast and peer-to-peer behaviour.	None

9.6.12.3.36 MaxCacheDays

When the Nomad cache cleaner runs, delete any application or package content that last triggered Nomad elections before the specified number of days ago.

Registry value	Default value	Notes	Installer property
MaxCacheDays	0 (turned off)	Set to delete application or package content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only application or package content that have triggered elections recently will be kept in the cache. 0 means that application and package content will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.	MODULE.NOMAD.MAXCACHEDAYS

9.6.12.3.37 MaxCacheDaysThreshold

This is the maximum number of days content is present on a client.

Registry value	Type	Default value	Notes	Installer property
MaxCacheDaysThreshold	REG_DWORD	0	This is the maximum number of	MODULE.NOMAD.MAXCACHEDAYSTHRESHOLD

Registry value	Type	Default value	Notes	Installer property
			days content is present on a client. If it's not zero, then content will be deleted without any other checks once it reaches the threshold. If the threshold has a value greater than zero and less than 30, Nomad uses the threshold of 30 days and creates an associated log. Default value is 0. New setting introduced in 8.0.	

Registry value	Type	Default value	Notes	Installer property
			Please refer to Cache management for details about other cache management settings.	

9.6.12.3.38 MaxCacheSizeMB

Provided for backward compatibility only – use PercentAvailableDisk instead. The value (in bytes) for the maximum size the cache is allowed to grow to, before automatic cache cleaning takes place.

Registry value	Default value	Notes	Installer property
MaxCacheSizeMB	0	There is no maximum value for this property. This method for determining the maximum size of the cache is an alternative to PercentAvailableDisk: If PercentAvailableDisk has a value greater than zero set its method will be used to control the cache size. If *MaxCacheSizeMB* is set to a value greater than zero and PercentAvailableDisk is set to zero then *MaxCacheSizeMB* will be used as the method for determining the maximum size of the Nomad cache.	MODULE.NOMAD.MAXCACHESIZEMB

9.6.12.3.39 MaxConcurrency

Sets the maximum number of concurrent PBA sessions that may be in use on the host.

Registry value	Default value	Notes	Installer property
NMDS\ MaxConcurrency	0x3 (3)	Located under the PBA registry key NomadBranch\NMDS.	MODULE.NOMAD.MAXCONCURRENCY

9.6.12.3.40 MaxDevicesFromAE

The maximum number of devices with the content that Nomad can retrieve from Content Distribution in one call.

Registry value	Default value	Notes	Installer property
MaxDevicesFromAE	10	The maximum number of devices (i.e. machines) with the content (package, application or software update) that Nomad can retrieve from Content Distribution in one call. The maximum value is 20.	MODULE.NOMAD.MAXDEVICESFROMAE

9.6.12.3.41 MaxElectionResponseLogging

Defines the number of election responses Nomad will write to the log for a given election.

Registry value	Default value	Notes	Installer Property
MaxElectionResponseLogging	By default this REG_DWORD value is not present and all election responses are logged.	Add this REG_DWORD value and set it to the number of responses that Nomad should log for any	MODULE.NOMAD.MAXELECTIONRESPONSELOGGING

Registry value	Default value	Notes	Installer Property
		given election. Setting the value to 0 effectively turns off logging of any election responses.	

Note

The value of MaxElectionResponseLogging specifies the number of election replies to be logged per election request. As an example, if MaxElectionResponseLogging = 5 and there are two election requests for the same package at different times, a maximum of 5 election responses will be logged for each elections (up to 10 election replies in total). If there are two concurrent election requests for the same package, the number of maximum election replies logged may vary from 5 to 10. In general, if MaxElectionResponseLogging = *n* and if there are *m* concurrent election requests for the same package, the number of maximum election replies logged may vary from *n* to *m***n*.

9.6.12.3.42 MaximumMegaByte

The maximum amount of space (in MB) that can be used for all the PBA shares combined on the host.

Registry value	Default value	Notes	Installer property
NMDS\MaximumMegaByte	0	A non-zero value enables PBA share. This registry value is located under the PBA registry key NomadBranch\NMDS.	MODULE.NOMAD.MAXIMUMMEGABYTE

9.6.12.3.43 MaxLogFileSize

The maximum size (in bytes) of the Nomad log file. Default is 5MB.

Registry value	Default value	Notes	Installer property
MaxLogFileSize	5242880	When the log file reaches this size, it is renamed with a *.LO_* extension and a new *.LOG* file is created. The *.LO* file is overwritten each time. **Note** The default has been increased from 1048576 (1MB) to 5242880 (5MB) for Nomad 7.0 onwards (1E Client 4.1). **Note** The installer property name is different to the registry name.	MODULE.NOMAD.MAXLOGSIZE

9.6.12.3.44 MaxPackageSizeFastLAN

The maximum size (in bytes) of a package that Nomad attempts to cache on a Fast LAN (>500 kbps) connection.

Registry value	Default value	Notes	Installer property
MaxPackageSizeFastLAN	0	Works in conjunction with the RunUncachedPermittedFastLAN registry value. **Note** The installer property name is different to the registry name.	MODULE.NOMAD.MAXPACKAGEFAST

9.6.12.3.45 MaxPackageSizeRAS

The maximum size (in bytes) of a package that Nomad will attempt to cache on a RAS (<55 kbps) connection.

Registry value	Default value	Notes	Installer property
MaxPackageSizeRAS	0	**Note** The installer property name is different to the registry name.	MODULE.NOMAD.MAXPACKAGERAS

9.6.12.3.46 MaxPackageSizeSlowLAN

Maximum size (in bytes) of a package that Nomad attempts to cache on a Slow LAN (55-500 kbps) connection.

Registry value	Default value	Notes	Installer property
MaxPackageSizeSlowLAN	0	**Note** The installer property name is different to the registry name.	MODULE.NOMAD.MAXPACKAGESLOW

9.6.12.3.47 MaxPacketsPerSecond

The maximum rate at which multicast packets are sent.

> **Warning**
>
> The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes	Installer property
MaxPacketsPerSecond	800	Modify this value with caution. If packets are sent too fast, machines will drop packets and multicast will not be effective - too slow and multicast	MODULE.NOMAD.MAXPACKETSPERSECOND

Registry value	Default value	Notes	Installer property
		works, but slowly. The default value is indicative of how this should be set.	

9.6.12.3.48 MaxPreCacheDays

When the Nomad cache cleaner runs, delete any pre-cached content that last triggered Nomad elections before the specified number of days ago.

Registry value	Default value	Notes	Installer property
MaxPreCacheDays	0 (turned off)	Set to delete pre-cached content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only pre-cached content that has triggered elections recently will be kept in the cache. 0 means that pre-cached content will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.	MODULE.NOMAD.MAXPRECACHEDAYS

9.6.12.3.49 MaxStatusFrequency

he minimum interval (in seconds) between sending transfer progress status messages, thereby governing the overall maximum frequency for sending the messages.

Registry value	Default value	Notes	Installer property
MaxStatusFrequency	3600	Works in conjunction with the ++sm setting on the Nomad properties tab and the StatusMsgEvents registry values.	MAXSTATUSFREQUENCY

9.6.12.3.50 MaxStuckCount

Registry value to hold an integer determining the number of times Nomad attempts to copy content and gets stuck before aborting.

If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this.

Registry value	Default value	Notes	Installer property
MaxStuckCount	100	The number of times Nomad attempts to copy content after failure (such as network outages, incomplete LSZ files, hash mismatches, election issues, connecting with peers) before it aborts the operation. The range is 3 to 1000, but if the value is less than 3 or greater than 1000, it sets to the default of 100. **Warning** The MaxStuckCount value is an internal NomadBranch registry value. You should not change this value unless advised by 1E.	MODULE.NOMAD.MAXSTUCKCOUNT

9.6.12.3.51 MaxSUCacheDays

When the Nomad cache cleaner runs, delete any software updates that last triggered Nomad elections before the specified number of days ago.

Registry value	Default value	Notes	Installer property
MaxSUCacheDays	0 (turned off)	Set to delete software updates that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only software updates that have triggered elections recently will be kept in the cache. 0 means that software updates will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.	MODULE.NOMAD.MAXSUCACHEDAYS

9.6.12.3.52 MaxWorkRates

MaxWorkRates is a registry key, that must be created, to hold registry values for each day of the week (Day0 to Day6) where the hourly maximums for the variable work rates are set.

Registry values	Default value	Notes	Installer property
MaxWorkRates\Day#		Hourly variable workmates can be set throughout the day. The days of the week are labelled: **Day0** to **Day6** where **Day0** = Sunday, **Day1** = Monday etc. Each day value is REG_SZ string set as a comma separated list of 24 hourly work rates for that day. Each value can be set from 1-100. The following is an example for setting for the Day# values where on Sunday, a maximum work rate of 20% will be used. On Monday, the max	None.

Registry values	Default value	Notes	Installer property

		work rate between 0:00-05:59 is 80%, between 06:00-17:59 is 20% and between 18:00-23:59 is it 80% again. For the rest of the week, the work rate specified on the command-line is used. If neither work rate is specified, the default is 80%.
		
		`Windows Registry Editor Version 5.00`
		
		`[HKEY_LOCAL_MACHINE\SOFTWARE\1E\NomadBranch\MaxWorkRates]`
		`"Day0"="20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20"`
		`"Day1"="80,80,80,80,80,80,20,20,20,20,20,20,20,20,20,20,80,80,80,80,80,80"`
		`"Day2"=""`
		`"Day3"=""`
		`"Day4"=""`
		`"Day5"=""`
		`"Day6"=""`	

Nomad allows hourly variable work rates to be set throughout the day enabling organizations to use different maximum percentage of available bandwidth during the working day and in the evenings. Intra-day work rates are set on the client using the *MaxWorkRates* registry value. If the intra-day work rate is less than that defined on the command-line, it will override the command-line value. If the intra-day work rate is higher than that defined on command-line, the command-line value is used in preference.

Note

Work rates only apply to transfers from a DP not to P2P transfers within a LAN.

Work rate override arguments

The intra-day work rates can be overridden using the --wro and --wr Nomad command-line arguments.

If these two arguments are combined, the value for the --wr switch is used in preference to the intra-day work rate set in the registry

If only the --wro argument is used, any intra-day value is overridden with a default maximum of 80%

If using intra-day work rates and the --wr argument only, the lower of the two values is used.

9.6.12.3.53 MultiCastMADCAPScope

The MADCAP scope for multicast.

Warning

The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes	Installer property
MultiCastMADCAPScope	SMSNomad	Values may be set using either of the formats in the table below.	MODULE.NOMAD.MADCAPSCOPE

Format	Description
<ScopeName>	*<ScopeName>* is the name of a scope defined in the DHCP (if you are using the Microsoft implementation of MADCAP). Use this format if you have multiple MADCAP servers. This method uses the time to live settings for the scope.
<MADCAP_ServerIP>	*<MADCAP_ServerIP>* is the IP address of a specific MADCAP server
<MADCAP_Scope_IP> *<TTL>*	*<MADCAP_ScopeIP>* is the starting IP address for a MADCAP scope defined in the DHCP (if you are using the Microsoft implementation of MADCAP) *<TTL>* is the time to live for the multicast packets **Note** Using a TTL greater than 1 is not recommended unless you have ensured that multicast traffic cannot leak back upstream through any intervening routers. The valid range for TTL is a number between 1 and 255 Nomad is also capable of performing control multicast without a MADCAP server installation on the network. In order to use this feature, the *<MADCAP_ServerIP>* must be set to *0.0.0.0*. For example, the following supports MADCAP server not being present, with a scope of *239.0.9.0* and a time to live of *3*. `0.0.0.0,239.0.9.0,3`

9.6.12.3.54 MulticastSupport

The behavior of local multicast.

Warning

The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes	Installer property
MulticastSupport	0x0 (0)	All machines in a single branch must be configured using the same value for this parameter. If you are not using multicast, deploy the Nomad branch agent with theMODULE.NOMAD.MULTICASTSUPPORT property set to 0 to reduce the noise in Nomad logs. Prior to Nomad 7.0 multicast was enabled (0x1) by default. Now it is disabled (0x0) by default.	MODULE.NOMAD.MULTICASTSUPPORT

Bit	Hex	Decimal	Description
	0x0	0	**No Multicast**– disables the feature.
0	0x1	1	**Data Only Multicast** – choose this for a standard Nomad multicast. Data refers to the content of the downloaded package. Nomad control communications are broadcast as normal on the local subnet. Select this option for standard functionality.
1	0x2	2	**Control Only Multicast** – control information refers to the communications between Nomad enabled machines, especially for elections. This may be used if there is more than one subnet in a single location to enable a single Nomad master to be elected for all the subnets.
	0x3	3	**Control and Data Multicast** – data and control information is multicast.

Bit	Hex	Decimal	Description
			Select this option if a branch has multiple subnets connected by high speed routers.

9.6.12.3.55 NoHardlink

Determines whether hard links are used between the Nomad cache and the Configuration Manager cache.

Registry value	Default value	Notes	Installer property
NoHardlink	0	Values are: 0 – hard links are used. The Nomad cache will link to the Configuration Manager cache so only a single copy of a package is held locally. 1 – hard links are not used and results in the content being double-cached For more detail about the Nomad Cache please refer to Nomad cache.	MODULE.NOMAD.NOHARDLINK

9.6.12.3.56 NomadInhibitedADSites

Prevents Nomad from calling an election when it is connected to a specified AD site, meaning that each Nomad client on the listed AD sites will automatically become a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content.

Registry value	Default value	Notes	Installer property
NomadInhibitedADSites	(empty)	A comma-separated list for each AD site to be inhibited. Useful for sites with: a local DP a VPN without isolation	MODULE.NOMAD.NOMADINHIBITEDADSITES

Registry value	Default value	Notes	Installer property
		For example, to inhibit three AD sites called site1, site2 and site3: `site1,site2,site3` Please refer to Design Considerations: Inhibiting subnets and sites.	

9.6.12.3.57 NomadInhibitedSubnets

Prevents Nomad from calling an election when it is connected to a specified IP subnet, meaning that each Nomad client on the IP subnet automatically becomes a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content.

Registry value	Default value	Notes	Installer property
NomadInhibitedSubnets	(empty)	A comma-separated list of each subnet to be inhibited in CIDR notation. Useful for sites with either of the following: a local DP a VPN without isolation For example, to isolate two subnets: `10.2.0.0/16,192.168.9.0/24`	MODULE.NOMAD.NOMADINHIBITEDSUBNETS

Registry value	Default value	Notes	Installer property
		Please refer to Design Considerations: Inhibiting subnets and sites.	

9.6.12.3.58 NomadNeverUseSubnets

Prevents Nomad from using specific network adaptors based on the IP subnet. For example, this can be used to exclude Server backup subnets.

Registry value	Default value	Notes	Installer property
NomadNeverUseSubnets	" "	A comma-separated list of each subnet to be inhibited in CIDR notation. When Nomad is excluded from using a subnet, it attempts other cards available to that machine. If no other cards are available, Nomad will wait until one comes available. For example, 192.168.100.0/24	None.

9.6.12.3.59 NoSsdReqOnInhibitedSubnets

Determines whether local and site SSD requests are disabled from elected masters located in NomadInhibitedSubnet.

Registry value	Type	Default value	Notes	Installer property
NoSsdReqOnInhibitedSubnets	REG_DWORD	0	Possible values are 0 or 1. If the value is set to 1 thenthe Nomad client will not send local or site SSD requests to ContentDistribut	MODULE.NOMAD.NOSSDREQONINHIBITEDSUBNETS

Registry value	Type	Default value	Notes	Installer property
			ion if both of the following are true: the Nomad client is an elected master the *connected* adapter's IP address subnet is present in the Nomad registry NomadInhibited Subnet registry	

9.6.12.3.60 P2P_Port

Port used to broadcast election messages, for connectionless cache access and package status broadcasts.

Registry value	Default value	Notes	Installer property
P2P_Port	1779		MODULE.NOMAD.P2PPORT

9.6.12.3.61 P2PClientCertWaitPeriodMins

Defines the number of minutes that Nomad waits from the start time of the download job for a valid client authentication certificate before failing the download job.

Registry Value	Default value	Notes	Installer Property
P2PClientCertWaitPeriodMins	1440	Number of minutes (0 to 4294967295 (MAXDWORD)).	None

9.6.12.3.62 P2PDisqualifyMaxNumPeers

Defines the max number of devices which a device will disqualify during a peer-to-peer copy.

If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this.

Registry value	Default value	Notes	Installer property
P2PDisqualifyMaxNumPeers	5	A device does not further disqualify a peer if it has disqualified P2PDisqualifyMaxNumPeers number of peers within last P2PDisqualifyMaxWindowMins minutes. **Warning** The P2PDisqualifyMaxNumPeers value is an internal NomadBranch registry value. You should not change this value unless advised by 1E.	MODULE.NOMAD.P2PDISQUALIFYMAXNUMPEERS

9.6.12.3.63 P2PDisqualifyMaxWindowMins

Defines the max number of minutes within which a device will disqualify a peer during a peer-to-peer copy.

If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this.

Registry value	Default value	Notes	Installer property
P2PDisqualifyMaxWindowMins	60	A device does not further disqualify a peer if it has disqualified P2PDisqualifyMaxNumPeersn umber of peers within last	MODULE.NOMAD.P2PDISQUALIFYMAXWINDOWMINS

Registry value	Default value	Notes	Installer property
		P2PDisqualifyMaxWindowMins minutes. **Warning** The P2PDisqualifyMaxWindowMins value is an internal NomadBranch registry value. You should not change this value unless advised by 1E.	

9.6.12.3.64 P2PElectionWeight

Determines the outcome of Nomad elections.

Registry value	Default value	Notes	Installer property
P2PElectionWeight	The registry value does not exist, and dynamic election weighting is used.	Nomad performs automatic weighting depending on its situation, according to the criteria listed below, and stores the value in memory (not registry). The higher the value, the greater the probability of winning the election. 61 – the agent is running on a server OS and it is not a domain controller (DC) 40 – the agent is running on a laptop 30 – the agent is running on a wireless network 10 – the agent is running on WinPE 50 – default	None

Registry value	Default value	Notes	Installer property
		If necessary, you can use the P2PElectionWeight registry setting to increase or decrease a Nomad client's probability of being elected a master. The range for this registry value must be between 0 and 99 inclusive. If not set, Nomad uses the values listed above. The registry key is located at: *HKLM\software\1e\NomadBranch\P2PElectionWeight* To take effect after setting the registry value, the client sevice must be restarted. This method is not recommended because Nomad is already quite efficient in the way it elects a master and needs very little intervention in this process. However, you may want to reduce the chance of computers with low processing power, or prevent critical servers, becoming a master. You should also consider the following points before you influence the weighting: Use this technique in exceptional circumstances and only after testing has shown that you need to make a particular computer more or less likely to be elected as a master for specific operational reasons. Choose the simplest weighting strategy possible - for example, set servers at 90, laptops at 10 and workstations at 50. The weighting does not guarantee that the more heavily weighted computers will win the election – they may be turned off or another local peer may have already cached more of the requested content. The final weighting value used by the computer during an election may differ from the registry value as Nomad will automatically adjust it depending on the chassis and the network connection used.	

Registry value	Default value	Notes	Installer property
		In the event you no longer need the values to be set, you should remove it and restart the service to resume dynamic election weighting. Setting to 0 is a special case called Sensitive server weighting designed for use on critical servers. The 0 value prevents Nomad from acting as master, and devices with this value will not respond to election requests.	

9.6.12.3.65 P2PEnabled

Determines how the Nomad cache is accessed. Please refer to Nomad cache for more details.

Registry value	Default value	Notes	Installer property
P2PEnabled	9	The default (Hex 0x0009) configures P2P to use SMB and Net Literal Names. You can set more than one option at the same time by combining the bit values. See the table below for details. **Note** We recommend restarting the Nomad Branch service when you modify this parameter.	MODULE.NOMAD.P2PENABLED

Bit	Hex	Decimal	Notes
0	0x0001	1	(Default) Use the SMB protocol to share its own cache, and create the NomadSHR file share upon the start of the Nomad service, unless the CustomShare option has been enabled in SpecialNetShare. When P2PEnabled is set in addition to Bit 5 (use HTTP) or Bit 6 (use HTTPS), Nomad will attempt to use HTTPS/HTTP and will fall-back to SMB if HTTPS/HTTP is unavailable on other peers. To disable SMB P2P, set this bit to 0.

Bit	Hex	Decimal	Notes
1	0x0002	2	Enable connectionless P2P server.
2	0x0004	4	Enable connectionless P2P client.
3	0x0008	8	(Default) Use Net Literal Names when connecting to P2P shares. This causes Nomad to use the Nomad master's IP address when connecting to the share and is recommended when running wirelessly.
4	0x0010	16	Use FQDN when connecting to P2P shares. Recommended when using a multi-forest environment where computers from different forests may be present in the same subnet. This requires that reverse lookup for IP addresses is correctly configured and running. If this is not available Nomad will revert to using the IP address for connecting to the P2P shares.
5	0x0020	32	Use the HTTP protocol to share its own cache and access other caches.
6	0x0040	64	Use the HTTPS protocol to share its own cache and access other caches.

9.6.12.3.66 P2PHttpPort

The HTTP port to use for peer copy.

Registry value	Default value	Notes	Installer property
P2PHttpPort	5080	Default HTTP port to use for peer copy. If you are using a custom port, ensure that all agents use the same custom port.	MODULE.NOMAD.P2PHTTPPORT

9.6.12.3.67 P2PHttpsPort

Registry value	Default value	Notes	Installer property
P2PHttpsPort	5443	Default HTTPS port to use for peer copy. If you are using a custom port, ensure that all agents use the same custom port.	MODULE.NOMAD.P2PHTTPSPORT

9.6.12.3.68 P2PSslSettings

Defines server and client authentication options when using HTTPS for P2P content transfer (i.e. P2PEnabled 0x60 option is set).

Registry value	Default value	Notes	Installer property
P2PSslSettings	0	The default value (0) configures Nomad to use a self-signed certificate for server authentication and disables certificate-based client authentication. P2PSslSettings is a numeric value where, when represented in binary, each bit represents a configurable option as defined in the table below. You can combine these options to derive the required value, for example setting P2PSslSettings to 3 (0x1 + 0x2) configures Nomad to use a PKI certificate for server authentication and also enables certificate-based authentication. These options are only applicable if the HTTPS protocol has been enabled in the P2PEnabled setting. If you are using PKI certificates you must deploy the certificates to all clients before enabling this option. Refer to Peer copy over HTTP or HTTPS for further details on using HTTPS and associated authentication.	MODULE.NOMAD.P2PSSLSETTINGS

Bit	Hex	Decimal	Notes
0	0x0001	1	If not set (0), use self-signed certificate for server (Master) authentication

Bit	Hex	Decimal	Notes
			If set (1), use PKI certificate for server (Master) authentication
1	0x0002	2	Enables certificate-based client authentication (Requires a PKI client authentication certificate) **Note** If this option is enabled and the Configuration Manager client is using self-signed client authentication certificates (or Nomad is being used outside of CM), you should specify CertIssuer to ensure Nomad uses the intended certificate.

9.6.12.3.69 PercentAvailableDisk

The limit on the Nomad cache. Specified as a percentage of the available disk space, it controls the automatic cache cleaning to ensure that the cache does not grow to a size whereby the percentage of available disk space is less than this value.

Registry value	Default value	Notes	Installer property
PercentAvailableDisk	10	By default, the cache will not grow such that less that 10% of total disk space is available. The maximum value is 80. The cache will not grow beyond 20% of the total available disk space. This method for determining the maximum size of the cache is provided as an alternative to MaxCacheSizeMB: If PercentAvailableDisk is greater than zero, its method is used to control the cache size If MaxCacheSizeMB is greater than zero and PercentAvailableDisk is	MODULE.NOMAD.PERCENTAVAILABLEDISK

Registry value	Default value	Notes	Installer property
		zero, MaxCacheSizeMB is used as the method for determining the maximum size of the Nomad cache.	

9.6.12.3.70 PercentDelayedContentReg

Warning

PercentDelayedContentReg is obsolete. Its value may exist in the Nomad registry, but it is not used. Instead, **Content Registration Sync Cycle** is now used, please refer to CacheStateSyncIntervalMinutes.

The **Content Registration Sync Cycle** is available in the following versions of 1E Client, where the Nomad client registers pending and failed content registrations with ActiveEfficiency or Tachyon Platform. Please refer to Single Site Download: Improved resilience of content registration.

Nomad 7.1 in 1E Client 5.2 - uses Content Distribution in Tachyon Platform

Nomad 7.0.200 in 1E Client 5.1 - uses ActiveEfficiency

Nomad 7.0.100 in 1E Client 5.0 - uses ActiveEfficiency

Nomad 7.0 in 1E Client 4.1 - uses ActiveEfficiency

{mul

Registry value	Type	Default value	Notes	Installer property
PercentDelayedContentReg	REG_DWORD	0	Do not modify this setting unless advised by 1E.	none

9.6.12.3.71 PermittedLSZShares

Restricts Nomad LSZ file generation requests to a list of permitted package source locations.

Registry value	Default value	Notes	Installer property
PermittedLSZShares	SMSPKG*$	A list of comma-separated package source locations. Enables increased security and is only used by the	MODULE.NOMAD.PERMITTEDLSZSHARES

Registry value	Default value	Notes	Installer property
	SMS_DP_SMSPKG*$	Nomad client installed on a distribution point. Nomad LSZ file generation requests will only be completed if the content location is listed. If you are using additional package source locations, you must manually add these to this registry value. *PermittedLSZShares* can incorporate wildcard characters to provide flexible naming convention support. If you leave the registry value blank, security checks on package source locations are not carried out. **Note** When Configuration Manager (specifically Distribution Point servers) is configured to use HTTPS only, you must also add *NOCERT_SMS_DP_SMSPKG*$* and CCMTOKENAUTH_SMS_DP_SMSPKG*$ to the PermittedLSZShares registry value.	

9.6.12.3.72 PlatformURL

Note

Platform features are now enabled by using the BackgroundChannelUrl instead of PlatformURL.

The URL of the Tachyon Platform, specifically the Tachyon Background Channel, which provides a reverse proxy for the Content Distribution component of Tachyon Platform. Usually of the form *https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/*

Registry value	Default value	Notes	Installer property
Platform\ PlatformURL	(empty)	Located under the following registry keys, depending on the component. For *NomadBranch*, it is found under *HKLM\Software\1E\NomadBranch\Platform* For *NomadBranchAdminUIExt* on 64-bit machines, it is found under *HKLM\Software\Wow6432Node\1E\NomadAdminUI\Platform* For *NomadBranchAdminUIExt* on 32-bit machines, it is found under *HKLM\Software\1E\NomadAdminUI\Platform* **Warning** Do not configure this registry setting, it is automatically configured on service startup. To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED is specified during installation, the registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for SSDEnabled and ContentRegistration, in addition to enabling the Tachyon client. The ContentDistribution registry setting is found under the Platform key. Nomad app provides visibility of content distribution activity Single Site Download (SSD) Single Site Peer Backup Assistant (SSPBA) High Availability Peer Backup Assistant (HAPBA) Get Migration Settings task sequence action used to manage computer associations	Not applicable.

Registry value	Default value	Notes	Installer property
		Nomad Pre-caching Nomad Download Pause. In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the 1EClient.conf file).	

9.6.12.3.73 PostCompleteTimeoutHours

The duration (in hours) after which the PBA share is deleted from the host.

Registry value	Default value	Notes	Installer property
NMDS\PostCompleteTimeoutHours	0xA8 (168)	Only applies to a PBA share after the NMDS_COMPLETE command has been run for it, otherwise the PreCompleteTimeoutHours value will apply. The intention is that an incomplete share will only be available for a short period of time, defined in PreCompleteTimeoutHours. Once the NMDS_COMPLETE command is sent, it will be fixed for this longer time. When the share is deleted the	MODULE.NOMAD.POSTCOMPLETETIMEOUTHOURS

Registry value	Default value	Notes	Installer property
		folder and associated user will be removed. This registry value is found under the PBA registry key NomadBranch\NMDS.	

9.6.12.3.74 PrecachePollBatchSize

The number of notifications a client processes in one pre-cache poll cycle.

Registry value	Default value	Notes	Installer property
PrecachePollBatchSize	20	Range is 1 to 500. If the value is greater than 500, it defaults to 500. If you set the value to 0, it defaults to 20.	None

9.6.12.3.75 PrecachePollMinutes

The interval (in minutes) between Nomad polling Content Distribution for new pre-cache jobs.

Registry value	Default value	Notes	Installer property
PrecachePollMinutes	0x5A0 (1440)	Nomad clients normally start their polling cycle when the service starts-up, with a random delay to minimize the possibility of concurrent polls from different clients. The range is 60 - 525600 (1 year). 0 disables polling	MODULE.NOMAD.PRECACHEPOLLMINUTES

9.6.12.3.76 PreCompleteTimeoutHours

The duration (in hours) after which PBA share is deleted from the host.

Registry value	Default value	Notes	Installer property
NMDS\PreCompleteTimeoutHours	0x3 (3)	Located under the PBA registry key NomadBranch\NMDS, it only applies to a PBA share after the NMDS_POLL command has been run, but not the NMDS_COMPLETE command. The intention is that an incomplete share will only be available for a short period of time. When the share is deleted the folder and associated user is removed.	MODULE.NOMAD.PRECOMPLETETIMEOUTHOURS

9.6.12.3.77 RandomizeRemotePaths

Allows you to enable and disable the remote paths randomization for CM and pre-cache jobs.

When Nomad begins content download, its content is pulled from the same distribution point by every client. For example, If a site has four Distribution Points (DP), the first one in the list is always used for downloading. In a very large environment, this can put an unnecessary load on a single DP.

Using**RandomizeRemotePaths**Nomad can randomize the content location list.

<table>
<tr><th>Registry value</th><th>Type</th><th>Default value</th><th>Notes</th><th>Installer property</th></tr>
<tr><td>RandomizeRemotePaths</td><td>REG_DWORD</td><td>0</td><td>By default, RandomizeRemotePaths is not present in the Nomad registry hive. To change the value, you need to create it and set your desired value.

You can enable and disable the remote paths randomization for either Configuration Manager (CM) or pre-cache jobs using the following bits:

<table><tr><th>Bit</th><th>Hex</th><th>Decimal</th><th>Notes</th></tr><tr><td>0</td><td>0x0001</td><td>1</td><td>Enable remote paths randomization for CM jobs.</td></tr><tr><td>1</td><td>0x0002</td><td>2</td><td>Enable remote paths randomization for Pre-cache jobs.</td></tr></table></td><td>MODULE.NOMAD.RANDOMIZEREMOTEPATHS</td></tr>
</table>

9.6.12.3.78 RecycleDPDelay

The delay (in seconds) before restarting retries from the first DP after the whole list of available DPs have been tried.

Registry value	Default value	Notes	Installer property
RecycleDPDelay	600	It is associated with the distribution point resilience feature and is used in conjunction with DownloadTimeout. The default equates to 10 minutes.	MODULE.NOMAD.RECYCLEDPDELAY

9.6.12.3.79 RunUncachedPermittedFastLAN

Determines where the download package is run from under certain conditions.

Registry value	Default value	Notes	Installer property
RunUncachedPermittedFastLAN	0	Works in conjunction with MaxPackageSizeFastLAN (which needs to contain a value value greater than zero). Values are: 0 – do not run package from the distribution point. 1 – run package directly from the distribution point if there is either insufficient disk space to create the cache, or the maximum package threshold is exceeded but the connection is fast (>500kbps). To ensure that the un-cached mode works correctly, set	MODULE.NOMAD.PERMITUNCACHED

Registry value	Default value	Notes	Installer property
		the Program Environment Properties to include the Drive mode/Require drive letter option.	

9.6.12.3.80 SigsFolder

The path to the Configuration Manager signature files.

Registry value	Default value	Notes	Installer property
SigsFolder	C:\SMSSIG$	Relates to RDC integration and must point to the folder where the signature files are held for Configuration Manager. Wildcards are not allowed. For example: `E:\SMSSIG$` When it is not set, Nomad assumes that signature files location as *`C:\SMSSIG$`*, if it exists.	MODULE.NOMAD.SIGSFOLDER

9.6.12.3.81 SiteSSDMinPackageSizeKB

Allows you to configure a minimum content size before making an SSD request.

Registry value	Type	Default value	Notes	Installer property
SiteSSDMinPackageSizeKB	REG_DWORD	0	The default value is 0 which can be changed after installation when it will be an	MODULE.NOMAD.SITESSDMINPACKAGESIZEKB

Registry value	Type	Default value	Notes	Installer property
			installer property. There is no lower limit for this key, upper limit is 10240. If the registry value is greater than 10240, the agent will only consider 10240 and will log a warning. Size of content is first taken from Job data, if that's not available it's taken from the LST file, if it's not present there, this key is ignored and an SSD request is made irrespective of size. **Note**	

Registry value	Type	Default value	Notes	Installer property
			This check is for site SSD, not for local SSD.	

9.6.12.3.82 SiteSsdStagger

Sets the site SSD query stagger duration (seconds).

Deployments to large numbers of clients (30,000 or more) generate significant network traffic from 1E Clients to ContentDistribution that may result in IIS 503 Overload errors on the server, causing content registrations and SSD requests to fail. SiteSsdStagger allows an elected subnet master to wait for a random configurable time before making a site SSD request. All peers in the subnet participating in the election would also synchronize and wait for the same time before copying from master machine.

Registry value	Type	Default value	Notes	Installer property
SiteSsdStagger	REG_DWORD	0	Sets the site SSD query stagger duration in seconds. The stagger is 0 (disabled) by default. The maximum value that can configured is 300	MODULE.NOMAD.SITESSDSTAGGER

Registry value	Type	Default value	Notes	Installer property
			seconds (5 minutes). There is no SSD staggering in WinPE. Site SSD happens when broadcast is enabled or if local SSD is enabled and it does not return any devices from ActiveEfficiency. **Note** Please consult 1E before changing this value. This setting works in conjunction with LocalSsdStagger.	

9.6.12.3.83 SpecialNetShare

Sets various special feature options related to the Nomad share.

Registry value	Default value	Notes	Installer property
SpecialNetShare	0x2060 (8288)	You can set more than one option at the same time by combining the bit values. For example, to have custom share permissions and use the machine account for access to the Nomad share, set the value for SpecialNetShare to 129 (decimal value 1+128 or 0x0081	MODULE.NOMAD.SPECIALNETSHARE

Registry value	Default value	Notes	Installer property
		hex). See for more detail on configuration and security. The default value in different versions has changed, based on feedback. Upgrading does not change the value unless explicitly set. Nomad version / Default in MSI Nomad 8.0 (1E Client 8.0): 0x2060 (8288) — Bit 5: Disables broadcast of download statistics; Bit 6: Enable Nomad FanOut; Bit 13: Use HTTP/S or SMB Nomad 7.1 (1E Client 5.2), Nomad 7.0 (1E Client 4.1 to 5.1): 0x2020 (8224) — Bit 5: Disables broadcast of download statistics; Bit 13: Use HTTP/S or SMB Nomad 6.x: 0x0000 (0) — No special features enabled. The default used in all versions of Client Deployment Assistant	

Registry value	Default value	Notes	Installer property
		(and earlier Endpoint Agent Installer) is 0x2070 (8304): Bit 4: Enable Nomad hidden share as NomadSHR$ Bit 5: Disables broadcast of download statistics Bit 6: Enable Nomad FanOut Bit 13: Use HTTP/S or SMB	

Bit	Hex	Decimal	Description
	0x0000	0	No special features enabled.
0	0x0001	1	Custom Share Permissions: Administrators configure and manage custom share permissions. The service doesn't create the *NomadSHR* share on start-up, leaving the administrator to manually create it and set the permissions. It is also not deleted when the service stops and therefore existing share permissions are preserved.
1	0x0002	2	Enables support for IPv6: If the network supports both IPv6 and IPv4, enable support for both – set bit 1 but not bit 2.
2	0x0004	4	Disables support for IPv4: If the network supports only IPv6, disable IPv4 and set both bit 1 and bit 2.
3	0x0008	8	RESERVED
4	0x0010	16	The Nomad share is hidden and named *NomadSHR$*. When using a hidden share, all Nomad installations must be configured to use this option. See The Nomad share for more detail on configuration and security.
5	0x0020	32	Disables broadcast of download statistics. By default, this is disabled. If enabled, Nomad broadcasts download statistics to all peers when a download is complete.

Bit	Hex	Decimal	Description
			Note Prior to 1E Client 4.1 (Nomad 7.0) this was enabled (0) by default, now it is disabled (1) by default.
6	0x0040	64	Enables Nomad FanOut.
7	0x0080	128	The machine account is used when connecting to a peer client. The SMSNomadP2P& account is not created. Please refer to The Nomad share: Use Machine Account. **Note** Will not work if peers exist in untrusted domains or workgroups.
8	0x0100	256	RESERVED
9	0x0200	512	RESERVED
10	0x0400	1024	RESERVED
11	0x0800	2048	RESERVED
12	0x1000	4096	RESERVED (deprecated)
13	0x2000	8192	Use HTTP/S or SMB. Ensure that this is set if Nomad integration is used by Tachyon. HTTP/S is automatically used if CM client is detected. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this was disabled (0) by default, now it is enabled (1) by default. This setting should be enabled in baseline or other policies.
14	0x4000	16384	Web LSZ generation: enables the Nomad client on Configuration Manager standalone DPs to handle LSZ file generation requests coming from HTTP/HTTPS enabled clients. Used when Nomad clients are configured with either of the following enabled: Bit13 (0x2000) – Use HTTP/S or SMB Bit 15 (0x8000) – Use HTTP/S only, not SMB

Bit	Hex	Decimal	Description
			When enabled, the Nomad distribution point client creates a virtual folder called *LSZFILES*. The permissions for this are copied from the Configuration Manager *SMS_DP_SMSPKGX$* share. By default, access to the LSZFILES folder requires SSL to be enabled. This is the case for Internet facing scenarios where local client access certificates will ensure authentication. If you are using HTTP instead of HTTPS, manually disable SSL on the LSZFILES web folder in order for the Nomad LSZ file generation process to work. Only needs to be enabled when using HTTP or HTTPS on standalone DPs; it is not required on site server DPs because Nomad automatically configures Web LSZ generation on them.
15	0x8000	32768	Use HTTP/S only, not SMB: enables the Nomad client to download content using HTTPS or HTTP depending on the content location provided by Configuration Manager or Tachyon. The Nomad client will not use SMB to download content when this is enabled.

9.6.12.3.84 SSDEnabled

Enables Single Site Download (SSD).

Registry value	Default value	Notes	Installer property
SSDEnabled	0	You can set more than one option at the same time by combining the bit values. For example, to enable clients to fetch downloads using SSD and provide them to peers, set the value to 3 (decimal value 1+2 or 0x3). To enable clients to fetch downloads using site and local SSD and provide them to peers, set the value to 7. To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED	MODULE.NOMAD.SSDENABLED

Registry value	Default value	Notes	Installer property
		is specified during installation, the registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for SSDEnabled and ContentRegistration, in addition to enabling the Tachyon client. The ContentDistribution registry setting is found under the Platform key. Nomad app provides visibility of content distribution activity Single Site Download (SSD) Single Site Peer Backup Assistant (SSPBA) High Availability Peer Backup Assistant (HAPBA) Get Migration Settings task sequence action used to manage computer associations Nomad Pre-caching Nomad Download Pause. In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the 1EClient.conf file). If your network is running over a WLAN or have devices on a wireless network you	

Registry value	Default value	Notes	Installer property
		want to be content providers, set ContentProviderOnWifi=1.	

Bit	Hex	Decimal	Description
	0x0	0	SSD is disabled, the Nomad client takes no part in the SSD on the site.
0	0x1	1	SSD is enabled and the Nomad client fetches downloads using SSD. This setting on its own (without provider mode set) should be used with sensitive server weighting. Provider mode is where a peer gets content from another peer but cannot serve it (it cannot act as a master).
1	0x2	2	SSD is enabled and the Nomad client provides downloads to peers. Enabling this bit causes Nomad to register content with Content Distribution. In practice, this is unlikely to be used on its own. This is automatically disabled for WinPE installations (because cached content is only temporary).
2	0x4	4	Local SSD is enabled and the Nomad client fetches downloads from a local client (also known as a subnet peer master - the term used for local devices which have content but cannot be located during the normal election process because network broadcasts have been disabled) within the subnet. The local SSD feature was introduced to supplement site SSD for clients on networks such as wireless where broadcasts are disabled, to prevent each client becoming its own master and downloading direct from the DP. In a SSD enabled environment, a master queries Content Distribution to get a list of devices on other subnets within the site that have content. With local SSD enabled, the master also queries for devices having content within local subnet. If any local peers with content are available, then the master downloads from them, otherwise it attempts to download from Site peers (other subnets in the site), and if the master still cannot find any peers, it downloads the content direct from the DP. In version 7.0 and later, a master skips using local SSD if it sees broadcast messages from peers. This means clients in mixed network environments can be configured with the same SSDEnabled setting (with Local SSD enabled) and clients can move seamlessly between networks. When on a

Bit	Hex	Decimal	Description
			wireless network (where broadcasts are typically disabled) local SSD can be used. On LAN networks (where broadcasts are typically allowed) local SSD would be skipped because a master is elected and sees broadcast activity from peers. This setting should only be used if networks have broadcasts being disabled (for example wireless networks) and clients are forced to download from the DP as they can't participate in an election. Local SSD requires that a peer on the local subnet be configured to provide downloads to peers, that is at least one client on the subnet must be configured with Bit 1 enabled. To maintain consistency with typical Nomad peer sharing behavior where local SSD is not required, configure all clients with *SSDEnabled=7*. You'll also want to set ContentProviderOnWifi=1. When enabled, the elected master: Queries Content Distribution to get a list of local devices having the content. Queries each of those devices to check if they are available and have the content. The list is ordered by percentage of content the device holds. Repeats the same process for devices on other subnets (existing SSD feature). Stores a list of subnets as well as site devices in memory. Cycles through the list in the following order: Subnet peer master (fetched from list of local devices from Content Distribution) Site master DP. To distinguish between a master derived from Content Distribution and an election, the log records: *Connection::SetDownloadSource = SubnetPeer* (an elected peer) instead of *Connection::SetDownloadSource = Peer* (an SSD peer master).

9.6.12.3.85 SSPBAEnabled

Enables the use of Single Site functionality for PBA data stores. See Single Site peer backup assistant for more details.

Registry value	Default value	Notes	Installer property
SSPBAEnabled	0	Has a dependency on the Tachyon Platform PlatformURL. Values are: 0 – disables single-site integration with ContentDistribution 1 – enables single-site integration with ContentDistribution	MODULE.NOMAD.SSPBAENABLED

9.6.12.3.86 StatusMsgEvents

Determines which Nomad events are reported using Configuration Manager status messages.

Registry value	Default value	Notes	Installer property
StatusMsgEvents	0x0	Nomad can send status messages through Configuration Manager based on specific download events which appear in its deployment status. They are provided mainly for advanced troubleshooting purposes, or for custom reporting solutions. From v7.1 onwards, they are no longer required for the Nomad Dashboard which now gets its status events directly via the Platform Content Distribution feature. However, you may have custom reporting in Configuration Manger that also use these messages, and you can configure this setting accordingly for this purpose. These messages are controlled by the StatusMsgEvents registry value. This is a *REG_SZ* string data type and the format of the parameter must be a 64-bit value. Status messages are only sent when there is an active deployment.	MODULE.NOMAD.STATUSMSGEVENTS

Registry value	Default value	Notes	Installer property
		Warning Status message events should be used with caution as they could impact your Configuration Manager environment when scaled up to tens of thousands of machines. For example, to set the request started, request completed, started copy and master changed events, update the StatusMsgEvents registry value to *0x80002060*. 0x0000000001 – SNO_EVT_START 0x0000000002 – SNO_EVT_STOP 0x0000000004 – SNO_EVT_ERROR 0x0000000008 – SNO_EVT_PAUSED 0x0000000010 – SNO_EVT_RESUMED 0x0000000020 – SNO_EVT_REQUEST_STARTED 0x0000000040 – SNO_EVT_REQUEST_COMPLETED 0x0000000080 – SNO_EVT_SERVICE_RESET 0x0000000100 – SNO_EVT_STARTED_CACHE_MANAGEMENT 0x0000000200 – SNO_EVT_FINISHED_CACHE_MANAGEMENT	

Registry value	Default value	Notes	Installer property
		0x0000000400 – SNO_EVT_STARTED_HASHCHECK 0x0000000800 – SNO_EVT_FINISHED_HASHCHECK 0x0000001000 – SNO_EVT_ELECTION_REQUEST 0x0000002000 – SNO_EVT_MASTER_CHANGED 0x0000004000 – SNO_EVT_FILLIN_MASTER_CHANGED 0x0000008000 – SNO_EVT_MCAST_CENTRALSCHED 0x0000010000 – SNO_EVT_MCAST_ERROR 0x0000020000 – SNO_EVT_MCAST_COMPLETE 0x0000040000 – SNO_EVT_SCHEDULER 0x0000080000 – SNO_EVT_STARTED_TX_CENTRALMCAST 0x0000100000 – SNO_EVT_STOPPED_TX_CENTRALMCAST 0x0000200000 – SNO_EVT_STARTED_TX_ACTIVEMCAST 0x0000400000 – SNO_EVT_STOPPED_TX_ACTIVEMCAST 0x0000800000 – SNO_EVT_STARTED_TX_FILLINMCAST	

Registry value	Default value	Notes	Installer property
		0x0001000000 – SNO_EVT_STOPPED_TX_FILLINMCAST 0x0002000000 – SNO_EVT_STARTED_RX_CENTRALMCAST 0x0004000000 – SNO_EVT_STOPPED_RX_CENTRALMCAST 0x0008000000 – SNO_EVT_STARTED_RX_ACTIVEMCAST 0x0010000000 – SNO_EVT_STOPPED_RX_ACTIVEMCAST 0x0020000000 – SNO_EVT_STARTED_RX_FILLINMCAST 0x0040000000 – SNO_EVT_STOPPED_RX_FILLINMCAST 0x0080000000 – SNO_EVT_STARTED_COPY 0x0100000000 – SNO_EVT_STOPPED_COPY 0x0200000000 – SNO_EVT_WORKRATE_CHANGED 0x0400000000 – SNO_EVT_WRONG_PKG_VERSION 0x0800000000 – SNO_EVT_INFORMATIONAL 0x1000000000 – SNO_EVT_FINALSTATS (see notes below) 0x2000000000 – SNO_EVT_WAIT	

Registry value	Default value	Notes	Installer property

0x4000000000 – SNO_EVT_MAX_EVENTID

SNO_EVT_FINALSTATS notes

For success reporting, this message provides feedback on the status of the download. For example, it can show how much data was received using multicast as opposed to peer-to-peer copying. Turning this message on creates an extra status message per machine for each deployment. The format of the status message is:

```
Evt_FinalStats MD100067 1 170 59195038 170 59195038 0 59195038 0 0
```

Configuration Manager status messages are made up of insertion strings. The strings for the final stats event are:

InstrStr0	Nomad event string (internal reference)	N/A
InstrStr1	Package Id and Package version	MD1000671
InstrStr2	Total number of files in package	170
InstrStr3	Total number of	59195038

Registry value	Default value	Notes			Installer property
			package bytes		
		InstrStr4	Number of files which are cached	170	
		InstrStr5	Bytes which are cached	59195038	
		InstrStr6	Bytes coped from a peer agent (P2P)	0	
		InstrStr7	Bytes copied from the DP	59195038	
		InstrStr8	Bytes received via local multicast	0	
		InstrStr9	Bytes received from a central multicast	0	
		If the package is already cached and is re-deployed with an unchanged package version, the final stats message will not be re-sent.			

9.6.12.3.87 SuccessCodes

A list of Nomad return codes that are translated as success to the Content Transfer Manager (CTM) component of the Configuration Manager client.

Registry value	Default	Notes	Installer property
SuccessCodes	0x206b, 0x2077, 0x103, 0xffffffff, 0x1, 0x70, 0x2050, 0x2051, 0x2052, 0x2053, 0x2054,0x2055, 0x2056, 0x2057, 0x2058, 0x205a, 0x205b, 0x205c, 0x205d, 0x205e, 0x2060, 0x2061,0x2062, 0x2063, 0x2064, 0x2065, 0x2066, 0x2067, 0x2068, 0x2069, 0x209A	This REG_SZ value contains a comma-delimited list of possible Nomad return codes that should be treated as a success and thereby prevent Configuration Manager from attempting to download the content itself or use another Alternate Content Provider (ACP). Any code returned by Nomad that is not on the list will be treated as a failure and trigger the Configuration Manager client to attempt to download the content using alternate means. Nomad also sends a status message to the Configuration Manager site containing its return code. Strictly speaking the Nomad return codes are actually internal status codes, Nomad will only ever return success or failure to the Content Transfer Manager (CTM) component of the Configuration Manager client. When CTM receives a success it passes control to the ExecMgr component of the Configuration Manager client, which attempts to execute the deployment. ExecMgr will fail if Nomad did not download the content and make it available in the Configuration Manager cache. In this case, ExecMgr sends a status message (e.g. failed deployment) back to the Configuration Manager site. If Nomad generates a return code that is not in the list, it passes a fail to the CTM component which causes the Configuration Manager client to try downloading the content itself using BITS, or use another Alternate Content Provider (ACP). This process may itself succeed or fail depending on the	MODULE.NOMAD.SUCCESSCODES (This installer property was introduced in 1E Client 4.1 for Nomad 7.0)

Registry value	Default	Notes	Installer property

conditions that resulted in the original Nomad return code, and may have an undesirable impact on the network.

Note

The special code 0x9999 can be added to the list, or used on its own, to cause Nomad to always return a success to CTM. As a consequence this code is also known as "prevent failover to BITS".

Note

The SuccessCodes list need not be modified under normal circumstances, other than to add or remove the 0x9999 code.

The following table shows the possible Nomad return codes that can be set in the list:

Note

This list is subject to change with each release of Nomad, and provided for reference only.

Return Code	Description	
-1	0xFFFFFFFF	Reserved.
1	0x0001	Reserved.

Registry value	Default	Notes			Installer property
		112	0x0070	Insufficient disk space to create the cache.	
		259	0x0103	Reserved.	
		8272	0x2050	The download has been suspended by APM.	
		8273	0x2051	The user has cancelled this download.	
		8274	0x2052	Invalid command line.	
		8275	0x2053	Command-line execution failure.	
		8276	0x2054	Internal Error.	
		8277	0x2055	The package exceeds the threshold for a RAS connection.	
		8278	0x2056	The package exceeds the threshold for a Slow LAN connection.	
		8279	0x2057	The package exceeds the threshold for a Fast LAN connection.	
		8280	0x2058	Reserved.	

Registry value	Default	Notes			Installer property
		8281	0x2059	Unknown transport. Returned when an attempt is made to download a Software Update from an Internet location (like Microsoft Updates).	
		8282	0x205A	Invalid special package path (set using --pp).	
		8283	0x205B	Incorrect file hash.	
		8284	0x205C	Exited due to a kill request.	
		8285	0x205D	DP path not found.	
		8286	0x205E	The MaxBusyBackOff consecutive event threshold has been exceeded.	
		8287	0x205F	The service has stopped.	
		8288	0x2060	The advertisement has expired.	
		8289	0x2061	Reserved.	
		8290	0x2062	This is an unlicensed version of Nomad.	

Registry value	Default	Notes			Installer property
		8291	0x2063	Invalid alternate cache path (set using --cp).	
		8292	0x2064	No Configuration Manager job data found in WMI.	
		8293	0x2065	Incorrect package hash.	
		8294	0x2066	MaxDuration or execution runtime for this program has been exceeded.	
		8295	0x2067	Reserved.	
		8296	0x2068	Incorrect package version.	
		8297	0x2069	Obsolete package version.	
		8298	0x206A	The BlockSize has been changed during download.	
		8299	0x206B	The "no progress" re-check threshold has been exceeded.	
		8300	0x206C	The parent process has terminated.	

Registry value	Default	Notes			Installer property
		8301	0x206D	Duplicate download for the package.	
		8302	0x206E	The service was reset. This will occur if certain configuration parameters are changed during a download e.g. NomadInhibitedSubnets	
		8303	0x206F	Nomad inhibited.	
		8311	0x2077	Internal error LST incomplete.	
		8346	0x209A	Client certificate missing. Nomad is configured to use certificate-based client authentication but was unable to find an appropriate certificate.	

9.6.12.3.88 SupportWPAD

Provides support for Web Proxy Auto-Discovery Protocol (WPAD).

Nomad always uses System level proxy if it has been set, irrespective of what SupportWPAD has been set to.

SupportWPAD was introduced in v7.1 and when disabled it does not change the default behavior, which is: If system level proxy is set then use it, otherwise access directly without proxy.

When SupportWPAD is enabled in Nomad, the behavior is:

If system level proxy is set then use it and do not try WPAD

If system level proxy is not set then fetch automatic proxy using WPAD and use it

If system level proxy is not set and failed to get automatic proxy using WPAD then try access directly without proxy.

How to know if a system level proxy has been set

```
netsh winhttp show proxy
```

Registry value	Default value	Notes	Installer property
SupportWPAD	0	By default, the WPAD feature is disabled. To enable WPAD in Nomad, add registry key 'SupportWPAD' and set it to 1 at registry path HKLM/Software/1E/NomadBranch To enable or disable the WPAD feature in Nomad: Disable WPAD set SupportWPAD = 0 Enable WPAD set SupportWPAD= 1 (or non-zero value).	MODULE.NOMAD.SUPPORTWPAD

9.6.12.3.89 WakeUpBatchSize

The maximum number of machines to wake up in a single call.

> **Warning**
>
> Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.
>
> The wake up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution and a NightWatchman infrastructure. The feature is enabled during installation of NightWatchman Management Center. Please refer to Nomad Preparation for requirements.

Registry value	Default value	Notes	Installer property
WakeUpBatchSize	10	Sets the maximum number of machines to wake up in one	MODULE.NOMAD.WAKEUPBATCHSIZE

Registry value	Default value	Notes	Installer property
		call, for subnet and site separately. (So up to twice this number of requests is sent in total if WakeUp is enabled for both subnet and site.) The next batch is launched, if necessary, after a re-election (usually a periodic election). The value cannot be greater than MaxDevicesFromAE, and hence itself cannot be more than 20.	

9.6.12.3.90 WakeUpEnabled

Enables WakeUp integration, see Integrating Nomad with WakeUp for more details.

> **Warning**
>
> Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.
>
> The wake up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution and a NightWatchman infrastructure. The feature is enabled during installation of NightWatchman Management Center. Please refer to Nomad Preparation for requirements.

Registry value	Default value	Notes	Installer property
WakeUpEnabled	0	Determines the status of the WakeUp integration. If configured by the installer, it is disabled (0) by default. If integration is enabled, Nomad attempts to wake up dormant	MODULE.NOMAD.WAKEUPENABLED

Registry value	Default value	Notes	Installer property
		hosts that are known to have the requested content in their caches. The integration has a dependency on the PlatformURL. To enable integration post-installation, for normal usage, set both bits 0 and 1 (0x3)	

Bit	Hex	Decimal	Description
	0x0	0	Disables WakeUp integration.
0	0x1	1	Enables WakeUp integration only for the local subnet.
1	0x2	2	Enables WakeUp integration only for the site.
	0x3	3	Enables WakeUp integration for the site and the local subnet.

9.6.12.3.91 WakeUpMinPackageSizeMB

The minimum size of content (in megabytes) that will cause a request for a wakeup. See Integrating Nomad with WakeUp for more details.

> **Warning**
>
> Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.
>
> The wake up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution and a NightWatchman infrastructure. The feature is enabled during installation of NightWatchman Management Center. Please refer to Nomad Preparation for requirements.

Registry value	Default value	Notes	Installer property
WakeUpMinPackageSizeMB	1024	Any content below this size is downloaded from the DP as downloads from the DP for files this size will likely complete before any wakeups will have had a chance to finish. The value can be 0, in which case wakeups will always be attempted. For example, if it is set to 512 and size of the content downloaded is 500 MB, a wake-up request (to site or subnet) is not be sent. Similarly, if size of the content is 600 MB, then wake-up requests (to site and subnet, determined by WakeupEnabled) is be sent. **Note** For standalone downloads (using SMSNomad.exe) and under WinPE, there has no effect as the size of the	MODULE.NOMAD.WAKEUPMINPACKAGESIZEMB

Registry value	Default value	Notes	Installer property
		content cannot easily be determined. Wake-up requests are always sent in these instances.	

9.6.12.3.92 WLanBlipSecs

The duration for temporarily disabling a wireless connection when a wired LAN connection becomes available, to provide time for the OS and Nomad to switch to the LAN connection. This is useful for OS versions and drivers that do not automatically switch to a preferred wired connection.

Registry value	Default value	Notes	Installer property
WLanBlipSecs	0	The value must be 20 seconds or more.	MODULE.NOMAD.WLANBLIPSECS

Nomad provides extra stability by managing a machine's network connections as they move between a wireless and a wired LAN. Depending on the OS version or other factors, once an SMB or HTTP session is running on a wireless connection, it will remain on wireless even when a wired LAN becomes available. Nomad uses **WLanBlipSecs** to temporarily drop a wireless connection when it detects a wired LAN connection, to give time for the OS and Nomad to automatically switch to the LAN connection.

For example, if a Nomad master was initiated when a machine was on a wireless connection and a wired connection subsequently became available, Nomad disables the wireless adapter for a long enough period to enable a switchover to the wired connection. As a result of this, the IP address and the share path will change and peers will log error messages until each peer re-establishes its connection to the master and the new share location.

This feature is turned off by default.

> **Note**
>
> Other applications may be affected when switching from wireless to wired connection.

Irrespective of the **WLanBlipSecs** setting, you can also control which service set identifier (SSID) Nomad connects to by managing a list. To do this, update the NomadBranch WLanProfileList registry value with a comma-delimited list of SSIDs or use the wildcard (*) character for any SSID.

Examples:

```
WLanProfileList REG_SZ WIFIGAP,GUEST
WLanProfileList REG_SZ *
```

9.6.12.3.93 WLanProfileList

A list of wireless SSIDs to enable switching from wireless to wired LAN connections.

Registry value	Default value	Notes	Installer property
WLanProfileList		A comma-delimited list of wireless SSIDs (* for any all) which enables Nomad to switch form wireless to a wired LAN connection when it becomes available.	MODULE.NOMAD.WLANPROFILELIST

9.6.13 Nomad return codes

The following is a list of the Nomad return codes and their descriptions.

> **Note**
>
> This list is subject to change with each release of Nomad, and provided for reference only.

Return Code	Description	
-1	0xFFFFFFFF	Reserved.
1	0x0001	Reserved.
112	0x0070	Insufficient disk space to create the cache.
259	0x0103	Reserved.
8272	0x2050	The download has been suspended by APM.
8273	0x2051	The user has cancelled this download.
8274	0x2052	Invalid command line.
8275	0x2053	Command-line execution failure.

Return Code	Description	
8276	0x2054	Internal Error.
8277	0x2055	The package exceeds the threshold for a RAS connection.
8278	0x2056	The package exceeds the threshold for a Slow LAN connection.
8279	0x2057	The package exceeds the threshold for a Fast LAN connection.
8280	0x2058	Reserved.
8281	0x2059	Unknown transport. Returned when an attempt is made to download a Software Update from an Internet location (like Microsoft Updates).
8282	0x205A	Invalid special package path (set using --pp).
8283	0x205B	Incorrect file hash.
8284	0x205C	Exited due to a kill request.
8285	0x205D	DP path not found.
8286	0x205E	The MaxBusyBackOff consecutive event threshold has been exceeded.
8287	0x205F	The service has stopped.
8288	0x2060	The advertisement has expired.
8289	0x2061	Reserved.
8290	0x2062	This is an unlicensed version of Nomad.
8291	0x2063	Invalid alternate cache path (set using --cp).
8292	0x2064	No Configuration Manager job data found in WMI.
8293	0x2065	Incorrect package hash.

Return Code	Description	
8294	0x2066	MaxDuration or execution runtime for this program has been exceeded.
8295	0x2067	Reserved.
8296	0x2068	Incorrect package version.
8297	0x2069	Obsolete package version.
8298	0x206A	The BlockSize has been changed during download.
8299	0x206B	The "no progress" re-check threshold has been exceeded.
8300	0x206C	The parent process has terminated.
8301	0x206D	Duplicate download for the package.
8302	0x206E	The service was reset. This will occur if certain configuration parameters are changed during a download e.g. NomadInhibitedSubnets
8303	0x206F	Nomad inhibited.
8311	0x2077	Internal error LST incomplete.
8346	0x209A	Client certificate missing. Nomad is configured to use certificate-based client authentication but was unable to find an appropriate certificate.

9.6.14 FIPS compliant communication encryption

Nomad has always provided encryption for most of its communications and uses an advanced FIPS compliant encryption algorithm. The United States Federal Information Processing Standard (FIPS) http://en.wikipedia.org/wiki/FIPS_140-2 is a standard that defines security requirements for software used by the U.S. federal government. It stipulates that applications that encrypt any sensitive data should use only a certain set of approved encryption algorithms.

9.6.14.1 FIPS compliant communication encryption

FIPS encrypts the following types of Nomad data sent over a network in peer-to-peer communications, including:

Election communications

Connectionless data transfer

Nomad FanOut requests

Sign-on/sign-off communication

SSD Package Status Requests

PBA communications.

9.6.14.2 Encryption types

Nomad provides two types of encryption, its default 40-bit RC2 encryption algorithm and FIPS compliant encryption. You can set the encryption type used by Nomad during installation or by modifying a Nomad registry entry.

> **Note**
>
> Nomad clients running different encryption types will be unable to communicate with each other. If you want to use FIPS compliant encryption and earlier versions of Nomad are already deployed, you should roll out Nomad using its default encryption standard. Once all clients have been upgraded, change the encryption level to FIPS compliant.

9.6.14.3 Installing Nomad with FIPS encryption

FIPS encryption can be set when you enable Nomad in the 1E Client. This is done by checking the **Use FIPS encryption** checkbox on the **Nomad** screen of the 1E Client installer, for more information refer to Installing the 1E Client for Nomad.

You can also set FIPS encryption with the MODULE.NOMAD.USEFIPS installer property.

9.6.14.4 Setting FIPS encryption post-installation

To change Nomad's encryption type after installation you can modify the EncryptionType registry value. By default, this is set to 0, for standard Nomad encryption, unless the **Use FIPS encryption** checkbox was checked during installation, in which case it is set to 1.

9.6.15 Glossary

A glossary of Tachyon terminology.

9.6.15.1 Tachyon alphabetical glossary

Term	Definition
1E Client	1E Client provides client features and modules for 1E products including Tachyon. It replaces the Tachyon Agent.

Term	Definition
Action	An Action is a specific type of instruction that is sent to client devices which can be used to modify the state of the target device. For example, setting a registry key, killing a process, deleting a file. Whereas a Question is an instruction that requests information from the target device, but does not change its state. Generally an Action needs to undergo an approval process before it is sent.
Agent	Agent is the old name for the client. The Agent has been replaced by the 1E Client which provides client features and modules for 1E products including Tachyon.
All Instructions Approver	This is a Tachyon system role which allows assigned users to approve actions for all Instruction Sets . Users can approve unless the action was requested by themselves.
All Instructions Questioner	This is a Tachyon system role which allows assigned users to ask questions and view responses for all Instruction Sets; use custom properties.
All Instructions Viewer	This is a Tachyon system role which allows assigned users to view instructions and responses for all Instruction Sets.
Audit information log	The Audit information log page displays audit information related to installation, permissions, instruction set and consumer related operations carried out using the Explorer and Settings applications. See Audit information log page
Historic Data Capture	The old name for Tachyon Activity Record.
Agent Language	The Agent language is an interpretive programming language that is executed by the client in the form of an **instruction payload**. Instructions, and their payload, are based on instruction definitions which are stored in the TachyonMaster database. Definitions are uploaded into the database from the Administrator console by dragging and dropping one or more Instruction Definition files, a Product Pack or ZIP file containing Instruction Definition files.

Term	Definition
	The language, called SCALE, uses Agent modules and methods and is documented in the SDK.
Agent Provider	A plug-in component for the 1E Client which communicates with an external component, such as an operating system facility (for example Windows registry) or a service-provider application (for example Content Distribution). 1E Client modules use Providers to get their work done. Examples: WMI provider Registry provider Nomad provider BASH provider
Auto-curation	Auto-curation is a Catalog function and refers to the automated process of creating match rules in 1E Catalog. These match rules are neither created by the customer not by the 1E curation team. The rules are created in the customer's local 1E Catalog copy using automated logic built by 1E.
Background Channel	The Background Channel is a mechanism by which the Tachyon client can download resources via HTTPS without loading the Switch. Since this traffic does not go through the Switch, the client is still able to receive and process instructions instructions while performing these downloads. From v2.0 onwards, the client is able to download resources via Content Distribution. The Background Channel is a web application on the Tachyon Server Website and provides the following: Stores Tachyon content from the Consumer API in the Background Channel for clients to retrieve Responds to clients retrieving Tachyon content from the Background Channel See Tachyon Architecture and Communication Ports.

Term	Definition
Client module	A plug-in component for the 1E Client which encapsulates business logic. Modules contain Methods, which can be invoked by SCALE. Modules (and their methods) effectively provide a platform independent API. To that end, Modules and their Methods do not (generally) talk about anything platform specific (Windows, Linux, Android etc). Examples: FileSystem OperatingSystem Network Software
Column filters	Some tables contain a column filter that lets you easily filter the information displayed in the table.**Using column filters**The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.To filter the table on the **Edition** column:Click on the filter iconjust beneath the header row in the **Edition** column.The filter popup is displayed.Now select the operator. In our example this will be **contains**.Then type the text **Prof** into the text field.Click **Apply** and a new filter will be added to the table.The table will be filtered to just those items whose **Edition** contains the text **Prof**.**Adding another filter**You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.**Removing filters**You can remove filters by clicking on the filter close icon at the end of the filter.
Column Picker	**Using column picker**Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.To pick the displayed columns:Click on the Choose columns iconto the right of the header row to view the visible columns.To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.The **Unknown Installs** column is now hidden.To move the **License Demand** column to the top of the list, hover your

Term	Definition
	mouse over **License Demand** and using the direction control drag it to the top of the list.The Microsoft Core License Demand page has now been automatically updated with our changes.
Column sorts	Some tables contain column sorts that let you easily re-order the information displayed in the table.**Using column sorts**The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column:Click on the sort iconjust beneath the header row in the **Cost** column.The sort popup is displayed.Now select the sort direction. In our example this will be **Sort descending**.After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon**Clearing the sort**You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.
Configuration Manager Extensions	The Configuration Manager Extensions currently include. Configuration Manager Agent emergency stop and resume actions Configuration Manager Agent actions Client Health Check Tachyon Run Instruction utility (used by the each of the above right-click actions to request Tachyon to run an instruction) Tachyon Instruction Runner (a mini UI version of the Tachyon Explorer) This feature is included in the Tachyon Toolkit. Documentation for installing and using the Configuration Manager Extensions will be available soon.
Consumer	A Consumer is any application that connects to and uses the Consumer API. An example is the Explorer application.
Consumer API	The Consumer API is a documented set of API endpoints provided by a web application on the Tachyon Web Server called Consumer. It is referred to as the Consumer API in order to avoid confusion with Tachyon Consumers, which are 'consumers' of the API. The Consumer API is a web application on the Tachyon Server Website, actually named Consumer, and provides the following:

Term	Definition
	Processes the consumer requests from the Explorer and other Consumers Publishes Tachyon content to the Background Channel Forwards requests for instrumentation data from the Explorer to the Tachyon Instrumentation component Forwards workflow commands from the Explorer to the Tachyon Workflow component See Tachyon Architecture and Communication Ports.
Consumer requests	A Consumer sends requests to the Consumer API.
Coordinator Service	The Coordinator Service has two modules: Instrumentation module Workflow module See Tachyon Architecture and Communication Ports.
Coordinator Instrumentation module	The Coordinator Instrumentation module is part of the Coordinator Service on the Tachyon Server which processes instrumentation data from the following components: Core Coordinator Workflow module Switch And responds to requests for instrumentation data from the Consumer API. See Tachyon Architecture and Communication Ports.
Coordinator Workflow module	The Coordinator Workflow module is part of the Coordinator Service on the Tachyon Server that provides the following: Forwards workflow commands from the Consumer API to the Core Stores workflow in SQL

Term	Definition
	Connects to remote SMTP to send emails used in the approval process for actions See Tachyon Architecture and Communication Ports.
Core	The Core is a Tachyon Server web component that does the following: Forwards workflow commands from the Coordinator workflow module to the Switch Forwards responses from the Switch to the Responses database (this task requires high throughput) Generates and sends instrumentation data to the Instrumentation service See Tachyon Architecture and Communication Ports.
Core Internal	Core Internal is the part of the Core which allows fast internal communication with the Switch using HTTP instead of HTTPS, restricted to the Switch server's local IP Address only. See Tachyon Architecture and Communication Ports.
Custom Role	Tachyon roles that define which Users have access to which Instruction Set. These roles can be modified in the Administration pages by users assigned to the Full Administrator role.
Custom Properties	Full Administrator can manage the custom properties using the Properties page in Explorer. The only custom property type available after installing the Tachyon server is Coverage tags, further types may be added during installation of other Consumers.
Device tags	Device tags can be used when setting the coverage for a particular question so that only client devices with a particular tag name and value get the question. The names and values of Device tags must be pre-configured by a Full Administrator before setting them on a client device using Device tag actions. Device tags can also be queried directly by Device tag questions.

Term	Definition
	Device tags were previously known as Coverage tags. In 1E Client log files, Device tags are also referenced as scopable tags. Please also see Freeform tags.

DNS Name	DNS Name FQDN is the term used in this documentation to represent the name of a Tachyon Server. Typically a Tachyon Server will have only one DNS Name, which will be the CNAME or an (A) Host record that uniquely represents a server's IP Address. 1E normally recommends using an CNAME record.
	
	In a Tachyon system, each Tachyon Server will have a DNS Name FQDN.
	
	In a single-Switch installation the Switch is on the same server and uses the same DNS Name. When a Response Stack has more than one Switch, each Switch has its own IP Address, so you can choose if the will share the same DNS Name, or if each will have its own DNS Name. The Tachyon Server certificate must have all
	
	`NAME TYPE VALUE`
	`----------`
	`tachyon.acme.com. CNAME tachyon.acme.local.`
	`tachyon.acme.local. CNAME foo.example.com.`
	`foo.example.com. A 192.0.2.23`
	
	`tachyon.acme.com is an Alias record`
	
	`tachyon.acme.local is a CNAME record`
	
	`foo.example.com is a (A) Host record`

Event Subscription	A type of instruction that can be sent to the client. An Event Subscription tells the client to monitor an arbitrary event source for a period of time (defined by the Instruction's TTL), to capture events as they occur and to report them back via the Switch.
Guaranteed State application	The Explorer application is the web portal used by users and administrators. It is an example of a Consumer application. **Note** Explorer can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/explorer/`

Term	Definition
	where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names. It is a web application on the Tachyon Server Website and provides the following: Browser connection providing the Explorer and Administration pages Sends consumer requests to the Consumer API See Tachyon Architecture and Communication Ports.
Filters	There are two kinds of filter: Question filters are used to reduce the responses from the clients; View filters reduce the information displayed in Explorer on the Responses page.
Freeform tags	Freeform tags may be used to set properties on client devices that can subsequently be used in Freeform tag questions. They cannot be used when defining the coverage for a question. Freeform tags can be set with arbitrary names and values that are defined only when running a Freeform tag action. In Tachyon log files, Freeform tags are also known a non-scopable tags. Please also see Device tags.
FQDN	Fully Qualified Domain Name. This is the complete domain name for a specific IP-connected device, and is unique within the network and unambiguous. The FQDN consists of two parts: the hostname and the domain name. For example tachyon.acme.com.
Full Administrator	This is a Tachyon system role which has the combined rights of all the other system roles.
Group Administrator	This is a Tachyon system role which allows assigned users to create, modify and delete Management groups and modify their membership.
Guaranteed State application	Guaranteed State application is used to ensure endpoint compliance to enterprise IT policies. It is an example of a Consumer application. **Note**

Term	Definition
	Guaranteed State can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/guaranteedstate/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described in DNS Names.
Instruction	Instruction is the generic term used to describe: Questions Actions An Instruction is sent to one or more clients, and will yield one or more responses.
Instruction Definitions	Instruction Definitions are retrieved from the Core by the Switch. They define the type and functionality of the instructions and are used to control the clients to respond in the appropriate way.
Instruction Definition Files	Instruction Definition files are XML format files that contain definitions for Instructions and any associated resources.
Instruction Sets	Instruction Sets provide a way of organizing instructions and setting permissions on those instructions. They can be created, modified and deleted from the Tachyon Administration console.
Instrumentation data	Each of the Tachyon components creates instrumentation data that can be used to display how the Tachyon system is performing.
JSON Provider	This is an internal provider within the Tachyon agent library, used to deserialize and return a JSON string as a data table. Analogous to the Windows specific PowerShell Provider.
Legacy OS	In this documentation, Windows XP, Vista and Windows Server 2003 are referred to as legacy OS. Microsoft has withdrawn support for Windows XP and Windows Server 2003, but 1E includes Vista in this list because it is not significantly used by business organizations.

Term	Definition
	For details of limitations and additional considerations for these OS, please see Supported Platforms.
License file	1E will provide you with a **Tachyon.lic** license file that defines the applications, tools, and features your Tachyon System is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license. The license must be activated. Once activated, it may be used only by the Tachyon System that activated it. Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable. For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk. For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server. Ensure the following URL is whitelisted: https://license-v1.1e.com This URL must be accessible from the Tachyon Server during setup and running of Tachyon. The Tachyon license must be validated on a regular basis via internet contact with the 1E license service. The regular validation period is set when the license is requested. For whitelisting purposes, the Tachyon Server (specifically the Coordinator Workflow module in the Master Stack) requires an Internet connection to the 1E license service, as defined in the license file itself. If activation fails, then the system will install but not be usable until activation is completed. **Upgrading** When upgrading, you are recommended to get a new license file and update your whitelist with the new URL. The old URL (https://license.1e.com) is suitable only for 8.0 and earlier. However, if you are upgrading and your license file has the old URL then you should also whitelist the old URL.

Term	Definition
License Service	The License Service is hosted in the cloud by 1E, and accessible via an internet connection.
Method	Methods are documented in the SDK.
Normalization	Normalization is a Platform function that refers to the process of finding (or not finding) a match rule in 1E Catalog, then deduplicating and rationalizing the information using Platform logic, and publishing the information on the 1E Catalog UI. Partial Matching for example does not have a match rule in 1E Catalog but it's still normalized and published on the UI using Platform logic.
Patch Success application	Patch Success application is used to report on and ensure successful patching of your enterprise. **Note** Patch Success can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/patchsuccess/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names
Permissions	How the Role-Based Access Control feature assigns Users to Roles, providing access to Instruction Sets and Administration pages.
Persistent Storage	The client stores information in Persistent Storage which it needs each time it starts. For example the last processed instruction. A hash value of each item of information is stored in the registry, which the client uses to ensure it trusts each item. Persistent storage includes a local database that is compressed and encrypted in a way that ensures a very low impact on device performance and security. This database is used to store data for the Tachyon Activity Record feature.
PowerShell Provider	This is a Windows specific internal provider within the Tachyon agent library. It provides functionality to execute powershell.exe from a fixed location (System32\WindowsPowerShell\v1.0) on a PowerShell (.sp1) script and return the result.

Term	Definition
	Some earlier versions of Windows (such as Windows XP) do not support PowerShell.
Product Pack	Product Packs contain instructions or other things which extend the capabilities of Tachyon. Product Packs which are required to support Tachyon features out-of-the-box are provided in the Tachyon Platform zip downloaded from the 1E Support Portal. Other Product Packs are available for download from the 1E Exchange. There are two types of Product Packs described in the following table. **Classic Product Packs**: Classic Product Packs contain instructions (actually Instruction Definition files) for use in Explorer and other Tachyon applications. Classic Product Packs can be uploaded into Tachyon using either of the following methods: Tachyon Product Pack Deployment Tool - which will upload the instructions in the pack and create an Instruction Set for them based on the name of the zip (with hyphens converted into spaces) the Tachyon Portal Settings app→ Instructions → Instruction Sets, described in Instructions Menu. This method requires instructions to be organized into Instruction Sets by an Instruction Set Administrator. Settings can also be used to export instructions. Either method requires an Instruction Set Administrator to configure permissions for accessing the instructions. **Integrated Product Packs**: Integrated Product Packs contain policies, rules and fragments for use by

Term	Definition
	Guaranteed State, and may also include instructions. If the Integrated Product Pack contains instructions associated with the policies, the tool creates an Instruction Set using the name in its manifest file. Integrated Product Packs are uploaded using the PPDT.
Tachyon Product Pack Deployment Tool	A tool for uploading Classic and Integrated Product Packs. Please see Tachyon Product Pack Deployment Tool.
Providers	Providers can be used by applications to leverage external tools to perform specific operations. For example the reclaim provider enables software to be uninstalled, thereby extending the functionality of the platform to include uninstallation.
Question	In Tachyon a Question is a specific type of instruction that requests information from client devices. The information is returned to Tachyon as responses.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box:
Response	The data resulting from a client executing an instruction.
Role-Based Access Control	Also known as RBAC. This is a general term for assigning users to roles which allow them access specific features of Tachyon. Roles can be assigned to AD users and groups added in the Administration Security page. A role can be either of the following: System role Custom role

Term	Definition
SCALE	The Agent Language.
SDK	The Tachyon SDK describes the following and is available here: /document/preview/736743#UUID-33c212b3-863e-21bc-bc5d-52e41a0492b3 Agent Language (SCALE) Agent modules and methods
Securable	Refers to an item that may be secured by Tachyon using RBAC.
Server installation account	This is the account used to run Tachyon Setup (and the MSI installer) when installing or upgrading a Tachyon Server. The account is automatically defined as a Tachyon admin user with limited rights which cannot be edited (called a system principal). The installation account only has sufficient rights to add other users, assign them to roles, and install Tachyon applications. The users and roles created by the installation account are then used for ongoing use and management of Tachyon. If you need the installation account to have additional roles or be a Full Administrator, then the recommended approach is: First create a role-based AD Security group, and add the installation and other accounts to this group Then, the installation account: Logs into Tachyon and navigates to Settings → Permissions → Users and Groups Creates a new user for the role-based AD Security Group Assigns the relevant system role(s) to the new user - this can be Full Administrator. When installing a Tachyon Server, the account must be an Active Directory domain account with various rights on the Tachyon Server and the SQL Server instance. For more detail see Tachyon Server Installation Account. For a new installation, only the Server installation account is able to use the Explorer and assign user rights to other users and groups. Once these other users or groups have been assigned, then the Server

Term	Definition
	installation account can be optionally disabled in AD pending future updates and upgrades. The Server installation account is a system principal and cannot be deleted or granted additional rights; it is able to manage additional users and groups, create and edit custom roles, which are then used for ongoing use and management of the system. However, the account may be included in any AD security group assigned to a Tachyon system or custom role.
Server instructions	A special type of instruction, which cannot be run in Explorer. They are for internal use only, run on the server, and used to carry out on-demand or scheduled processing of data across various datasources, such as SQL databases. For example, the Dashboards app uses them to populate tiles and charts with data from the TachyonMaster and Experience databases. They are also called server-side instructions, to differentiate them from client-side instructions which run on client devices.
Settings application	Settings application is used to configure Tachyon system and application settings. It is an example of a Tachyon Consumer application. **Note** Settings can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/platform/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names.
Single-Switch installation	A **single-Switch installation** is a type of single-server installation which has only one Switch. This is the simplest Tachyon Server configuration.
Single-server installation	A **single-server installation** is where all Tachyon Server components are installed on the same Web Server, with one to five Switches, and SQL Server either local or remote. A single-Switch installation is the simplest configuration. More than one Switch requires additional hardware resources.

Term	Definition
	If SQL Server is remote then it is also referred to as a **split-server configuration**. Best performance is achieved using a local SQL Server installation. See Tachyon Architecture and Communication Ports.
SMTP gateway	Systems such as the Tachyon Server connect to the gateway in order to send emails. Also known as SMTP relay.
Switch	The Switch component on the Tachyon Server provides the following: Sends instructions to and retrieves responses from the clients Forwards responses to the Core component Receives workflow commands from the Core component Retrieves instruction definitions from the Core component Sends instrumentation data to the Instrumentation component On the Tachyon Server, the Switch Host service is responsible for managing all the local Switches The Switch configuration is stored in the SwitchConfiguration table of the TachyonMaster database. This includes the number of slots and workers used by the Switch which controls the maximum number of devices that can be managed by each Switch. A Switch restart will fail if the Switch failed to de-register itself, therefore the registration entry in the TachyonMaster database will need to be manually removed after troubleshooting. See Tachyon Architecture and Communication Ports.
Switch Host	The Switch Host service is a Windows service that manages local Switches automatically starts each Switch and if a Switch stops, the Switch Host analyses the reason and attempt to restart it has a configuration file contains entries for one or more Switches has its own log file See Tachyon Architecture and Communication Ports.

Term	Definition
System Principal	A system principal is a Tachyon user which cannot be modified in the Administration pages, and is assigned to a system role. The Server installation account is a system principal which is assigned to the Consumer Administrator, Security Administrator and Instruction Set Administrator system roles.
System Role	Tachyon roles which cannot be modified in the Administration pages. Tachyon users can be assigned to these roles. For more information about System and Custom roles, please refer to Roles and Securables. The following are built-in system roles. All Instructions Actioner All Instructions Approver All Instructions Questioner All Instructions Viewer Full Administrator Group Administrator Guaranteed State Administrator Guaranteed State Policy Assigner Guaranteed State User Installer Inventory Administrator Inventory User Tachyon System
Tachyon Activity Record	This is a client feature, also known as inventory, previously known as Historic Data Capture. This feature captures data from a number of sources on the client device, encrypts and stores in compressed form on the client device. Raw and summarized (aggregated) data is stored and can be queried using instructions.

Term	Definition
	See Tachyon client settings.
Tachyon client	Client features are provided by the 1E Client. The 1E Client includes client features and modules for other 1E products including Tachyon. Tachyon enables rapid response to instructions using the client, which supports the retrieval of information, running actions and device tagging. The client can also be extended to support additional features. The client connects to the Switch and the Background Channel. See Tachyon Architecture and Communication Ports.
Tachyon content	Tachyon content is: files (such as scripts) associated with a particular instruction via their which the client will download when it performs that instruction. extensibles (normally in the form of DLLs on Windows), which the client will download when it self-updates. This allows additional client functionality to be deployed. Tachyon content is downloaded on demand via the Background Channel.
1E Exchange	The 1E Exchange is a community platform and library of automation modules (Product Packs) for systems management created by 1E. Our goal for this community is to democratize the development and optimization of automation processes to simplify work. Leveraging SCALE, Tachyon's native language, and the Tachyon Platform we wish to grow into a community that builds powerful modules to serve each other's needs. https://tachyonexchange.1e.com/ You can browse the 1E Exchange but you will need a 1E Support login to download.
Tachyon Instruction Management Studio (TIMS)	This feature is included in the Tachyon Toolkit. TIMS provides a user interface for developing and testing instructions using SCALE. It includes an isolated copy of the 1E Client so that you can develop instructions for that client version, independent of the 1E Client version that may be installed on your computer.

Term	Definition
	By default TIMS and its Tachyon client run under the security context of the user that started it. To use the context of **Local System**, as used by a normal Tachyon client, you can start TIMS using PSexec. More information about TIMS is available in the Tachyon Community on the 1E Support Portal. TIMS should be used to edit and save Instruction Definition files.
Tachyon Instruction Runner	This feature is the graphical user interface part of the Configuration Manager Extensions which is included in the Tachyon Toolkit. It is a mini UI version of Explorer. It is an example of a Tachyon Consumer. It should not to be confused with the Tachyon Run Instruction utility available in the Tachyon Toolkit.
TachyonMaster database	The SQL Server database which contains: Configuration details of the Tachyon System instruction definitions and Instruction Sets Users (Principals) Permissions Roles Devices Audit log The configuration files for the following components contain SQL Connection strings for the TachyonMaster database. Core Coordinator Workflow module Consumer API
Tachyon Master Stack	A Tachyon Master Stack is part of a Tachyon System. There is one Tachyon Master Stack that all the Tachyon Response Stacks

Term	Definition
	communicate with. A Tachyon Master Stack contains the following components: SQL Server instance with TachyonMaster Database (local or remote/split) Consumer API Coordinator Explorer Authentication Registration
Tachyon Portal	The Tachyon Portal is the home page for Tachyon applications, which can be reached using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names. The following buttons appear on all application pages of the Tachyon Portal. The refresh button is used to refresh the contents of the page. The expand button toggles the size of the page inside the browser by hiding or showing the menu and main title bar.
TachyonResponses database	The SQL Server database which contains: Responses

Term	Definition
Tachyon Response Stacks	A Response Stack is part of a Tachyon System. This is where one or more Response Stacks talk back to a single Tachyon Master Stack. Multiple Response Stacks are necessary when additional Switches are required for scale, security or for geographic or other network reasons. Each Switch can handle 50000 devices, so each Response Stack can handle a maximum of 250000 devices. Each Response Stack has the following components: Switch Host Switches (up to 5, local or remote/split) Core SQL Server instance with Tachyon Responses database (local or remote/split) Background Channel A Response Stack will typically host Switches and Background Channel using the same DNS Alias.
Tachyon Role	Tachyon roles are used to implement Role-base access control (RBAC) and assign permissions to users and restrict access to areas of Explorer and ability to use instructions in Instruction Sets .The roles may be system roles or custom roles related to specific Instruction Sets .
Tachyon Run Instruction utility	This command-line utility is included in the Tachyon Toolkit and is targeted at 3rd party integration, and can be used by scripts. It is an example of a Tachyon Consumer. It is used by the Configuration Manager Extensions which is also available in the Tachyon Toolkit. More information about the Tachyon Run Instruction utility is available in the Tachyon Community on the 1E Support Portal.
Tachyon Server	A Tachyon Server is any server on which a Tachyon Server component is installed. The following are Tachyon Server components. Coordinator service (Instrumentation and Workflow modules) Switch Host

Term	Definition
	Switches Website (including Explorer and Core) A Tachyon Server can have one or more Switches. See also single-server installation and single-Switch installation. See Tachyon Architecture and Communication Ports.
Tachyon Stack	There are two types of Stack: Master Stack and Response Stack. Every Tachyon system has a single **Master Stack**, which provides web services for Tachyon applications. Master Stack components are typically all installed on a single **Master Server**. Tachyon real-time features require **Response Stacks**, which are made up of one or more **Response Servers**. A **DMZ Server** is an example of a Response Server. Each Response Stack has at least one **Background Channel** for sharing resources, and a single **Core** component that supports an associated set of up to five **Switches**. Switches are the primary mechanism for rapidly requesting and retrieving responses from the **clients**. As each Switch can handle up to 50,000 devices there is a limit of 250,000 devices per Response Stack. Higher numbers can be achieved if you contact 1E for guidance. Switches may be local or remote to the other components in the Response Stack. **Databases** for Tachyon, Catalog, Content Distribution, Experience, SLA and BI, are installed on SQL Server database instance(s) that may also be local or remote to their respective Master and Response servers. It is also possible for multiple Response Stacks to share the same Responses database. The **Cube** used by Patch Success (SLA-BI) is installed on a local or remote SQL Server Analysis Services (SSAS) instance. For more details about architecture and components, please see Tachyon Architecture. Also see Architectural requirements.
Tachyon System	At the top-most level, a Tachyon System consists of Tachyon Server components, grouped into Tachyon Stacks, and a set of clients that are deployed onto the devices that you want to manage. In addition, a system can have one or more Consumers (the built-in Consumer is Explorer). See Tachyon Architecture and Communication Ports.

Term	Definition
	Tachyon System is also a system role, used by Tachyon for service an equivalent account to perform Tachyon system operations.
Tachyon Toolkit	The Tachyon Toolkit is a collection of the following tools, which can be installed on a Windows computer for use by a User who has appropriate permissions. Configuration Manager Extensions - this can be installed only on a computer that has already installed a Supported Platforms Tachyon Instruction Management Studio. .Tachyon Run Instruction utility The toolkit is available for download from the Tachyon Community in the 1E Support Portal. Documentation for installing and using the Toolkit will be available soon.
Tachyon User	A domain account that is authorized to access Explorer portal and/or the Tachyon Administration pages. Authorization is achieved by adding the AD account or group and assigning it to a role.
Tags	There are two types of tag: coverage tags and freeform tags. In Tachyon log files, these tags are also known a scopable and non-scopable tags.
Two-factor authentication	Also known as 2FA. See Two-factor authentication.
Website	The Tachyon Website hosts the following web applications: Master: Admin Consumer - Consumer API CoreExternal Platform

Term	Definition
	Tachyon Response and DMZ: Background - Background Channel Core Optional applications on Master: ContentDistrbution Experience The Website has an HTTP binding and HTTPS binding. The HTTP binding uses the server's hostname FQDN as a host header, and is used only by SLA components - please refer to Removing the HTTP binding from the Tachyon website One or more HTTPS bindings - these use the Tachyon Web Server certificate, the server's DNS Alias as the host name, and has SNI enabled. See Tachyon Architecture and Communication Ports.
Workflow commands	Workflow commands determine how the Coordinator Workflow module processes an instruction, particularly in terms of the permissions required to run the instruction.

9.6.16 Nomad Product Packs reference

Reference information for **Nomad** feature-related Product Packs that are included in the **Tachyon Platform** zip. These Product Packs are required to support various features of **Nomad.**

The **Tachyon Platform** zip is downloaded from the 1E Support Portal (1eportal.force.com/s/tachyontopicdetail). Additional Product Packs are available from Tachyon Exchange (tachyonexchange.1e.com) that are not documented here.

Classic Product Packs contain instructions, for use in Explorer and other Tachyon applications.

Integrated Product Packs contain policies, rules and fragments for use by Guaranteed State, and may also include instructions.

9.6.16.1 1E Nomad product pack

Classic product pack used to create the **1E Nomad** instruction set in Tachyon, required by the following Nomad features:

Downloads tab on Device views - instructions used to populate details about Content download and other Nomad features

Nomad Download Pause - instructions used by the CM Admin Console extensions

Instructions to help with the following Nomad features: Nomad cache, CacheCleaner, Single Site Download, Nomad jobs, NomadBranch service.

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
Nomad cache Nomad jobs	**Get the percentage of content %ContentId% in the local Nomad cache**	Question	Get the percentage of the specified content in the local Nomad cache.	**1E-Nomad-CachedPkgStatus**	8
Nomad cache CacheCleaner Nomad jobs	**Clean the SCCM and Nomad cache for an application %packageId%**	Action	Cleans the SCCM and Nomad cache for an application with the specified package ID. This package ID is the Content ID of the deployment type of the application.	**1E-Nomad-CleanNomadCacheForApplication**	16

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
Nomad cache CacheCleaner Nomad jobs	**Clean the SCCM and Nomad cache for a package %packageId% and %packageVersion%**	Action	Cleans the SCCM and Nomad cache for the package with the specified ID and version.	**1E-Nomad-CleanNomadCacheForPackage**	16
Nomad cache Nomad jobs	**Find the Nomad host that has the greatest percentage of content %ContentId%**	Question	Find the Nomad host that has the greatest percentage of the specified content.	**1E-Nomad-FindBestPkgCache**	8
Nomad jobs	**Find the ConfigMgr locations (i.e. on DPs) that have content %ContentId% at version %Version%**	Question	Find the ConfigMgr locations (i.e. on DPs) that have the specified content.	**1E-Nomad-GetCmContentLocations**	8
Nomad jobs	**Get the status of Nomad jobs**	Question	Get the status of Nomad jobs.	**1E-Nomad-NomadJobsStatus**	11

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
Nomad jobs	**Get the status of Nomad**	Question	Get the status of Nomad.	**1E-Nomad-NomadStatus**	11
Nomad jobs	**Pause any current Nomad job**	Action	Pause any current Nomad job.	**1E-Nomad-PauseCurrentNomadJob**	12
Nomad Download Pause Nomad jobs	**Pause the Nomad job queue for %PauseDurationMinutes% minutes**	Action	Pause Nomad job queue.	**1E-Nomad-PauseNomadJobQueue**	14
Nomad Download Pause Nomad jobs	**Resume the paused Nomad job queue**	Action	Resume paused Nomad job queue.	**1E-Nomad-ResumeNomadJobQueue**	11
Nomad jobs	**Resume any paused Nomad job**	Action	Resume any paused Nomad job.	**1E-Nomad-ResumePausedNomadJob**	12
Single Site Download	**Ask SSD site master with %deviceIdType% '%deviceId%' whether any device has more than %percent%% of content %contentId% v%version% with format %format%**	Question	Ask SSD site master whether any device has more than the specified percentage of the	**1E-Nomad-RunPkgStatusRequest**	9

Nomad feature	Instruction text (ReadablePayload)	Type	Description	FileName	Version
			specified content.		
Single Site Download	**Use SSD to find where at least %percent% percent of content %contentId% v%version% with format %format% is cached with extent %extent% and AllSubnets %allSubnets %, returning up to %maxDevices% devices**	Question	Use Nomad's Single Site Download feature to find where the specified content is cached.	**1E-Nomad-RunSsdQuery**	8
NomadBranch service	**Start the Nomad service**	Action	Start the Nomad service.	**1E-Nomad-StartNomadService**	12
Nomad jobs	**Stop any current Nomad job**	Action	Stop any current Nomad job.	**1E-Nomad-StopCurrentNomadJob**	12
NomadBranch service	**Stop the Nomad service**	Action	Stop the Nomad service.	**1E-Nomad-StopNomadService**	12

9.6.16.2 Nomad Client Health integrated product pack

Integrated Product Pack used to create the **Nomad Client Health** instruction set and **Nomad Client Health** policy.

For more information please refer to Nomad Client Health Policy.

Nomad is included as part of the 1E Client, and as part of that integration, we offer a Nomad client health compliance policy in Guaranteed State. This verifies common Nomad requirements such as ACP registration, disk availability, firewall exceptions, crash notifications and cache monitoring.

The Nomad client health policy replaces the client health tile in the Nomad dashboard plus additional remediation steps:

Keeps content distribution services up and running on Nomad clients, so that users are secure and productive

Ensures Alternative Content Provider (ACP) registration configuration is set

Maintains optimal disk availability and monitors cache size for storage capacity planning

Enforces Firewall exceptions.

Note

This policy is intended for deployment to Windows devices only.

9.6.16.2.1 Instructions

The following table shows the instructions included in the Integrated Product Pack. Unless already uploaded, the following instructions are added to an Instruction set named: **Nomad Client Health**.

Readable Payload	Type	Description	Name	Version
P2P election weight vs criticality	Question	Returns the Nomad peer-to-peer election weight and the criticality of the device. This instruction is useful if you use - and want to correlate - the Nomad feature Sensitive server weighting and Device Criticality. The P2PElectionWeight registry entry does not exist unless it is explicitly set - for example by a Configuration Manager baseline or Tachyon instruction. If the registry entry does not exist, the response will be **Not set**. Similarly, the default criticality value assigned to a device is **Undefined**. The following is an extract from Download once to branch: Election weighting: Click here to expand... Nomad performs automatic weighting depending on its situation, according to the criteria listed below, and stores the value in memory (not registry). The higher the value, the greater the probability of winning the election.	**1E-Explorer-NomadClientHealth-ElectionWeightVsCriticality**	3

Readable Payload	Type	Description	Name	Version
		61 – the agent is running on a server OS and it is not a domain controller (DC) 40 – the agent is running on a laptop 30 – the agent is running on a wireless network 10 – the agent is running on WinPE 50 – default If necessary, you can use the P2PElectionWeight registry setting to increase or decrease a Nomad client's probability of being elected a master. The range for this registry value must be between 0 and 99 inclusive. If not set, Nomad uses the values listed above. The registry key is located at: *HKLM\software\1e\NomadBranch\P2PElectionWeight* To take effect after setting the registry value, the client sevice must be restarted. This method is not recommended because Nomad is already quite efficient in the way it elects a master and needs very little intervention in this process. However, you may want to reduce the chance of computers with low processing power, or prevent critical servers, becoming a master. You should also consider the following points before you influence the weighting: Use this technique in exceptional circumstances and only after testing has shown that you need to make a particular		

Readable Payload	Type	Description	Name	Version
		computer more or less likely to be elected as a master for specific operational reasons. Choose the simplest weighting strategy possible - for example, set servers at 90, laptops at 10 and workstations at 50. The weighting does not guarantee that the more heavily weighted computers will win the election – they may be turned off or another local peer may have already cached more of the requested content. The final weighting value used by the computer during an election may differ from the registry value as Nomad will automatically adjust it depending on the chassis and the network connection used. In the event you no longer need the values to be set, you should remove it and restart the service to resume dynamic election weighting. Setting to 0 is a special case called Sensitive server weighting designed for use on critical servers. The 0 value prevents Nomad from acting as master, and devices with this value will not respond to election requests.		

9.6.16.2.2 Policies

The following table shows the policies included in the Nomad Client Health Integrated Product Pack:

Name	Description
Nomad Client Health	The Nomad Client Health policy ensures that the health of the Nomad client is compliant with a reference baseline.

9.6.16.2.3 Rules

The following table shows the rules included in the Nomad Client Health Integrated Product Pack:

> **Note**
>
> Any parameter values shown in the table below are specifically set in the rules when the pack is uploaded. These may be different to the default values shown in the Fragments and Trigger templates tables. You can modify these if required.

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
Check Nomad ActiveEfficiency connectivity status	Check	Checks the Nomad agent connectivity to ActiveEfficiency.	1E-GuaranteedState-Nomad-Check-AEConnectivity No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\ActiveEfficiency* Include Sub keys=0 TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0
Check Nomad can communicate through the Windows Firewall	Check	Check that there are Windows Firewall program exceptions for Nomad and its related executables.	1E-GuaranteedState-Nomad-Check-FirewallExceptions No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1 TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
Ensure Nomad can communicate through the Windows Firewall	Fix	Ensures there are Windows Firewall program exceptions for Nomad and its related executables.	1E-GuaranteedState-Nomad-Check-FirewallExceptions No parameters 1E-GuaranteedState-Nomad-Fix-FirewallExceptions No parameters	TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0
Check Nomad can generate LSZ files on ConfigMgr distribution points	Check	Check that LSZ generation is enabled on ConfigMgr distribution points.	1E-GuaranteedState-Nomad-Check-DpLszEnabled No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1 TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 **sccmDp=1** smbEnabled=0
Check Nomad can hash content	Check	Checks Nomad content hashing is enabled.	1E-GuaranteedState-Nomad-Check-HashingEnabled No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
				TriggerTemplate-IntervalHours intervalHours=1	hasCmClient=0 sccmDp=0 smbEnabled=0
Check Nomad crash dumps status	Check	Checks whether Nomad has generated any crash dump in the last seven days.	1E-GuaranteedState-Nomad-Check-CrashDumps No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1 TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0
Check Nomad does not have its content indexed by ConfigMgr software inventory checks	Check	Checks whether skpswi.dat exists in the Nomad cache directory.	1E-GuaranteedState-Nomad-Check-SkpSwiDat No parameters	TriggerTemplate-FileChange File Name=C:\ProgramData\1E\NomadBranch\skpswi.dat TriggerTemplate-IntervalHours intervalHours=1 **Warning** Do NOT use this Check if you have changed your cache location.	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
Ensure Nomad does not have its content indexed by ConfigMgr software inventory checks	Fix	Ensures that skpswi.dat exists in the Nomad cache directory.	1E-GuaranteedState-Nomad-Check-SkpSwiDat No parameters 1E-GuaranteedState-Nomad-Fix-SkpSwiDat No parameters	TriggerTemplate-FileChange File Name=C:\ProgramData\1E\NomadBranch\skpswi.dat TriggerTemplate-IntervalHours intervalHours=1 **Warning** Do NOT use this Fix if you have changed your cache location.	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0
Check Nomad has a virtual directory on ConfigMgr distribution points to perform LSZ generation	Check	Check that an LSZFILES virtual directory has been created on a ConfigMgr distribution point.	1E-GuaranteedState-Nomad-Check-DpLszVirtualDirectory No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1 TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 **sccmDp=1** smbEnabled=0
Ensure Nomad has a virtual directory on ConfigMgr	Fix	Ensure that an LSZFILES virtual directory has been created on a	1E-GuaranteedState-Nomad-Check-DpLszVirtualDirectory No parameters	TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
distribution points to perform LSZ generation		ConfigMgr distribution point.	1E-GuaranteedState-Nomad-Fix-DpLszVirtualDirectory No parameters		hasCmClient=0 **sccmDp=1** smbEnabled=0
Check Nomad has sufficient disk space to download content	Check	Check the drive that Nomad is using for content download has sufficient disk space.	1E-GuaranteedState-Nomad-Check-DiskAvailablility No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1 TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0
Check Nomad is not using the Windows temp directory for caching	Check	Checks that Nomad is not configured to use the Windows temporary directory for caching.	1E-GuaranteedState-Nomad-Check-CacheInTemp No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1 TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
Check Nomad is registered as an Alternate Content Provider with ConfigMgr	Check	Check that Nomad is correctly registered as an Alternate Content Provider with ConfigMgr.	1E-GuaranteedState-Nomad-Check-AlternateContentProvider No parameters	TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests **hasCmClient=1** sccmDp=0 smbEnabled=0
Ensure Nomad is registered as an Alternate Content Provider with ConfigMgr	Fix	Ensure Nomad is registered as an Alternate Content Provider with ConfigMgr, registering it if necessary.	1E-GuaranteedState-Nomad-Check-AlternateContentProvider No parameters 1E-GuaranteedState-Nomad-Fix-AlternateContentProvider No parameters	TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests **hasCmClient=1** sccmDp=0 smbEnabled=0
Check Nomad run status	Check	Checks that the Nomad service is running.	1E-GuaranteedState-Nomad-Check-StartService No parameters	TriggerTemplate-IntervalHours intervalHours=1 TriggerTemplate-ServiceStatusChange ServiceName=*NomadBranch*	1E-GuaranteedState-Nomad-PreCondition-MultiTests

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
					hasCmClient=0 sccmDp=0 smbEnabled=0
Ensure Nomad is running	Fix	Ensure the Nomad service is running, starting the service if required.	1E-GuaranteedState-Nomad-Check-StartService No parameters 1E-GuaranteedState-Nomad-Fix-StartService No parameters	TriggerTemplate-IntervalHours intervalHours=1 TriggerTemplate-ServiceStatusChange ServiceName=*NomadBranch*	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0
Check Nomad variant status	Check	Checks whether the running Nomad service was one supplied with the 1E Client.	1E-GuaranteedState-Nomad-Check-Variant No parameters	TriggerTemplate-IntervalHours intervalHours=1 TriggerTemplate-ServiceStatusChange ServiceName=*NomadBranch*	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 smbEnabled=0

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
Check Nomad's share directory is accessible	Check	Check whether Nomad needs a share, and if it does that it would be accessible to other devices.	1E-GuaranteedState-Nomad-Check-Share No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1 TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 **smbEnabled=1**
Ensure Nomad's share directory is accessible	Fix	Ensures that Nomad's share is accessible if it is configured to require a share.	1E-GuaranteedState-Nomad-Check-Share No parameters 1E-GuaranteedState-Nomad-Fix-Share No parameters	TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 **smbEnabled=1**
Check Nomad's share is accessible by specific accounts	Check	Checks that the correct accounts are able to access Nomad's share.	1E-GuaranteedState-Nomad-Check-ShareAccount No parameters	TriggerTemplate-WindowsRegistryChange Hive=*HKLM* *Subkey=Software\1E\NomadBranch\NomadBranch* Include Sub keys=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0

Name	Type	Description	Check and Fix fragments	Triggers	Precondition fragment
				TriggerTemplate-IntervalHours intervalHours=1	sccmDp=0 **smbEnabled=1**
Ensure Nomad's share is accessible by specific accounts	Fix	Ensures that the correct accounts are able to access Nomad's share.	1E-GuaranteedState-Nomad-Check-ShareAccount No parameters 1E-GuaranteedState-Nomad-Fix-ShareAccount No parameters	TriggerTemplate-IntervalHours intervalHours=1	1E-GuaranteedState-Nomad-PreCondition-MultiTests hasCmClient=0 sccmDp=0 **smbEnabled=1**

9.6.16.2.4 Fragments

The following table shows the fragments included in the Nomad Client Health Integrated Product Pack:

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these fragments, unless you select alternative values.

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-PreCondition-	Precondition	**Check if standard conditions apply for Nomad plus optionally: is a ConfigMgr DP (<sccmDp>); has a ConfigMgr client (<hasCmClient>); SMB sharing is enabled (<smbEnabled>)** The precondition passes for all of the following standard tests:	hasCmClient

Name	Type	Readable Payload and summary	Parameters
MultiTests		The device is running a version of Windows - Nomad is only supported on Windows operating systems The device is not running Windows XP - which is no longer supported by Nomad The *NomadBranch* service is installed, although not necessarily running. The precondition also tests for each of the following if it is enabled by changing its parameter from 0 to 1: **hasCmClient** : The ConfigMgr client is installed **sccmDp** : The device is a ConfigMgr Distribution Point (DP) **smbEnabled** : SMB sharing of Nomad's cache is enabled. If **smbEnabled** test is set in the rule precondition then an additonal test is made to see if the device is a Domain Controller (DC). When installed on a DC Nomad must use its computer account instead of SMSNomadP2P& in order to share its cache. This requires registry value *HKLM\SOFTWARE\1E\NomadBranch\SpecialNetShare* to have its 0x80 bit set. If not set then Nomad does not share its cache on a DC and does not respond to elections. For early adopters, the readable payload of this precondition was: Carries out the specified checks; if any fail (i.e. they are logically AND-ed) then the preconditions fails.	sccmDp smbEnabled Range 0 or 1, defaults=0
1E-GuaranteedState-Nomad-Check-AEConnectivity	Check	**Check whether there is a working connection to ActiveEfficiency** Tests whether the URL given by registry value *HKLM\SOFTWARE\1E\NomadBranch\ActiveEfficiency\PlatformUrl*, if it is not empty, is contactable and returns a 200 code.	None
1E-GuaranteedState-Nomad-	Check	**Check whether Nomad is correctly registered within Microsoft ConfigMgr** Check that the ConfigMgr client's list of ACPs includes an object for Nomad in WMI class	None

Name	Type	Readable Payload and summary	Parameters
Check-AlternateContentProvider		*ROOT\ccm\Policy\Machine\RequestedConfig\CCM_DownloadProvider*, with *CLSID* "*25A6160D-4543-495F-975E-32CFBD6F70E0*", *LogicalName* "*NomadBranch*", *V4CompatibleHash* is set, and just "*<Data></Data>*" in *GlobalSettings*.	
1E-GuaranteedState-Nomad-Fix-AlternateContentProvider	Fix	**Ensures Nomad is correctly registered within Microsoft ConfigMgr** If the same checks as 1E-GuaranteedState-Nomad-Check-AlternateContentProvider are not satisfied, restarts the *NomadBranch* service, waits 10 seconds for Nomad to establish itself as an ACP, then carries out the checks again.	None
1E-GuaranteedState-Nomad-Check-CacheInTemp	Check	**Check whether Nomad's cache is not in a temporary directory** The Nomad cache can sometimes be configured to be in the Windows *Temp* directory (usually *C:\Windows\Temp*) or one of its subdirectories. Since all the contents of the Windows *Temp* directory are considered to be transient and could be deleted at any time, this is not suitable for Nomad's cache which should be a permanent location. The check examines Nomad's *HKLM\SOFTWARE\1E\NomadBranch\LocalCachePath* registry value and verifies that the specified location actually exists. It then gets the *TEMP* environment variable, which, because both the *1E Client* and *NomadBranch* services run as *Local System*, is usually the WIndows *TEMP* directory. If the *LocalCachePath* value is the same as the *TEMP* environment variable, or *LocalCachePath* specifies a subdirectory within it, the check fails.	None
1E-GuaranteedState-Nomad-Check-CrashDumps	Check	**Check whether there have been any crashdump files created by Nomad in last 7 days** Nomad dump files are saved in the same directory as the log file, the parent directory of the *HKLM\SOFTWARE\1E\NomadBranch\LogFileName* registry value. The check looks in here for any files with a "*.dmp*" suffix (ignoring case), and if it finds any examines the modification time (not creation time!) of each, reporting as a failed	None

Name	Type	Readable Payload and summary	Parameters
		check any that were modified in the last 7 days. So the check passes if there are no "*.dmp*" files or they are all older than 7 days.	
1E-GuaranteedState-Nomad-Check-DiskAvailablility	Check	**Checks whether there is sufficient disk space for Nomad** This examines Nomad's *HKLM\SOFTWARE\1E\NomadBranch\ PercentAvailableDisk* registry value. (It ignores the older *MaxCacheSizeMB* value which has been superseded by *PercentAvailableDisk*.) If the value is greater than or equal to 80, the check fails because the setting is too high. It then compares the size of the contents of the folder given by *HKLM\SOFTWARE\1E\NomadBranch\ LocalCachePath* in the registry, i.e. Nomad's cache, with the free space of the drive on which the folder resides, as reported by WMI's *root\cimv\Win32_LogicalDisk*. The check fails if the percentage of free space on the drive is less than or equal too *PercentAvailableDisk*.	None
1E-GuaranteedState-Nomad-Check-DpLszEnabled	Check	**Check whether web LSZ generation is correctly configured on stand alone distribution points** Nomad automatically sets up LSZ file generation on DPs that are ConfigMgr site servers, but extra configuration is required for standalone DPs. The device is a standalone DP if, under registry key *HKLM\SOFTWARE\Microsoft\SMS\Operations Management\SMS Server Role*, the subkey *SMS Distribution Point* exists but *SMS Site Server* does not. If the device is a standalone DP, registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* should have its 16384/0x4000 bit set to turn on web LSZ generation for HTTP/HTTPS enabled clients; if not, the check fails.	None
1E-GuaranteedState-Nomad-Check-DpLszVirtualDirectory	Check	**Check whether the LSZ directory is correctly configured on distribution points** At time of writing there is a bug such that the overall check status is usually "Passed" even when individually reported checks fail. If the device is a standalone DP, the check first verifes that registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* has its 16384/0x4000 bit set. (This bit is not required for a DP on a site	None

Name	Type	Readable Payload and summary	Parameters
		server.) Then the *LSZFILES* web site is examined to verify that all these conditions are satisfied: Anonymous authentication is enabled Windows authentication is enabled No SSL Default document is enabled Directory browsing is enabled, with Date, Time, Size, Extension and LongDate all available Content indexing is disabled.	
1E-GuaranteedState-Nomad-Fix-DpLszVirtualDirectory	Fix	**Ensure that the LSZ directory is correctly configured on distribution points** At time of writing there is a bug such that the overall check status is usually "Passed" even when individually reported checks fail. If any of the conditions described above for the corresponding check fragment is not true, the LSZFILES website is reconfigured to set that condition.	None
1E-GuaranteedState-Nomad-Check-FirewallExceptions	Check	**Checks whether firewall exceptions exist for Nomad** First is a check that at least one Windows firewall profile is enabled and that the firewall itself is enabled with either *HKLM\SOFTWARE\Policies\Microsoft\WindowsFirewall\DomainProfile\EnableFirewall* set to 1 or *HKLM\SOFTWARE\Policies\Microsoft\WindowsFirewall\StandardProfile\EnableFirewall* set to 1 in the registry. If no firewall and no firewall profile is enabled then no firewall exceptions are necessary and so there is nothing more to do. Otherwise,the Nomad-related firewall rules are examined. These are the rules named: *NomadBranch.exe* *NomadPackageLocatorTcp*	None

Name	Type	Readable Payload and summary	Parameters
		NomadPackageLocatorUdp *PackageStatusRequestTcp* *PackageStatusRequestUdp* *NomadBranchPeerHttp* *NomadBranchPeerHttps* Using the *NomadBranch* service's path of *NomadBranch.exe*, the paths of *NomadPackageLocator.exe* and *PackageStatusRequest.exe* are deduced. Using the *HKLM\SOFTWARE\1E\NomadBranch\P2PEnabled* , *P2P_Port* , *P2PHttpPort* , and *P2PHttpsPort* settings in the registry, the fragment works out which Nomad features are enabled and hence which firewall rules are required. The firewall rule checks involve: Whether the rule even exists That the rule is enabled and not blocked The local port (which may be a specific one or all) Which protocol (TCP or UDP) is involved The path to the associated executable. Rulesfor *NomadBranch.exe* , *NomadPackageLocatorTcp* , *NomadPackageLocatorUdp* , *PackageStatusRequestTcp* and *PackageStatusRequestUdp* must always be correctly defined. *NomadBranchPeerHttp* is only required if the 0x20 bit of *P2P_Enabled* is set, and likewise the 0x40 bit requires *NomadBranchPeerHttps* .	
1E-GuaranteedState-Nomad-Fix-FirewallExceptions	Fix	**Ensures the required firewall exceptions exist for Nomad** This carries out all the checks as described above for 1E-GuaranteedState-Nomad-Check-FirewallExceptions then, for each absent or incorrectly configured rule that is required to support the *P2PEnabled* registry setting,configures that rule.	None

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Check-HashingEnabled	Check	**Check whether hashing is enabled in Nomad** This examines the *HKLM\SOFTWARE\1E\NomadBranch\CompatibilityFlags* registry value. If the host is a ConfigMgr DP the 0x80000 bit should be set ("enable full hash generation for SIS content when an LsZ file is generated on a DP"), otherwise the 0x100000 bit ("abort download on the Nomad client if an LsZ hash mismatch is detected").	None
1E-GuaranteedState-Nomad-Check-Share	Check	**Checks whether the Nomad share is available** This first checks the firewall settings. If the firewall is enabled then "*File and Printer Sharing*" (i.e. SMB) cannot be disabled. Next the 0x10 bit of registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* is examined to see if the share name is the default "*NomadSHR*" or the hidden "*NomadSHR$*". The share's security descriptor is read and check made that the local "*SMSNomadP2P&*" account has read permission. The share's properties are then verified as follows: The shared directory is that named by registry value *HKLM\SOFTWARE\1E\NomadBranch\ LocalCachePath* The shared directory also matches the *Path* from WMI's *root\cimv2\Win32_Share* object for the share. The *Status* of the *root\cimv2\Win32_Share* object is "*OK*". These additional checks are *not* carried out if the host is a server or a custom share is involved: The maximum number of connections specified by the upper word of *SpecialNetShare* does not exceed the *MaximumAllowed* value of the WMI object. The *Data* value reported back by the check contains the results of the individual checks.	None
1E-GuaranteedState-	Fix	**Ensures the Nomad share is available**	None

Name	Type	Readable Payload and summary	Parameters
Nomad-Fix-Share		This carries out the checks as in 1E-GuaranteedState-Nomad-Check-Share above, then if any of them fails it restarts the *NomadBranch* service which should recreate the share correctly.	
1E-GuaranteedState-Nomad-Check-ShareAccount	Check	**Checks whether the Nomad share account is correctly configured** If the machine account is used rather than the default "*SMSNomadP2P&*", as specified by bit 0x80 in registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* , no checks are carried out. A WMI *root\cimv2\Win32_UserAccount* object for the local *SMSNomadP2P&* account must exist and the account cannot be disabled.	None
1E-GuaranteedState-Nomad-Fix-ShareAccount	Fix	**Ensures the Nomad share account is correctly configured** If the checks as described above for 1E-GuaranteedState-Nomad-Check-ShareAccount do not pass, the *NomadBranch* service is restarted to create a local *SMSNomadP2P&* account.	None
1E-GuaranteedState-Nomad-Check-SkpSwiDat	Check	**Check whether skpswi.dat exists on disk** A *skpswi.dat* file in a directory prevents ConfigMgr from falsely detecting that software is installed there during a Software Inventory scan, so Nomad requires one in its cache. Such a file must exist in the directory named by the *HKLM\SOFTWARE\1E\NomadBranch\ LocalCachePath* registry value, and it must also be a hidden file.	None
1E-GuaranteedState-Nomad-Fix-SkpSwiDat	Fix	**Ensure skpswi.dat exists on disk** If the directory named by the *HKLM\SOFTWARE\1E\NomadBranch\ LocalCachePath* registry value does not contain a "*skpswi.dat*" file, such a file is created and its hidden attribute set.	None

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Check-StartService	Check	**Checks that Nomad is running** The *NomadBranch* service must be in "*Running*" or "*Starting*" state and be configured to start automatically.	None
1E-GuaranteedState-Nomad-Fix-StartService	Fix	**Ensures that Nomad is running** If the *NomadBranch* service is not in "*Running*" or "*Starting*" state and configured to start automatically, it is started and configured to be so.	None
1E-GuaranteedState-Nomad-Check-Variant	Check	**Check whether the correct variant of Nomad (that supplied with the 1E Client, not standalone Nomad) is used for the service** This verifies that the parent directory of the executable that the Service Control Manager uses to run the *NomadBranch* service is the *Extensibility* directory of the 1E Client, and hence not, for example, an older standalone version of Nomad.	None

9.6.16.2.5 Trigger templates

The following table shows the trigger templates included in the Nomad Client Health Integrated Product Pack:

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these templates, unless you select alternative values.

Name	Readable Payload and summary	Parameters
TriggerTemplate-FileChange	The page: **Trigger templates and preconditions reference**	**File Name**

Name	Readable Payload and summary	Parameters
	was not found. Please check/update the page name used in the 'multiexcerpt-include' macro.	File path of file to be monitored, default is null.
TriggerTemplate-IntervalHours	The page: **Trigger templates and preconditions reference** was not found. Please check/update the page name used in the 'multiexcerpt-include' macro.	**Interval Hours** 0 to 999 hours (approximately 42 days), default interval is 12 hours.
TriggerTemplate-IntervalMinutes	The page: **Trigger templates and preconditions reference** was not found. Please check/update the page name used in the 'multiexcerpt-include' macro.	**Interval Minutes** 0 to 99,999 minutes (approximately 69 days), default interval is 30 minutes.
TriggerTemplate-IntervalSeconds	The page: **Trigger templates and preconditions reference** was not found. Please check/update the page name used in the 'multiexcerpt-include' macro.	**Interval Seconds** 0 to 999,999 seconds (approximately 11 days), default interval is 3600 seconds (1 hour).
TriggerTemplate-ServiceStatusChange	The page: **Trigger templates and preconditions reference** was not found. Please check/update the page name used in the 'multiexcerpt-include' macro.	**Service Name** Short name of service - for example NomadBranch.
TriggerTemplate-WindowsRegistryChange	The page: **Trigger templates and preconditions reference** was not found. Please check/update the page name used in the 'multiexcerpt-include' macro.	**Hive**, which must be one of: HKLM (default) HKCR

Name	Readable Payload and summary	Parameters
		Subkey : free text string, default empty. **Include Sub Keys** : 1/0 default 0.

Integrated Product Pack used to create the **Nomad Client Health** instruction set and **Nomad Client Health** policy.

For more information please refer to Nomad Client Health Policy.

Nomad is included as part of the 1E Client, and as part of that integration, we offer a Nomad client health compliance policy in Guaranteed State. This verifies common Nomad requirements such as ACP registration, disk availability, firewall exceptions, crash notifications and cache monitoring.

The Nomad client health policy replaces the client health tile in the Nomad dashboard plus additional remediation steps:

Keeps content distribution services up and running on Nomad clients, so that users are secure and productive

Ensures Alternative Content Provider (ACP) registration configuration is set

Maintains optimal disk availability and monitors cache size for storage capacity planning

Enforces Firewall exceptions.

Note

This policy is intended for deployment to Windows devices only.

9.6.16.2.6

Note

Instructions

1E-Explorer-NomadClientHealth-ElectionWeightVsCriticality

Policies

Nomad Client Health

Rules

Check Nomad ActiveEfficiency connectivity status

Check Nomad can communicate through the Windows Firewall

Check Nomad can generate LSZ files on ConfigMgr distribution points

Check Nomad can hash content

Check Nomad crash dumps status

Check Nomad does not have its content indexed by ConfigMgr software inventory checks

Check Nomad has a virtual directory on ConfigMgr distribution points to perform LSZ generation

Check Nomad has sufficient disk space to download content

Check Nomad is not using the Windows temp directory for caching

Check Nomad is registered as an Alternate Content Provider with ConfigMgr

Check Nomad run status

Check Nomad variant status

Check Nomad's share directory is accessible

Check Nomad's share is accessible by specific accounts

9.6.16.2.9 Fragments

The following table shows the fragments included in the Nomad Client Health Integrated Product Pack:

> **Note**
>
> The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these fragments, unless you select alternative values.

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-PreCondition-MultiTests	Precondition	**Check if standard conditions apply for Nomad plus optionally: is a ConfigMgr DP (<sccmDp>); has a ConfigMgr client (<hasCmClient>); SMB sharing is enabled (<smbEnabled>)** The precondition passes for all of the following standard tests: The device is running a version of Windows - Nomad is only supported on Windows operating systems The device is not running Windows XP - which is no longer supported by Nomad The *NomadBranch* service is installed, although not necessarily running. The precondition also tests for each of the following if it is enabled by changing its parameter from 0 to 1: **hasCmClient** : The ConfigMgr client is installed **sccmDp** : The device is a ConfigMgr Distribution Point (DP) **smbEnabled** : SMB sharing of Nomad's cache is enabled. If **smbEnabled** test is set in the rule precondition then an additonal test is made to see if the device is a Domain Controller (DC). When installed on a DC Nomad must use its computer account instead of SMSNomadP2P& in order to share its cache. This requires registry value *HKLM\SOFTWARE\1E\NomadBranch\SpecialNetShare* to have its 0x80 bit set. If not set then Nomad does not share its cache on a DC and does not respond to elections. For early adopters, the readable payload of this precondition was: Carries out the specified checks; if any fail (i.e. they are logically AND-ed) then the preconditions fails.	hasCmClient sccmDp smbEnabled Range 0 or 1, defaults=0
1E-GuaranteedState-Nomad-Check-	Check	**Check whether there is a working connection to ActiveEfficiency** Tests whether the URL given by registry value *HKLM\SOFTWARE\1E\NomadBranch\ActiveEfficiency\PlatformUrl,* if it is not empty, is contactable and returns a 200 code.	None

Name	Type	Readable Payload and summary	Parameters
AEConnectivity			
1E-GuaranteedState-Nomad-Check-AlternateContentProvider	Check	**Check whether Nomad is correctly registered within Microsoft ConfigMgr** Check that the ConfigMgr client's list of ACPs includes an object for Nomad in WMI class *ROOT\ccm\Policy\Machine\RequestedConfig\CCM_DownloadProvider*, with *CLSID* "*25A6160D-4543-495F-975E-32CFBD6F70E0*", *LogicalName* "*NomadBranch*", *V4CompatibleHash* is set, and just "*<Data></Data>*" in *GlobalSettings*.	None
1E-GuaranteedState-Nomad-Fix-AlternateContentProvider	Fix	**Ensures Nomad is correctly registered within Microsoft ConfigMgr** If the same checks as 1E-GuaranteedState-Nomad-Check-AlternateContentProvider are not satisfied, restarts the *NomadBranch* service, waits 10 seconds for Nomad to establish itself as an ACP, then carries out the checks again.	None
1E-GuaranteedState-Nomad-Check-CacheInTemp	Check	**Check whether Nomad's cache is not in a temporary directory** The Nomad cache can sometimes be configured to be in the Windows *Temp* directory (usually *C:\Windows\Temp*) or one of its subdirectories. Since all the contents of the Windows *Temp* directory are considered to be transient and could be deleted at any time, this is not suitable for Nomad's cache which should be a permanent location. The check examines Nomad's *HKLM\SOFTWARE\1E\NomadBranch\LocalCachePath* registry value and verifies that the specified location actually exists. It then gets the *TEMP* environment variable, which, because both the *1E Client* and *NomadBranch* services run as *Local System*, is usually the WIndows *TEMP* directory. If the *LocalCachePath* value is the same as the *TEMP* environment variable, or *LocalCachePath* specifies a subdirectory within it, the check fails.	None

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Check-CrashDumps	Check	**Check whether there have been any crashdump files created by Nomad in last 7 days** Nomad dump files are saved in the same directory as the log file, the parent directory of the *HKLM\SOFTWARE\1E\NomadBranch\LogFileName* registry value. The check looks in here for any files with a "*.dmp*" suffix (ignoring case), and if it finds any examines the modification time (not creation time!) of each, reporting as a failed check any that were modified in the last 7 days. So the check passes if there are no "*.dmp*" files or they are all older than 7 days.	None
1E-GuaranteedState-Nomad-Check-DiskAvailablility	Check	**Checks whether there is sufficient disk space for Nomad** This examines Nomad's *HKLM\SOFTWARE\1E\NomadBranch\PercentAvailableDisk* registry value. (It ignores the older *MaxCacheSizeMB* value which has been superseded by *PercentAvailableDisk*.) If the value is greater than or equal to 80, the check fails because the setting is too high. It then compares the size of the contents of the folder given by *HKLM\SOFTWARE\1E\NomadBranch\ LocalCachePath* in the registry, i.e. Nomad's cache, with the free space of the drive on which the folder resides, as reported by WMI's *root\cimv\Win32_LogicalDisk*. The check fails if the percentage of free space on the drive is less than or equal too *PercentAvailableDisk*.	None
1E-GuaranteedState-Nomad-Check-DpLszEnabled	Check	**Check whether web LSZ generation is correctly configured on stand alone distribution points** Nomad automatically sets up LSZ file generation on DPs that are ConfigMgr site servers, but extra configuration is required for standalone DPs. The device is a standalone DP if, under registry key *HKLM\SOFTWARE\Microsoft\SMS\Operations Management\SMS Server Role*, the subkey *SMS Distribution Point* exists but *SMS Site Server* does not. If the device is a standalone DP, registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* should have its 16384/0x4000 bit set to turn on web LSZ generation for HTTP/HTTPS enabled clients; if not, the check fails.	None

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Check-DpLszVirtualDirectory	Check	**Check whether the LSZ directory is correctly configured on distribution points** At time of writing there is a bug such that the overall check status is usually "Passed" even when individually reported checks fail. If the device is a standalone DP, the check first verifes that registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* has its 16384/0x4000 bit set. (This bit is not required for a DP on a site server.) Then the *LSZFILES* web site is examined to verify that all these conditions are satisfied: Anonymous authentication is enabled Windows authentication is enabled No SSL Default document is enabled Directory browsing is enabled, with Date, Time, Size, Extension and LongDate all available Content indexing is disabled.	None
1E-GuaranteedState-Nomad-Fix-DpLszVirtualDirectory	Fix	**Ensure that the LSZ directory is correctly configured on distribution points** At time of writing there is a bug such that the overall check status is usually "Passed" even when individually reported checks fail. If any of the conditions described above for the corresponding check fragment is not true, the LSZFILES website is reconfigured to set that condition.	None
1E-GuaranteedState-Nomad-Check-FirewallExceptions	Check	**Checks whether firewall exceptions exist for Nomad** First is a check that at least one Windows firewall profile is enabled and that the firewall itself is enabled with either *HKLM\SOFTWARE\Policies\Microsoft\WindowsFirewall\DomainProfile\EnableFirewall* set to 1 or *HKLM\SOFTWARE\Policies\Microsoft\WindowsFirewall\StandardProfile\EnableFirewall* set to 1 in the registry. If no firewall and	None

Name	Type	Readable Payload and summary	Parameters

no firewall profile is enabled then no firewall exceptions are necessary and so there is nothing more to do.

Otherwise,the Nomad-related firewall rules are examined. These are the rules named:

NomadBranch.exe

NomadPackageLocatorTcp

NomadPackageLocatorUdp

PackageStatusRequestTcp

PackageStatusRequestUdp

NomadBranchPeerHttp

NomadBranchPeerHttps

Using the *NomadBranch* service's path of *NomadBranch.exe*, the paths of *NomadPackageLocator.exe* and *PackageStatusRequest.exe* are deduced. Using the *HKLM\SOFTWARE\1E\NomadBranch\P2PEnabled* , *P2P_Port* , *P2PHttpPort* , and *P2PHttpsPort* settings in the registry, the fragment works out which Nomad features are enabled and hence which firewall rules are required. The firewall rule checks involve:

Whether the rule even exists

That the rule is enabled and not blocked

The local port (which may be a specific one or all)

Which protocol (TCP or UDP) is involved

The path to the associated executable.

Rulesfor *NomadBranch.exe* , *NomadPackageLocatorTcp* , *NomadPackageLocatorUdp* , *PackageStatusRequestTcp* and *PackageStatusRequestUdp* must always be correctly defined. *NomadBranchPeerHttp* is only required if the 0x20 bit of *P2P_Enabled* is set, and likewise the 0x40 bit requires *NomadBranchPeerHttps* .

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Fix-FirewallExceptions	Fix	**Ensures the required firewall exceptions exist for Nomad** This carries out all the checks as described above for 1E-GuaranteedState-Nomad-Check-FirewallExceptions then, for each absent or incorrectly configured rule that is required to support the *P2PEnabled* registry setting,configures that rule.	None
1E-GuaranteedState-Nomad-Check-HashingEnabled	Check	**Check whether hashing is enabled in Nomad** This examines the *HKLM\SOFTWARE\1E\NomadBranch\CompatibilityFlags* registry value. If the host is a ConfigMgr DP the 0x80000 bit should be set ("enable full hash generation for SIS content when an LsZ file is generated on a DP"), otherwise the 0x100000 bit ("abort download on the Nomad client if an LsZ hash mismatch is detected").	None
1E-GuaranteedState-Nomad-Check-Share	Check	**Checks whether the Nomad share is available** This first checks the firewall settings. If the firewall is enabled then "*File and Printer Sharing*" (i.e. SMB) cannot be disabled. Next the 0x10 bit of registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* is examined to see if the share name is the default "*NomadSHR*" or the hidden "*NomadSHR$*". The share's security descriptor is read and check made that the local "*SMSNomadP2P&*" account has read permission. The share's properties are then verified as follows: The shared directory is that named by registry value *HKLM\SOFTWARE\1E\NomadBranch\ LocalCachePath* The shared directory also matches the *Path* from WMI's *root\cimv2\Win32_Share* object for the share. The *Status* of the *root\cimv2\Win32_Share* object is "*OK*". These additional checks are *not* carried out if the host is a server or a custom share is involved:	None

Name	Type	Readable Payload and summary	Parameters
		The maximum number of connections specified by the upper word of *SpecialNetShare* does not exceed the *MaximumAllowed* value of the WMI object. The *Data* value reported back by the check contains the results of the individual checks.	
1E-GuaranteedState-Nomad-Fix-Share	Fix	**Ensures the Nomad share is available** This carries out the checks as in 1E-GuaranteedState-Nomad-Check-Share above, then if any of them fails it restarts the *NomadBranch* service which should recreate the share correctly.	None
1E-GuaranteedState-Nomad-Check-ShareAccount	Check	**Checks whether the Nomad share account is correctly configured** If the machine account is used rather than the default "*SMSNomadP2P&*", as specified by bit 0x80 in registry value *HKLM\SOFTWARE\1E\\NomadBranch\SpecialNetShare* , no checks are carried out. A WMI *root\cimv2\Win32_UserAccount* object for the local *SMSNomadP2P&* account must exist and the account cannot be disabled.	None
1E-GuaranteedState-Nomad-Fix-ShareAccount	Fix	**Ensures the Nomad share account is correctly configured** If the checks as described above for 1E-GuaranteedState-Nomad-Check-ShareAccount do not pass, the *NomadBranch* service is restarted to create a local *SMSNomadP2P&* account.	None
1E-GuaranteedState-Nomad-Check-SkpSwiDat	Check	**Check whether skpswi.dat exists on disk** A *skpswi.dat* file in a directory prevents ConfigMgr from falsely detecting that software is installed there during a Software Inventory scan, so Nomad requires one in its cache. Such a file must exist in the directory named by the *HKLM\SOFTWARE\1E\NomadBranch\ LocalCachePath* registry value, and it must also be a hidden file.	None

Name	Type	Readable Payload and summary	Parameters
1E-GuaranteedState-Nomad-Fix-SkpSwiDat	Fix	**Ensure skpswi.dat exists on disk** If the directory named by the *HKLM\SOFTWARE\1E\NomadBranch\LocalCachePath* registry value does not contain a "*skpswi.dat*" file, such a file is created and its hidden attribute set.	None
1E-GuaranteedState-Nomad-Check-StartService	Check	**Checks that Nomad is running** The *NomadBranch* service must be in "*Running*" or "*Starting*" state and be configured to start automatically.	None
1E-GuaranteedState-Nomad-Fix-StartService	Fix	**Ensures that Nomad is running** If the *NomadBranch* service is not in "*Running*" or "*Starting*" state and configured to start automatically, it is started and configured to be so.	None
1E-GuaranteedState-Nomad-Check-Variant	Check	**Check whether the correct variant of Nomad (that supplied with the 1E Client, not standalone Nomad) is used for the service** This verifies that the parent directory of the executable that the Service Control Manager uses to run the *NomadBranch* service is the *Extensibility* directory of the 1E Client, and hence not, for example, an older standalone version of Nomad.	None

9.6.16.2.10 Trigger templates

The following table shows the trigger templates included in the Nomad Client Health Integrated Product Pack.

Note

The **Parameters** column in the following table shows the ranges and default values for the parameters. The default values are used when you create custom rules using these templates, unless you select alternative values.

Name	Readable Payload and summary	Parameters
TriggerTemplate-FileChange	**On change of file "<fileName>"** When a file changes (Windows only)	**File Name** File path of file to be monitored, default is null.
TriggerTemplate-IntervalHours	**Every <intervalHours> hours** Periodic (hours)	**Interval Hours** 0 to 999 hours (approximately 42 days), default interval is 12 hours.
TriggerTemplate-IntervalMinutes	**Every <intervalMinutes> minutes** Periodic (minutes)	**Interval Minutes** 0 to 99,999 minutes (approximately 69 days), default interval is 30 minutes.
TriggerTemplate-IntervalSeconds	**Every <intervalSeconds> seconds** Periodic (seconds)	**Interval Seconds** 0 to 999,999 seconds (approximately 11 days), default interval is

Name	Readable Payload and summary	Parameters
		3600 seconds (1 hour).
TriggerTemplate-ServiceStatusChange	**On change of running state of the "<serviceName>" service** When the state of the named Windows service changes **Note** You can determine the short name of a service using the PowerShell cmdlet `get-service -DisplayName "Network Location Awareness"` This will return **NlaSvc** in the above example. It is this short name you specify in the <ServiceName> parameter.	**Service Name** Short name of service - for example NomadBranch.
TriggerTemplate-WindowsRegistryChange	**On change of registry values in "<hive>\<subkey>" (include subkeys=<includeSubkeys>)** When the value of a Windows registry key changes.	**Hive**, which must be one of: HKLM (default) HKCR **Subkey** : free text string, default empty. **Include Sub Keys** : 1/0 default 0.

9.6.17 Nomad release information

9.6.17.1 Nomad 8.1 release information – last updated 09-August-2022

These notes contain late-breaking information about Nomad 8.1 that you need to have to successfully install and use the product. For the most up-to-date information please see the online

readme. You should read these release notes and the online documentation for Nomad 8.1 thoroughly before installing the software.

9.6.17.1.1 New features in Nomad 8.1

This release introduces the following new and enhanced features:

9.6.17.1.1.1 Platform

Insights on how Nomad enhances user experience - with the rapid shift to a Work From Anywhere (WFA) workforce and an increased focus on the Digital End-User eXperience, Nomad on Tachyon Platform now provides insights into how it helps to ensure a great user eXperience. With the introduction of Nomad's Bandwidth Protection Reporting, you can now see how Nomad is preventing end-user disruption due to software and update deployments. Bandwidth Protection Reporting will allow you to see the positive impact Nomad is having across the organization, to individual sites, subnets, all the way down to a single client.

Support for Cloud-based content in Task Sequences- cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Feature improvements - as Configuration Manager evolves and new features are released, Nomad on Tachyon Platform is being continuously maintained to ensure it works seamlessly with new releases.

Content Distribution service no longer uses SQL Linked Server to connect to Microsoft Endpoint Configuration Manager.

9.6.17.1.1.2 Client

NomadBranch 8.1 client is the Nomad module in 1E Client 8.1

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Enhancements:

Improvements to the Certificate Selection criteria to authenticate with a DP (or any download source)

Download reporting now includes back-off data, for Bandwdith Protection Reporting.

9.6.17.1.1.3 Tools

Nomad AdminUI Console Extensions now require .NET Framework 4.8

Cloud infrastructure support

Enhancements:

Provide a way for SCCM Console users to use alternate credentials to authenticate with ContentDistribution/Platform

PlatformUrl validation is improved, by logging a warning during installation. In UI mode users have the option of continuing with the installation.

9.6.17.2 Troubleshooting

9.6.17.2.1 Online help

Nomad comes with online help that shows you how to install, configure and use the product. Click the following link to view the help:

Introducing Nomad.

For support queries, please:

Use https://support.1e.com/ where you can search the KB or submit a support case.

Contact support@1e.com.

9.6.17.2.2 Known issues

The current known issues related to the installation and running of Nomad 8.1 can be found on the Troubleshooting Known issues page of the Nomad documentation.

Known issues for the Tachyon Platform and other applications can be found in the 1E platform - Known issues documentation.

9.6.17.3 Nomad Release History

9.6.17.3.1 8.1.2.60 11 Mar 2022

9.6.17.3.1.1 Features and enhancements

For new features in this release please refer to the top of the page.

Nomad and Content Distribution are included in Tachyon Platform 8.1.

NomadBranch 8.1 client is the Nomad module in 1E Client 8.1.

9.6.17.3.1.2 Contained fixes (Nomad and Content Distribution)

Q22048 - An unhandled exception is thrown if Content Distribution is installed on a non-English server. (TFS 247999)

Q22010 - Task sequence does not get synced if an entry of precached task sequence was created before the CMSync (TFS 247742)

Q21984 - Multiple Task sequences with same name displayed on Nomad dashboard TaskSequence page. (TFS 246962)

Q21982 - Nomad Sites page on Nomad dashboard displays 0 for “Unknown” category of site. (TFS 246477)

Q21980 - NomadBranch Admin UI Extensions: "Pre-caching Jobs" view only shows 50 most recent jobs (TFS 246609)

Q21978 - Device tab displays status as "Partially Downloaded" (TFS 247193)

Q21976- Subnet Drawer displays "Partially downloaded" status (TFS 247268)

Q21974 - Selecting Subnet Drawer of TS content causes exception (TFS 247269)

Q21972 - Precache jobs report incorrectly as “Partially Downloaded” (TFS 245156)

Q21856 - Subnets counts on Nomad Site page gets changed by changing time filter. (TFS 245938)

Q21854 - Subnet Drawers and Site Detail page shows null subnet (TFS 245937)

Q21852 - Device Details page shows incorrect counts (TFS 245936)

Q21850 - Content Details page never returns data. (TFS 245939)

9.6.17.3.1.3 Contained fixes (client)

Q22068 - Content download from Cloud DP does not work when Enhanced HTTP is enabled in CM 2107 (TFS 248101)

Q22056 - Superfluous informational message in NomadBranch log (TFS 249059)

Q22054 - Failing to decrypt content while downloading from Cloud Distribution Points (TFS 247202)

Q21930 - Nomad precache content status is not in sync with Content Download DB (TFS 244875)

Q21928 - Nomad download over enhanced HTTP fails with CM 2107 (TFS 245217)

9.6.17.3.1.4 Contained fixes (tools)

Q22028 - ConfigMgr Console Crashes when attempting to search in Nomad specific views (TFS 246444)

Q22026 - Nomad Baseline wizard creates incorrect baseline for missing integer values (TFS 247629)

Q22024 - Support for providing alternate credentials in SCCM Extensions to authenticate with Tachyon Platform (TFS 246003)

9.6.17.3.2 8.0.4.298 29 Oct 2021

9.6.17.3.2.1 Features and enhancements

For new features in this release please refer to Nomad features by release.

Nomad and Content Distribution are included in Tachyon Platform 8.0.

NomadBranch 8.0 client is the Nomad module in 1E Client 8.0.

OSD Tools and Nomad Configuration Manager console extensions are now included in a single installer called Nomad Branch Tools.

9.6.17.3.2.2 Contained fixes (Nomad and Content Distribution)

Q21754 - CM Sync fails to sync content because of null SourceVersion (TFS 241994)

Q21750 - Nomad clients are unable to communicate with ContentDistribution (TFS 244275)

Q21702 - An error occurred whilst migrating legacy pre cache data. CM sync failed. (TFS 237645)

Q21700 - Get Migration Settings TS action sets an incorrect PBAComputerName for restore (TFS 239635)

Q21698 - Failed to register devices because Ip4SubnetAddr column does not allow nulls. (TFS 232498)

Q21678 - Duplicate Devices in Tachyon and Nomad dashboards (TFS 229352)

Q21612 - Support for feature updates in TS (TFS 233798)

Q21610 - Known Subnets are showing under Unknown as well in Nomad Dashboard (TFS 234520)

Q21608 - CM sync's failing in CD due to FOREIGN KEY constraint (TFS 234770)

Q21598 - CM Sync's failing in Content Distribution (TFS 233608)

9.6.17.3.2.3 Contained fixes (client)

Q21786 - Nomad - Automatic CacheClean updates. (TFS 244966)

Q21784 - Nomad is not doing any DP load balancing (TFS 234960)

Q21782 - Nomad failing download content requested by VMware Workspace One (TFS 244963)

Q21724 - Nomad - Get Migration Settings step is not using correct MAC address to query CM computer association (TFS 241912)

Q21694 - Nomad - CDSSync doesn't report complete download data (TFS 236909)

Q21692 - Nomad isn't honouring Job timeout (TFS 237633)

Q21690 - Nomad crashing on multiple devices (TFS 235899)

Q21628 - Nomad fails during byte-range download if ContentRegistration is disabled (TFS 235180)

Q21602 - Standardize Nomad date logging (TFS 231355)

Q21600 - Nomad hash errors on 3rd party software update downloads via WUMU (TFS 230142)

9.6.17.3.2.4 Contained fixes (tools)

Q21790 - AdminUI - Automatic CacheClean updates. (TFS 244966)

Q21788 - AdminUI - Nomad is not doing any DP load balancing (TFS 234960)

Q21696 - Nomad Branch Tools - Nomad isn't honouring Job timeout (TFS 237633)

Q21604 - Nomad Branch Tools - Standardize Nomad date logging (TFS 231355)

Q21538 - Nomad Branch Tools - SSD is not working in Windows PE (TFS 232110)

9.6.17.3.3 7.1.5.456 25 Mar 2021

For new features in this release please refer to Nomad features by release.

Nomad is now an application in Tachyon Platform 5.2, and ActiveEfficiency has been replaced by Content Distribution in Tachyon Platform 5.2.

NomadBranch 7.1 client is the Nomad module in 1E Client 5.2.

Nomad Branch (OSD) Tools and Nomad Configuration Manager console extensions are provided as separate installers.

9.6.17.3.3.1 Contained fixes (client)

Q21386 - Nomad does not work as ACP after CM Client upgrade to 5.00.9040.1015 (CB 2010) (TFS 221969)

Q21374 - Nomad - Fails to retrieve content locations from the MP if there are no boundary groups except the default (TFS 220818)

Q21330 - Nomad - Failing to get patches from WUMU (TFS 212827)

9.6.17.3.3.2 Contained fixes (tools)

Q21372 - ValidateWiFi step fails on non-English machines in WSA task sequence (TFS 221362)

9.6.17.3.4 7.0.200.214 24 Jul 2020

9.6.17.3.4.1 Features and enhancements

This maintenance release is implemented as the Nomad module in 1E Client 5.1 and introduces the following features:

Certificate-based client authentication for Nomad P2P communication

Configuration Manager Enhanced HTTP support

Support for multiple Certificate Authorities

Improved PKI client certificate selection logic

VMWare Workspace One support

Handling download content for "expired" offer

Improved handling of updated Software Update content

Option to reduce election notifications in Nomad logs

Nomad 1EClient Telemetry

9.6.17.3.4.2 Contained fixes

Q21089 - Unable to download Pre-cache Content from Cloud DP on VPN clients

Q21061, Q21051 - CertIssuer - specifying issuer name sub string does not work for selecting Server Auth PKI cert for Nomad P2P / PBA over HTTPS

Q21021, Q21033 - Support pre-caching on internet clients using AE on internet and content distributed on CDP or IBCM based DP

Q21021, Q21033 - Nomad failing to download the content in first attempt (from CMG) and succeeding in second attempt after 10 min

Q20979, Q20973 - If enhanced http was enabled, the Pre-stage Content Using Nomad step failed to download the content.

Q20979, Q20973 - If using SMB to download content from DP in WinPE, the login to the DP share failed and Nomad failed to download the content.

Q20979, Q20973 - The Pre-stage Content Using Nomad step failed to download content over SMB if the SMB path had a backslash at the end

Q20943 - Enable DP recycling feature in Win-PE by default

Q20983 - Legacy Pre-Stage using Nomad task sequence step fails in CB1910

Q20983, Q20979, Q20973 - Nomad Task Sequence steps fail if Nomad module is not initialized

Q20973 - Nomad fails a download when similar expired deployment is present

9.6.17.3.5 7.0.100.77 27 Mar 2020

9.6.17.3.5.1 Features and enhancements

NomadBranch 7.0.100 client is the Nomad module in 1E Client 5.0

9.6.17.3.5.2 Contained fixes

Q20694 - When an LST is created for a cloud DP a zero byte file causes download failure

Q20682 - LSZGEN fails on long file path with Nomad SECure enabled

Q20680 - LSZGEN issues on DP when CACHEPATH installer property has no trailing backslash

Q20678 - Physical path in the LSZFILES virtual directory in IIS is not updated when LocalCachePath is changes after installation

Q20676 - Nomad downloads previous version of content

Q20674 - Captive Portal Web page (eg Logon Page from Public Wifi) may cause issues with Nomad Downloads

Q20570 - Nomad fails to download updated task sequence references with future deployment dates

Q20672 - Nomad fails to download updated task sequence references with ConfigMgr Pre-download option

Q20670 - Nomad service failure on PBA host with hidden share enabled during PBA backup

Q20666 - PBA Size estimation doesn't update TS progress bar

Q20664 - Nomad not failing package on CRC failure

Q20662 - Nomad Status Message Improvements

Q20660 - Nomad service may fail whilst running cachecleaner manually

Q20658 - Unable to download 0365 updates with Nomad

Q20733 - Local SSD is not working

Q20592 - 1EClient Nomad Module's install fails if Windows Firewall service is disabled or in stopped state

9.6.17.3.6 7.0.0.203 04 May 2019

9.6.17.3.6.1 Features and enhancements

NomadBranch 7.0 client is replaced as the Nomad module in 1E Client 4.1

Support for NomadBranchTools installation on SCCM SMS Provider

Support for Windows 10 Express Files Update

Support for Regular Software Update (including Win 10 Feature updates) downloads from Windows Update / Microsoft Update (WUMU)

Support for Windows 10 Express Files and Office 365 downloads from Windows Update / Microsoft Update (WUMU)

New Content Registration Cycle to mark failed content registrations with ActiveEfficiency server

New Nomad registry settings to average out the content registration and SSD request load in AE where CM deployment size is of the order of 100K or more.

Support for P2P downloads when a client machine switches from NomadInhibitedAdSite to a non InhibitedAdSite

Ignore Local SSD if machine is in a NomadInhibitedSubnet

Support for SSD usage as a criteria for Nomad cache clean cycle

Some registry values have new defaults set to support new features and running Tachyon on computers that do not have the Configuration Manager client. These include SpecialNetShare and CompatibilityFlags.

DP recycling feature in WinPE is enabled by default, for upgrade from previous version the previous settings will be preserved.

Dynamic Block Size (DBS) is now disabled by default (even in WinPE), for upgrade from previous version the previous settings will be preserved.

MulticastSupport is now disabled by default, for upgrade from previous version the previous settings will be preserved.

Broadcasting download statistics is disabled by default, for upgrade from previous version the previous settings will be preserved.

Support for downloading from source over HTTP/S or SMB is enabled by default, for upgrade from previous version the previous settings will be preserved.

By default SHA-256 is used to verify integrity of downloaded content.

Stage Nomad and Install Nomad TS steps updated to support staging and installing 1EClient

Added 'SMSTSNomadDefaultCachePriority' TS variable to be used when SMSTSNomad is unable to get cache priority from package policy or policy itself is missing from TS variables.

Support for TLS 1.1/1.2 in environments where TLS 1.0 is disabled

Status Message consistency improvements

1E Client Health feature has been removed

9.6.17.3.6.2 Contained fixes

Q20390 - Allow WSA to exclude data backup

Q20384 - Cache cleaner unable to remove content when cache already exceeded configured size

Q20382 - Nomad O365 download from untrusted forest not using Network Access Account (NAA)

Q20368 - Active Efficiency Web service logs exception if FQDN is missing from client data

Q20350 - Same disqualified master keeps winning elections

Q20322 - Don't download content to USB if it's already in the Nomad cache

Q20314 - HTTP Proxy causes failures while downloading from Windows Update

Q20310 - Nomad Service Failure while logging disqualification details

Q20266 - SMSTSNomad fails if the Nomad service is slow to start

Q20262 - NMDS ExtraReplyDelayMS setting capped at 5000

Q20260 - Nomad download logs CopyLoopWait CopyError: Missing File(s)

Q20256 - Nomad failing to download SU from Cloud Distribution Points

Q20254 - TLS 1.2 compliance testing and fixes for Nomad

Q20252 - CTM DP order with neighboring boundary group DPs

Q20250 - Nomad O365 downloads fail when requested range does not exist

Q20248 - Active Efficiency Nomad sync is failing with a "Arithmetic overflow error converting expression to data type bigint" error

Q20246 - Cannot download software updates from Windows Update

Q20198 - LSZ downloads fail when package contains files with Unicode names

Q20196 - Ignore Local SSD if machine is in a NomadInhibitedSubnet

Q20194 - SSD queries may connect on inhibited subnets if the master moves

Q20192 - Active Efficiency experiencing database deadlocks at high utilization

Q20144 - Express Update support for Nomad (from on premises DP)

Q20142 - RDC doesn't work in some cases

Q20140 - Nomad downloads previous version of content

Q20138 - SMSTSNomad does not set cache priority correctly

Q20136 - Issues working Nomad HTTP with WINHTTP Proxy

Q20134 - Disqualifications sent when too many connections reached over HTTP(S)

Q20132 - Slow Nomad downloads from DP when BranchCache is enabled

Q20130 - NomadBranch Range Overlap Exception

Q20128 - Nomad Not Sending Error Status Messages

Q20056 - NomadBranch fails on NMDS_FIND HTTPPull when trying to restore a PBA user state backup

Q20054 - Nomad not failing package on CRC failure

9.6.17.4 Nomad 8.1 release information – last updated 09-August-2022

These notes contain late-breaking information about Nomad 8.1 that you need to have to successfully install and use the product. For the most up-to-date information please see the online readme. You should read these release notes and the online documentation for Nomad 8.1 thoroughly before installing the software.

9.6.17.4.1 New features in Nomad

Many Nomad features are available with minimal configuration of the 1E Client. However, some features require additional configuration of the 1E Client on Configuration Manager Distribution Points.

9.6.17.4.1.1 Platform

Works with Tachyon 8.1

Insights on how Nomad enhances user experience - with the rapid shift to a Work From Anywhere (WFA) workforce and an increased focus on the Digital End-User eXperience, Nomad on Tachyon Platform now provides insights into how it helps to ensure a great user eXperience. With the introduction of Nomad's Bandwidth Protection Reporting, you can now see how Nomad is preventing end-user disruption due to software and update deployments. Bandwidth Protection Reporting will allow you to see the positive impact Nomad is having across the organization, to individual sites, subnets, all the way down to a single client.

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Feature improvements - as Configuration Manager evolves and new features are released, Nomad on Tachyon Platform is being continuously maintained to ensure it works seamlessly with new releases.

9.6.17.4.1.2 Client

NomadBranch 8.1 client is the Nomad module in 1E Client 8.1

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, and there is an increased reliance on Cloud Distribution Points for distributing content.

Enhancements:

Improvements to the Certificate Selection criteria to authenticate with a DP (or any download source)

Download reporting now includes back-off data, for Bandwdith Protection Reporting.

9.6.17.4.1.3 Tools

Nomad AdminUI Console Extensions now require .NET Framework 4.8

Cloud infrastructure support

Enhancements:

Provide a way for SCCM Console users to use alternate credentials to authenticate with ContentDistribution/Platform, for details refer to Using Nomad pre-caching.

PlatformUrl validation is improved, by logging a warning during installation. In UI mode users have the option of continuing with the installation, for details refer to Installing Nomad Branch Tools.

9.6.17.5 Nomad features by release

9.6.17.5.1 Summary

A list of the Tachyon features organized by the release they were implemented in. Links through to the features have been provided for convenience.

9.6.17.5.2 New features in Nomad 8.1

This release introduces the following new and enhanced features:

9.6.17.5.2.1 Platform

Insights on how Nomad enhances user experience - with the rapid shift to a Work From Anywhere (WFA) workforce and an increased focus on the Digital End-User eXperience, Nomad on Tachyon Platform now provides insights into how it helps to ensure a great user eXperience. With the introduction of Nomad's Bandwidth Protection Reporting, you can now see how Nomad is preventing end-user disruption due to software and update deployments. Bandwidth Protection Reporting will allow you to see the positive impact Nomad is having across the organization, to individual sites, subnets, all the way down to a single client.

Support for Cloud-based content in Task Sequences- cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Feature improvements - as Configuration Manager evolves and new features are released, Nomad on Tachyon Platform is being continuously maintained to ensure it works seamlessly with new releases.

Content Distribution service no longer uses SQL Linked Server to connect to Microsoft Endpoint Configuration Manager.

9.6.17.5.2.2 Client

NomadBranch 8.1 client is the Nomad module in 1E Client 8.1

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Enhancements:

Improvements to the Certificate Selection criteria to authenticate with a DP (or any download source)

Download reporting now includes back-off data, for Bandwdith Protection Reporting.

9.6.17.5.2.3 Tools

Nomad AdminUI Console Extensions now require .NET Framework 4.8

Cloud infrastructure support

Enhancements:

Provide a way for SCCM Console users to use alternate credentials to authenticate with ContentDistribution/Platform

PlatformUrl validation is improved, by logging a warning during installation. In UI mode users have the option of continuing with the installation.

9.6.17.5.3 Released in Nomad 8.0

9.6.17.5.3.1 Platform

Works with Tachyon Platform 8.0

Integrating Nomad with WakeUp

Enhancements:

Task Sequence support for Windows feature updates

Automatic grooming of the Content Distribution database

Support for Windows Authentication between Background Channel and Content Distribution API

Tachyon Setup: Nomad screen has improved authentication options

Improving performance of the dashboards

API versioning using Tachyon SDK.

9.6.17.5.3.2 Client

NomadBranch 8.0 client is the Nomad module in 1E Client 8.0

New registry setting **SiteSSDMinPackageSizeKB**to set the minimum size of content before making SSD request

Installer changes:

Integrating Nomad with WakeUp

Enable **Nomad FanOut** as a default - default value of **SpecialNetShare**has changed to 0x2060 (8288)

Platform features enabled by using the BackgroundChannelUrl instead of PlatformURL

Enhancements to **CacheCleaner** functionality to better support remote users as part of the Working From Anywhere initiative.

9.6.17.5.3.3 Tools

A single combined installer called **Nomad Branch Tools** containing both OSD Tools and Nomad Configuration Manager console extensions.

9.6.17.5.4 Released in Nomad 7.1

9.6.17.5.4.1 Platform

Works with Tachyon Platform 5.2

Modernized backend infrastructure - Nomad requires a back-end server, which was previously the legacy ActiveEfficiency platform, this has been replaced by the Tachyon Platform to provide Single-Site download, Pre-caching and a new Dashboard. For customers moving to Modern Management, Nomad provides visibility and control of Delivery Optimization, which is used by Intune, MS store and MS update.

Leverage the Tachyon Platform and 1E Client - with the Tachyon Platform you can enable further features including Experience, User Sentiment, Guaranteed State and Patch Success, as well as opening up real-time management to any task by acquiring the appropriate license.

Content Distribution - Content Distribution is a new component of the Tachyon Platform that provides control and visibility on content deployments and delivery in an organization

Replaces ActiveEfficiency features, maintaining support during upgrade for legacy Nomad clients (versions earlier than Nomad 7.1 in 1E Client 5.2)

Nomad 7.1 clients now connect to Tachyon Response Stack components (Switch and Background Channel) which act as a proxy for Content Distribution, and legacy clients continue to connect directly to Content Distribution.

Nomad app - the user interface for Content Distribution, provides real-time visibility of what content is downloading or available in each location, subnet and client, see how much WAN traffic is being saved overall and each day

Delivery Optimization (DO) Visibility - visibility of Delivery Optimization downloads and content availability in each location, subnet and device

Delivery Optimization (DO) and Windows Update Agent (WUA) monitoring - track Windows download or Microsoft Endpoint Configuration Manager deployments on clients being downloaded via Delivery Optimization in real time, their peer to peer downloads efficiency, sources of the downloaded content and see this reported in the Nomad app dashboards

Overview page - gives a high-level view of the current status of content throughout the entire network

Content page - provides a Content-centric view of content distributed throughout your network

Task Sequences page - provides that visibility by grouping the reference content for each Task Sequence into a single view, so you can see which content is cached and which is not

Devices page - lists all Devices that have sent Nomad device registration events and have sent download events within a selected time period, links through to Device View

Nomad Sites page - shows how the network is being used for content distribution in different locations

Client Health page - shows information from two Integrated Product Packs provided with the Tachyon Platform.

9.6.17.5.4.2 Client

NomadBranch 7.1 client is the Nomad module in 1E Client 5.2

ActiveEfficiency features are now provided by Content Distribution on Tachyon Platform 5.2

Client status messages are sent via Tachyon event policy system - Content Distribution uses these instead of StatusMsgEvents using Configuration Manager

New client settings:

DeliveryOptimizationReportingEnabled - monitoring of Delivery Optimization downloads and reporting them to Content Distribution - disabled by default

SupportWPAD - provides support for Web Proxy Auto-Discovery Protocol (WPAD) - disabled by default.

9.6.17.5.4.3 Tools

ActiveEfficiency features are now provided by Content Distribution on Tachyon Platform 5.2.

9.6.17.5.5 Released in Nomad 7.0.200

Certificate-based client authentication . Nomad peers can now use client authentication certificates to authenticate peer-to-peer communications, as an alternative to the default Windows authentication using the local SMSNomadP2P& account that the Nomad service creates and manages. When you enable this option, Nomad will not create the local account and you no longer need to allow the local account to access the computer from the network. This feature is supported in the full OS, in Windows PE and for Peer Backup Assistant. This enables organizations to implement Nomad in conjunction with best practice security policies.

Configuration Manager Enhanced HTTP Support . Microsoft introduced Enhanced HTTP in CM1810 to allow organizations that struggled to manage PKI certificates to use secure communication between clients and DP without the need for PKI-generated certificates. Enhanced HTTP also allows administrators to remove the Network Access Account as it implements a new token-based authentication endpoint on DPs and MPs that do not require Windows authentication. Nomad is now able to communicate with this token-based endpoint and download content from a DP when Enhanced HTTP has been enabled. In this scenario the Network Access account can also be removed. Refer to the Microsoft Configuration Manager documentation for more details on Enhanced HTTP and the Network Access Account

Support for multiple Certificate Authorities . When configuring Nomad to use HTTPS when communicating with a DP or for P2P communication, the Nomad CertIssuer registry setting defines the issuing Certificate Authority (CA). Nomad now allows multiple CAs to be defined and also supports sub-string matching (for example, if you have ROOTCA1 and ROOTCA2, you can specify ROOTCA as the CertIssuer and Nomad will be able to use a certificate from either ROOTCA1 or ROOTCA2).

Improved PKI client certificate selection logic . When using HTTPS for communication with HTTPS CM Site Systems or P2P communication using PKI client certificates and the CM client is using PKI client certiicates, Nomad will use the same certificate that CM uses. If CM is using self-signed certificates (or is not present at all) then in most cases Nomad will be able to select an appropriate certificate from the local computer personal store without additional configuration.

VMWare Workspace One support. Nomad 7.0.200 includes updates that will enable VMWare Workspace One clients to download and share content using Nomad. This will be supported in an upcoming VMWare Workspace One release.

Improved handling of updated Software Updates . If the source for a Software Update is updated after it has been distributed to one or more clients, Nomad clients may get into a situation where they get into a loop downloading an invalid LsZ file from peers that have the older version of the content. Improvements have been made that can be enabled through the CompatibilityFlags.

Option to turn off or reduce election notifications in Nomad log. By default, Nomad logs all election responses when elections occur. In large subnets this can result in the logs filling up and rolling over. You can now turn off or limit the number of election responses that are logged.

1E Client telemetry for Nomad feature usage. To help 1E understand how customers are using and configuring our products, a telemetry feature has been implemented in Tachyon Platform 5.1. When the Tachyon Platform is implemented, the 1E Client sends telemetry data relating to enabled Nomad features to the Tachyon server. This data will be forwarded to 1E if you enable email and telemetry in Tachyon Setup. If telemetry is not enabled in the platform, the data can be manually exported and may be requested by 1E Support when troubleshooting issues.

The Nomad 7.0.100 maintenance release was implemented as the Nomad module in 1E Client 5.0. This release included rolled up hotfixes but did not introduce any new features.

The main Nomad 7.0 release contained the following features:

NomadBranch 7.0 client is the Nomad module in 1E Client 4.1 - refer to Installing and upgrading for more details on how to install/upgrade Nomad 7.0

Support for NomadBranchTools installation on remote SMS Providers - NomadBranchTools can now be installed on remote SMS Providers without the manual steps that were required previously.

Support for Windows 10 Express File Updates - 1E Client 4.1 supports download of express installation files deployed through Configuration Manager. To use this feature in Nomad, you must first configure Delivery Optimization Download Mode to 0 on all clients. For new installations, the feature is enabled by default and for upgrades it can be enabled in 1E Client 4.1 by setting bit 26 (0x4000000, 67108864 in decimal) of the **CompatibilityFlags** registry value.

Support for downloading content for CM Software Updates from Microsoft Update - if you deploy Software Updates, including regular updates, Windows 10 express updates and Office 365 updates with Configuration Manager and in the deployment settings select the option
If software updates are not available on distribution points in current, neighbor or site boundary groups, download content from Microsoft Updates, Nomad will be used to download that content from Microsoft Update if it is not available from a DP or local Nomad peers. (Please refer to **CompatibilityFlags** bits 27 and 28 for further details).

Enhancements:

SSD optimizations

Large Configuration Manager deployments and downloads to 30K or more machines could result in significant traffic spike from 1E Client to an ActiveEfficiency server that may result in IIS 503 Overload errors, this has been optimized.

When Local SSD is enabled to support networks where broadcasts are disabled, it is not used when a Nomad master detects broadcasts. This allows the same SSD setting to be used by all clients in a mixed network environment.

Improved resilience of content registration - a Content Registration Cycle mechanism has been introduced that registers the pending and failed content registrations with ActiveEfficiency.

Support for TLS 1.1/1.2 in environments where TLS 1.0 is disabled.

9.6.17.5.6 Summary

A list of the Tachyon features organized by the release they were implemented in. Links through to the features have been provided for convenience.

9.6.17.5.7 New features in Nomad 8.1

This release introduces the following new and enhanced features:

9.6.17.5.7.1 Platform

Insights on how Nomad enhances user experience - with the rapid shift to a Work From Anywhere (WFA) workforce and an increased focus on the Digital End-User eXperience, Nomad on Tachyon Platform now provides insights into how it helps to ensure a great user eXperience. With the introduction of Nomad's Bandwidth Protection Reporting, you can now see how Nomad is preventing end-user disruption due to software and update deployments. Bandwidth Protection Reporting will allow you to see the positive impact Nomad is having across the organization, to individual sites, subnets, all the way down to a single client.

Support for Cloud-based content in Task Sequences- cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Feature improvements - as Configuration Manager evolves and new features are released, Nomad on Tachyon Platform is being continuously maintained to ensure it works seamlessly with new releases.

Content Distribution service no longer uses SQL Linked Server to connect to Microsoft Endpoint Configuration Manager.

9.6.17.5.7.2 Client

NomadBranch 8.1 client is the Nomad module in 1E Client 8.1

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Enhancements:

Improvements to the Certificate Selection criteria to authenticate with a DP (or any download source)

Download reporting now includes back-off data, for Bandwdith Protection Reporting.

9.6.17.5.7.3 Tools

Nomad AdminUI Console Extensions now require .NET Framework 4.8

Cloud infrastructure support

Enhancements:

Provide a way for SCCM Console users to use alternate credentials to authenticate with ContentDistribution/Platform

PlatformUrl validation is improved, by logging a warning during installation. In UI mode users have the option of continuing with the installation.

9.6.17.5.8 Released in Nomad 8.0

9.6.17.5.8.1 Platform

Works with Tachyon Platform 8.0

Integrating Nomad with WakeUp

Enhancements:

Task Sequence support for Windows feature updates

Automatic grooming of the Content Distribution database

Support for Windows Authentication between Background Channel and Content Distribution API

Tachyon Setup: Nomad screen has improved authentication options

Improving performance of the dashboards

API versioning using Tachyon SDK.

9.6.17.5.8.2 Client

NomadBranch 8.0 client is the Nomad module in 1E Client 8.0

New registry setting **SiteSSDMinPackageSizeKB**to set the minimum size of content before making SSD request

Installer changes:

Integrating Nomad with WakeUp

Enable **Nomad FanOut** as a default - default value of **SpecialNetShare**has changed to 0x2060 (8288)

Platform features enabled by using the BackgroundChannelUrl instead of PlatformURL

Enhancements to **CacheCleaner** functionality to better support remote users as part of the Working From Anywhere initiative.

9.6.17.5.8.3 Tools

A single combined installer called **Nomad Branch Tools** containing both OSD Tools and Nomad Configuration Manager console extensions.

9.6.17.5.9 Released in Nomad 7.1

9.6.17.5.9.1 Platform

Works with Tachyon Platform 5.2

Modernized backend infrastructure - Nomad requires a back-end server, which was previously the legacy ActiveEfficiency platform, this has been replaced by the Tachyon Platform to provide Single-Site download, Pre-caching and a new Dashboard. For customers moving to Modern Management, Nomad provides visibility and control of Delivery Optimization, which is used by Intune, MS store and MS update.

Leverage the Tachyon Platform and 1E Client - with the Tachyon Platform you can enable further features including Experience, User Sentiment, Guaranteed State and Patch Success, as well as opening up real-time management to any task by acquiring the appropriate license.

Content Distribution - Content Distribution is a new component of the Tachyon Platform that provides control and visibility on content deployments and delivery in an organization

Replaces ActiveEfficiency features, maintaining support during upgrade for legacy Nomad clients (versions earlier than Nomad 7.1 in 1E Client 5.2)

Nomad 7.1 clients now connect to Tachyon Response Stack components (Switch and Background Channel) which act as a proxy for Content Distribution, and legacy clients continue to connect directly to Content Distribution.

Nomad app - the user interface for Content Distribution, provides real-time visibility of what content is downloading or available in each location, subnet and client, see how much WAN traffic is being saved overall and each day

Delivery Optimization (DO) Visibility - visibility of Delivery Optimization downloads and content availability in each location, subnet and device

Delivery Optimization (DO) and Windows Update Agent (WUA) monitoring - track Windows download or Microsoft Endpoint Configuration Manager deployments on clients being downloaded via Delivery Optimization in real time, their peer to peer downloads efficiency, sources of the downloaded content and see this reported in the Nomad app dashboards

Overview page - gives a high-level view of the current status of content throughout the entire network

Content page - provides a Content-centric view of content distributed throughout your network

Task Sequences page - provides that visibility by grouping the reference content for each Task Sequence into a single view, so you can see which content is cached and which is not

Devices page - lists all Devices that have sent Nomad device registration events and have sent download events within a selected time period, links through to Device View

Nomad Sites page - shows how the network is being used for content distribution in different locations

Client Health page - shows information from two Integrated Product Packs provided with the Tachyon Platform.

9.6.17.5.9.2 Client

NomadBranch 7.1 client is the Nomad module in 1E Client 5.2

ActiveEfficiency features are now provided by Content Distribution on Tachyon Platform 5.2

Client status messages are sent via Tachyon event policy system - Content Distribution uses these instead of StatusMsgEvents using Configuration Manager

New client settings:

DeliveryOptimizationReportingEnabled - monitoring of Delivery Optimization downloads and reporting them to Content Distribution - disabled by default

SupportWPAD - provides support for Web Proxy Auto-Discovery Protocol (WPAD) - disabled by default.

9.6.17.5.9.3 Tools

ActiveEfficiency features are now provided by Content Distribution on Tachyon Platform 5.2.

9.6.17.5.10 Released in Nomad 7.0.200

Certificate-based client authentication . Nomad peers can now use client authentication certificates to authenticate peer-to-peer communications, as an alternative to the default Windows authentication using the local SMSNomadP2P& account that the Nomad service creates and manages. When you enable this option, Nomad will not create the local account and you no longer need to allow the local account to access the computer from the network. This feature is supported in the full OS, in Windows PE and for Peer Backup Assistant. This enables organizations to implement Nomad in conjunction with best practice security policies.

Configuration Manager Enhanced HTTP Support . Microsoft introduced Enhanced HTTP in CM1810 to allow organizations that struggled to manage PKI certificates to use secure communication between clients and DP without the need for PKI-generated certificates. Enhanced HTTP also allows administrators to remove the Network Access Account as it implements a new token-based authentication endpoint on DPs and MPs that do not require Windows authentication. Nomad is now able to communicate with this token-based endpoint and download content from a DP when Enhanced HTTP has been enabled. In this scenario the Network Access account can also be removed. Refer to the Microsoft Configuration Manager documentation for more details on Enhanced HTTP and the Network Access Account

Support for multiple Certificate Authorities . When configuring Nomad to use HTTPS when communicating with a DP or for P2P communication, the Nomad CertIssuer registry setting defines the issuing Certificate Authority (CA). Nomad now allows multiple CAs to be defined and also supports sub-string matching (for example, if you have ROOTCA1 and ROOTCA2, you can specify ROOTCA as the CertIssuer and Nomad will be able to use a certificate from either ROOTCA1 or ROOTCA2).

Improved PKI client certificate selection logic . When using HTTPS for communication with HTTPS CM Site Systems or P2P communication using PKI client certificates and the CM client is using PKI client certiicates, Nomad will use the same certificate that CM uses. If CM is using self-signed certificates (or is not present at all) then in most cases Nomad will be able to select an appropriate certificate from the local computer personal store without additional configuration.

VMWare Workspace One support. Nomad 7.0.200 includes updates that will enable VMWare Workspace One clients to download and share content using Nomad. This will be supported in an upcoming VMWare Workspace One release.

Improved handling of updated Software Updates . If the source for a Software Update is updated after it has been distributed to one or more clients, Nomad clients may get into a situation where they get into a loop downloading an invalid LsZ file from peers that have the older version of the content. Improvements have been made that can be enabled through the CompatibilityFlags.

Option to turn off or reduce election notifications in Nomad log. By default, Nomad logs all election responses when elections occur. In large subnets this can result in the logs filling up and rolling over. You can now turn off or limit the number of election responses that are logged.

1E Client telemetry for Nomad feature usage. To help 1E understand how customers are using and configuring our products, a telemetry feature has been implemented in Tachyon Platform 5.1. When the Tachyon Platform is implemented, the 1E Client sends telemetry data relating to enabled Nomad features to the Tachyon server. This data will be forwarded to 1E if you enable email and telemetry in Tachyon Setup. If telemetry is not

enabled in the platform, the data can be manually exported and may be requested by 1E Support when troubleshooting issues.

The Nomad 7.0.100 maintenance release was implemented as the Nomad module in 1E Client 5.0. This release included rolled up hotfixes but did not introduce any new features.

The main Nomad 7.0 release contained the following features:

NomadBranch 7.0 client is the Nomad module in 1E Client 4.1 - refer to Installing and upgrading for more details on how to install/upgrade Nomad 7.0

Support for NomadBranchTools installation on remote SMS Providers - NomadBranchTools can now be installed on remote SMS Providers without the manual steps that were required previously.

Support for Windows 10 Express File Updates - 1E Client 4.1 supports download of express installation files deployed through Configuration Manager. To use this feature in Nomad, you must first configure Delivery Optimization Download Mode to 0 on all clients. For new installations, the feature is enabled by default and for upgrades it can be enabled in 1E Client 4.1 by setting bit 26 (0x4000000, 67108864 in decimal) of the **CompatibilityFlags** registry value.

Support for downloading content for CM Software Updates from Microsoft Update - if you deploy Software Updates, including regular updates, Windows 10 express updates and Office 365 updates with Configuration Manager and in the deployment settings select the option **If software updates are not available on distribution points in current, neighbor or site boundary groups, download content from Microsoft Updates**, Nomad will be used to download that content from Microsoft Update if it is not available from a DP or local Nomad peers. (Please refer to **CompatibilityFlags** bits 27 and 28 for further details).

Enhancements:

SSD optimizations

Large Configuration Manager deployments and downloads to 30K or more machines could result in significant traffic spike from 1E Client to an ActiveEfficiency server that may result in IIS 503 Overload errors, this has been optimized.

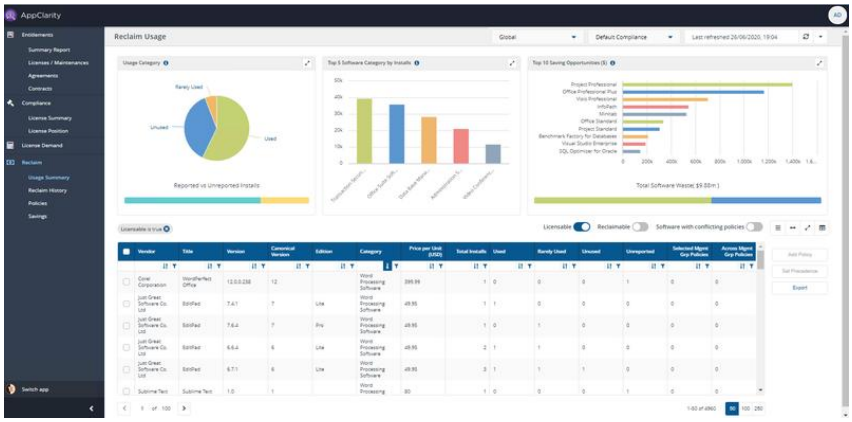
When Local SSD is enabled to support networks where broadcasts are disabled, it is not used when a Nomad master detects broadcasts. This allows the same SSD setting to be used by all clients in a mixed network environment.

Improved resilience of content registration - a Content Registration Cycle mechanism has been introduced that registers the pending and failed content registrations with ActiveEfficiency.

Support for TLS 1.1/1.2 in environments where TLS 1.0 is disabled.

10 AppClarity

AppClarity is aimed at Software Asset Management (SAM) users, helping you get to grips with software waste, take control of license compliance and manage application portfolios easily. It offers an immediate reduction in software costs by helping you manage your software assets on desktops more effectively and maintain software license compliance.



10.1Introducing AppClarity

An overview of AppClarity, what it does, and how it can benefit your organization. An introduction to the features of AppClarity is provided, alongside a high-level explanation of the AppClarity architecture.

AppClarity is a Tachyon application aimed at Software Asset Management (SAM) users, helping you get to grips with software waste, take control of license compliance, and manage application portfolios easily. It offers an immediate reduction in software costs by helping you manage your software assets on desktops more effectively and maintain software license compliance.

The main benefits of using AppClarity are:

Software license compliance – provides a summary of whether a particular product is license compliant or not

Efficient management of entitlements and agreements for an organization

Software waste identification – shows unused or rarely used software which is probably the two largest forms of software waste and enables to reclaim

License Demand based on different metrics for vendors

Efficient application management – identifies version sprawl where many versions of the same product are in use.

Now, you can financially quantify all software waste by identifying and controlling unused software across your enterprise and improving your compliance status.

10.1.1 AppClarity Features

An overview of AppClarity features.

10.1.1.1 New features

Works with Tachyon 8.1

No features or feature changes added in this release, but includes any hotfixes from previous versions.

10.1.2 AppClarity Architecture

The AppClarity architecture is identical to the Tachyon platform architecture, please refer to Tachyon Architecture.

Please refer to Design considerations for a simpler description, with design considerations for AppClarity.

10.2Implementing AppClarity

Everything you need to know about getting AppClarity installed and running in your network. This section is structured in a way that leads you through a typical implementation project.

10.2.1 Design considerations

Information that will help you design and plan the implementation of AppClarity in your organization.

This page is part of the design phase of implementation.

10.2.1.1 Architecture

The picture opposite shows the AppClarity consumer application installed on a Tachyon server, along with other applications that are installed using Tachyon Setup.

If you have an older version of Tachyon, or SLA Platform, then you will need to upgrade it to Tachyon 5.1 to install AppClarity. For more information on installing and upgrading, please refer to Installation scenarios below.

10.2.1.1.1 Software Reclaimer

The Software Reclaimer is an optional feature. It's an executable run on Windows clients responsible for implementing reclaim policies provided by AppClarity. For more information, please refer to Deploying Software Reclaimer.

If you intend to use Software Reclaimer, then consider whether you will use HTTP or HTTPS, and which port.

A default installation of Tachyon uses standard ports HTTP 80 and HTTPS 443. You may wish to use a different port for Software Reclaimer, for example, if you previously used:

HTTP 8335 or HTTPS 8336 with AppClarity 5.2

HTTP 8080 or HTTPS 8443 with SLA Platform 3.3 and AppClarity 6.1

You can manually add a website binding after installation of Tachyon. You may already be using a non-standard port if specified in Tachyon Setup during its installation, or you manually added a binding after installation for another application like Application Migration, or ActiveEfficiency.

If you intend on using Software Reclaimer with HTTPS then the following applies to the Tachyon website's SSL certificate:

It must be trusted by clients running the Software Reclaimer. This is also the same requirement for Tachyon clients. Please refer to Client authentication certificates

Its public key must be encoded in each of the Software Reclaimer XML file(s) as described in Deploying Software Reclaimer.

10.2.1.1.2 AI Powered Auto-curation

Using the AI Powered Auto-curation feature, you'll be able to increase the total amount of normalized software in your Inventory repositories. This is done using AI that integrates with the inventory consolidation process. By using AI, your organization will benefit from significant numbers of normalized software and a reduced manual effort needed to normalize software.

You can enable AI Powered Auto-curation either when you install Tachyon or post installation. Refer to AI Powered Auto-curation to find out how you can do this.

10.2.1.2 Installation scenarios

For all installation scenarios you require:

A valid licensed installation of Tachyon

The license must include AppClarity and Inventory.

10.2.1.2.1 New installation

> **Note**
>
> AppClarity is included with Tachyon, so you'll need to use the Tachyon setup wizard to install AppClarity. To activate AppClarity you'll need a valid license file.
>
> 1E will provide you with a **Tachyon.lic** license file that defines the products and features your Tachyon System is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license.

The license must be activated. Once activated, it may be used only by the Tachyon System that activated it.

Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable.

For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk.

For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server.

> For details of what the license file needs to contain, please refer to License requirements for consumer applications.
>
> Before installing Tachyon, please refer to Planning for Tachyon, this includes details of server sizing. The addition of AppClarity does not affect sizing, as it is included with Tachyon.

10.2.1.2.2 Existing Tachyon installation

You may already have Tachyon installed, perhaps with the Application Migration consumer application installed to support 1E Windows Servicing Suite (WSS).

You can install AppClarity as a local consumer application on your existing Tachyon web server if it is Tachyon 5.1 or later.

Please refer to Upgrading to Tachyon Platform.

10.2.1.2.3 Existing SLA Platform installation

You may still have a legacy SLA Platform installation, perhaps with Application Migration to support 1E Windows Servicing Suite (WSS), or AppClarity 6.1.

You can upgrade SLA Platform to Tachyon 5.1 and then upgrade that to 1E 8.1. Please refer to Upgrading to Tachyon Platform.

> **Tip**
>
> If you only require the Inventory features of Tachyon, and do not require its Real-time features, then you do not need a Response Stack, and you can choose the Tachyon Master Stack configuration inTachyon Setup.

10.2.1.3 Migrating from AppClarity 5.x

There is no upgrade path to AppClarity 8.1 from AppClarity 5.x.

If you have AppClarity 5.x, the simplest scenario is to install Tachyon platform and AppClarity on a separate server. Before installation, you should consider taking a copy of your existing Catalog database and using that for the new Tachyon platform installation. You will then have two installations of 1E Catalog, and you will have to maintain both site-defined Catalog entries separately until you decommission AppClarity 5.x.

You can install Tachyon platform and AppClarity on the same server as an existing AppClarity 5.x installation, provided the hardware specification is suitable. Both installations can share the same 1E Catalog, provided AppClarity 5.x is already using 1E Catalog 2.0 or later. You can have separate Catalog installations if you want, but sharing the same Catalog ensures your site-defined Catalog entries are accessible to both systems.

In either scenario, after installation, you can optionally migrate certain entitlements from AppClarity 5.2 to AppClarity using the AppClarity v5.2 connector.

10.2.1.4 Comparison of AppClarity 5.2 and AppClarity 6.1 features

The following differences are not definitive or exhaustive. Later versions of AppClarity have additional features not included in AppClarity 6.1.

Area	Feature	New feature in 6.1	Comparison with 5.2
Entitlement	Types	SKU, defined in Catalog, auto-populates product details and rights. Contracts	Entitlement storage is compliant with ISO 19770-3. AppClarity 5.x was first tool on market using this standard developed by 1E. 6.1 console does not have renewals reminder. Renewal Date column appears as End Date in 6.1.

Area	Feature	New feature in 6.1	Comparison with 5.2
		can be linked to agreements and link back to licenses soft copies can be uploaded and attached	The table below explains differences between entitlement entry screens.

Category name in 5.2	5.2	6.1
Entitlement types	The **New Entitlement** screen allows you to select the type of entitlement: License Maintenance Evaluation Other You can also select if it is a renewal, upgrade or consolidation, and link to an existing entitlement.	Entitlement type must be selected first: License Maintenance Agreement Contract (the selector provides this option, but Contract is not actually an entitlement type) More options for linking.
Version, edition, upgrade, downgrade, and persistent	Default settings for upgrade, downgrade, and

			Purchase Order sub-category.	Sub-category moved to **Additional information**.
			Direct Supplier Purchase Order sub-category.	Sub-category renamed as **Direct Supplier** and moved to **Additional information**.
			Internal order sub-category.	Sub-category moved to **Additional information**. Also includes Line item number.
			Licensor sub-category.	Sub-category renamed as **Licensor details** and moved to **Additional i**

Area	Feature	New feature in 6.1	Comparison with 5.2		
				nformation. Also includes Line item number.	
			Product Details	Separate category only in 5.2. The following exist only in 5.2: Entitlement Key Channel Type Product Family Registration Key Persistent ID	Category no longer exists. **SKU** is now part of **Product**. **FOSS details** is now a separate sub-category under **Additional information**. New in 6.1: FOSS trademark
			Audit & Exclusions	The following exist onlyin 5.2 Audit penalty	Category exists with same name.
			Internal Details	Sub-category	**Internal Details** is a new sub-

Area	Feature	New feature in 6.1	Comparison with 5.2		
				doesn't exist in 5.2. You must choose the management group before creating an entitlement. An entitlement can belong to only one management group.	category of **Additional information**, with options: Management group Business Unit Sponsor
Import	Staged bulk upload as drafts for verification in the console, and then published.	6.1's Entitlement .tsv connector (file upload of TSV) uses different headings to 5.2 6.1 does not have: The entitlements ISO utility (XML export) importing of XML			
License Demand Calculation	LDC	LDCs for the following complex metrics: IBM Processor Value Unit (PVU)			

Area	Feature	New feature in 6.1	Comparison with 5.2	
		Microsoft Core - only for SQL Server currently Oracle Processor		
Compliance	Compliance	Create separate compliance repositories for separate environments by linking them to a unique set of Inventory and Entitlement repositories Server-based software licensing and compliance Complex license metric covered such as core/processor Effective license position summary table Entitlement usage summary table License optimization	6.1 does not use XPS for reports; XPS Viewer is no longer a requirement. The following is a list of XPS reports available in 5.2 and similar in 6.1. Some of these reports are not related to Compliance but included here for completeness. Also see other reports in Introducing Inventory.	
			Adobe Acrobat	Viewing software install counts across all devices
			Compliance Risk Report	Running your first Compliance License Summary
			Product Installation	Viewing software install counts across all devices
			Product Reclaimer	Viewing the software reclaim reports
			Product Suite Optimization	Not available in 6.1

Area	Feature	New feature in 6.1	Comparison with 5.2	
			Shelfware Identification	Viewing your effective license position
			Software Reclaim Savings	Viewing the software reclaim reports
			Specific Device	Viewing product usage and Viewing the software reclaim reports
			System Diagnostics	SLA report: Basic Summary report
			Unused Software Identification	Viewing product usage
			Vendor Compliance	Viewing your effective license position
			VMware Optimization	Not available in 6.1
Currency		Default currency is configurable in the database.		

Area	Feature	New feature in 6.1	Comparison with 5.2
		Currency exchange rates, and consolidation into a single currency is not used.	
Reclaim	Policies	A single policy can support multiple editions and versions. Multiple editions can be selected. Versions support wildcards. For example, Microsoft Visio 8.* to create a policy for Visio with major version 8. Each VTVE in the 1E Catalog can then have its own custom command line. 6.1 allows reclaim policies to be created for products that are not yet inventoried, provided they exist in the 1E Catalog. A reclaim policy can be applied globally or to one or more management groups. Any machine can only have one policy applied for a product, therefore AppClarity warns you if there are similar	Usage is calculated slightly differently, so you will see different numbers in AppClarity 5.2 and 6.1. See Usage categories. The following reclaim features are not available in 6.1: multiple custom command lines (only a single command is possible) - **fixed in 7.0 hotfix** integration scripts custom SCCM Uninstall - **added in 7.0** changing the 7/30/90 day Usage categories (in 5.2 these were configurable in the database) reclaim on server OS (only Windows workstations are supported) Big red button: The 'disable integration services' option in 5.2 is replaced by a Reclaimer provider on/off button in 6.1. 6.1 version of the pre-flight (evaluate) report does not have summary details.

Area	Feature	New feature in 6.1	Comparison with 5.2
		policies and lets you set a **precedence** for which policy to apply.	
Software Reclaimer		Software Reclaimer executable, its settings, and its API are the same as before. Only the base URL is changed, which means new deployments are required. In 6.1, the Software Reclaimer and API are installed as part of the SLA Platform; policies are managed by the AppClarity consumer application.	
SLA Platform	Console	New web based UI instead of the old click-to-run Console. AppClarity 6.x is a consumer application, installed on the SLA Platform web server. This is why you sometimes see the name AppClarity Web.	
Catalog	SLA Platform console	For 6.1, SLA Platform connects directly to the 1E Catalog, allowing you to create site-defined	

Area	Feature	New feature in 6.1	Comparison with 5.2
	allows for bulk export of Catalog entries from the Console into a macro-enabled Excel spreadsheet, and using macros to import via theSLA Platform API.	entries via either the SLA Platform console, or Catalog console. For 5.2, AppClarity connects directly to the 1E Catalog. Site-defined entries are created in the Catalog console. BDNA integration is not included in 6.1.	
Connectors to data sources	AppClarity uses SLA Platform connectors to get invent	AppClarity 6.x does not require ActiveEfficiency. ActiveEfficiency and its Scout are replaced by SLA Platform and its connectors.	

Area	Feature	New feature in 6.1	Comparison with 5.2
	ory and usage data from various data sources, including Tachyon, and third party sources such as SCCM, BigFix, ServiceNow, vCenter, as well as general SQL queries to SQL Server and Oracle, and file uploads. The above	AppV and iQSonar not supported in 6.1.	

Area	Feature	New feature in 6.1	Comparison with 5.2
	connectors are provided by SLA Platform, AppClarity provides additional connectors for importing entitlements. See Connectors page.		
Management groups	More flexible. AppClarity now supports devices in multiple management groups	Management groups operate differently. In 5.x devices can be a member of only one management group according to precedence rules. In 6.x devices can be a member of multiple management groups.	

Area	Feature	New feature in 6.1		Comparison with 5.2
	, including global, and uses precedence to decide which reclaim policy should be used if a device is a member of different management groups with similar policies. Management groups are configured in SLA Platfor	Inventory	5.2	6.1
		Machine (Device)	name OU name domain name	same as 5.2 in 6.1.0 multiple new rules in 6.1.100
		Application (Product)	publisher (vendor) name (title)	multiple new rules in 6.1.100
		Tag	tag name + value	n/a
		In 6.1, Entitlement is assigned to a management group in the Additional

10.2.2 Requirements

Please refer to Supported Platforms a list of all the platforms supported by AppClarity and the software required to allow you to install AppClarity successfully.

10.2.3 Preparation

What you will need to prepare in advance of implementing AppClarity in your network. Typically, these are tasks that may take some time, depending on how your organization works.

10.2.3.1 Installation order

Note

AppClarity is included with Tachyon, so you'll need to use the Tachyon setup wizard to install AppClarity. To activate AppClarity you'll need a valid license file.

1E will provide you with a **Tachyon.lic** license file that defines the products and features your Tachyon System is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license.

The license must be activated. Once activated, it may be used only by the Tachyon System that activated it.

Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable.

For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk.

For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server.

For details of what the license file needs to contain, please refer to License requirements for consumer applications.

Before installing Tachyon, please refer to Planning for Tachyon, this includes details of server sizing. The addition of AppClarity does not affect sizing, as it is included with Tachyon.

10.2.3.2 SQL Server

Installation and upgrade requires that the Tachyon service account, which is set to the Network Service account, has an SQL Login with certain permissions:

10.2.3.2.1 SQL Login for the Network Service account

The SQL Login that is used by the Tachyon Server web applications and services depends on whether the SQL Server is remote from the Tachyon Server or is local, as described in the following table:

Installation scenario	Service account SQL Login
Tachyon Server is remote from SQL	The computer account of the remote Tachyon Server. For example **ACME\ACME-TCN01$**

Installation scenario	Service account SQL Login
Tachyon Server and SQL are local	The local network service account, **NT AUTHORITY\NETWORK SERVICE**

Note

Before upgrading Tachyon, or installing or upgrading Consumer applications like Application Migration or AppClarity, the SQL Login must be granted the following rights to support Database Snapshot of the 1E Catalog and SLA databases, to restore them if an error occurs:

dbcreator rights on the SQL database instance hosting the 1E Catalog database.

dbcreator rights on the SQL database instance hosting the SLA databases.

During installation, the Tachyon Setup will **always**:

Attempt to create the SQL Login

Grant it **db_owner** permission on each of the Tachyon databases

Remove the **db_owner** permissions when installation is completed.

10.2.3.3 Accounts needed to install AppClarity

10.2.3.3.1 Tachyon Server Installation Account

The server installation account has the following requirements on the server.

Local admin rights on the Tachyon Server. It must be an Directory domain user account that is a direct or indirect member of the Administrators local group on the server where Tachyon Server will be installed.

Can be disabled (not deleted) in Directory after additional Tachyon admin users have been created in Tachyon, and installation has been verified.

In addition, the server installation account requires SQL rights as described in SQL Server and SSAS Databases.

The server installation account is granted the following permissions as a Tachyon user, configured during installation of the Tachyon Server.

It is the first Tachyon user account and is a **System Principal**, which means it cannot be deleted or assigned any other rights

It is assigned to the Tachyon system role of Installer

It should be used to add additional Tachyon users and administrators, assign them to Tachyon roles, which should then be used for ongoing use and management of Tachyon.

It may be included in any AD security group assigned to a Tachyon system or custom role.

Refer to Roles and Securables for a complete reference of Tachyon system roles, custom roles, securables and operations.

> **Note**
>
> For a new installation of Tachyon, the only account that exists in Tachyon will be the **installation account**, which by default is assigned to the Tachyon roles listed above. You will need to add users and assign roles to them.
>
> When upgrading from SLA Platform, SLA users are migrated to Tachyon, but are not assigned to any roles. You will need to assign users to appropriate roles in Tachyon.
>
> For steps on viewing existing users and adding a new user in Tachyon please refer to Users and Groups page.
>
> **Warning**
>
> When installing Tachyon or upgrading from SLA Platform, do not install Tachyon using an **installation account** that you also intend for using and administrating Tachyon and AppClarity. The Tachyon **installation account** is purposefully given limited capabilities which can't be easily edited later.

10.2.4 Installing and upgrading

How to install AppClarity in your organization.

10.2.4.1 Installing AppClarity

AppClarity is installed through Tachyon setup. The **Select Configuration** section of setup allows you to choose whether to install AppClarity.

For full details of how to setup Tachyon, please refer to Tachyon Setup.

10.2.4.2 Upgrading AppClarity

Guidance for upgrading AppClarity.

10.2.4.2.1 Supported upgrade paths

AppClarity 8.1 can be upgraded directly from AppClarity 6.1.100 or from AppClarity 7.0.0.

Supported upgrade paths for AppClarity.

Source (Existing setup)	Destination (Upgrading to)		
1E Catalog	1.2.0	1E Catalog*	2.1.0
SLA Platform	3.3.0 (with Hotfixes)	SLA Platform*	5.1.0
AppClarity	**6.1.100**	Tachyon Server*	5.1.0

Source (Existing setup)	Destination (Upgrading to)
AppClarity*	**7.1.0**

Source (Existing setup)	Destination (Upgrading to)		
1E Catalog	1.2.100	1E Catalog*	2.1.0
SLA Platform	3.3.100 (with Hotfixes)	SLA Platform*	5.1.0
AppClarity	**6.1.100**	Tachyon Server*	5.1.0
AppClarity*	**7.1.0**		

Source (Existing setup)	Destination (Upgrading to)		
1E Catalog*	2.0.0	1E Catalog*	2.1.0
Tachyon Server*	5.0.0	SLA Platform*	5.1.0
SLA Platform*	5.0.0 (with HotFixes)	Tachyon Server*	5.1.0
AppClarity	**7.0.0**	AppClarity*	**7.1.0**

Note

*The AppClarity, 1E Catalog, SLA Platform and Tachyon Server installers are bundled together and are installed using a single installation process. They do not need to be installed separately.

10.2.4.2.2 Upgrading AppClarity 6.1.100 to AppClarity 7.1.0

Note

Before upgrading AppClarity, refer to Tachyon Setup and Installing AppClarity for full installation instructions.

To upgrade from AppClarity 6.1.100 to AppClarity 7.1.0 follow these steps:

Run Tachyon Setup to upgrade to AppClarity 8.1

Once the upgrade has completed, execute the attached post upgrade database script (see Running the post upgrade database script section below) for data cleansing and correction as a part of your post upgrade activity.Ensure this script is successfully executed.

To include the latest data, run an Inventory sync (a Basic Inventory Consolidation refresh is enough). Then, refresh the following reports in the same order:

LDC reports for - Microsoft Core LDC, Oracle Processor LDC, IBM Processor Value Unit (PVU) LDC, Red Hat Socket LDC

Entitlement Consolidation report

Compliance report

Reclaim Consolidation report

Reclaim Reporting report.

10.2.4.2.2.1 Running the post upgrade database script

Download the AppC_v7.1.0_Post_Upgrade_ProviderOperation.zip

When the script is run, it performs a retention of:

Policy data (which are in process under Policy Admin section)

Policy historical data and their correct status.

If you do not run the script, there is an expectation that:

Reclaim is setup in AppClarity 6.1.100 with some reclaimable policies

Some reclaim policies have already resulted in successful reclaims

Few reclaims are in process (i.e. needs administrator action by accepting or rejecting their opt-out requests)

Reclaim History displays for some reclaim transactions.

After a successful upgrade to AppClarity 8.1, if the **Post_Upgrade_ProviderOperation** script is not run, then:

In transit reclaims (i.e. which are to be accepted or rejected by an administrator), will be lost or unstable behavior may observe

History status of reclaim transactions, which had been opt-out, would be spoiled and may display an incorrect status.

> **Note**
>
> If reclaim is notcorrectlyconfigured or simply not being used (as in, no reclaimable policy exists or is published), and the post upgrade database script is run there should be no observable errors, but there may be some unwanted behavior in the application.
>
> **Warning**

We do not recommend running the post upgrade database script if reclaim is not correctly configured or simply not being used.

10.2.4.2.3 Upgrading AppClarity 7.0.0 to AppClarity 8.1.0

Note

Before upgrading AppClarity, refer to Tachyon Setup and Installing AppClarity for full installation instructions.

To upgrade from AppClarity 7.0 to AppClarity 8.1 follow these steps:

Refer to Planning for Tachyon and Upgrading Tachyon Platform, then run Tachyon Setup to upgrade to AppClarity 8.1

Once the upgrade has been completed, the system is ready for use.

Refresh the following reports in the same order:

License Demand Consolidation reports for - Microsoft Core License Demand, Oracle Processor License Demand, IBM Processor Value Unit (PVU) License Demand, Red Hat Socket Demand.

Entitlement Consolidation report.

Compliance report.

Reclaim Consolidation report.

Reclaim Reporting.

Note

When you upgrade from AppClarity 7.0 to AppClarity 8.1,you do not need to run the **Post_Upgrade_ProviderOperation** database script.

Please refer to Design Considerations regarding migration from AppClarity 5.x and the co-existence of AppClarity 5.x and AppClarity 8.1.

10.2.5 Verifying

Verification of AppClarity after installation.

10.2.5.1 Verifying the AppClarity installation

AppClarity is a consumer of Tachyon. When it's installed, all its components will be added to the Tachyon portal.

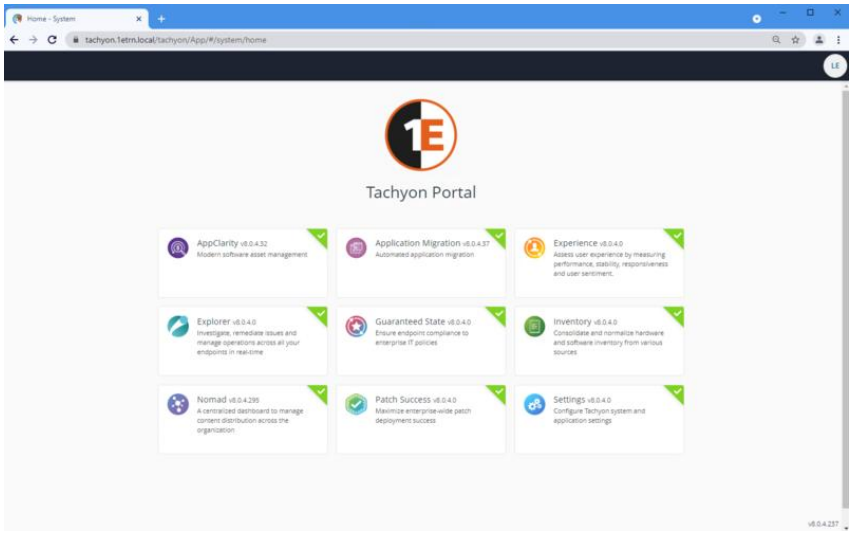
The Tachyon Portal website will be available after installation using the Tachyon DNS Alias FQDN. For example:

Note

https://tachyon.1etrn.local/Tachyon

After installation, log on to Tachyon using the Tachyon installation account

Once you've entered the site, a list of Tachyon applications are displayed, to confirm that **AppClarity**is present.



10.2.5.2 Accessing AppClarity

The Tachyon installation account is restricted by default to a minimum set of permissions required to bootstrap other users into the system but not access any of the applications other than **Settings**.

If you used the Tachyon installation account to install AppClarity or you followed the instructions for setting the Tachyon roles for the AppClarity installation account - please refer to Accounts needed to install AppClarity for more details.

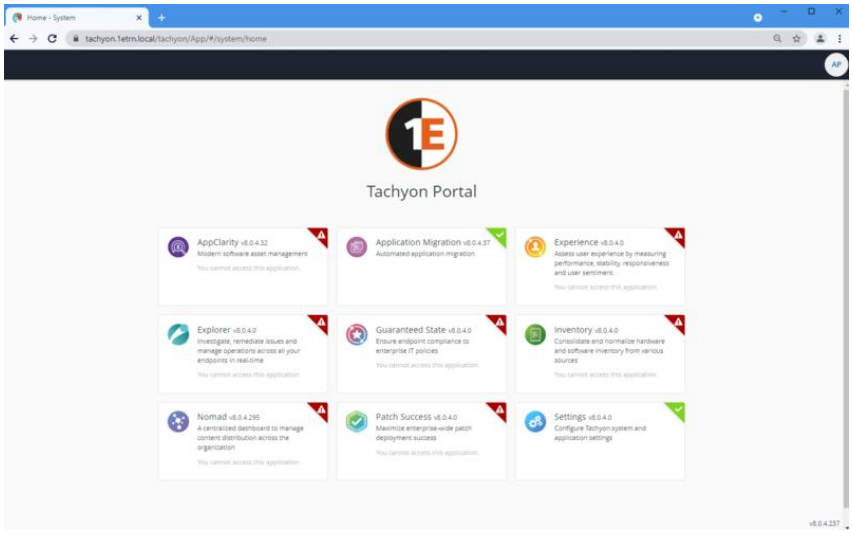
Initially, you will not be able to access AppClarity as you require a Tachyon account with permissions to view the application. If you click on AppClarity on the list of applications displayed on first entering the portal, you will see a screen similar to the one shown.

Note

AppClarity now comes with a number of roles that can be applied to Tachyon users. Refer to Tachyon roles for configuring AppClarity and AppClarity user roles for details.

Tip

You can view which applications are installed and manage them using the **Maintenance** screen in the Tachyon installer. Refer to Maintenance for details.



10.2.5.3 Adding the AppClarity Administrator role to a user to verify AppClarity installation

To verify AppClarity installed successfully, you will need to add the appropriate permissions to a Tachyon account. You'll first need to add an existing AD domain user to Tachyon.

10.2.5.3.1 Adding Tachyon users

Log on to the Tachyon portal using a Tachyon user account with the **Full Administrator**, or the **Installer** role if it is a new Tachyon installation.

Navigate to the **Settings**→**Permissions**→**Users and Groups** page.

Click on the **Add** button, doing this displays the **Add user** popup.

In the **Select AD user or security group** field, type the name, or part of the name, for the Active Directory user or security group that you want to add, then click the search icon.

Select the Active Directory user or security group from the list of matching names displayed in the drop-down list and click **Add**.

You can now apply the **AppClarity Administrator** role to the user you've just added.

10.2.5.3.2 Adding Tachyon roles to users or groups

Once added to Tachyon, you can use **Assignments** to edit the roles for a Tachyon user or group:

On the **Settings**→**Permissions**→**Users and Groups** page, click on the **Assignments** link for the user or group you want to add the role to, this displays the Assignments page focused on the selected user.

On the Assignments page, the focus is on **Users and Groups**.

Click the plus sign button to add a **Role** and your choice of associated **Management Group**.

Once you've selected your Tachyon Roles and Management Groups, click the **Save** button.

For details about how Assignments in Tachyon refer to Assignments page.

The **Assignments** page lets you view and manage current assignments for Tachyon roles, management groups, users and groups, from this page you can:

View all current assignments

Add new assignments

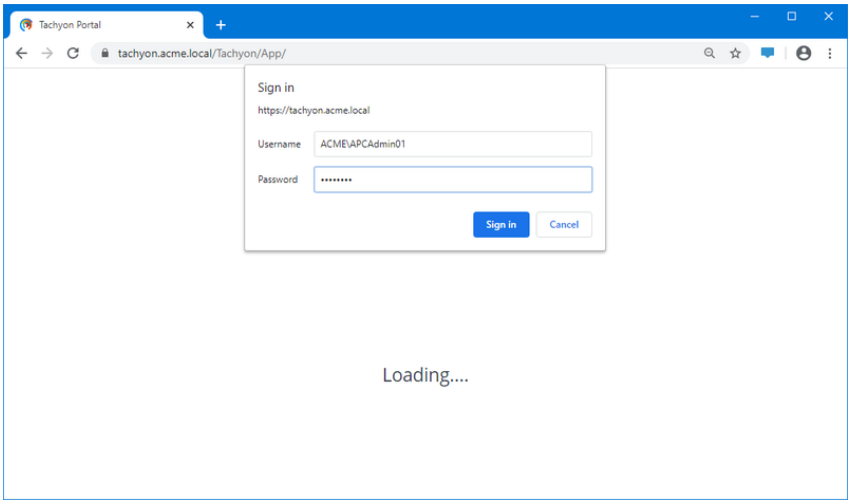
Remove current assignments.

10.2.5.4 Verifying AppClarity in the Tachyon portal

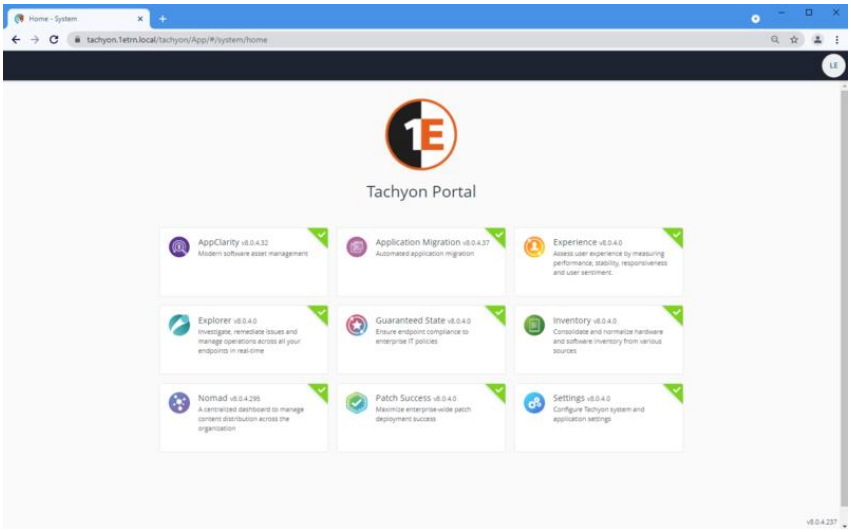
Log on to Tachyon as the new Tachyon user with the AppClarity Administrators role set.

The new **Tachyon user** will now have permissions to view and interact with the AppClarity application. They will be able to complete the verification of the AppClarity installation. To do this:

Log on to the Tachyon portal using the credentials for the Tachyon user added in the previous steps. In our example, this is **ACME\APCAdmin01**, as shown.



The user credentials will be verified and then the applications list will be displayed, as shown. Click on the **AppClarity** application at the top of the list.



This time, the user has the correct role set to be able to view the AppClarity application.

10.2.5.4.1 Verifying the application

Once you've entered the application, you will see four main headings:

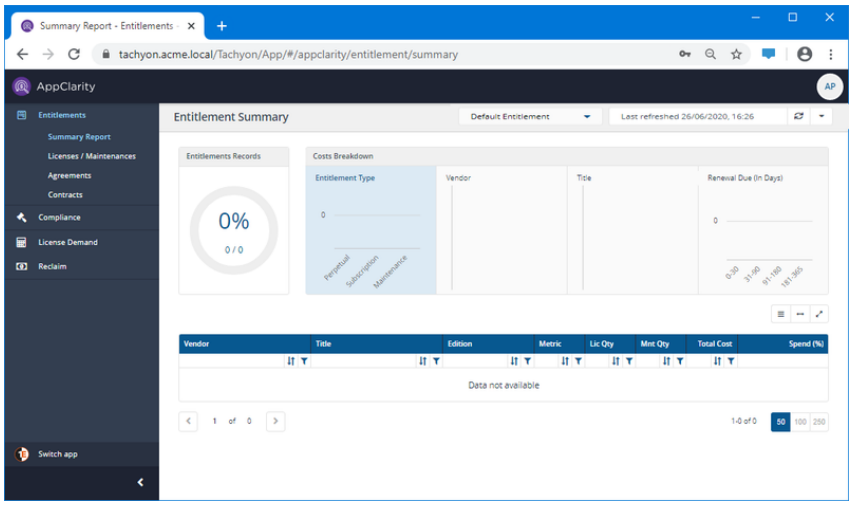
Entitlements

Compliance

License Demand

Reclaim.

The first page that is displayed is the **Entitlement Summary.** Initially the page will contain no data, and you'll see the message **Data not available**. For now don't worry about this, information will appear later after you've entered and published your first entitlement.



10.2.5.4.2 Verifying the new AppClarity default repositories

When AppClarity is installed it **creates** two new default repositories in Tachyon, one for each new repository type:

Default compliance

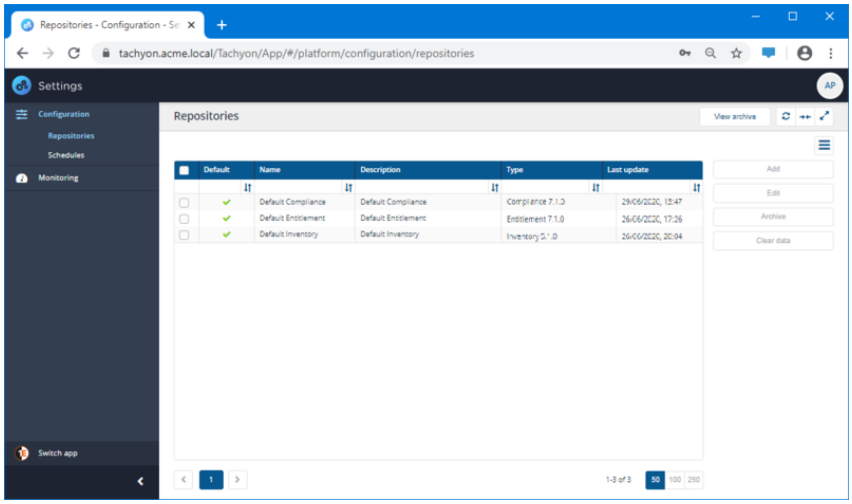
Default entitlement.

You can verify these have been added in the **Settings** application:

From the **Switch app** menu at the bottom-left of the console select **Settings**.

In the **Settings** application navigate to **Configuration**->**Repositories**.

Verify the two new default repositories have been added.



10.2.5.4.3 Verifying the new AppClarity repository types

When AppClarity is installed it creates two new repository types in Tachyon:

Entitlement - this can be used to create new repositories to hold your licenses

Compliance - this can be used to create new repositories to hold different compliance positions - derived from a combination of an Inventory repository and an Entitlement repository.

To verify these have been added, in the **Settings** application:

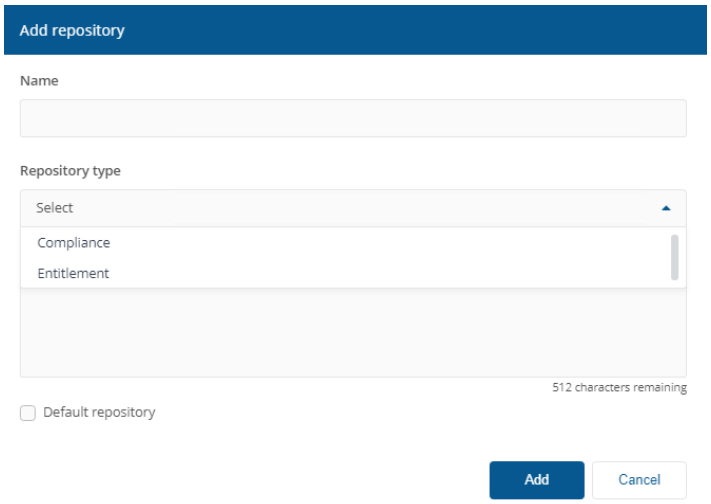
Navigate to **Settings** → **Configuration** → **Repositories**.

Select any of the displayed repositories then click **Add**.

In the **Add repository** dialog click on the **Repository type** dropdown.

Verify that the two new repository types have been added.

Click **Cancel**.



10.3 Configuring AppClarity

How to configure AppClarity.

10.3.1 Tachyon roles for configuring AppClarity

Tachyon and AppClarity roles needed to successfully configure AppClarity.

10.3.1.1 AppClarity Configuration

AppClarity comes with a number of roles, as described in AppClarity user roles, that can be applied to Tachyon users, as described in Configuring Access Rights - tutorial.

To perform all the configuration tasks needed for AppClarity, you need the following roles:

Tachyon Role	Description
Inventory Administrator	This Tachyon System role is needed to be able to: Populate and view inventory repositories Create and test connectors for populating the inventory and entitlement repositories.
AppClarity Administrator	This AppClarity Custom role is needed to be able to access and perform configurations and actions in the AppClarity application.

10.3.2 Connectors page

Tachyon platform uses connectors to connect to other 1E and third-party systems. In addition to the inventory connectors provided, the following entitlement connectors are provided by AppClarity.

Please refer to the Connectors page for details.

10.3.2.1 AppClarity v5.2 connector

Exports entitlements from an AppClarity 5.2 database into a TSV file, which can then be reviewed and imported into AppClarity. You only require access to the AppClarity 5.2 database, you do not require a full installation of AppClarity 5.2. The TSV export file contains all the exported entitlements, this is a summary of the process:

Set permissions on the AppClarity 5.2 database

Set permissions on the export folder

Configure the AppClarity v5.2 connector

After export, you should review the TSV file you will need to use the Entitlement .tsv connector to import them into AppClarity. See Entitlement import files reference page regarding structure and content of TSV files.

> **Note**
>
> If you are migrating from AppClarity 5.2 please contact 1E for help, with using this process and reviewing the contents of your TSV file before importing into AppClarity.

The AppClarity 5.2 connector is a preview for a forthcoming feature that will enable the migration of entitlements from AppClarity 5.2 so that they can be imported into AppClarity. We recommend that this feature is not used in a production environment and evaluated only in a lab environment.

The following limitations apply:

Only license and maintenance entitlement types are exported from AppClarity 5.2

Linked entitlements only support a single license with associated maintenance entitlements. For example, License1 is associated with Maintenance1, Maintenance2, Maintenance3 etc.

Files attached to contracts in AppClarity 5.2 are not exported or imported.

Management groups must exist in Tachyon if they are referenced in any entitlements in AppClarity 5.2. Please refer to Management Groups page.

Bundled entitlements are not supported for extended cases and may result in incorrect linking or export results. For example, when a single license is associated with multiple contracts or when a single maintenance is associated with multiple licenses and many more such cases.

There are some input value restrictions in AppClarity that are not in AppClarity 5.2. For example, contract number is allowed as alphanumeric in AppClarity 5.2, but must be a number only in AppClarity. Issues should be highlighted as caveats during import, most of which you can resolve by editing any problematic entitlement.

Metric Type and Metric Name in AppClarity 5.2 do not map directly to Metric Type and Metric Other in AppClarity. Therefore, you will see Invalid Metric Other caveat for every entitlement you import, unless the original Metric Type is Other. For Metric Type of Device, which is most common, you can publish directly without any concern. For remaining metric types, you can review before import, or correct after import.

10.3.2.1.1 Set permissions on the AppClarity 5.2 database

The connector requires an SQL login to exist in the AppClarity 5.2 database, with explicit *Execute* permissions to the stored procedure **dbo.APSP_ExportEntitlement**

This can be granted in any of the following ways:

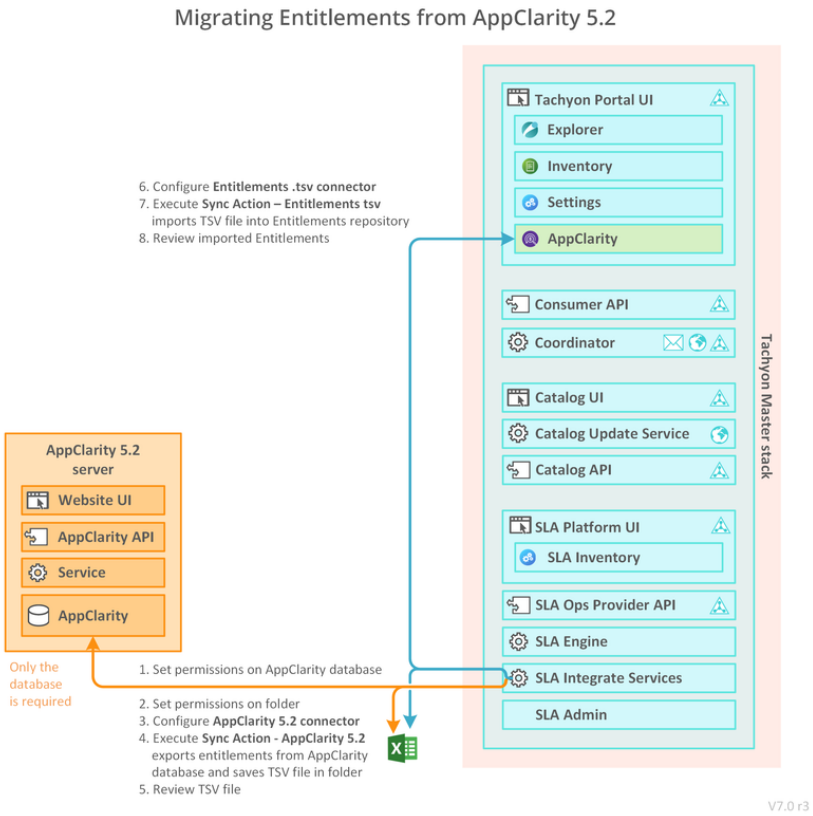
If the connector is using **Trusted Connection**, the SQL login is the **SLA Integrate Services Agent account** which is normally **Network Service**

If the connector is not using **Trusted Connection**, then you can use any SQL login on the AppClarity database and grant it the above rights, and use this login as User ID and password in the AppClarity 5.2 connector.

10.3.2.1.2 Set permissions on the export folder

The connector requires a folder location that must be file share, or a folder on the Tachyon server, to which the **SLA Integrate Services Agent account** has **write** access to.

The folder location can be a folder on the Tachyon server, or a remote share, provided write access is given to the **SLA Integrate Services Agent account** which is normally **Network Service**.



10.3.2.1.3 Configure the AppClarity v5.2 connector

Navigate to **Settings**→**Configuration**→**Connectors**.

Click the **Add** button.

In the **Add Connector** popup select the required **Connector type** from the list of connector types.

Once you've made a selection the **Add connector** popup will show fields appropriate to the selected **Connector type**.

Enter **Connector name**.

In **Name**, enter a logical name for this connector, for example **AppClarity 5.2 production**

> **Tip**
>
> You should use a naming convention for connector names:
>
> **<connector type> <scope> <RCR>**

Scope describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

In **SQL Server**, enter the name of the SQL Server instance where the AppClarity 5.2 database is hosted. If it is a named instance, append it to the server name, for example *Server_Name**Instance*.

In **Database**, enter the name of the AppClarity 5.2 database, this is usually **AppClarity**.

If you are using Windows Authentication to authenticate with the SQL Server instance:

Check **Trusted Connection**

You do not need to populate the **User Id** and **Password** fields.

If you are using a SQL Login to authenticate with the SQL Server instance:

Uncheck **Trusted Connection**

In **User Id**, enter the name for the SQL login you want to use to connect to the database.

In **Password**, enter the password for this login.

In **Folder Location**, enter the location for where your exported TSV file will be written.

Click **Save**.

Note

Test will confirm whether the **SLA Integrate Services Agent account**, or specified SQL Login, can connect to the specified database instance.

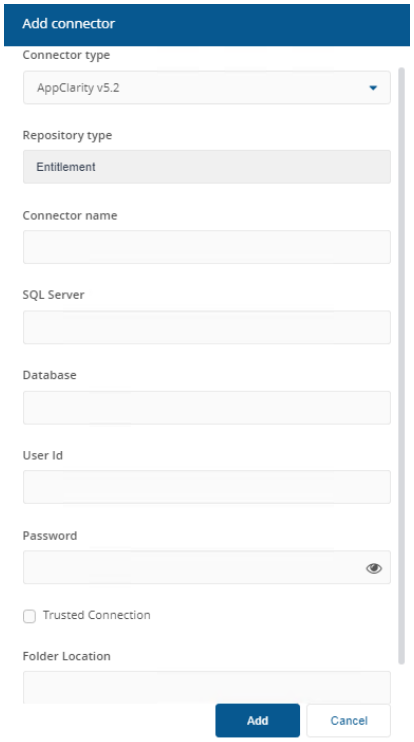
It does not test the following:

If permissions on the AppClarity 5.2 database have been set correctly (refer to Set permissions on the AppClarity 5.2 database)

If permissions on the AppClarity 5.2 database have been set correctly (refer to Set permissions on the export folder).

It is only when you attempt to use the connector (create new action Sync Data) that you will experience an issue if these points are not addressed. Then you will find the export TSV file is not created, and not see any error or warning.

Additionally, **Test** does not test if the stored procedure has been hotfixed.



10.3.2.1.4 Execute Sync Action - AppClarity 5.2

When a new connector is saved a new action is defined in Tachyon. This new action will have a name of the form: **Sync Data - Connector name**, for example **Sync Action - AppClarity 5.2 production**.

Click the **Execute** button.

In the **Execute action** popup subsequently displayed, use the **Repository** menu to select the inventory repository you want to populate.

Once the repository has been selected you can then select the action to run. In the case of inventory repositories the actions will be restricted to inventory related actions. For a connector you will be looking for an action with the form **Sync Data - <connector name>**.

For inventory syncs you have the option to check the **Clean Sync** checkbox.

10.3.2.2 Entitlement .tsv connector

Uploads entitlements from a folder containing one or more tab or comma separated value file(s).

Entitlement files can be created using the AppClarity v5.2 connector (if you are migrating from AppClarity 5.2), or created manually.

10.3.2.2.1 Requirements

Before adding a new **Entitlement .tsv** connector, you will need the following:

Entitlement files must be either tab or comma separated with corresponding **.tsv** or **.csv** extension

Entitlement files must have the correct column structure and content, as described in the reference page: Entitlement import files

The location of entitlement TSV files, which can be a folder location, or share, with at least **read access** for the **SLA Integrate Services Agent account**.

10.3.2.2.2 Entitlement .tsv connector configuration

In **Name**, enter a logical name for this connector

> **Tip**
>
> You should use a naming convention for connector names:
>
> **<connector type> <scope> <RCR>**
>
> **Scope** describes where data is coming from or what it's being used for. For example Demo, Test, Lab, Q2 Audit.

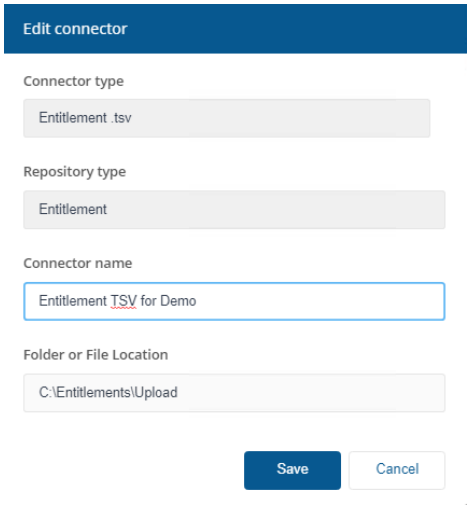
In **Folder or File Location**, enter the location for your entitlement TSV file(s)

> **Tip**
>
> The folder location can be a folder on the server, or a remote share, which the **SLA Integrate Services Agent account** has read access to.
>
> All files in the folder location will be uploaded, including sub-directories. Files can have any name, provided they have a **.tsv** or **.csv** extension.

Click **Save**

> **Tip**
>
> **Test** will error if the service account does not have read access to the folder location, or if there are no files in the folder.
>
> **Note**
>
> Once uploaded, ensure you remove uploaded files from the location. Duplicates will be created if you upload the same file(s) to the same Entitlements repository, which you will then need to manually delete.

Execute or schedule an action as described on the Connectors page.



10.3.3 Repositories page

How to configure repositories for use with AppClarity.

10.3.3.1 Managing your repositories

Go to**Settings → Configuration → Repositories**

Adding a new repository

Click on the **Add** button.

In the **Add repository** popup enter the details for the new repository.

Enter a suitable **Name** for the repository this must not match any existing repository.

Select the **Repository type**.

Enter a suitable description for the new repository.

If you want the new repository to be the default for the selected **Repository type** then check the **Default repository** checkbox, otherwise leave this unchecked.

When all the settings have been made click **Add** to create the repository.

> **Tip**
>
> You should use a naming convention for repository names:
>
> **<scope> <repository type>**
>
> Naming with **scope** first makes it easier to know which repository you are using. The name of the **repository** you are currently using is visible in a drop-down list at the top of pages in the user interface.
>
> Including the **repository type** in the name helps when creating an action or schedule.

10.3.3.1.1 Changing the name of a repository

Select a repository and click **Edit**

In the **Edit repository** popup change the Name

Change the description if required.

If you want the repository to be the default for the selected **Repository type** then check the **Default repository** checkbox, otherwise leave this unchecked.

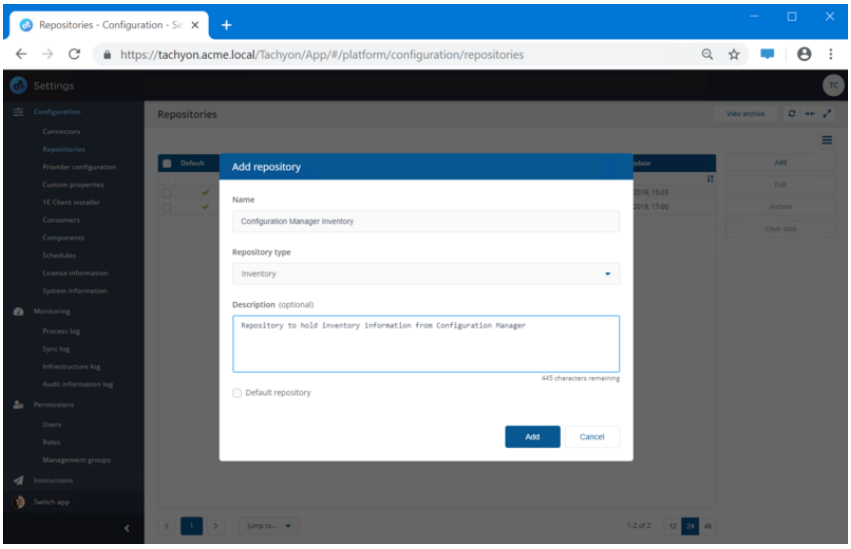
Click **Save**.

10.3.3.1.2 Setting the default repository

Select a repository, for example **Configuration Manager Inventory** and click **Edit**.

In the **Edit repository** popup check the **Default repository** checkbox and click **Save**.

Confirm the repository is listed as Default for its repository Type.



From this point on all pages that show information from an inventory repository would show the **Configuration Manager Inventory** by default. You can still change the repository for a particular page by clicking on the repository selector at the top-right of the page.

If you no longer wish a repository to be the default, then you must choose another repository instead.

> **Tip**
>
> Repositories are useful when you want to segregate different types of data. For example, you could have one inventory repository for Configuration Manager inventory data, and another one for BigFix data. Alternatively, you can have connectors to different inventory sources pushing data into one repository. Any Management Groups that you create will span all the repositories you have.

> **Note**
>
> Once you've created a new repository you cannot delete it. You can only change its details, clear its data or archive it.
>
> The name of a repository must be unique, but can be changed.

Setting a repository as the default repository means it is used as the default on certain screens.

10.3.3.2 Creating a new compliance or entitlement repository

The process is similar to creating a new inventory repository with the additional step of Configuring associations for a new compliance repository. Each **compliance** repository must be associated with one **entitlement** repository and one **inventory** repository.

When you first installed AppClarity, two repositories were created called **Default compliance** and **Default Entitlement** to add to the existing **Default Inventory**. You can associate using the steps described in Running your first Compliance License Summary.

When creating new repositories, please refer to Naming conventions.

10.3.3.2.1 Guidance for using multiple repositories

In general, you will not need additional repositories. Once a compliance repository has been used you should not change its associated entitlement or inventory repositories because that will produce inconsistent compliance results, you should keep all your:

Entitlements in a single entitlements repository, for example **Default Entitlements**, you can use additional entitlements repositories for testing entitlement imports

Reclaim policies in a single compliance repository, for example **Default compliance**, the reclaim system uses all compliance repositories, so if you create reclaim policies in multiple compliance repositories they will all be used and troubleshooting may be difficult, but you can use management groups to manage reclaim policies.

You can use a single compliance repository for compliance reporting. If you want you can create a new compliance repository for a specific compliance audit project, for example, every quarter or annually, so that you can compare one period with another. You would associate each compliance repository with your default entitlement repository, but maybe associate an additional inventory repository for each snapshot inventory.

10.3.3.2.2 Configuring associations for a new compliance repository

To create a new **compliance** repository and associate it with one **entitlement** repository and one **inventory** repository, you'll need to:

Under the **Settings**→**Configuration**→**Repositories** click **Add**.

In the **Add repository** screen for:

Name - enter a logical name for the new repository.

Repository type - select Compliance from the drop-down menu.

Inventory repository - select which Inventory repository is used by Compliance.

Entitlement repository - select which Entitlement repository is used by Compliance

Description (optional) - enter a description for the new repository.

Default repository - check if you want this to be a default repository.

When you first run AppClarity the **Entitlement repository** dropdown in the **Add repository** screen will only contain the **Default Entitlement** repository, you can select the default or other entitlement repository if you have created one.

You're now ready to start populating the compliance repository.

10.3.4 SCCM Uninstall Provider

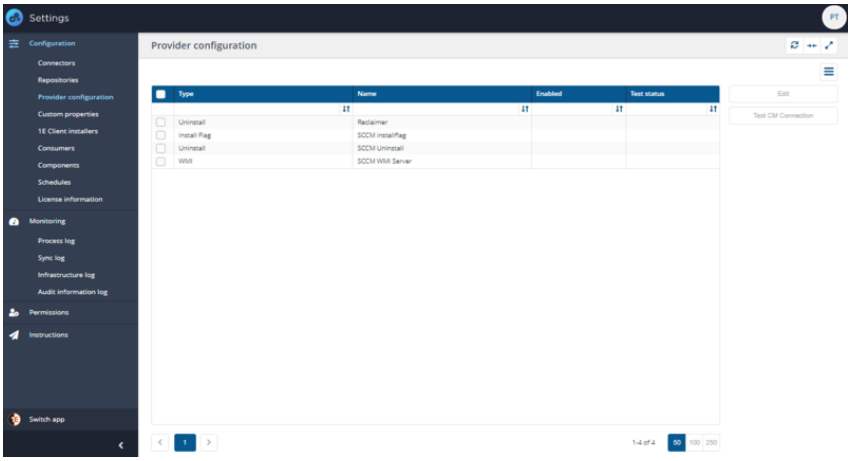
10.3.4.1 Configuring the SCCM Uninstall Provider

Enable the SCCM Uninstall provider to support the use of the SCCM custom Reclaim feature.

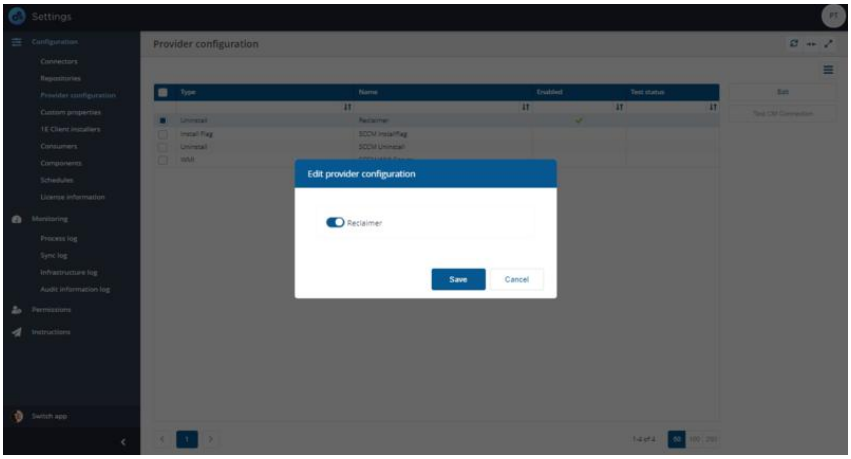
> **User role**
>
> Ensure you have **Full Administrator** role assigned to enable/disable SCCM Uninstall provider configuration from **Settings**.

To switch the **SCCM Uninstall** on:

Switch app to **Settings**→**Configuration**→**Provider Configuration** and select the **Reclaimer** provider type.

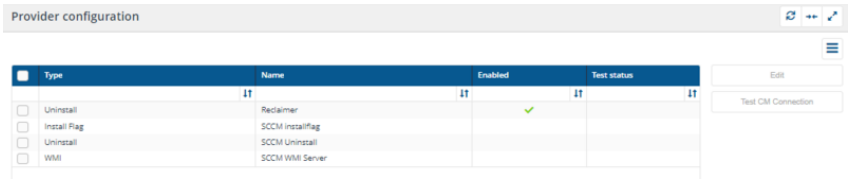


Click **Edit**.



Slide the toggle to **ON** next to **Reclaimer**.

Click **Save**.



Once you have set up the SCCM Uninstall provider configuration, on the Provider Configuration screen, select **SCCM Uninstall** and click **Test CM Connection**. A successful test connection ensures the provider configuration can connect with your SCCM server using the provided information and is ready to use.

To use the SCCM custom Reclaim, please refer to Reclaiming a product using SCCM Uninstall.

10.3.5 Deploying Software Reclaimer

The **Software Reclaimer** is an executable that is run on Windows clients and is responsible for implementing reclaim policies provided by AppClarity. It can be distributed to devices using Configuration Manager. For more details on how to set up reclaim policies, please see Reclaiming a product based on its usage.

10.3.5.1 Software Reclaimer files

Note

Software Reclaimer is deployed and run on client devices, it is not installed. The supported deployment method is using Microsoft System Center Configuration Manager, described in Configuration Manager setup below.

Before deployment, the Software Reclaimer requires configuration, described in Configuring the Software Reclaimer below.

During installation of Tachyon, Tachyon Setup (specifically the SLA Platform installer) copies three files into **C:\ProgramData\1E\SLA Platform**

AppClarity.SoftwareReclaimer.exe	The Software Reclaimer executable
AppClarity.SoftwareReclaimer.xml	Template for optional customization of the software reclaim dialog. See Customizing the dialogs. Contains the public key of the Tachyon web server when using HTTPS.
logo.png	The banner logo, preferably 500x90 pixels. See Customizing the dialogs.

If the executable is run without the customization files, it will display the default English text and 1E banner logo.

10.3.5.2 Configuring the Software Reclaimer

10.3.5.2.1 Overview

The Software Reclaimer is designed to run in two modes using the **-mode** parameter. These modes should be run at different times of the day, on all Windows workstations.

Optout mode processes optional software reclaim policies. When run, it contacts the **SLA Operations Provider API** to determine whether there is software to optionally uninstall from the local machine, and displays a dialog to the user only if there are polices for optional uninstallation. Optout mode does not uninstall any software. The Software Reclaimer does not need elevated rights to run in this mode, but does require a user to be logged on.

If there isn't software to optionally uninstall, the **SLA API** returns an empty list, and the Software Reclaimer exits without displaying anything;

If there is, the Software Reclaimer prompts the user for a response, and sends back the user's response to the **SLA Operations Provider API**

If the response is **Remove software**, then the server will convert the reclaim policy from optional to mandatory, so that the software will be uninstalled later. If the response is **I still need this**, then software is not uninstalled.

> **Tip**
>
> Optout mode is best used at a time when users are most likely at their computers so that they can respond to prompts.

Mandatory mode processes mandatory reclaim policies. In this mode, the Reclaimer runs unattended and does not display any dialog or progress bars. When run, it contacts the **SLA Operations Provider API** service to determine whether there is software to uninstall from the local machine. For this to work, the Software Reclaimer must be run with administrative privileges.

If there isn't software to uninstall, the server returns an empty list, and the Software Reclaimer exits

If there is, the **SLA Operations Provider API** returns the software it considers the highest priority to remove for the Software Reclaimer to act on immediately. The Reclaimer attempts to uninstall the software, returning the result to the **SLA Operations Provider API**.

> **Tip**
>
> Mandatory mode is best used at a time when users are not at their computers so that any software uninstall does not disrupt them during working hours.
>
> Mandatory mode should be run at least one hour after optout in order to allow the server to process opt-out responses. Typically, you will configure deployments to run opt-out mode in the morning when the user is logged on, and mandatory mode in the afternoon when the computer is switched on.
>
> **Note**
>
> Regardless of the mode in which it is run, by default the Software Reclaimer will wait a random amount of time before it begins. The random wait is anywhere between 0 and

60 minutes and is implemented to prevent flooding the **SLA Operations Provider API** in larger organizations.

Mandatory reclaim process will reclaim only one software in a cycle.

Note

The supported deployment method is using Microsoft System Center Configuration Manager, described in Configuration Manager setup.

10.3.5.2.2 Software Reclaimer command line

```
AppClarity.SoftwareReclaimer.exe [-mode <mode>] [-service "<serverURL>/CoreExternal/api/ReclaimAction/Action/"]
```

Name	Value options	Notes
-mode	mandatory optout both (default)	This parameter determines the Software Reclaimer request mode. Although this parameter is optional, you should always use it with a value of **mandatory** or **optout**. **Warning** Do not use the value**both**unless testing; because it will run optout and then immediately run mandatory, without sufficient time for the server to have processed the opt-out response, especially if you have used the **-nowait** parameter. You would typically wait for several minutes up to an hour to allow opt-out responses to be processed.
-service	`<serverURL>/CoreExternal/api/ReclaimAction/Action/`	**<serverURL>** is the binding used to connect to the Tachyon server which hosts the SLA Operations Provider API, for example: **https://tachyon.acme.local:443** If this parameter is not used, the Software Reclaimer will attempt to use the URL specified in **<appClarityReclaimerServiceUrl>** under the **<appSettings>** section of the **AppClarity.SoftwareReclaimer.xml** file. The URL in the template XML files uses HTTPS. You can change the URL to use HTTP, or keep HTTPS and add the public key of the Tachyon web server. **Warning** To use HTTPS please refer to Configuring Software Reclaimer to use HTTP or HTTPS. Using HTTP does not require any additional configuration if the **-service** parameter is used. This parameter is not required in Demo mode, however if not provided you will see COM exception errors logged.

Name	Value options	Notes
-nowait		By default, the Software Reclaimer waits a random amount of time before it contacts the server, regardless of the mode in which it is run. The random wait is anywhere between 0 and 60 minutes and is implemented to prevent flooding the AppClarity service in large organizations. The **-nowait** parameter can be used to avoid the random wait, which is useful when testing. **Note** The **-nowait** parameter is for testing purposes only and must never be used in a production environment.

10.3.5.2.3 Configuring Software Reclaimer to use HTTP or HTTPS

10.3.5.2.3.1 If using HTTP

Specify HTTP in the server URL used to connect to the Tachyon Web Server (Master Stack):

Either edit the server URL in each XML file(s)

Use the **-service** parameter to override XML file(s).

10.3.5.2.3.2 If using HTTPS

You can configure the Software Reclaimer to use SSL over HTTPS to connect to the Tachyon website. The following applies to the Tachyon website's SSL certificate:

It must be trusted by clients running the Software Reclaimer. This is also the same requirement for Tachyon clients. Please refer to Client authentication certificates

Its public key must be encoded in each of the Software Reclaimer XML file(s)

Use the attached ReclaimerPublicKey.ps1 to encode the public key and add it to the XML file.

Either run the script on the Tachyon Web Server (Master Stack)

Or copy the XML file from the Web Server into the same folder as the PowerShell script, and then run the script

If you have multiple XML files to support customizations then you will need to add the public key to each of them.

10.3.5.2.3.3 Using a non-standard port

A default installation of Tachyon uses standard ports HTTP 80 and HTTPS 443. You may wish to use a different port for Software Reclaimer, for example, if you previously used:

HTTP 8335 or HTTPS 8336 with AppClarity 5.2

HTTP 8080 or HTTPS 8443 with SLA Platform 3.3 and AppClarity 6.1

You can manually add a website binding after installation of Tachyon. You may already be using a non-standard port if specified in Tachyon Setup during installation of Tachyon, or you manually added a binding after installation for another application like Application Migration, or ActiveEfficiency.

10.3.5.2.4 Testing Software Reclaimer

If you simply want to demonstrate how the reclaimer behaves, or test customizations (refer to Customizing the dialogs), then you can use Demo mode.

If you run Software Reclaimer on a device that has a reclaim policy then it will process the reclaim in the normal way. That is, it will present the optout dialog if the policy is configured for optional uninstall, and uninstall the software in mandatory mode. You will not be able to easily repeat the test even if you re-install the software, because the policy will have been processed on the server and be subject to Site Settings affecting the Software Reclaimer, including uss_AutomaticUninstallOptOutInterval_Days (7) and uss_MinimumResendCompletedPolicy_Days (14).

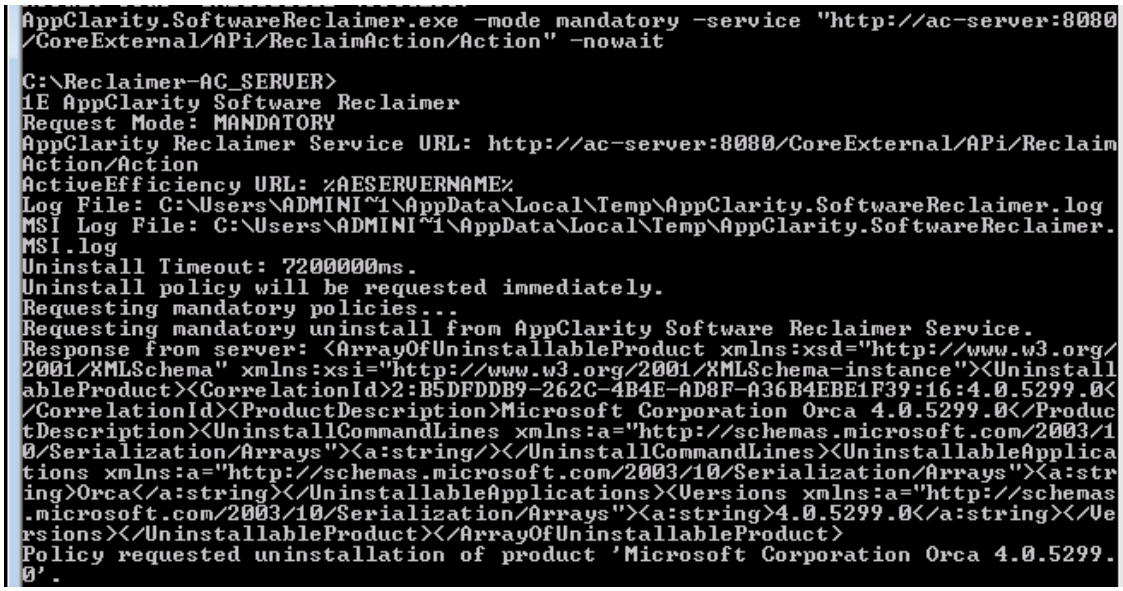
Warning

Only add the -nowait parameter when testing.

```
AppClarity.SoftwareReclaimer.exe [-mode <mode>] [-service <serverURL>/CoreExter
nal/api/ReclaimAction/Action/] -nowait
```

You can see reclaim reports in Viewing the software reclaim reports.

10.3.5.2.5 Example command-line for testing mandatory mode



To view what policies affect a device, without processing a reclaim, you can test the URL in a browser:

```
<serverURL>/CoreExternal/api/ReclaimAction/Action/OptionalPolicy?machinegroup=<
Domain Name>&machinename=<Machine Name>
```

```
<serverURL>/CoreExternal/api/ReclaimAction/Action/UninstallPolicy?machinegroup=
<Domain Name>&machinename=<Machine Name>
```

<serverURL> is the binding used to connect to the Tachyon server which hosts the SLA Operations Provider API, for example: **https://tachyon.acme.local:443**

Below is an example XML response for a mandatory request. You would only see details for one application at any time. If you have multiple reclaims for the same device then the server will prioritize one at a time.

Example XML response for a mandatory request Expand source

```
<ArrayOfUninstallableProduct xmlns="http://www.1e.com/appclarity/services/softw
arereclaimer/" xmlns:i="http://www.w3.org/2001/XMLSchema-instance">

</ArrayOfUninstallableProduct>
```

10.3.5.2.6 Log files

Every time the Reclaimer runs it will create a local log file of the process it is doing. The location and name of the log file depends on what task the reclaimer is doing.

Task	Logpath	Notes
Optout	**C:\Users\{USER}\AppData\Local\Temp\ AppClarity.SoftwareReclaimer.log**	Optout mode is normally run under user context so that the user can interact with the dialog.

Task	Logpath	Notes
		This means the log file will be in the users Temp folder within the user profile.
Mandatory	**C:\windows\Temp\AppClarity.SoftwareReclaimer.log**	Mandatory mode is normally set to run under system context, in order to process reclaim uninstall commands. Therefore, the log file will be under the system temp directory.
Reclaim	**C:\windows\Temp\AppClarity.SoftwareReclaimer.MSI.log**	For a mandatory reclaim, if a reclaim occurs using an MSI then an MSI log

Task	Logpath	Notes
		file is also created.

10.3.5.3 Configuration Manager setup

The following assumes you will create one Configuration Manager package, with two deployments. However, an additional two deployments are recommended for initial testing.

10.3.5.3.1 To setup the Software Reclaimer in Configuration Manager

Create a source folder in your Configuration Manager site source folder structure

Copy the AppClarity.SoftwareReclaimer.exe and optionally the two customization files into the source folder

Optionally include other customization files, if required for language support - see customizing the dialogs

> **Tip**
>
> During Tachyon installation, AppClarity.SoftwareReclaimer.exe and the two customization files are copied to : <installation drive>:\ProgramData\1E\SLA Platform

In Configuration Manager console, deploy a new software distribution package, with two programs

In package settings, point the source directory to the source folder where you copied all the files.

For the newly created package, distribute to relevant distribution points.

Create a new collection to be used specifically for the Software Reclaimer.

Create two new programs for the package – one for the mandatory mode and one for the opt-out mode.

Create two deployments – one for each program.

10.3.5.3.2 Collections

We recommend you create at least one new collection specifically for use with the Software Reclaimer. DO NOT reuse an existing collection made for another purpose in case you need to add exclusions at a later date. The collection must contain all the Windows workstations you want to run the Software Reclaimer on. There may be instances where it is advisable to create more than one collection so that you can stagger the times the Software Reclaimer is run within your organization.

10.3.5.3.3 Programs

You must create up two programs for the package – one for opt-out mode and one for mandatory mode.

The parameters you need to set in Configuration Manager when you run it in mandatory mode are:

Parameter	Value
Command line:	`AppClarity.SoftwareReclaimer.exe -mode MANDATORY -service "<server URL>/CoreExternal/api/ReclaimAction/Action"` See Software Reclaimer command-line regarding the **-service** parameter.
Program can run:	Whether or not a user is logged on.
Run mode:	Run with administrative rights. In mandatory mode, the Software Reclaimer requires administrative privileges to run without user intervention and it is advisable to run it when users are not at their computers to avoid interrupting them during working hours. When the application to be uninstalled has been installed in per user mode, i.e. the **only for me** option was selected during installation, the program for the Configuration Manager package must be run with user's rights. If the application has not been installed in per user mode, i.e. the **for everyone** option was selected during installation, the program for the Configuration Manager package must be run with administrative rights.

In opt-out mode, the Software Reclaimer does not require elevated rights and it is advisable to run it at a time when users are most likely at their computers so that they can respond to prompts. The parameters you need to set in Configuration Manager when you run it in opt-out mode are:

Parameter	Value
Command line:	`AppClarity.SoftwareReclaimer.exe -mode OPTOUT -service "<serverURL>/CoreExternal/api/ReclaimAction/Action"` See Software Reclaimer command-line regarding the **-service** parameter.
Program can run:	Only when a user is logged on.
Run mode:	Run with user's rights.
When this program is assigned to a computer:	Run once for every user who logs on.

10.3.5.3.4 Deployments

Each program created (one for opt-out mode and one for mandatory mode) must have its own deployment. Additionally, if you created more than one collection, you must create an advertisement for each collection. The parameters for the deployments are:

Parameter	Value
Mandatory assignments:	Occurs every 1 day(s) effective **<date>** where **<date>** is when the mandatory assignment comes into effect.
Program rerun behavior:	Always rerun program.
Distribution points:	Download content from distribution point and run locally.

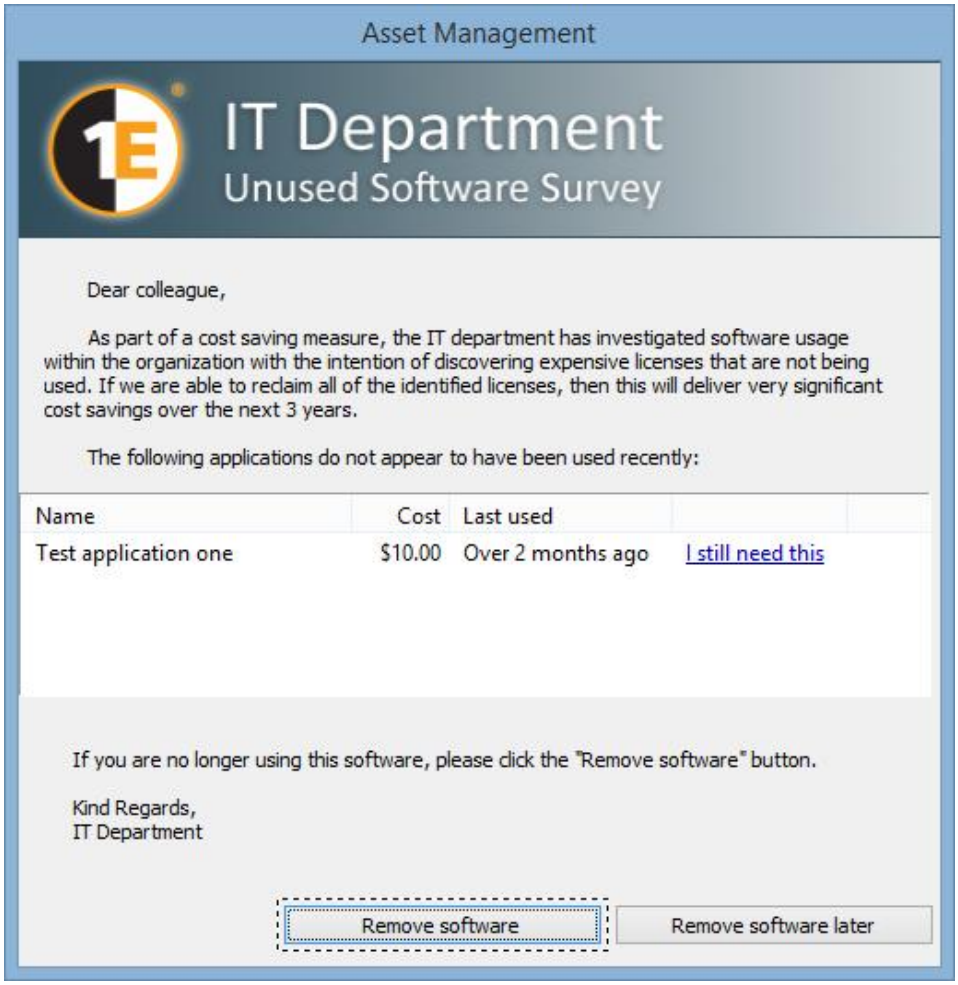
> **Tip**
>
> Mandatory mode is best used at a time when users are not at their computers so that any software uninstall does not disrupt them during working hours.
>
> Mandatory mode should be run at least one hour after optout in order to allow the server to process opt-out responses. Typically, you will configure deployments to run opt-out mode in the morning when the user is logged on, and mandatory mode in the afternoon when the computer is switched on.

10.3.5.3.5 Testing

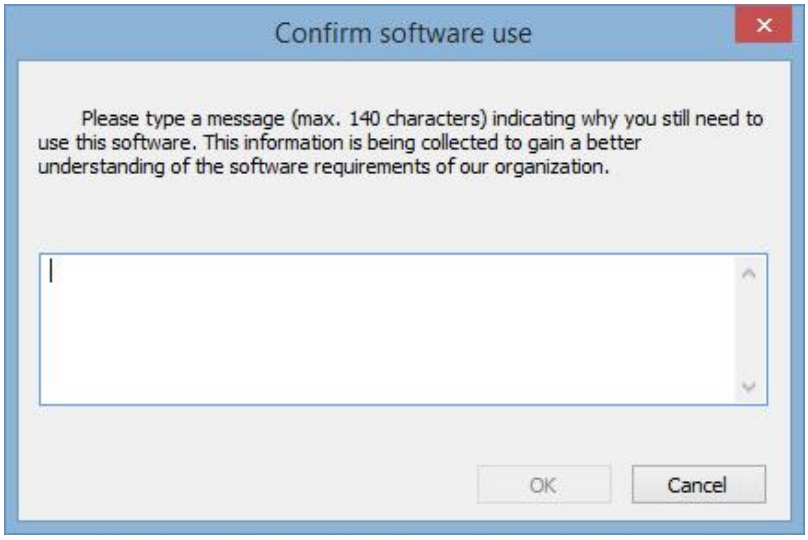
Please refer to Testing Software Reclaimer above.

10.3.5.4 Opt-out dialog and reclaim override management

This dialog is displayed when the Software Reclaimer is run in opt-out mode and only if there is at least one application that is a candidate for un-installation. If there is more than one candidate for removal, it will show up to three items as prioritized by the AppClarity server.



If the end-user selects an **I still need this...** link, a second dialog is displayed prompting them to justify their need for the corresponding application.



To close the main opt-out dialog, the end-user must select either **Remove Software** or **Remove software later**.

The Software Reclaimer closes automatically after 120 minutes if the end-user does not interact with the dialog.

Action by end-user	Response sent back to the server	Action by AppClarity	Next experience for the end-user
No action	None.	None, because the Reclaimer does not send anything back to the server.	The next time the Reclaimer runs in opt-out mode, the opt-out dialog is displayed. The applications listed depend on whether priorities have changed.
Remove software	The Reclaimer sends back a response with: end-user's choice details of any justification reasons the end-user has entered	The policy for each of the displayed applications is converted from optional to mandatory, except for applications where the end-user has given a reason using **I still need this...**. If an administrator rejects the user's reason, then the policy for that application is converted to mandatory.	The next time the Reclaimer runs in opt-out mode, the opt-out dialog is displayed only if there are further applications with optional policies. Each time the Software Reclaimer runs in mandatory mode, the Reclaimer uninstalls the top priority application that has a mandatory policy.
Remove software later	The Reclaimer sends back a response with: end-user's choice details of any justification reasons the end-user has entered	They defer the decision of whether or not to uninstall all the displayed applications. The opt-out dialog is not displayed on that machine for the next seven days even if the Software Reclaimer is run in opt-out mode on that machine within the seven-day window. When an end-user defers the decision for the first time, they must choose **I still need this...** within the next 21 days or it will be scheduled for uninstallation and not be displayed in the opt-out dialog again.	The next time the Reclaimer runs in opt-out mode, the opt-out dialog is displayed only if there are further applications with optional policies. The opt-out dialog is only shown again if there are further applications with optional policies. Next time the Software Reclaimer runs in

Action by end-user	Response sent back to the server	Action by AppClarity	Next experience for the end-user
		If an administrator rejects the user's reason, then the policy for that application is converted to mandatory.	mandatory mode, the Reclaimer uninstalls the top priority application.

When a policy for an application is converted from optional to mandatory, then the application will be handled the same as any other application that has a mandatory policy. The mandatory policies for the machine are prioritized by the AppClarity server, and the next time the Software Reclaimer runs in mandatory mode, the application with the highest mandatory policy will be uninstalled. The Software Reclaimer uninstalls only one application each time it runs.

Reclaim overrides

When a user chooses to opt out of a reclaim, their reason is displayed in Reclaim override management under the Policy tab. Administrators then have an option whether to accept or reject the end-user's reason. The end-user is not informed of the administrator's decision. Please see Opt-out dialog and reclaim override management for more information.

Administrator actions

If an administrator accepts the reason, the application policy for the end-user's machine is de-activated (is neither an optional nor mandatory policy) and the application starts again with the normal usage assessment that may cause re-activation at a later date

If an administrator rejects the reason, the policy for the application is converted from optional to mandatory.

User actions

If the user selects **Remove software**, then all applications in the list will be scheduled for un-installation. The actual un-installation is reassessed on the next mandatory-mode software reclaim run and prioritized along any other candidates for mandatory uninstall.

If the user selects **Remove software later**, they defer the decision of whether to uninstall the applications. The opt-out dialog is not displayed on that machine for the next seven days even if the Software Reclaimer is run in opt-out mode on that machine within the seven-day window.

When a user defers the decision for the first time, they must choose I still need this... within the next 21 days or it will be scheduled for uninstallation and not be displayed in the opt-out dialog again.

When a policy for an application is converted from optional to mandatory, then the application will be handled the same as any other application that has a mandatory policy. The mandatory policies for the machine are prioritized by the AppClarity server, and the next time the Software Reclaimer runs in mandatory mode, the application with the highest mandatory policy will be uninstalled. The Software Reclaimer uninstalls only one application each time it runs.

10.3.5.5 Site Settings affecting the Software Reclaimer

The Sofware Reclaimer has the following settings in the SLA databases, which directly relate to the behaviour of the Reclaimer. There are other settings in the same database tables which relate to usage policies and other behaviour of the system, some are described in Usage categories

Warning

The following is for information only, to help understand how the Reclaimer process works. Do not make changes to any settings unless advised by 1E.

Setting	Default	Purpose
uss_AutomaticUninstallRetryLimit	5	Number of times an uninstall is retried if a status is returned indicating that the uninstall failed but a retry is permitted. The retries must complete within the time window given by the setting uss_minimumResendCompletedPolicy_Days (by default, 14 days). After this the policy is recorded as having failed for the device in question
uss_AutomaticUninstallMaxItemsCount	1	Do not change this setting.
uss_AutomaticUninstallOptOutTimeoutMins	120	This is the number of minutes for which the Software Reclaimer opt-out dialog is displayed. If the user has not interacted with the dialog after this time period, it automatically closes. No default user action is associated with this closure.
uss_AutomaticUninstallOptOutMaxLimit_Days	28	This defines the length of time for which a user can continually defer the decision with regard to software reclaim, when presented with the opt-out dialog. After this time period elapses, if the user has not either requested approval for the software to be retained, or acceded to its removal, then a mandatory policy to uninstall it will be activated. The time period

Setting	Default	Purpose
		commences when the user first defers the decision from the opt-out dialog.
uss_AutomaticUninstallOptOutInterval_Days	7	The number of days before the Reclaimer opt-out dialog is redisplayed to the user, if previously the end-user responded to the dialog in any way.
uss_AutomaticUninstallOptOutMaxItemsCount	3	Do not change this setting.
uss_MinimumResendActivePolicy_Days	2	The number of days before an active policy is re-sent to a machine.
uss_MinimumResendCompletedPolicy_Days	14	The number of days before a completed policy (either successfully completed or failed) can be re-sent to a machine.
uss_AutomaticUninstallRemoveComponentProducts	1	If set, indicates that, if a software reclaim policy is associated with a product which is a suite (e.g Microsoft Office Professional Plus), then any component products associated with that suite (e.g Excel) will also be uninstalled.
uss_AutomaticUninstallKeepInterval_Days	60	The number of days before an active policy is re-sent to a machine If a user has requested that a software item not be reclaimed, and the request has not already been approved or rejected, then this is the number of days that must elapse before the user will again be prompted as to what action should be taken.
uss_ReclaimOptOutInfoDetails_MaxRows	100	Do not change this setting.

Warning

Do not make changes to any settings unless advised by 1E.

The settings exist in **[SLA-Shared].[dbo].[ProjectSetting]** table, which gets copied to **[SLA-Data].[dbo].[InstanceSetting]** when a new Inventory repository is created. Each Inventory repository will have its own group of settings in the InstanceSetting table. You can edit **[SLA-Data].[dbo].[InstanceSetting]** to change the settings for an existing repository. If that repository contains reclaim policies, the new settings will take effect and update the policies after an action is run on the repository.

Use the following SQL script to view settings in both tables.

```
SELECT * for [SLA-Shared]

SELECT * FROM [SLA-Data].dbo.InstanceSetting AS ISG
JOIN [SLA-Data].dbo.InstalledProject AS IP ON IP.ProjectID=ISG.ProjectID
JOIN [SLA-Data].dbo.Instance AS I ON I.InstanceID=ISG.InstanceID
WHERE IP.Title='Compliance' AND I.IsArchived=0
```

10.3.5.6 Customizing the dialogs

Either or both of these dialogs can be customized:

For the main (Asset Management) dialog, all text plus the header logo can be customized

For the confirmation (Confirm software use dialog), all text can be customized

Dialogs are customized by using one or more locale specific XML files to override any or all parts of the two dialogs. Locales and XML search order, are discussed in more detail below under Per-locale customization.

Although you can have multiple XML files for different languages, you cannot use multiple files to independently configure either dialog. The first XML file which is considered applicable will always be used, to the exclusion of any other files.

The XML files

must be included in the same folder as the Reclaimer executable

can have any name but we recommend a convention such as **AppClarity.SoftwareReclaimer(locale).xml**

10.3.5.6.1 Customizing the logo in the main dialog

The built-in header logo used in the main dialog can be replaced using an image file called **logo.png** which must exist in the same folder as the Reclaimer executable.

For best results, this image should be **500x90 pixels**.

There can be only one logo file, because the filename is hard-coded in the software reclaimer, and is not referenced in any XML files.

10.3.5.6.2 Sample XML customization file

A sample XML file is shown below, which includes all the element names for text strings that are configurable. Any element included in an XML file will override the default built-in both dialogs for

all target locales. If the element is missing then the built-in default text will be used, as decribed below under Partial customization.

Note

The use of the CDATA sections ensures that text containing special XML characters, such as **<**, **>** and **&**, does not need to be specially escaped.

```
<?xml version="1.0" encoding="utf-8"?>
<configuration>
  <dialogResourceStrings>
    <mainDialog>
      <title>Asset Management(No LANGUAGE)</title>
      <instructions><![CDATA[
        Dear colleague,

eclaimAction/Action/</appClarityReclaimerServiceUrl>
    <activeEfficiencyUrl>http://%AESERVERNAME%/ActiveEfficiency</activeEfficien
cyUrl>
        <publicKey></publicKey>
  </appSettings>
</configuration>
```

10.3.5.6.3 AppSettings

The **<appSettings>** section of the XML file can be ignored or removed if you are using the **-service** parameter on the Software Reclaimer command-line.

If you are not using the **-service** parameter, then you must ensure that all XML files contain the correct value for **appClarityReclaimerServiceUrl**.

The **<activeEfficiencyUrl>** section is not used, and can be deleted.

The **<publicKey>** section is used to support the optional SSL pinning feature. Please contact 1E for more details about this feature.

10.3.5.6.4 Partial customization

For a partial customization, exclude elements from the XML file. This will cause the hard-coded default values embedded in the Reclaimer executable to be used. For example, if you exclude the

```
<button1><![CDATA[Remove software]]></button1>
```

element in the **<mainDialog>** section, the Remove software button will take the default value. However, any other elements which override hard-coded defaults would still take effect.

If the element corresponding to the entire dialog is omitted, then that dialog reverts to its hard-coded defaults. For example, omitting the **<confDialog>** element and its children will result in the main dialog being customized and the confirmation dialog reverting to its hard-coded defaults.

10.3.5.6.5 Per-locale customization

Locales are specified by two attributes, using the Microsoft locale name format:

The first attribute is the language associated with the locale, for example, **de** for German

The second attribute is the geographical region associated with the locale, for example, **at** for Austria

In this example **de-at** represents German (Austria). Another example is **en-us** which represents English (United States).

You can specify either the first attribute, or both attributes, when creating a customization XML file. The example XML file below specifies both attributes: *<configuration xml:lang="de-at">*. A customization file that specifies only the first attribute, for example de, would specify the language attribute as such: *<configuration xml:lang="de">*.

When the Software Reclaimer runs, it reads the Windows user locale and uses the following search order to select the first applicable customization XML file:

Region - the first XML file found whose language attribute exactly matches the full locale e.g. **<configuration xml:lang="de-at">**

Language - the first XML file found whose language attribute matches the language of the locale e.g. **<configuration xml:lang="de">**

Global default - the first XML file found that does not specify a language attribute i.e. **<configuration>**

Built-in default - otherwise use the internal hard-coded default text

The selection is then used for both dialogs. Although you can have multiple XML files for different regions and languages, you cannot use multiple files to independently configure either dialog. The first XML file which is considered applicable will always be used, to the exclusion of any other files. If the selected XML file has partial customization, the built-in default text will be used for the omitted elements.

The example XML below is a full customization of the text in both dialogs for the locale **de-at**.

```
<?xml version="1.0" encoding="utf-8"?>
<configuration xml:lang="de-at">
  <dialogResourceStrings>

```

10.3.5.7 Demo mode

Demo mode allows you to run the Software Reclaimer dialogs without the need for a server or policies, so that you can:

simply demonstrate what it looks like out of the box

validate customizations, including logo, text and locale, as described Customizing the dialogs.

Note

Demo mode does not test connection to the server, nor does it test reclaim policies.

If not using demo mode, you would need all the following in order to demonstrate or test the Reclaimer optout dialog.

Full SLA Platform infrastructure installed and working, with a Configuration Manager connector

Applications installed on your test machine

Optional policies configured that match your test machine.

The following is a way that you can run the Reclaimer as many times as you want using optout mode without requiring policies or affecting anything already configured.

Download **AppClarity.SoftwareReclaimer.Demo.xml**

Make modifications to the **OptionalUninstall** applications

You can specify from 1 up to 3 applications.

Copy the following into a test folder on your computer

AppClarity.SoftwareReclaimer.exe

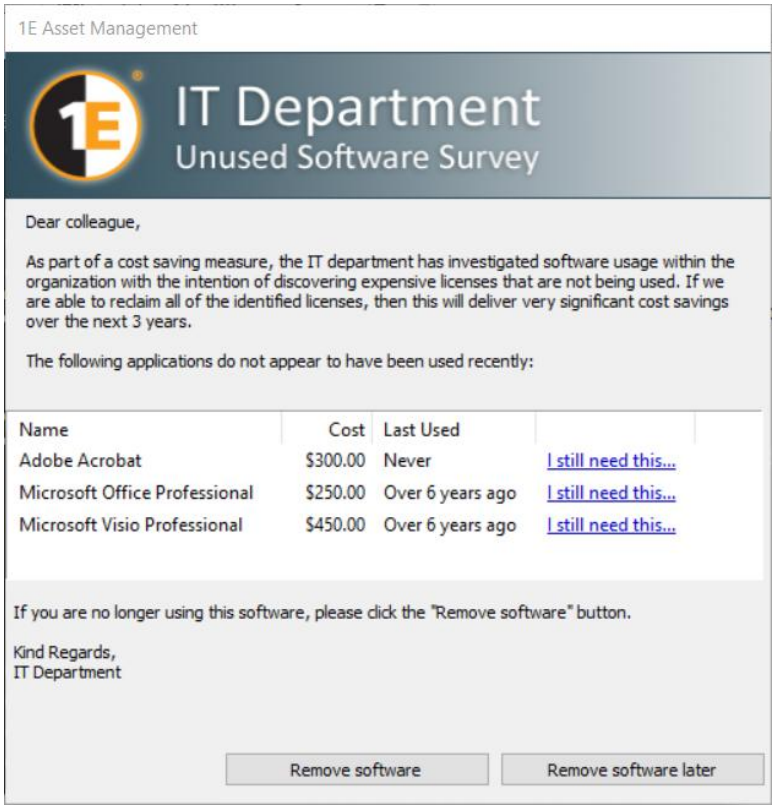
Your copy of **AppClarity.SoftwareReclaimer.Demo.xml**

Any custom XML files and logo.png that you wish to test.

From a command prompt run the following:

```
AppClarity.SoftwareReclaimer.exe -mode OPTOUT -nowait
```

The dialog is displayed showing the optional uninstall applications, with a new logo and customized dialog text from other custom XML files



Click on **I still need this...** to show the second dialog with its text customization

To close the window select one of the buttons

in demo mode these buttons do not send opt-out responses back to the server

You can then make further changes to your custom XML files, and repeat testing until you are happy with the customizations

When done, copy the custom XML files to your deployment package for deployment testing (do not include the Demo XML file).

Download AppClarity.SoftwareReclaimer.Demo.xml ...

AppClarity.SoftwareReclaimer.Demo.xml Expand source

```
<?xml version="1.0" encoding="utf-8"?>
<OptionalUninstalls>
  <!--
    name is required
    cost is optional
    if lastUsedDate is given, it must be of the form "YYYY-MM-DDTHH:MM:SSZ" (ex
ample: 2011-03-10T10:53:12Z)
    if lastUsedDate is not given, the application will be shown as "never" used
  -->
  <OptionalUninstall name="Adobe Acrobat" cost="$300" />
  <OptionalUninstall name="Microsoft Office Professional" cost="$250" lastUsedD
ate="2011-03-10T10:53:12Z" />
  <OptionalUninstall name="Microsoft Visio Professional" cost="$450" lastUsedDa
te="2011-03-10T10:53:12Z" />
</OptionalUninstalls>
```

Tip

You do not need to specify **-service** in the command line because demo mode does not use the server. Even if specified, the parameter is ignored in demo mode.

For the same reason you do not need to configure the **<appClarityReclaimerServiceUrl>** setting in the **<appSettings>** section of any XML files, or the publicKey for HTTPS.

10.3.5.8 Digital signing certificates

10.3.5.8.1 Certificate limitations - signing certificates missing

On Windows computers, the installation MSI files, and binary executable and DLL files of 1E software are digitally signed. The 1E code signing certificate uses a timestamping certificate as its countersignature. 1E occasionally changes its code signing certificate, and uses it for new releases and patches for older versions, as shown in the table(s) below.

Root Certificate Authorities are implicitly trusted to validate certificates, and their certificates must be correctly installed to do this. Your computers should already have the necessary **root CA** certificates installed, however this may have been prevented by your organization's security policies, or inability to connect to the Internet, or they are legacy OS. In general this is not an issue because by default Windows allows software to be

installed and run without validation, although you may see a warning or experience a delay. However, you *must* have relevant CA certificates installed if you are using 1E Client (which self-validates its own files), or your organization has applied more secure polices (for example UAC, AppLocker or SmartScreen).

Typical reasons for issues with signing certificate are:

If your organization has disabled **Automatic Root Certificates Update** then you must ensure the relevant **root CA** certificates are correctly installed on each computer

If computers do not have access to the Internet then you must ensure the relevant **root and issuing CA** certificates are correctly installed on each computer, numbered in the table(s) below.

The signature algorithm of the 1E code signing certificate is SHA256RSA. In most cases, the file digest algorithm of an authenticode signature is SHA256, and the countersignature is a RFC3161 compliant timestamp. The exception is on legacy OS (Windows XP, Vista, Server 2003 and Server 2008) which require the file digest algorithm of an authenticode signature to be SHA1, and a legacy countersignature.

The table below applies to software and hotfixes released in 2020.

2020	**Signing certificate**	**Timestamping certificates**
Certificate	1E Limited	TIMESTAMP-SHA256-2019-10-15 ***and*** DigiCert Timestamp Responder
Issuing CA	**DigiCert EV Code Signing CA (SHA2)** Thumbprint: 60ee3fc53d4bdfd1697ae5beae1cab1c0f3ad4e3	**DigiCert SHA2 Assured ID Timestamping CA** Thumbprint: 3ba63a6e4841355772debef9cdcf4d5af353a297 ***and*** **DigiCert Assured ID CA-1** Thumbprint: 19a09b5a36f4dd99727df783c17a51231a56c117
Root CA	**DigiCert High Assurance EV Root CA** Thumbprint: 5fb7ee0633e259dbad0c4c9ae6d38f1a61c7dc25	**DigiCert Assured ID Root CA** Thumbprint: 0563b8630d62d75abbc8ab1e4bdfb5a899b24d43

10.3.5.8.2 Certificate limitations - expired root certificates

Ensure that your Root CA Certificates are up-to-date on clients and servers. The **Automatic Root Certificates Update** feature is enabled by default, but its configuration may have been changed or restricted by Group Policy **Turn off Automatic Root Certificates Update**.

If this GPO is enabled, then you will see *DisableRootAutoUpdate = 1 (dword)* in *HKLM\Software\Policies\Microsoft\SystemCertificates\AuthRoot.*

10.4Using AppClarity

How SAM users use AppClarity to view software inventory and usage, handle software reclaim, manage entitlements and view effective license positions, compliance and calculate license demand.

10.4.1 AppClarity user roles

AppClarity supports Role Based Access Control (RBAC). RBAC allows a Tachyon Administrator to allocate specific AppClarity based roles to different users, thereby enabling access and actions to the screens those users need to carry out their roles. This avoids unwanted access being permitted to SAM team members outside of their role, ensuring data security and improving governance.

There are pre-defined roles with sets of permissions aimed at particular SAM user types. Tachyon Administrators can assign any of these AppClarity based roles to any AD domain user.

Typically you would install AppClarity using the the Tachyon installation account. This role has purposefully limited permissions, but is able to add new Tachyon users and assign roles to those users. So after installing AppClarity one of the first steps would be to add the **AppClarity Administrator** role to an existing or new Tachyon user and then continue with the verification steps to confirm that AppClarity has been successfully installed. Please refer to Verifying for more details.

After the AppClarity installation has been verified you would then have the ongoing task of identifying your SAM users adding them as Tachyon users and assigning their AppClarity roles to allow them to carry out their SAM duties.

> **Note**
>
> AppClarity permissions are granted on a module level (for example, Entitlement, Reclaim or Compliance) and not at per screen level (such as **Entitlement→Summary Report** or **Reclaim→Savings**), for example:

A Tachyon Administrator has a request for a Reclaim Viewer to only view the **Entitlement**→Summary Report.

The Tachyon Administrator assigns the role of **Entitlement Administrator** to the Reclaim Viewer.

The Reclaim Viewer would be able to view all screens under Entitlement module, not just the requested screen, **Entitlement**→Summary Report.

10.4.1.1 Pre-defined AppClarity roles

The pre-defined roles are:

Role	Actions
AppClarity Administrator	Create, update, delete and view AppClarity Compliance, Entitlement, License Demand and Reclaim - view and export Inventory - view, edit, delete and export Associations
Reclaim Administrator	Create, update, delete and view AppClarity Reclaim - view and export Inventory - view, edit, delete and export Associations
Reclaim Viewer	View only AppClarity Reclaims
Entitlement Administrator	Create, update, delete and view AppClarity Entitlement - view and export Inventory - view, edit, delete and export Associations
Compliance Administrator	Create, update, delete and view AppClarity Compliance, Entitlement and License Demand - view AppClarity Reclaim - view and export Inventory - view, edit, delete and export Associations
Compliance Viewer	View only AppClarity Compliance, Entitlement and License Demand

10.4.1.2 AppClarity screen access and actions per role

In this section we will define the screens and actions that each Role will be able to access, and what actions are available, the actual function of each screen and action is detailed in the later pages.

10.4.1.2.1 AppClarity Administrator

This user is not able to assign roles in the settings application

Screen	Actions	View only
Entitlements - Summary Report	Refresh Report	Yes
Entitlements - Licenses / Maintenances	New License, New Maintenance, Edit, Publish, Clone, Move to Draft, Delete, Components, Export, Refresh Report	No

License Demand - Oracle Processor License Demand	Show Detailed Report	No

Screen	Actions	View only
License Demand - Oracle Processor License Demand - Detailed Report	Export	No
License Demand - Red Hat Socket License Demand	Show Detailed Report	No
License Demand - Red Hat Socket License Demand - Detailed Report	Export	No
Reclaim - Usage Summary	Add Policy, Export, Refresh Report	No
Reclaim - Usage Summary - New Policy	Evaluate, Save Draft, Publish, Cancel	No
Reclaim - Reclaim History	Export, Refresh Report	No
Reclaim - Policies	New Policy, Edit, Publish, Clone, Move to Draft, Delete,Manage Associations, Export, Refresh Report	No
Reclaim - Policies - New Policy	Evaluate, Save Draft, Publish, Cancel	No
Reclaim - Policies - Edit Policy	Evaluate, Save Draft, Publish, Cancel	No
Reclaim - Policies - Cloned Policy	Evaluate, Save Draft, Publish, Cancel	No
Reclaim - Policies - Manage Associations	Opens the Inventory - Manage Associations - Product to CM Screen with the Reclaimable filter selected Add Association, Edit Association and Remove Association Buttons are disabled unless a Reclaim has been created	No
Reclaim - Savings	Export, Refresh Report	No

10.4.1.2.2 Reclaim Administrator

This user is not able to assign roles in the settings application

Screen	Actions	View only
Reclaim - Usage Summary	Add Policy, Export, Refresh Report	No
Reclaim - Usage Summary - New Policy	Evaluate, Save Draft, Publish, Cancel	No
Reclaim - Reclaim History	Export, Refresh Report	No
Reclaim - Policies	New Policy, Edit, Publish, Clone, Move to Draft, Delete, Manage Associations, Export, Refresh Report	No
Reclaim - Policies - New Policy	Evaluate, Save Draft, Publish, Cancel	No
Reclaim - Policies - Edit Policy	Evaluate, Save Draft, Publish, Cancel	No
Reclaim - Policies - Cloned Policy	Evaluate, Save Draft, Publish, Cancel	No
Reclaim - Policies - Manage Associations	Opens the Inventory - Manage Associations - Product to CM Screen with the Reclaimable filter selected Add Association, Edit Association and Remove Association Buttons are disabled unless a Reclaim has been created	No
Reclaim - Savings	Export, Refresh Report	No
Compliance - License Summary - Add Reclaim Policy	Add Policy	No

10.4.1.2.3 Reclaim Viewer

This user is not able to assign roles in the settings application

Screen	Actions	View only
Reclaim - Usage Summary	No actions possible on this screen	Yes
Reclaim - Reclaim History	No actions possible on this screen	Yes
Reclaim - Policies	Manage Associations	No
Reclaim - Policies - Manage Associations	Opens the Inventory - Manage Associations - Product to CM Screen with the Reclaimable filter selected No actions possible on this screen	Yes
Reclaim - Savings	No actions possible on this screen	Yes

10.4.1.2.4 Entitlement Administrator

This user is not able to assign roles in the settings application

Screen	Actions	View only
Entitlements - Summary Report	Refresh Report	No
Entitlements - Licenses / Maintenances	New License, New Maintenance, Edit, Publish, Clone, Move to Draft, Delete, Components, Export, Refresh Report	No
Entitlements - Licenses / Maintenances - Links popup	No actions possible on this screen	Yes
Entitlements - Licenses / Maintenances - Vendor popup	No actions possible on this screen	Yes
Entitlements - Licenses / Maintenances - New License	Publish, Save Draft, Cancel	No
Entitlements - Licenses / Maintenances - New Maintenance	Publish, Save Draft, Cancel	No

Screen	Actions	View only
Entitlements - Licenses / Maintenances - Edit License	Publish, Save Draft, Cancel	No
Entitlements - Licenses / Maintenances - Clone	Publish, Save Draft, Cancel	No
Entitlements - Licenses / Maintenances - Components	No actions possible on this screen	No
Entitlements - Agreements	New Agreement, Edit, Publish, Clone, Move to Draft, Delete, Export, Refresh Reports	No
Entitlements - Agreements - Links popup	No actions possible on this screen	Yes
Entitlements - Agreements - New Agreement	Publish, Save Draft, Cancel	No
Entitlements - Agreements - Edit	Publish, Save Draft, Cancel	No
Entitlements - Agreements - Clone	Publish, Save Draft, Cancel	No
Entitlements - Contracts	New Contract, Edit, Delete, Export, Refresh Reports	No
Entitlements - Contracts - New Contract	Save, Cancel	No
Entitlements - Contracts - Edit	Save, Cancel	No

10.4.1.2.5 Compliance Administrator

This user is not able to assign roles in the settings application

Screen	Actions	View only
Entitlements - Summary Report	Refresh Report	No

Screen	Actions	View only
Entitlements - Licenses / Maintenances	New License, New Maintenance, Edit, Publish, Clone, Move to Draft, Delete, Components, Export, Refresh Report	No

Screen	Actions	View only
License Demand - Oracle Processor License Demand	No actions possible on this screen	Yes
License Demand - Red Hat Socket License Demand	No actions possible on this screen	Yes

10.4.2 Running your first Compliance License Summary

The first time you start AppClarity it's advisable and helpful to start with viewing the **License Summary** for the situation where you have no entitlements defined in the selected compliance repository, refer to the Repositories page for more information.

This gives you an established baseline to work with, where you can see what AppClarity is reporting to you without involving entitlements. It also lets you get familiar with the way that the information gets into the **License Summary** for a particular compliance repository.

10.4.2.1 Default repositories and permissions needed

The compliance screens in AppClarity rely on selecting a compliance repository that has been associated to both entitlement and inventory repositories. When you installed AppClarity, this created two new default repositories in **Settings**→Configuration→Repositories to add to the existing default inventory making three:

Default Inventory.

Default Entitlement.

Default Compliance.

To run a Compliance Report, an AppClarity user must have any of the following roles:

Full Administrator

AppClarity Administrator

Compliance Administrator.

Logged-in users with any of the following roles can view the **AppClarity→Compliance→License Summary** screen:

Full Administrator

AppClarity Administrator

Compliance Administrator

Compliance Viewer.

10.4.2.2 Associating the default repositories

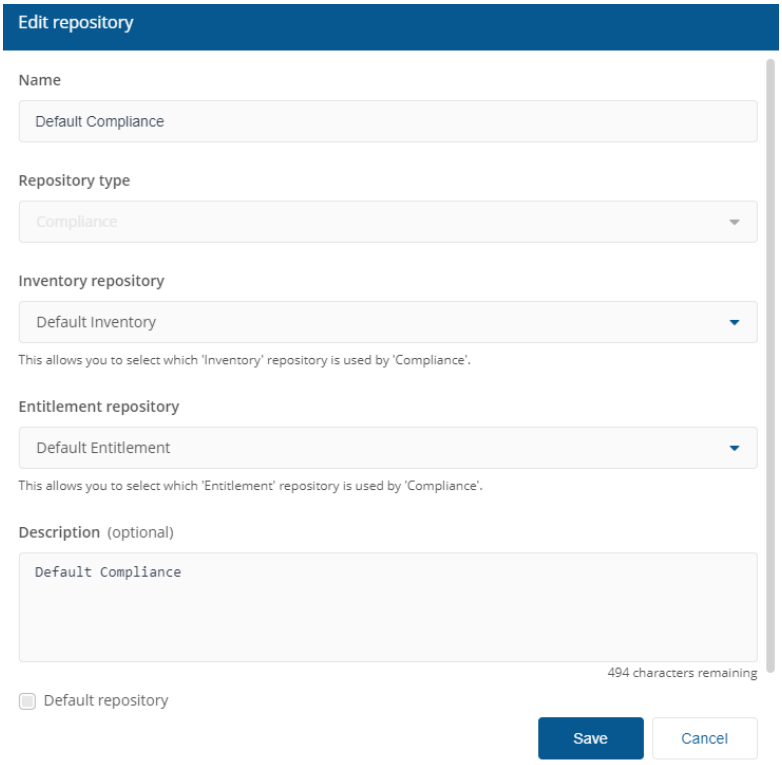
The first time you browse to the AppClarity pages the only repositories available are the default ones. To run the **AppClarity→ Compliance→License Summary** you will use the **Default Compliance** repository, it will already be associated with the **Default Inventory** but you'll also need to associate it with the **Default Entitlement** repository. Switch to **Settings→Configuration→Repositories**:

Check the checkbox for the **Default Compliance** repository, and click **Edit**.

Once the **Default Compliance repository** opens in edit mode, select the **Default Inventory** and **Default Entitlement** repositories.

Optionally enter a description.

Click **Save**.



10.4.2.3 Viewing the Compliance License Position

Before viewing the Compliance License Position, ensure **License Demand Compliance (LDC)** reports for Microsoft Core, Oracle Processor, IBM PVU and RedHat Socket have been refreshed.

To run and view License Demand Compliance (LDC) reports :

Switch to **AppClarity→License Demand**.

On the **License Demand Calculation Report** screen, select your compliance repository from the dropdown list.

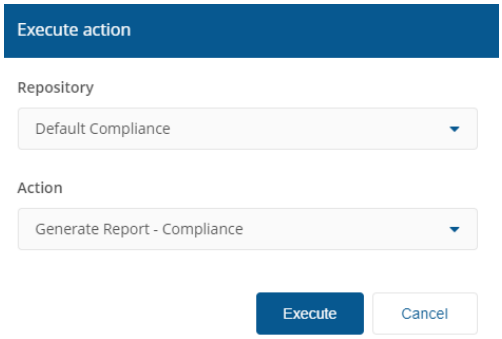
Click **Refresh** for each report.

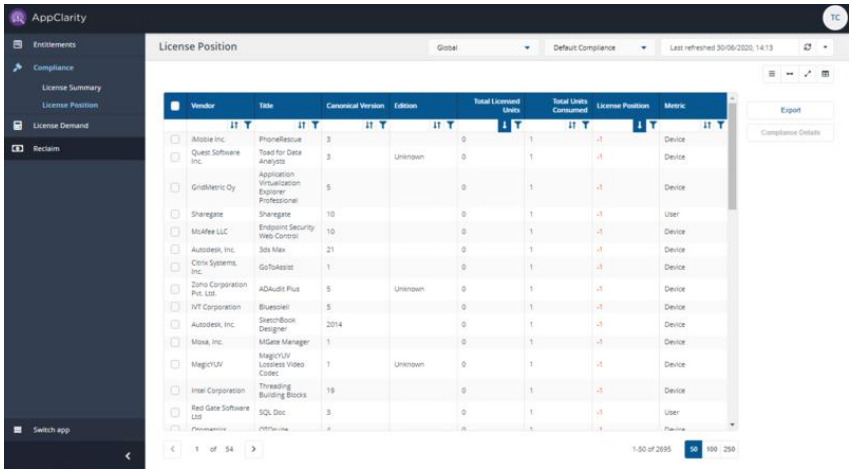
Once the report refresh shows as complete, click **View Report**.

When you have refreshed the LDC reports, refresh the Compliance Report and view License Position for Compliance using the **Refresh reports** icon on the top right of the page.

The screen should now display the information derived from the reports we just refreshed. Here we can see entries for each product, including the **Vendor**, **Title** and **Edition** and the most significant value, which is in the **License Position** column.

This shows the status of the licenses for each of those products, as there are no entitlements defined, they'll show negative values. The numbers indicate how many licenses are needed in order to make that product compliant. The **License Metric** column at the end of the row shows how the licenses are calculated, either by **Device**, **User**, **Core** or by **Processor**.





10.4.2.4 Viewing Compliance License details

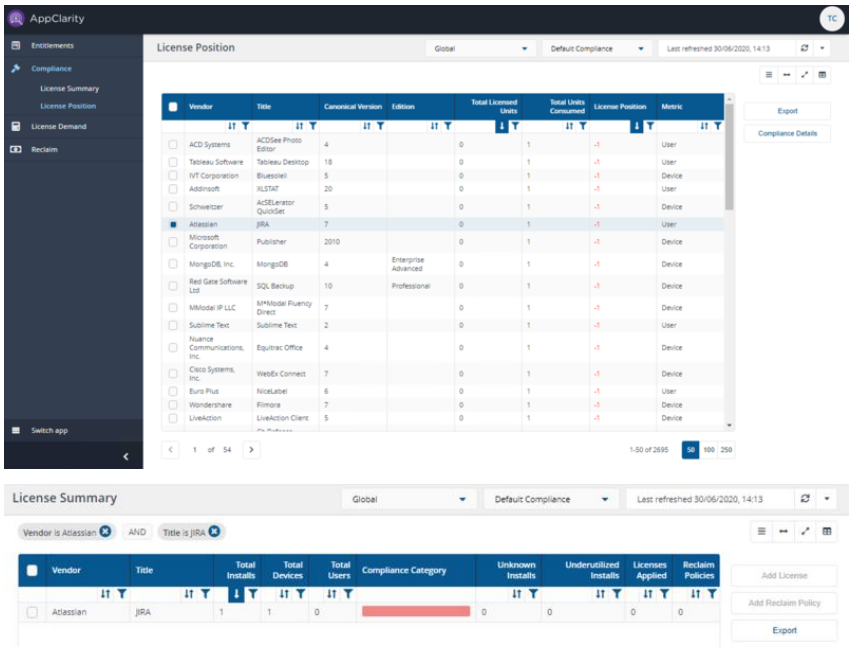
To view the **Compliance Details** for any of the products displayed:

On the **License Postion** page check the checkbox one or more products and click **Compliance Details**.

The License Summary for the selected product or products. From here you can further explore the **Compliance Category** for a particular product by clicking on the colored **Compliance Category** bar.

In the License Summary by Installs, you can review the license position for that software and filter a detailed table, for example by **Status**, **Machine Name** or by **Primary User**.

You've just created your first report in AppClarity and had a quick glance at your compliance position, without any entitlements set, showing what types of software are installed in your network and how many licenses must be created in order to make that software compliant.



Note

The Effective License Position (ELP) shows details for the installation title for product titles where they differ, for example:

SQL Server Master Data Services, SQL Server Data Quality Services, SQL Server Integration Services etc. - mapping with the demand for SQL Server

RedHat Linux Server installation on VMs - mapped with demand of RedHat Enterprise Linux for Virtual Datacenters.

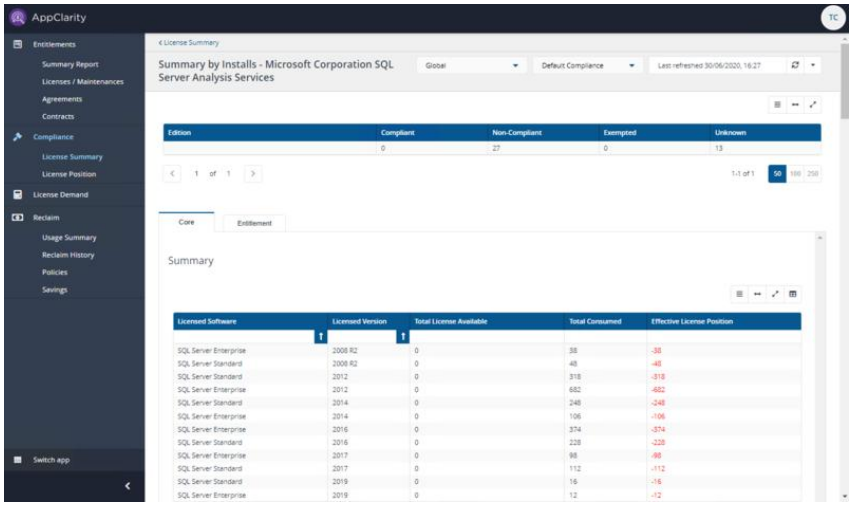
In the example shown, the **License Summary** page has been filtered to show results with the title, SQL Server Analysis Services (SSAS), then clicking on **Compliance Category** color bar for SSASshows the ELP for this product. SSAS is now matched with mapped with SQL Server, this means the complete ELP position is shown for SQL Server.

In addition, the ELP for the licensed and mapped titles remain the same for a given Management Group, for example:

If there are 100 installs of SSAS in the Global Management Group and 10 in Management Group 1

100 installs of SQL Server in Global and 70 in Management Group 1.

A selection of either SSAS or SQL Server would show a license position of SQL Server for Management Group 1 based on the combined 70 installs of SQL Server and 10 of SSAS.



10.4.2.5 Refreshing reports for your repositories

You can refresh reports from individual AppClarity screens, as well as using the Settings App, by using the refresh icon next to the **Last Refreshed** box:

Clicking the dropdown icon next to the refresh icon shows you the last report that was run, a link to the **Settings→Monitoring→Process Log** and a **Status**:

Green tick - indicates a successful refresh

Triangle exclamation - indicates a failed refresh.

You can refresh reports from the following pages:

Title page	Sub-Page	Report
Entitlements	Entitlement Summary	Entitlement Consolidation
License / Maintenance	Entitlement Consolidation	
Agreement	Entitlement Consolidation	
Contract	Entitlement Consolidation	
Compliance	License Summary	Compliance
Compliance Summary by Installs	Compliance	

Title page	Sub-Page	Report
License Position	Compliance	
License Demand	License Demand Calculation Summary report - first page	License Demand Calculation report
License Demand - Detailed Report	License Demand Calculation report	
Reclaim	Usage Summary	Reclaim Product Usage
Reclaim History	Reclaim Reporting	
Policies	Reclaim Consolidation	
Savings	Reclaim Reporting	

10.4.2.5.1 Refresh reports using Settings

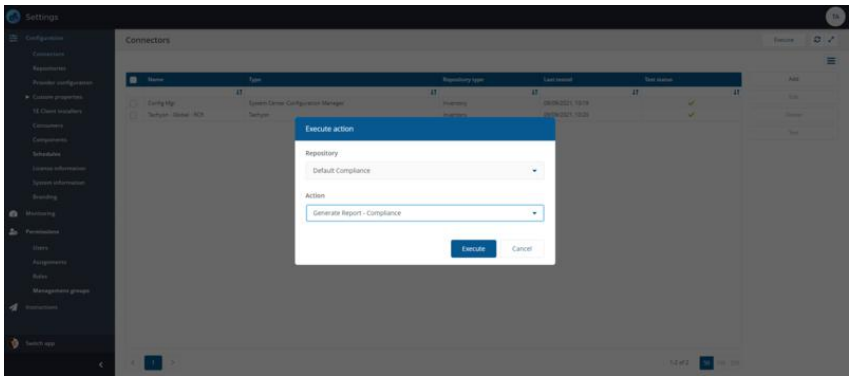
You can also refresh reports using the **Settings** app, for example:

Switch to **Settings**→**Configuration**→**Connectors** and click **Execute**.

In the **Execute action** popup from **Repository** select **Default Compliance** and **Action** as **Generate Report - Compliance**, and click **Execute**.

To monitor the progress of the new action navigate to **Settings**→**Monitoring**→**Process log** to view the **Generate Report** action running.

When the **Generate Report** action has completed, switch app to **AppClarity**→**Compliance**→**License Position**.



10.4.2.5.2 Scheduling a report refresh for a repository

Toautomaticallyrefresh a report for a repository you can set up a schedule:

Under the **Settings**→Configuration→Schedules and click **Add**.

In the Add schedule screen for:

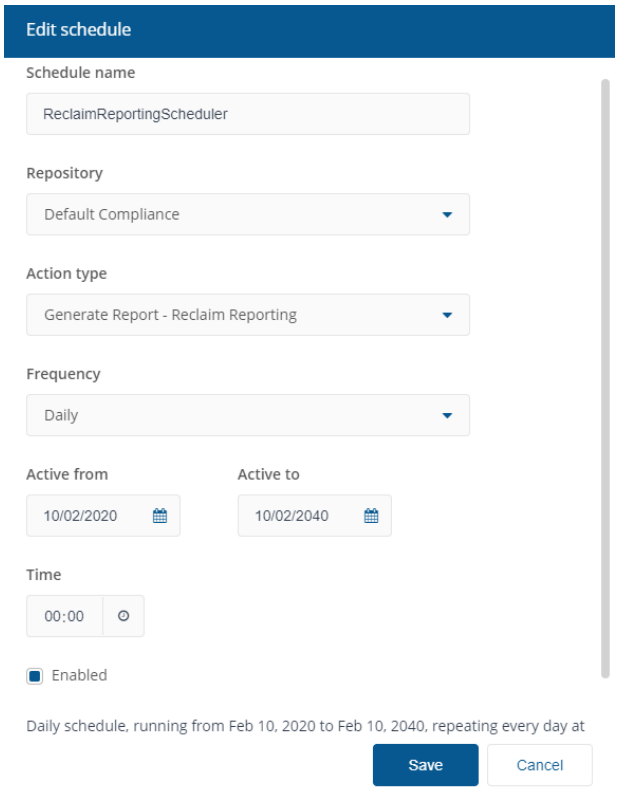
Schedule name - enter a logical name for the new schedule.

Repository - select your repository from the dropdown menu.

Action type - select the associated action type you want to schedule.

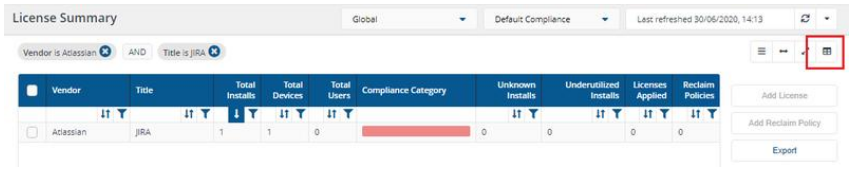
Frequency - select the frequency.

> **Note**
>
> For any entitlement repository, when a new entitlement is created (which triggers an entitlement consolidation) a **Schedule** called **EntitlementConsolidationScheduler** is created for this repository by default, it's set to run on a 24 hrs frequency (daily basis).



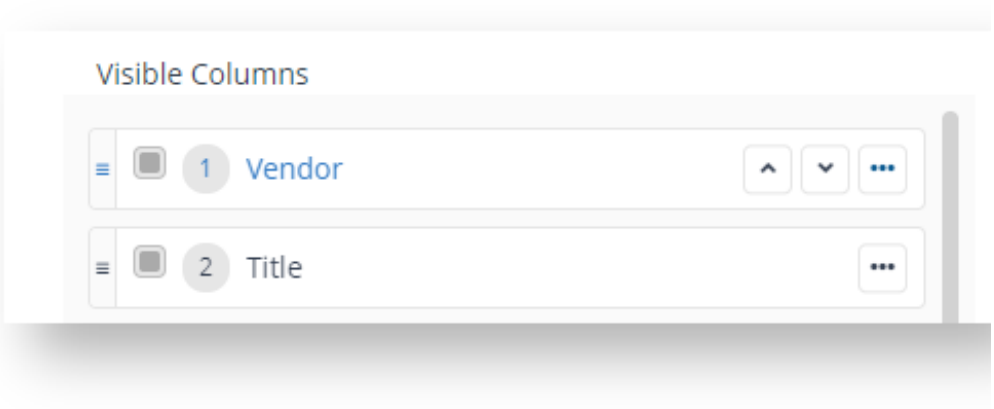
10.4.2.6 Choosing the columns displayed in reports

You can choose which columns are displayed in AppClarity detail tables to increase readability. On the pages where you can pick the displayed columns you'll see the control highlighted in the example.



When you click on the **Choose columns** control it opens a popup displaying every column on the current screen, the controls are:

Control	Explanation
Available Columns	Columns which are by default hidden from display on screen. You can still include any of them to display on screen.
Visible Columns	Displays the list of columns displayed on screen. Mandatory Columns cannot be excluded, the selection controls for these items are disabled. They can still be moved up or down. **Tip** Some pages have mandatory columns and a set of default hidden columns.
Arrow buttons	To move up or move down, exclude or include any column, clicking on the ellipsis displays these additional controls.
Drag and drop	You can drag and drop columns to change how they are displayed.
Exclude columns	Exclude column button allows you to select columns to exclude from the current display.



For example, in Viewing License Compliance Details we viewed the**License Summary**, using the **Choose columns** control you can pick which columns are displayed in the table. On this page, the default columns are:

Vendor

Title

Total Installs

Total Devices

Total Users

Compliance Category

Unknown Installs

Underutilized Installs

Licenses Applied

Reclaim Policies.

Each page also has some mandatory columns which cannot be excluded from display. When you click the **Choose columns** icon the excluded columns are greyed out and cannot be removed.

For example, in License Summary you cannot remove these columns:

Vendor

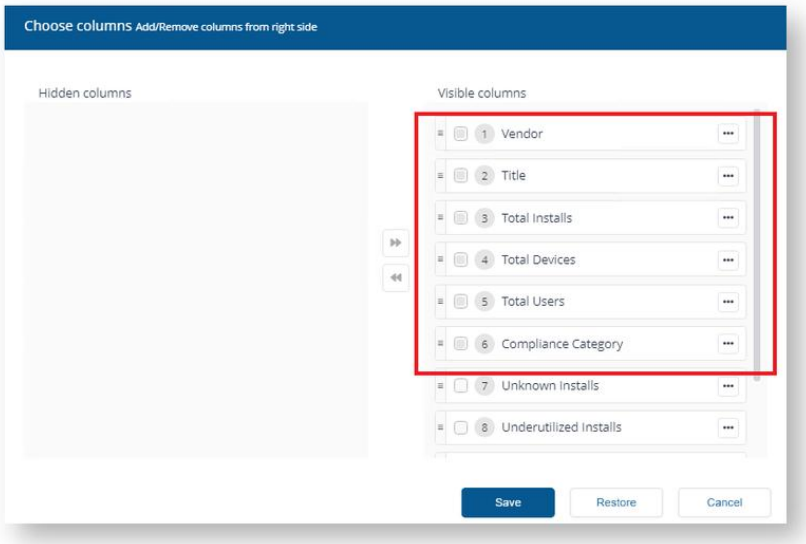
Title

Total Installs

Total Devices

Total Users

Compliance Category



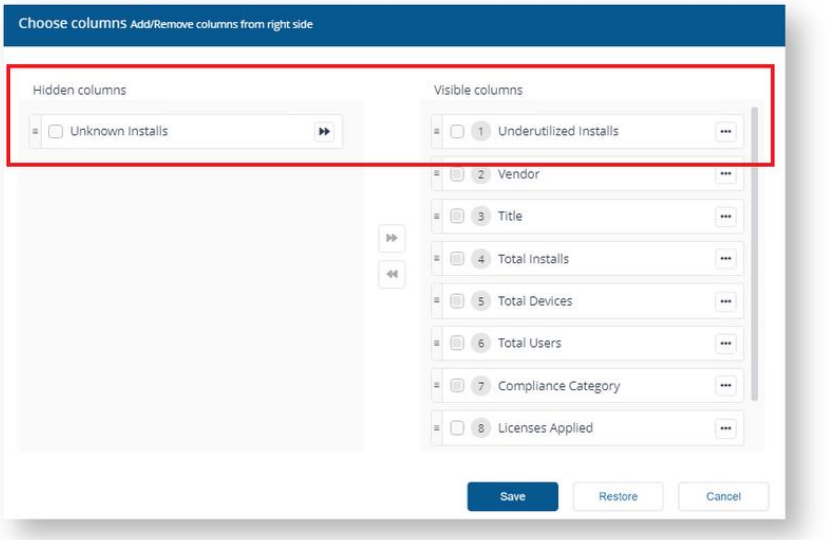
From this screen we chose to exclude **Unknown Installs** and move **Underutilized Installs** to the top of the list.

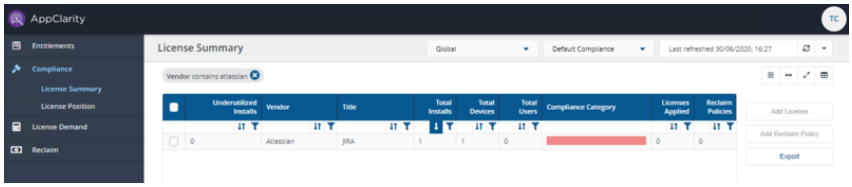
To apply this view to the current report, click **Save**.

You can also choose **Restore** to reset the column chooser UI or **Cancel** to cancel your changes and exit the **Choose columns** control.

Note

When you refresh reports on a page where you have amended the displayed columns, the report view will reset back to its default view once the refresh completes and the page reloads.





10.4.3 Viewing software install counts across all devices

The AppClarity reports are fundamentally based on inventory provided by Tachyon. The inventory shows what software is installed on what devices. If you're a user interested in the software reclaimer aspects of AppClarity you can focus on the software you want to reclaim. Or, if you're a S AM user interested in license compliance, you can focus on the software you want to be compliant on.

To view software install counts across all devices you can use the inventory **by Product** and **by Device** screens, which are both accessible using the Inventory app, to focus on the software and devices you are interested in.

You can view software installation counts using two screens in the Inventory app by using **Switch app** to navigate to **Inventory→SLA Inventory** and using the following two screens:

By Product - shows the inventory organized according to the software titles installed in your enterprise

By Device - shows the inventory organized according to the devices in your enterprise.

10.4.3.1 Using the Inventory By Product screen

Navigate to **Switch apps→Inventory→SLA Inventory→ By Product**

This displays the **Products By Vendor** screen. This screen shows:

A bar showing the distribution of **Licensable** (orange) and **Non licensable** (green) products

A chart showing the top 5 **Vendors by product count**, that is the vendors who sell the most installed products on your enterprise, divided into vendors according to their licensable and non-licensable installed products

A chart showing the top 5 **Products by edition count**, that is the product titles that have the most installed editions on your enterprise, divided into licensable and non-licensable installed titles

A chart showing the top 5 **Product editions by install**, that is the editions that have the most installations on your enterprise, divided into licensable and non-licensable installed editions

> Each of the blocks of color in bar at the top, the **Vendors by product count** and **Products by edition count** charts is an interactive filter that filters all the other components on the screen

For example, clicking on the licensable block of color on the bar at the top filters the three charts to show the top 5 licensable installed products and editions. Notice how the **FILTER BY** field now displays a **License Required Equals true** filter.

Clicking on one of the vendors displayed in the **Vendors by product count** chart filters the screen to just display information related to that vendor. In our example we click on the **Microsoft Corporation** vendor and the **FILTER BY** field now shows **License Required Equals true AND Vendor Equals Microsoft Corporation** filters.

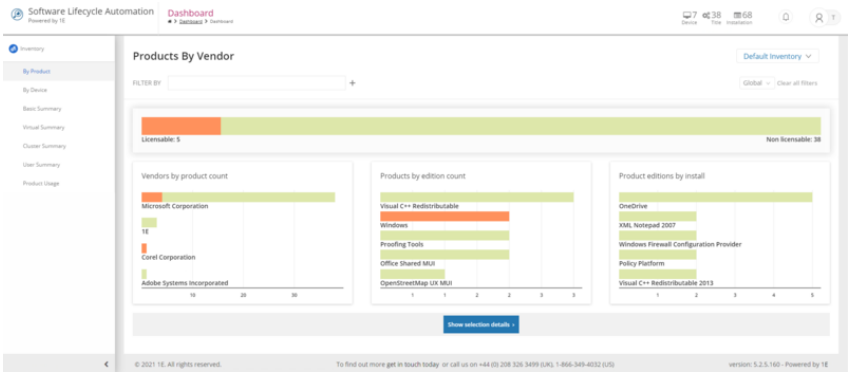
Clicking on one of the products displayed in the **Products by edition count** chart filters the screen to just display information related to that product. In our example we click on **Office 365** and a filter for that also gets added to the **FILTER BY** field.

The **Product editions by install** chart works slightly differently. Clicking on one of the licensable editions, instead of just adding a new filter to the page, it displays the **Product Details** for that installed edition. In our example we click on the **Office 365 ProPlus** edition and the screen changes to a table with the details for **Office 365** displayed. The columns displayed on this screen are described in the following table:

Column heading	Description
Vendor	The vendor who sells the installed software title. For example **Microsoft Corporation** is the vendor for **Office 365**.
Title	The title name for the installed software title. For example the title for Microsoft Office 365 can be **Office 365**.
Colloquial Version	Any associated informal name for the version of the installed software title. For example the Colloquial Version for Microsoft Office 365 could be **2016**.
Edition	The specific edition of the installed software title. For example the Edition for Microsoft Office 365 could be **ProPlus**.
Version	The specific version for the installed software title. For example the specific version for Microsoft Office 365 could be **16.0.10228.20080**.

Host	The host where the software title is installed. For example **Acme-win1002**.
Host Computer Name	The computer name for the host where the software title is installed.
Computer Type	The type of the computer where the software title is installed. For example **Workstation**, **Server** or **Virtual Machine**.
OS	The Operating System where the software title is installed. For example **Windows 10 Pro**.

The **Host** column contains a link to the device where the software title is installed. Clicking on the link displays the details for the host machine with a table showing all the software titles installed on that machine, as well as highlighting above the table the host's OS, machine type and how many processors it has.



10.4.3.2 Using the Inventory By Device screen

Navigate to **Switch apps**→**Inventory**→**SLA Inventory**→ **By Device**

This displays the **Products By Device** screen. The columns on this screen are described in the following table:

Column heading	Description
Host Name	The name for the device. This is a link that navigates to the Product Details table for the selected device.
Last Inventory Date	The date when inventory information was lastreturned for the device.
Computer Type	The type of the device. For example **Workstation**, **Desktop**, **Laptop**, **Server** or **Virtual Machine** etc.
Device Model	The model for the device. For example: **Virtual Machine**, **Surface Pro 3**, **Optiplex 910** etc.

OS	The Operating System installed on the device. For example **Windows 10 Pro**.
Number of Unnormalized Software Records	The number of unnormalized software records associated with the device, i.e. the number of installed software titles on the device that couldn't be automatically matched by 1E Catalog. This is formatted as a link, click to match the records to the catalog.
Number of Normalized Software Records	The number of normalized software records associated with the device, i.e. the number of software titles installed on the device that were matched by 1E Catalog.

You can filter the devices displayed in the table by clicking the **+** at the end of the **FILTER BY** field.

The filter builder contains three sections:

The FIELD section, where you specify what column you want to filter on

The OPERATOR section, where you specify the comparison you want to make

The VALUE section, where you specify the value you want to compare the column against

In our example we set:

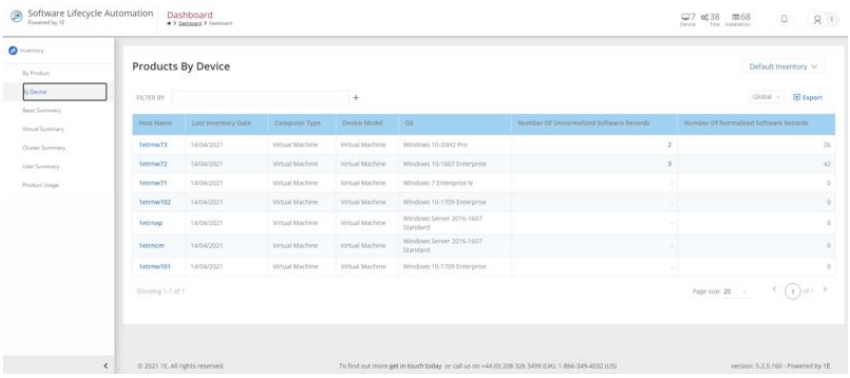
FIELD to Host Name

OPERATOR to Contains

VALUE to win10

This will filter the table to only show devices with **win10** in their host name.

Clicking on the link in the **Host Name** column for any device navigates to the **Product Details** table for that device. Where you can see the same information for the device as shown when navigating via the **By Product** screen.



10.4.4 Viewing product usage

The inventory information retrieved by Inventory from sources such as Configuration Manager and Tachyon includes data on how often products are being used on particular devices. If you're a user interested in the software reclaimer aspects of AppClarity you can focus on reclaiming software based on its usage. There are two ways of viewing product usage in AppClarity:

To view product usage information across all servers and workstations in your network switch to**Inventory**→**SLA Inventory**and then **Inventory**→ **ProductUsage**to investigate the products you are interested in.

To view usage information for reclaimable software, i.e. software installed on workstations not on servers, switch to**AppClarity**→**Reclaim**→**Usage Summary**. By default, that page also contains a filter to show licensable products only, but you can remove that if you're interested in reclaiming any type of software on workstations.

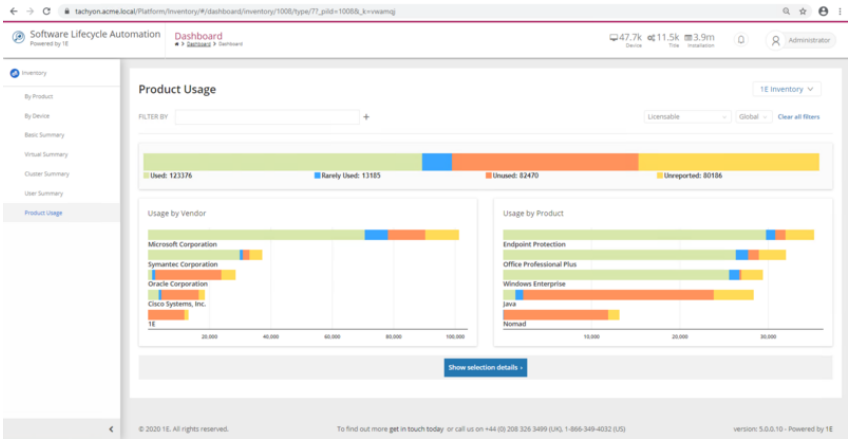
> **Note**
>
> The reclaimer does not work on server OS. From AppClarity 7.1 software reclaimer works for any device where Server OS does not contain "Server" (ie. only client OS) or Server OS is not NULL. Other types of device are removed from the reclaim reports.

Product usage information is reported through the inventory repository when connected to a Microsoft System Center Configuration Manager or Tachyon data source. If you're interested in the possibilities of reclaiming unused software and thereby reducing license waste and costs, AppClarity provides a way of navigating the products installed on your system and seeing how much they are being used. These investigations can then be used as the basis for defining reclaim policies that will target the right software.

There are two views on product usage. One is in Inventory and the other, geared more towards software reclaim, is in AppClarity.

10.4.4.1 Inventory Product Usage page

Switch to **Inventory**→**SLA Inventory**→**Product Usage** . This page displays usage information on both Servers and Workstations.



Here you'll see three charts displaying products organized according to their usage categories. The main chart that spans the width of the page displays the overall usage categories and the counts of software in each.

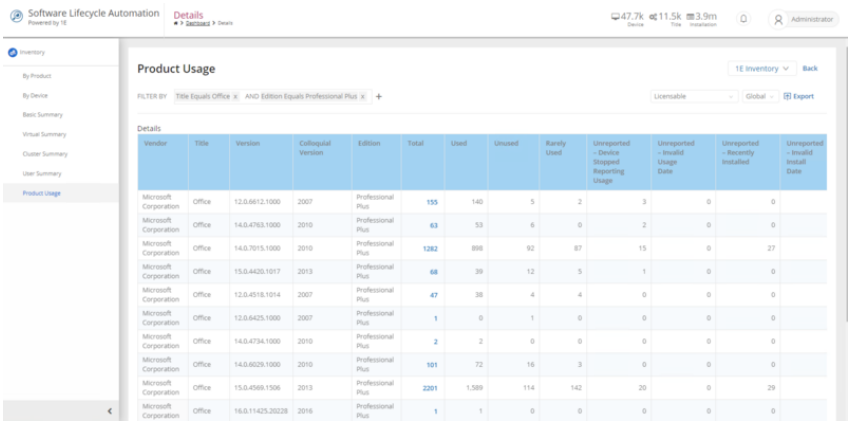
The **Usage by Vendor** chart on the left shows the vendors that have the most installed products in the environment. For example, **Microsoft Corporation**, **Symantec Corporation** and **Oracle Corporation**.

The **Usage by Product** chart on the right displays the top five products with the most installations. In our example **Endpoint Protection**, **Office Professional Plus**, **Windows Enterprise, Java** and **Nomad**.

Hovering over one of the color blocks in the chart displays information for that usage type. For example the blue color block on the **Office Professional Plus** product shows that there are **1394** rarely used installations the red color block for that product shows that there are **1204** unused installations of **Office Professional Plus**.

Clicking on a block in the **Usage by Product** chart drills down to the details for that particular product. In our example by clicking on a block in the **Office Professional Plus** product.

Doing this displays the **Product Usage** table for that product. Here you can see the vendor, title, version, colloquial version and edition for the product alongside a total that shows the number of installations for the product. There are also four columns for each of the usage categories. In our example **Office Professional Plus** version 12.0.6612.1000 has **155**installations, **5** of which are unused and **2** are rarely used.



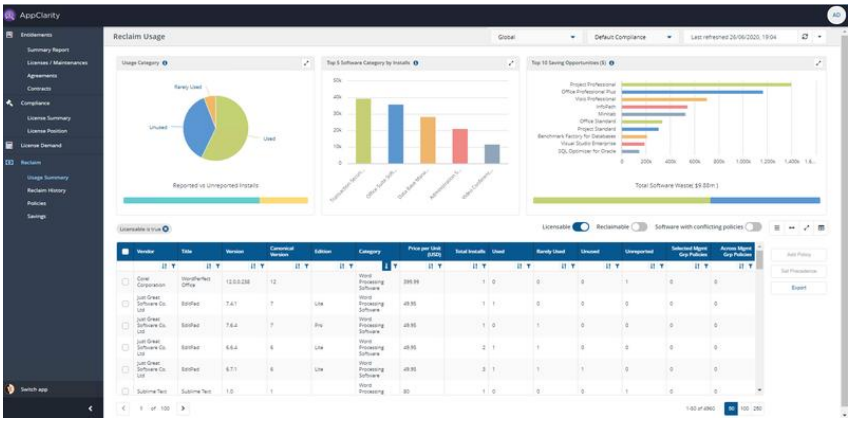
The total column contains a link that, when clicked, displays the **Product Details** table for the product's installations. In our example we can see that this version of **Office Professional Plus** is installed on **162** computers. This will be significant later when we compare the **Inventory Product Usage** page with the **AppClarity Product Usage** page.

Clicking on the name for a device displays detailed information and all the installations for that device.

We then click **Back** a few times to return to the top-level **Inventory Product Usage** page. Fix the totals on this page in your mind to compare them with the **AppClarity Product Usage** page. In our example there are **140** used, **2** rarely used, **5** unused products.

10.4.4.1.1 AppClarity Usage Summary page

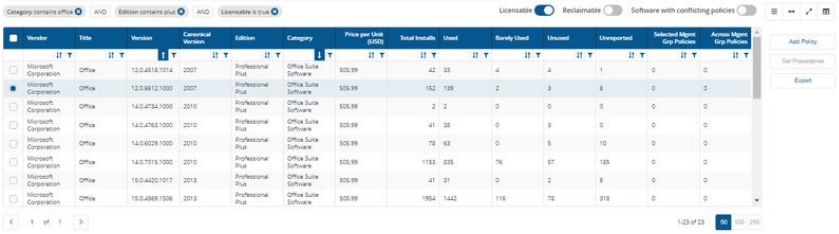
Switch to **AppClarity→Reclaim→Usage Summary**. There's a filter set by default only showing information for the selected management group and only products which are licensable.



This page also displays**Usage Category and Reported Vs UnReported Installs**, **Top 5 Software Category by Installs** and **Top 10 Saving Opportunities ($) and Total Software Waste** charts and a table showing vendor, title, version, colloquial version and edition for the product alongside a total that shows the number of installations for the product. There are also four columns for each of the usage categories **Used**, **Rarely Used**, **Unused** and **Unreported**.

To filter the table by **Usage Category**, **Top 5 Software Category by Installs** or byTop 10 Saving Opportunities click on the color bar for the category you're interested in, for example in our case there's 1,711 records in **Unused** software in **Usage Category.**

In our example let's investigate **Office Professional Plus** for example you could do this by filtering the table view by **Category** containing **Office** and by **Edition** containing **Plus** or if you know the version, by filtering on **Version**.



Now notice how there are different values for the usage categories. In our example on this page there are 139 **Used**, 2 **Rarely Used**, 3 **Unused** products. The difference between the two pages is down to the fact that this page displays just the reclaimable software, i.e. the software installed on workstations, and is filtered to display only licensable software on those workstations, whereas the **Inventory→SLA Inventory→Product Usage** page showed all the software installed on both workstations and servers.

In our example this shows us 3 prime candidates for reclaiming **Office Professional Plus**. To find out how you can reclaim these, refer to Reclaiming a product based on its usage.

In this example we've investigated product usage data and seen the differences between the **SLA Inventory Product Usage** and **AppClarity Product Usage** pages. We've also seen how we can focus on a particular product and investigate its rarely used and unused installations.

> **Note**
>
> You can change the default displayed currency from USD to a currency of your choice, refer to Changing the default currency in AppClarity for details.

10.4.5 Viewing product compliance

You can view your compliance position focusing on the products installed on your system. From here you can also add entitlements for a specific product.

> **Note**
>
> Before viewing the Compliance → License Summary, please ensure that License Demand reports for SQL Core, IBM PVU, Oracle Processor and RedHat Socket has been successfully refreshed for the Default Compliance repository.

This example assumes that you have associated your chosen compliance repository with your chosen entitlement repository, this example uses **Default Compliance** and **Default Entitlement** and you have run the **Compliance** report on your chosen compliance repository.

Please refer to Running your first Compliance License Summary for steps that show how to do this.

To view product compliance and interact with the products to create new licenses and improve your compliance:

> **Note**
>
> You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:
>
> >
>
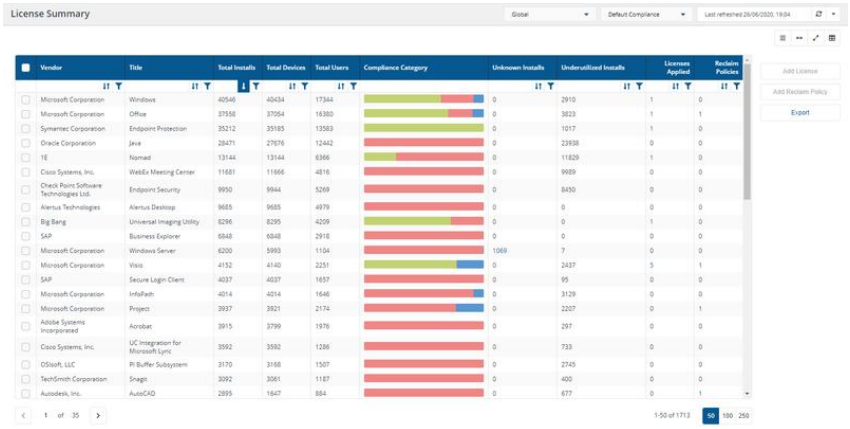
> To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.

Navigate to **AppClarity→Compliance→License Summary**. Here you'll see a summary of your compliance position. The displayed table shows compliance information about all your products.

This displays the License Summary page, for more details on the fields on this page please refer to License Summary page.



Following a defaulter install, there are no entitlements so all the products are showing as red in the **Compliance Category** because they're non-compliant.

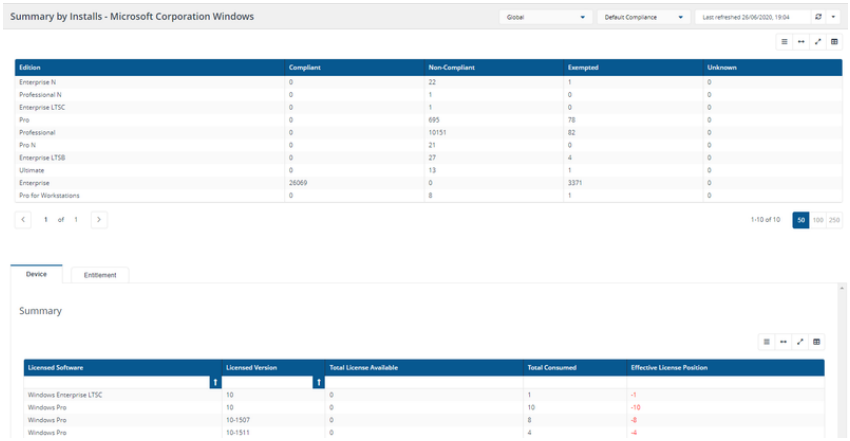
To view Compliance Information about a specific product click directly on the colored bar in the **Compliance Category**. Also, on mouse hover, it displays 3 categories as below and also display hover tool top %

Compliant (green) - Total no of compliant counts

Non Compliant (red) - Total no of non compliant counts

Exempted (blue) - Total no of exempted counts

This displays the compliance **Summary by Installs** page, for more details on the fields on this page please refer to Summary by Installs page.



10.4.6 Viewing your effective license position

AppClarity can take Inventory and combine that with your entitlements to show your current compliance position, or the license position. The compliance position shows the result of matching up your current installations with your currently defined entitlements so that you can tell whether your entitlements are deficient, sufficient or surplus to your installations.

In this example, we will show how to use the **License Summary** and **License Position** pages to identify license deficits and how you can work to quickly implement the entitlements you need to change the deficits into

surpluses. Before viewing License Summary, please ensure all**License Demand**reports have refreshed to get the correct numbers for complex metric based products.

10.4.6.1 Viewing your license position

Your license position contrasts with your product compliance position, as shown in the previous Viewing product compliance example, in that it not only shows you license deficiencies it also shows your surplus licenses. This lets you work towards the ideal position where you roughly balance the two, so that you are completely compliant but have not drastically overspent on your licenses - some slight excess may be desirable to cater for future demand.

Navigate to the **AppClarity→Compliance→License Position** page. For more details on the fields in this page please refer to License Position page.

In our example, on this page in the **License Position** column we can see the **5** excess of licenses implemented for the **Microsoft Visio** product.

Scanning down the products we can see a **-8** deficit for **Microsoft Project**. Based on **10** licenses we have purchased for Microsoft Project we'd like to turn this now into a similar excess of **5** licenses.

> **Note**
>
> You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:
>
> >
>
> To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.

The quickest way of doing this is to navigate to the **AppClarity→Licenses / Maintenances** page, we then set a filter to get directly to the Microsoft Project installations:

Click the filter at the right-hand under the **Title** Column header.

Construct the **filter Contains Project**.

Click **Apply** to set the filter.

In our example select the row with **Microsoft Project** and a Type of **License** click the **Edit** button when it becomes enabled.

In the **Edit License** page prefilled with the details for **Microsoft Project** we set:

Quantity to **24**

Unit cost to **$400**.

> **Note**
>
> You can change the default displayed currency from USD to a currency of your choice, refer to Changing the default currency in AppClarity for details.

Then click **Publish** to publish the new entitlement and then refresh the necessary**Compliance**report to make the new entitlement count against our installations, using the **Refresh reports** icon on the top right of the page.

> **Note**
>
> You can refresh reports from individual AppClarity screens as well as using the **Settings** App. You can do this by using the refresh icon next to the**Last Refreshed**box, for example:
>
> >
>
> For a complete list of the specific reports you can run from particular pages refer to Running your first Compliance License Summary: Refresh Reports.

The multiexcerpt named '**RefreshReportsUsingSettings**' was not found. Please check the page name and MultiExcerpt name used in the MultiExcerpt Include macro.

Having made the entitlement count we now navigate back to the **AppClarity**→**Compliance**→**License Position**page where in our example we can see that the deficit of **-8** for **Microsoft Project** is now a surplus of **5**.

In this example we've seen how to view the license position for each product. We've identified a deficit of **-8** for **Microsoft Project** and used the **License Summary** page to add additional Microsoft Project licenses. We've then browsed back to the **License Position** and seen the deficit turn into a surplus.

10.4.7 Creating a license entitlement

Entitlements are key components for determining your compliance position, also known as the license position. The license entitlements you create are taken into account against the installations on your enterprise, you can then create various reports to show exactly what your effective license position is.

There are three types of entitlement you can create in AppClarity:

Licenses

Maintenance

Agreement.

You may see when you create an entitlement that there is a fourth type called **Contract**. Contracts are really just placeholders for documentary evidence of ownership and may be associated with

any of the three types of entitlement. In our example, we show how a contract can be associated with a license.

By combining these types, you can model a wide range of complex entitlements that you may have in your enterprise, allowing these to convert easily into AppClarity.

In this example

In this example, we introduce entitlements by creating a simple license for Microsoft Visio, and show how that is processed by AppClarity and taken into account against the software installed on our example network.

At the end of this example, you will have created one license entitlement in AppClarity. You will also have created a contract, which is a placeholder for any document, link or written evidence as proof of ownership for the license, the contract will then be linked to the license.

To carry out the actions described below, your user will require either the Entitlement Administrator, Compliance Administrator or Full Administrator role.

It is generally a good idea if the license, maintenance, and agreement entitlements you create have at least one associated contract. It's not mandatory, but it makes sense if the entitlements you create have proof that you own the particular license, maintenance, or agreement. For example, the contract may contain an enterprise agreement, a scan of a proof of purchase, a .PDF of an order or a paid purchase order. You create the contract and link to or load the associated proof into it. After saving, it may then be linked to the license, maintenance, or agreement you want it associated with. Subsequently, when auditing your licenses, AppClarity holds the proof of ownership linked to the entitlements that cover your installations.

10.4.7.1 Creating a simple entitlement

This example shows how a license deficit for a Microsoft Visio installation can be turned into a surfeit by creating a license entitlement. It assumes that you already have inventory data and that you've run the Compliance report.

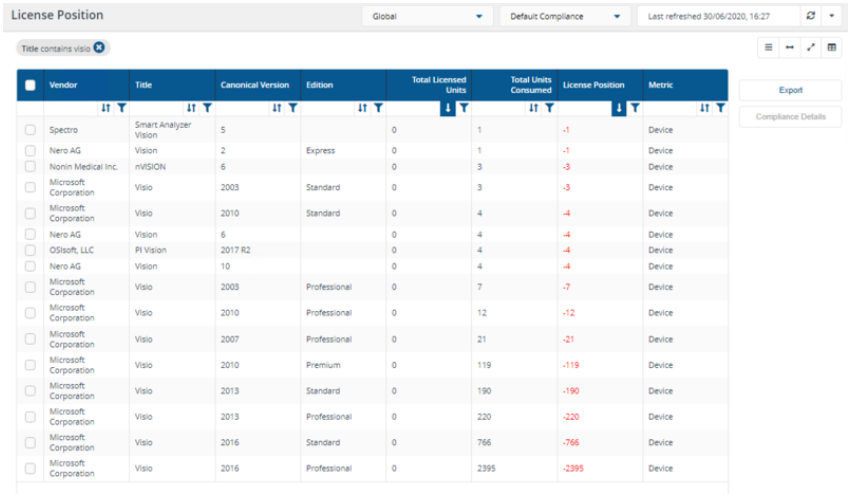
Navigate to the **AppClarity**→**Compliance**→**License Position** page.

Click on the in the **Title** Column and enter **contains** in the dropdown and Visio in the next field, click **Apply**.

Note

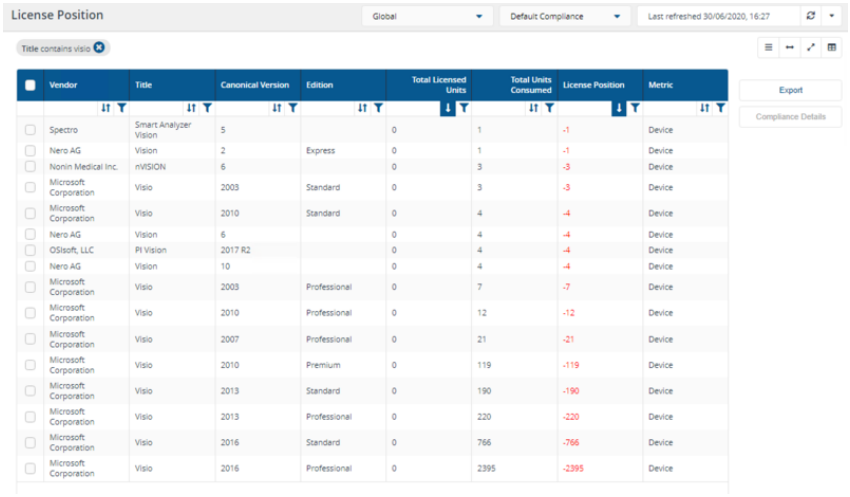
You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:

To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.



In our example you can see that there are multiple entries with the **Title contains Visio** including those with the **Canonical Version** of 2013 and on 2016, both are the Professional Edition.

By selecting either of those listed the **Compliance Details** button becomes enabled, click **Compliance Details**.



This opens the **License Summary** page, filtered on Microsoft Corporation and Visio.

Displayed is the consolidated Summary for all versions of Visio.

It's also possible to achieve the same result directly from the **License Summary** page and adding filters there.

10.4.7.1.1 Creating a simple license

To create our example license, we know the following information about the license:

Vendor: **Microsoft Corporation**

The units per license (**1 unit** per device in case of **Device** Metric**)**

Title: **Visio**

Edition: **Professional**

Version: **2016**

The cost per unit for the license, in this case **$150**

> **Note**
>
> You can change the default displayed currency from USD to a currency of your choice, refer to Changing the default currency in AppClarity for details.

To create and publish a license entitlement:

Select the displayed product and click **Add License**, located just to the right.

In the **New License** page we will choose a specific set of options to show how this page works. For more details on all the fields in this page please refer to New License page.

There are lots of fields on the page, but only a few are mandatory. The mandatory fields have an * next to their name.

The page is split into a number of sections, we will start in the **Basic Information** section.

The **Management Group** is the first mandatory field, it's set by default to Global, but it can be changed to any of your existing Management Groups, in this example we will leave it at **Global**.

The next mandatory item is the **Vendor** field. As we have opened this page after selecting a product, any known fields are prepopulated. Where they are not then as you start to type information suggestions are shown which are bought in from 1E Catalog.

Now we set:

Title: Visio

Version Type: Colloquial (need to set this, so we can specify the **Version** as **2016**)

Version: 2016

Edition: Professional

Metric Type: Device (this is the default)

Quantity: 65 (For other more complex metric types you will need to adjust the **Quantity** accordingly.

Entitlement Type: Perpetual

Start date: to the date the license started, or is due to start on. In our example, it's set to the default of the current date

Duration set the duration of the license, this will be required if the license is not Perpetual

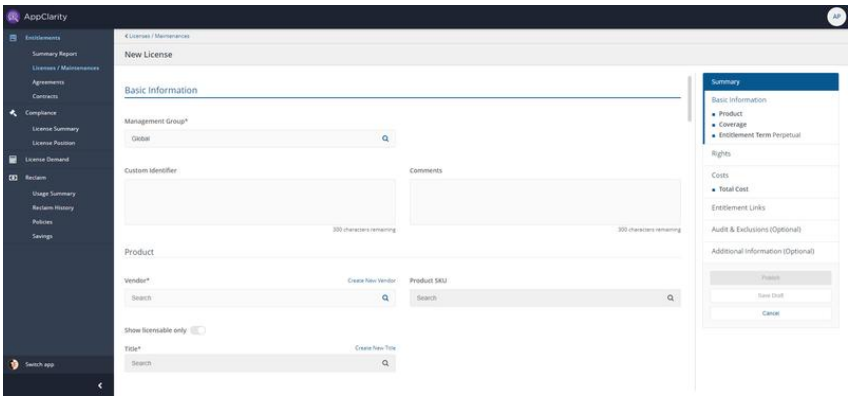
Version Downgrade: We now ensure that the both **Available** and **Persistent** checkboxes under the **Rights** section are checked, as it should be by default. This will confirm that this license can be applied to versions of Visio earlier than 2016.

Costs: 150

Currency: is already set to **USD** by default. AppClarity then calculates the total cost of the 65 licenses as **$9750.00**.

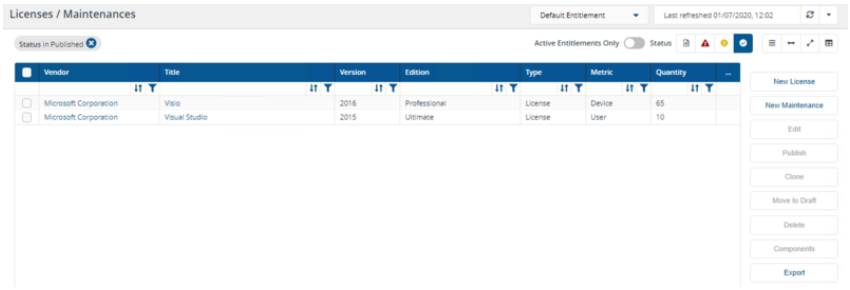
Now everything is set how we want it lets make this license entitlement take effect. To do this we click the **Publish** button at the bottom of the page. We could have clicked **Save draft**, if we were in the middle of making changes and didn't want to make the license active and the license would have been saved as draft in the **Licenses / Maintenances** page.

> **Note**
>
> These steps can also be carried out directly on the **Entitlements - Licenses/Maintenances** page and clicking on **New License**, but the prefilled information will not be there, and you will need to enter that yourself.



Having published the license entitlement an entry now appears in the **Licenses / Maintenances** page.

Click the green tick published icon to show the License we just published.

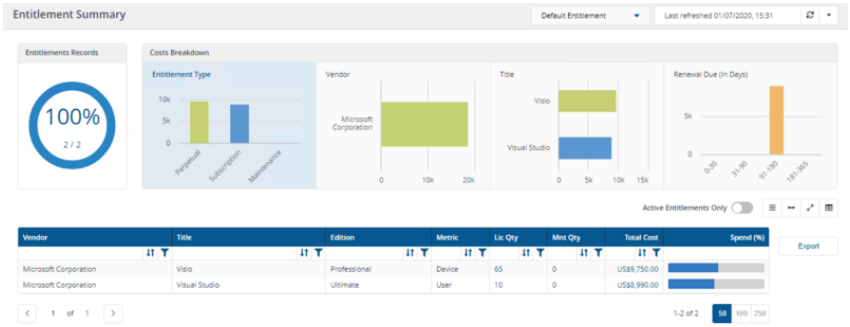


On publishing an entitlement, the **Entitlement Consolidation** report is refreshed. Once this is done, data can be seen on the **Entitlement Summary** page.

> **Note**
>
> You can download a .tsv report of the Entitlement Summary for your organization.
>
> Click **Export** to download a file in the format EntitlementSummary_currentdate.tsv

Note

The **Active Entitlements Only** control has been added to the **Entitlement Summary** page. The control adds a filter when it's turned on that filters the table to only display the entitlements that have been published and not the ones that are in draft.



To make a published license entitlement take effect you have to run the **Compliance** report:

Navigate to the **Settings**→**Connector** page and click on the **Execute** button.

The **Execute** action popup is displayed, enter the following:

Repository: Default Compliance

Action: Generate Report - Compliance

Navigate to **Settings**→**Monitoring**→**Process Log** and wait for the action to complete, this will be **Compliance** and will have a green tick in the **Status** column when complete.

Navigate to the **AppClarity**→**Compliance**→**License Position** page.

In our example you can see that **Visio** with **Edition** of **Professional** now has a **License Position** of **5.** This indicates that the installations of the software title are now licensed and there are **5** spare licenses for **Visio**.

Note

You can refresh reports from individual AppClarity screens as well as using the **Settings** App. You can do this by using the refresh icon next to the **Last Refreshed** box, for example:

For a complete list of the specific reports you can run from particular pages refer to Running your first Compliance License Summary: Refresh Reports.

10.4.7.1.2 Creating a contract

In our example we will create a new contract and load a scan of the proof of purchase for **Visio**.

To create a new contract:

Navigate to the **AppClarity**→**Entitlements**→**Contracts** page.

Click the **New Contract** button, located just to the right of the page.

In the **New Contract** page set the details for the contract. In our example we make the following settings:

Name: Visio

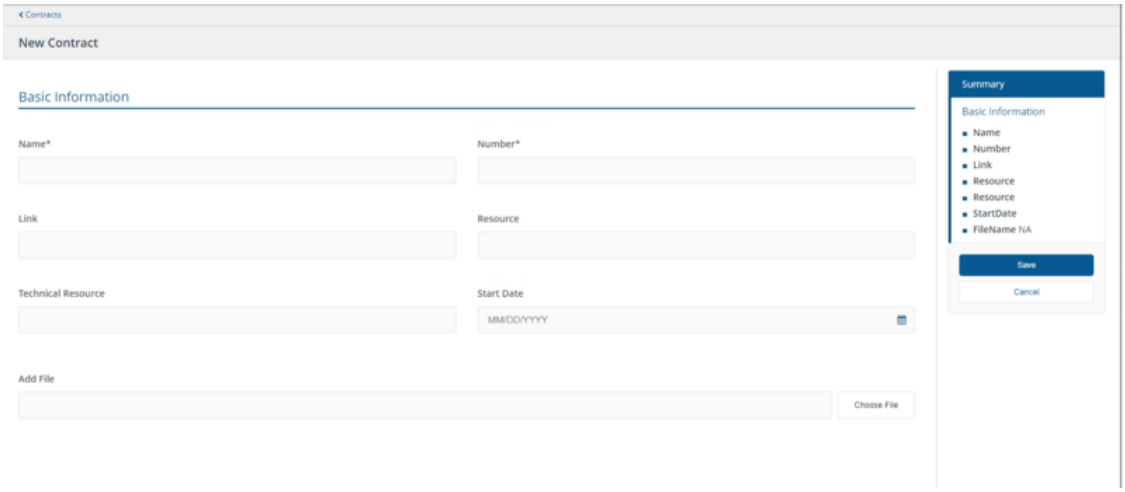
Number:11

Start date: 03/01/2018

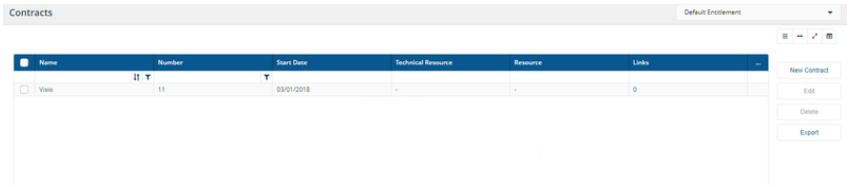
On this page you could set a link to the contract (if the contract is online), specify the name of the person or role who manages the agreement, specify the name of the person or role who knows the technical detail of the license. In our example we will just add an attachment of a scan of the proof of purchase for **Visio**.

Clicking **Choose File** displays a system **Open** dialog, here you can browse to and select the file you want to attach. In our example the file is in **C:\AppClarity\Contract Scans** and is called **Visio20180607.png**. When the file is selected click **Open** to attach the file.

Once all the settings have been made on the screen click **Save contract**.



The newly created contract is now added to the **Contracts** page.



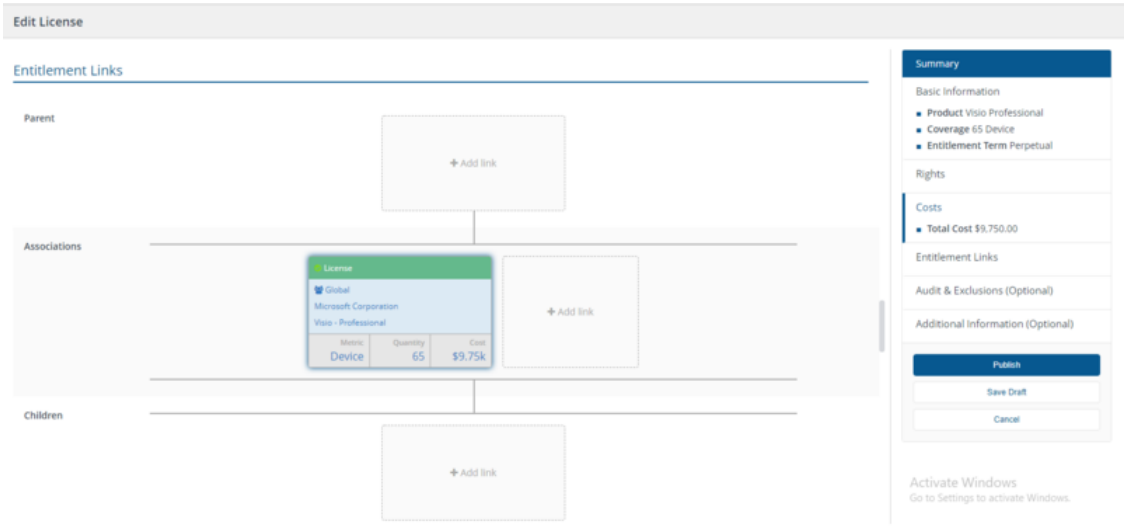
10.4.7.1.3 Linking the license to the contract

Once the new contract has been saved you can now link it to a license, maintenance or agreement entitlement.

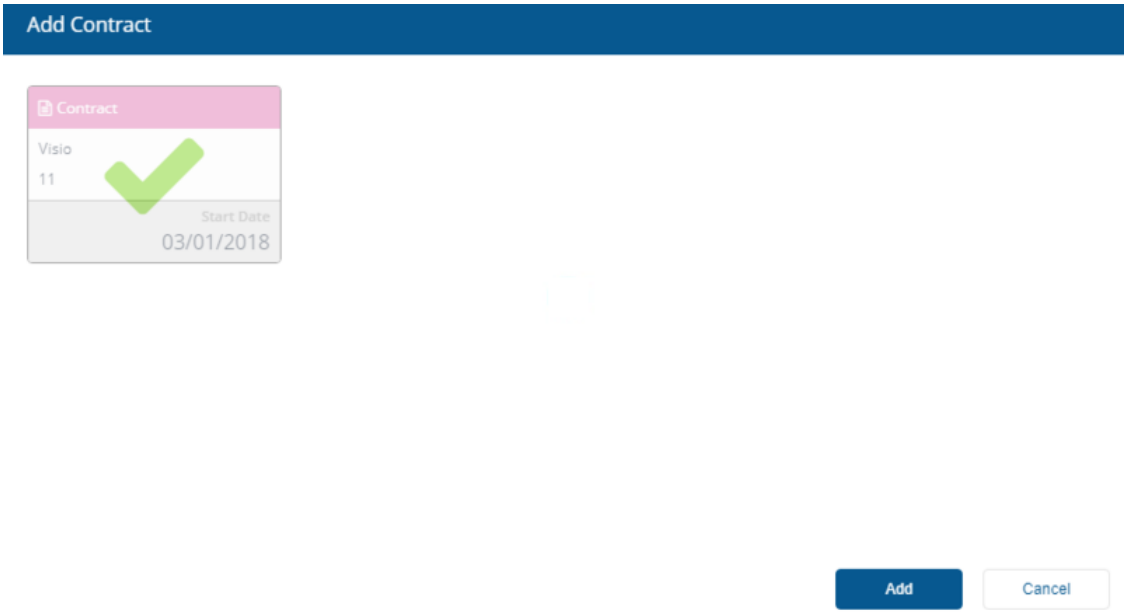
To link a contract:

On the **AppClarity**→**Entitlements**→**License / Maintenances** screen locate the entitlement you want to link the contract to. At the right-hand end of the entitlement's entry click on the **Edit** link. In our example we click on the **Edit** link for the **Visio** license entitlement we created earlier.

On the **Edit License** page scroll to the **Entitlement Links** section and click the **+ Add Link** in the **Associations** area.



On the **Add Contract** popup subsequently displayed, locate the contract created earlier. In our example this was called **Visio**, and click the contract, a green tick will appear and click **Add**.

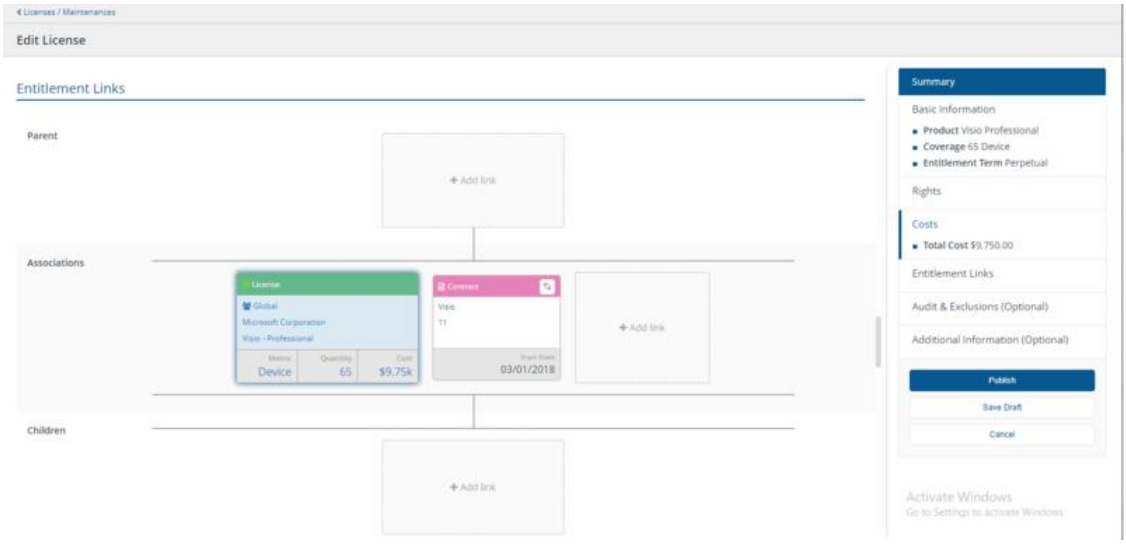


The **Edit License Entitlement Links** will be updated.

Click on **Publish**, this returns to the **Licenses / Maintenances** screen, and a 1 will now appear in the **Links** column for this entitlement.

If you click on the 1 in the **Links** column this will open the **Entitlement Links** page in view mode showing the **Associations**.

Congratulations! You have now created your first license entitlement and your first contract and linked one to the other.

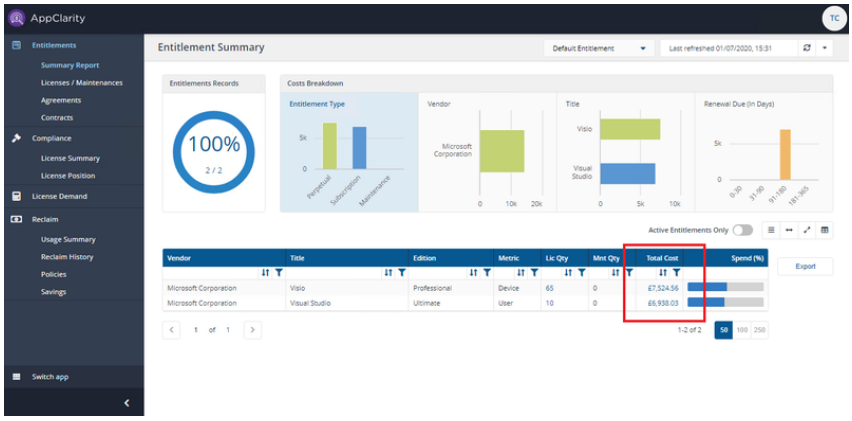


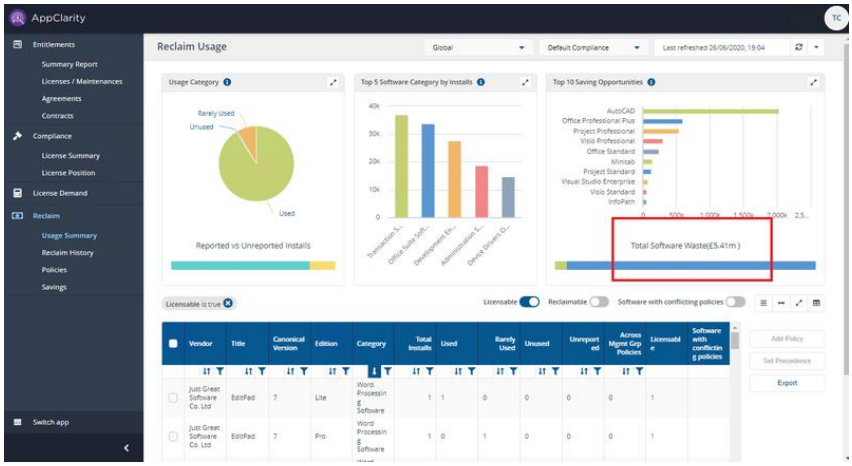
10.4.7.2 Changing the default currency in AppClarity

You can change the default currency (USD) along with the appropriate currency symbol and name from USD to a currency of your choice. For example, if you set the default currency to GBP then all cost values should be displayed in GBP after currency conversion (if required) along with the correct currency symbol (in case of graphs).

You can change the cost values displayed on the following pages, costs will show the default currency name and graphs will reflect cost values with default currency name and symbol.

Title page	Sub-page	Sub-page
Entitlements	Summary Report	n\a
Reclaim	Usage Summary	n\a
Policies	New Policy	
Edit Policy		
Savings	n\a	





10.4.7.2.1 Setting the default currency

The default currency is set to USD by default, you can change this using an SQL script run against your SLA-Shared database. For example to change the default currency to GBP, you would run the following query:

Changing the default currency

```
USE [SLA-Shared]

UPDATE Setting

SET [Value] = 'GBP'

WHERE [Key] = 'DefaultCurrency'
```

You can view all the currencies available in AppClarity by running the query against SLA-Shared database:

Display available currencies

```
SELECT * FROM Currency
```

Running *SELECT * FROM Currency* returns these results:

CurrencyID	Name	DisplayName	Symbol
1	USD	NULL	$
2	EUR	NULL	€
3	GDP	NULL	£
4	JPY	NULL	¥
5	CAD	NULL	C$
6	AUD	NULL	A$
7	CNY	NULL	¥
8	CHF	NULL	Fr.
9	SGD	NULL	S$
10	HKD	NULL	HK$
11	ZAR	NULL	R$

Note

You can only set the default currency to a value which exists in the Currency table. If the default currency value does not exist in Currency table, then USD will be used as the default currency and all cost values will be displayed in USD.

However the currency symbol and currency may not be in USD and will be same as entered by you when setting default currency, when you set the default currency value, it should be in upper case.

10.4.7.2.2 Updating Currency Conversion Rates

To convert cost values from one currency to another currency, you should maintain a conversion table based on the latest conversion rate. Because all cost values are stored in USD, you will need to update the conversion rate from USD to DefaultCurrency and DefaultCurrency to USD. You can use the following SQL queries to do this.

For example, if you have set the default currency to GBP, you will need to set the conversion rate for converting USD -> GBP and GBP -> USD.

Converting USD to GBP

```
UPDATE cc

SET cc.Rate =  0.77175 -- Take the latest conversion rate

FROM CurrencyConversion cc

JOIN Currency fromCurrency ON cc.FromCurrencyID = fromCurrency.CurrencyID

JOIN Currency toCurrency ON cc.ToCurrencyID = toCurrency.CurrencyID

WHERE fromCurrency.Name = 'USD' and toCurrency.Name = 'GBP'
```

Converting GDP to USD

```
UPDATE cc

SET cc.Rate =  1.295756 -- Take the latest conversion rate

FROM CurrencyConversion cc

JOIN Currency fromCurrency ON cc.FromCurrencyID = fromCurrency.CurrencyID

JOIN Currency toCurrency ON cc.ToCurrencyID = toCurrency.CurrencyID

WHERE fromCurrency.Name = 'GBP' and toCurrency.Name = 'USD'
```

After updating then to view the changes reports on the following screens will require refreshing: Entitlements - Summary, Reclaim - Usage Summary, Reclaim - Policies and Reclaim - Savings

10.4.8 Creating and linking a maintenance entitlement

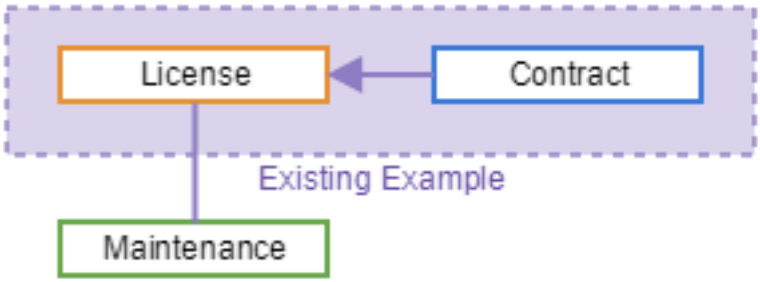
A Maintenance entitlement type in AppClarity specifies the rights and limitations for an organization to install and/or use updated versions of software defined in a license. For example you could specify a maintenance entitlement for Microsoft Visio 2016 to cover all new versions from the current date for the next 3 years.

A maintenance entitlement can be linked as a child of an agreement, a license or another maintenance entitlement. Maintenance entitlements can also have other child maintenance entitlements. As with all the entitlements, maintenance can also have one or more associated contracts.

In this example

In this example we extend the example described in Creating a license entitlement by creating an additional maintenance entitlement for Microsoft Visio to extend the licensing for that product to include all future versions for the next three years.

At the end of this example you will have created a new maintenance entitlement in AppClarity and linked it to the existing Microsoft Visio license entitlement from the Creating a license entitlement example.



To create our example maintenance we know the following information about the license:

Vendor: **Microsoft Corporation**

The units per license, in this case **10** units each covering 1 device

Title: **Visio**

Duration: How long the maintenance period lasts in months, in our example **36** months (3 years)

The cost per unit for the license, in this case **$50** (maintenance at 1/3 of the basic license cost).

10.4.8.1 Creating the maintenance entitlement

To create and publish a maintenance entitlement:

Navigate to **AppClarity→Entitlement→Licenses / Maintenances**. This displays the **Entitlement Repository** page for the repository selected in the top-right of the screen. In our example this is the **Default Entitlement** repository, you can see in our example that **Visio** has a green tick on this page, this is the entitlement that results from having just followed the Creating a license entitlement instructions.

Select **Visio** and click on the **New Maintenance** button, located just to the right of the screen.

The **New Maintenance page** opens. For more details on all the fields in this page please refer to New Maintenance page.

There are lots of fields on the page but a few are mandatory. The mandatory fields have an * next to their name.

The page is split into a number of sections, we will start in the **Basic Information** section.

The **Management Group** is the first mandatory field, it's set by default to **Global**, but it can be changed to any of your existing Management Groups, in this example we will leave it at **Global**.

Now we set the following fields and click **Publish**:

Vendor: Microsoft Corporation

Title: Visio

Edition: Professional

Quantity: 10

Entitlement Type: For maintenance entitlements defaults to **Subscription**, (which requires that both the **Duration** and **End date** fields are set. The **End date** is automatically determined by the combination of the **Start date** and **Duration** fields)

Duration: 36. which has automatically set the **End date** to 36 months after the **Start date**.

Unit Cost: $50, the **Currency** is already set to **USD** by default. AppClarity then calculates the total cost of the 10 maintenance additions as **$500.00**.

> **Note**
>
> You can change the default displayed currency from USD to a currency of your choice, refer to Changing the default currency in AppClarity.

The new maintenance entitlement now appears in the **Licenses / Maintenances screen**. It is listed as a new entry with the type listed as **Maintenance** and is row two on the screenshot to the right.

> **Note**
>
> You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:
>
> >
>
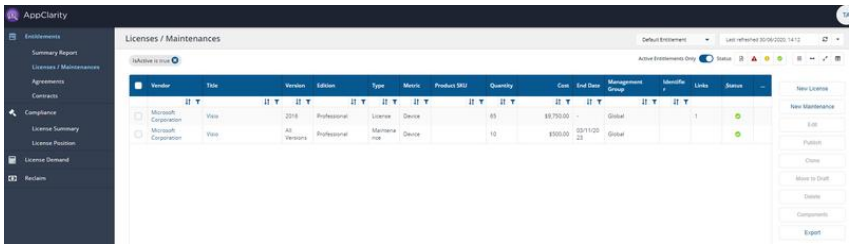
> To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.

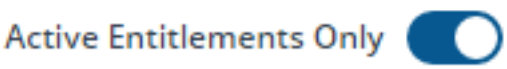
> **Note**
>
> You can download a .tsv report of the Licenses / Maintenances for your organization.
>
> Click **Export** to download a file in the format LicensesMaintenances_currentdate.tsv
>
> This button takes the filters currently applied to the table into account, but not the sorting or the current selection.



10.4.8.2 Linking the maintenance entitlement

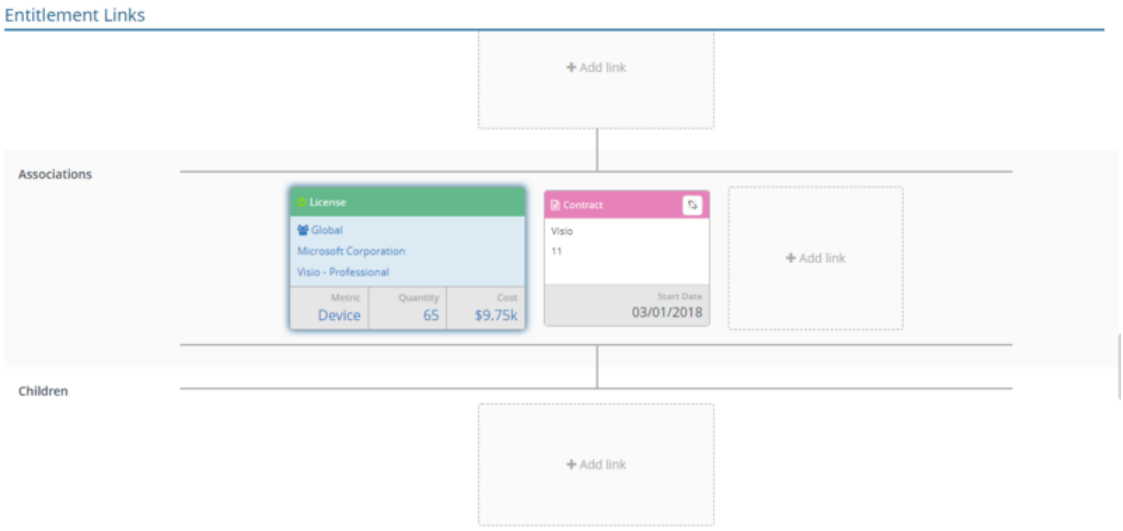
To link a maintenance entitlement to a previously created license entitlement:

On the **AppClarity**→**Entitlements**→**Licenses / Maintenances** page locate the entitlement you want to link the maintenance to. If you toggle the



toggle then this will reduce the number of entitlements displayed and will make finding the relevant one simpler. In our example we click on the **Edit** link for the **Visio** license entitlement we created earlier in Creating a license entitlement.

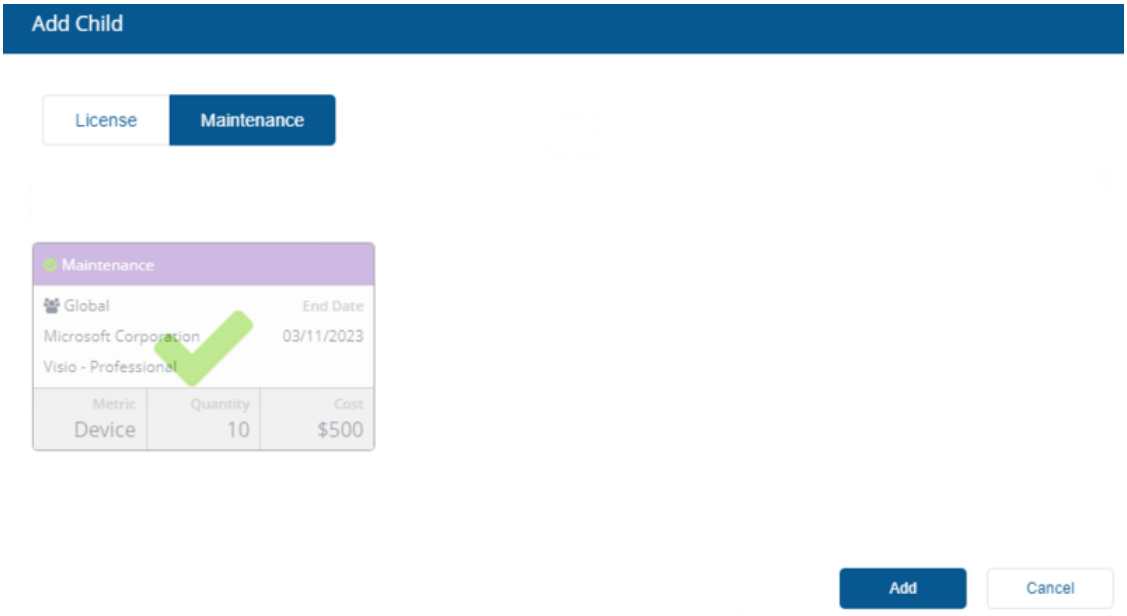
On the **Edit License** page scroll to the **Entitlement Links** section and click in the **Children +Link** area.



In the **Add Child** screen, select **Maintenance**, and click on the displayed **Maintenance**, a green tick will appear.

Click **Add**.

Click **Publish** to save the entitlement and keep it in effect. And you will be returned to the **Licenses / Maintenance** screen.



The maintenance is now linked to the license entitlement.

10.4.8.3 Refreshing the data

To make this immediately count against your compliance position, you should then refresh the following:

Navigate to the **Settings**→**Connector** page and click on the **Execute** button.

The **Execute action** popup is displayed, enter the following:

Repository: Default Compliance

Action: Generate Report - Compliance

Navigate to **Monitoring**→Process Log and wait for the action to complete, this will be **Compliance** and will have a green tick in the **Status** column when complete.

The new maintenance entitlement will now be in force for any new versions of Microsoft Visio that's installed during the next 3 years.

10.4.9 Creating an entitlement using a SKU

Stock Keeping Unit (SKU) codes can be used in some cases to help quickly fill out the details for an entitlement, they can even automatically create and link additional entitlements to model associated maintenance details. AppClarity will retrieve the information for a SKU from 1E Catalog.

Note

A SKU (pronounced 'skue') is an identification, usually alphanumeric, of a particular product that allows it to be tracked for inventory purposes. In AppClarity, via the 1E Catalog, a SKU is associated with the license metrics and use rights associated with a particular software product purchase.

SKUs are in widespread use throughout the software industry, where publishers refer to their software using a SKU. The SKU gets added to most purchase orders to indicate the software or package being bought. Even small differences between two software titles are indicated by different SKUs. The SKU also indicates the license metrics and maintenance terms associated with the purchase and any additional use rights covered by the purchased license.

AppClarity uses the SKU data to automatically:

Prefill the settings in an entitlement with the product details, license metrics, and basic maintenance terms that are indicated by the SKU

Set the additional use rights that are part of the license indicated by the SKU

In this example

In this example, we show how the previous example of a license and maintenance entitlement for Microsoft Visio can be done in a single operation using a SKU number to fetch the details from 1E Catalog.

By the end of this example, you will have created a license entitlement in AppClarity and used a SKU to populate its fields for a Microsoft Visio license and automatically create and link an associated 36 month maintenance for Microsoft Visio.

Let's take a step back now and look at the entitlements we've created so far. The first simple license entitlement covered installations for the Microsoft Visio product, and we had to add the details for the Vendor, License Type, Metric details, Product title, Version Type, Version and Edition. Along the way we also created a contract and attached this to the license. We then created a maintenance entitlement that defined a 3-year subscription and attached that to the license and effectively extended the perpetual license to cover any new versions released during those 3 years.

This example shows how the first and last parts of that sequence can be created in a single step, assuming you know the SKU for Microsoft Visio with a 3-year maintenance. When you use a SKU it must be known by the 1E Catalog, new SKUs from different Vendors are added on a regular basis.

To create an entitlement using a SKU we know the following information in advance:

The vendor of the product, in this case **Microsoft Corporation**

The SKU for the product, in this case for the **Standard** edition of **Visio** this is **D86-03848**

The cost per unit for the license, in this case **$150**

This example assumes that instead of manually creating the two parts of the license and maintenance separately, we start from scratch and instead create and publish a license and maintenance entitlement using a SKU.

> **Note**
>
> You can change the default currency (USD) along with the appropriate currency symbol and name from USD to a currency of your choice, for more details refer to Creating a license entitlement: Changing the default currency in AppClarity

10.4.9.1 Creating the maintenance entitlement from the SKU

To create and publish a license entitlement:

Navigate to the **AppClarity→Entitlements→Licenses / Maintenances** page and click on **New License**.

In the **New License** page we will choose a specific set of options to show how this page works. For more details on all the fields in this page please refer to New License page.

There are lots of fields on the page, but a few are mandatory. The mandatory fields have an * next to their name.

The page is split into a number of sections, we will start in the **Basic Information** section.

The **Management Group** is the first mandatory field, it is set by default to **Global**, but it can be changed to any of your existing Management Groups, in this example we will leave it at **Global**.

The next mandatory item is the **Vendor** field. We know that the vendor for **Visio** is **Microsoft Corporation**, so we start by typing **Micros** into the field and select **Microsoft Corporation** from the dropdown list of suggestions.

This time the **Product SKU** field is the next one we have to fill out. So we start typing the SKU, after entering the first few characters matching SKUs are displayed. We select the matching **D86-03848** from the dropdown list of suggestions.

Note, the page title has now changed to **Edit LicensePlusMaintenance**

Notice how after selecting the SKU the **License Type**, **Metric Type**, **Duration**, **End date**, **Product title** and **Edition** fields are now filled out.

Now we set the following fields and click **Publish**, we could have clicked **Save draft**, if we were in the middle of making changes and didn't want to make the license active and the license would have been saved:

Quantity: 10

Units: 1

Unit Costs: 150

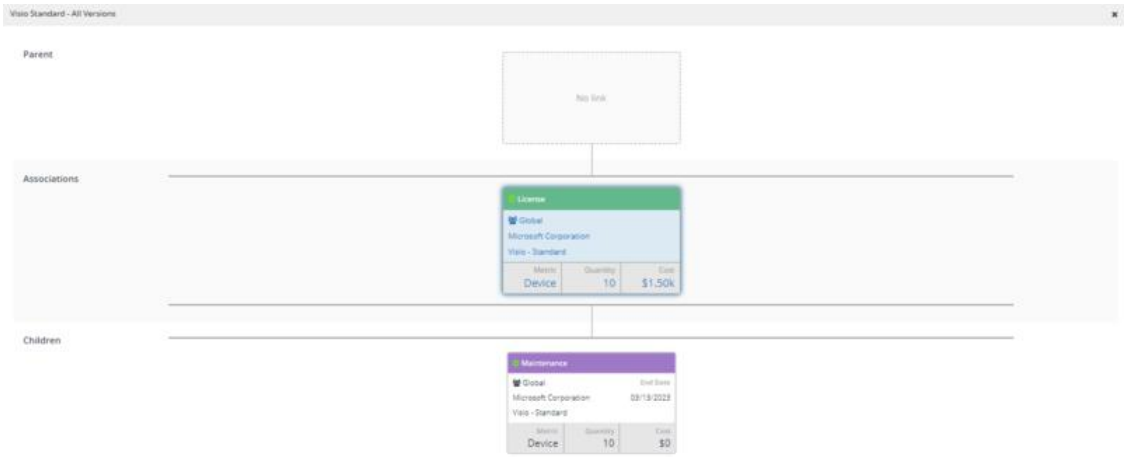
Currency: is already set to **USD** by default. AppClarity then calculates the total cost of the 10 licenses as **$1500.00**

Confirm the Entitlement is created:

Having published the license entitlement an entry now appears in the **Licenses / Maintenances** page. For **Visio Standard** Edition, with the **Product SKU** populated with the previously entered values.

To check this further click on the **1** in the **Links** column for the Entitlement.

In the popup you'll see the entitlement linked to the **Children Maintenance**.



To make a published license entitlement take effect you have to run the **Compliance** report:

Navigate to the **Settings**→**Connector** page and click **Execute**.

The **Execute action** popup is displayed, enter the following:

Repository: Default Compliance

Action: Generate Report - Compliance.

Navigate to **Monitoring**→**Process Log** and wait for the **Action** to complete, this will be **Compliance** and will have a green tick in the **Status** column when complete.

Navigate to the **AppClarity**→**Compliance**→**License Position** page.

In our example you can see that**Visio** with **Edition** of **Standard** now has a **License Position** of **10.** This indicates that the installations of the software title are now licensed and there are **10** spare licenses for **Visio**.

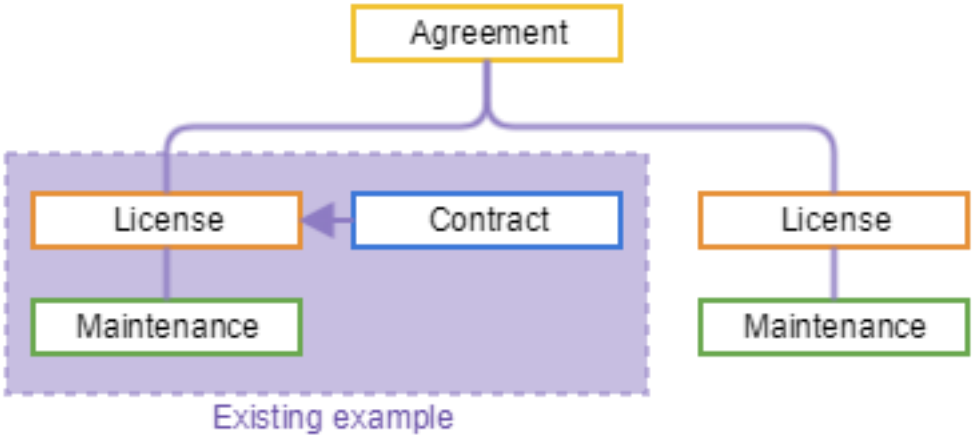
10.4.10 Creating an agreement entitlement

Agreement entitlements provide a way of grouping and organizing entitlements together to model the agreement structures in place between your organization and a vendor of a specific software title. Agreements can act as containers for license, maintenance, and even other agreement entitlements.

In this example

In this example we will extend the Microsoft Visio license and associated maintenance and contract created in Creating a license entitlement and Creating and linking a maintenance entitlement.

By the end of this example you will have created a new Microsoft Product agreement entitlement and linked the existing Visio license to it. You will also have created a new Microsoft Project license and associated 36 month maintenance and then linked that to the new agreement.



10.4.10.1 Check we have a deficit

To the right we have navigated to **AppClarity→Compliance→License Position** page and filtered the **Title** on Project which shows that we have an installation for **Microsoft Project** and that has a total license deficiency of **-19**.

> **Note**
>
> You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:
>
> >
>
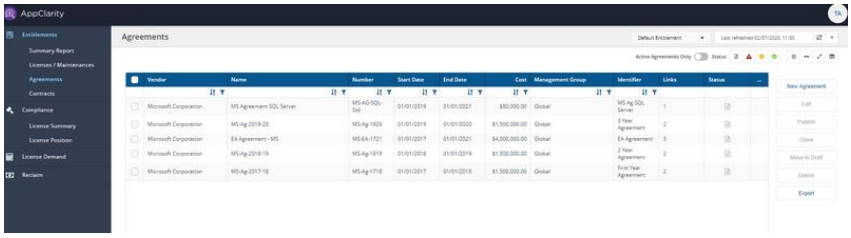
> To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.

Selecting any of the displayed products and then **Compliance Details** opens the **License Summary** page, this display can also be accessed directly and filtered, but you should know there are multiple ways to access the page.

10.4.10.2 Add a New Agreement

To add a new **Microsoft Products** agreement entitlement, navigate to the **Entitlements→Agreements** page and click on **New Agreement**, located just to the right.



To add a new **Microsoft Products** agreement entitlement:

Navigate to the **Entitlements**→Agreements screen and click **New Agreement**, located just to the right.

In the **New Agreement** page we will choose a specific set of options to show how this page works. For more details on all the fields in this page please refer to New Agreement page.

There are lots of fields on the page but a few are mandatory. The mandatory fields have an * next to their name.

The page is split into a number of sections, we will start in the **Basic Information** section.

The **Management Group** is the first mandatory field, it is set by default to **Global**, but it can be changed to any of your existing Management Groups, in this example we will leave it at **Global**.

The next mandatory item is the **Vendor** field. We know that the vendoris **Microsoft Corporation**.

Now we set the following fields and click **Publish**. We could have clicked **Save draft**, if we were in the middle of making changes and didn't want to make the agreement active, the draft agreement would then be saved.

Name to **Microsoft Product Agreement** - this should be the name of your agreement

Number to **Ag123456** - this is not mandatory, but should be the Agreement Number

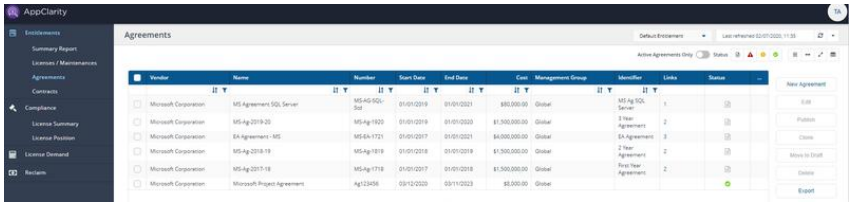
Entitlement Term Start Date defaults to today's date, but should be set to the date your agreement starts, in the example we will use today's date

Duration to **36**

Total Cost to **$8000**

> **Note**
>
> You can change the default currency (USD) along with the appropriate currency symbol and name from USD to a currency of your choice, for more details refer to Creating a license entitlement: Changing the default currency in AppClarity

The **Agreements** page will update and the new agreement will be listed, with the **Status** column having a green tick to show it is published.



We will now link the new **Agreement** to our existing **License** for **Microsoft Visio**.

After the actions above, we are returned to the **Entitlements - Agreements** screen.

Select the **Agreement** just created and click **Edit**.

Scroll to the **Entitlements Links** section and click **+ Add link** in the **Children** section.

Scroll to find the **Visio Professional License,** and then click on this and the green tick we have previously seen will appear.

Click **Add**.

Click **Publish**.

Now we'll add a new license for **Microsoft Project** (refer to Creating a license entitlement for the steps to achieve this, not forgetting to **Publish** once added):

Enter the following details for the license:

Vendor: Microsoft Corporation

Title: Project

Version Type: Colloquial

Version: 2016

Edition: Professional

Metric Type: Device (this is the default)

Quantity: 20

Entitlement Type: Perpetual

Start date: to the date the license started, or is due to start on. In our example it's set to the default of the current date

Costs $200

Adding a new maintenance entitlement for **Microsoft Project**:

Return to the **Licenses / Maintenances** screen. Click the **New Maintenance** button.

We then set the details for the Maintenance click **Publish** when entered:

Vendor: Microsoft Corporation

Title: Project

Edition: Professional

Quantity: 20

Entitlement Type: Subscription (default for maintenance)

Duration: 36

Unit Cost: 50

We will now link the **Microsoft Product Agreement** to our new **License** for **Microsoft Project**.

Navigate to **Entitlements** → **Agreements** screen.

Select the **Microsoft Product Agreement** and click **Edit**.

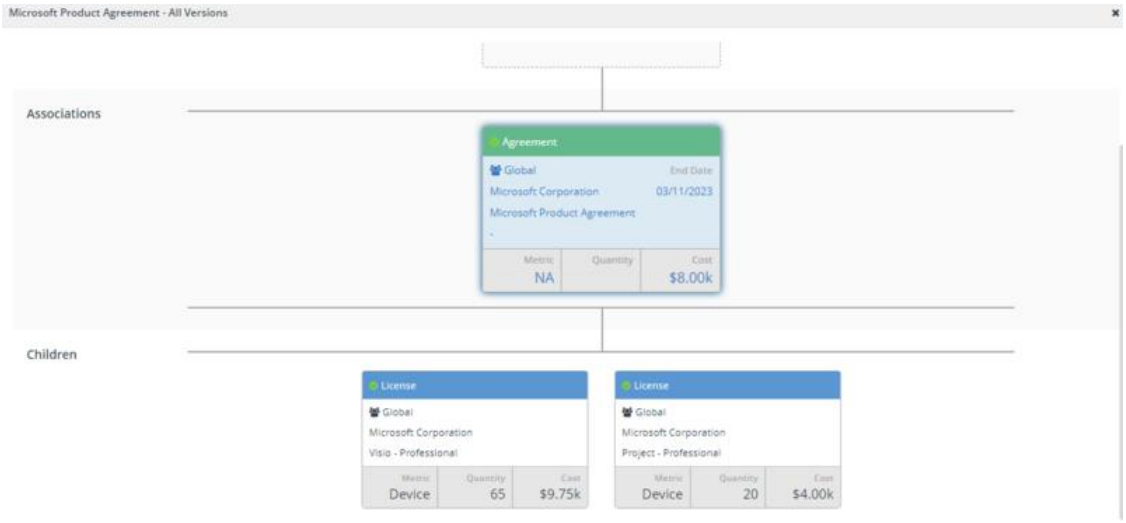
Scroll to the **Entitlements Links** section and Click **+ Add link** in the **Children** section.

Scroll to find the **Project Professional License** click on this and the green tick we have previously seen will appear.

Click **Add**.

Click **Publish**.

That has created the structure for our agreement. To see this click on the **2** in the **Links** column for the **Microsoft Product Agreement**, this will display the screen:



To make a published license entitlement take effect, you have to run the **Compliance** report:

Switch to the **Settings**→**Configuration**→Connectors page and click on the **Execute** button.

The **Execute action** popup is displayed, enter the following:

Repository: Default Compliance

Action: Generate Report - Compliance.

Navigate to **Monitoring**→**Process Log** and wait for the action to complete, this will be **Compliance** and will have a green tick in the **Status** column when complete.

Now that the compliance report has been run, to see the impact of implementing the entitlements:

Switch to the **AppClarity**→**Compliance**→**License Position** page.

In our example you can see that**Visio** with **Edition** of **Professional** now has a **License Position** of **5.** This indicates that the installations of the software title are now licensed and there are **5** spare licenses for **Visio.** And the **License Position** for **Project** is 1.

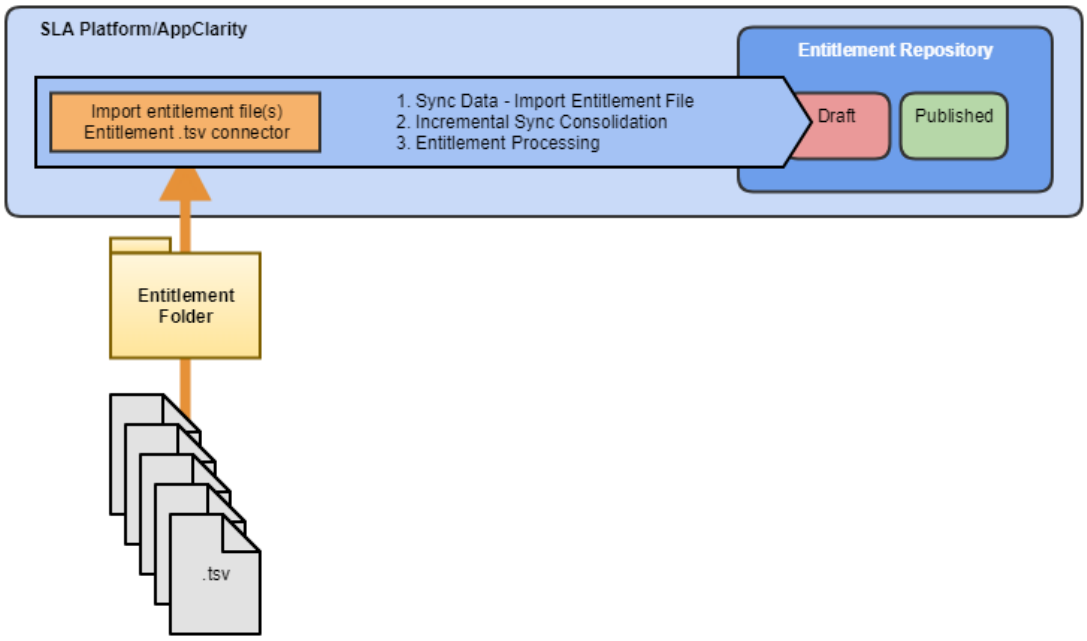
10.4.11 Importing entitlements from a folder

Large organizations may have thousands of entitlements to arrange. For AppClarity to report on your effective license position these need to be defined in AppClarity. To help get your entitlements in place, quickly and effectively AppClarity enables you to import directly from a particular folder. This means you can construct your TSV files as needed, place them in the folder and then import.

After importing the entitlements into AppClarity they are marked as Draft Entitlements. It gives you a chance to view any issues that arose as a result of the import process, and when that's done you can publish all of these entitlements in one go.

In this example

In this example we will show how to create and configure an **Entitlement .tsv** connector to point at a directory where the entitlement files will be placed. We will then show how the entitlement files are imported as **Draft Entitlements** and then the process of removing the imported entitlements with errors.



By the end of this example you will have:

Created a new connector that points at an entitlement directory holding some entitlement files

Added a new entitlements repository that will hold all the imported entitlements

Identified and resolved issues with the imported files

Published some entitlements derived from those files.

10.4.11.1 Importing entitlements from a file

10.4.11.1.1Configuring a connector

Entitlements are imported from .tsv formatted files with a particular schema. The way these files are brought in to AppClarity is using a connector pointing at a directory where the entitlement files are located or will be placed. For more details see Entitlement .tsv connector. The steps for configuring the connector are as follows:

Navigate to **Settings→Configuration→Connectors**.

Click the **Add** button.

In the **Add Connector** popup select the **Entitlement .tsv** connector from the list of connector types.

In the **Connector n ame** field enter a suitable name for the new connector, for a description of suggested naming conventions please refer to Naming conventions. In our example we call the connector **Entitlement File(s) Example**.

In the **Folder or File Location** field enter the folder where you are going to place the entitlement files. In our case we use the folder **C:\AppClarity\File Upload\Example**

Click **Add** to save the new connector.

Click the **Test** to ensure access to the folder with the entitlement files.

If the test is a success you'll see a green tick in the **Test Status** column.

If you see a red triangle, click on it to display its description. Use this information to help resolve the issue, then cycle through resolving and running the test until it's a success.

10.4.11.1.2Add a new entitlement repository

To keep the imported entitlements separate from our default or other entitlement repositories it's useful to create a new entitlement repository to test the import process and resolve any issues in isolation. For more details on adding and configuring repositories please refer to Repositories page. To create a new entitlement repository:

Navigate to the **Settings→Configuration→Repositories** page and click **Add.**

In the **Add repository** popup enter the details for the new repository.

Enter a unique **Name** for the repository that does not match an existing repository. For a description of suggested naming conventions, please refer to Naming conventions. In our example we call the repository **1E Entitlements**.

From the Repository type dropdown menu choose the type, **Entitlement**.

In the **Description** field set a suitable description that will let you know the purpose of the repository at a later stage. In our example this is **Entitlement files in the Example folder can be imported and tested here.**

Leave the **Default repository** checkbox unchecked and click **Add**.

10.4.11.1.3Populating the new entitlement repository

The next step is populating the new entitlement repository using the connector created earlier. To do this:

Navigate to **Settings→Configuration→Connectors** and click **Execute**.

In the **Execute action** popup select your new entitlement repository, In our example this is **1E Entitlements**.

From the **Action** dropdown, choose the **Sync Data** action for your **Entitlement .tsv** connector, and click **Execute.**

To monitor the progress of the new action navigate to **Settings→Monitoring→Process log** to view the **Sync Data** for Entitlement .tsv and dependent actions running.

There are three actions that run when you select the **Sync Data - <connector name>** action:

Sync Data

Incremental Sync Consolidation

Entitlement Processing

The output of each of these three related actions is:

Fetch the entitlement files from the folder pointed at by the connector.

Consolidate and de-duplicate entries in the information.

Process the imported entitlements and place them a draft state in **Entitlements**.

You should make sure these three actions complete successfully before continuing.

10.4.11.1.4Viewing the draft imported entitlements

When the actions have completed you can navigate to the **AppClarity→Entitlements→Licenses / Maintenances** page to view the imported entitlements. After creating a new entitlement repository you need to be aware that it won't initially be selected by default on any of the entitlements pages. To select the new entitlement repository:

On the **AppClarity→Entitlement→**Licenses / Maintenances page click on the entitlement name drop down in the top-right of the page. In our example when we first browse to the **AppClarity→Entitlement→**Licenses / Maintenances page the **Default entitlement** is selected.

From the list of entitlement repositories subsequently displayed in the drop down list, click on the name of the entitlements repository created and populated earlier. In our example this is **1E Entitlements**.

When this is selected, the newly imported entitlements will be visible on the **Licenses / Maintenances** page, in the **Status** column you can see the status of each entry will be set if there are no errors or warnings to **Drafts with no warnings**. If any entitlements have any errors or warnings, they will have an icon to warn of the issue (See the table below for the various statuses)**.**

If an Entitlement has a warning icon then to see the detail of what the issue is, click on the Entitlement title (it's a hyperlink) this will open the detailed page for the Entitlement. Scroll to the bottom section to view any warnings or errors for the entitlement.

10.4.11.1.5Bulk publishing the imported entitlements

Once the entitlements are displaying in the **Licenses / Maintenances** page you can check for and resolve any immediate errors and then bulk publish the imported entitlements. In our basic example the entitlement import into draft hasn't raised any issues, so we can get straight on with the business of publishing.

After reviewing the items and ensuring there are no errors. Scroll to the top of the page and click the **Select all** button. This checks all the boxes in the left-hand column.

Click the **Publish** button. This publishes all the rows where the boxes are checked.

When you publish the imported entitlements you sometimes get additional errors, for example incorrect or missing information or matching related issues. Check the icon's in the **Status** column for any items that do not display a published green tick.

To resolve an issue, where the Vendor, Title and Edition information hasn't completely matched with the catalog you'll need to edit the entitlement. Click **Edit** for the row in question.

In the entitlement edit page the values will be prefilled from the imported entitlement. You then need to check each of the following fields by clicking on the:

Vendor field and select any matching vendor returned from the 1E Catalog.

Title field and select any matching product returned from the 1E Catalog.

Version field and select any matching product version returned from the 1E Catalog.

Edition, if it's been set, and select any matching edition returned from the 1E Catalog.

After checking the vendor, title, version and edition click the **Publish** button to check any changed values.

Now all the imported entitlements have been processed successfully, navigate to the **AppClarity**→**Entitlements**→**Summary Report**→Entitlement Summary page to view all imported entitlements.

You can search for errors in the imported data by using the **Status** filters at the top of the **Licenses / Maintenances** page, by hovering your mouse over the icons you'll see a description for each filter:

Status Icon	Description
	Drafts with no warnings.
	Drafts with errors.
	Drafts with warnings.
	Published.

10.4.12 Managing compliance for user-based licenses

You can view your compliance position by focusing on how licenses are consumed by user as well as by device. From here, you can also add entitlements for a specific product.

10.4.12.1 Viewing product compliance by user

This example assumes that you have associated your chosen compliance repository with your chosen entitlement repository, this example uses**Default Compliance** and**Default Entitlement,** and you have run the **Compliance** report on your chosen compliance repository.

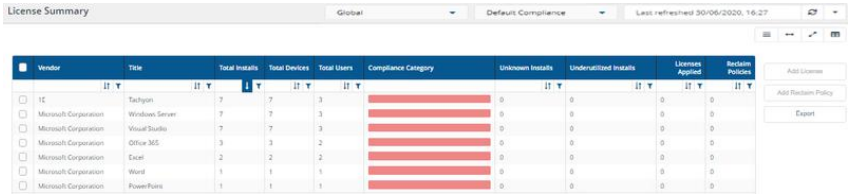
Please refer to Running your first Compliance License Summary for steps that show how to do this.

Our example, shows a simple workflow of how one user who is a primary user on multiple devices and uses the same software on those devices may need only one license for the installs to be compliant. In this example the user **ACME\Paul.Harris** uses 2 **Installations** on 2 **devices** running **Visual Studio Professional**, but would only

need 1 license because user based compliance works across devices, where device based compliance works per individual device.

To view product compliance and interact with the products to create new licenses and improve your compliance:

Navigate to **AppClarity→Compliance→License Summary**. Here you'll see a summary of your compliance position. The displayed table shows compliance information about all your products.



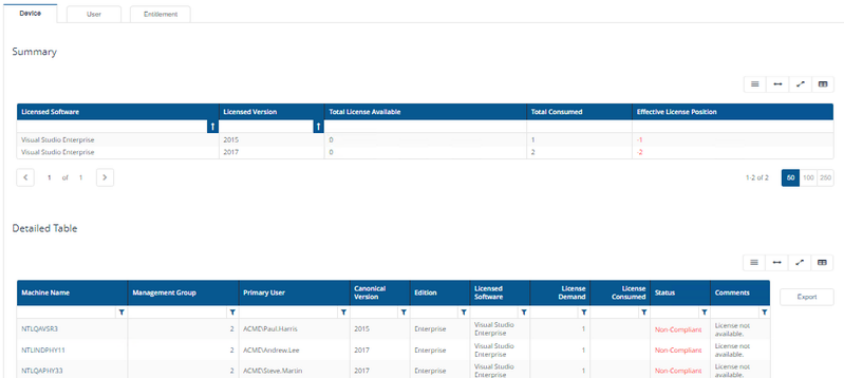
This displays the License Summary page, for more details on the fields on this page please refer to License Summary page. The compliance position for **Visual Studio** shows that **Visual Studio** has **7 installations** on **7 devices**, which are primarily used by **3 Users.** To make **Visual Studio** compliant we could use either of these options:

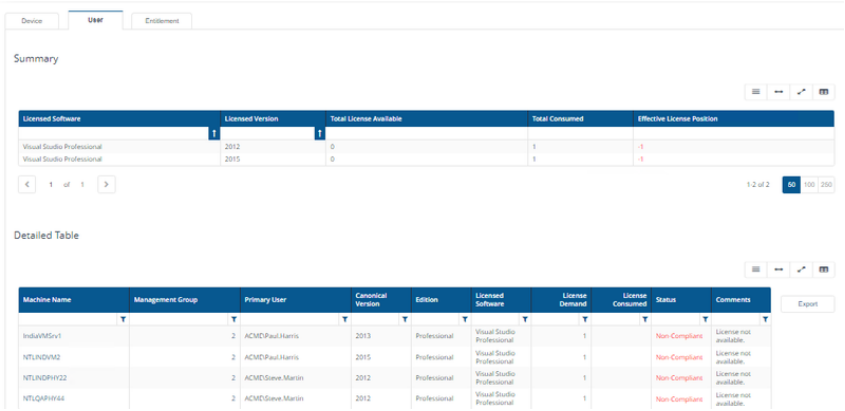
7 Device metric based licenses

3 User metric based licenses.

> This example focuses on setting up a User metric based license for **Visual Studio** to make this product compliant.

Select the product by clicking on the color bar in the **Compliance Category** column you want to add a license entitlement for, in our example this is**Microsoft Corporation**,**Visual Studio**.





10.4.12.2 To create and publish a license entitlement:

This displays the**New License**page, for this example, we set the following fields to create the license entitlement:

> **Note**
>
> These steps can also be carried out directly on the**Entitlements - Licenses /Maintenances**page and clicking on**New License**, but the prefilled information will not be there and you will need to enter that yourself.

Select the displayed product and click**Add License**, located just to the right.

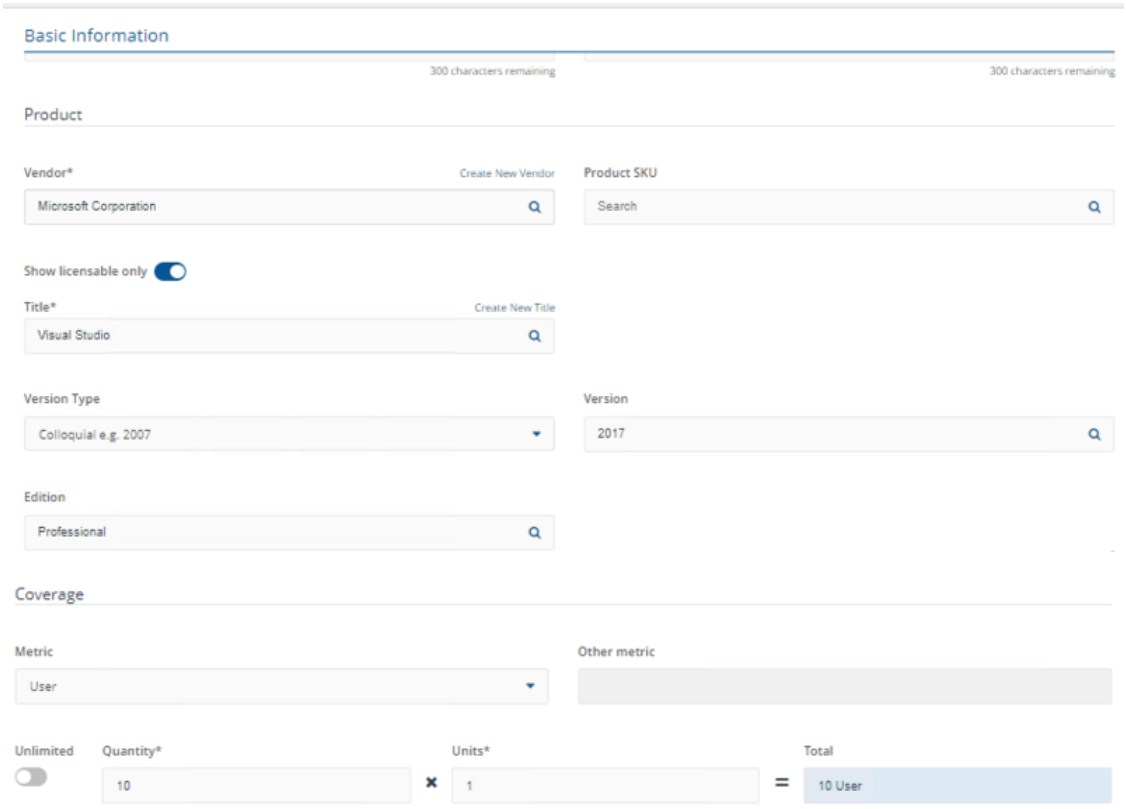
In the **New License** page we will choose a specific set of options to show how this page works. For more details on all the fields in this page please refer to New License page.

There are lots of fields on the page but a few are mandatory. The mandatory fields have an * next to their name.

The page is split into a number of sections, we will start in the **Basic Information** section.

The **Management Group** is the first mandatory field, it's set by default to Global, but it can be changed to any of your existing Management Groups, in this example we will leave it at **Global**.

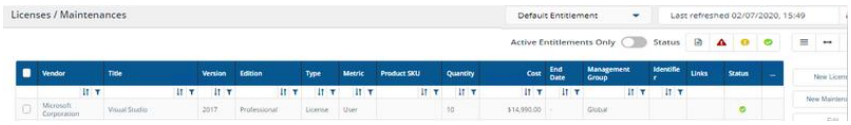
The next mandatory item is the **Vendor** field. As we have opened this page after selecting a product, any known fields are prepopulated. Where they are not, then as you start to type information suggestions are shown which are brought in from 1E Catalog.



Now everything is set how we want it lets make this license entitlement take effect. To do this we click the **Publish** button at the bottom of the page. We could have clicked **Save draft**, if we were in the middle of making changes and didn't want to make the license active and the license would have been saved as draft in the **Licenses / Maintenances** page.

Having published the license entitlement an entry now appears in the **Licenses / Maintenances** page.

The License we just published is shown with a green tick next to it, those in draft have a paper icon next to them.



For this simple example we populated the following fields:

Title: Visual Studio

Edition: Professional

Version Type: Colloquial

Version: 2017

Metric Type: User (Device is default selection)

Quantity: 10 (For other more complex metric types, you will need to adjust the **Quantity** accordingly. For example, Microsoft Office 365 may be purchased in blocks of 5 devices, so if you bought 10 licenses at 5 devices each you would need to enter 50 in the **Quantity** field)

Entitlement Type: Perpetual

Start date: to the date the license started, or is due to start on. In our example, it's set to the default of the current date

Duration set the duration of the license, this will be required if the license is not Perpetual

Version Downgrade: We now ensure that the both **Available** and **Persistent** check boxes under the **Rights** section are checked, as it should be by default. This will confirm that this license can be applied to earlier versions of Windows Server.

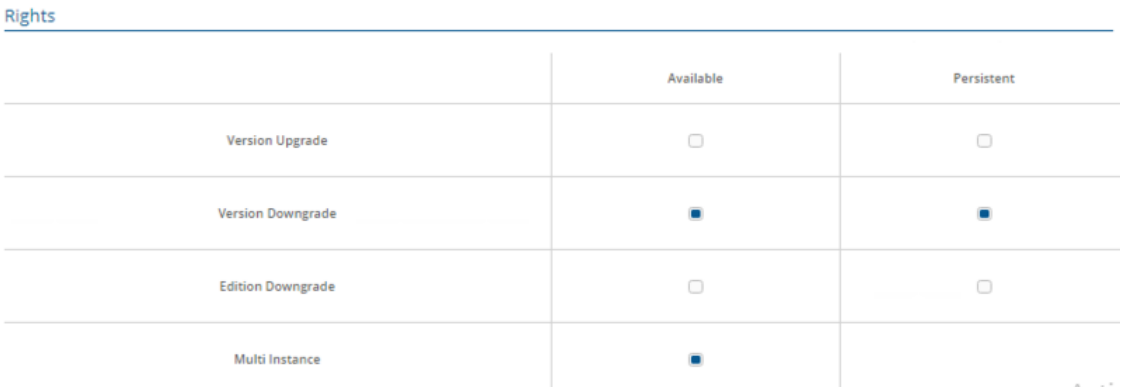
Costs: 150

Multi Instance: you must **ensure this is checked** to set the license as one that applies across multiple devices (In case of **User metric** based licenses, **Multi Instance right is compulsory**)

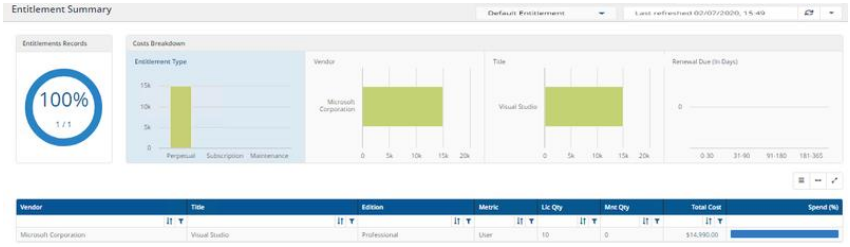
Currency: is already set to **USD** by default. AppClarity then calculates the total cost of the 10 licenses.

> **Note**
>
> **Edition Downgrade** has been improved. For example Visual Studio can have multiple editions like Ultimate, Professional and Enterprise editions. In previous versions of AppClarity if you used Visual Studio Enterprise and in other addition downgraded versions like Visual Studio Professional, the lower version also consumed the same license as Visual Studio Enterprise.
>
> If you only have an entitlement for Visual Studio Enterprise in your Inventory, the Enterprise license will cover Visual Studio Enterprise but also downgraded versions like Visual Studio Professional and Visual Studio Ultimate.

> **Note**
>
> You must ensure you check the **Multi Instance** checkbox to set the license as one that applies across multiple devices, otherwise setting the license by user will not work.



On publishing an entitlement, the **Entitlement Consolidation** report is refreshed. Once this is done, the data can be seen on the **Entitlement Summary** page.



To make a published license entitlement take effect you have to run the **Compliance** report:

> **Note**
>
> You can refresh reports from individual AppClarity screens as well as using the **Settings** App. You can do this by using the refresh icon next to the**Last Refreshed**box, for example:
>
>
>
>
> For a complete list of the specific reports you can run from particular pages refer to Running your first Compliance License Summary: Refresh Reports.

> **Note**
>
> You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:
>
> >
>
> To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.

Navigate to the **Settings→Connectors** page and click on the **Execute** button.

The **Execute** action popup is displayed, enter the following:

Navigate to **Settings→Monitoring→Process Log** and wait for the action to complete, this will be **Compliance** and will have a green tick in the **Status** column when complete.

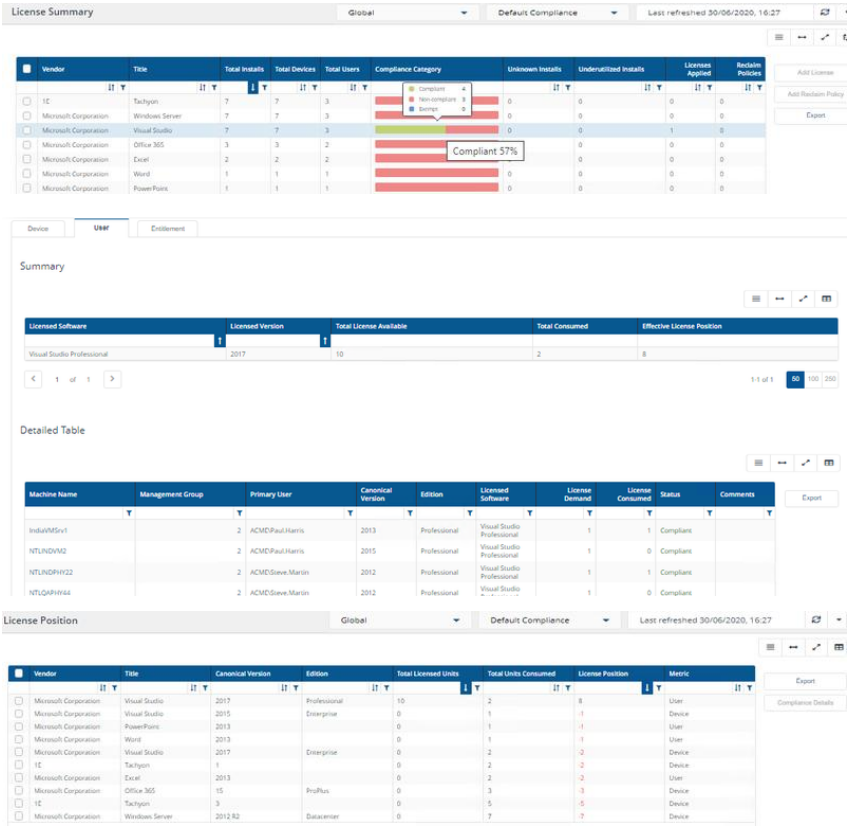
Navigate to the **AppClarity→Compliance→License Position** page.

In this example, you can see that **Visual Studio Professional** is now **Compliant** for 4 devices but with only 2 users**.**

> **Visual Studio Professional** has 4 installations on 4 devices. But, only 2 user metric based licenses were consumed as only 2 users were accessing these 4 devices.

Repository: Default Compliance

Action: Generate Report - Compliance



10.4.13 Calculating license demand

To calculate the license demand, you need to refresh the report you are interested in. In our example we have refreshed all three reports.

> **Note**
>
> The License Demand Compliance (LDC) reports do not take into account any current entitlements set in AppClarity. They are purely for the purpose of determining the overall number of license units that would be required to make the installations compliant. In effect, the LDC reports answer the following question:
>
> If you currently had no licenses how many licenses,in the most efficient arrangement,would you need to procure in order to become compliant?

To run and view License Demand Compliance (LDC) reports :

Switch to **AppClarity→License Demand**.

On the **License Demand Calculation Report** screen, select your compliance repository from the dropdown list.

Click **Refresh** for each report.

Once the report refresh shows as complete, click **View Report**.

The displayed summary table lists **Licensed Software**, the total number of **Installs**, **License Demand** and **Unknown Installs**. You also have the option to select one or multiple titles and then clicking **Show Detailed Report** to further explore and filter the number of selected titles.

You may want to find out the quantity of licenses you would need to purchase or submit into AppClarity in order to make your product compliant. AppClarity provides license demand calculation reports that perform complex licensing calculations to find out what your ideal licensing position should be.

The complex server licensing covers four major reports of different vendors, for the most used and most expensive forms of licensing that occur in customer environments:

Microsoft Core License Demand

IBM Processor Value Unit (PVU) License Demand

Oracle Processor License Demand

Red Hat Socket Demand.

The Microsoft Core License Demand report includes Windows Server OS licensing because it is core-based, and therefore it is now included in our Microsoft Core License Demand.

To view and refresh these reports, the logged-in user must have any of the user roles:

License Demand Calculation Report (LDC) page	Role
View a License Demand Calculation (LDC) pages	Full Administrator
	Compliance Administrator
	Compliance Viewer
Refresh a License Demand Calculation (LDC) Report	Full Administrator
	Compliance Administrator

Refer to AppClarity user roles for more information about Role Based Access Controls (RBAC) in AppClarity. In future versions of AppClarity we plan to extend the number of vendors and products available. This example focuses on the Microsoft Core License Demand report.

10.4.13.1 Summary table

At the top of the page is a summary, where the primary bit of information is what AppClarity has estimated as the license demand. This appears under the **License Demand** column for each product.

The example shows the **Microsoft Core License Demand** for SQL Server (for Standard and Enterprise editions) displaying the unknown (or unparented) installation for its components, for example Reporting Services and Analysis Services.

In the example, both the **SQL Server Integration Services** and **SQL Server Reporting Services** show 0 **Installs** and 248 and 67 **Unknown Installs** respectively:

SQL Server Enterprise - License Demand indicates you would need to buy 1,310 cores licenses to be compliant

SQL Server Standard - License Demand indicates you would need to buy 970cores licenses to be compliant.

The example also shows the **Microsoft Core License Demand** for Windows Server Enterprise and Windows Server Standard, for this calculation:

Windows Server Enterprise - License Demand indicates that you would need to buy 4,192 cores licensesto be compliant

Windows Server Standard - License Demand indicates that you would need to buy 24,130 cores licensesto be compliant.

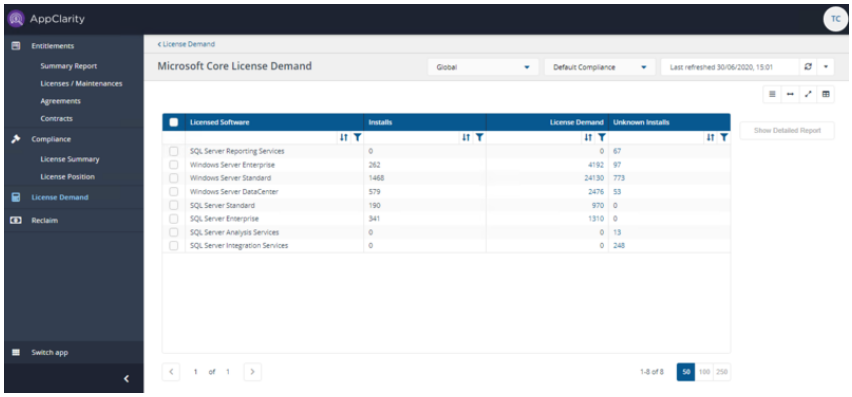
This value is calculated by incorporating all the licensing schemes for SQL Server and Windows Server that Microsoft provides in order to derive the most efficient value. Clicking on one of these values will take you to the rows in the detailed table displaying the installations on devices.

> **Note**
>
> There are some common reasons why **Unknown Installs** prevent License Demand from being calculated:

The host information is unknown to AppClarity

The hardware information (i.e., no of cores) is unknown to AppClarity

Any SQL Server component (For example, SQL Server Integration Services or Reporting Services) does not have a parent installation on any device (i.e., on any device, only the component is installed, and SQL Server installation is missing).



10.4.13.2 Detailed Report table

In the rest of the report, a table is displayed where each row shows the installation for the product on a particular device (Physical servers, physical host with VM's or Clusters). The **License Demand** value for each **Machine Name** row in the table is added together to form the summary **License Demand** value. The table is sorted by the different **Licensed Software** column.

The rows in the table are also organized into clusters containing **Physical Host** containing the physical hosts and the virtual guests they are hosting. It is important to see this relationship as this can sometimes make a significant difference to the license requirements. The table also shows the hardware information which again can make a difference to the license requirements.

Note

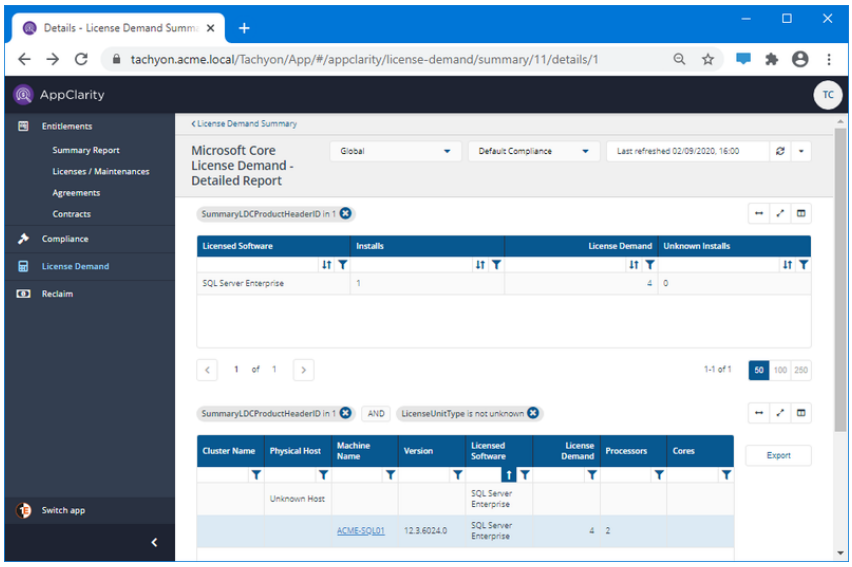
You can refresh reports from individual AppClarity screens as well as using the **Settings** App. You can do this by using the refresh icon next to the**Last Refreshed**box, for example:

For a complete list of the specific reports you can run from particular pages refer to Running your first Compliance License Summary: Refresh Reports.

Note

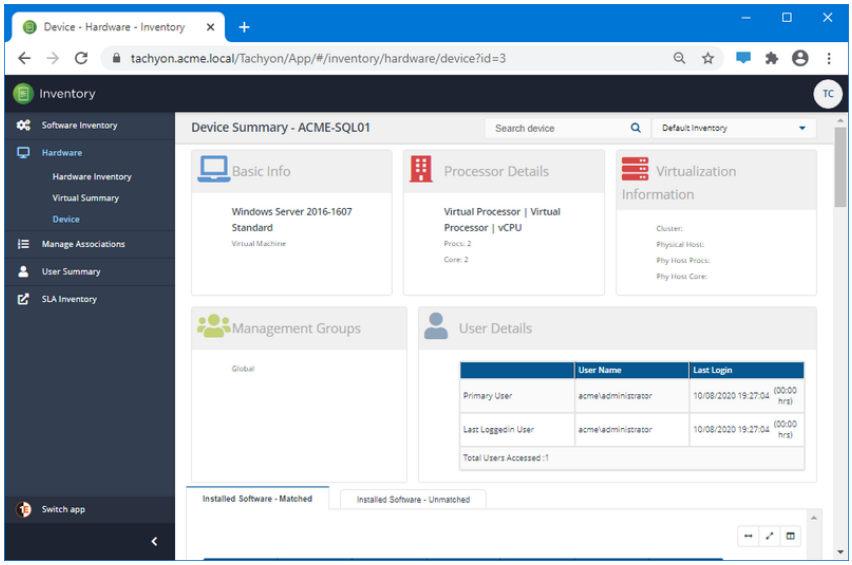
You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:

To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.



Entries in the **Machine Name** column are links to the corresponding **Device Summary** for that machine in the Inventory app.

In our example by clicking on ACME-SQL01 in the **device Name** column we can view the device's associated **Device Summary** in **Inventory**→**Hardware**→**Device**.



To automatically refresh a report for a repository you can set up a schedule:

Under the **Settings**→Configuration→Schedules and click **Add**.

In the Add schedule screen for:

Schedule name - enter a logical name for the new schedule.

Repository - select your repository from the dropdown menu.

Action type - select the associated action type you want to schedule.

Frequency - select the frequency.

> **Note**
>
> For any entitlement repository, when a new entitlement is created (which triggers an entitlement consolidation) a **Schedule** called **EntitlementConsolidationScheduler** is created for this repository by default, it's set to run on a 24 hrs frequency (daily basis).

10.4.14 Excluding devices from License Demand Calculation using Management Groups

It may be required to exclude some groups of machines from LDC or Compliance reporting, as these may be for developer's devices for which an exemption is permitted and therefore the software on those devices should not be considered in the count of licenses. In AppClarity 8.1 this exemption is carried out by adding the machines to a Management Group. The naming convention of the Management group is very specific and care should be taken when creating it, the name is of the format:

License Exemption OR

License Exemption - Vendor name OR

License Exemption - Vendor name "Identifier for Management group"

Each of these has a specific function, the first will exclude all software for the machines in the group from the LDC and Compliance, the others will exclude all software for the specified vendor from the LDC and Compliance.

For the same vendor, two separate management groups could be created as below, and devices falling in either management group would exempt them for SQL Server installations from the Microsoft Core LDC, and in the Compliance Reporting, all installations where the Vendor is Microsoft Corporation will be excluded from the device (this would include, SQL Server, Office 365, Visual Studio etc.).

License Exemption - Microsoft Corporation

License Exemption - Microsoft Corporation "for MSDN licenses".

> **Warning**
>
> Take care when naming Management groups, as any misspelling of the License Exemption, the Vendor or inappropriate spacing will result in the exemption of installations not being applied.

Remember that when being audited for Compliance, you may have to prove that you are entitled to exempt machines from licensing.

10.4.14.1 Create an Exclusion Management Group

The devices to be excluded need to be added to an Exclusion Management Group. This Exclusion group has a specific naming convention mentioned above, and because all products or all products for a specific vendor will be excluded, care should be taken when populating these groups. The creation and population of Management groups are documented here Management Groups page. The user creating the Management group will require the **Group Administrator** role.

10.4.14.1.1Create the Microsoft Corporation exclusion Management group

In this example, we will exclude Microsoft Products from the Development Computers OU:

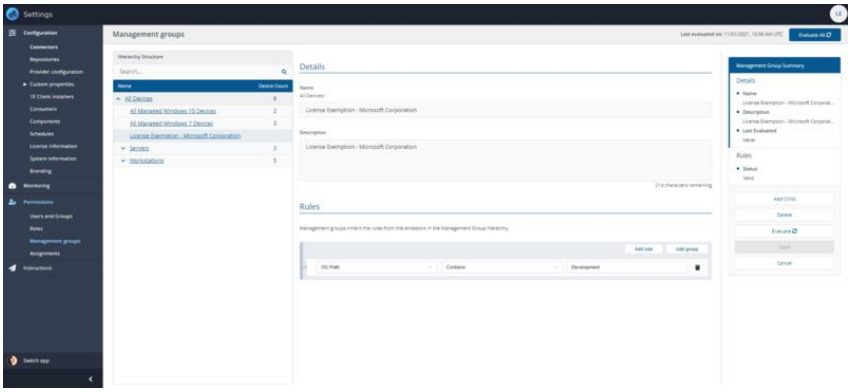
In the **Settings** application, navigate to **Permissions**→**Management groups.**

Create the Management Group with name as **License Exemption - Microsoft Corporation**.

In rules, add the **OU path contains Development**.

Save the Management Group, the screen is shown to the right.

Evaluate the Management Groups by clicking the Evaluate button on the right of the Management groups screen.



10.4.14.2 View the effect of creating the exclusion

The exclusion will take place at the next scheduled refresh/run of the 'Compliance' action against associated compliance repository or refreshing the License Demand report for Microsoft Core License Demand, or it can be run on demand, the following roles have these permissions:

AppClarity Administrator

Compliance Administrator.

To run on demand:

Switch App **Settings**→**Monitoring**→**Process log**

Click **Execute** and select:

Repository: **Default Compliance**.

Action: **Generate Report - Compliance** and then Click **Execute** button.

Monitor the progress in the **Process log**.

10.4.14.2.1View the LDC - Microsoft Core License Demand report

As one of the following users, open AppClarity, and navigate to License Demand:

AppClarity Administrator

Compliance Administrator.

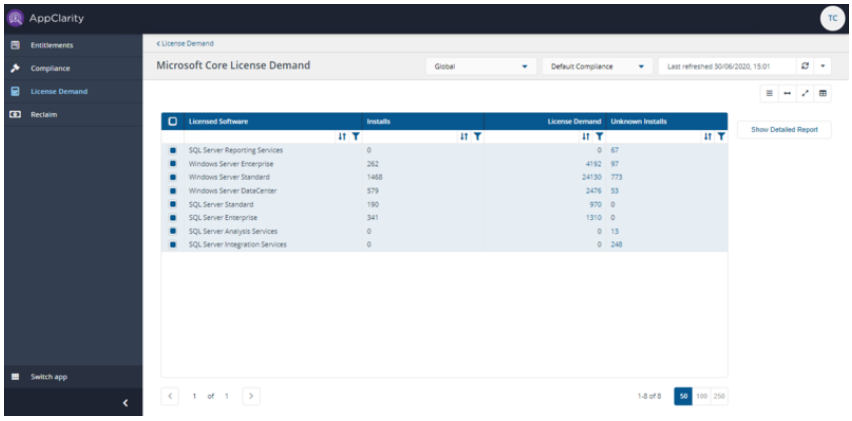
Click on **Refresh** in the Microsoft Core License Demand tile.

When the refresh completes, **Last run: a few seconds ago** shows.

Click on **View Report.**

Select the select all checkbox next to the Licensed Software column title.

Click Show Detailed Report.



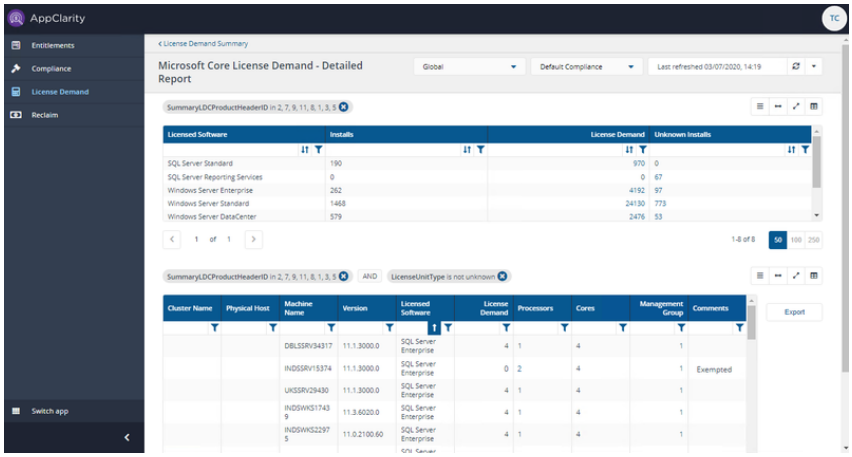
Microsoft Core License Demand - Detailed Report will be displayed. In the example to the right, we have added the Management Group and Comments columns to the default display.

Under column name **Comments**, any installations which had been excluded from license demand calculation, would display the comment as **Excempted**. Also, License Demand value displays as 0 under **License Demand** column.

Note

You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:

To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.



In the Management Group Column, on clicking the value displays the group the machine is a member of, clicking this shows that the machine is a member of 2 groups:

License Exemption - Microsoft Corporation

Global.

Management Group(s)

License Exemption - Microsoft Corporation
Global

10.4.14.2.2View the Compliance - License Summary report

Users with these roles:

AppClarity Administrator

Compliance Administrator

Compliance Viewer.

Can carry out these instructions, open AppClarity, and navigate to **Entitlements - Licenses / Maintenances**. To view results of an exclusion, you MUST have published a License, in this example we will look at Visual Studio.

The License for Visual Studio in this example applies to all versions, is User based, there are 100 Licenses and it is published. In this example we have added the Status column to the default displayed columns.

> **Note**
>
> You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:
>
> >
>
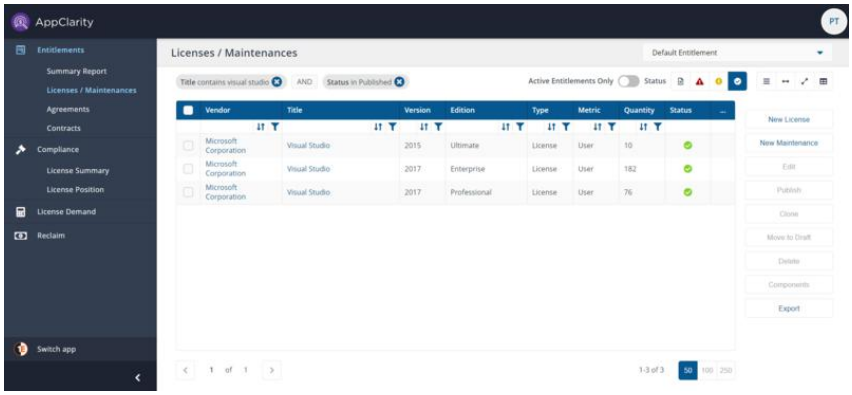
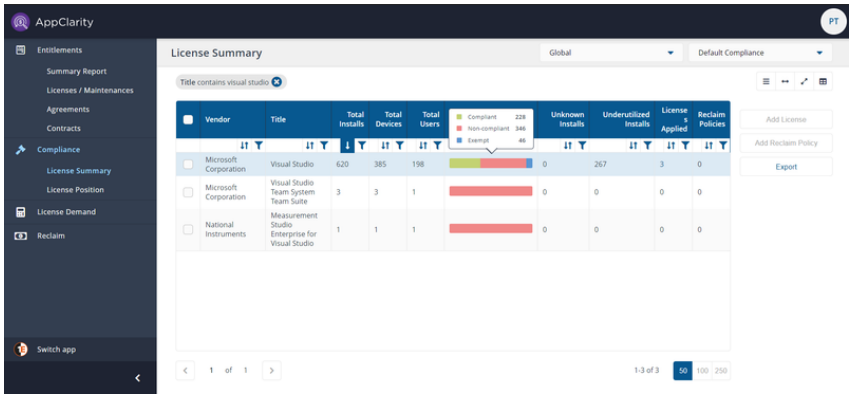
> To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.



Now we have confirmed we have published a License, navigate to **Compliance - License Summary**.

Viewing the entry for Visual Studio, we can see that the Compliance Category Column has a bar showing Green, Red and Blue, floating over this shows that we have 228 Compliant, 346 Non-compliant and 46 Exempt.



Click on the Compliance Category Column bar for Visual Studio, this opens the Summary by Installs - Microsoft Corporation Visual Studio Page, the page defaults to the Global Management group.

Select **License Exemption - Microsoft Corporation** the page will display as shown.

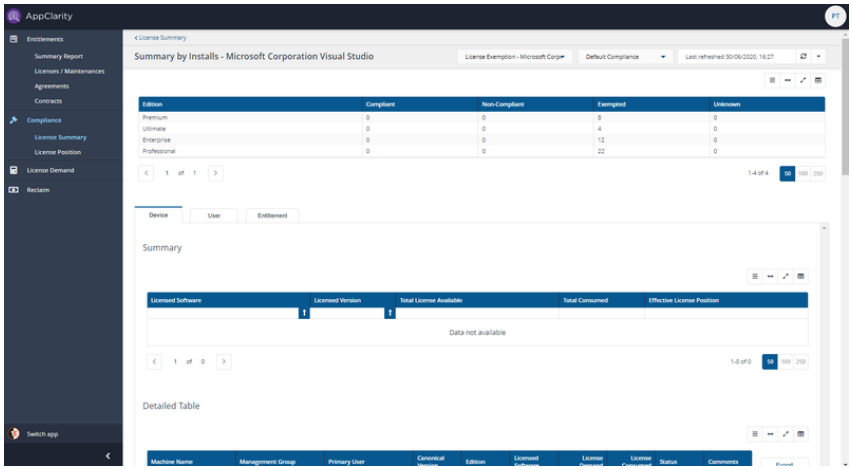
Observe that there are multiple entries for machine DBLSANY19431 and user UserName_33775, however looking at the Canonical Version and Edition we can see that these are all distinct entries for the application.

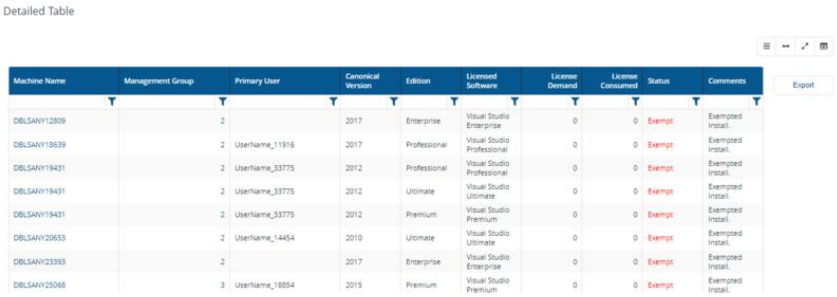
Also, the Status is Compliant, and the Comments show as exempted.

Note

You can refresh reports from individual AppClarity screens as well as using the **Settings** App. You can do this by using the refresh icon next to the**Last Refreshed**box, for example:

For a complete list of the specific reports you can run from particular pages refer to [Running your first Compliance License Summary: Refresh Reports].





We have now looked at the creation of a Management group to add an exemption for Microsoft Corporation, and show how to apply and verify its application. This can be carried out for any Vendor, by amending the Vendor section of the Management Group name.

10.4.15 Reclaiming a product based on its usage

Inventory fetches information from its data sources to return details of how products are being used, wherever available. Reclaim Administrators who are interested in reclaiming unused software in order to recycle licenses can use this information to set their reclaim policies.

We'll start with a simple example based on reclaiming unused versions of a software. In this case the policy we set up will be soft (optional) in that it will only trigger a reclaim that allows the user to opt out and keep the software, as long as they provide suitable justification. In this example we use the global management group, more on that later.

This example assumes that you have already run a sync on your selected inventory repository to retrieve inventory data from one or more connector sources. As a result of doing this a number of reports are automatically run. The essential one, particularly for reclaim, is:

Reclaim Product Usage is run on the compliance repository associated with your chosen inventory repository. In our example we use the **Default Compliance** repository (which is automatically associated with the **Default Inventory**).

> **Note**
>
> You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:
>
> >
>
> To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.

To view the current product usage and create a reclaim policy for a particular product:

Navigate to the **AppClarity**→**Reclaim**→**Usage Summary**→Reclaim Usage page.

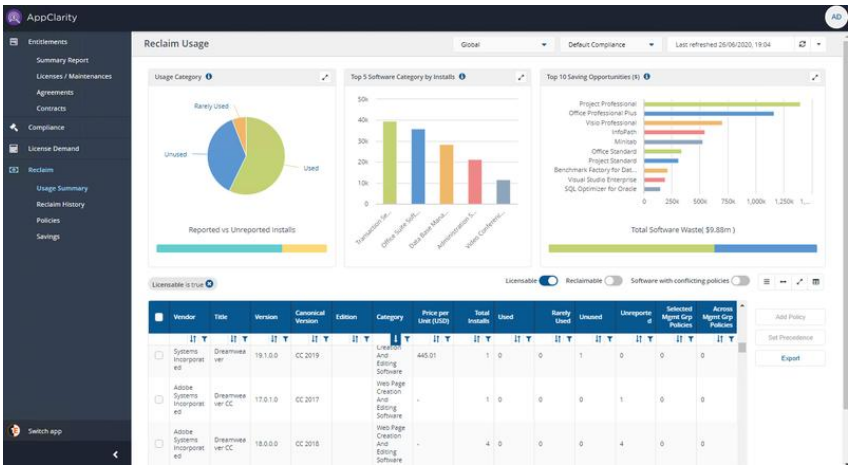
> **Note**
>
> The first thing to notice is how this page displays a chart of software organized according to the four usage categories for software in the inventory. Three categories are for reported usage:, **Used**, **Rarely Used**, **Unused**, and the 4th category is

Unreported. The pie chart shows the proportions of the **reported** categories. The bar underneath shows the proportions of **unreported** and **reported**.

The next thing to notice is that there is a filter set by default that limits the display to the selected management group, in our example the **Global** management group, and another filter that limits the display to licensable products only. You can remove these filters if you don't see the software you want to reclaim. Your charts will only show the categories which your software fall into, and how you apply filters.

Unused software is usually the best candidate for reclaim.

Please refer to Usage categories for a detailed understanding of how usage categories are calculated.



In our example let's investigate **Project Professional** for example, you could do this by filtering the table view by **Title** containing **Project** and by **Edition** containing **Professional** or if you know the version, by filtering on **Version**.

For our example we'll focus on **Project Professional 2013**, notice there are 116 **Total Installs**, 30 **Used**, 16 **Rarely Used**, 45 **Unused** and 25 **Unreported products**. Please refer to Usage Summary page for more details on how this page works and the columns displayed in the table. In our example you can see the usage details for the **Project Professional 2013** product indicating that it has **45** unused installations and there are no reclaim policies currently set for it.

You can click on the **Add Policy** button on the left side of the **Reclaim Usage** page after selecting the product. Doing this displays the **New Policy** page with the details pre-filled with the information related to the selected product, please refer to the New Policy page for more details on how this page works. Here you can see the following information has been set automatically:

Note

Vendor is set to **Microsoft Corporation**

Title is set to **Project**

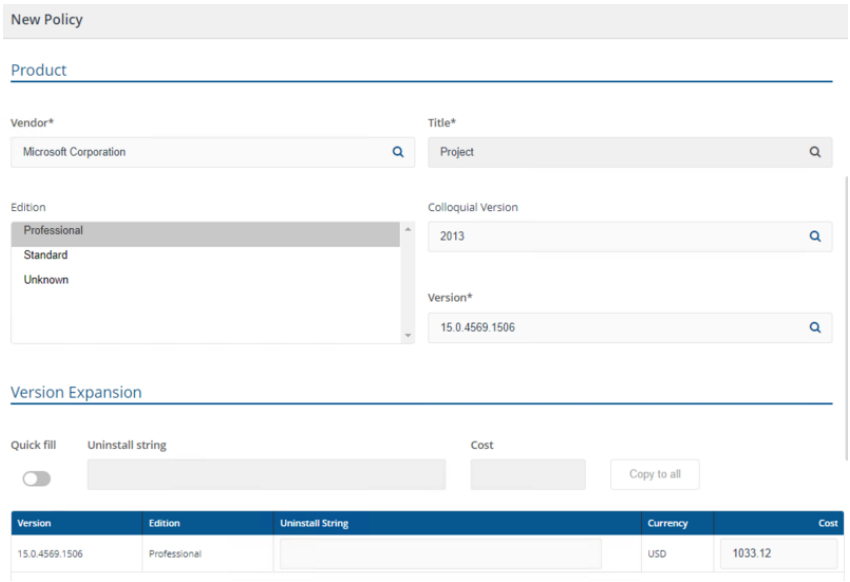
Edition is selected as **Professional**

Colloquial Version is set to **2013**

Version is set to **15.0.4569.1506**

Version Expansion is already expanded to that same version.

> **Note**
>
> There are constraints on the fields when you enter the information manually that you won't necessarily encounter in a pre-filled **New Policy** page like this one. Please refer to the New Policy page for more details on those constraints.



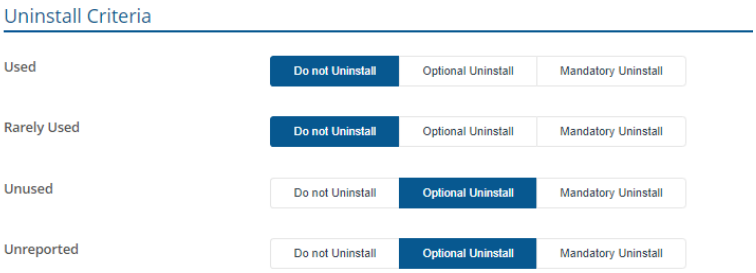
We can now decide which devices where the reclaim policy will run by applying the policy to a management group. You can select the global management group (also known as All Devices) by checking the **Global** checkbox.

We also want to publish the reclaim policy straight away and have it active, so we ensure that the **Enabled** checkbox is checked.

Now we set the reclaim aspects of the policy. There are four **Uninstall Criteria** controls corresponding to each of the software usage categories, where you can select the action to take if the target software is in that category.

In our example we want to leave the **Used** and **Rarely Used** controls at their default of **Do not Uninstall**.

For **Unused** and **Unreported** we want to set both of these to **Optional Uninstall**. This will mean that users on the devices where the targeted software in those states are installed will receive a notification requesting to uninstall the software.



Having set the policy we can now click **Publish** to start the process of making the policy active.

The new reclaim policy now appears on the **Policies** page, it's reported as **Is Enabled = TRUE** and **Status = Published** AppClarity will now make the policy live by automatically running the **Reclaim Consolidation** report.

> **Tip**
>
> When setting up a reclaim policy, for example for Notepad++, if you know **uninstall command line**, then you may enter it inside **Uninstall string** box for the version. Please follow these rules.

Each uninstall command line must be **enclosed** in **double quotes** - for example:

```
"C:\Program Files (x86)\Notepad++\Uninstall.exe"
```

You can use **multiple command lines** for same product version which are tried in succession. Ensure each command line is **enclosed** in **double quotes**, and **separated** by **double pipe character ("||") .** For example:

```
"C:\Program Files (x86)\Notepad++\Uninstall.exe"||"C:\All Softwares\Notepad++\Uninstall.exe"||"C:\Tools\Notepad++\Uninstall.exe"||"D:\Softwares\Notepad++\Uninstall.exe"
```

10.4.15.1 What the end-user sees

Let's suppose there is a device where the target software is installed and it is in the unused usage category. The reclaimer should have been configured to run on each device where reclaim is supported, this is done in two modes:

Is in mandatory mode, usually scheduled to run overnight on the device.

Is in opt-out mode, usually scheduled to run during the day when the end-user is logged on to the device.

When the reclaimer on that device runs in opt-out mode to fetch policies, it will be informed that it needs to start the process of uninstalling the software in opt-out mode. This will mean that an **reclaimer opt out** notification dialog will be displayed to the next end-user that logs on, informing them that a particular software title on their device is reported as not having been used and is therefore due for a reclaim. In more detail:

The dialog shows them:

the name of the software.

the cost that would be recovered by reclaiming the software.

the last time the software was used.

The end-user then has the choice of:

Clicking on the **I still need this** link, and entering a suitable reason why the software should not be reclaimed.

Clicking the **Remove software button**, in which case the software is marked for immediate uninstallation.

Clicking the **Remove software later** button, in which case the software will be scheduled for uninstallation at some point in the future and not for immediate uninstallation.

In our example the end-user chooses to keep the software by clicking on the **I still need this** link and providing a suitable reason. Doing this displays the **Confirm software use** dialog.

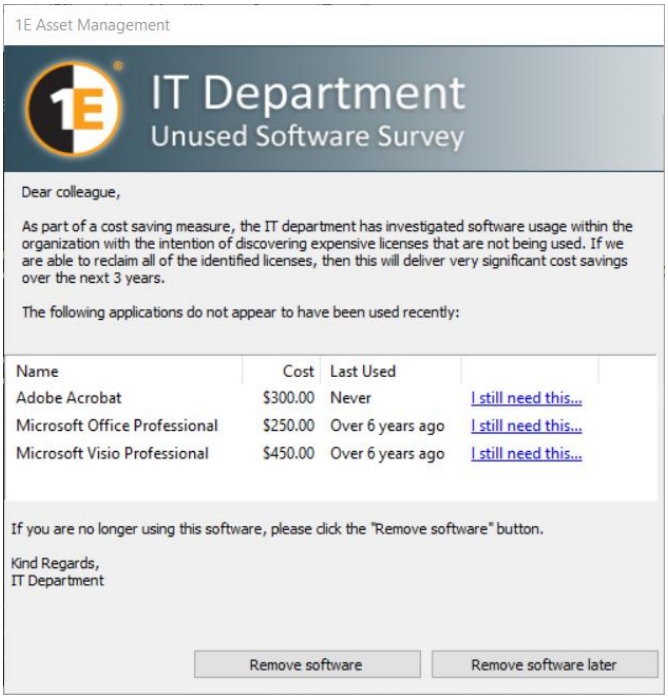
The user enters their reasons for retaining the software and then clicks the **OK** button.

The **Confirm software use** and the **reclaimer opot out** dialogs both close.

The user has provided their reasons, it's now up to the AppClarity administrator to accept or reject their request to retain the software.

Tip

Please refer to Deploying Software Reclaimer for more details about customizing, deploying and testing the Software Reclaimer.



10.4.15.2 Responding to an end-user request to retain reclaimable software

After you've created some opt-out reclaim policies you will need to keep track of the ones that are currently in operation and requires attention from reclaim administrator.

To administer software reclaim policies:

Navigate to the **AppClarity→Reclaim→Policies** page, you may need to refresh the page if you are already there.

Locate the required reclaim policy, you should see that the **Admin Actions** column shows **1**, indicating that there is one pending request to be processed.

Clicking on the number in the **Admin Actions** column displays the **Administration** page for that reclaim policy, please refer to Administration page for more details.

Here you can see the reclaims that have been completed for this policy and the reclaims still in progress. At the bottom of the page is the **Reclaim Override Management** table that lets you respond to requests for retaining software. To respond to a particular request you do the following:

Check the checkbox at the start of the request entry in the table

You then have the option of:

Clicking the **Accept** button to accept the end-user request to retain the software

Clicking the **Reject** button, in which case the optional software reclaim will be converted to a mandatory reclaim and the software will be removed without any further interaction with the end-user in very next cycle.

In our example we click the **Accept** button to allow the end-user to start using the software again, as they indicated in their reason.

A notification popup appears saying that the user's opt out request has been accepted and that the software will not be reclaimed at this time. Click on **OK** to close the notification.

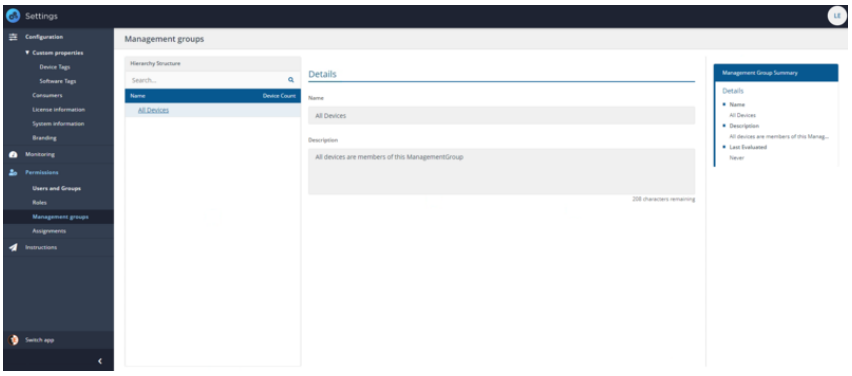
Clicking on the **AppClarity→Reclaim→Polices** page shows that there are now **0 Admin Actions** for this software reclaim policy.

10.4.15.3 Resolving overlapping reclaim policies

As a result of defining reclaim policies you may find that they overlap in terms of the devices and products they apply to. Only one policy can be applied for a given device and product and to resolve the conflict you can set the precedence to decide which of your policies are preferred. This becomes significant when management groups are involved.

> **Note**
>
> Click here to see how to create the management groups for this example...
>
> **Tip**
>
> Here we present an overview for the management groups used by this reclaim example. For detailed instructions on creating management groups please refer to Management Groups page.
>
> **Management Groups - tutorial**
>
> **In this tutorial**
>
> In this tutorial, we add a number of Management Groups for the ACME organization: one that uses the name of the devices and several that use the Organizational Unit (OU)

the devices belong to. The following picture shows what we have in our example Active Directory and how this will appear as Management Groups in Tachyon. Here you can see there are two servers in the AD Computers group, an additional Domain Controller server and five workstations in the OU.



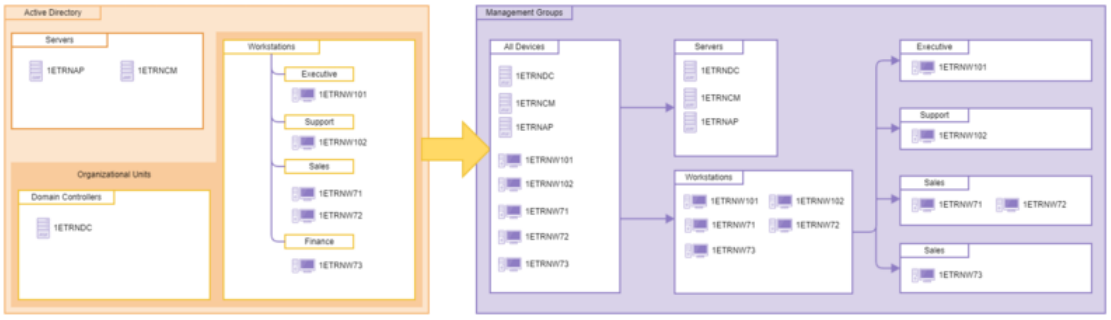
By the end of this example, you will have added six Management Groups in addition to the default All Devices Management Group:

All Devices - this Management Group brings all devices into a single Management Group

Servers, Workstations, Executive, Support, Sales and Finance - these Management Groups will use an OU rule to separate the devices according to the OU they belong to.

Note

If you want to take advantage of your Configuration Manager database, and pull in its inventory and usage data, so that you can mirror your Active Directory OU structure in your Management Groups, then you'll need to configure a System Center Configuration Manager connector in your Tachyon system.



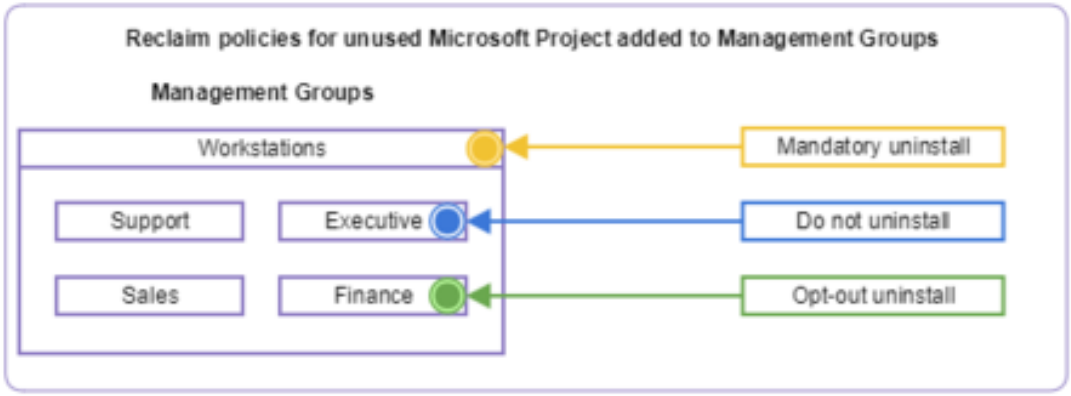
In this example

In this example we create three reclaim policies that target unused installations of Microsoft Project Professional. These overlapping policies will have different reclaim actions for unused software depending on the management groups, that come from the management group example above.

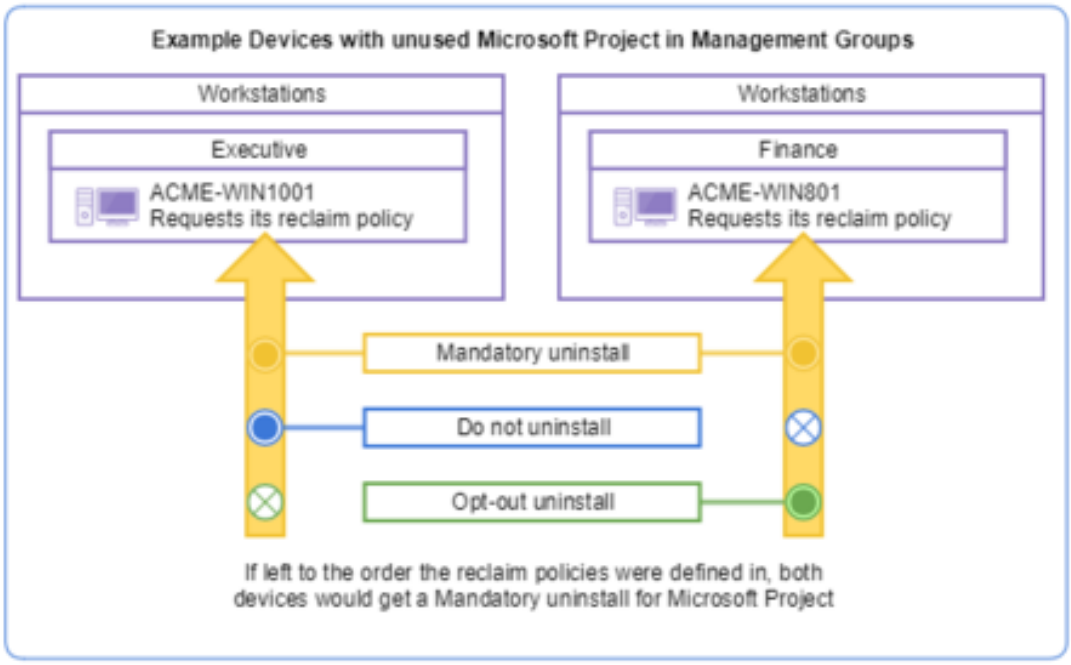
We will use three management groups which correspond to OU configured on our example ACME AD site. The first one, **Workstations** contains all the devices that are present in the other two, **Executive** and **Finance**, but those two sub OU are mutually exclusive. This means that devices in the **Executive** management group are also in the **Workstations** management and likewise devices in the **Finance** management group are also in the **Workstations** management group.

The purpose of this example is to create three reclaim policies for unused installations of Microsoft Project Professional for each of the **Workstations**, **Executive** and **Finance** management groups. Each reclaim policy will have a different reclaim action according to the management group they are associated with. However, in practice this means that the devices in the **Executive** and **Finance** management groups with their own reclaim policies will also be eligible for the reclaim policy associated with the **Workstations** management group.

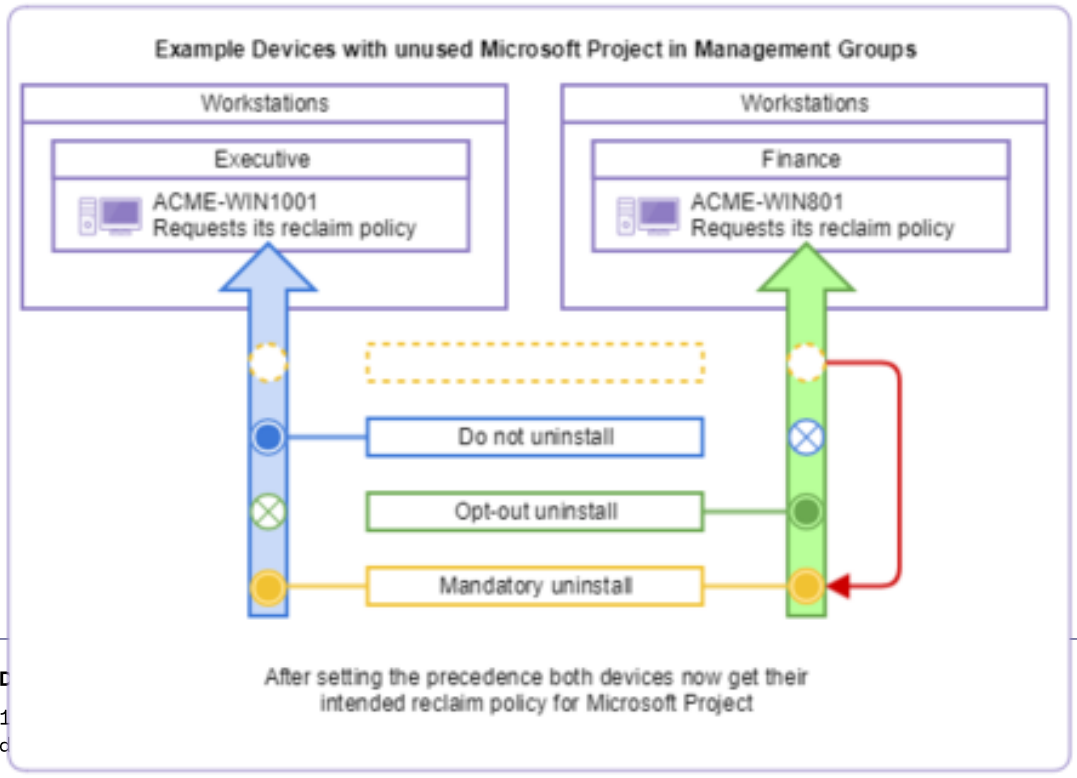
For this reason a mechanism exists to set the precedence for the reclaim policies associated with a particular program so that you can ensure that the devices in each management group get the right reclaim policy.



Reclaim policies for unused Microsoft Project added to Management Groups
Management Groups
Workstations
Support
Executive
Sales
Finance
Mandatory uninstall
Do not uninstall
Opt-out uninstall



Example Devices with unused Microsoft Project in Management Groups
Workstations
Executive
ACME-WIN1001
Requests its reclaim policy
Workstations
Finance
ACME-WIN801
Requests its reclaim policy
Mandatory uninstall
Do not uninstall
Opt-out uninstall
If left to the order the reclaim policies were defined in, both devices would get a Mandatory uninstall for Microsoft Project



Example Devices with unused Microsoft Project in Management Groups
Workstations
Executive
ACME-WIN1001
Requests its reclaim policy
Workstations
Finance
ACME-WIN801
Requests its reclaim policy
Do not uninstall
Opt-out uninstall
Mandatory uninstall
After setting the precedence both devices now get their intended reclaim policy for Microsoft Project

By the end of this example you will have defined 3 new reclaim policies:

In the **Workstations** management group we will create a general policy that performs a mandatory uninstallation.

In the **Finance** management group we will create an opt-out uninstallation where the end-user can choose to keep the software.

For the **Executive** management group we will create a do not uninstall action for Microsoft Project Professional.

You will then have set the precedence for the policies so that they are selected in the correct order when a device runs its scheduled reclaimer policy retrieval.

In our example we have three Management Groups we are interested in: **Workstations**, **Executive** and **Finance**. You can set Management Groups up in **Settings->Permissions**->Management groups. The creation and population of Management groups is documented in the Management Groups page.

To set reclaim policies in each of these management groups:

Navigate to **AppClarity→Reclaim→Usage Summary**. In our example, we'll create our first reclaim policy directly from some known installations of the **Microsoft Project** product showing in the **Usage Summary** pages.

Initially we filter on the unused products, which will help to focus on the unused products we want to reclaim.

In our example we filter on **Visio Standard 2013** in the **Reclaim Usage** table, on **Title** containing **Visio** and by **Edition** containing **Standard**. If you have a large number of unused products in your environment you may need to set a specific filter to find the specific one you want to reclaim.

Selecting the product and at the end of the product's entry in the table click on the **Add Policy** button.

This displays the **Reclaim Policy** page prefilled with the product's details. In our example this shows:

Vendor is set to **Microsoft Corporation**

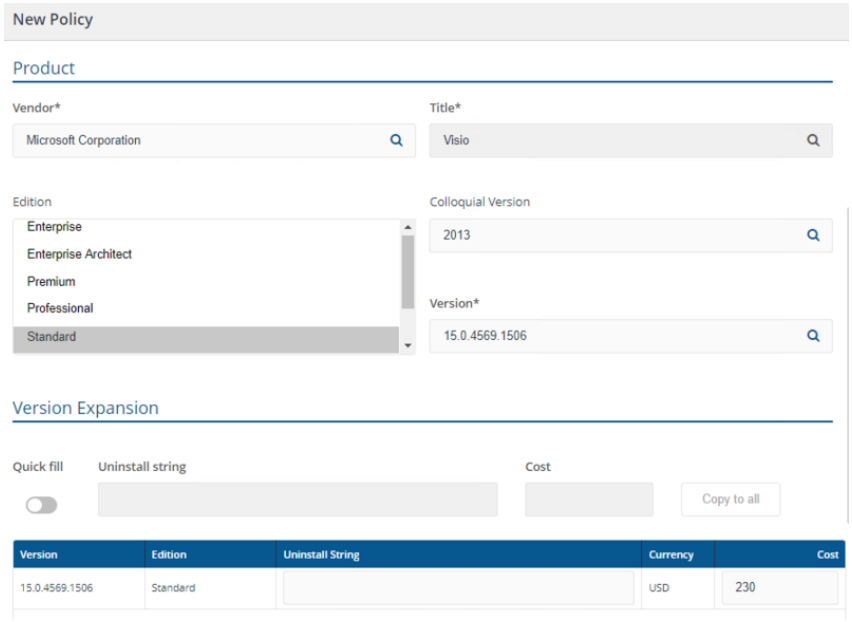
Title is set to **Visio**

Edition is selected as **Standard**

Colloquial Version is set to **2013**

Version is set to **15.0.4569.1506**

Version Expansion is already expanded to that same version.

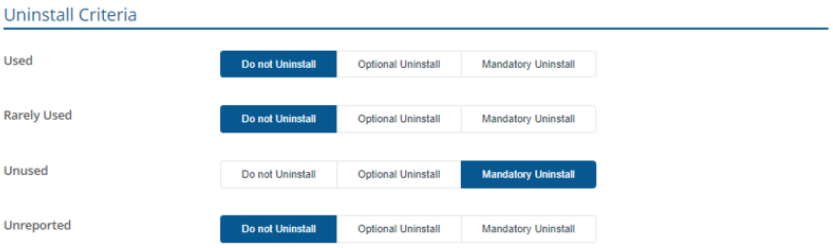


In our scenario we know that we want to create three reclaim policies for the same product which could lead to conflicts. So it makes sense to initially publish them so that they are not enabled, then resolve any conflicts and finally enable all the policies once the resolution is in place.

> In our scenario we can plan ahead, but you may encounter scenarios where you are not aware that there is another existing reclaim policy that overlaps with a new one that you want to publish. AppClarity deals with this by notifying you that there is an existing policy and automatically setting the new one so that it is not enabled, thereby giving you the opportunity to resolve the conflicts in the same way.

Having ensured that the policy is not enabled, you then select the management group the reclaim policy will be associated with. In our example this first reclaim policy for **Visio** will be associated with the **Workstations** management group.

Next, set the reclaim actions for **Used**, **Rarely Used**, **Unused**, and **Unreported**. In our example we are only concerned with the **Unused** category and leave the others at their default of **Do not Uninstall**. We then set the **Unused** action to **Mandatory Uninstall**.

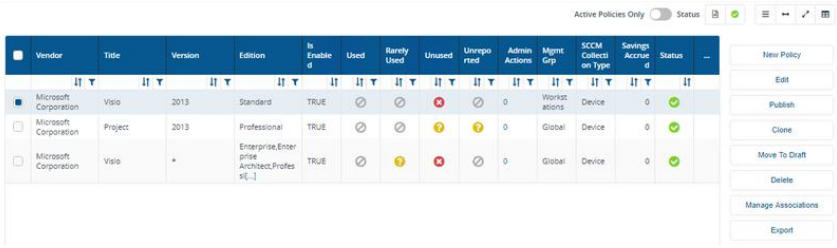


After the settings have been made click **Publish** to save the reclaim policy. This will display the **Published Reclaim Policies** page showing the saved policy.

10.4.15.3.1 Cloning a reclaim policy

In our example we want to create three reclaim policies for the same product, just in different Management Groups. We could go through the process outlined in the steps above for each of these, but a quicker method of doing this is to clone the reclaim policy we've just created:

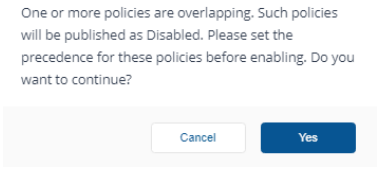
We select the policy entry for Visio Standard in the **Policies** table and then click **Clone** at the right-hand end of the reclaim policy's entry.



A new **Reclaim Policy** page will be displayed prefilled with the contents of the cloned reclaim policy.

The only things you need to change here would be the selected management group and the **Unused** category action. In our example we select the **Finance** management group and set the **Unused** category action to **Optional Uninstall**.

When you click **Publish** to save the new policy. You will then be prompted to set the precedence as you will now have overlapping policies which are published as Disabled by default.



10.4.15.3.2 Setting precedence reclaim policies

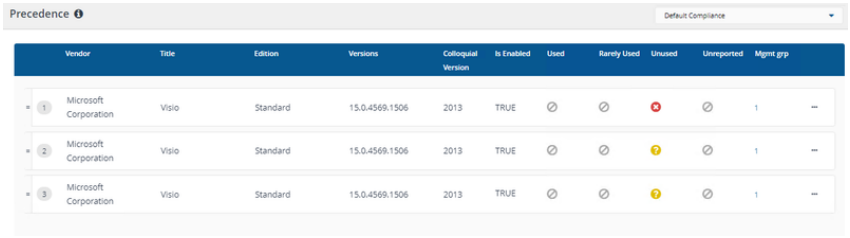
Conflicts between overlapping policies for a product are resolved from the **Reclaim Usage** page.

Navigate to **Usage Summary**.

Locate the product with overlapping policies in the **Across Mgmt Grp Policies** column. In our example we have filtered this column by **greater or equal** is set to **1**.

There is a **3** in the **Across Mgmt Grp Policies** column for **Visio Standard v15.0.4569.1506** indicating that there are 3 reclaim policies applied to this product across all management groups.

On the far side of the table we click **Set precedence**, doing this displays the **Precedence** page.



Reclaim policies are considered from top-to-bottom in this list. When the reclaimer runs on the target device, (usually according to a schedule set by the administrator who distributed the reclaimer on the network), it retrieves a single reclaim policy per targeted product from Inventory. The single reclaim policy provided to a device is dependent on the product, the management group and the order of the reclaim policy in the precedence list.

> Note the following about reclaim policies and the way they apply to devices in more than one management group:

A device can only get one policy per product

The policy for the product is dependent on the management groups the device belongs to

A device may be in more than one management group, so there may be more than one candidate policy

Reclaim may only provide one policy from the candidates, by default this is done in the order they were defined, which you can't easily control

You have to set the precedence for the policies to ensure the right one gets applied to the devices you are managing.

To set the precedence between overlapping policies you will usually need to check the Management Group that the policy belongs to. The Management Group **Names** column contains a number **Mgmt grp** link at the end of each row that displays the Management Group(s) that the policy applies to. In our example by clicking on each row we would see the reclaim policy in the:

Top row applies to the **Workstations** Management Group.

Second row applies to the **Finance** Management Group.

Third row applies to the **Executive** Management Group.

To change the precedence you can click, drag and drop (up or down) a row in the table to another position in the table. In our example we change the order of the reclaim policies in the following way:

Click and drag the reclaim policy with the **Unused Mandatory Uninstall** reclaim action, associated with the **Workstations** management group, to the bottom.

Click and drag the reclaim policy with the **Unused Optional Uninstall** reclaim action, associated with the **Finance** management group, to the second place.

The more general **Unused Mandatory Uninstall** reclaim policy associated with the **Workstations** management group is now at the bottom, this means that any device with an unused installation of **Visio Standard** in the:

Executive management group will get the **Do not Uninstall** reclaim action

Finance management group will get the **Optional Uninstall** reclaim action

Workstations management group will get the **Mandatory Uninstall** reclaim action.

At this point the reclaim consolidation report runs automatically, making the set precedence live.

We now need to enable each of the published policies to make them live:

Navigate to **Policies**.

Click on the **Edit** link at the end of one of the reclaim policy rows where the **Is Enabled** column shows **FALSE**.

Check the **Enabled** checkbox and then click **Publish**.

Repeat steps **b.** and **c.** for the other disabled policies until all the policies display **TRUE** in the **Is Enabled** column.

Our three reclaim policies for unused Visio Standard installations are now defined and associated with the **Workstations**, **Executive** and **Finance** Management Groups.

The reclaim policies have been made live and their precedence set and processed. This means that devices will subsequently receive appropriate reclaim policies for their unused Visio Standard installations depending on the management group they belong to.

10.4.15.4 Evaluating a reclaim policy without affecting your environment

If you're planning on setting up a reclaim policy want to be sure what the impact will be, (i.e. on impacted devices, where software is no longer installed and reclaimed), can evaluate your policy before setting it up. By using **Reclaim Evaluate** you can identify devices where software would be:

Marked for Mandatory Uninstall (i.e. will be removed in upcoming mandatory reclaim cycle)

Marked for Optional Uninstall.

If, after you evaluate the policy and you're comfortable with the impacted devices, you can setup the policy the same reclaim actions.

10.4.15.4.1Evaluating a Reclaim Policy

To evaluate a reclaim policy:

Navigate to **AppClarity**→**Reclaim**→**Policies** and click **New Policy**.

On **New Policy** screen, enter all the mandatory fields and all sections.

Click **Evaluate**.

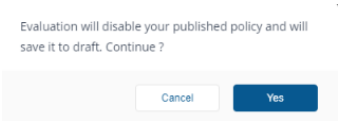
Refer to New Policy page for more details on how this page works.

The evaluate button generates a downloadable TSV file containing information about the devices and actions the policy contains.

Cost	DomainName	HostName	MatchedVendor	MatchedT	NextReclaimAction	User	UninstallAction	UsageCategory	ManagementGroup
10	1ETRN	1ETRNW71	Notepad++ Team	Notepad+	Marked for Optional uninstall	1ETRN\User	OptionalUninstall	Unreported	Global
10	1ETRN	1ETRNW72	Notepad++ Team	Notepad+	Marked for Optional uninstall	1ETRN\Tachyon_AdminPP	OptionalUninstall	Unreported	Global
10	1ETRN	1ETRNW73	Notepad++ Team	Notepad+	Marked for Optional uninstall	1ETRN\Tachyon_Admin1	OptionalUninstall	Unreported	Global
10	1ETRN	1ETRNW101	Notepad++ Team	Notepad+	Marked for Optional uninstall	1ETRN\Manager1	OptionalUninstall	Unreported	Global
10	1ETRN	1ETRNW102	Notepad++ Team	Notepad+	Marked for Optional uninstall	1ETRN\Tachyon_AdminG	OptionalUninstall	Unreported	Global

If you click evaluate on a **published policy**, you will get this warning message. Click on **Yes** and evaluate report is downloaded.

But, now this reclaim policy is converted into draft policy (i.e. not a reclaimable policy anymore). You will then have to go back click **Publish** again to move that policy back to published status and make it reclaimable. If you do not re-publish, none of the devices in your evaluate report will act on the policy.



10.4.15.5 Reclaiming a product using SCCM Uninstall

You can reclaim any software from your environment using either of these methods:

Traditional reclaim - the reclaimer included with earlier versions of AppClarity

SCCM custom Reclaim - which uses existing SCCM packages/applications added to any install collections

Using **1E SCCM Reclaim** creates an uninstall collection you can use to reclaim software using your SCCM installation.

> **Note**
>
> To use SCCM custom Reclaim, your administrator must have enabled the SCCM Uninstall Provider.

10.4.15.5.1 Setting up a reclaim policy

Once the SCCM Uninstall is switched on you can create a reclaim policy and associate it with the appropriate ConfigMgr package or application.

Switch app to **AppClarity→Reclaim→Policies**.

Click on **New Policy**.

Configure your policy as required, completing the **Basic Information**, **Product**, **Version Expansion** sections

Set the **Uninstall Criteria** as **Mandatory Uninstall** - SCCM Workflow is driven on reclaim policies for mandatory uninstall. Any optional reclaim policy will not work with SCCM Uninstall, until it becomes a candidate for mandatory uninstall.

Select a value in the **SCCM uninstall Collection Type** section. This selection is important, as it allows SCCM to create suitable uninstall collections and drive the reclaim workflow accordingly.

Click **Publish.**

10.4.15.5.2 Adding the Association

Switch app to **AppClarity→Reclaim→Policies**

Select the reclaim policy in the Policies listing page and click **Manage Associations**.

This opens the **Inventory→Manage Associations→Product to CM** page, and opens with your policy selected.

Select the product you want to associate to the SCCM Uninstall workflow with this reclaim policy then click **Add Association**.

On the **Add Associations** page, type in the name or part of the name of your SCCM Package or application.

Enter CM application/package name inside the **Search for a CM Application or Package** text box, the selected package/application details will show in grid below).

Select product and choose your desired action for:

Install Programs and **Uninstall Programs** for packages (for example **Per System Unattended** for Install Program OR **Per System Uninstall** for Uninstall program).

Applications do not require any selection for Install/Uninstall programs.

Click **Save**.

> **Note**
>
> You will see either an **A** or **P** icon next to the name, that will show either Package or Application Model. For a package, you will need to select the correct programs.

10.4.15.5.3 Verifying Reports

When the setup is completed the following reports are automatically triggered, and can be see in **Settings→Monitoring→Process logs**:

Reclaim Consolidation - to convert this reclaim policy from a traditional reclaim based setup to an SCCM reclaim based setup

SCCM uninstall report, to perform the following actions:

Verifies if the root folder (under Device Collection/User Collection) already exists to host device/useruninstall collections. If not, then **create root folder** with name as **1E**

Create an **Uninstall collection** under **1E** folder

Add those **device/user** into the **Uninstall collection**, from which software needs to be removed (i.e. based on the reclaim policy set)

Remove these **device/user** from **Install collection**

If the device, user or both are members of collections that have deployments for an install of the software that needs reclaiming, AppClarity removes them from the installation collection.

SCCM Uninstall actions also act as status poller, to fetch the statuses of uninstall or if any new device needs to be added into the Uninstall collection.

10.4.15.5.4 Verifying Reclaim History

To view the status history for these reclaims:

Run the **Reclaim Reporting** action for associated Compliance repository from **Settings**→**Monitoring**→**Process logs** and click **Execute**.

Select Compliance Repository, and action as **Reclaim Reporting** and click **Execute**.

Wait till the **Reclaim Reporting** action successfully completes, then:

Switch app to **AppClarity**→**Reclaim**→**Reclaim History**.

All devices which were added to Uninstall Collection in SCCM, and are still waiting to be uninstalled display a **CollectionUpdated** status.

After a successful uninstall, these devices will display a status of **Uninstalled**.

10.4.16 Stopping a reclaim policy

SAM users (AppClarity Administrator, Reclaim Administrator) who have defined reclaim policies may want to stop those policies from being applied. There are many reasons why this may be required, but here are some reasons:

A published policy needs to be temporarily stopped.

A published policy needs revision.

The policy is no longer needed or the policy was created accidentally or was used as part of a test.

There's an emergency, policies are not working as expected and need to be stopped to prevent any further consequences.

10.4.16.1 Disabling a published policy

Temporarily suspending a reclaim policy leaves the policy unchanged in a published state but disabled. You can subsequently re-enable it whenever necessary without requiring any other change to the policy.

To do this:

Navigate to **AppClarity**→**Reclaim**→**Policies**.

Locate the policy you want to disable. In our example, this is a policy for a mandatory uninstall of unused **Microsoft Project**.

Click on the **Edit** link at the right-hand end of the policy's row in the table to display the **Reclaim Policy** page.

Under '**Basic Information**' section, uncheck the **Enabled** checkbox.

Click **Publish** to save the change.

Notice how the **Is Enabled** column now displays **FALSE**.

The **Reclaim Consolidation** report is refreshed automatically when **Publish** is clicked, so the reclaimer changes come into effect immediately.

The published policy will still be published but will not be enabled any longer, and hence no reclaim will happen against this policy.

10.4.16.2 Save a published reclaim policy as a draft

Like disabling a published policy, this also has the effect of temporarily stopping the policy. The downside is that it gets converted into draft reclaim policy, and will need to be published again to make it reclaimable. But if the policy needs any revision, this may be a good option.

To do this:

Navigate to **AppClarity→Reclaim→Policies**.

Locate the policy you want to disable. In our example this is a policy for a mandatory uninstall of **Adobe Acrobat Reader MUI**.

Click on the **Edit** link at the right-hand end of the policy's row in the table to display the **Reclaim Policy** page (alternatively, from Policies screen only, a policy can be moved to draft, by selecting the policy and click on **Move to Draft** button at right hand side)

Scroll down to the bottom of the page.

Click **Save draft**.

This has the effect of changing the status of the policy from the **Published** to **Draft**.

The **Reclaim Consolidation** report is refreshed automatically when **Save draft** is clicked so the reclaimer changes come into effect immediately.

The published policy will no longer be published but will be in the draft state, so that it can be re-published at a later time.

10.4.16.3 Deleting a published reclaim policy

When you are sure that a published reclaim policy is no longer needed, and will not be needed again in the future, you can delete the policy.

To do this:

Navigate to **AppClarity→Reclaim→Policies**.

Locate the policy you want to disable. In our example this is a policy for a mandatory uninstall of all versions of **Microsoft Office 365**.

Check the checkbox at the left-hand end of the policy's row in the table.

Click **Delete**.

In the confirmation popup, click **OK** to delete the selected policy permanently. If you have instead changed your mind you can click **Cancel**.

This has the effect of removing the policy from the **Policies** listing page and from AppClarity altogether.

The **Reclaim Consolidation** report is refreshed automatically when **Delete** is clicked so the reclaimer changes come into effect immediately.

The published policy will no longer be available in AppClarity.

10.4.16.4 Perform an emergency stop of all reclaim policies

If you are in an emergency state, and not sure which reclaim policy to target you can disable all the policies in one step.

To do this:

Navigate to **Settings**→**Configuration**→**Provider Configuration**.

Select the check-box for **Reclaimer** uninstall configuration type, and click **Edit**

Click on the toggle button, to **toggle Off** (to disable) the **Reclaimer** control to stop all devices from downloading their reclaim policies, and then **Save**.

This will stop any subsequent attempts to download the reclaim policy. This will not prevent any reclaim policies that have already been downloaded from running.

When the emergency has been resolved, you can click on the toggle to turn reclaim policy downloads back on.

10.4.17 Viewing the software reclaim reports

SAM users interested in software reclaim would like to view summary/history information of software reclaim (i.e. successful, failed, in progress, opt out) in order to:

Verify a software reclaim policy is working as expected

Check the progress of a reclaim policy

Audit the software reclaims

Evaluate how effectively AppClarity saves money on licenses.

To do this the user checks the Software Reclaim Summary page.

10.4.17.1 Viewing software reclaim summary

When AppClarity is installed it creates a schedule to run **Reclaim reporting** each night at 00:00. This report updates the contents of the **AppClarity→Reclaim→ Reclaim History** and **Savings** pages. Both of these reports can be filtered by Management Group (if you have set these up) from the dropdown list at the top of the page. You can run the report manually also, if you need more up to date information, as will be seen in the following steps.

To view the**Software Reclaim Summary**report:

Navigate to **AppClarity**→**Reclaim**→**Reclaim History**.

Refresh **Reclaim reporting** using the **Refresh Reports** icon on the top right of the page.

The table should now display the summary status for software reclaims that have been performed up to the current time.

To filter on specific software, for example Microsoft Project, set a filter to get directly to the Microsoft Project installations.

Click the

at the right-hand under the **Title** Column header.

Construct thefilter **Contains Project**.

Click **Apply** to set the filter.

> **Note**
>
> You can refresh reports from individual AppClarity screens as well as using the **Settings** App. You can do this by using the refresh icon next to the**Last Refreshed**box, for example:
>
> >
>
> For a complete list of the specific reports you can run from particular pages refer to Running your first Compliance License Summary: Refresh Reports.

> **Note**
>
> You can choose which columns are displayed in Inventory and AppClarity detail tables to increase readability. On pages where you can pick the displayed columns you'll see a new control like the one highlighted below:
>
> >
>
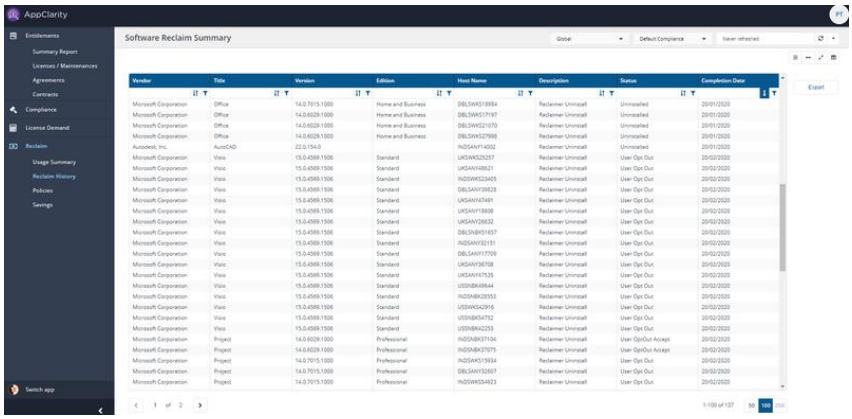
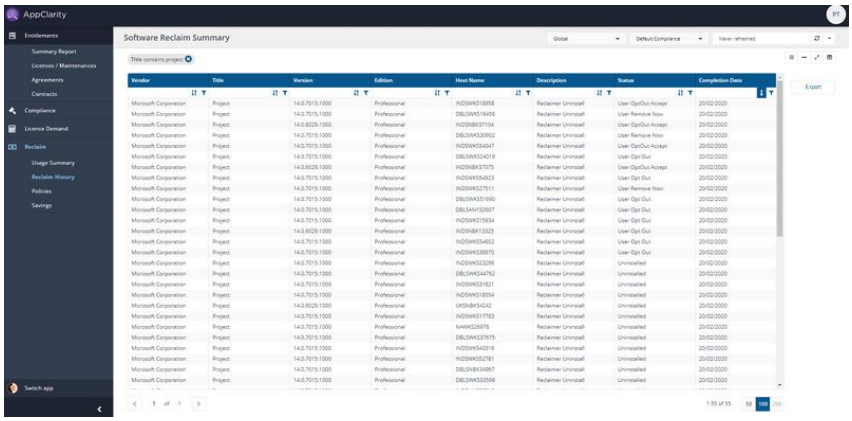
> To find out more about this feature refer to Running your first Compliance License Summary: Choosing the columns to display in reports.



The rows in the filtered table indicate:

Status	Description
User OptOut Accept	A user requested to keep the software, they provided a suitable explanation and this was accepted by the AppClarity administrator for that policy so no software was reclaimed.
User Opt Out	A user requested to keep the software, they provided an explanation and this is pending acceptance by the AppClarity administrator for that policy.
User Remove Now	A user elected to remove the software now when prompted by the reclaimer running on their device.
Uninstalled	A user selected to remove the software, a mandatory uninstall policy was implemented and the software was successfully removed from their device.
FailedUninstallNoRetry	A user selected to remove the software, a mandatory uninstall policy was implemented and reclaimer attempts to uninstall software from device multiple times, and fails to uninstall. After a threshold of attempts, no further attempt to uninstall the software.
FailedUninstallRetry	A user selected to remove the software, a mandatory uninstall policy was implemented and reclaimer attempts to uninstall software from device. Reclaimer attempts will be made again to uninstall until a threshold is reached.
CollectionUpdated	When SCCM collection is updated (i.e. device is added to uninstall collection) through SCCM custom uninstall workflow.



10.4.17.2 Viewing the savings made by reclaiming software

To view the software reclaim savings report:

Navigate to **AppClarity**→**Reclaim**→**Savings** .

Having refreshed **Reclaim reporting** in the previous example, this page displays the reclaim savings that have been made by successful reclaims to date.

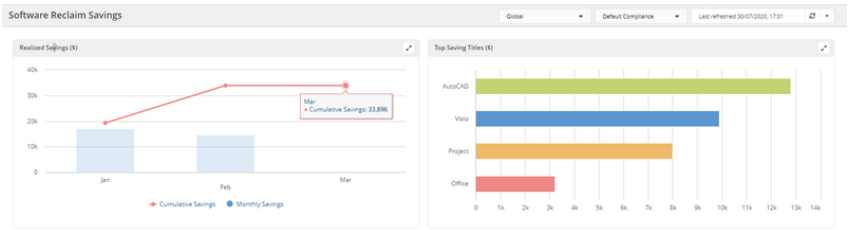
Here we can see in the **Realized Savings ($)** graph, it displays

Cumulative savings of successful reclaims so far, is **33,896**.

Monthly Savings due to successful reclaims each month (plots the data of last 12 months).

In the **Top Savings Titles ($)** you can click on each title and it's individual Cumulative Savings total will be displayed in **Realized Savings ($)**. **Top Savings Titles ($)** displays the top 5 saving titles.

> **Note**
>
> You can change the default displayed currency from USD to a currency of your choice, refer to Changing the default currency in AppClarity for details.



10.4.18 Scheduling AppClarity reports

When an entitlement repository or compliance repository is created, and e.g. reclaim consolidation is run for an compliance repository, then it creates a default reclaim consolidation schedule for this compliance repository, to run on daily basis. You can also create schedules for the repositories you create and schedule them to run at a frequency of your choice.

10.4.18.1 Scheduling a report refresh for a repository

Toautomaticallyrefresh a report for a repository you can set up a schedule:

Under the **Settings**→Configuration→Schedules and click **Add**.

In the Add schedule screen for:

Schedule name - enter a logical name for the new schedule.

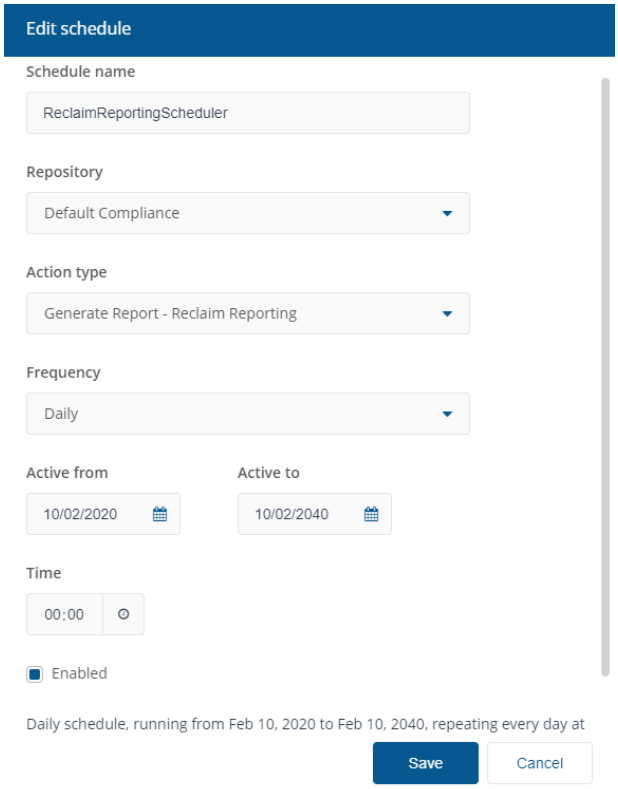
Repository - select your repository from the dropdown menu.

Action type - select the associated action type you want to schedule.

Frequency - select the frequency.

Note

For any entitlement repository, when a new entitlement is created (which triggers an entitlement consolidation) a **Schedule** called **EntitlementConsolidationScheduler** is created for this repository by default, it's set to run on a 24 hrs frequency (daily basis).



10.5 Troubleshooting

A general methodology for investigating issues with AppClarity, as well as identifying key issues and their resolutions.

For known issues relating to specific components, please refer to the respective troubleshooting pages:

Clients	Platform	Applications	Integration
1E Client	1E	Endpoint Automation	1E Core for ServiceNow
1E Client Deployment Assistant		Experience Analytics	1E ITSM Connect for ServiceNow
PXE Everywhere		Endpoint Troubleshooting	1E Service Catalog Connect for ServiceNow
		Writing 1E Instructions (1E SDK)	1E Virtual Assistant

10.5.1 1E Support contact details

10.5.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

10.5.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

US/Canada:	1-866-349-4032 (Toll-Free)
	1-917-339-2360 (Standard)
UK/Europe:	+44 (0)208 326 3499
India:	+91 120 402 4002
Australia:	+61 739 111 118

10.5.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation.

support@1e.com

10.5.2 The technical support process

Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

10.5.2.1 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

10.5.2.1.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

10.5.2.1.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

10.5.2.1.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

10.5.2.2 Log files

Tachyon Server log files

For any issue, please provide a zip containing log files from the following locations:

%ALLUSERSPROFILE%\1E\Catalog*.log

%ALLUSERSPROFILE%\1E\ContentDistribution*.log

%ALLUSERSPROFILE%\1E\Platform Consumers*.log

%ALLUSERSPROFILE%\1E\SLA Platform*.log

%ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

%ALLUSERSPROFILE%\1E\Licensing*

Please refer to the Tachyon Platform 8.1 - Log files page for more details.

1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

Nomad client log

%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles\NomadBranch.log

WakeUp client log

%ALLUSERSPROFILE%\1E\Agent\WakeUpAgt.log

Shopping WSA client log

%ALLUSERSPROFILE%\1E\Client\WSA.log

10.5.2.2.1 Software Reclaimer log files

Every time the Reclaimer runs it will create a local log file of the process it is doing. The location and name of the log file depends on what task the reclaimer is doing.

Task	Logpath	Notes
Optout	**C:\Users\{USER}\AppData\Local\Temp\ AppClarity.SoftwareReclaimer.log**	Optout mode is normally run under user context so that the user can interact with the dialog. This

Task	Logpath	Notes
		means the log file will be in the users Temp folder within the user profile.
Mandatory	**C:\windows\Temp\AppClarity.SoftwareReclaimer.log**	Mandatory mode is normally set to run under system context, in order to process reclaim uninstall commands. Therefore, the log file will be under the system temp directory.
Reclaim	**C:\windows\Temp\AppClarity.SoftwareReclaimer.MSI.log**	For a mandatory reclaim, if a reclaim occurs using an MSI then an MSI log

Task	Logpath	Notes
		file is also created.

10.5.3 Known Issues

Lists of the current known issues with implementing, configuring, using, and extending Nomad.

If you cannot find an issue and its workaround on this page, please try searching the 1E Support Portal https://support.1e.com/ for issues that have hotfixes.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

Issue	Description	Workaround
Compliance Report fails, when there are many entitlements are available for the same vendor and title, with quantity as 1.	For any vendor, hundreds of entitlements are available in the system with qty=1 (For example, 500+ entitlements are available for Microsoft Corporation - Word with entitlement quantity =1) and also a large number of installations (For example, 50 K+ installations) exist for same vendor and title.	You can consolidate multiple entitlements into a single logical entitlement (For example, multiple entries for same vendor, title, version, metric type can be converted into a single entitlement).
While creating a new license/ maintenance based entitlement, a page has a tabbing problem if form data is entered using keyboard control only (and no mouse h/w is used).	The following are tab related problems, while adding a new form using manual input (mouse h/w is not used and only keyboard is being used). Tabs skipping drop-down fields such as Version Type, Metric, License Type etc Users can't select list and date using arrow keys & space bar When a user reaches on date control using tab, the date picker opens but does not get closed on moving to next control, so, It remains open on page	n\a

	Users cannot publish / save draft / cancel entitlements as the tab does not move on these buttons.	
When uploading entitlements using the entitlement.tsv connector, and the entitlement contains a wild card (that is, *) as Version, then it will not be automatically set as * in entitlement on UI.	While uploading an entitlement through .tsv files using the entitlement connector, if a user sets the version as * for any vendor and title, then it does not get assigned as * on the entitlement screen (that is, on license screen) after a successful upload.	n\a
Upgrading from AppClarity 6.1.100 to AppClarity 7.1 entitlements with caveats (in 6.1.100) do not display with a caveats warning icon and simply display as draft (with draft icon).	When AppClarity 6.1.100 is upgraded to AppClarity 7.1 and some entitlements in 6.1.100 had caveats. After the upgrade, these caveat entitlements do not display with a caveats warning icon, instead, they display as draft (with draft icon).	n\a
Reclaim Consolidation occasionally fails due to deadlock if any Vendor and Title has large number of policies (~ 18-20), and precedence is set.	Reclaim → Usage Summary → Precedence Any Vendor and Title which has a large number of overlapping policies (which need to be set for precedence) when a user opens the set precedence screen, on clicking the 'move up' arrow button for the last policy and this is done in quick succession for 3-4 times (for different policies), two errors are can be seen: System triggers the Reclaim Consolidation for each 'up' arrow click Out of those many reclaim consolidation actions, one fails with a deadlock error.	If multiple policies are available for precedence, and last policy is needed to be set for highest precedence, then use 'move to top' button, and it moves this policy on top.

For any uploaded License / Maintenance, which has several warnings, AppClarity only displays the remediation part to the user (instead of both warning and remediation) on the license / maintenance screen drawer.	Entitlements→License / Maintenance screen If any entitlement has warnings when uploaded using the entitlement connector, then only the remediation is displayed for that entitlement, instead of both warnings and remediation on entitlement drawers.	n\a
License Demand displaying as 1 for management group name 'License Exemption - Oracle Corporation'.	On the IBM Processor Value Unit (PVU) License Demand and Oracle Processor License Demand screens, License Demand displays as 1 for exempted management groups. This happens in the case of a Virtual Host Cluster Soft Partition, where optimized license demand is calculated based on physical devices, but the installations are on virtual machines. In other situations, it works correctly.	n\a
License exempted comment does not appear for Oracle Processor License Demand.	In Oracle license demand, exempted comments do not appear when the device is exempt.	n\a
Installations on non exempted devices are also marked for exemption under the Global Management group.	In case of IBM PVU and Oracle Processor License Demand, the installations on non exempted devices are also marked for exemption under the Global Management group.	n\a
Entitlement tsv uploaded using the entitlement .tsv connector fails if the tsv file only has a row with a newline/carriage return.	When uploading an entitlement.tsv file using the entitlement upload connector, if there are any blank lines inbetween the entitlements, then the entitlement connector fails.	Before you upload the .tsv file, make sure the data is sanitized.

Multiple issues when navigating to and from screens with favorite and non favorite repositories.	AppClarity [Compliance] : Adding a license from Compliance->License Summary opens license form in the default repository even though compliance is associated to non-default Entitlement repository. AppClarity [Manage Associations] : VTVE is selected (from Compliance-2, which is not favorite), and the Manage Association button is clicked, then AppClarity navigates the user to (INV-1, which is a favorite).	After switching between screens from different modules/consumers, make sure you have selected the intended repository.
On Compliance→License Summary installs by details screen, if a user keeps this screen open for long time, an error occurred while loading table data on details table.	On Compliance→License Summary installs by details screen, if a user keeps this screen open for a long time, an error occurred while loading table data on details table.	Refresh the page to view the data.
No reclaim policy displayed on Reclaim→Policies screen, as the policy is created for *. User navigated to policy using reclaim usage version 14.0.0.5548.	Reclaim→Usage Summary If a reclaim policy is created on wild card (for example, 1E - Tachyon - and version as *), then on the Reclaim→Usage Summary screen, for 1E Tachyon 1.0.0.0, Count of 'selected management group policies' displays as 1 (as hyperlink). On clicking this hyperlink, AppClarity navigates to Reclaim→Policies screen to display the total number of policies. Blank data is displayed on the Policies screen (due to incorrect version/edition filter).	n\a

	It works correctly, if a reclaim policy is created with the exact version.	
Error appears on creating a license for specific title (that is, Office 365 ProPlus) and few other version specific generic issues.	The following are issues when publishing a license for a specific title and edition (Office 365 ProPlus) and also with version values: Error comes up, when a user tries to create/publish a license for Office 365 (with edition as ProPlus) and (Version as Dot Version with value as 16.*) When creating a license for 'Office 365' with Edition as 'ProPlus' and Version as 'All versions', then after it's published, it's edition is changed to ***E3*** instead of ProPlus When a license is created as Version using 'Colloquial version', after publishing the license, the version is set as 'dot format' instead of 'Colloquial version'.	n\a
RBAC issues with different AppClarity user roles.	Multiple RBAC related issues for different AppClarity user roles: Reclaim Viewer user - can can also see the AppMigration consumer screen Reclaim v iewer role - when opening the report refresh dropdown, a user is able to see the Full report list link and when they click it, the page breaks with the message ‘Something went wrong’ Compliance viewer user role - on the compliance detailed installation screen or LDC detailed report screen, when a user clicks	n\a

	on device hyperlinks, the 'Something went wrong' message appears and the page breaks Entitlement administrator role - provider log displaying the reclaim PO's is visible to a user with the entitlement administrator role Entitlement administrator role - user is able to see inventory application and perform Configuration Manager manage associations activities.	
Intermittent issues on Reclaim Policies→Policy Administration screen.	Policy Administration (links like User Rejected, succeeded etc) when they have more than 500 or 1000 records, then pagination links do not appear until the user scrolls till the last record. If any reclaim policy has large number of pending admin action records (that is, 1197) available (on which reclaim admin need to take action), then when they drill down to the Policy Administration screen by clicking the counts hyperlink, a blank screen displays with no data showing in tabular structure.	The user needs to scroll till the last record (that is, up till bottom of page) to see the pagination buttons. Remove the sorting from 'Completed On' column, then data starts appearing.
Contracts which are exported, cannot be re-imported.	Contracts which are exported, cannot be reimported and AppClarity shows an error for "Start date" due to a space character.	n\a
Export not working for filtered data on aggregated columns such as 'Lic Qty', 'Mnt Qty' and' Total cost'	Entitlement→Summary Report If there are 4-5 entitlements (of the same vendor and title), and the user applies a filter on column 'License Qty' then when using the	n\a

columns of Entitlement Summary screen.	Export button, Filter and Export do not work on aggregated columns.	
Perpetual entitlements with future dates come with the 'Active only' filter.	If 'Active Only' filter is applied on entitlement listing page then Perpetual entitlements with future dates also come with this filter applied. It works for Subscription entitlements where future dates are filtered out.	n/a
Column picker choices goes back to default after refresh	When you refresh reports on a page where you have changed the displayed columns, the view will reset back to its view once the refresh completes and the page reloads.	n\a

10.6Reference

All the AppClarity-related tables of information, such as supported platforms, communications ports etc.

10.6.1 Supported Platforms

A list of all the platforms supported by AppClarity and the software required to allow AppClarity to be installed and work correctly.

> **Note**
>
> The list of Supported Platforms for AppClarity is identical to Tachyon Platform 8.1 because AppClarity is a Tachyon consumer application.

> **Note**
>
> 1E will provide you with a **Tachyon.lic** license file that defines the products and features your Tachyon System is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license.

The license must be activated. Once activated, it may be used only by the Tachyon System that activated it.

Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable.

For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk.

For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server.

> For details of what the license file needs to contain, please refer to Design Considerations: License requirements for consumer applications.

The list of Supported Platforms for AppClarity is identical to Tachyon Platform because AppClarity is a Tachyon consumer application.

Please refer to Windows Server requirements for details.

10.6.1.1 1E Companion Products

Supported versions of 1E companion products that AppClarity 8.1 features depend on.

Products and features that AppClarity depends on	Supported versions of companion products	
1E Catalog	Required by all AppClarity features.	1E Catalog (included in Tachyon Platform 8.1)
Tachyon	Tachyon powered inventory using the optional Tachyon connector and full Tachyon infrastructure.	Tachyon Platform 8.1
AppClarity 5.2	Optional feature of AppClarity 8.1 to use its AppClarity 5.2 connector to migrate entitlements from AppClarity 5.2. Only requires the AppClarity 5.2 database, not the full AppClarity 5.2 infrastructure.	AppClarity 5.2.0

Supported versions of 1E companion products with features that depend on AppClarity 8.1.

Products and features that depend on AppClarity	Supported versions of companion products
None	

10.6.1.2 Connectors

The following table shows the supported versions of software used by the Tachyon out-of-box connectors.

The following table shows the supported versions of software used by the Tachyon out-of-box connectors.

Connector	Product	Notes
BigFix	BigFix	Please refer to the BigFix connector for prerequisites.
Intune	Intune	Please refer to the Intune connector page for prerequisites.
Microsoft Office 365	Azure	Please refer to the Microsoft Office 365 connector page for prerequisites.
OpenLM	OpenLM Server version 21.12	Please refer to the OpenLM connector page for prerequisites.
Oracle LMS	Oracle LMS	Please refer to the Oracle LMS connector page for prerequisites.
ServiceNow	ServiceNow Jakarta release	Please refer to the ServiceNow connector page for prerequisites.
System Center Configuration Manager (SCCM)	SCCM CB 2203 SCCM CB 2111 SCCM CB 2107 SCCM CB 2103 SCCM CB 2010	Please refer to the System Center Configuration Manager connector page for prerequisites.

Connector	Product	Notes
Tachyon	Tachyon 8.1	Please refer to the Tachyon connector page for prerequisites.
vCenter	VMware PowerCLI 11.1.0	VMware PowerCLI 11.1.0 (code.vmware.com/web/dp/tool/vmware-powercli/11.1.0) must be installed on the Tachyon Master server (where the SLA Integrate Services Agent service is hosted) before you can configure and use the vCenter connector. Earlier or later versions of PowerCLI are not supported and may cause errors. VMware PowerCLI is freeware and was previously known as vSphere PowerCLI. VMware PowerCLI supports multiple versions of VMware vCenter Server. For details, please refer to the VMware compatibility matrix using the following link: https://www.vmware.com/resources/compatibility/sim/interop_matrix.php#interop&2=&106= Please refer to the vCenter connector page for configuration details.
WSUS (Windows Server Update Services)	WSUS	Please refer to the Windows Server Update Services connector page for configuration details.

10.6.2 1E Companion Products

A list of the feature dependencies between AppClarity and other 1E companion products.

To view the general platform related dependencies for AppClarity please refer to Supported Platforms.

10.6.2.1 1E companion products that AppClarity 8.1 depends on

Supported versions of 1E companion products that AppClarity 8.1 features depend on.

Products and features that AppClarity depends on	Supported versions of companion products	
1E Catalog	Required by all AppClarity features.	1E Catalog (included in

Products and features that AppClarity depends on	Supported versions of companion products	
		Tachyon Platform 8.1)
Tachyon	Tachyon powered inventory using the optional Tachyon connector and full Tachyon infrastructure.	Tachyon Platform 8.1
AppClarity 5.2	Optional feature of AppClarity 8.1 to use its AppClarity 5.2 connector to migrate entitlements from AppClarity 5.2. Only requires the AppClarity 5.2 database, not the full AppClarity 5.2 infrastructure.	AppClarity 5.2.0

10.6.2.2 1E companion products that depend on AppClarity 8.1

Supported versions of 1E companion products with features that depend on AppClarity 8.1.

Products and features that depend on AppClarity	Supported versions of companion products
None	

10.6.3 Communication Ports

Diagrams and links to tables for all the external communication ports used by Tachyon and locally installed consumer applications. Useful, if needed, for configuring network and device firewalls.

Please refer to Tachyon Architecture for architecture diagrams.

10.6.3.1 Connections diagram

Please refer to Communications ports for the Tachyon Platform connections diagram.

10.6.3.2 Firewall requirements

Please refer to Firewall requirements for a Single-Server for details.

10.6.4 Installer properties

Please refer to AppClarity installer properties for details.

10.6.5 AppClarity page reference

A reference for the fields and tables on the pages in the AppClarity application.

10.6.5.1 Entitlements

A reference for the fields and tables on the pages under the **Entitlements** node in the **AppClarity** application.

10.6.5.1.1 Summary Report page

A description of the fields on the **Summary Report** page.

Here you can view the entitlements for a selected entitlements repository. You get to this page by clicking the **AppClarity→Entitlements→Summary Report** node in the navigation panel.

The fields on the **Summary Report** page are:

Entitlements repository selector

Entitlements Records

Costs Breakdown

Active Entitlements only toggle

Action Buttons

Export

Entitlements table

Vendor

Title

Edition

Metric

Lic Qty

Mnt Qty

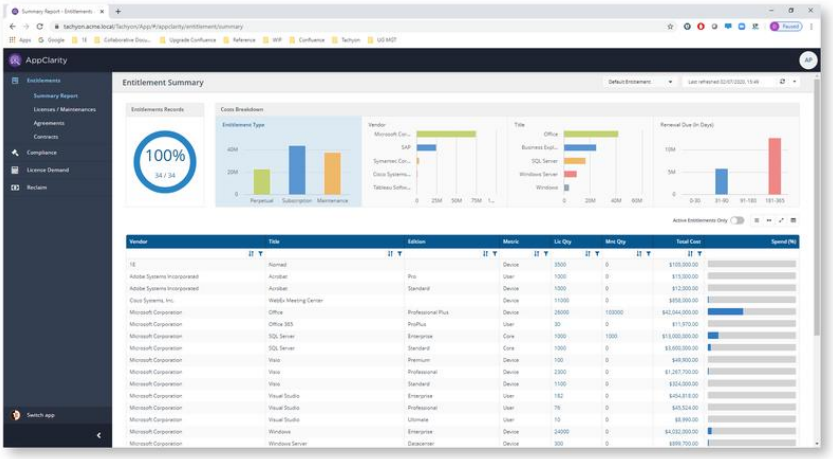
Total Cost

Spend (%)

Column actions

Column sort

Column filter



Field	Description
Entitlements repository selector	This field lets you select the repository where the entitlements data displayed on the page comes from. By default this is set to **Default Entitlements**. If you have created your own entitlements repositories, click on the name to select any of these from the drop-down list.
Entitlements Records	This chart shows the percentage of the total number of Entitlements Records in the selected Entitlements repository that are currently being displayed on this page as a result of the applied filters. The figures below the chart show the number of Entitlements Records being displayed over the total number of Entitlements Records in the selected Entitlements repository. Costs Breakdown	These charts show the costs breakdown for various aspects of the Entitlements in the currently selected Entitlements repository.

Chart	Description
Entitlement Type	This chart shows the breakdown and numbers for the Entitlements Records in the selected Entitlements repository according to their Entitlement type: Perpetual, Subscription or Maintenance.

Field	Description
	Vendor	This chart shows the breakdown and numbers for the top 5 Vendors according to their total Entitlements costs in the selected Entitlements repository. Title	This chart shows the breakdown and numbers for the top 5 software Titles according to their total Entitlements costs in the selected Entitlements repository. Renewal Due (In Days)	This chart shows the number of entitlement renewals that are due within certain numbers of days in the selected Entitlements repository. Active Entitlements only toggle	The **Active Entitlements only** toggle adds a filter when it's turned on that filters the table to only display the entitlements that have been published and not the ones that are in draft.

Field	Description
Action Buttons	The following table describes the action buttons displayed on the**Summary Report**page.

Button	Description
Export	Exports all the entitlements currently displayed in the **Entitlements** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.

Entitlements table

The following table describes the columns displayed in the **Entitlements** table:

Column	Description
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement or agreement is for. For example, **Microsoft Corporation** or **1E**. You can sort and filter on this column.
Title	The title portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement is for. For example, **Visio** or **Nomad**. You cansortandfilteron this column.
Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement is for. For example, **Standard** or **-** (where no edition is specified or exists). You cansortandfilteron this column.
Metric	The metric type for a license or maintenance entitlement. This may be one of:

Type	Description
Core	The metric for the license is related to the number of cores present on a device. For example, licenses for **Microsoft SQL database** are related to the

Field	Description		
			number of cores on the server where **Microsoft SQL** is installed.
		Device	The metric for the license is for devices. For example licenses for **Microsoft Visio** are on a per device basis. This is the default type.
		Other	This can be used to reference your own license metric type.
		Processor	The metric for the license is related to the number of processors for a device. For example, licenses for certain **Oracle** products are related to the number of processors on the server where the **Oracle** product is installed.
		PVU	The metric for the license is related to the Processor Value Unit present on a device. For example. licenses for **IBM** products are related to the **Processor Value Unit (PVU)** for the device where the IBM product is installed.
		User	The metric for the license is related to the users for the product. For example, **Microsoft Office 365** licenses are related to users and not the devices the software is running on.
		You cansortandfilteron this column.	
	Lic Qty	The **Lic Qty** column shows the number of licenses related to each Entitlement in the table. You can sort and filter on this column.	
	Mnt Qty	The **Mnt Qty** column shows the number of maintenance licenses related to each Entitlement int the table. You can sort and filter on this column.	

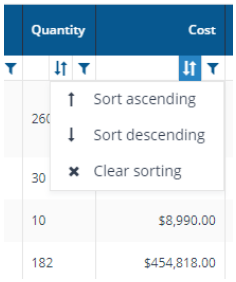
Field	Description
Total Cost	The **Total Cost** column displays the total cost for the number of licenses and maintenances covered by each entitlement in the table. You can sort and filter on this column.
Spend (%)	The **Spend (%)** column shows the percentage of the overall spend for each Entitlement in the selected Entitlement repository. The complete bar represents the overall spend, the blue bar indicates the % spend for this Entitlement and the grey bar shows the % remainder.

Column actions

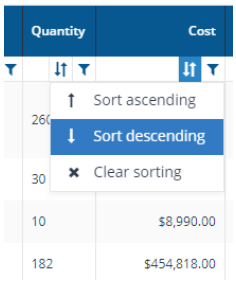
The following column actions are available on some columns in the table.

Column action	Description
Column sort	**Using column sorts** The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom.To sort the table on the **Cost** column: Click on the sort icon ⇅ just beneath the header row in the **Cost** column.  The sort popup is displayed.

Field	Description

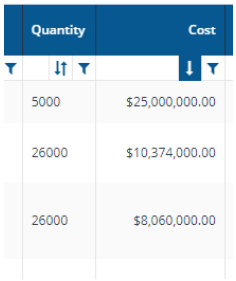


Now select the sort direction. In our example this will be **Sort descending**.



After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon

.



Clearing the sort

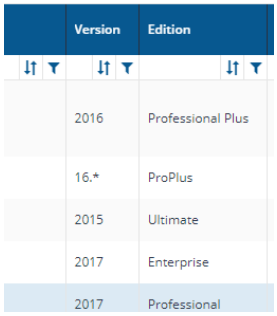
You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.

Column filter

Using column filters

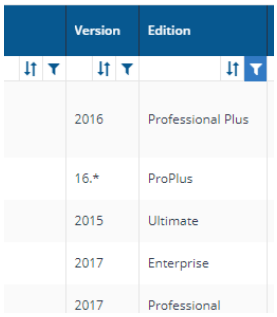
The picture shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.

Field	Description

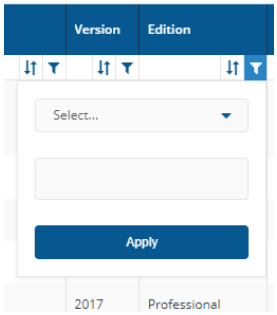


To filter the table on the **Edition** column:

Click on the filter icon just beneath the header row in the **Edition** column.

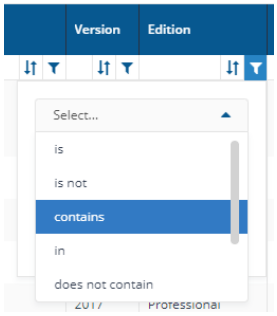


The filter popup is displayed.

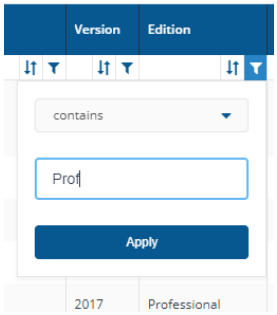


Now select the operator. In our example this will be **contains**.

Field	Description

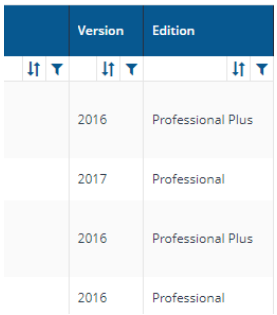


Then type the text **Prof** into the text field.



Click **Apply** and a new filter will be added to the table.

The table will be filtered to just those items whose **Edition** contains the text **Prof**.



Adding another filter

You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.

Field	Description
	Removing filters You can remove filters by clicking on the filter close icon at the end of the filter.

10.6.5.1.2 Licenses / Maintenances page

A description of the fields on the **Licenses / Maintenances** page.

Here you can view, edit, copy, create, publish and delete License and Maintenance entitlements. You can also view any components related to a License or Maintenance and export all the entitlements in the selected repository to a TSV file. You get to this page by clicking the **AppClarity→Entitlements→Licenses / Maintenances** node in the navigation panel.

The fields on the **Licenses / Maintenances** page are:

Entitlement Repository selector

Report Refresh

Active Entitlements only toggle

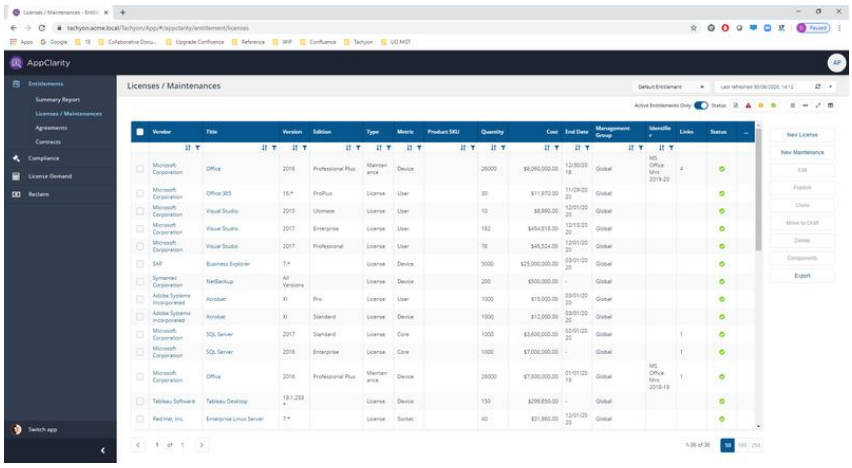
Column sort

Column filter



Field	Description
Entitlement Repository selector	This field lets you select the repository where the entitlements data displayed on the page comes from. By default this is set to **Default Entitlements**. If you have created your own entitlements repositories, click on the name to select any of these from the drop-down list.

Field	Description
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box: Active Entitlements only toggle	The **Active Entitlements only** toggle adds a filter when it's turned on that filters the table to only display the entitlements that have been published and not the ones that are in draft.
Status filters	The Status filters are displayed in the top-right of the page and let you filter the table according to the status of the items in the table. Clicking on an icon filters the table to display only items with that status, as described in the following table.

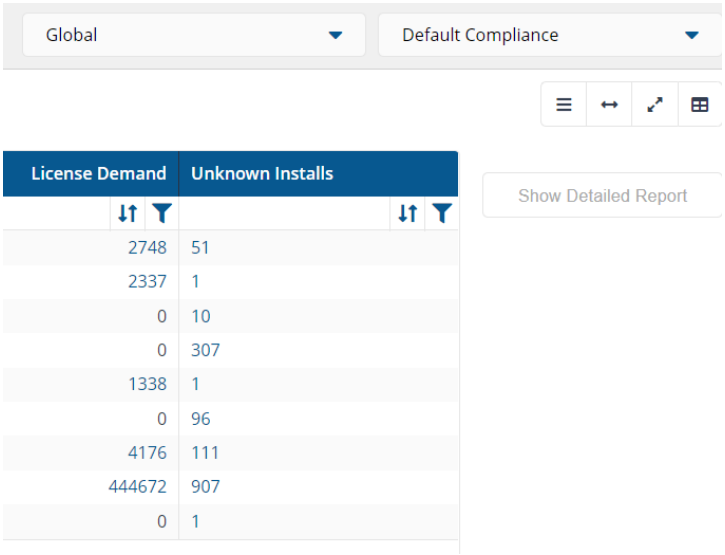
Icon	Description
	Filters to show only items in Draft.
	Filters to show only items in Draft with errors.
	Filters to show only items in Draft with warnings.
	Filters to show only items that are Published.

Action Buttons	The following table describes the action buttons displayed on the **Licenses / Maintenances** page.

Button	Description
New License	Creates a New License. Please refer to New License page for more details.
New Maintenance	Creates a New Maintenance. Please refer to New Maintenance page for more details.
Edit	This button is only enabled when there is a single selection in the **Licenses / Maintenances** table.

Field	Description
	Edits the selected entitlement and opens the Edit License or Edit Maintenance page, depending on the type of the selected entitlement. Please refer to New License or New Maintenance pages for more details.
Publish	This button is enabled when there is at least one selection in the **Licenses / Maintenances** table. Publishes the selected entitlements.
Clone	This button is only enabled when there is a single selection in the **Licenses / Maintenances** table. Clones the selected entitlement and opens the Edit License or Edit Maintenance page, depending on the type of the selected entitlement, with a clone of the details from the entitlement. Please refer to New License or New Maintenance pages for more details.
Move to Draft	This button is enabled when there is at least one selection in the **Licenses / Maintenances** table. Moves the selected entitlements to Draft.
Delete	This button is enabled when there is at least one selection in the **Licenses / Maintenances** table. Deletes the selected entitlements.
Components	This button is only enabled when there is a single selection in the **Licenses / Maintenances** table. Displays the components for the selected entitlement. If the entitlement has no components the message displayed is **Data not available**. Components refer to the bundled software related to a license. For example you may have a bundle for **Microsoft BackOffice Small Business Server**, which would contain components for **Exchange Server**, **FrontPage**, **Internet Explorer** and **Outlook**.

Field	Description
	Export Exports all the entitlements currently displayed in the **Licenses / Maintenances** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.
Column Picker	Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.

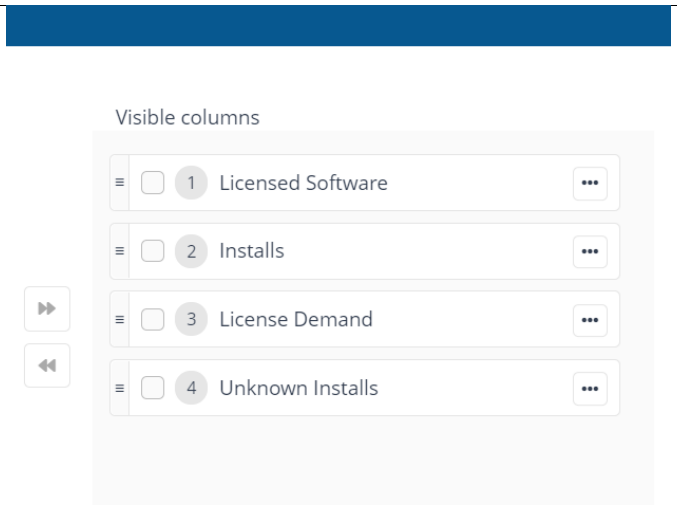


License Demand	Unknown Installs
2748	51
2337	1
0	10
0	307
1338	1
0	96
4176	111
444672	907
0	1

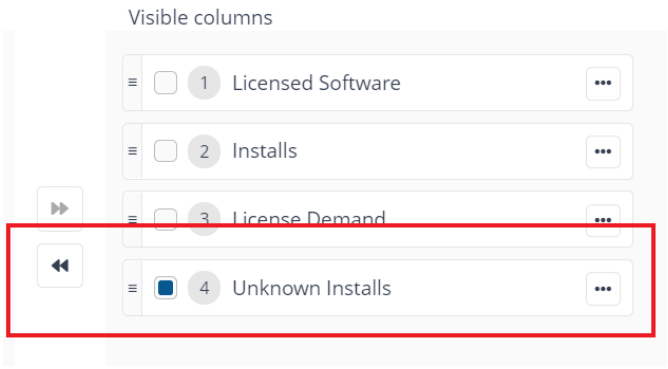
To pick the displayed columns:

Click on the Choose columns icon to the right of the header row to view the visible columns.

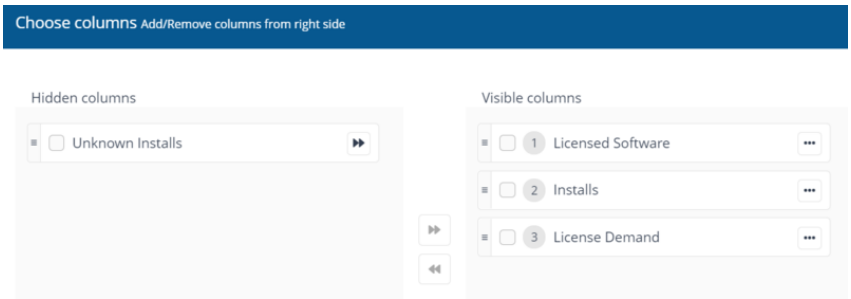
Field	Description



To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.

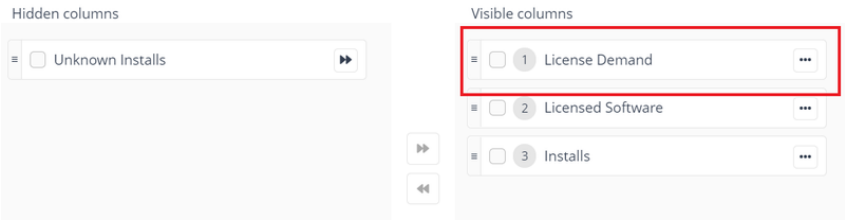


The **Unknown Installs** column is now hidden.



To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.

Field	Description



The Microsoft Core License Demand page has now been automatically updated with our changes.

License Demand	Licensed Software	Installs
2748	Windows Server DataCenter	647
2337	SQL Server Enterprise	649
0	SQL Server Analysis Services	0
0	SQL Server Integration Services	0
1338	SQL Server Standard	300
0	SQL Server Reporting Services	0
4176	Windows Server Enterprise	265
444672	Windows Server Standard	4019
0	SQL Server Data Quality Services	0

Licenses / Maintenances table

The following table describes the columns displayed in the **Licenses / Maintenances** table:

Column	Description
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement or agreement is for. For example, **Microsoft Corporation** or **1E**. You can sort and filter on this column.
Title	The title portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement is for. For example, **Visio** or **Nomad**. You can sort and filter on this column.
Version	The version portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **11.0.3216.5614** or **6.3.100.0**. You can sort and filter on this column.

Field	Description
Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement is for. For example, **Standard** or **-** (where no edition is specified or exists). You can sort and filter on this column.
Type	The **Type** column displays the type of the entitlement in the table. This can be either **License** or **Maintenance**. You can sort and filter on this column.
Metric	The metric type for a license or maintenance entitlement. This may be one of:

Type	Description
Core	The metric for the license is related to the number of cores present on a device. For example, licenses for **Microsoft SQL database** are related to the number of cores on the server where **Microsoft SQL** is installed.
Device	The metric for the license is for devices. For example licenses for **Microsoft Visio** are on a per device basis. This is the default type.
Other	This can be used to reference your own license metric type.
Processor	The metric for the license is related to the number of processors for a device. For example, licenses for certain **Oracle** products are related to the number of processors on the server where the **Oracle** product is installed.
PVU	The metric for the license is related to the Processor Value Unit present on a device. For example. licenses for **IBM** products are

Field	Description	
		related to the **Processor Value Unit (PVU)** for the device where the IBM product is installed.
	User	The metric for the license is related to the users for the product. For example, **Microsoft Office 365** licenses are related to users and not the devices the software is running on.
		You can sort and filter on this column.
Product SKU		A SKU (pronounced 'skue') is an identification, usually alphanumeric, of a particular product that allows it to be tracked for inventory purposes. In AppClarity, via the 1E Catalog, a SKU is associated with the license metrics and use rights associated with a particular software product purchase. You can sort and filter on this column.
Quantity		The **Quantity** column displays the number of licenses covered by the entitlement. You can sort and filter on this column.
Cost		The **Cost** column displays the cost for each entitlement in the table. You can sort and filter on this column.
End Date		The **End Date** column shows the date the entitlement will end. You can sort and filter on this column.
Management Group		Displays all of the management groups the software reclaim policy is associated with. You can sort and filter on this column.
Identifier		Displays the **Identifier** information configured for the entitlement or agreement.

Field	Description
	You can sort and filter on this column.
Links	Displays the **Identifier** information configured for the entitlement or agreement.
Status	The icon indicates the status of the entitlement or agreement:

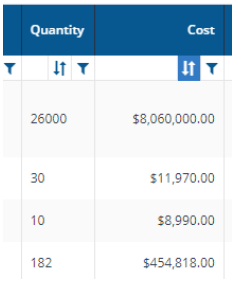
Icon	Description
	Draft.
	Draft with errors.
	Draft with warnings.
	Published.

...

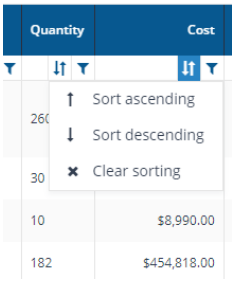
The following column actions are available on some table columns.

Column actions	Description
Column sort	**Using column sorts** The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom.To sort the table on the **Cost** column: Click on the sort icon ⇅ just beneath the header row in the **Cost** column.

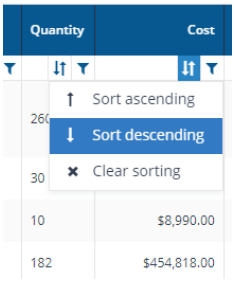
Field	Description



The sort popup is displayed.

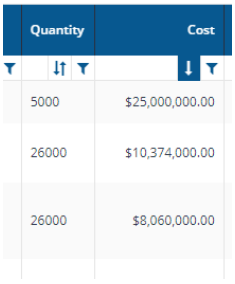


Now select the sort direction. In our example this will be **Sort descending**.



After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon

.



Field	Description

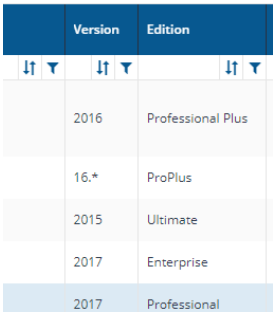
Clearing the sort

You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.

Column filter

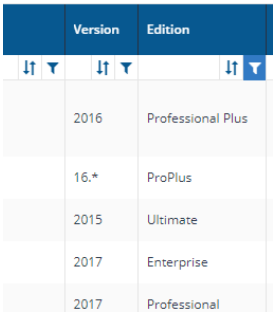
Using column filters

The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.

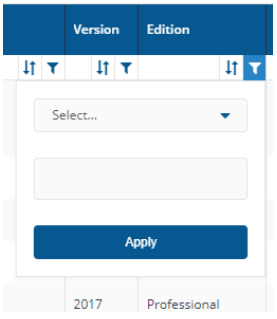


To filter the table on the **Edition** column:

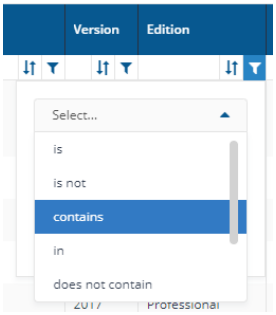
Click on the filter icon just beneath the header row in the **Edition** column.



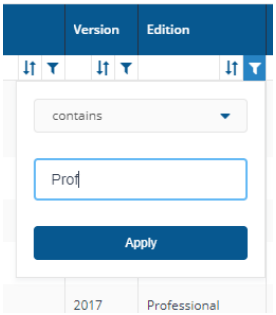
The filter popup is displayed.



Now select the operator. In our example this will be **contains**.

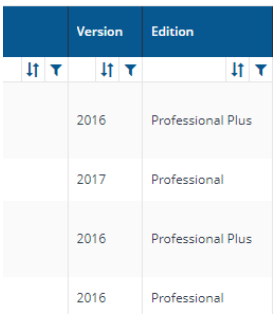


Then type the text **Prof** into the text field.



Click **Apply** and a new filter will be added to the table.

The table will be filtered to just those items whose **Edition** contains the text **Prof**.



Adding another filter

You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.

Field	Description
	 **Removing filters** You can remove filters by clicking on the filter close icon at the end of the filter.

10.6.5.1.2.1 New License page

A description of the fields in each section of the **New License** page. This also covers the **Edit License** page.

A license entitlement type in AppClarity specifies the rights and limitations of software and/or services that may be installed and/or used on an organizations computing devices. For example you could specify a license for Microsoft Visio 2016 and enable version downgrade rights to ensure that the license covers all versions up to 2016.

The sections on the **New License** or **Edit License** page are:

The Summary panel

Basic Information

Product

Coverage

Entitlement Term

Rights

Costs

Entitlement Links

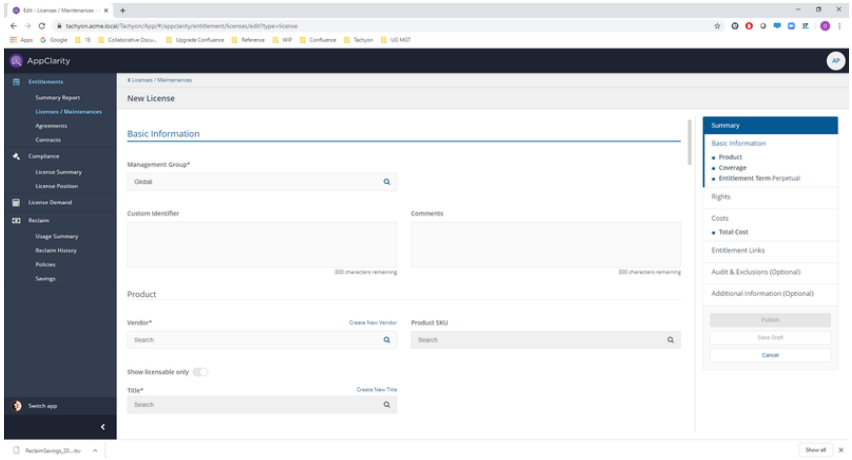
Parent

Associations

Children

Audit & Exclusions (Optional)

Additional information (Optional)

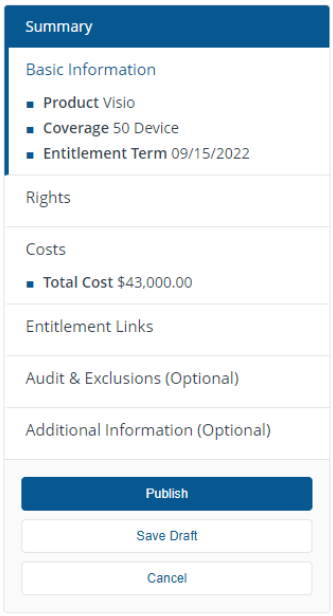


10.6.5.1.2.1.1 The Summary panel

The Summary panel on the right-hand side of the entitlement displays a summary of the settings that have been made in the entitlement so far. It's always visible on screen and can be used to navigate between the various sections of the entitlement.

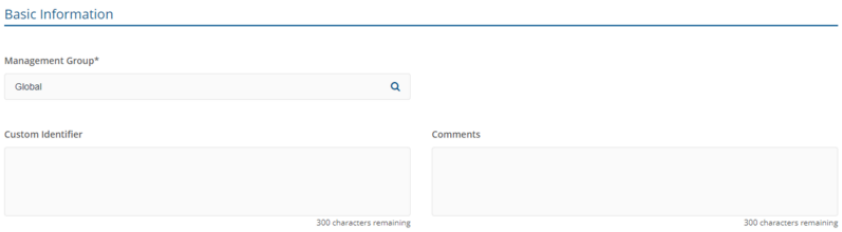
The panel also contains the following buttons:

Button	Description
Publish	Publishes the entitlement so it becomes active.
Save Draft	Saves the current settings in the entitlement to a draft. This can be used to save edits if you are part way through creating or making changes to the entitlement. It can also be used to inactivate an entitlement by removing its published status.
Cancel	Cancels the current edits and closes the page.



10.6.5.1.2.1.2 Basic Information

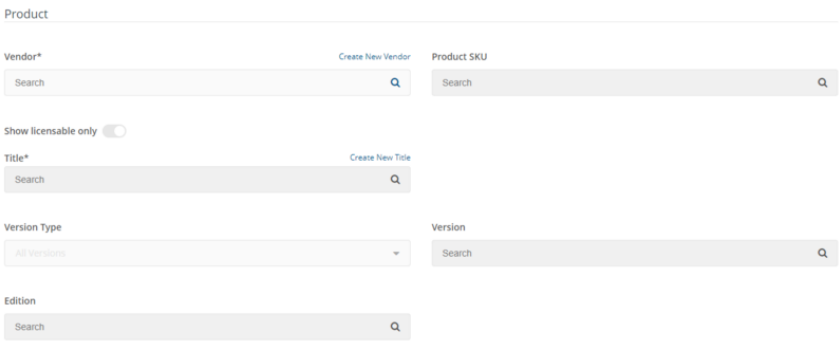
This section deals with the basic information for the entitlement, such as details of the product, the coverage and term of the entitlement.



Field	Details
Management Group*	Here you can associate the entitlement with Management Group of your choice.
Custom Identifier	An optional field. You can specify any alpha-numeric value to help identify the entitlement in the**Draft**and**Published**pages and when linking to other entitlements.
Comments	Enter text here to store any comments you have related to the entitlement.

10.6.5.1.2.1.2.1 Product

This sub-section defines the product covered by the entitlement.

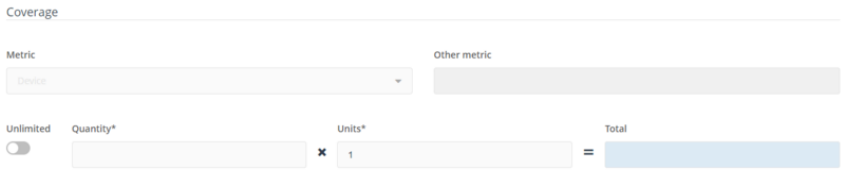


Field	Details
Vendor*	Defines the vendor of the product the license will apply to. The vendor part of the vendor, title, version and edition for a product. This must be filled out before any other fields. Suggested suitable vendors that match your text are displayed as you type into the field, which you can select to auto-complete the entry.
Product SKU	Suggested matching SKU are displayed as you type into the field, which you can select to auto-complete the entry. When you select a SKU other fields in the license will be automatically prefilled. For example, selecting the SKU for a particular edition of Microsoft Office 365 may set the **License Type** to **Subscription**, the **Product title** to **Office 365** and the **Edition** to **ProPlus**. These fields will then be fixed as they are derived from the SKU and not entered by hand.
Show licensable only	This toggle, which is on by default, sets whether the matches from 1E Catalog are filtered to show only products that are marked as licensable - and therefore appropriate for entitlements. You can flip this to off, if the product you are looking for is not visible and you're not sure if it's licensable or not, to see the unfiltered list of product related information from 1E Catalog.
Title*	Defines the title of the product the license will apply to. This is a mandatory field. The title part of the vendor, title, version and edition for a product. Suggested suitable titles from the selected vendor that match your text are displayed as you type into the field, which you can select to auto-complete the entry.
Version Type	**All Versions**, **Dot Format**,or **Colloquial**. By default this is set to**All Versions**.
Version	Defines the version of the product the license will apply to.

Field	Details
	The version part of the vendor, title, version and edition for a product. The Version format is dependent on the chosen **Version Type**. This field is disabled for a **Version Type** of **All Versions.**
Edition	Defines the edition of the product the license will apply to. The edition part of the vendor, title, version and edition for a product. Suggested suitable editions for the selected vendor and title that match your text are displayed as you type into the field, which you can select to auto-complete the entry.

10.6.5.1.2.1.2.2 Coverage

This sub-section defines the coverage details for the entitlement, such as: the metric that will be used for the entitlement and the number of installations the entitlement covers, i.e. whether the entitlement is unlimited or defined by a specific quantity of units.



Field	Details
Metric	The metric type for a license or maintenance entitlement. This may be one of:

Type	Description
Core	The metric for the license is related to the number of cores present on a device. For example, licenses for **Microsoft SQL database** are related to the number of cores on the server where **Microsoft SQL** is installed.
Device	The metric for the license is for devices. For example licenses for **Microsoft Visio** are on a per device basis. This is the default type.
Other	This can be used to reference your own license metric type.
Processor	The metric for the license is related to the number of processors for a device. For example, licenses for certain **Oracle** products are related

Field	Details	
		to the number of processors on the server where the **Oracle** product is installed.
	PVU	The metric for the license is related to the Processor Value Unit present on a device. For example. licenses for **IBM** products are related to the **Processor Value Unit (PVU)** for the device where the IBM product is installed.
	User	The metric for the license is related to the users for the product. For example, **Microsoft Office 365** licenses are related to users and not the devices the software is running on.
	The **Metric** works with the **Quantity** field to determine how licenses are applied.	
Other metric	This field is enabled if the Metric field is set to Other and allows you to specify an entitlement metric that is not covered by default in AppClarity. This field is only enabled if **Other** is selected in the **Metric Type** for entitlements and allows you to enter a metric that is not covered by the basic **Metric Type** options.	
Unlimited	If you set the**Unlimited**toggle to on, this entitlement will cover all installations and the**Quantity**and **Units** fields will be disabled.	
Quantity	Sets the number of licenses bought for this entitlement. Only enabled if the **Unlimited** toggle is set to off, in which case this field is also mandatory.	
Units	Sets the number of units per licenses purchased. Only enabled if the**Unlimited**toggle is set to off, in which case this field is also mandatory.	
Total	The total number of licenses, which is the Quantity value times the Units value. AppClarity will count each unit in the **Total** field against a single unit of the given **Metric** type. So if the **Metric** type is **Device** and the **Total** calculates to **50** this will count against **50** devices. For an SQL Server Enterprise example the **Metric** type would be **Core** so this will count against **50** cores.	

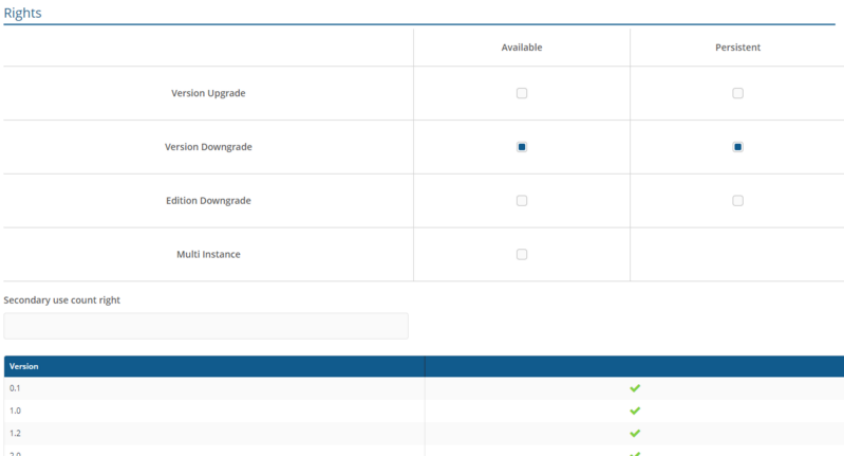
10.6.5.1.2.1.2.3 Entitlement Term

This sub-section defines the type and length details for the entitlement, such as: the type (perpetual or subscription), the start date and, if the type is subscription, the duration and end date.

Field	Details
Entitlement Type	For License entitlements this can be set to **Perpetual** or **Subscription**. By default this is set to **Perpetual**. For Maintenance entitlements this can only be set to **Subscription**.
Start Date*	When the entitlement starts applying. This defaults to the date the entitlement was created.
Duration*	The **Duration** and **End Date** fields are only enabled for **Subscription** entitlements. If you set the **Duration** the **End Date** is calculated. If you set the **End Date** the **Duration** is calculated. These fields determine how long the entitlement is applicable for after start date. The **Duration** is set in terms of months and determines the number of months the entitlement will be valid for.
End Date*	The **Duration** and **End Date** fields are only enabled for **Subscription** entitlements. If you set the **Duration** the **End Date** is calculated. If you set the **End Date** the **Duration** is calculated. These fields determine how long the entitlement is applicable for after start date. The **End Date** indicates the last date the entitlement will be valid until and is set using a date picker.

10.6.5.1.2.1.3 Rights

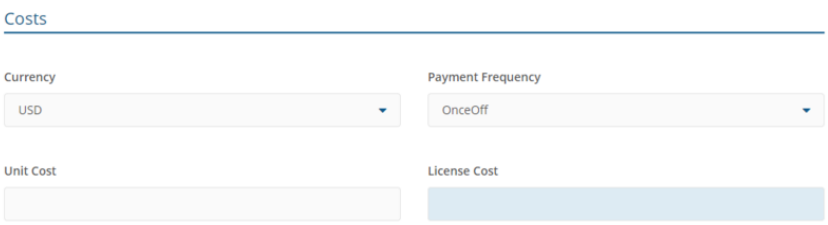
This section lets you control how the entitlement applies to existing versions of the product it's related to.



Field	Details
Version Upgrade	Rights to check if the entitlement is also applicable on higher versions of selected version
Version Downgrade	Rights to check if the entitlement is also applicable on lower versions of selected version. By default it is true
Edition Downgrade	Rights to check if the entitlement is also applicable on lower editions of selected edition
Multi Instance	Rights to check if the same license is also applicable on multiple installations on same device
Secondary use count right	The available count of secondary uses
Versions covered	The table below the fields shows the overall versions and editions covered by the entitlement based on the selected rights.

10.6.5.1.2.1.4 Costs

This section lets you control how the entitlement is costed and how it can be considered within the overall spend.



Field	Details
Currency	The currency applied to the entitlement. Clicking on the Currency field displays a list of currencies to choose from. Payment Frequency	**OnceOff, Monthly, Quarterly, Yearly**. The default is **OnceOff**.
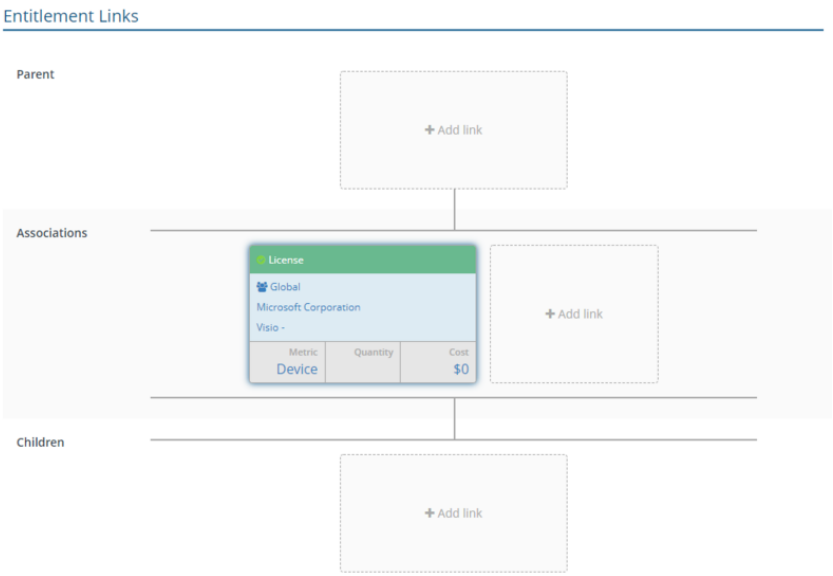
Unit Cost	The cost of the licence per unit, combined with the **Quantity** and **Unit Cost Type** values to calculate the license cost.
License Cost	This is calculated based on value filed in the **Quantity**, **Unit Cost** and **Payment Frequency**. This value only displays the cost and cannot be edited directly.

10.6.5.1.2.1.5 Entitlement Links

This section lets you create links between your entitlements. If you are creating a new entitlement this section will initially look like this:

After you have saved the entitlement this section provides an interface for linking it to other entitlements:

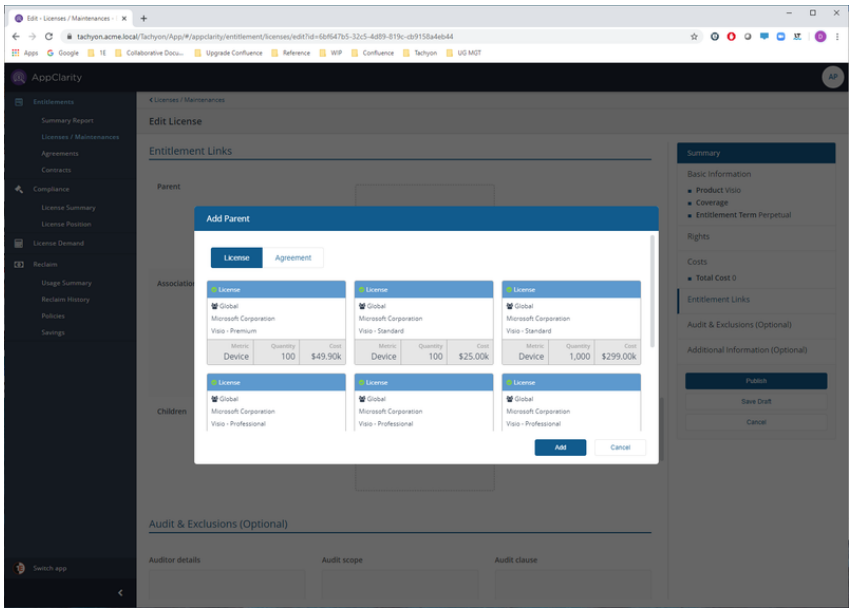


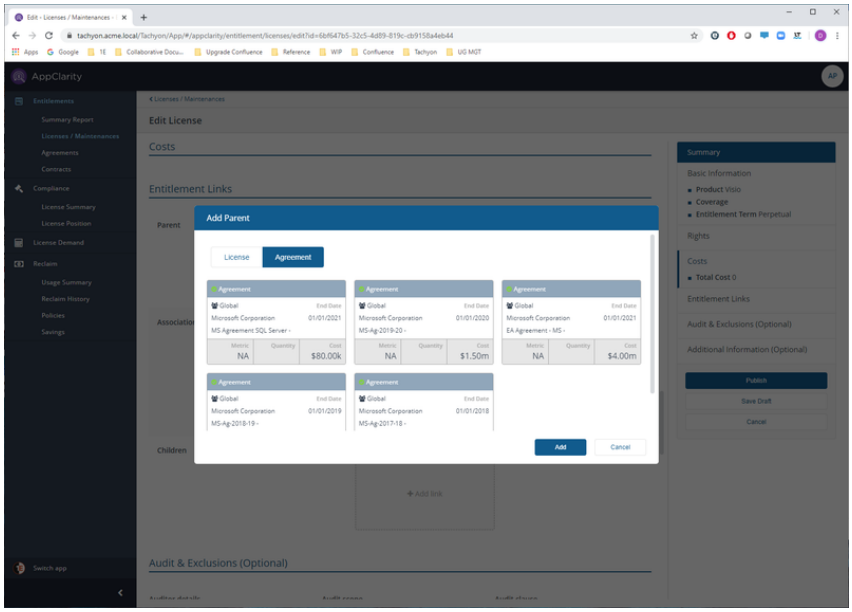
There are three sub-sections:

10.6.5.1.2.1.5.1 Parent

Here you can link parent licenses or agreements. Clicking on the **+Add link** area displays the **Add Parent** popup.

Select **License** or **Agreement** to add that type of link, a list of entitlements of the selected type will be displayed. Click on any of these and a green check mark will appear to indicate the selected parent, you can only select one. Once you've made your choice click the **Add** button to link the checked parent.

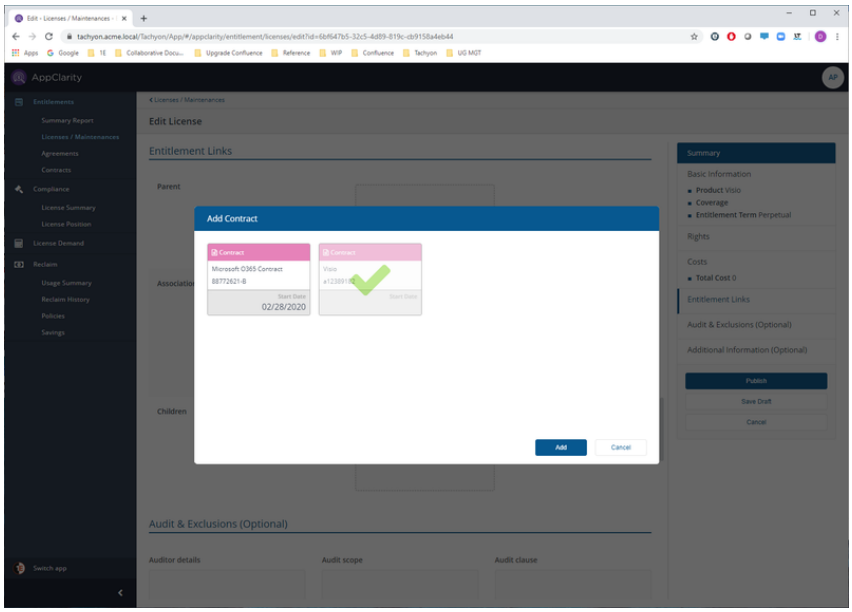




10.6.5.1.2.1.5.2 Associations

Here you can link contracts. Clicking on the **+Add link** area displays the **Add Contract** popup.

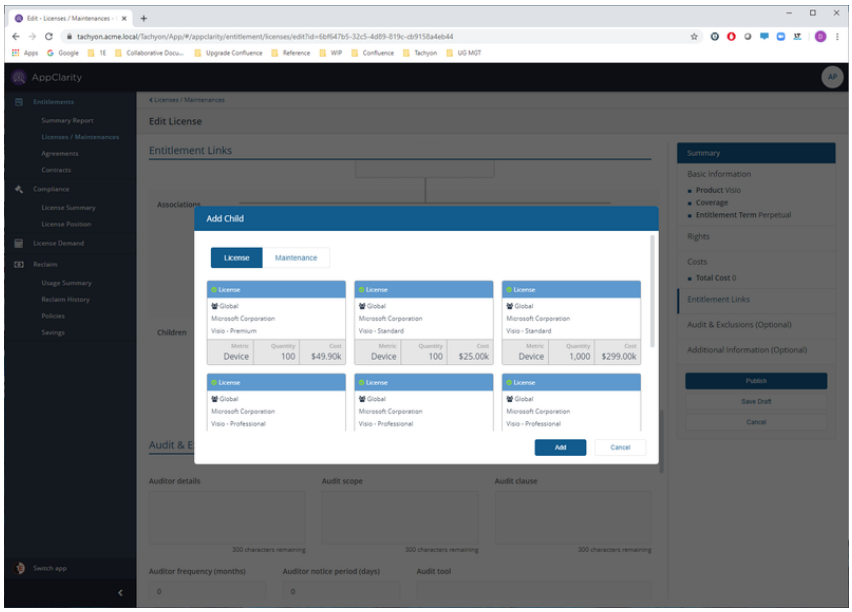
A list of contracts will be displayed. Click on any of these and a green check mark will appear to indicate the selected contract, you can select more than one contract to link. Once you've made your choice click the **Add** button to link the checked contract(s).



10.6.5.1.2.1.5.3 Children

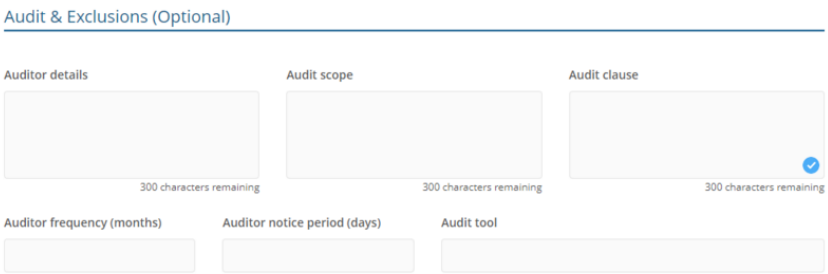
Here you can link child licenses or maintenances. Clicking on the **+Add link** area displays the **Add Child** popup.

Select **License** or **Agreement** to add that type of link, a list of entitlements of the selected type will be displayed. Click on any of these and a green check mark will appear to indicate the selected child - you can select more than one. Once you've made your choice click the **Add** button to link the checked children.



10.6.5.1.2.1.6 Audit & Exclusions (Optional)

This section lets you control how the entitlement is audited.



Field	Details
Auditor Details	Organizations that are allowed to perform the audit including (if appropriate), the licensor organization and any third-party organizations, according to what was agreed in the contract.
Audit Scope	Defines what part of the software customer organization is allowed to be audited.
Audit Clause	Provides additional information on what could trigger the audit.

Field	Details
Auditor Frequency	Definition of the highest agreed frequency of the audit expressed in months.
Auditor Notice period	Notice period in days.
Audit Tool	Name of the tool(s) which are approved for use in the audit.

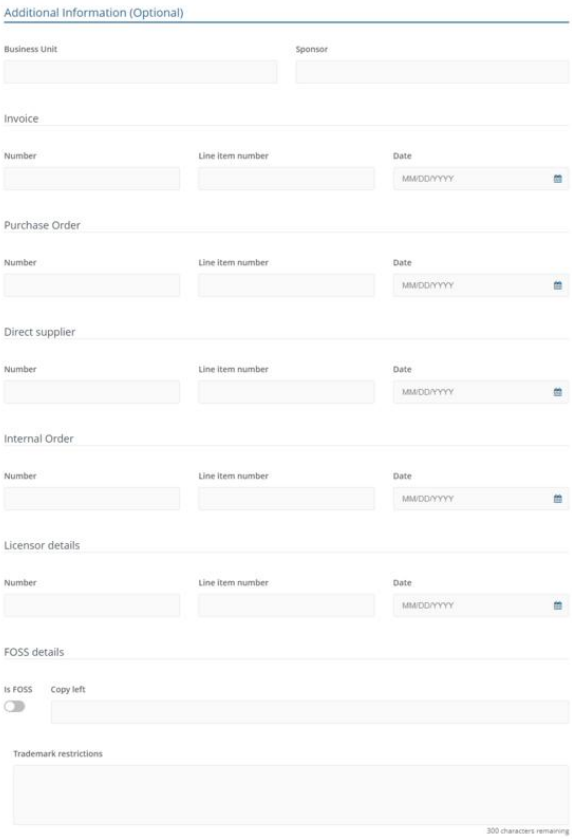
10.6.5.1.2.1.7 Additional information (Optional)

This section lets you enter additional information related to the entitlement that may come from a Vendor agreement or contract.

Sub-Section	Field	Field Details
	Business Unit	Specifies the Business Unit the agreement will be applied to. This may correspond to your management groups, depending on how you have those configured.
Sponsor	Name of the person who manages the budget associated with an agreement (this field is likely to be used only on agreements, but could be extended to other entitlements)	
Invoice	Number	The invoice number, usually specified in the customer contract.
Line Item Number	This optionally identifies the line number (if provided) on the customer contract that pertains to the invoice.	
Date	The date for the invoice.	
Purchase Order	Number	The purchase order number, usually specified in the customer contract.

Sub-Section	Field	Field Details
Line Item Number	This optionally identifies the line number (if provided) on the customer contract that pertains to the purchase order.	
Date	The date for the purchase order.	
Direct Supplier	Number	The number that identifies the direct supplier. For example, in some organizations this may be the same as the contract number.
Line Item Number	This optionally identifies the line number (if provided) on the contract that pertains to the direct supplier.	
Date	The date for the contract.	
Internal Order	Number	The ITARS or similar internal identifier for the order as specified in the customer contract.
Line Item Number	This optionally identifies the line number(if provided)on the contract that pertains to the internal order.	
Date	The date for the contract.	
Licensor Details	Number	The number (or name) of the licensor, could be the vendor or a VAR.
Line Item Number	This is intended as a reference to a licensor source other than an invoice, e.g. to an on-line portal of license purchases.	
Date	The date for the contract.	
FOSS Details	IsFoss	This value is true only if the granted rights fulfill the

Sub-Section	Field	Field Details
		requirements of both definition of the Free software maintained by the Free Software Foundation.
Copy Left	This value provides information on whether derivative works (which are always allowed for open source software) are themselves required to be open source software. There are three allowed values: “strong” means that all kinds of derivative works are required to be open source software themselves, “no” means that for all kinds of derivative works, it is allowed to distribute the derivative work as proprietary software. The intermediate value of “weak” means that there are some restrictions and the details are to be checked in the license.	
Trademark restrictions	FOSS trademark restrictions.	



10.6.5.1.2.2 New Maintenance page

A description of the fields in each section of the **Create Maintenance** page. This also covers the **Edit Maintenance** page.

A Maintenance entitlement type in AppClarity specifies the rights and limitations for an organization to install and/or use updated versions of software defined in a license. For example you could specify a maintenance entitlement for Microsoft Visio 2016 to cover all new versions from the current date for the next 3 years.

The sections on the **New Maintenance** or **Edit Maintenance** page are:

The Summary panel

Basic Information

Product

Coverage

Entitlement Term

Rights

Costs

Entitlement Links

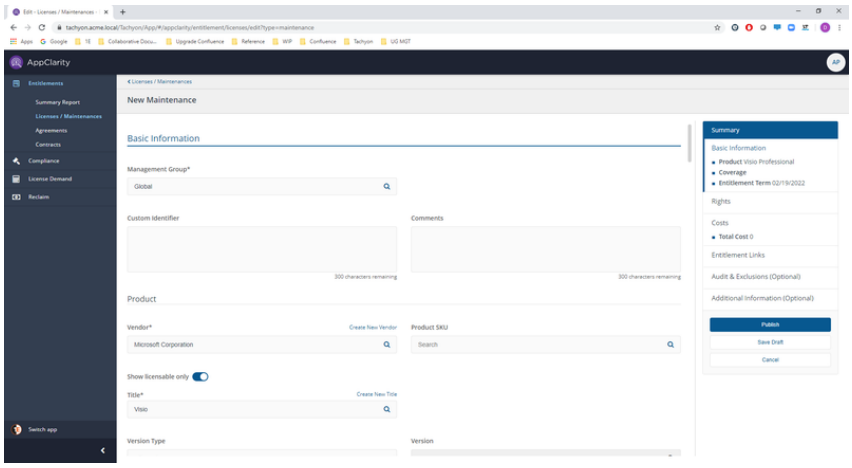
Parent

Associations

Children

Audit & Exclusions (Optional)

Additional information (Optional)



10.6.5.1.2.2.1 The Summary panel

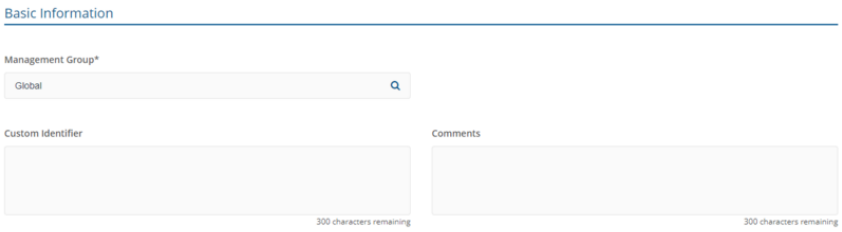
The Summary panel on the right-hand side of the entitlement displays a summary of the settings that have been made in the entitlement so far. It's always visible on screen and can be used to navigate between the various sections of the entitlement.

The panel also contains the following buttons:

Button	Description
Publish	Publishes the entitlement so it becomes active.
Save Draft	Saves the current settings in the entitlement to a draft. This can be used to save edits if you are part way through creating or making changes to the entitlement. It can also be used to inactivate an entitlement by removing its published status.
Cancel	Cancels the current edits and closes the page.

10.6.5.1.2.2.2 Basic Information

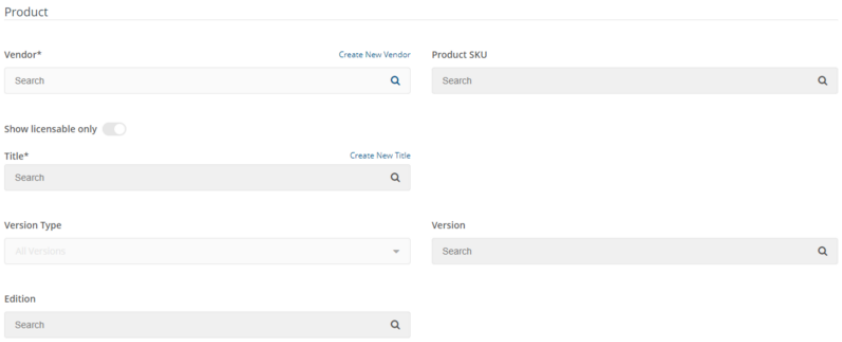
This section deals with the basic information for the entitlement, such as details of the product, the coverage and term of the entitlement.



Field	Details
Management Group*	Here you can associate the entitlement with Management Group of your choice.
Custom Identifier	An optional field. You can specify any alpha-numeric value to help identify the entitlement in the**Draft**and**Published**pages and when linking to other entitlements.
Comments	Enter text here to store any comments you have related to the entitlement.

10.6.5.1.2.2.2.1 Product

This sub-section defines the product covered by the entitlement.

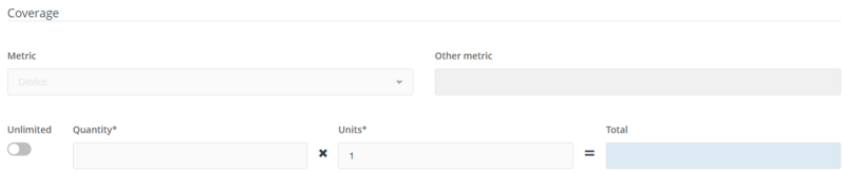


Field	Details
Vendor*	Defines the vendor of the product the license will apply to.The vendor part of the vendor, title, version and edition for a product. This must be filled out before any other fields. Suggested suitable vendors that match your text are displayed as you type into the field, which you can select to auto-complete the entry.
Product SKU	Suggested matching SKU are displayed as you type into the field, which you can select to auto-complete the entry. When you select a SKU other fields in the license will be automatically prefilled. For example, selecting the SKU for a particular edition of Microsoft Office 365 may set the **License Type** to **Subscription**, the **Product title** to **Office 365** and the

Field	Details
	Edition to **ProPlus**. These fields will then be fixed as they are derived from the SKU and not entered by hand.
Show licensable only	This toggle, which is on by default, sets whether the matches from 1E Catalog are filtered to show only products that are marked as licensable - and therefore appropriate for entitlements. You can flip this to off, if the product you are looking for is not visible and you're not sure if it's licensable or not, to see the unfiltered list of product related information from 1E Catalog.
Title*	Defines the title of the product the license will apply to. This is a mandatory field.The title part of the vendor, title, version and edition for a product. Suggested suitable titles from the selected vendor that match your text are displayed as you type into the field, which you can select to auto-complete the entry.
Version Type	**All Versions**, **Dot Format**,or **Colloquial**. By default this is set to**All Versions**.
Version	Defines the version of the product the license will apply to.The version part of the vendor, title, version and edition for a product. The Version format is dependent on the chosen **Version Type**. This field is disabled for a **Version Type** of **All Versions.**
Edition	Defines the edition of the product the license will apply to.The edition part of the vendor, title, version and edition for a product. Suggested suitable editions for the selected vendor and title that match your text are displayed as you type into the field, which you can select to auto-complete the entry.

10.6.5.1.2.2.2.2 Coverage

This sub-section defines the coverage details for the entitlement, such as: the metric that will be used for the entitlement and the number of installations the entitlement covers, i.e. whether the entitlement is unlimited or defined by a specific quantity of units.



Field	Details
Metric	The metric type for a license or maintenance entitlement. This may be one of:

Type	Description
Core	The metric for the license is related to the number of cores present on a device. For example, licenses for **Microsoft SQL database** are related to the number of cores on the server where **Microsoft SQL** is installed.
Device	The metric for the license is for devices. For example licenses for **Microsoft Visio** are on a per device basis. This is the default type.
Other	This can be used to reference your own license metric type.
Processor	The metric for the license is related to the number of processors for a device. For example, licenses for certain **Oracle** products are related to the number of processors on the server where the **Oracle** product is installed.
PVU	The metric for the license is related to the Processor Value Unit present on a device. For example. licenses for **IBM** products are related to the **Processor Value Unit (PVU)** for the device where the IBM product is installed.
User	The metric for the license is related to the users for the product. For example, **Microsoft Office 365** licenses are related to users and not the devices the software is running on.

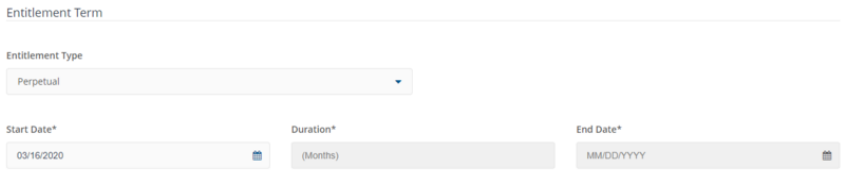
The **Metric** works with the **Quantity** field to determine how licenses are applied.

Other metric	This field is enabled if the Metric field is set to Other and allows you to specify an entitlement metric that is not covered by default in AppClarity. This field is only enabled if **Other** is selected in the **Metric Type** for entitlements and allows you to enter a metric that is not covered by the basic **Metric Type** options.
Unlimited	If you set the**Unlimited**toggle to on, this entitlement will cover all installations and the**Quantity**and **Units** fields will be disabled.

Field	Details
Quantity	Sets the number of licenses bought for this entitlement. Only enabled if the **Unlimited** toggle is set to off, in which case this field is also mandatory.
Units	Sets the number of units per licenses purchased. Only enabled if the**Unlimited**toggle is set to off, in which case this field is also mandatory.
Total	The total number of licenses, which is the Quantity value times the Units value. AppClarity will count each unit in the **Total** field against a single unit of the given **Metric** type. So if the **Metric** type is **Device** and the **Total** calculates to **50** this will count against **50** devices. For an SQL Server Enterprise example the **Metric** type would be **Core** so this will count against **50** cores.

10.6.5.1.2.2.3 Entitlement Term

This sub-section defines the type and length details for the entitlement, such as: the start date and the duration and end date.

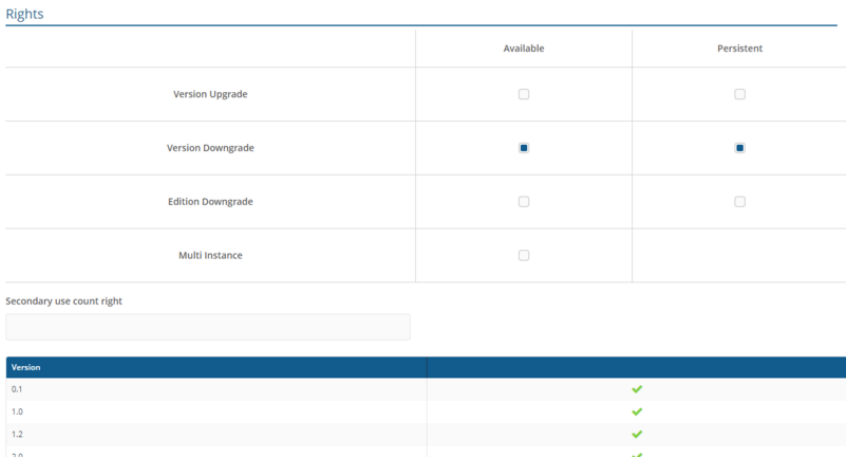


Field	Details
Entitlement Type	For License entitlements this can be set to **Perpetual** or **Subscription**. By default this is set to **Perpetual**. For Maintenance entitlements this can only be set to **Subscription**.
Start Date*	When the entitlement starts applying. This defaults to the date the entitlement was created.
Duration*	The **Duration** and **End Date** fields are only enabled for **Subscription** entitlements. If you set the **Duration** the **End Date** is calculated. If you set the **End Date** the **Duration** is calculated. These fields determine how long the entitlement is applicable for after start date.

Field	Details
	The **Duration** is set in terms of months and determines the number of months the entitlement will be valid for.
End Date*	The **Duration** and **End Date** fields are only enabled for **Subscription** entitlements. If you set the **Duration** the **End Date** is calculated. If you set the **End Date** the **Duration** is calculated. These fields determine how long the entitlement is applicable for after start date. The **End Date** indicates the last date the entitlement will be valid until and is set using a date picker.

10.6.5.1.2.2.3 Rights

This section lets you control how the entitlement applies to existing versions of the product it's related to.

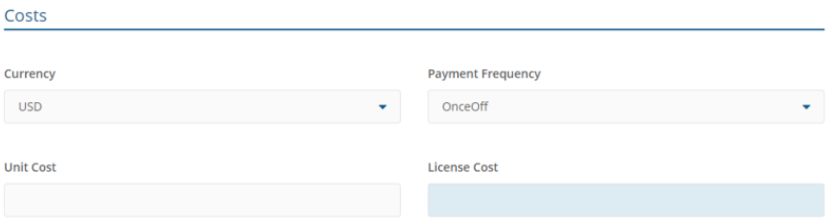


Field	Details
Version Upgrade	Rights to check if the entitlement is also applicable on higher versions of selected version
Version Downgrade	Rights to check if the entitlement is also applicable on lower versions of selected version. By default it is true
Edition Downgrade	Rights to check if the entitlement is also applicable on lower editions of selected edition

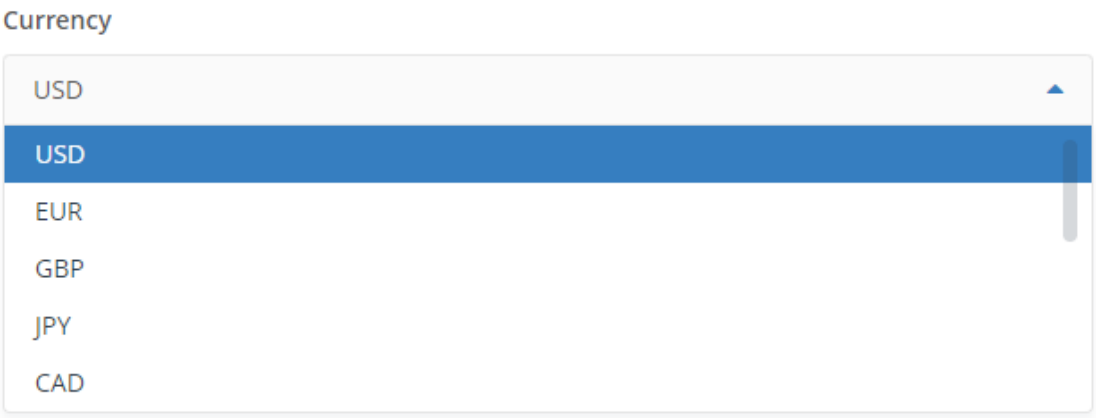
Field	Details
Multi Instance	Rights to check if the same license is also applicable on multiple installations on same device
Secondary use count right	The available count of secondary uses
Versions covered	The table below the fields shows the overall versions and editions covered by the entitlement based on the selected rights.

10.6.5.1.2.2.4 Costs

This section lets you control how the entitlement is costed and how it can be considered within the overall spend.



Field	Details
Currency	The currency applied to the entitlement. Clicking on the Currency field displays a list of currencies to choose from.
Payment Frequency	**OnceOff, Monthly, Quarterly, Yearly**. The default is **OnceOff**.

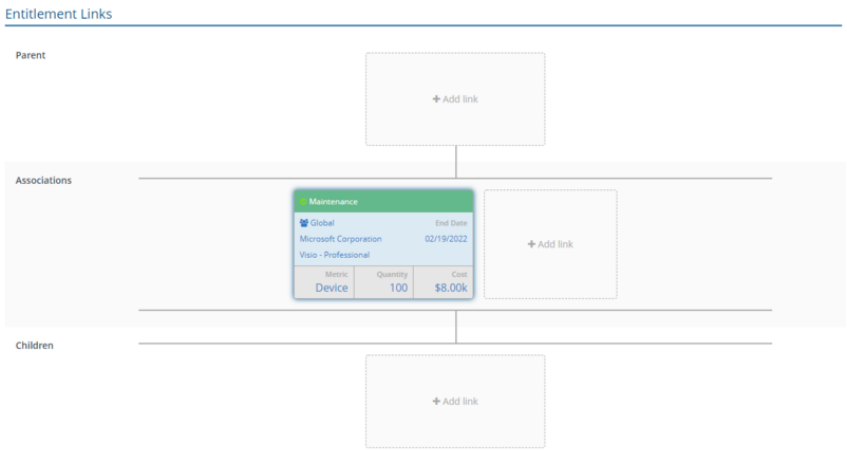


Field	Details
Unit Cost	The cost of the licence per unit, combined with the **Quantity** and **Unit Cost Type** values to calculate the license cost.
License Cost	This is calculated based on value filed in the **Quantity**, **Unit Cost** and **Payment Frequency**. This value only displays the cost and cannot be edited directly.

10.6.5.1.2.2.5 Entitlement Links

This section lets you create links between your entitlements. If you are creating a new entitlement this section will initially look like this:

After you have saved the entitlement this section provides an interface for linking it to other entitlements:

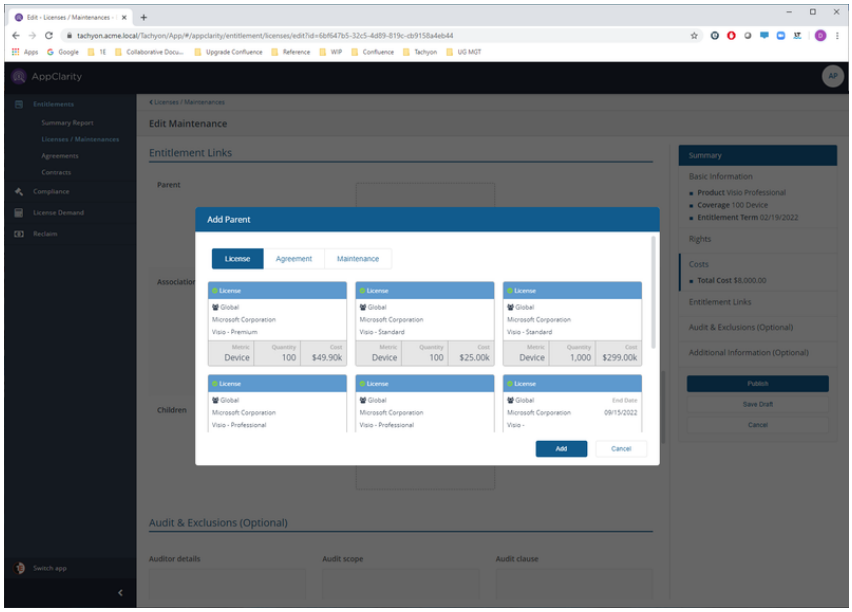


There are three sub-sections:

10.6.5.1.2.2.5.1 Parent

Here you can link a parent license, agreement or maintenance. Clicking on the **+Add link** area displays the **Add Parent** popup.

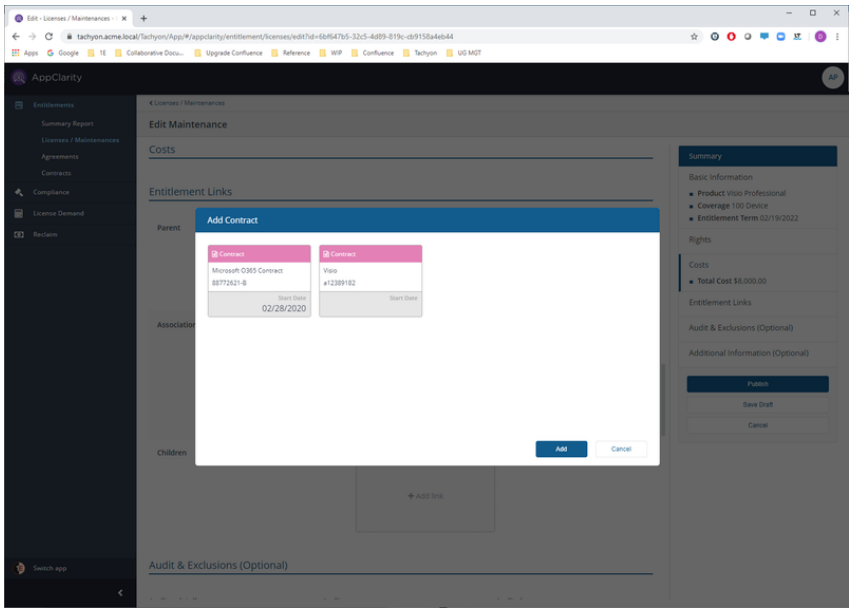
Select **License**, **Agreement** or **Maintenance** to add that type of link - a list of entitlements of the selected type will be displayed. Click on any of these and a green check mark will appear to indicate the selected parent, you can only select one. Once you've made your choice click the **Add** button to link the checked parent.



10.6.5.1.2.2.5.2 Associations

Here you can link contracts. Clicking on the **+Add link** area displays the **Add Contract** popup.

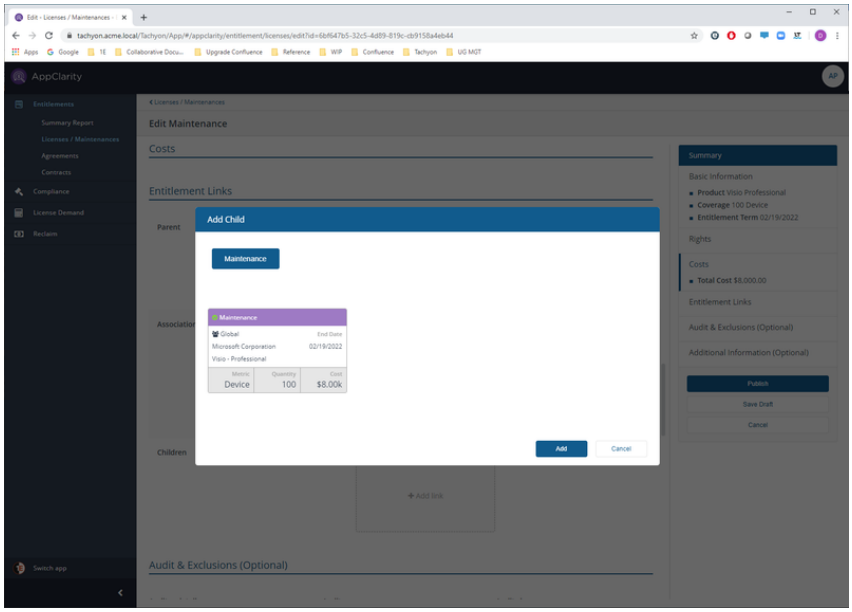
A list of contracts will be displayed. Click on any of these and a green check mark will appear to indicate the selected contract, you can select more than one contract to link. Once you've made your choice click the **Add** button to link the checked contract(s).



10.6.5.1.2.2.5.3 Children

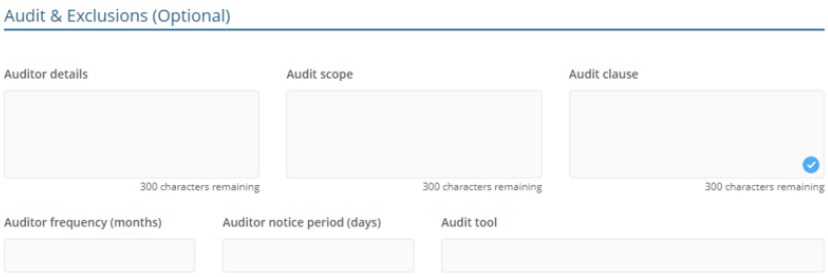
Here you can link child maintenances. Clicking on the **+Add link** area displays the **Add Child** popup.

A list of maintenance entitlements is displayed. Click on any of these and a green check mark will appear to indicate the selected child - you can select more than one child. Once you've made your choice click the **Add** button to link the checked children.



10.6.5.1.2.2.6 Audit & Exclusions (Optional)

This section lets you control how the entitlement is audited.



Field	Details
Auditor Details	Organizations that are allowed to perform the audit including (if appropriate), the licensor organization and any third-party organizations, according to what was agreed in the contract.
Audit Scope	Defines what part of the software customer organization is allowed to be audited.
Audit Clause	Provides additional information on what could trigger the audit.
Auditor Frequency	Definition of the highest agreed frequency of the audit expressed in months.

Field	Details
Auditor Notice period	Notice period in days.
Audit Tool	Name of the tool(s) which are approved for use in the audit.

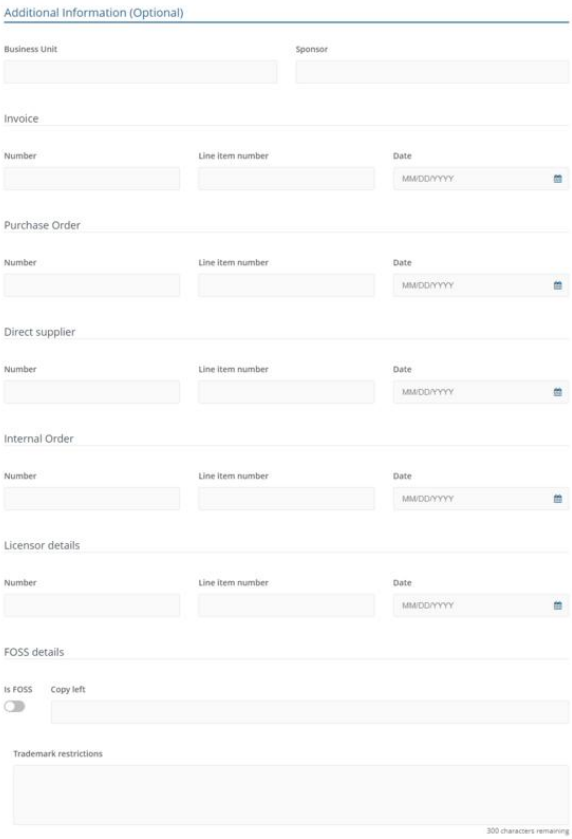
10.6.5.1.2.2.7 Additional information (Optional)

This section lets you enter additional information related to the entitlement that may come from a Vendor agreement or contract.

Sub-Section	Field	Field Details
	Business Unit	Specifies the Business Unit the agreement will be applied to. This may correspond to your management groups, depending on how you have those configured.
Sponsor	Name of the person who manages the budget associated with an agreement (this field is likely to be used only on agreements, but could be extended to other entitlements)	
Invoice	Number	The invoice number, usually specified in the customer contract.
Line Item Number	This optionally identifies the line number (if provided) on the customer contract that pertains to the invoice.	
Date	The date for the invoice.	
Purchase Order	Number	The purchase order number, usually specified in the customer contract.

Sub-Section	Field	Field Details
Line Item Number	This optionally identifies the line number (if provided) on the customer contract that pertains to the purchase order.	
Date	The date for the purchase order.	
Direct Supplier	Number	The number that identifies the direct supplier. For example, in some organizations this may be the same as the contract number.
Line Item Number	This optionally identifies the line number (if provided) on the contract that pertains to the direct supplier.	
Date	The date for the contract.	
Internal Order	Number	The ITARS or similar internal identifier for the order as specified in the customer contract.
Line Item Number	This optionally identifies the line number(if provided)on the contract that pertains to the internal order.	
Date	The date for the contract.	
Licensor Details	Number	The number (or name) of the licensor, could be the vendor or a VAR.
Line Item Number	This is intended as a reference to a licensor source other than an invoice, e.g. to an on-line portal of license purchases.	
Date	The date for the contract.	
FOSS Details	IsFoss	This value is true only if the granted rights fulfill the

Sub-Section	Field	Field Details
		requirements of both definition of the Free software maintained by the Free Software Foundation.
Copy Left	This value provides information on whether derivative works (which are always allowed for open source software) are themselves required to be open source software. There are three allowed values: “strong” means that all kinds of derivative works are required to be open source software themselves, “no” means that for all kinds of derivative works, it is allowed to distribute the derivative work as proprietary software. The intermediate value of “weak” means that there are some restrictions and the details are to be checked in the license.	
Trademark restrictions	FOSS trademark restrictions.	



10.6.5.1.3 Agreements page

A description of the fields on the **Agreements** page.

Here you can view, edit, copy, create, publish and delete agreements. You can also export all the agreements in the selected repository to a TSV file. You get to this page by clicking the **AppClarity→Entitlements→Agreements** node in the navigation panel.

The fields on the **Agreements** page are:

Report RefreshReport Refresh

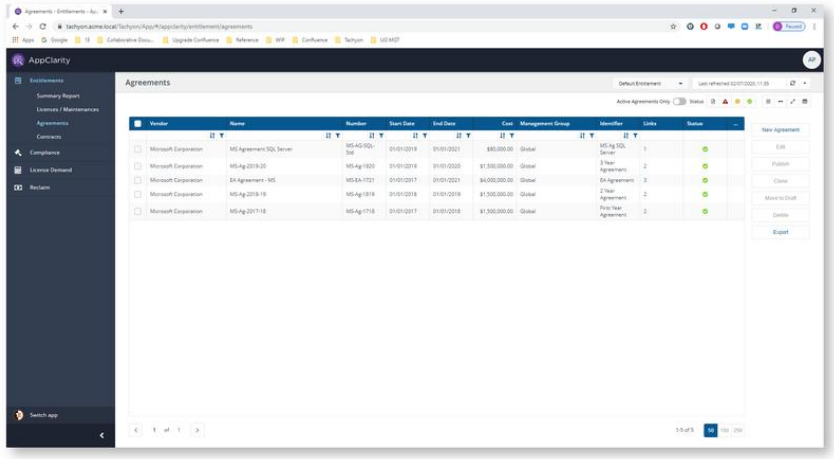
Move to Draft

Delete

Export



Field	Description
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box: Active Agreements only toggle	The **Active Agreements only** toggle adds a filter when it's turned on that filters the table to only display the agreements that have been published and not the ones that are in draft.
Status filters	The Status filters are displayed in the top-right of the page and let you filter the table according to the status of the items in the table. Clicking on an icon filters the table to display only items with that status, as described in the following table.
Column Picker	Where the column picker control is shown you can choose which columns are displayed. In the following example on the Microsoft Core License Demand page we hide the Unknown Installs column and move the License Demand column to the left of the page.To pick the displayed columns:Click on the Choose columns icon to the right of the header row to view the visable columns.To exclude Unknown Installs, select the Unknown Installs row and click Exclude columns button.The Unknown Installs column is now hidden.To move the License Demand column to the top of the list, hover your mouse over License Demand and using the direction control drag it to the top of the list.The Microsoft Core License Demand page has now been automatically updated with our changes.

Icon	Description
	Filters to show only items in Draft.
	Filters to show only items in Draft with errors.
	Filters to show only items in Draft with warnings.
	Filters to show only items that are Published.

Field	Description
Agreements table	The following table describes the columns displayed in the **Agreements** table:

Column	Description
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement or agreement is for. For example, **Microsoft Corporation** or **1E**. You can sort and filter on this column.
Name	The name used for the agreement. For example, you might want to define an agreement that covers all your Microsoft Office and related products, so you could name the agreement**Microsoft Office Agreement - 2018**. You can sort and filter on this column.
Number	Corresponds to the contract number, usually supplied on the customer contract. You can sort and filter on this column.
Start Date	When the agreement starts to be applicable. You can sort and filter on this column.
End Date	This is the last date the agreement is applicable until. You can sort and filter on this column.
Cost	The cost of the agreement as arranged with the Vendor. You can sort and filter on this column.
Management Group	Displays all of the management groups the software reclaim policy is associated with. You can sort and filter on this column.
Identifier	Displays the **Identifier** information configured for the entitlement or agreement.

Field	Description
	You can sort and filter on this column.
Links	Displays the **Parent**, **Associations** and **Children Links** to other entitlements, agreements or contracts configured for the entitlement or agreement.
Status	The icon indicates the status of the entitlement or agreement:

Icon	Description
	Draft.
	Draft with errors.
	Draft with warnings.
	Published.

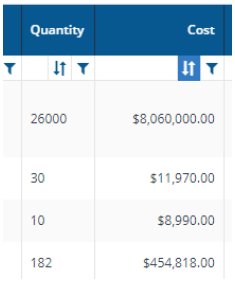
...

Column actions

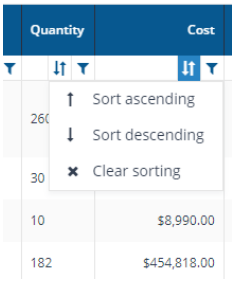
The following column actions are available on some columns in the table.

Column action	Description
Column sort	**Using column sorts** The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column: Click on the sort icon just beneath the header row in the **Cost** column.

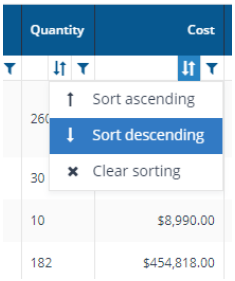
Field	Description



The sort popup is displayed.



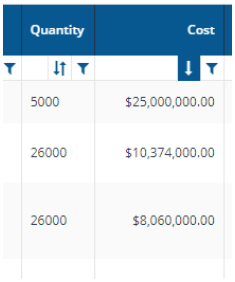
Now select the sort direction. In our example this will be **Sort descending**.



After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon

.

Field	Description



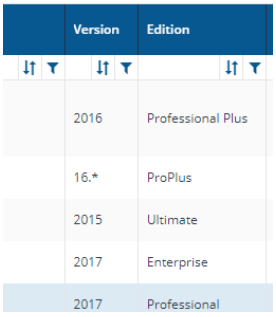
Clearing the sort

You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.

Column filter

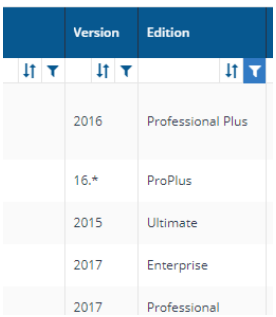
Using column filters

The picture opposite below an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.



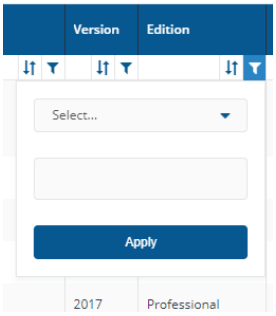
To filter the table on the **Edition** column:

Click on the filter icon just beneath the header row in the **Edition** column.

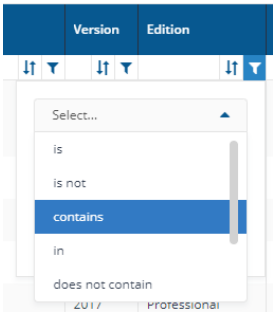


The filter popup is displayed.

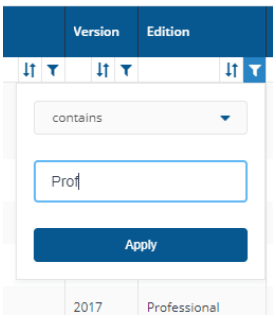
Field	Description



Now select the operator. In our example this will be **contains**.



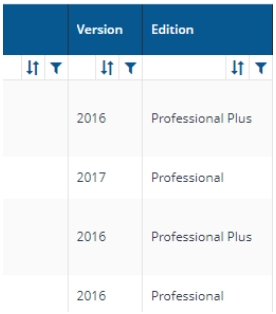
Then type the text **Prof** into the text field.



Click **Apply** and a new filter will be added to the table.

The table will be filtered to just those items whose **Edition** contains the text **Prof**.

Field	Description



Adding another filter

You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.

Removing filters

You can remove filters by clicking on the filter close icon at the end of the filter.

Action Buttons

The following table describes the action buttons displayed on the **Agreements** page.

Button	Description
New Agreement	Creates a new agreement. See New Agreement page for more details.
Edit	This button is only enabled when there is a single selection in the **Agreements** table. Edits the selected agreement and opens the **Edit Agreement** page. SeeNew Agreement pagefor more details.
Publish	This button is enabled when there is at least one selection in the **Agreements** table. Publishes the selected agreements.

Field	Description
Clone	This button is only enabled when there is a single selection in the **Agreements** table. Clones the selected agreement and opens the Edit License or Edit Maintenance page, depending on the type of the selected agreement, with a clone of the details from the agreement. SeeNew Agreement pagefor more details.
Move to Draft	This button is enabled when there is at least one selection in the **Agreements** table. Moves the selected agreements to Draft.
Delete	This button is enabled when there is at least one selection in the **Agreements** table. Deletes the selected agreements.
Export	Exports all the agreements currently displayed in the **Agreements** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.

10.6.5.1.3.1 New Agreement page

A description of the fields in each section of the **New Agreement** page. This also covers the **Edit Agreement** page.

An agreement entitlement type in AppClarity provides a structure to license and maintenance entitlements. Agreements can be used to model the contractual structure an organization uses for their purchasing process, or their internal software disbursement process.

The sections on the **New Agreement** or **Edit Agreement** page are:

The Summary panel

Basic Information

Particulars

Entitlement Term

Costs

Entitlement Links

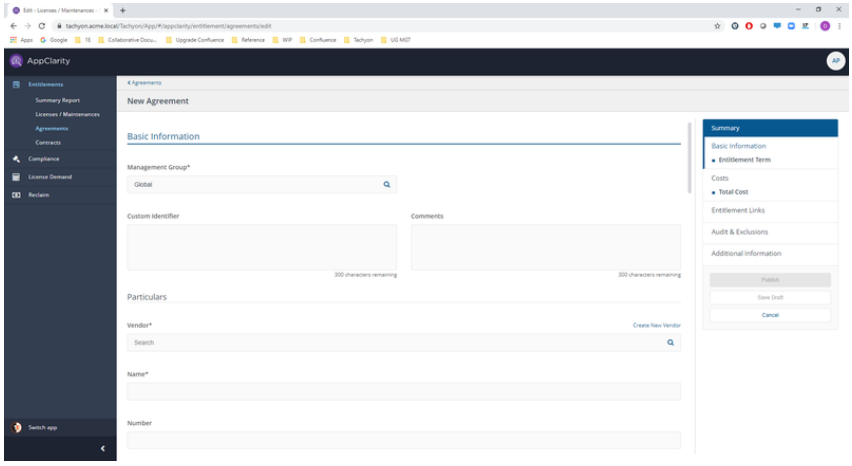
Parent

[Associations]

[Children]

[Audit & Exclusions]

[Additional information (Optional)]

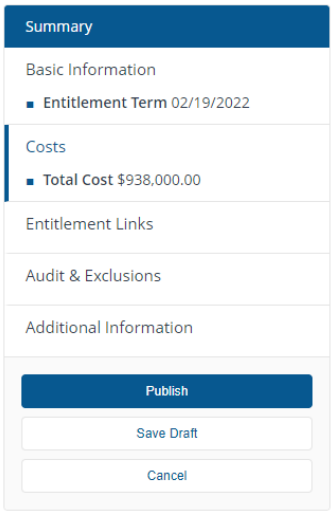


10.6.5.1.3.1.1 The Summary panel

The Summary panel on the right-hand side of the entitlement displays a summary of the settings that have been made in the entitlement so far. It's always visible on screen and can be used to navigate between the various sections of the entitlement.

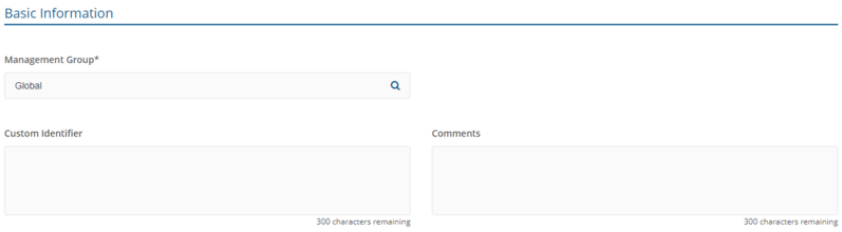
The panel also contains the following buttons:

Button	Description
Publish	Publishes the entitlement so it becomes active.
Save Draft	Saves the current settings in the entitlement to a draft. This can be used to save edits if you are part way through creating or making changes to the entitlement. It can also be used to inactivate an entitlement by removing its published status.
Cancel	Cancels the current edits and closes the page.



10.6.5.1.3.1.2 Basic Information

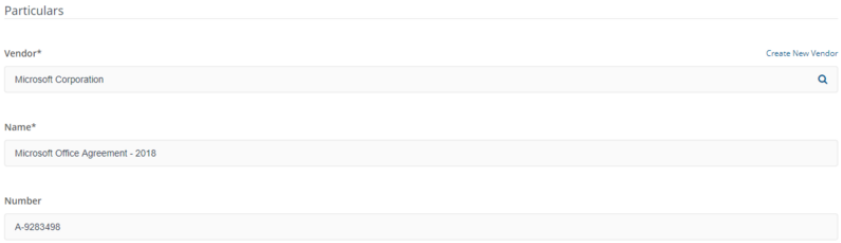
This section deals with the basic information for the entitlement, such as details of the product, the coverage and term of the entitlement.



Field	Details
Management Group*	Here you can associate the entitlement with Management Group of your choice.
Custom Identifier	An optional field. You can specify any alpha-numeric value to help identify the entitlement in the**Draft**and**Published**pages and when linking to other entitlements.
Comments	Enter text here to store any comments you have related to the entitlement.

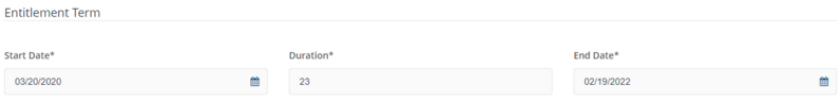
10.6.5.1.3.1.2.1 Particulars

This sub-section defines the basis of the agreement.



Field	Details
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement or agreement is for. For example, **Microsoft Corporation** or **1E**.In the **New Agreement** page this must be filled out before any other fields. Suggested suitable vendors that match your text are displayed as you type into the field, which you can select to auto-complete the entry.
Name	The name used for the agreement. For example, you might want to define an agreement that covers all your Microsoft Office and related products, so you could name the agreement**Microsoft Office Agreement - 2018**.
Number	Corresponds to the contract number, usually supplied on the customer contract.

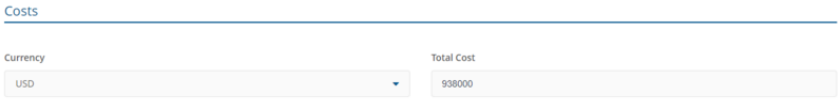
10.6.5.1.3.1.2.2 Entitlement Term



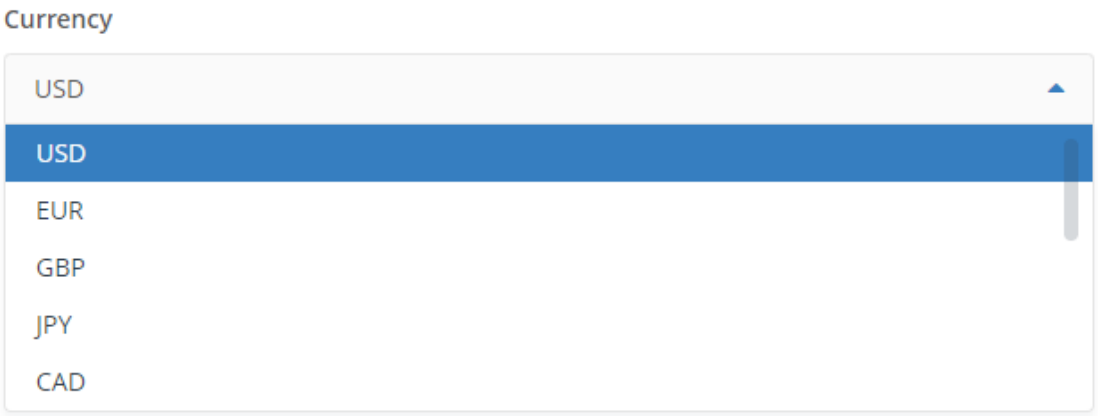
Field	Details
Start Date	When the agreement starts to be applicable.
Duration	How long in months the agreement is applicable for after the start date.Setting the **Duration** sets the **End Date**. Setting the **End Date** sets the **Duration**.
End Date	This is the last date the agreement is applicable until.Setting the **Duration** sets the **End Date**. Setting the **End Date** sets the **Duration**.

10.6.5.1.3.1.2.3 Costs

This section lets you control how the entitlement is costed and how it can be considered within the overall spend.



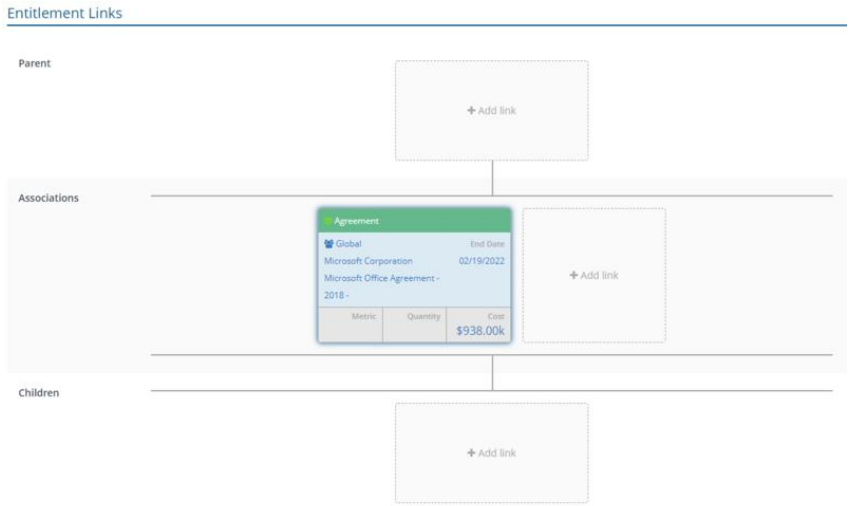
Field	Details
Currency	The currency applied to the entitlement. Clicking on the Currency field displays a list of currencies to choose from.
Total Cost	The cost of the agreement as arranged with the Vendor.Here you enter the total cost of the agreement corresponding with the currency field.



10.6.5.1.3.1.3 Entitlement Links

This section lets you create links between your entitlements. If you are creating a new entitlement this section will initially look like this:

After you have saved the entitlement this section provides an interface for linking it to other entitlements:

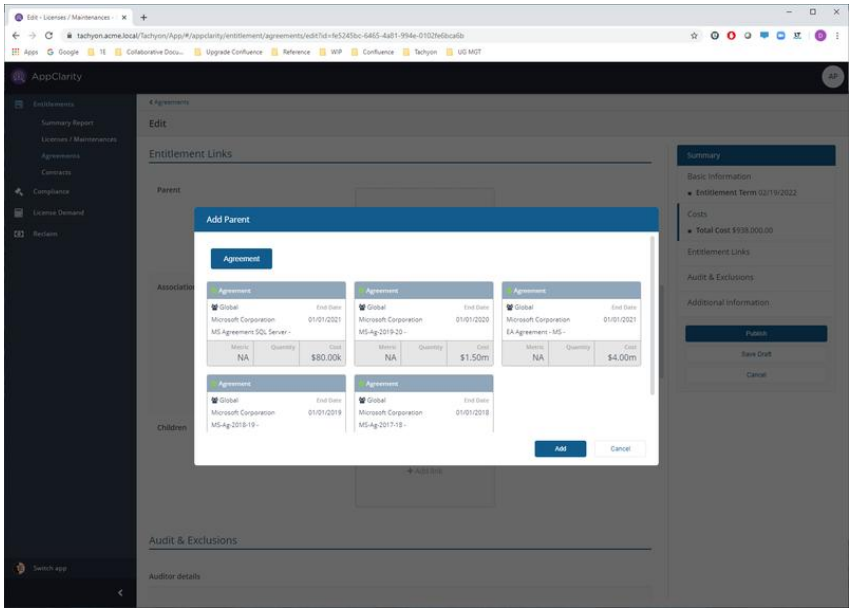


There are three sub-sections:

10.6.5.1.3.1.3.1 Parent

Here you can link parent agreements. Clicking on the **+Add link** area displays the **Add Parent** popup.

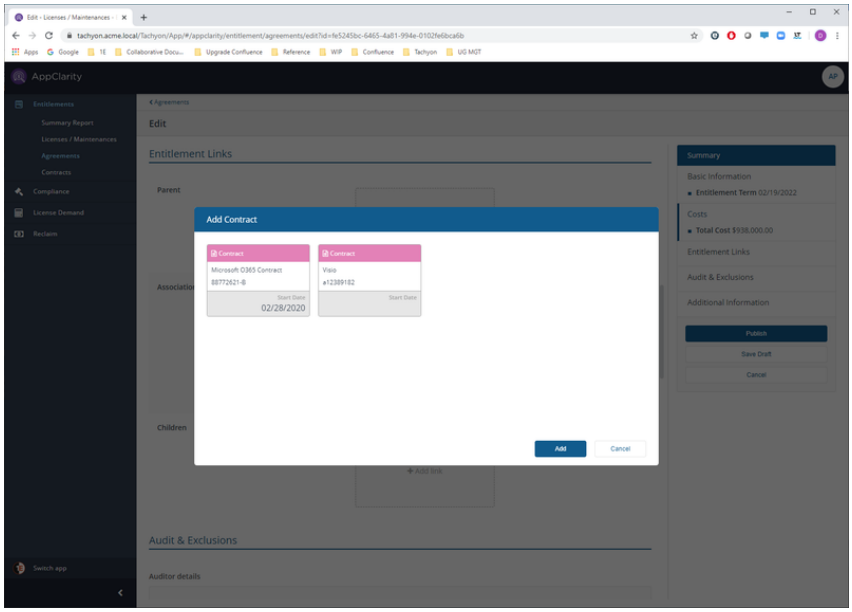
A list of agreement entitlements is displayed. Click on any of these and a green check mark will appear to indicate the selected parent, you can only select one. Once you've made your choice click the **Add** button to link the checked parent.



10.6.5.1.3.1.3.2 Associations

Here you can link contracts. Clicking on the **+Add link** area displays the **Add Contract** popup.

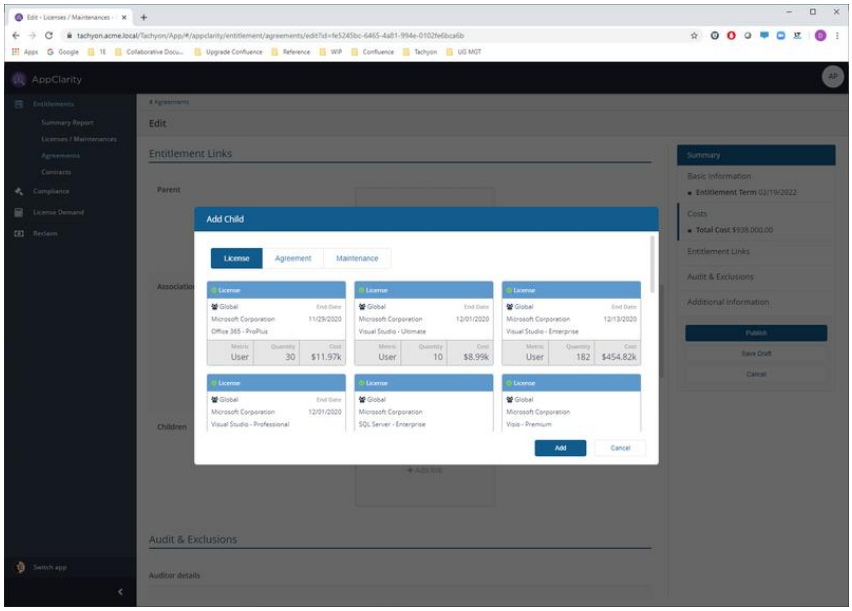
A list of contracts will be displayed. Click on any of these and a green check mark will appear to indicate the selected contract, you can select more than one contract to link. Once you've made your choice click the **Add** button to link the checked contract(s).



10.6.5.1.3.1.3.3 Children

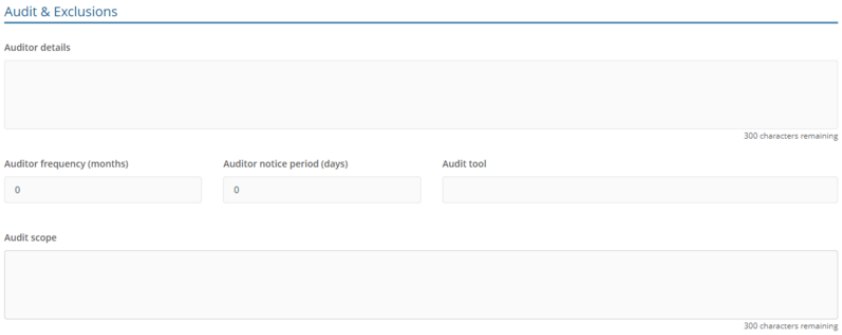
Here you can link child licenses, agreements or maintenances. Clicking on the **+Add link** area displays the **Add Child** popup.

Select **License**, **Agreement** or **Maintenance** to add that type of link, a list of entitlements of the selected type will be displayed. Click on any of these and a green check mark will appear to indicate the selected child - you can select more than one. Once you've made your choice click the **Add** button to link the checked children.



10.6.5.1.3.1.4 Audit & Exclusions

This section lets you control how the entitlement is audited.



Field	Details
Auditor Details	Organizations that are allowed to perform the audit including (if appropriate), the licensor organization and any third-party organizations, according to what was agreed in the contract.
Audit Clause	Provides additional information on what could trigger the audit.
Auditor Frequency	Definition of the highest agreed frequency of the audit expressed in months.
Auditor Notice period	Notice period in days.
Audit Tool	Name of the tool(s) which are approved for use in the audit.
Audit Scope	Defines what part of the software customer organization is allowed to be audited.

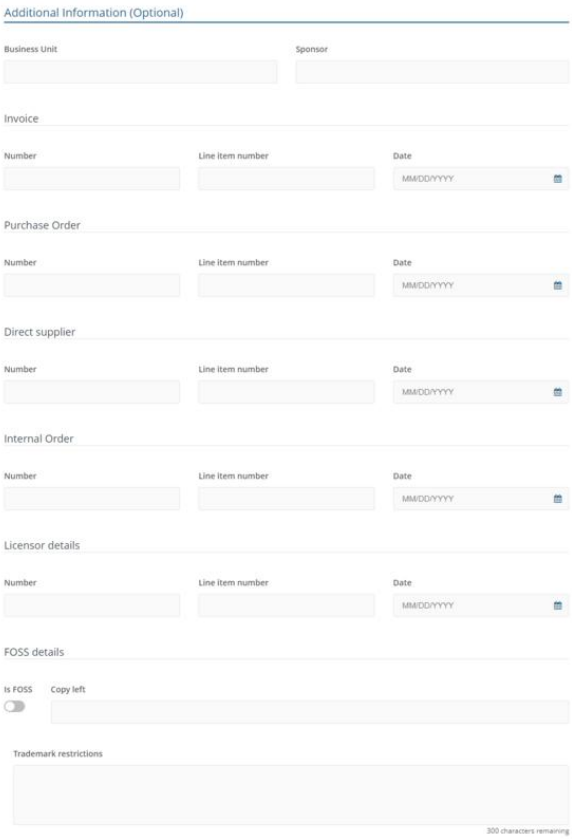
10.6.5.1.3.1.4.1 Additional information (Optional)

This section lets you enter additional information related to the entitlement that may come from a Vendor agreement or contract.

Sub-Section	Field	Field Details
	Business Unit	Specifies the Business Unit the agreement will be applied to. This may correspond to your management groups, depending on how you have those configured.

Sub-Section	Field	Field Details
Sponsor	Name of the person who manages the budget associated with an agreement (this field is likely to be used only on agreements, but could be extended to other entitlements)	
Invoice	Number	The invoice number, usually specified in the customer contract.
Line Item Number	This optionally identifies the line number (if provided) on the customer contract that pertains to the invoice.	
Date	The date for the invoice.	
Purchase Order	Number	The purchase order number, usually specified in the customer contract.
Line Item Number	This optionally identifies the line number (if provided) on the customer contract that pertains to the purchase order.	
Date	The date for the purchase order.	
Direct Supplier	Number	The number that identifies the direct supplier. For example, in some organizations this may be the same as the contract number.
Line Item Number	This optionally identifies the line number (if provided) on the contract that pertains to the direct supplier.	
Date	The date for the contract.	
Internal Order	Number	The ITARS or similar internal identifier for the order as

Sub-Section	Field	Field Details
		specified in the customer contract.
Line Item Number	This optionally identifies the line number(if provided)on the contract that pertains to the internal order.	
Date	The date for the contract.	
Licensor Details	Number	The number (or name) of the licensor, could be the vendor or a VAR.
Line Item Number	This is intended as a reference to a licensor source other than an invoice, e.g. to an on-line portal of license purchases.	
Date	The date for the contract.	
FOSS Details	IsFoss	This value is true only if the granted rights fulfill the requirements of both definition of the Free software maintained by the Free Software Foundation.
Copy Left	This value provides information on whether derivative works (which are always allowed for open source software) are themselves required to be open source software. There are three allowed values: “strong” means that all kinds of derivative works are required to be open source software themselves, “no” means that for all kinds of derivative works, it is allowed to distribute the derivative work as proprietary software. The intermediate value of “weak” means that there are some restrictions and the details are to be checked in the license.	
Trademark restrictions	FOSS trademark restrictions.	



10.6.5.1.4 Contracts page

A description of the fields on the **Contracts** page.

Here you can view, edit, and delete contracts. You can also export all the contracts in the selected repository to a TSV file. You get to this page by clicking the **AppClarity**→**Entitlements**→**Contracts** node in the navigation panel.

The fields on the **Contracts** page are:

Field	Description
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box:
Contracts table	The following table describes the columns displayed in the **Contracts** table:

Column	Description
Name	The vendor portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement or agreement is for. For example, **Microsoft Corporation** or **1E**. You can sort and filter on this column.

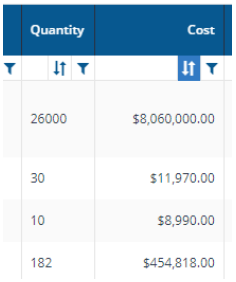
Field	Description
Number	An alpha-numeric string that identifies the contract. For example: **8877621-B** could be used to identify a particular contract, perhaps taken from a paper or emailed copy of the contract. You can filter on this column.
Start Date	The date when the contracts starts.
Technical Resource	The name of the person who knows the technical details behind licensing, or product information for an agreement (optional) This would likely be used only on agreements, but could be extended to individual entitlements.
Resource	Name of the person who manages the agreement This would likely be used only on agreements, but could be extended to individual entitlements.
Links	Identifies the number of times the contract has been linked to from other entitlements or agreements.
...	

Column actions

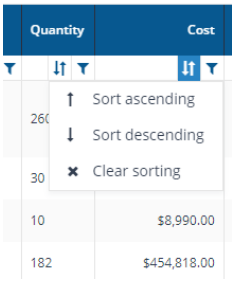
The following column actions are available on some columns in the table.

Column action	Description
Column sort	**Using column sorts** The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column: Click on the sort icon ⇅ just beneath the header row in the **Cost** column.

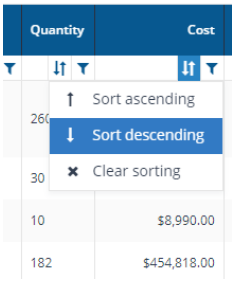
Field	Description



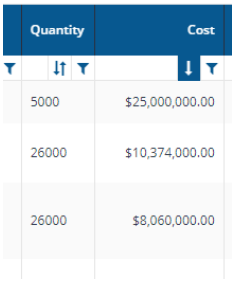
The sort popup is displayed.



Now select the sort direction. In our example this will be **Sort descending**.

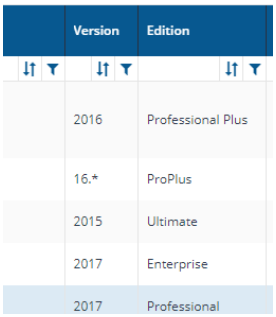


After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon



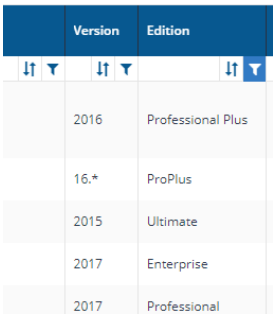
Clearing the sort

Field	Description
	You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.
Column filter	**Using column filters** The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.

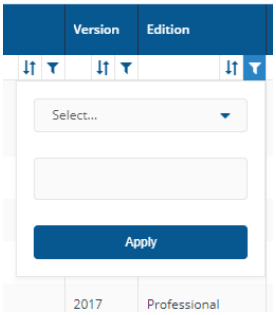


To filter the table on the **Edition** column:

Click on the filter icon just beneath the header row in the **Edition** column.

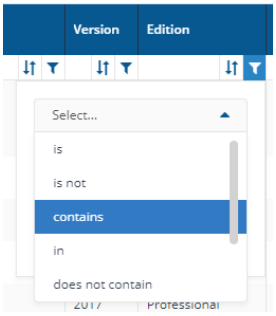


The filter popup is displayed.

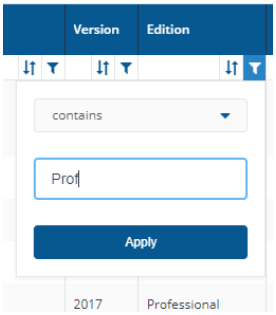


Now select the operator. In our example this will be **contains**.

Field	Description

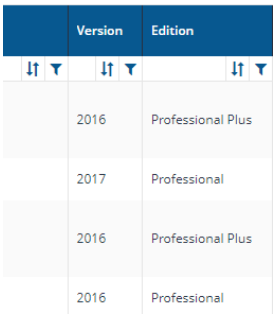


Then type the text **Prof** into the text field.



Click **Apply** and a new filter will be added to the table.

The table will be filtered to just those items whose **Edition** contains the text **Prof**.

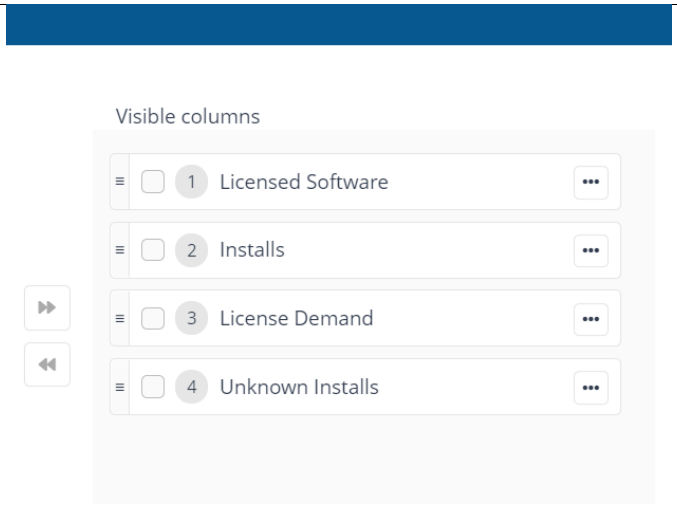


Adding another filter

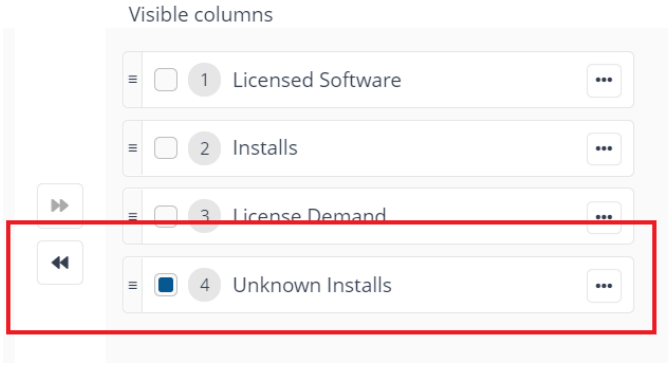
You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.

Field	Description
	Removing filters You can remove filters by clicking on the filter close icon at the end of the filter.
Column Picker	Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.  To pick the displayed columns: Click on the Choose columns icon o the right of the header row to view the visable columns.

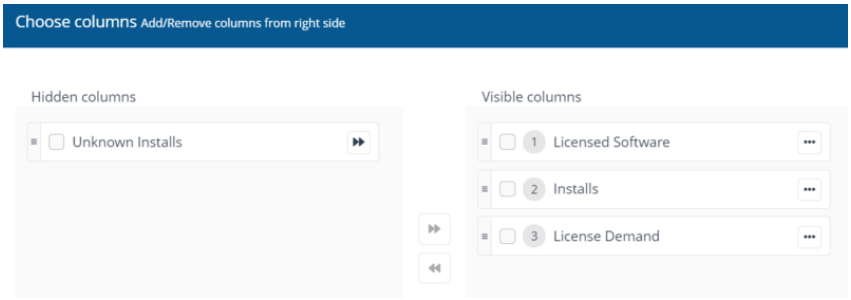
Field	Description



To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.

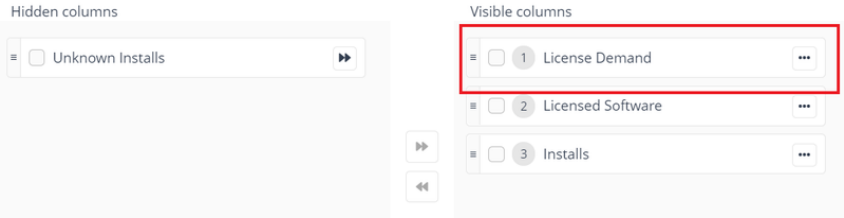


The **Unknown Installs** column is now hidden.



To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.

Field	Description



The Microsoft Core License Demand page has now been automatically updated with our changes.

License Demand	Licensed Software	Installs
2748	Windows Server DataCenter	647
2337	SQL Server Enterprise	649
0	SQL Server Analysis Services	0
0	SQL Server Integration Services	0
1338	SQL Server Standard	300
0	SQL Server Reporting Services	0
4176	Windows Server Enterprise	265
444672	Windows Server Standard	4019
0	SQL Server Data Quality Services	0

Action Buttons

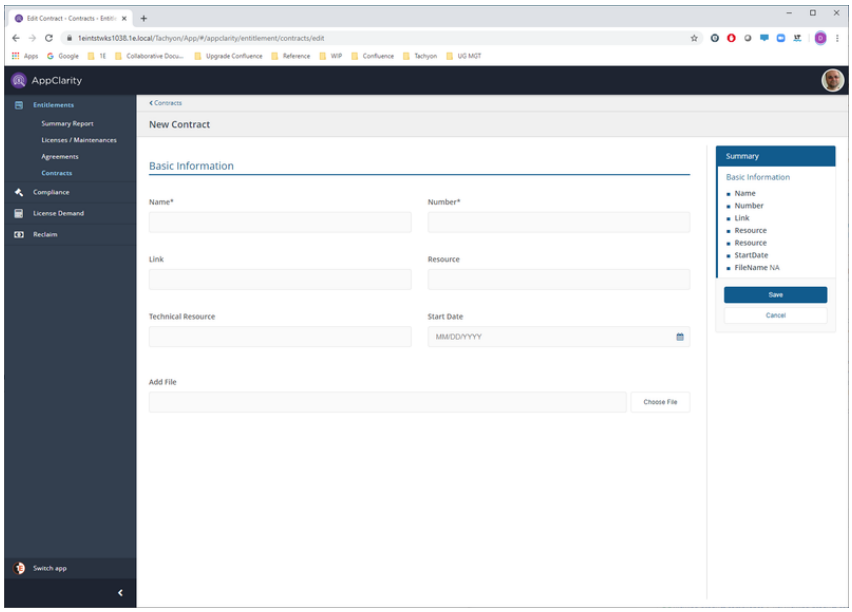
The following table describes the action buttons displayed on the **Contracts** page.

Button	Description
New Contract	Creates a new contract. Please refer to New Contract page for more details.
Edit	This button is only enabled when there is a single selection in the **Contracts** table. Edits the selected contract and opens the **Edit Contract** page. Please refer to New Contract page for more details.
Delete	This button is enabled when there is at least one selection in the **Contracts** table. Deletes the selected contracts.
Export	Exports all the contracts currently displayed in the **Contracts** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.

10.6.5.1.4.1 New Contract page

A description of the fields on the**Create Contract**page. This also covers the **Edit Contract** page.

A contract entitlement type in AppClarity represents the evidence or proof that the license exists and is genuine. It is an artifact that can be virtually anything - it may be a scan of the signed contract for an enterprise agreement, for example, or it could be a PDF of the use rights for the software. Essentially the contract is where you will link file details that describe the specifics of an agreement.



10.6.5.1.4.1.1 The Summary panel

The Summary panel on the right-hand side displays a summary of the settings that have been made in the contract so far.

The panel also contains the following buttons:

Button	Description
Save	Saves the contract so it becomes available for linking to entitlements.
Cancel	Cancels the current edits and closes the page.

10.6.5.1.4.1.2 Basic Information

The following fields are available on the **New Contract** page.

Field	Details
Name	Name of the contract. For example: **Microsoft O365 Contract**.
Number	An alpha-numeric string that identifies the contract. For example: **8877621-B** could be used to identify a particular contract, perhaps taken from a paper or

Field	Details
	emailed copy of the contract.You should ensure that the combination of the **Name** and **Number** is unique.
Link	A link to an online contract.
Resource	Name of the person who manages the agreement This would likely be used only on agreements, but could be extended to individual entitlements.
Technical Resource	The name of the person who knows the technical details behind licensing, or product information for an agreement (optional) This would likely be used only on agreements, but could be extended to individual entitlements.
Start Date	The date when the contracts starts.You can select the date using the date picker.
Add File	The file attachment. This field displays the attachment after it has been selected using the **Choose File** button.
Choose File	Clicking this button displays a file **Open** dialog where you can browse to find any attachment that you want to add to the contract.

10.6.5.2 Compliance

A reference for the fields and tables on the pages under the **Compliance** node in the **AppClarity** section of the SLA Platform.

10.6.5.2.1 License Summary page

A description of the fields on the **License Summary** page.

Here you can view your License Summary. You get to this page by clicking the **AppClarity→Compliance→License Summary** node in the navigation panel.

The fields on the **License Summary** page are:

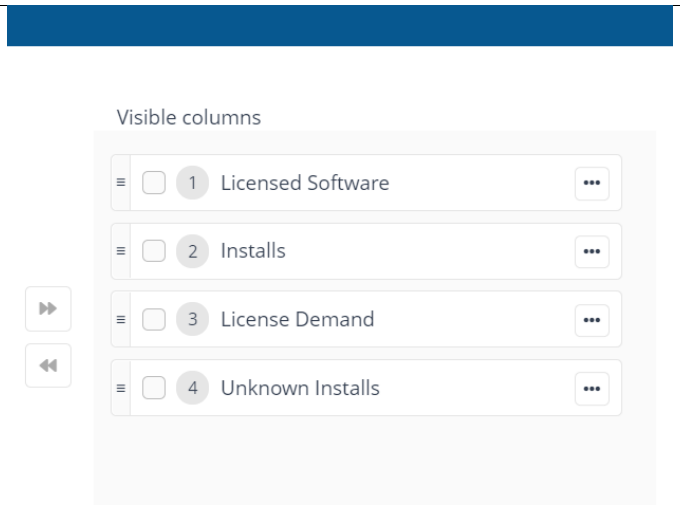
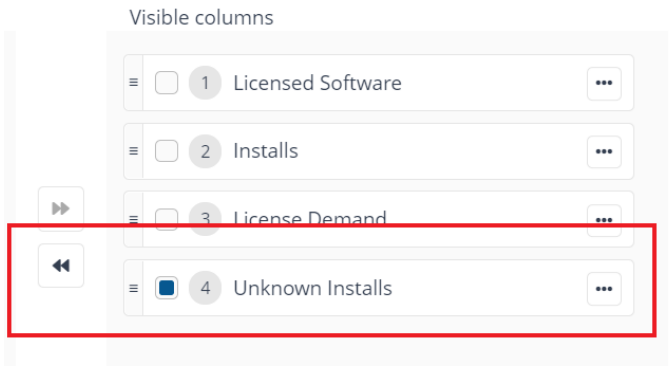
Field	Description
Management group selector	Certain pages in AppClarity have a management groups selector. This drop-down lets you select the management group you are interested in. By default this is set to **Global**.
Compliance repository selector	This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to **Default Compliance**.

Field	Description
	If you have created your own compliance repositories, click on the name to select these from the drop-down list.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box:
Column Picker	Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.  To pick the displayed columns: Click on the Choose columns icon to the right of the header row to view the visible columns.

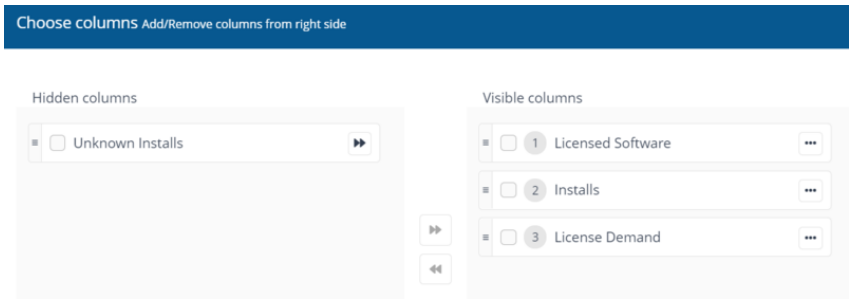
Field	Description



To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.

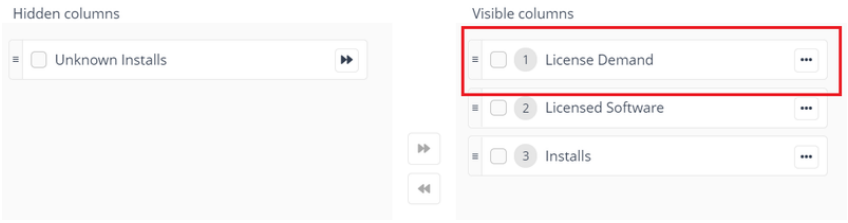


The **Unknown Installs** column is now hidden.



To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.

Field	Description



The Microsoft Core License Demand page has now been automatically updated with our changes.

License Demand	Licensed Software	Installs
2748	Windows Server DataCenter	647
2337	SQL Server Enterprise	649
0	SQL Server Analysis Services	0
0	SQL Server Integration Services	0
1338	SQL Server Standard	300
0	SQL Server Reporting Services	0
4176	Windows Server Enterprise	265
444672	Windows Server Standard	4019
0	SQL Server Data Quality Services	0

Action Buttons

The following table describes the action buttons displayed on the **License Summary** page:

Button	Description
Add License	This button is only enabled when there is a single selection in the **License Summary** table. Creates a new license for the selected product and opens the New License page with the details of the product pre-filled. Please refer to New License page for more details.
Add Reclaim Policy	This button is only enabled when there is a single selection in the **License Summary** table. Creates a new reclaim policy for the selected product and opens the New Policy page with the details of the product pre-filled. Please refer to <New Policy page placeholder> for more details.
Export	Exports all the entitlements currently displayed in the **License Summary** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.

Field	Description
License Summary table	The following table describes the columns displayed in the **License Summary** table:

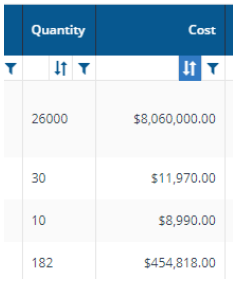
Column	Description
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Microsoft Corporation** or **1E**.
Title	The title portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Visio** or **Nomad**.
Total Installs	This column provides a total count of the installations for the product. This may be different from the **Total Devices** column as some software, such as Microsoft SQL Server, may be installed more than once on a device.
Total Devices	This column provides a total count of the devices where the product is installed. This may be different from the **Total Installs** column as some software may be installed more than once on a device.
Total Users	This column provides the total users accessing the software across all these devices.
Compliance Category	This column displays a compliance status bar for each product.  This bar displays a summary of the compliance status for the product installations in the selected compliance repository, taking into account any entitlements you have added. Hovering over the bar displays a summary of the compliance breakdown for the product. This is divided into **Compliant**, **Non-compliant** and **Exempt** installations.

Field	Description
	Clicking on the bar displays the Summary by Installs page for the selected product.
Unknown Installs	This column provides a count of the installations for the product where there are details that are unknown, thereby implying a risk for compliance calculation.
Underutilized Installs	This column provides a count of the installations for the product where the product is rarely used or unused.
Licenses Applied	This column provides a count of the licenses that have been applied to the product. If this number is greater than zero it becomes a link to the Licenses / Maintenances page filtered to show the applied licenses.
Reclaim Policies	This column provides a count of the reclaim policies that have been associated with the product. If this number is greater than zero it becomes a link to the filtered to show the associated reclaim policies.

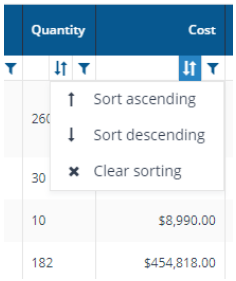
The following column actions are available on some table columns.

Column actions	Description
Column sort	**Using column sorts** The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column: Click on the sort icon ⇅ just beneath the header row in the **Cost** column.

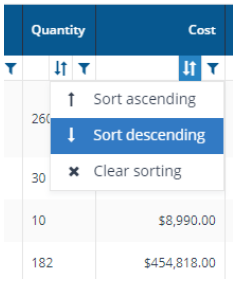
Field	Description



The sort popup is displayed.



Now select the sort direction. In our example this will be **Sort descending**.



After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon

.

Field	Description

Quantity	Cost
5000	$25,000,000.00
26000	$10,374,000.00
26000	$8,060,000.00

Clearing the sort

You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.

Column filter

Using column filters

The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.

Version	Edition
2016	Professional Plus
16.*	ProPlus
2015	Ultimate
2017	Enterprise
2017	Professional

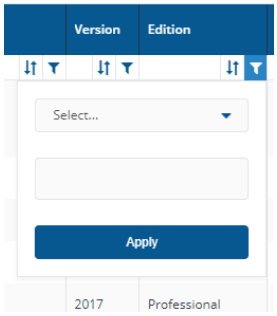
To filter the table on the **Edition** column:

Click on the filter icon just beneath the header row in the **Edition** column.

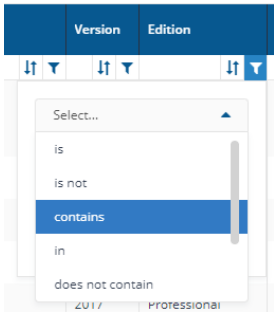
Version	Edition
2016	Professional Plus
16.*	ProPlus
2015	Ultimate
2017	Enterprise
2017	Professional

The filter popup is displayed.

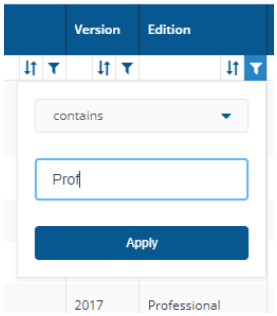
Field	Description



Now select the operator. In our example this will be **contains**.



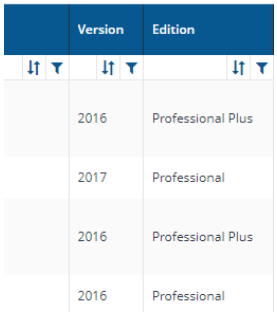
Then type the text **Prof** into the text field.



Click **Apply** and a new filter will be added to the table.

The table will be filtered to just those items whose **Edition** contains the text **Prof**.

Field	Description



Adding another filter

You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.

Removing filters

You can remove filters by clicking on the filter close icon at the end of the filter.

10.6.5.2.1.1 Summary by Installs page

A description of the fields on the **Summary by Installs** page.

Here you can view summary and detailed information for the installations of a selected product. You get to this page by clicking the Compliance Category bar for a product on the License Summary page.

The fields on the **Summary by Installs** page are:

Field	Description
Management Group Selector	Certain pages in AppClarity have a management groups selector. This drop-down lets you select the management group you are interested in. By default this is set to **Global**.
Repository Selector	This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to **Default Compliance**. If you have created your own compliance repositories, click on the name to select these from the drop-down list.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box:
Edition Table	The following table shows the column headings in the **Edition** table:

Column	Description
Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify which software product the compliance status relates to.
Compliant	This column provides a count of the compliant installations for the product. When the number is not zero this is a link to a list of devices where the product is installed.

Field	Description	
	Non-Compliant	This column provides a count of the non-compliant installations for the product.
	Exempted	This column provides a count of the exempted installations that are associated with an exemption management group. Please refer to Excluding devices from License Demand Calculation using Management Groups for more details.
	Unknown	This column provides a count of the installations for the product where there are details that are unknown, thereby implying a risk for compliance calculation.

Device Summary Table

The following table shows the column headings in the **Device Summary** table:

Column	Description
Licensed Software	The title portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Visio** or **Nomad**. You can sort on this column.
Licensed Version	The version portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **11.0.3216.5614** or **6.3.100.0**. You can sort on this column.
Total License Available	Shows the total number of licenses available for this product from all the entitlements related to it.
Total Consumed	Shows the number of licenses consumed by installations from the total available for this product.
Effective License Position	The effective license position is a calculation of the entitlements for a particular software product against the installations for that product. It may be one of: a negative number, in which case there are more installations for that software product than entitlements zero where the numbers match exactly

Field	Description
	a positive number, which indicates you have paid for more licenses than you are using. Your ideal is to get the numbers positive but as close to zero as fits in with your current and predicted demand.
Device Detailed Table	The following table shows the column headings in the **Detailed** table:

Column	Description
Machine Name	The device name where the software is installed. The name is a link that navigates to the **Device Summary** page for the selected device in the **Inventory** application. You can filter on this column.
Management Group	Displays the number of Management Groups a device is associated with. Clicking on the number displays a popup listing the Management Groups. You can filter on this column.
Primary User	This column displays the user name for the primary user on a device. You can filter on this column.
Canonical Version	The canonical representation of the productversion installed on a device. You can filter on this column.
Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Standard** or **-** (where no edition exists). You can filter on this column.
Licensed Software	The title for the software installed on a device. You can filter on this column.
License Demand	The license demand for the software on the device where the software is installed. You can filter on this column.

Field	Description
	License Consumed — This column shows the number of available licenses consumed by the software on the device where it is installed. You can filter on this column.
	Status — This column displays an indicator for the current compliance status for the product. You can filter on this column.
	Comments — This column provides comments on how the entitlement is applied to the installation. Currently this indicates whether the installation has been exempted or not. You can filter on this column.

This table also has the following action buttons:

Button	Description
Export	Pages in AppClarity that include an **Export all** button allow you to export all the data for any tables of information displayed on the page. This may also include columns that are not currently visible in the table display.

Entitlement Summary Table

The following table shows the column headings in the**Entitlement Summary**table:

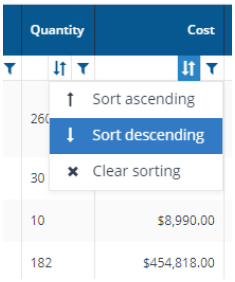
Column	Description
License Vendor	The vendor for the software as defined in the entitlement.
License Title	The title for the software as defined in the entitlement.
License Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Standard** or **-** (where no edition exists).
License Metric	The metric type for a license or maintenance entitlement. This may be one of:

Field	Description		
		Type	Description
		Core	The metric for the license is related to the number of cores present on a device. For example, licenses for **Microsoft SQL database** are related to the number of cores on the server where **Microsoft SQL** is installed.
		Device	The metric for the license is for devices. For example licenses for **Microsoft Visio** are on a per device basis. This is the default type.
		Other	This can be used to reference your own license metric type.
		Processor	The metric for the license is related to the number of processors for a device. For example, licenses for certain **Oracle** products are related to the number of processors on the server where the **Oracle** product is installed.
		PVU	The metric for the license is related to the Processor Value Unit present on a device. For example. licenses for **IBM** products are related to the **Processor Value Unit (PVU)** for the device where the IBM product is installed.
		User	The metric for the license is related to the users for the product. For example, **Microsoft Office 365** licenses are related to users and not the devices the software is running on.
	Management Group	This column displays the names of the Management Groups an entitlement is associated with.	
	Total License Units	Shows the total number of licenses units available from an entitlement.	

Field	Description	
	Consumed	Shows the number of licenses consumed by installations from a particular entitlement.
	Remaining	Shows the number of licenses remaining for a particular entitlement after subtracting the **Consumed** licenses consumed from the **Total License Units**.
Column Actions	The following column actions are available on some table columns.	

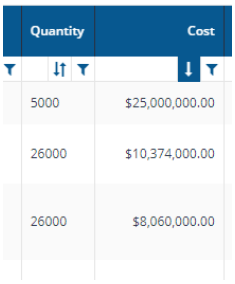
Column actions	Description
Column sort	**Using column sorts** The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom.To sort the table on the **Cost** column: Click on the sort icon ⇅ just beneath the header row in the **Cost** column.  The sort popup is displayed.  Now select the sort direction. In our example this will be **Sort descending**.

Field	Description



After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon

.



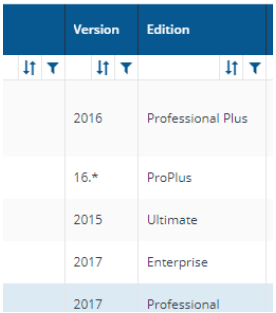
Clearing the sort

You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.

Column filter

Using column filters

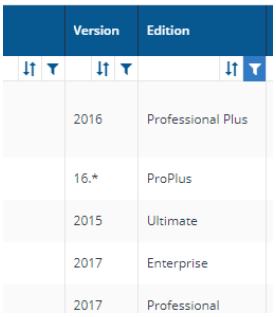
The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.



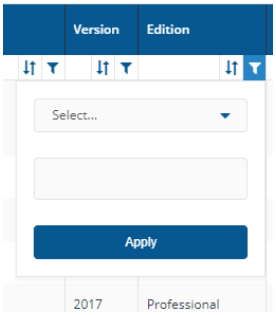
Field	Description

To filter the table on the **Edition** column:

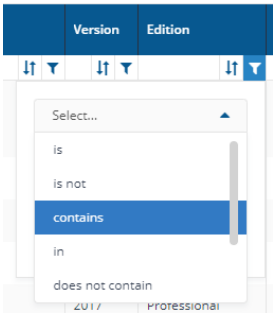
Click on the filter icon just beneath the header row in the **Edition** column.



The filter popup is displayed.

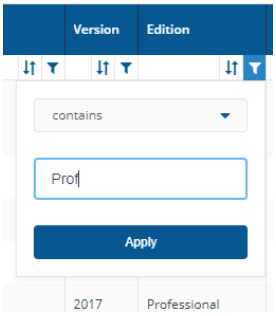


Now select the operator. In our example this will be **contains**.



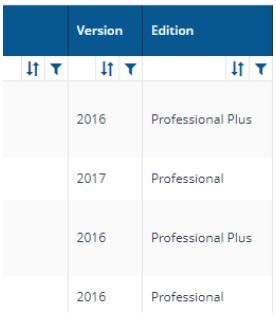
Then type the text **Prof** into the text field.

Field	Description



Click **Apply** and a new filter will be added to the table.

The table will be filtered to just those items whose **Edition** contains the text **Prof**.



Adding another filter

You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.

Removing filters

You can remove filters by clicking on the filter close icon at the end of the filter.

10.6.5.2.2 License Position page

A description of the fields on the **License Position** page.

Here you can view your License Summary. You get to this page by clicking the **AppClarity→Compliance→License Position** node in the navigation panel.

The fields on the **License Position** page are:

Field	Description
Management group	Certain pages in AppClarity have a management groups selector. This drop-down lets you select the management group you are interested in. By default this is set to **Global**.
Compliance Repository	This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to **Default Compliance**. If you have created your own compliance repositories, click on the name to select these from the drop-down list.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box:
Action buttons	The following table describes the action buttons displayed on the **License Position** page.

Button	Description
Export	Exports all the products currently displayed in the **License Position** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.
Compliance Details	This button is only enabled when there is a single selection in the **License Position** table. Displays the License Summary page filtered to just display the information for the selected product.

License Position table

The following table describes the columns displayed in the **License Position** table:

Column	Description
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Microsoft Corporation** or **1E**.

Field	Description
Title	The title portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Visio** or **Nomad**.
Canonical Version	The canonical representation of the productversion installed on a device.
Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Standard** or **-** (where no edition exists).
Total Licensed Units	Shows the total number of license units available from entitlements related to the product.
Total Units Consumed	Shows the total number of available license units that have been consumed by product installations.
License Position	Shows the license position for the product calculated by subtracting the value in the **Total Units Consumed** column from the value in the **Total Licensed Units** column. Negative numbers in red indicate a license deficit. Positive numbers in black indicates a license excess.
Metric	The metric type for a license or maintenance entitlement. This may be one of:

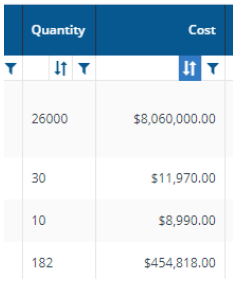
Type	Description
Core	The metric for the license is related to the number of cores present on a device. For example, licenses for **Microsoft SQL database** are related to the number of cores on the server where **Microsoft SQL** is installed.
Device	The metric for the license is for devices. For example licenses for **Microsoft Visio** are on a per device basis. This is the default type.

Field	Description	
	Other	This can be used to reference your own license metric type.
	Processor	The metric for the license is related to the number of processors for a device. For example, licenses for certain **Oracle** products are related to the number of processors on the server where the **Oracle** product is installed.
	PVU	The metric for the license is related to the Processor Value Unit present on a device. For example. licenses for **IBM** products are related to the **Processor Value Unit (PVU)** for the device where the IBM product is installed.
	User	The metric for the license is related to the users for the product. For example, **Microsoft Office 365** licenses are related to users and not the devices the software is running on.

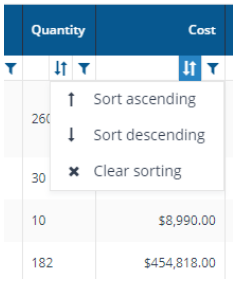
The following column actions are available on some table columns:

Column actions	Description
Column sort	**Using column sorts** The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom.To sort the table on the **Cost** column: Click on the sort icon ↓↑ just beneath the header row in the **Cost** column.

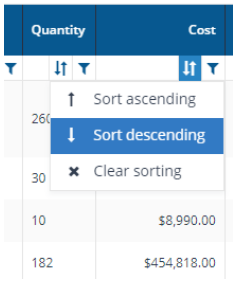
Field	Description



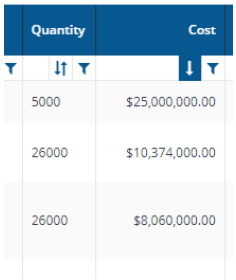
The sort popup is displayed.



Now select the sort direction. In our example this will be **Sort descending**.



After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon



Clearing the sort

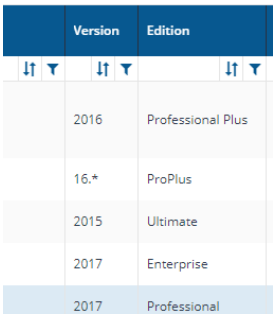
Field	Description

You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.

Column filter

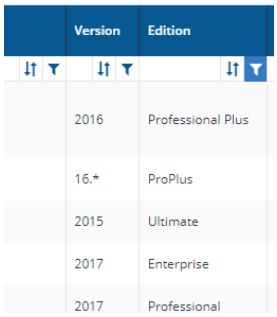
Using column filters

The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.

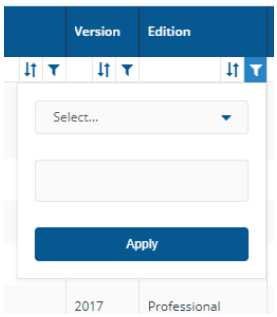


To filter the table on the **Edition** column:

Click on the filter icon just beneath the header row in the **Edition** column.

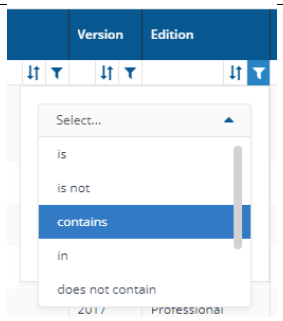


The filter popup is displayed.

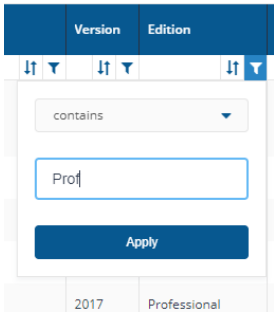


Now select the operator. In our example this will be **contains**.

Field	Description

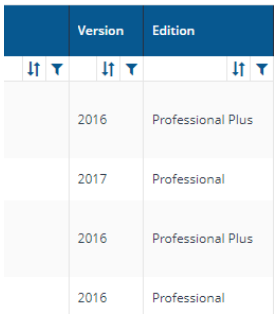


Then type the text **Prof** into the text field.



Click **Apply** and a new filter will be added to the table.

The table will be filtered to just those items whose **Edition** contains the text **Prof**.



Adding another filter

You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.

Field	Description
	Removing filters You can remove filters by clicking on the filter close icon at the end of the filter.

10.6.5.3 License Demand

A description of the fields on the **License Demand** page.

Here you can view the License Demand reports. You get to this page by clicking the **AppClarity→License Demand** node in the navigation panel.

The fields on the **License Demand** page are:

Management Group selector

Compliance Repository selector	This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to **Default Compliance**. If you have created your own compliance repositories, click on the name to select these from the drop-down list.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box: Column Picker	**Using column picker**Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.To pick the displayed columns:Click on the Choose columns iconto the right of the header row to view the visible columns.To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.The **Unknown Installs** column is now hidden.To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.The Microsoft Core License Demand page has now been automatically updated with our changes.
Action buttons	The following table describes the action buttons displayed on the **Oracle Processor License Demand - Detailed Report** page:

Button	Description
Export	Exports all the entries currently displayed in the **Oracle Processor License Demand - Detailed Report** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.

Oracle Processor License Demand - Summary table	This table displays a summary of the rows displayed in the **Oracle Processor License Demand - Detailed Report** table. The following table describes the columns displayed in the **Oracle Processor License Demand Summary** table:

Field	Description

Column	Description
Licensed Software	Displays software titles that are part of the License Demand report, where that software also has installations present in the inventory.
Installs	This column shows the number of installs for the software titles that are part of the License Demand report.
License Demand	This column shows the license demand for the software titles that are part of the License Demand report.
Unknown Installs	This column provides a count of the installations for the software titles that are part of the License Demand report where there are details that are unknown, thereby implying a risk for compliance calculation.

Oracle Processor License Demand - Detailed Report table

The following table describes the columns displayed in the **Oracle Processor License Demand - Detailed Report** table:

Column	Description
Cluster Name	The Cluster Name, if any, where the software in the License Demand report is installed.
Physical Host	The Physical Host, if any, where the software in the License Demand report is installed.
Machine Name	The device name, if any, where the software in the License Demand report is installed.
Machine Type	The type of the device where the software in the License Demand report is installed. This may be one of: Machine Type --- Cluster Physical

Field	Description
	Physical Host Virtual
Version	The version portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **11.0.3216.5614** or **6.3.100.0**.
Colloquial Version	The colloquial version name for the product. For example, **2003**, **2016** etc. This is an additional attribute to the vendor, title, version and edition for a software product that may identify a range of versions.
Licensed Software	Displays software titles that are part of the License Demand report, where that software also has installations present in the inventory.
Installs	This column shows the number of installs for the software titles that are part of the License Demand report.
License Demand	This column shows the license demand for the software titles that are part of the License Demand report.
Management Group	Displays the number of Management Groups a device is associated with. Clicking on the number displays a popup listing the Management Groups.
Classification	Displays the classification for the device where the software is installed. If set this may be one of: Classification --- Production Test
Sockets	Displays the number of processor sockets available on the mainboard for the device where the software is installed.

Field	Description	
	Processors	Displays the number of processors available on the mainboard for the device where the software is installed.
	Cores	Displays the number of processor cores available on the mainboard for the device where the software is installed.
	Comments	Provides recommendations on how to license the software to achieve the optimum license demand.

Column actions The following column actions are available on some table columns:

Column actions	Description
Column sort	Some tables contain column sorts that let you easily re-order the information displayed in the table.**Using column sorts**The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column:Click on the sort iconjust beneath the header row in the **Cost** column.The sort popup is displayed.Now select the sort direction. In our example this will be **Sort descending**.After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon**Clearing the sort**You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.
Column filter	Some tables contain a column filter that lets you easily filter the information displayed in the table.**Using column filters**The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.To filter the table on the **Edition** column:Click on the filter iconjust beneath the header row in the **Edition** column.The filter popup is displayed.Now select the operator. In our example this will be **contains**.Then type the text **Prof** into the text field.Click **Apply** and a new filter will be added to the table.The table will be filtered to just those items whose **Edition** contains the text **Prof**.**Adding another filter**You can add another filter by clicking on the filter icon for any of the columns. The picture opposite

Field	Description
	shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.**Removing filters**You can remove filters by clicking on the filter close icon at the end of the filter.

10.6.5.3.4 Red Hat Socket Demand page

A description of the fields on the **Red Hat Socket Demand** page.

This page provides an overview of the data in the **Red Hat Socket Demand** report. You get to this page by navigating to the **AppClarity**→**Licence Demand** node in the navigation panel and then clicking on the **View Report** button for the **Red Hat Socket Demand** report.

The fields on the **Red Hat Socket Demand** page are:

Management Group selector

Compliance Repository selector

Report Refresh

Column Picker

Field	Description
Management Groups selector	Certain pages in AppClarity have a management groups selector. This drop-down lets you select the management group you are interested in. By default this is set to **Global**.
Compliance repository selector	This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to **Default Compliance**. If you have created your own compliance repositories, click on the name to select these from the drop-down list.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box: 
Field	Description
Usage Category chart	This chart shows the distribution of installations into the three usage categories: User, Rarely Used and Unused as a percentage of the total installations that reported usage. The bar at the bottom shows the number of installations with reported versus unreported usage as a percentage of the total number of installations. Top 5 Software Category by Installs chart	This chart shows the top five categories according to the numbers of installations. This chart disregards Operating Systems and Internet Browser categories. Top 10 Saving Opportunities ($) chart	This chart shows the top ten products that offer the best savings opportunities in USD. It is calculated by multiplying each product's unit price and the sum of unused and rarely used installations. The bar at the bottom shows the total opportunity in USD split into unused and rarely used installations.

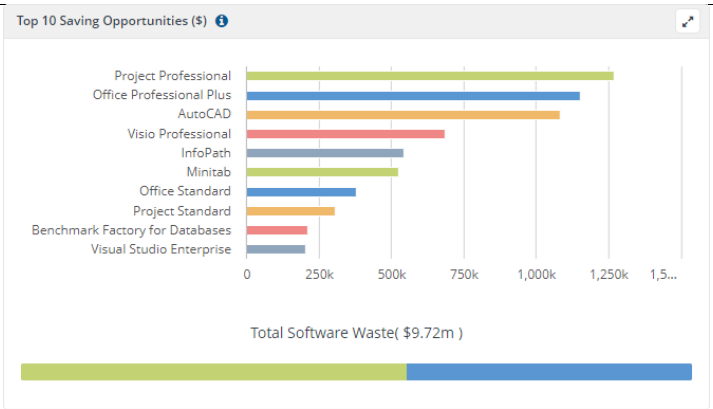
Field	Description



Licensable toggle	The **Licensable** toggle adds a filter when it's turned on that filters the table to only display the products that are licensable, according to the catalog.
Reclaimable toggle	The **Reclaimable** toggle adds a filter when it's turned on that filters the table to only display the products that have a reclaim policy associated with them.
Software with conflicting policies toggle	The **Software with conflicting policies** toggle adds a filter when it's turned on that filters the table to only display the products that have reclaim policies that conflict.
Column Picker	**Using column picker**Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.To pick the displayed columns:Click on the Choose columns iconto the right of the header row to view the visible columns.To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.The **Unknown Installs** column is now hidden.To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.The Microsoft Core License Demand page has now been automatically updated with our changes.
Action buttons	The following table describes the action buttons displayed on the**Usage Summary**page:

Button	Description
Add Policy	This button is only enabled when there is a single selection in the **Usage Summary** table.

Field	Description	
		Creates a new reclaim policy for the selected product and opens the **New Policy** page with the details of the product pre-filled. Please refer to for more details.
	Set Precedence	This button is only enabled when a product with conflicting reclaim policies is selected in the **Usage Summary** table. Opens the Precedence page showing the conflicting reclaim policies allowing you to set their precedence.
	Export	Exports all the entries currently displayed in the **Usage Summary** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.
Usage Summary table	The following table describes the columns displayed in the**Usage Summary**table:	

Column	Description
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Microsoft Corporation** or **1E**.
Title	The title portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Visio** or **Nomad**.
Version	The version portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **11.0.3216.5614** or **6.3.100.0**.
Canonical Version	The canonical representation of the productversion installed on a device.
Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Standard** or **-** (where no edition exists).

Field	Description
Category	The **Category** column shows the category for each product.
Price per Unit (USD)	The **Price per Unit (USD)** shows the cost in USD for each license of a product.
Total Installs	The **Total Installs** column shows the total number of installations for each product.
Used	The **Used** column shows the number of installations for each product that have been reported as being used.
Rarely Used	The **Rarely Used** column shows the number of installations for each product that have been reported as being rarely used.
Unused	The **Unused** column shows the number of installations for each product that have been reported as not being used.
Unreported	The **Unreported** column shows the number of installations for each product where no recent usage data has been reported.
Selected Mgmt Grp Policies	The **Selected Mgmt Grp Policies** column shows the number of reclaim policies for a product in the currently selected Management Group.
Across Mgmt Grp Policies	The **Across Mgmt Grp Policies** column shows the number of policies for a product across all management groups.

The following column actions are available on some table columns:

Column actions	Description

10.6.5.4.1.1 Precedence page

A description of the fields on the **Precedence** page.

Here you can set the precedence for overlapping reclaim policies. You get to this page by:

Navigate to the **AppClarity**→**Reclaim**→**Usage Summary** node in the navigation panel

Select a product with conflicting reclaim policies

Click on the **Set Precedence** button.

The fields on the **Precedence** page are:

Compliance Repository selector

Conflicting reclaim policies table

Vendor

Title

Edition

Versions

Colloquial Version

Is Enabled

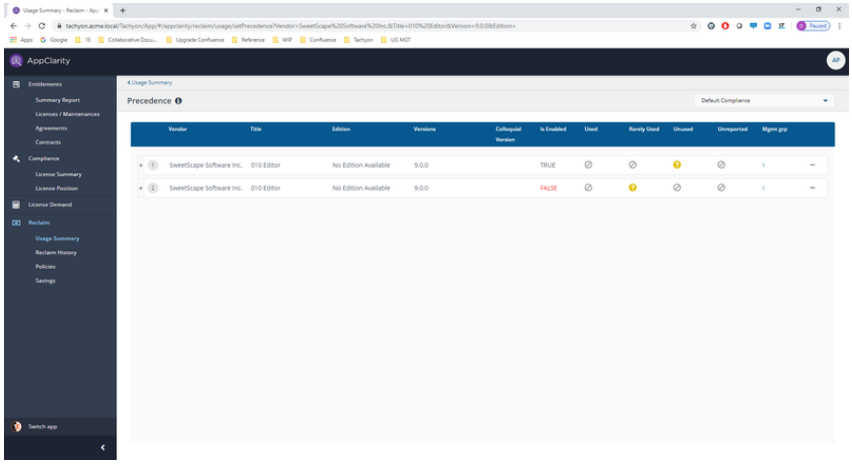
Used

Rarely Used

Unused

Unreported

Mgmt grp



10.6.5.4.1.1.1 Setting the precedence

This page lets you set the precedence for multiple policies that cover the same product. Initially this page will display the overlapping reclaim policies in the order they were created, with the most recently created having the lowest precedence. Policies at the top of the page have the highest precedence. Policies are considered in order from the top of the table to the bottom, and you can reorder the rows by clicking and dragging each row up or down. The way that the policies apply to specific products on specific devices are described in the following bullet points:

Just one of the reclaim policies shown on this page will be applied to a product, as defined by the **Matched Vendor**, **Matched Title**, **Editions** and versions for the policy, on any given device.

Whether a particular policy displayed in the list applies to that device also depends on the management group(s) the policy is active for.

If a device with a matching product belongs to more than one management group it will use the first policy it comes to that is active on one of its management groups.

Once the precedence is set, it triggers a **Reclaim Consolidation** report to make any necessary changes. You need to ensure you have identified which policy to set at the highest precedence, you can use the **Move to top** option from the 3 dots on the right side of the policy to do this.

> **Warning**
>
> When you subsequently publish a reclaim policy this will automatically change its precedence to be the lowest. i.e. it will appear at the bottom of the precedence list. Beware that simply viewing a page and clicking Publish to exit will reset that reclaim policy's precedence.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Compliance Repository selector</td><td>This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to Default Compliance.

If you have created your own compliance repositories, click on the name to select these from the drop-down list.</td></tr>
<tr><td>Conflicting reclaim policies table</td><td>The following table describes the columns in the table that can be used to identify each conflicting policy:

<table>
<tr><th>Column</th><th>Description</th></tr>
<tr><td>Vendor</td><td>On the reclaim policy pages, this displays the vendor for the product the reclaim policy will be aimed at.</td></tr>
<tr><td>Title</td><td>On the reclaim policy pages, this displays the title for the product the reclaim policy will be aimed at.</td></tr>
<tr><td>Edition</td><td>On the reclaim pages in AppClarity an Editions column is sometimes displayed. This shows a list of editions that determine which products the reclaim policy will be aimed at.</td></tr>
<tr><td>Versions</td><td>The version portion of the vendor, title, version and edition attributes for the product that the reclaim policy applies to.</td></tr>
<tr><td>Colloquial Version</td><td>The colloquial version name for the product. For example, 2003, 2016 etc. This is an additional attribute to the vendor, title, version and edition for a software product that may identify a range of versions.</td></tr>
</table>
</td></tr>
</table>

Field	Description
Is Enabled	This column shows whether the **Enabled** checkbox has been set for the reclaim policy.
Used	Displays the action that will be taken by a reclaim policy for software with a usage category of used. Please refer to Usage categories for more details.
Rarely Used	Displays the action that will be taken by a reclaim policy for software with a usage category of rarely used. Please refer to Usage categories for more details.
Unused	Displays the action that will be taken by a reclaim policy for software with a usage category of unused. Please refer to Usage categories for more details.
Unreported	Displays the action that will be taken by a reclaim policy for software with a usage category of unreported. Please refer to Usage categories for more details.
Mgmt grp	This column contains a **Show** link, which displays a popup containing a list of the Management Group(s) the reclaim policy applies to.

10.6.5.4.2 Reclaim History page

A description of the fields on the **Reclaim History** page.

The picture opposite

Field	Description
	shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.**Removing filters**You can remove filters by clicking on the filter close icon at the end of the filter.

10.6.5.4.3 Policies page

A description of the fields on the **Policies** page.

Here you can view the reclaim policies that have been published. You get to this page by clicking the **AppClarity**→**Reclaim**→**Policies** node in the navigation panel.

The fields on the **Policies** page are:

Compliance Repository selector

Report Refresh

Active Policies Only toggle

Column Picker

Action buttons

New Policy

Edit

Publish

Clone

Move to Draft

Delete

Admin Actions

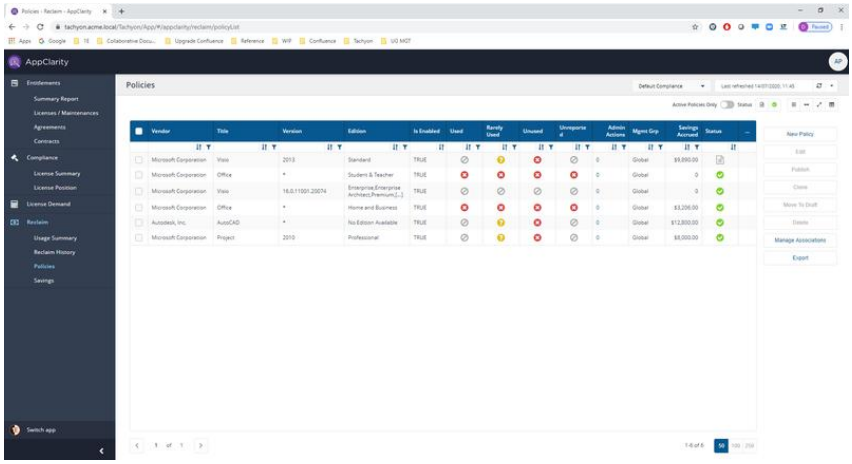
SCCM Collection Type

Savings Accrued

Status

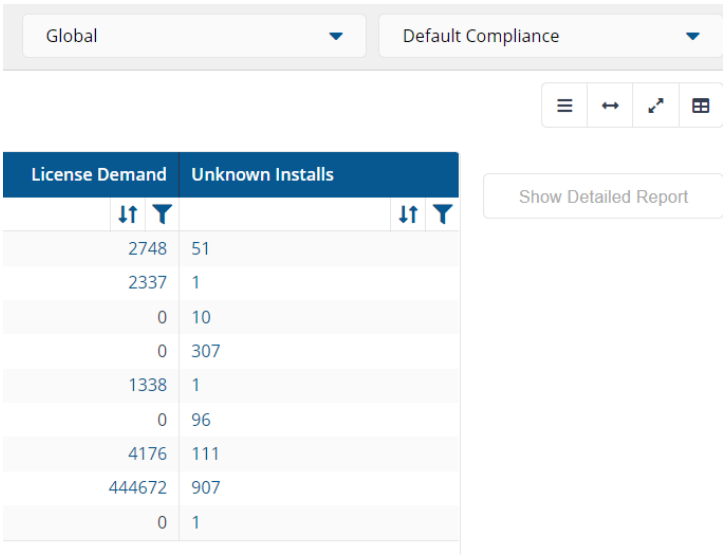
Column sort

Column filter



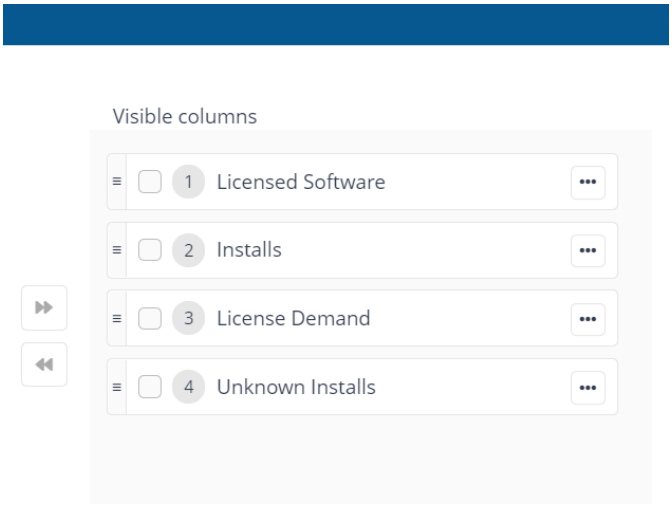
Field	Description
Compliance Repository selector	This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to **Default Compliance**. If you have created your own compliance repositories, click on the name to select these from the drop-down list.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box:

Field	Description
Active Policies Only toggle	The **Active Policies Only** toggle adds a filter when it's turned on that filters the table to only display the reclaim policies that have been published and their status is set to enabled.
Column Picker	Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.



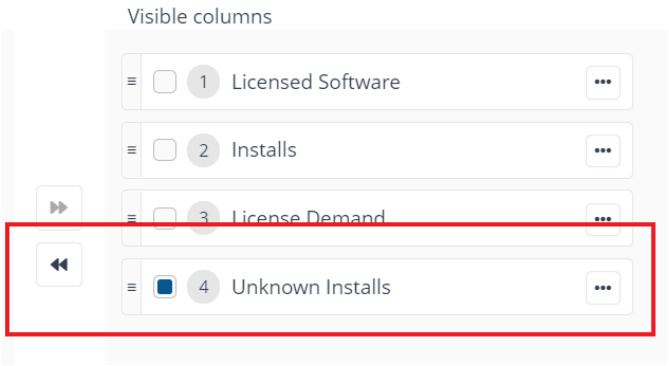
To pick the displayed columns:

Click on the Choose columns icon to the right of the header row to view the visible columns.

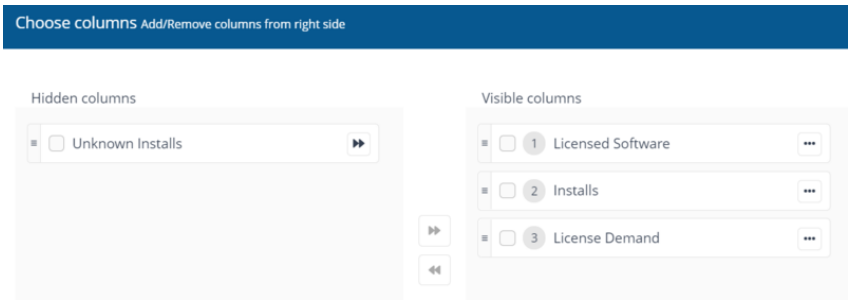


Field	Description

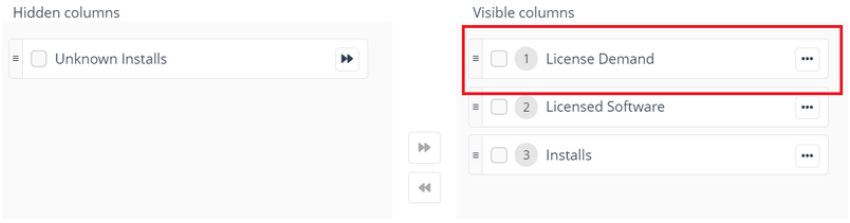
To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.



The **Unknown Installs** column is now hidden.



To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.



The Microsoft Core License Demand page has now been automatically updated with our changes.

Field	Description

License Demand	Licensed Software	Installs
2748	Windows Server DataCenter	647
2337	SQL Server Enterprise	649
0	SQL Server Analysis Services	0
0	SQL Server Integration Services	0
1338	SQL Server Standard	300
0	SQL Server Reporting Services	0
4176	Windows Server Enterprise	265
444672	Windows Server Standard	4019
0	SQL Server Data Quality Services	0

Action buttons

The following table describes the action buttons displayed on the **Policies** page:

Button	Description
New Policy	Creates a new policy. Please refer to New Policy page for more details.
Edit	This button is only enabled when there is a single selection in the Policies table. Edits the selected policy and opens the Edit Policy page. Please refer to New Policy page for more details.
Publish	This button is enabled when there is at least one selection in the **Policies** table. Publishes the selected policies.
Clone	This button is only enabled when there is a single selection in the **Policies** table. Clones the selected policy and opens the Edit Policy page with a clone of the details from the policy. Please refer to New Policy page for more details.
Move to Draft	This button is enabled when there is at least one selection in the **Policies** table. Moves the selected policies to Draft.
Delete	This button is enabled when there is at least one selection in the **Policies** table. Deletes the selected policies.

Field	Description	
	Manage Associations	Clicking this link navigates to **Inventory→Manage Associations→Product to CM** page in the Inventory application.
	Export	Exports all the policies currently displayed in the **Policies** table as a TSV file. This button takes the filters currently applied to the table into account, but not the sorting or the current selection.

Policies table

The following table describes the columns displayed in the **Policies** table:

Column	Description
Vendor	On the reclaim policy pages, this displays the vendor for the product the reclaim policy will be aimed at.
Title	On the reclaim policy pages, this displays the title for the product the reclaim policy will be aimed at.
Version	The version portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **11.0.3216.5614** or **6.3.100.0**.
Colloquial Version	The colloquial version name for the product. For example, **2003**, **2016** etc. This is an additional attribute to the vendor, title, version and edition for a software product that may identify a range of versions.
Edition	On the reclaim pages in AppClarity an **Editions** column is sometimes displayed. This shows a list of editions that determine which products the reclaim policy will be aimed at.
Is Enabled	This column shows whether the **Enabled** checkbox has been set for the reclaim policy.
Used	Displays the action that will be taken by a reclaim policy for software with a usage category of used. Please refer to Usage categories for more details.

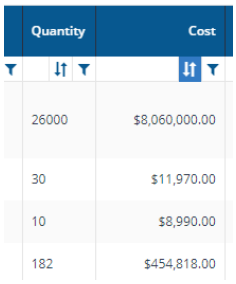
Field	Description
Rarely Used	Displays the action that will be taken by a reclaim policy for software with a usage category of rarely used. Please refer to Usage categories for more details.
Unused	Displays the action that will be taken by a reclaim policy for software with a usage category of unused. Please refer to Usage categories for more details.
Unreported	Displays the action that will be taken by a reclaim policy for software with a usage category of unreported. Please refer to Usage categories for more details.
Admin Actions	This link takes you to the Administration page for the reclaim policy. From there you can monitor the progress of the reclaim and respond to any end-user requests to opt-out of optional reclaim policies.
Mgmt Grp	Displays the Management Group the policy is associated with.
SCCM Collection Type	Displays the Configuration Manager collection type that will be used to manage the reclaims.
Savings Accrued	Displays the savings accrued to date as a result of running the reclaim policy.
Status	Indicates whether the policy is in published or draft state.

The following column actions are available on some table columns:

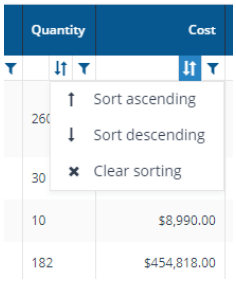
Column actions	Description
Column sort	**Using column sorts** The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column:

Field	Description

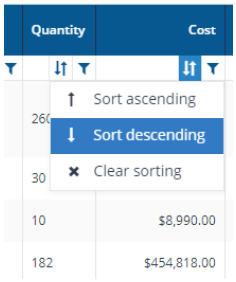
Click on the sort icon ⇅ just beneath the header row in the **Cost** column.



The sort popup is displayed.

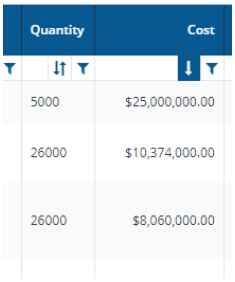


Now select the sort direction. In our example this will be **Sort descending**.



After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon ⬇

Field	Description



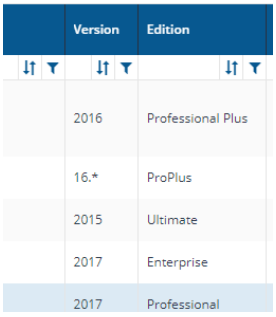
Clearing the sort

You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.

Column filter

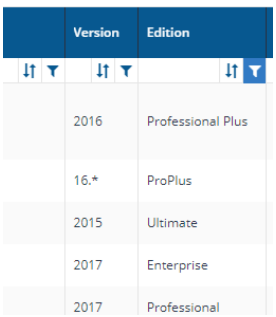
Using column filters

The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.



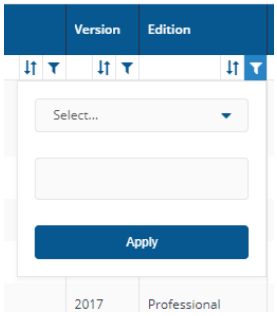
To filter the table on the **Edition** column:

Click on the filter icon just beneath the header row in the **Edition** column.

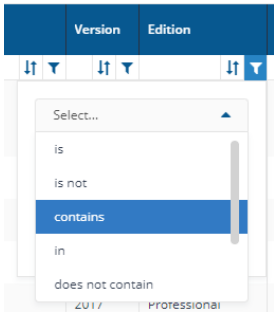


The filter popup is displayed.

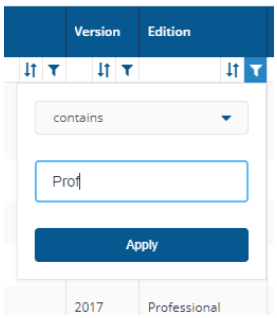
Field	Description



Now select the operator. In our example this will be **contains**.



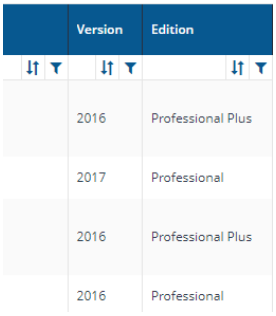
Then type the text **Prof** into the text field.



Click **Apply** and a new filter will be added to the table.

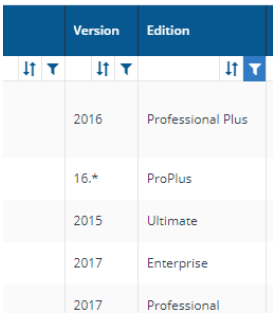
The table will be filtered to just those items whose **Edition** contains the text **Prof**.

Field	Description



Adding another filter

You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.



Removing filters

You can remove filters by clicking on the filter close icon at the end of the filter.

10.6.5.4.3.1 New Policy page

A description of the fields on the **Reclaim Policies** page.

Here you can create a Reclaim Policy for a specific product. You get to this page by any of the following ways:

Clicking the **Reclaim→Policies** node in the navigation panel, then clicking the **New Policy** button

Clicking on the **Add Policy** button on the side of a product entry in the Usage Summary page. If this method is selected the page will be pre-filled with the details of the product.

Clicking on the **Edit** button on the Policies page. When this is done the **Reclaim Policy** page will be pre-filled with the contents of the selected reclaim policy.

Clicking on the **Clone** link on the Policies page. When this is done the **Reclaim Policy** page will be pre-filled with the contents of the selected reclaim policy and when you subsequently click **Draft** or **Publish** a copy of the original reclaim policy will be saved including any changes you have made.

The fields on the **Reclaim Policy** page are:

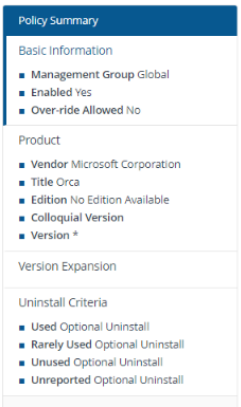
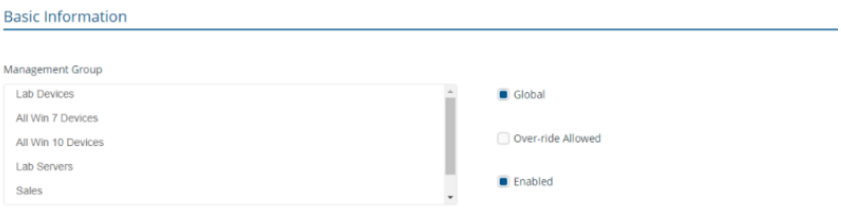
10.6.5.4.3.1.1 Policy Summary

This table to the right shows you the information about the policy as you are building the policy or if you are editing a policy. This is useful because the policy pane is larger than can be seen on one screen. Each of these sections are hyperlinks to that specific area of the policy page.

Field	Description
Basic Information	Details about the Management Group, if the policy is enabled and if Over-ride is allowed
Product	Give Vendor, Title, Edition, Colloquial Version and Version for the software in the policy
Version Expansion	No details here, just a hyperlink to the Version Expansion area
Uninstall Criteria	Details each usage category and the action that Reclaimer will take

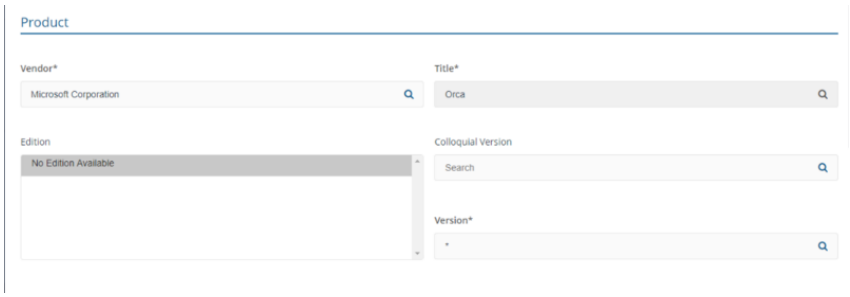


10.6.5.4.3.1.2 Basic Information



Field	Description
Management Group	This field displays a list of the current management groups, you can select all the management groups that you want this reclaim policy to apply to. You must select at least one management group or set the reclaim policy to global.
Global	This checkbox determines whether the reclaim policy will be applied to all products matching the vendor, title, version and edition information regardless of which management groups they belong to.
Override Allowed	This checkbox is only displayed when the **Global** checkbox has been checked. When **Override Allowed** is checked: Subsequent reclaim policies for the same product can be defined in global and other management groups. Those policies will be warned on publishing that a similar policy is already present. When**Override Allowed**is unchecked: Subsequent reclaim policies for the same product can still be published in global. Those policies will be warned on publishing that a similar policy is already present. However, subsequent reclaim policies for the same product cannot be published in other management groups. Those policies will notified that asimilar policy for Global is already present which cannot be overridden and the publish will not be allowed to continue.
Enabled	This checkbox determines whether the policy is enabled or not, even if it is published. You can use this to disable policies that are no longer in use, or re-enable policies that have been disabled previously.

10.6.5.4.3.1.3 Product

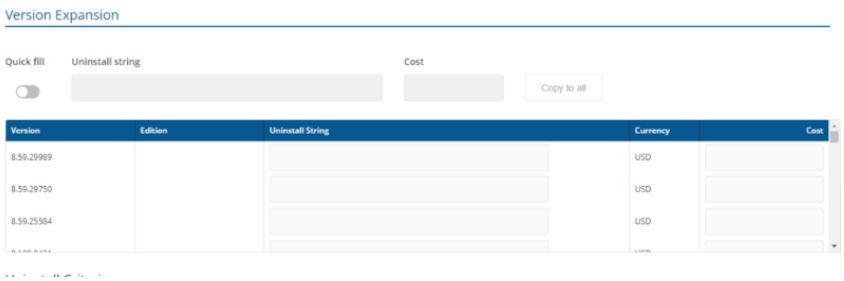


Field	Description
Vendor	The vendor part of the vendor, title, version and edition for a product. This must be filled out before any other fields. Suggested suitable vendors that match your text are displayed as you type into the field, which you can select to auto-complete the entry.
Title	The title part of the vendor, title, version and edition for a product. Suggested suitable titles from the selected vendor that match your text are displayed as you type into the field, which you can select to auto-complete the entry.
Edition	Sets the edition for the product to be reclaimed. This field displays a list of editions that match the selected **Vendor** and **Title** fields. **Note** You must ensure that you select at least one edition from the**Edition**list. If the list shows**No edition available**, then you must ensure that you select that option.
Colloquial Version	This field is optional and sets the colloquial version for the product to be reclaimed.

Note

When manually entering the information on the **Reclaim Policy** page you must enter the values in the order they are presented, as each subsequent field is dependent on the fields above it.

10.6.5.4.3.1.4 Version Expansion

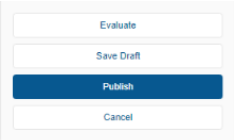


Field	Description
Versions	Here you select the versions of the software you want the reclaim policy to apply to. Enter a value and then select one from the list of versions displayed. This is taken into account in addition to the vendor, title and edition. This field accepts the asterisk character * as a wildcard. For example. This field could be set to: * to specify all versions for the selected vendor, title and edition. 11.* to specify all sub-versions of version 11. 11.0.* to specify all sub-sub-versions of 11.0 and so on.
Version Expansion	This field will expand all the individual matching versions for the vendor, title, edition and version. The expansion is done according to the wildcards in the **Versions** string: If that string contains no wildcards the **Version Expansion** field will contain a single entry for that specific version. If the **Versions** string contains just an asterisk ***** then the **Version Expansion** field will contain all the versions for the selected vendor, title and edition. If the **Versions** string contains a number followed by *****, for example **11.***, then the **Version Expansion** field will contain all the versions starting with that number and so on. There are four fields for each matching version row displayed in the **Version Expansion** field, as described in the following table:

Field	Description
Version	The expanded version number for this row

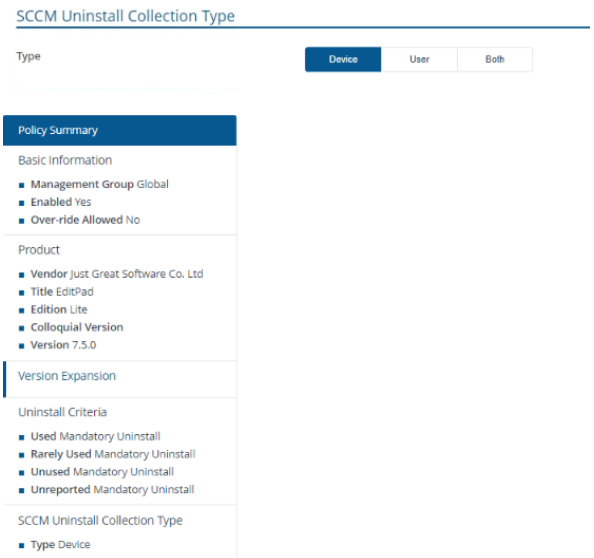
Field	Description
Edition	The matching edition for the vendor, title and version
Uninstall String	This string can be used if the version requires a custom uninstall string. **Note** The quick fill can be used to populate all uninstall strings and cost with the same information. If the no custom uninstall string is required leave this field blank.
Currency	The currency for the cost. Default is US Dollar.
Cost	The estimated cost savings that would be made by retrieving the license covered by this reclaim.

Field	Description
Evaluate	Click this button to run the evaluation report for the reclaim policy to see which devices and software installations would be affected by the policy. Clicking this button creates a report that is downloaded by the browser as a TSV file. **Note** You may need to enable popups on the Tachyon site to enable the download to proceed.
Save draft	Click this button if want to save a copy of the policy you are currently working on. Clicking this button does not close the **Reclaim Policy** page.
Publish	Click this button to publish the policy. **Note** When you publish the policy a check will be made to see if it overlaps with any other existing policy. If it does, you will see a popup similar to the following: 
Field	Description
	If you decide to proceed with the publishing you will subsequently need to set the precedence for the policies to decide which one should be preferred. This is done on the Precedence page but can only be done for live policies. This means that you will have to refresh the **reclaim consolidation** report first, which can be done from the Policies page.
Cancel	Click this button to leave without making any changes to the policy.



10.6.5.4.3.1.5 SCCM Uninstall Collection Type

When you have the SCCM Uninstall Provider configured you are presented with an additional section in your Policy Summary. This will allow the Reclaimer to use the SCCM Uninstall for the Reclaimer. The Reclaimer will create a device collection, a user collection or one of each. Based on the setting in the picture below (from the policy). When the Reclaimer runs either the device or the user or both is added to the collection. The Reclaimer also creates deployments for the Program or the Application model for the uninstallation.



10.6.5.4.3.2 Administration page

A description of the fields on the reclaim policy **Adminstration** page.

Here you can view the current progress and status for the selected reclaim policy. You get to this page by clicking the **AppClarity**→**Reclaim**→**Policies** node in the navigation panel and then clicking on the **Number** link in the **Admin Actions** column.

The fields on the **Administration** page are:

Report Refresh

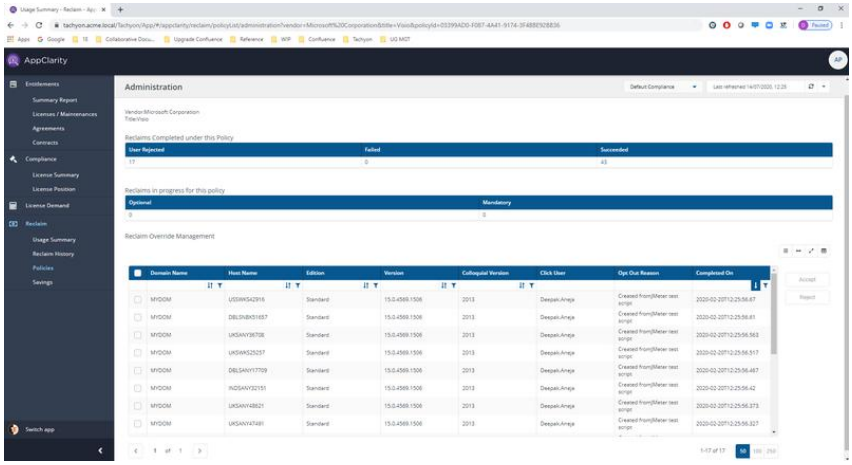
Column Picker



Field	Description
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box:
Vendor	Displays the vendor for the target product related to the selected reclaim policy
Title	Displays the software title for the target product related to the selected reclaim policy
Reclaims completed under this policy	This table shows the reclaims that have been completed by this reclaim policy. The columns of the table are as follows: **Column** — **Description** **User rejected** — Shows the number of reclaims where the user has requested to keep the product. **Failed** — Shows the number of reclaims where the attempt to uninstall the software failed. **Succeeded** — Shows the number of reclaims where the software was successfully uninstalled.

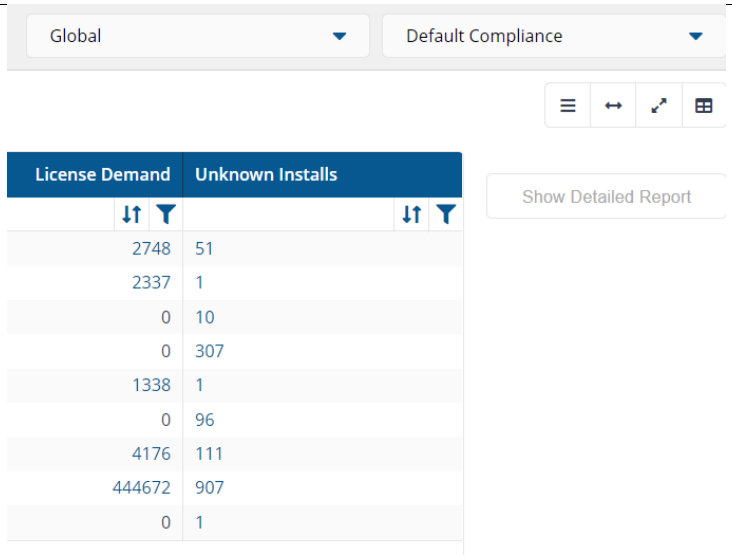
Field	Description
Reclaims in progress for this policy	This table shows the number of reclaims currently in progress for this reclaim policy. The columns of the table are as follows: **Optional** — Shows the number of reclaim policies currently under way that allow the end-user to opt out of the reclaim. **Mandatory** — Shows the number of reclaim policies currently under way where the software will be uninstalled without end-user interaction.
Reclaim Override Management	This table shows the reclaims that must be processed by the administrator. This is where the user has opted to keep the software and provided a suitable reason for it and that reason must be approved or rejected by the administrator. The columns of the table are as follows: **Domain Name** — The domain name for the target device. **Host Name** — The host name for the target device. **Edition** — The edition of the software being reclaimed. **Version** — The version of the software being reclaimed. **Colloquial Version** — The colloquial version of the software being reclaimed (if any). **Click User** — The end-user who requested to keep the software. **Opt Out Reason** — The reason given by the end-user why they should be allowed to keep the software. **Completed On** — The time and date the administrator responded.

Field	Description
	There are also two buttons below the table that determine the action to take on the selected rows in the table: Button — Description **Accept** — Clicking this means that the administrator has approved the end-user's reasons for keeping the software. The reclaim will not go ahead and the end-user will retain the software. **Reject** — Clicking this means that the administrator has rejected the end-user's reasons for keeping the software. The reclaim will be changed to mandatory and the software will be removed without any further end-user interaction.

The three buttons above Accept and Reject

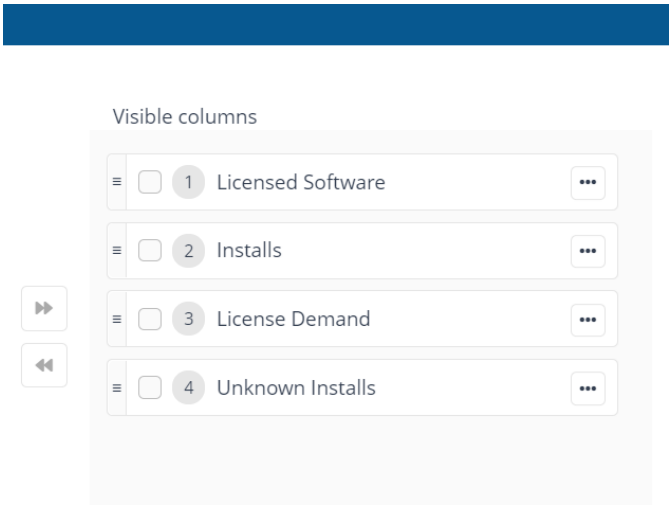
Icon	Name	Description
	Toggle compact rows	Allows the rows to have slightly more space for easier viewing.
	Toggle action buttons	Allows the action buttons (Accept and Reject) to be displayed as a hamburger menu only. This expansion of the table allows for easier viewing.
	View fullscreen	Allows the table only to be viewed in the full browser window. Clicking the button while in fullscreen mode will collapse it back to default.
	Column Picker	Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.

Icon	Name	Description



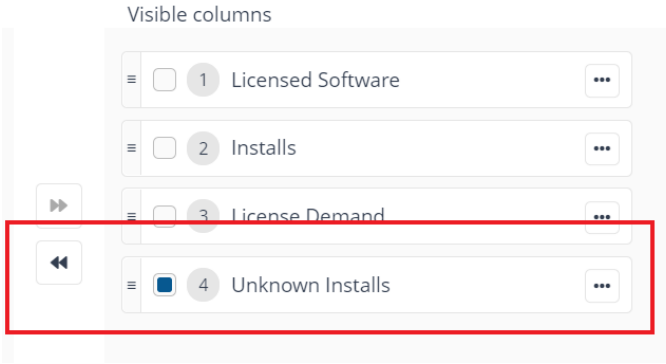
To pick the displayed columns:

Click on the Choose columns icon to the right of the header row to view the visible columns.

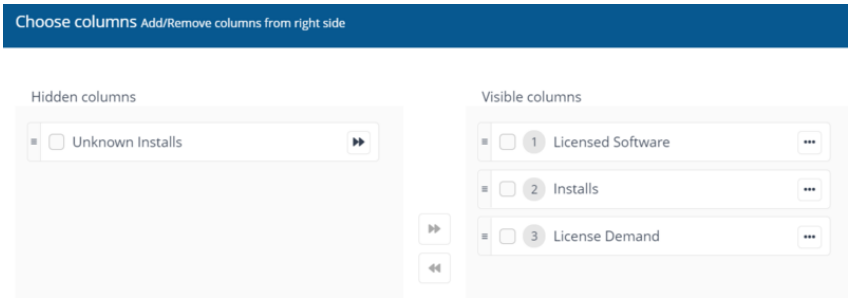


To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.

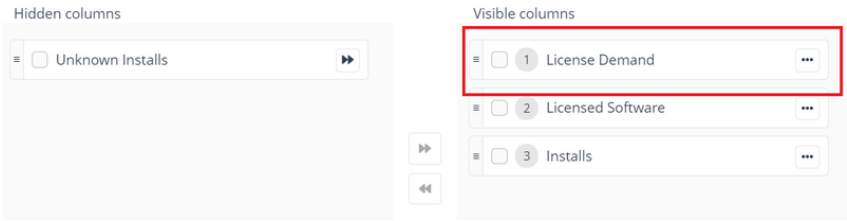
Icon	Name	Description



The **Unknown Installs** column is now hidden.



To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.



The Microsoft Core License Demand page has now been automatically updated with our changes.

License Demand	Licensed Software	Installs
2748	Windows Server DataCenter	647
2337	SQL Server Enterprise	649
0	SQL Server Analysis Services	0
0	SQL Server Integration Services	0
1338	SQL Server Standard	300
0	SQL Server Reporting Services	0
4176	Windows Server Enterprise	265
444672	Windows Server Standard	4019
0	SQL Server Data Quality Services	0

10.6.5.4.4 Savings page

A description of the fields on the **Savings** page.

Here you can review an estimate of the cost savings made by applying particular reclaim policies, that is, on successful reclaims. You get to this page by clicking the **AppClarity→Reclaim→Savings** node in the navigation panel.

> **Note**
>
> Please Execute a**Generate Report - Reclaim Reporting**action for your compliance repository, before viewing this screen.

The fields on the **Savings** page are:

Management Groups

Compliance repository selector

Report Refresh

Back

Column Picker

Export All

Savings table

Vendor

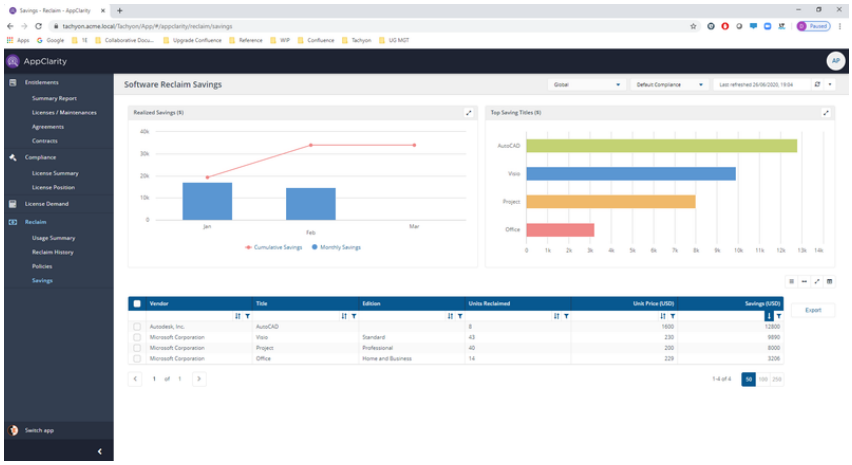
Title

Edition

Units Reclaimed

Unit Price (USD)

Savings (USD)



Field	Description
Management Groups	Certain pages in AppClarity have a management groups selector. This drop-down lets you select the management group you are interested in. By default this is set to **Global**.
Compliance repository selector	This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to **Default Compliance**. If you have created your own compliance repositories, click on the name to select these from the drop-down list.
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box:
Back	Each page in AppClarity has a back link on the page. Clicking this link takes you back to the previous page you were browsing, and works differently to the browser's back button for this application in that it takes you to the last page you were on in the application.
Column Picker	**Using column picker**Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.To pick the displayed columns:Click on the Choose columns iconto the right of the header row to view the visible columns.To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.The **Unknown Installs** column is now hidden.To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.The Microsoft Core License Demand page has now been automatically updated with our changes.
Export All	Pages in AppClarity that include an **Export all** button allow you to export all the data for any tables of information displayed on the page. This may also include columns that are not currently visible in the table display. Click this button to export all of the software reclaim summary details.
Savings table	The **Savings** table contains the following columns:

Field	Description

Column	Description
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify which software product the reclaim policy was applied to.
Title	The title portion of the vendor, title, version and edition attributes that are used to identify which software product the reclaim policy was applied to.
Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify which software product the reclaim policy was applied to.
Units Reclaimed	A count of the number of reclaims performed by applying this policy.
Unit Price (USD)	Shows the unit price in USD for the product associated with the policy.
Savings (USD)	The sum of the estimated savings made by applying this reclaim policy.

10.6.6 Usage categories

Definitions of the four usage categories in the Product Usage report.

Please refer to 1E platform - Usage categories for details.

10.6.7 Entitlement import files

Definitions of each type of record that may be imported into an AppClarity entitlement repository.

The following tables show each category, sub-category, and the record types that can be imported. The 11 sub-categories are visible as tabs in the home page of an entitlement repository.

> **Note**
>
> The **Manual upload**feature available in AppClarity 6.1 no longer exists in AppClarity 7.x . When importing entitlements you must use the Entitlement.tsv connector.

Entitlement information is managed using various fields, in 11 sub-categories (one of which is not used), which map directly to columns in a import file. **TSV** and **CSV** files are both supported, but the documentation here refers to **TSV**.

Import files must have the following:

All columns must have column headings

Column headings must not have spaces

The Version column must be named Version and not Version/Number as it did in some older export files

Please note the following:

When using a simple editor like notepad ensure you leave the tab/comma delimiters between headings

Any column heading with an incorrect name is ignored; this allows additional columns to be used as notes or extra information

Columns can be in any order; it may help you to standardize on the column order listed below

In the tables below, mandatory means the column and value are expected. If a mandatory column or value is omitted you will see caveats reported

Ensure date formats are correct. When editing a file using Excel, the date columns should have their number format set as**Text**instead of**Date**, otherwise you will see integers instead of dates when saved as a TSV/CSV file.**Text**ensures that whatever you type will remain unchanged.

Note

Use the ISO 8601 date format for date fields: **yyyy/mm/dd** or **yyyy-mm-dd**

When exporting dates from other SQL servers, the format may be different due to the region settings of the source server, for example **mm-dd-yyyy** for English (US). To ensure dates are imported correctly, changing the data format to ISO 8601 is recommended, or you should ensure the SQL Server instance hosting the AppClarity database uses the same or equivalent region settings. In most cases SQL Server will intelligently convert dates, but you should review your imports to be sure.

Tip

You should test your system with a few test entitlements before you do any bulk imports.

10.6.7.1 Base Entitlement (1)

Column	Mandatory	Default if not specified	Datatype	Notes
EntitlementId	No	Auto-generated GUID	String	Identity id of this entitlement. This is auto-generated as a GUID if this entitlement was created in the user-interface.

Column	Mandatory	Default if not specified	Datatype	Notes
ParentEntitlementId	No		String	Identity id of the parent entitlement linked to this entitlement. This is auto-generated as a GUID if this entitlement was created in the user-interface, and it is linked to a parent Entitlement. If **ParentEntitlementId** is specified, then you must have a matching **EntitlementId** earlier in the import file, or you already know the **EntitlementId** has been imported previously. From AppClarity 8.1 an entitlement can only have one parent or none. When exporting from AppClarity 5.2, if any entitlement has multiple parents then only one will be used, and the ParentEntitlementId of the others will exported into the comments column, and appear in the

Column	Mandatory	Default if not specified	Datatype	Notes
				comments field when imported into AppClarity 8.1. **Warning** Finding the **EntitlementId** from the database or UI is not supported currently.
EntitlementType	Yes		String	Valid values are: **License** **Maintenance Agreement** Once imported it can not be changed.
Identifier	No		String	Appears in pages as **Custom identifier**. Enter any alphanumeric text that will help identify the entitlement.
LicenseType	No	**Perpetual** for **License** and **Maintenance**.	String	Valid values are: **Perpetual** **Subscription**

Column	Mandatory	Default if not specified	Datatype	Notes
		NA for **Agreement**.		Agreement is always '**NA**'
StartDate	No	Calulated as EndDate - DurationInMonths for **Agreements** and **Subscription**. If neither is set then today's date. If DurationInMonths is not set, then 12 is the default. Today's date for **Perpetual**.	Date	When the entitlement starts applying.
EndDate	Yes/no depending on other fields.	Calculated as StartDate + DurationInMonths for **Agreements** and **Subscription**. If DurationInMonths is not set then 12 is the default. It is set only for **Agreements**	Date	This is last date of entitlement.

Column	Mandatory	Default if not specified	Datatype	Notes
		and **Subscription**.		
DurationInMonths	No	Calculated as EndDate - StartDate. If either of these are missing then 12 is the default. It is set only for **Agreements** and **Subscription**.	Decimal	For how long the entitlement is applicable after start date. For example, if start date if Jan 14, 2016 and Durationmonths is 24 months then end date would be Jan 14, 2018
ProductSKU	No		String	Product SKU
IsEntitlementProduct	No	FALSE	Boolean	Is the entitlement entered an SKU based from Catalog
Vendor	Yes if ProductSKU is not present for **License** and **Maintenance**. Yes for **Agreement**.		String	Vendor. The name of product Vendor.
Title	Yes if ProductSKU is not present for **License** and **Maintenance**. No for **Agreement**.		String	For license and maintenance pages, this is Product title; the name of the product.

Column	Mandatory	Default if not specified	Datatype	Notes
				For agreement page, this is Name.
Version	No		String	For license and maintenance pages, this is Version; the version of product. Version can be given in any format depending on chosen Version Type. For agreement page, this is Number.
VersionType	No	AllVersions	String	AllVersions DotFormat Colloquial NA - Agreements are always 'NA'
Edition	Yes if ProductSKU is not present for **License** and **Maintenance**. No for **Agreement**.		String	Edition. The name of product edition.
IsEditionBased	No	FALSE	Boolean	If edition is available then True otherwise False.
IsRenewal	No	FALSE	Boolean	Entitlement types that needs to be

Column	Mandatory	Default if not specified	Datatype	Notes
				renewed (has an end date).
IsUpgrade	No	FALSE	Boolean	This specifies rights, if upgrade rights are allowed.
IsQuantityUnlimited	No	FALSE	Boolean	If the number of licenses purchased is unlimited then True otherwise False. If True then Quantity is ignored.
Quantity	Yes if IsQuantityUnlimited is FALSE for **License** and **Maintenance**. No for **Agreement**.		Integer	Number of licenses purchased.
MetricType	No	Device	String	Valid values are: Device Processor Core PVU Other Agreement is always 'NA'
OtherMetric	No		String	Used only if Metric Type is 'Other'
IsVersionUpgradeRight	No	TRUE	Boolean	Whether the entitlement is

Column	Mandatory	Default if not specified	Datatype	Notes
				applicable on the later versions of chosen product version. Only applicable, and automatically enabled, if Vendor is Microsoft Corporation, and SA is selected.
IsVersionUpgradeRightPersistent	No	TRUE	Boolean	Version upgrade persists after maintenance is expired. If this right is False, then the license rights resets back to original version at the time of purchase of perpetual license when maintenance expires. Only applicable, and automatically enabled, Vendor is Microsoft Corporation, and SA is selected.
IsVersionDowngradeRight	No	FALSE	Boolean	Whether the entitlement is applicable on the previous versions of chosen product version. By default these rights are active

Column	Mandatory	Default if not specified	Datatype	Notes
IsVersionDowngradeRightPersistent	No	FALSE	Boolean	Version downgrade persists after maintenance is expired. If this right is False, then the license rights resets back to original version at the time of purchase of perpetual license when maintenance expires.
IsEditionDowngradeRight	No	FALSE	Boolean	Whether the entitlement is applicable on the previous editions of chosen product edition.
IsEditionDowngradeRightPersistent	No	FALSE	Boolean	Edition downgrade persists after maintenance is expired. If this right is False, then the license rights resets back to original edition at the time of purchase of perpetual license when maintenance expires.
IsMultiInstanceRight	No	FALSE	Boolean	Whether the same license is applicable on multiple installations.
IsSoftwareAssurance	No	FALSE	Boolean	SA is applicable only for Microsoft

Column	Mandatory	Default if not specified	Datatype	Notes
				Corporation products. On selecting SA Version upgrade rights are automatically set to True.
SecondaryUseCountRight	No	FALSE	Boolean/ Int	This refers to the use right to allow users to use same product on their second device free of cost (example one office desktop and one home laptop) with their single device-based license
Currency	No	USD	3 chars	ISO 4217 currency code. The code must match one of the codes already existing in the database. Please contact 1E if you need to add additional codes to the database. Code Symbol USD $ EUR € GBP £ JPY ¥

Column	Mandatory	Default if not specified	Datatype	Notes
				CAD C$ AUD A$ CNY ¥ CHF Fr. SGD S$ HKD HK$ ZAR R$
UnitCost	No	0	Decimal	Cost of licence per unit
TotalCost	Yes for **Agreement**.	For **License** and **Maintenance**, the value is automatically calculated if Unit Cost Type is **OnceOff**, and values are povided in Quantity and Unit Cost.	Decimal	For **Agreement**, this value must be supplied. It appears as **License Cost** in the Agreement page. For **License** and **Maintenance**, do not provide a value. It will be automatically calculated if Unit Cost Type is **OnceOff**, and values are povided in Quantity and Unit Cost.
UnitCostType	No	OnceOff	String	Valid values are: OnceOff

Column	Mandatory	Default if not specified	Datatype	Notes
				Monthly Quarterly Yearly
Comments	No		String	Used for any comments you want to import. If an AppClarity 5.2 entitlement includes any of the following product details, these will be exported in the comments field: Colloquial SubVersion Registration Key Persistent Id Entitlement Key Channel Type Product Family UNSPSC Code ParentEntitlementId - In AppClarity 7.0 an entitlement can only have one parent or none. When exporting from AppClarity 5.2, if any entitlement has multiple parents then only one will

Column	Mandatory	Default if not specified	Datatype	Notes
				be used in the ParentEntitlementId column, and the ParentEntitlementId of the others will appear here in the Comments column.
MasterAllocationPercentage	No		Integer	Not supported. This is to handle complex agreement scenarios; currently not supported. There are Agreements where total amount is fixed and can be distributed among various entitlements in that agreement. This defines the percentage of that amount allocated to this entitlement.

10.6.7.2 FOSSDetail (3)

Column	Mandatory	Default	Datatype	Notes
FossDetail.FossDetailId	No		String	**Warning** Do not use for imports.
FossDetail.IsFoss	No		Boolean	This value is true only if the granted rights fulfil the requirements of the definition of free software

Column	Mandatory	Default	Datatype	Notes
				maintained by the Free Software Foundation (FSF)
FossDetail.CopyLeft	No		String	This value provides information on whether derivative works (which are always allowed for open source software) are themselves required to be open source software. There are three allowed values: **strong** - that all kinds of derivative works are required to be open source software themselves **no** - means that for all kinds of derivative works, it is allowed to distribute the derivative work as proprietary software **weak** - the intermediate value means that there are some restrictions and the details are to be checked in the license
FossDetail.TrademarkRestrictions	No		String	FOSS trademark restrictions

10.6.7.3 Internal Order (4)

Column	Mandatory	Default	Datatype	Notes
InternalOrder.InternalOrderId	No		String	**Warning** Do not use for imports.

Column	Mandatory	Default	Datatype	Notes
InternalOrder.Number	No		String	Free text but recommendation is integer
InternalOrder.LineItemNumber	No		String	Free text but recommendation is integer
InternalOrder.Date	No		Date	Date

10.6.7.4 Licensor Detail (5)

Column	Mandatory	Default	Datatype	Notes
LicensorDetail.LicensorDetailId	No	NULL	String	**Warning** Do not use for imports.
LicensorDetail.Name	No	NULL	String	The name of the licensor, could be the vendor or a VAR
LicensorDetail.Number	No	NULL	String	This is intended as a reference to a licensor source other than an invoice, e.g. to an on-line portal of license purchases. Free text but recommendation is integer
LicensorDetail.Date	No	NULL	Date	Date

10.6.7.5 Miscellaneous Details (6)

Column	Mandatory	Default	Datatype	Notes
MiscellaneousDetail.MiscellaneousDetailId	No	NULL	String	**Warning** Do not use for imports.
MiscellaneousDetail.ManagementGroup	No	NULL	String	The entitlement can be associated with

Column	Mandatory	Default	Datatype	Notes
				the specified Management Group. **Warning** The management group must already exist. **Note** In the current version of AppClarity, associations with management groups do not affect compliance calculations. Calculations apply to all devices in the repository, irrespective of Management Groups.
MiscellaneousDetail.BusinessUnit	No	NULL	String	May be covered by Management Group, but may not - in the VA, this is the Pillar the software is

Column	Mandatory	Default	Datatype	Notes
				associated with. (Kapil Makhija)
MiscellaneousDetail.Sponsor	No	NULL	String	Name of the person who manages the budget associated with an agreement (likely used only on agreements, but could be extended to individual entitlements)

10.6.7.6 Audit Detail (7)

Column	Mandatory	Default	Datatype	Notes
AuditDetail.AuditDetailId	No	NULL	String	**Warning** Do not use for imports.
AuditDetail.Auditor	No	NULL	String	Names of organisations entitled to perform the audit including, if appropriate, the licensor organisation and third party organisations according to what was agreed in the contract.
AuditDetail.Frequency	No	NULL	String	Definition of the highest agreed frequency of the audit expressed in months
AuditDetail.Tool	No	NULL	String	Name of the tool(s) which are approved for use in the audit.
AuditDetail.NoticePeriod	No	NULL	Integer	Notice period expressed in months
AuditDetail.Scope	No	NULL	String	Defines what part of the software customer organisation is allowed to be audited.

Column	Mandatory	Default	Datatype	Notes
AuditDetail.Clause	No	NULL	String	Provides additional information on what could trigger the audit.

10.6.7.7 Contract (8)

Column	Mandatory	Default	Datatype	Notes
Contract.ContractId	No	NULL	String	Identity id of the contract. This is auto-generated as a GUID if the entitlement was created in the user-interface. **Warning** Do not use for imports.
Contract.Data	No	NULL	String	**Warning** Do not use for imports.
Contract.Name	No	NULL	String	Name of the contract.
Contract.Number	No	NULL	Integer	Contract number
Contract.StartDate	Yes	NULL	Date	When the contracts starts applying
Contract.Link	No	NULL	String	A link to a referenced contract (not uploaded)
Contract.Resource	No	NULL	String	Name of the person who manages the agreement (likely used only on agreements, but could be extended to individual entitlements)
Contract.TechnicalResource	No	NULL	String	Name of the person who knows the technical details behind licensing, or product information for an agreement (likely only used on

Column	Mandatory	Default	Datatype	Notes
				agreements, but could be extended to individual entitlements)
Contract.FileName		NULL		If there is any attachment - then what? (currently not supported through tsv file)

10.6.7.8 Direct Supplier (9)

Column	Mandatory	Default	Datatype	Notes
DirectSupplier.DirectSupplierId	No	NULL	String	**Warning** Do not use for imports.
DirectSupplier.Number	No	NULL	String	Free text but recommendation is integer
DirectSupplier.LineItemNumber	No	NULL	Integer	LineItemNumber
DirectSupplier.Date	No	NULL	Date	Date

10.6.7.9 Invoice Detail (10)

Column	Mandatory	Default	Datatype	Notes
InvoiceDetail.InvoiceDetailId	No	NULL	String	**Warning** Do not use for imports.
InvoiceDetail.Number	No	NULL	String	Free text but recommendation is integer
InvoiceDetail.LineItemNumber	No	NULL	Integer	Line item number
InvoiceDetail.Date	No	NULL	Date	Date

10.6.7.10 Purchase Order Detail (11)

Column	Mandatory	Default	Datatype	Notes
PurchaseOrderDetail.PurchaseOrderDetailId	No	NULL	String	**Warning** Do not use for imports.
PurchaseOrderDetail.Number	No	NULL	String	Free text but recommendation is integer
PurchaseOrderDetail.LineItemNumber	No	NULL	Integer	LineItemNumber
PurchaseOrderDetail.Date	No	NULL	Date	Date

10.6.8 AppClarity release information

10.6.8.1 AppClarity 8.1 Release Notes – last updated 05-August-2022

These notes contain late-breaking information about AppClarity that you need to have to successfully install and use the product. For the most up-to-date information, please see the online readme. You should read these release notes and the online documentation for AppClarity thoroughly before installing the software.

10.6.8.1.1 New features in AppClarity 8.1

Works with Tachyon Platform 8.1

No features or feature changes added in this release, but includes any hotfixes from previous versions.

10.6.8.2 Troubleshooting

10.6.8.2.1 Online help

Nomad comes with online help that shows you how to install, configure and use the product. Click the following link to view the help:

Introducing AppClarity

For support queries, please:

Use https://support.1e.com/ where you can search the KB or submit a support case.

Contact support@1e.com.

10.6.8.2.2 Known issues

The current known issues related to the installation and running of AppClarity can be found in the Troubleshooting Known issues page of the AppClarity documentation.

Known issues for the Platform and other applications can be found in the 1E platform - Known issues documentation.

10.6.8.3 AppClarity Release History

10.6.8.3.1 AppClarity 8.1.?.??? Web release (01 Mar 2022)

Works with Tachyon Platform 8.1

No features or feature changes added in this release, but includes any hotfixes from previous versions.

10.6.8.3.2 AppClarity 8.0.5.xx Web release (01 Nov 2021)

Works with Tachyon Platform 8.0

No features or feature changes added in this release, but includes any hotfixes from previous versions.

10.6.8.3.3 AppClarity 7.1.105.xx Web release (01 April 2021)

Works with Tachyon Platform 5.2

No features or feature changes added in this maintenance release.

10.6.8.3.4 AppClarity 7.1.0.95 Web release (27 July 2020)

Works with Tachyon 5.1

Windows Server OS LDC

Support for Currency Conversion

New UI controls

AppClarity is now included in Tachyon Setup and can be installed and maintained this way

Enhancements

Entitlement

License Demand

Compliance

Reclaim

10.6.8.3.5 AppClarity 7.0.0.206 Web release (17 Mar 2020)

Management Group view in LDC, Entitlements and Compliance

New UX with improved display and dashboards

RBAC feature to access screens and Reports

RHEL Server LDC

Custom SCCM Uninstall

User Based Compliance

Indirect and/or direct association of maintenance with license

Fallback approach to improve Compliance mechanism

Maintenance quantity consumption behavior is restructured

Device Exempted from LDC/Compliance

Performance Improvements in Reclaim Consolidation and Reporting

Improvements in entitlement connector (import from TSV and APC 5.2.300)

Wildcard support in entitlement

License Position (ELP) Report enhancements

Addition of User, Socket metrics in entitlement

10.6.8.3.6 AppClarity 6.1.100.57 Web release (14 Nov 2018)

Loading image jammed up on bulk publishing the entitlements.

Auto triggering the Entitlement and Reclaim consolidation on Publish.

Reclaim policy creation on any product exist in Catalog.

'Pending Administrative Actions' notification on Published Reclaim Policies.

Overlapping/Overriding reclaim policies Published as "Disabled", to set the precedence first.

'Management group names' information on Policy Precedence page.

Ability to refresh only one LDC at a time, instead of all LDC refresh.

License/Maintenance entitlements give option to view "Licensable" products only.

FIPS support.

Support for TLS 1.1 and TLS 1.2.

10.6.8.3.7 AppClarity 6.1.0.30 Web release (26 July 2018)

Entitlement

License Demand Calculation (LDC)

Reclaim

SLA Platform - the new AppClarity is built upon the SLA Platform

Tachyon powered

10.6.8.4 AppClarity features by release

10.6.8.4.1 Summary

List of AppClarity features organized by the release they were implemented in. Links through to the features have been provided for convenience.

10.6.8.4.2 New features in AppClarity 8.1

This main release contains the following features:

Works with Tachyon Platform 8.1

No features or feature changes added in this release, but includes any hotfixes from previous versions.

10.6.8.4.3 AppClarity 8.0

Works with Tachyon Platform 8.0

No features or feature changes added in this release, but includes any hotfixes from previous versions.

10.6.8.4.4 AppClarity 7.1

10.6.8.4.4.1 AppClarity 7.1.105

This maintenance release contains a number of bug fixes:

Works with Tachyon Platform 5.2

No features or feature changes added in this maintenance release.

10.6.8.4.4.2 Features in the AppClarity 7.1 main release

This release introduced the following features:

Works with Tachyon 5.1

Windows Server OS LDC

New license demand for core based licensing of Windows Server OS (calculated with-in Microsoft Core LDC)

Compliance calculation is now based on new license demand

Support for Currency Conversion

When you can set a default currency (other than USD) AppClarity now renders all reporting and financial numbers (or graphs) only in that set currency

New UI controls added to improve usability:

Report refresh - ability to refresh reports on individual pages, and the ability to view the status of the last report refresh

UI Controls - ability to choose columns as either shown or hidden on individual screens

Installation mode change

AppClarity is now included in Tachyon Setup and can be installed and maintained this way

Hotfixing capability

Enhancements

Entitlement

New Active Entitlements Only toggle filter on Entitlement Summary page

The ability to export entitlement summary data

License Demand

Device names are now shown as hyperlinks on LDC reports

Compliance

Improved logic for rendering installs, and a new "Exempt" status on the compliance detailed table

Effective License Position (ELP) displayed for SQL Server components as it is for SQL Server entitlement

Reclaim

Reclaim product usage screen loading time is optimized for quick page load.

10.6.8.4.5 AppClarity 7.0

10.6.8.4.5.1 AppClarity 7.0 will significantly enhance your Software Asset Management (SAM) capabilities.

Improved Usability

The New UI experience is more user friendly compared to previous version, applying sorting, filtering etc is much easier

There are additional navigation options for operational ease

There are interactive charts in the Entitlement and Reclaim sections and more detailed compliance reports

There are suggestions on Top 10 reclaim policies users should create for maximum savings

Compliance and usage are shown in same pane for users to make informed procurement decisions.

SaaS Monitoring

Manage Renewals - monitor usage and renew only active subscriptions

Reallocate licenses: Monitor usage and reallocate under utilized subscriptions to other users

Compare usage of competing products - if users use apps from multiple vendors to achieve same things, consolidate to one/fewer vendors based on usage.

AI Powered Autocuration

Removes the delay in software identification so there's no delay in identifying software

Increases productivity, so users no longer have to spend hundreds of hours curating software, AI can help automatically match majority of the software as soon as they appear in the estate.

Avoids human errors, the AI is a more reliable and accurate source normalization

Users can enable AI-powered Autocuration to automatically identify installed software in the estate if recognized at a very high confidence level

If the confidence is lower than the threshold, it appears as a suggestion for customers to quickly add review and add the match rules, making it extremely quick to manage the unknown/unmatched software.

User-based Compliance

Ability to show license demand per user

Optimize procurement - customers can save significant cost by identifying when same users have access to same apps on multiple devices

Audit defence - gives users the ability to report accurately on apps that are licensed per user when vendor audits take place

There is software which can be licensed on both device as well as user metrics, AppClarity 7.0 will use entitlements of both metrics (user and device) to compute compliance and effective license position.

Compliance by Management Group

Entitlements can now be affiliated to specific Management Groups, allowing users to compute and view license demand for those Management Groups

Software Audits, entitlements are valid to be used only in a particular region

Internal Chargeback, budgets/profitability of a specific cost center

Specific Management Group Owner, when specific users view/monitor compliance for a specific Management Group.

Exempt Device(s) from license demand & Compliance

Exempt Device(s) from license demand and compliance calculations using Management Groups – exempt devices for accurate License Demand Compliance (LDC) reporting

Accurate reporting allows users to input company specific context into AppClarity so they don't have to adjust the AppClarity report every time they need to assess their license position

Once the license exemptions are specified in the product, users do not need to worry about manually adjusting the numbers

MSDN: Devices used by MSDN subscribers for Dev purposes only

MSDN subscribers get umbrella access to numerous MS products including Visual Studio, Visio, Project, Office, SQL Server etc. These subscribers usually access a very well defined set of devices, which are used for development purposes only. Customers do not wish to count licenses for those software in LDC/Compliance reports as those are all covered under MSDN licenses.

Customers can exempt select devices, by adding those to a specific management group name (pre-defined template) to exempt those for Microsoft LDC and compliance reports

Helps customers compute accurate license demand for renewal/true-up

Test/Disaster Recovery/Admin/Third Party Devices - customers do not want certain devices to be considered for license/compliance calculations

There are devices purely used for Disaster Recovery, backups, testing, or belong to a third party and do not need to be licensed, customers can add exempt those devices (and all its installs) for a specific vendor or for ALL vendors by adding them to a specific Management Group.

The feature does not allow you to exempt devices for specific software, they can either exempt devices for all software from a particular vendor or all software of all installs.

RedHat LDC

Audit defence, users can respond to audits, compliance reports can help assess compliance position and mitigate risks

Optimization, reduce your software cost by applying the most efficient and cost effective way of licensing the estate

Renewal exercise, users can renew RedHat agreement using RedHat LDC reports

Users can compute license demand for RedHat products (LDC), counter on Sockets on devices

Users can compute Compliance position based on available entitlements and compute effective license position

Helps customers prepare for RedHat renewals/true-up exercise.

Role Based Access Control (RBAC), access to screens/actions as per role/permissions provided to user

Control Access, avoid unwanted access to different SAM team members, ensure data security and governance

Users will be able to control access to screens and actions (read/write/edit) on each screen for every role

There are a few pre-defined roles with appropriate permissions, however, users can create their custom roles by selecting from the list of permissions for each role.

Custom SCCM Uninstall

Offers an alternative way of uninstalling software, customers using SCCM and building custom packages can trigger SCCM-driven software uninstalls based on reclaim policies defined in AppClarity

If customers have created apps/packages in SCCM they want to use for uninstallation, they can use SCCM to Uninstall software, users can choose SCCM collection type as Device/User/or Both for a given policy.

Identify Vulnerabilities

Identify Vulnerabilities – end of support date, Software Category, and Latest Known Version fields have been exposed on UI for users to be able to identify vulnerabilities.

End of support (EoS) date - helps users identify installs nearing EoS or Past EoS, prompting users to upgrade

Latest Version Known for a software in 1E Catalog - allows users to see if they're on the latest version of the software release that's installed, once this new version is seen, other installations not updated will be identified as not on the latest version

Top Software Categories - shows you the number of different products you have in the same software category, for example, if users have 4 different BI products – that may be something like PowerBI, QlickView, Tableau and ThoughtSpot – it enables them to identify areas for consolidation and more effective negotiations for pricing on the consolidated title.

10.6.8.4.6 AppClarity 6.1

10.6.8.4.6.1 AppClarity 6.1.100

This maintenance release introduced the following enhancements:

Entitlement consolidation reports are automatically run when publishing entitlements.

Reclaim consolidation reports are automatically run when publishing reclaim policies.

Reclaim policies can now be created for any product that exists in the 1E Catalog, previously reclaim policies could only be created for software currently installed in the environment.

Pending administrative actions notifications are now displayed for Published Reclaim Policies when an action is expected of the AppClarity administrator. For example, the administrator needs to respond to a user opting out of a reclaim.

Overlapping/Overriding reclaim policies are now automatically published as disabled. This gives the administrator the opportunity to set the precedence before the reclaim policies become active.

Information on the Management Groups a reclaim policy applies to is now displayed on the Policy Precedence page. This gives the administrator the information they need in order to appropriately set the precedence for overlapping reclaim policies.

Ability to refresh only one License Demand Calculation (LDC) report at a time, previously refreshing an LDC also forced the refresh of the LDCs below it on the page.

License/Maintenance entitlements now provide an option to view **Licensable** products only.

FIPS support.

Support for TLS 1.1 and TLS 1.2.

10.6.8.4.6.2 Features in the AppClarity 6.1 main release

This release introduced the following features:

Entitlement - there are a whole set of features that help you model your organization's entitlements:

Create a centralized collection of all your entitlements in AppClarity, using an ISO 19770-3 aligned entitlement library

Create license, maintenance and agreement entitlements, with associated product usage rights. You can also attach Contracts, containing the proof of license ownership, to the entitlements

Bulk upload of entitlements using TSV files to create draft entitlements for verification, before bulk publishing them

Use SKU to create entitlements; SKU auto-populate product specifications and use-rights

Link one entitlement to another to help model complex agreements and contracts

Upload soft copies of contracts

Create separate sets of entitlements in different repositories

Schedule Entitlement consolidation to run at regular intervals

License Demand Calculation (LDC) Reports - AppClarity lets you calculate how many licenses you need for specific products with complex license requirements

Perform license demand calculations for complex license metrics. Currently related to Microsoft SQL Server, IBM PVUs, and Oracle Processors

Use LDCs to compute the optimum number of licenses required to cover your complex virtual/physical/clustered server environment, letting you see the best way to purchase new licenses or renew your subscription-based licenses

Review records that couldn't be processed by AppClarity for any reason to perform due diligence and mitigate risk

Schedule LDC consolidations to run at regular intervals

Compliance - these features let you gauge how well your entitlements cover your installations

View the compliance position of each software based on your entitlements

Optimally make use of licenses to compute your compliance position

Review records that couldn't be processed by AppClarity for any reason to perform due diligence and mitigate risk

View compliant and non-compliant installations

Create separate compliance repositories for separate environments by linking them to a unique set of Inventory and Entitlement repositories

Reclaim - these features let you reclaim software to minimize license costs or protect your devices

Reclaim software based on software usage

Create policies for software you want to reclaim

Create policies that are focused on particular management groups

If policies overlap across management groups, your can set their precedence to resolve conflict

Evaluate the impact of a policy by running a pre-flight report before putting it into production

View Software saving reports showing the value of software reclaims performed using Appclarity

Schedule reclaim consolidations to run at regular intervals so that you are viewing up to date information

SLA Platform - the new AppClarity is built upon the SLA Platform and is able to use its consolidated inventory data to derive software installations and usage.

SLA Platform now contains two new connectors:

Tachyon powered inventory - information gathered by Tachyon can be used to augment the software and hardware inventory and software usage data, normally found in Microsoft System Center Configuration Manager, or to enable AppClarity solutions to work in environments where no Configuration Manager or other inventory tools are available. Using the Tachyon inventory data source means that the information displayed in AppClarity will be more accurate and up-to-date than using Configuration Manager on its own. Each device will need to have the Tachyon Agent installed, which will enable Tachyon to bring inventory data where no other solution agents are present or where they are not responding. If you have Configuration Manager installed, but without the SQL MOF implemented, Tachyon will fill in the gaps in the Configuration Manager data to provide information about the SQL Server editions in your environment. Currently this is specific to SQL Server but will be extended to include more products in subsequent releases.

IBM BigFix inventory connector - an IBM BigFix connector has been added to the SLA Platform enabling AppClarity to work in environments where that product is being used to manage your computer software estate.

AppClarity Business Intelligence dashboard - The new Business Intelligence SLA Platform consumer provides several dashboard tiles that let you view and examine your AppClarity features graphically.

10.6.9 Glossary

A glossary of AppClarity terminology.

10.6.9.1 AppClarity alphabetical glossary

Term	Definition
Across Mgmt Grp Policies column	This column is displayed on the Usage Summary page. The **Across Mgmt Grp Policies** column shows the number of policies for a product across all management groups.
Active Agreements only	This toggle is displayed on the Agreements page. The **Active Agreements only** toggle adds a filter when it's turned on that filters the table to only display the agreements that have been published and not the ones that are in draft.

Term	Definition
toggle	
Active Entitlements only toggle	This toggle is displayed on the Licenses / Maintenances page and the Entitlements page. The **Active Entitlements only** toggle adds a filter when it's turned on that filters the table to only display the entitlements that have been published and not the ones that are in draft.
Active Policies Only toggle	This toggle is displayed on the Policies page. The **Active Policies Only** toggle adds a filter when it's turned on that filters the table to only display the reclaim policies that have been published and their status is set to enabled.
Agreement entitlement	An agreement entitlement type in AppClarity provides a structure to license and maintenance entitlements. Agreements can be used to model the contractual structure an organization uses for their purchasing process, or their internal software disbursement process.
AppClarity	AppClarity is a software asset management (SAM) tool that enables you to define entitlements and determine your license compliance position. It does this based on the software and hardware inventory data provided by the Software Lifecycle Automation (SLA) Platform that AppClarity is installed on. The software inventory also includes details of product usage which can be used by AppClarity as the basis for its policy-based software reclaim capabilities.
AppClarity administrator	These users are initially defined in SLA Platform by the primary SLA Platform administrator (typically the SLA Platform installation account). They are able to set up repositories, create connectors, defined schedules and run AppClarity reports etc.

Term	Definition
Application	Synonymous with software product. Also known as App.
Back link	Each page in AppClarity has a back link on the page. Clicking this link takes you back to the previous page you were browsing, and works differently to the browser's back button for this application in that it takes you to the last page you were on in the application.
Bundle	[ISO/IEC 19770-5, 3.1.4] A grouping of products which is the result of a marketing/licensing strategy to sell entitlements to multiple products as one purchased item. A bundle can be referred to as a “suite”, if the products are closely related and typically integrated (such as an office suite containing a spreadsheet, word processor, presentation and other related items). Bundles can also refer to software titles that are less closely related such as a game, a virus scanner and a utility “bundled” together with a new computer, or to groups of entitlements, such as multiple entitlements for a backup software product.
Canonical representation	In SLA Platform this specifically refers to representations of software products, devices and processors having all the attributes that they need to be used consistently. **Product canonical representation** Products consist of software vendor, title, version and edition entries in the catalog that are structured as follows.AttributeDescriptionVendorPublisher of the software title, for example Microsoft Corporation.TitleName of the software product, for example Visio.VersionFull version number of each release of the product.EditionIf the product is an edition based product, the editions of this specific version of the product.Edition Match rulesRules that link one or more inventory source data entries to this specific edition, of this version, of this product.End of support datesDate when this version of the product is due to go end of support.Colloquial versionIf the product uses colloquial versions, then the one related to this specific version, for example 2013.Version match rulesRules that link one or more inventory source data entries to this specific version of this product.UNSPSCUnited Nations Standard Products and Services Code for this product, for example 43233004 for operating systems. **Device canonical representation** AttributeDescriptionVendorDevice vendor, for example, Dell.Device TypeDevice type, for example Desktop.FamilyDevice family, for example, Inspiron.ModelDevice Model, for example, 400.Max Socket CountMaximum number of sockets for the device, for

Term	Definition
	example, 1.Device Match RulesRules that link one or more inventory source data entries to this specific device, device type, family and model. **Processor canonical representation** AttributeDescriptionVendorProcessor vendor, for example, Advanced Micro Devices Inc.Processor TypeProcessor type, for example, Desktop.FamilyProcessor family, for example, A10.ModelProcessor model, for example, 5700.FrequencyProcessor frequency, for example, 3,400.SocketThe socket type the processor uses, for example, FMZ.Core CountProcessor core count, for example, 4.Threads per coreThe number of threads per core for the processor, for example, 2.
Canonical Version column	The **Canonical Version** column is displayed on the **Device Detailed** table on the Summary by Installs page and on the License Position page.The canonical representation of the productversion installed on a device.
Category column	This column is displayed on the Usage Summary page.The **Category** column shows the category for each product.
Catalog curator	This user is responsible for curating the matching rules in the 1E Catalog.
Classification column	The **Classification** column is displayed on the following pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page Displays the classification for the device where the software is installed. If set this may be one of:

Term	Definition
	Classification Production Test
Clear all filters link	On most pages in AppClarity where a filter can be set there is also a **Clear all filters** link, this enables you in a single-click to clear all of the filters set in the **FILTER BY** field.
Cluster Name column	The **Cluster Name** column is displayed on the following pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page The Cluster Name, if any, where the software in the License Demand report is installed.
Colloquial version	The colloquial version name for the product. For example, **2003**, **2016** etc. This is an additional attribute to the vendor, title, version and edition for a software product that may identify a range of versions. See also Version.
Column filters	Some tables contain a column filter that lets you easily filter the information displayed in the table.**Using column filters**The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.To filter the table on the **Edition** column:Click on the filter iconjust beneath the header row in the **Edition** column.The filter popup is displayed.Now select the operator. In our example this will be **contains**.Then type the text **Prof** into the text field.Click **Apply** and a new filter will be added to the table.The table will be filtered to just those items whose **Edition** contains the text **Prof**.**Adding another filter**You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.**Removing filters**You can remove filters by clicking on the filter close icon at the end of the filter.

Term	Definition
Column Picker	**Using column picker**Where the column picker control is shown you can choose which columns are displayed. In the following example on the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.To pick the displayed columns:Click on the Choose columns iconto the right of the header row to view the visible columns.To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.The **Unknown Installs** column is now hidden.To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.The Microsoft Core License Demand page has now been automatically updated with our changes.
Column sorts	Some tables contain column sorts that let you easily re-order the information displayed in the table.**Using column sorts**The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column:Click on the sort iconjust beneath the header row in the **Cost** column.The sort popup is displayed.Now select the sort direction. In our example this will be **Sort descending**.After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon**Clearing the sort**You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.
Comments column	The **Comments** column is displayed on the **Device Detailed** table on the Summary by Installs page. This column provides comments on how the entitlement is applied to the installation. Currently this indicates whether the installation has been exempted or not. The **Comments** column is displayed on the following Licence Demand Detailed Reports pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page Provides recommendations on how to license the software to achieve the optimum license demand.
Completi	This column indicates the date the reclaim policy was applied and completed.

Term	Definition
on Date colu mn	
Com plian ce Cate gory colu mn	The **Compliance Category** column is displayed on the License Summary page. This column displays a compliance status bar for each product.  This bar displays a summary of the compliance status for the product installations in the selected compliance repository, taking into account any entitlements you have added. Hovering over the bar displays a summary of the compliance breakdown for the product. This is divided into **Compliant**, **Non-compliant** and **Exempt** installations. Clicking on the bar displays the Summary by Installs page for the selected product.
Com plian ce positi on	The compliance position describes the comparison between the installed versions of a product and the entitlements held for that product. In AppClarity you can view your compliance position using the License Summary page. For a description of how you would use that page please refer to Viewing product compliance.
Com plian ce repos itory	AppClarity extends SLA Platform to include two new repository types: compliance and entitlement. Compliance repositories have their own reports that combine information from an SLA Platform inventory repository with an entitlement repository to determine a company's compliance position.
Com plian ce repos itory selec tor	This field lets you select the repository where the compliance data displayed on the page comes from. By default this is set to **Default Compliance**. If you have created your own compliance repositories, click on the name to select these from the drop-down list.
Com plian ce	This column displays an indicator for the current compliance status for the product.

Term	Definition
Status column	
Compliant Installs column	This column provides a count of the compliant installations for the product. When the number is not zero this is a link to a list of devices where the product is installed.
Components	Components refer to the bundled software related to a license. For example you may have a bundle for **Microsoft BackOffice Small Business Server**, which would contain components for **Exchange Server**, **FrontPage**, **Internet Explorer** and **Outlook**.
Connectors	A feature which enables SLA Platform to communicate with external systems, usually data sources.
Consolidation	The process of taking raw inventory data from different inventory data sources and combining them into a single de-duplicated data set in SLA Platform. For example, taking software inventory from Tachyon, Big Fix and Configuration Manager into a single usable repository.
Consumed column	The **Consumed** column is displayed on the Summary by Installs page. Shows the number of licenses consumed by installations from a particular entitlement.
Contract entitlement	A contract entitlement type in AppClarity represents the evidence or proof that the license exists and is genuine. It is an artifact that can be virtually anything - it may be a scan of the signed contract for an enterprise agreement, for example, or it could be a PDF of the use rights for the software. Essentially the contract is where you will link file details that describe the specifics of an agreement.
Contract	This user validates that contracts have been entered properly and that all prioritized contracts are managed.

Term	Definition
manager	
Cores column	The **Cores** column is displayed on the following pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page Displays the number of processor cores available on the mainboard for the device where the software is installed.
Cost column	The **Cost** column is displayed on the Licenses / Maintenances page:The **Cost** column displays the cost for each entitlement in the table.
Curation	Firstly, the process of defining the canonical representations in the 1E Catalog to be used by 1E companion products including: SLA Platform and AppClarity. Secondly, the process of defining the matching rules that will enable the normalization of the software products, processors and devices found in your environment into those canonical representations.
Description column	This column describes the reclaim action. Generally this is set to **Reclaimer Uninstall**.
Edition	The edition portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Standard** or **-** (where no edition exists).
Edition column	The **Edition** column in AppClarity pages displays information related to the edition of a product. Depending on the context this may show different things: On entitlement pages this will show:The edition portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement is for. For example, **Standard** or **-** (where no edition is specified or exists). On the License Position page this will show:

Term	Definition
	The edition portion of the vendor, title, version and edition attributes that are used to identify which software product the compliance status relates to. On the reclaim Usage Summary page and the Savings page this will show: The edition portion of the vendor, title, version and edition attributes that are used to identify which software product the reclaim policy was applied to.
Editions column	On the reclaim pages in AppClarity an **Editions** column is sometimes displayed. This shows a list of editions that determine which products the reclaim policy will be aimed at. The edition portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Standard** or **-** (where no edition exists).
Effective License Position column	The effective license position is a calculation of the entitlements for a particular software product against the installations for that product. It may be one of: a negative number, in which case there are more installations for that software product than entitlements zero where the numbers match exactly a positive number, which indicates you have paid for more licenses than you are using. Your ideal is to get the numbers positive but as close to zero as fits in with your current and predicted demand.
End Date column	The End Date column is displayed on the Licenses / Maintenances page: The **End Date** column shows the date the entitlement will end.
Entitlement	In AppClarity an entitlement refers to a license, maintenance or agreement that may be linked together to define the owned rights to use or install a particular software product. License entitlements count towards a companies compliance position against the number of installations of a particular product.
Entitlement repository	Entitlement repositories hold the entitlements entered by AppClarity users for specific software products.

Term	Definition
Entitlement type	The type for a particular entitlement. This may be one of: Perpetual Subscription Maintenance
Entitlement Type chart	The **Entitlement Type** chart is displayed on the Summary Report page. This chart shows the breakdown and numbers for the Entitlements Records in the selected Entitlements repository according to their Entitlement type: Perpetual, Subscription or Maintenance. Entitlements Records chart	The **Entitlements Records** chart is displayed on the Summary Report page. This chart shows the percentage of the total number of Entitlements Records in the selected Entitlements repository that are currently being displayed on this page as a result of the applied filters. The figures below the chart show the number of Entitlements Records being displayed over the total number of Entitlements Records in the selected Entitlements repository. Entitlements repository selector	This field lets you select the repository where the entitlements data displayed on the page comes from. By default this is set to **Default Entitlements**. If you have created your own entitlements repositories, click on the name to select any of these from the drop-down list.

Term	Definition
Entitlements Available	This column provides a count of the entitlements currently defined for the product.
Exempted column	The **Exempted** column is displayed on the Summary by Installs page. This column provides a count of the exempted installations that are associated with an exemption management group. Please refer to Excluding devices from License Demand Calculation using Management Groups for more details.
Export all button	Pages in AppClarity that include an **Export all** button allow you to export all the data for any tables of information displayed on the page. This may also include columns that are not currently visible in the table display.
Host Name column	The **Host Name** column is displayed on the Reclaim History page. Displays the host name for the device where the reclaim policy was applied.
Identifier column	The **Identifier** column is displayed on the Licenses / Maintenances page and Agreements page. Displays the **Identifier** information configured for the entitlement or agreement.
Installs column	The **Licensed Software** column displayed on the **License Demand** table for each of the following License Demand and License Demand - Detailed Reports:

License Demand Report	License Demand Detailed Report
Microsoft Core License Demand page	Microsoft Core License Demand - Detailed Report page
IBM Processor Value Unit (PVU) License Demand page	IBM Processor Value Unit (PVU) License Demand - Detailed Report page
Oracle Processor License Demand page	Oracle Processor License Demand - Detailed Report page

Term	Definition
	Red Hat Socket Demand page Red Hat Socket Demand - Detailed Report page This column shows the number of installs for the software titles that are part of the License Demand report.
Inventory	Inventory is the hardware, software and software usage information from your environment. This information is gathered by SLA Platform and placed into an Inventory repository for use by consumers, such as AppClarity.
Inventory repository	An inventory repository is a consolidated view containing inventory information from your network. SLA Platform uses connectors to fetch information from the inventory sources, which is then processed until it becomes usable by the consumers of the SLA Platform.
Lic Qty column	The **Lic Qty** column is displayed on the Summary Report page. The **Lic Qty** column shows the number of licenses related to each Entitlement in the table.
License Consumed column	The **License Consumed** column is displayed on the **Device Detailed** table on the Summary by Installs page. This column shows the number of available licenses consumed by the software on the device where it is installed.
License Demand Calculation reports	AppClarity provides a number of license demand calculation reports that show information on the license demand for complex product licensing. These reports are described in Calculating license demand.
License Demand	The **License Demand** column is displayed on the **Device Detailed** table on the Summary by Installs page. The license demand for the software on the device where the software is installed.

Term	Definition
column	The **Licensed Software** column displayed on the **License Demand** table for each of the following License Demand and License Demand - Detailed Reports: License Demand Report / License Demand Detailed Report Microsoft Core License Demand page / Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand page / IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand page / Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand page / Red Hat Socket Demand - Detailed Report page This column shows the license demand for the software titles that are part of the License Demand report.
License Edition	The **License Edition** column is displayed on the **Entitlement Summary** table on the Summary by Installs page. The edition for the software as defined in the entitlement.
License entitlement	A license entitlement type in AppClarity specifies the rights and limitations of software and/or services that may be installed and/or used on an organizations computing devices. For example you could specify a license for Microsoft Visio 2016 and enable version downgrade rights to ensure that the license covers all versions up to 2016.
License Position column	The **License Position** column is displayed on the License Position page. Shows the license position for the product calculated by subtracting the value in the **Total Units Consumed** column from the value in the **Total Licensed Units** column. Negative numbers in red indicate a license deficit. Positive numbers in black indicates a license excess.
License Title	The **License Title** column is displayed on the **Entitlement Summary** table on the Summary by Installs page. The title for the software as defined in the entitlement.

Term	Definition
column	
License Vendor column	The **License Vendor** column is displayed on the **Entitlement Summary** table on the Summary by Installs page. The vendor for the software as defined in the entitlement.
Licensable toggle	This toggle is displayed on the Usage Summary page. The **Licensable** toggle adds a filter when it's turned on that filters the table to only display the products that are licensable, according to the catalog.
Licensed Software column	The **Licensed Software** column displayed on the **Device Detailed** table on the Summary by Installs page shows the following information. The title for the software installed on a device. The **Licensed Software** column displayed on the **License Demand** table for each of the following License Demand and License Demand - Detailed Reports:

License Demand Report	License Demand Detailed Report
Microsoft Core License Demand page	Microsoft Core License Demand - Detailed Report page
IBM Processor Value Unit (PVU) License Demand page	IBM Processor Value Unit (PVU) License Demand - Detailed Report page
Oracle Processor License Demand page	Oracle Processor License Demand - Detailed Report page
Red Hat Socket Demand page	Red Hat Socket Demand - Detailed Report page

On the these pages the following information is shown:Displays software titles that are part of the License Demand report, where that software also has installations present in the inventory.

Licenses Appli	The **Licenses Applied** column is displayed on the License Summary page.

Term	Definition
ed column	This column provides a count of the licenses that have been applied to the product. If this number is greater than zero it becomes a link to the Licenses / Maintenances page filtered to show the applied licenses.
Links column	The **Links** column is displayed on the Licenses / Maintenances page and Agreements page. Displays the **Parent**, **Associations** and **Children Links** to other entitlements, agreements or contracts configured for the entitlement or agreement.
Machine Name column	The **Machine Name** column is displayed on the Summary by Installs page. The device name where the software is installed. The name is a link that navigates to the **Device Summary** page for the selected device in the **Inventory** application.The **Machine Name** column is also displayed on the License Demand Detailed Reports pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page The device name, if any, where the software in the License Demand report is installed.
Machine Type column	The **Machine Type** column is displayed on the following License Demand Detailed Reports pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page The type of the device where the software in the License Demand report is installed. This may be one of: Machine Type --- Cluster Physical Physical Host

Term	Definition
	Virtual
Maintenance entitlement	A Maintenance entitlement type in AppClarity specifies the rights and limitations for an organization to install and/or use updated versions of software defined in a license. For example you could specify a maintenance entitlement for Microsoft Visio 2016 to cover all new versions from the current date for the next 3 years.
Management Group column	Displays all of the management groups the software reclaim policy is associated with.The **Management Group** column is displayed on the **Entitlement** table on the Summary by Installs page. This column displays the names of the Management Groups an entitlement is associated with.The **Management Group** column is displayed on the **Device Detailed** table on the Summary by Installs page. Displays the number of Management Groups a device is associated with. Clicking on the number displays a popup listing the Management Groups.
Management Group Names column	This column is displayed on the Precedence page. This column contains a **Show** link, which displays a popup containing a list of the Management Group(s) the reclaim policy applies to.
Management Groups	Management Groups are containers used to group devices and the software installed on those devices. Management Groups are defined using configurable rules that look at various properties of the devices and their installed software, these are then evaluated to determine the group membership. This means that Management Group membership adapts to changes to the devices and software in your environment.
Management Groups	Certain pages in AppClarity have a management groups selector. This drop-down lets you select the management group you are interested in. By default this is set to **Global**.

Term	Definition
selector	
Matched Title column	On the reclaim policy pages, this displays the title for the product the reclaim policy will be aimed at.
Matched Vendor column	On the reclaim policy pages, this displays the vendor for the product the reclaim policy will be aimed at.
Matching	The process of taking software product, processor and device data and comparing that with the data held in the 1E Catalog to find a suitable canonical representation. If a completely suitable matching canonical representation is found the software product, processor and device data is said to be normalized. If a suitable matching canonical representation cannot be found the data will be tagged as unmatched and the 1E Catalog will make its best guess at what the canonical representation could be. You can then go through the curation process to either create a new canonical representation or matching rule or both until all the data you need has been normalized.
Matching rules	Matching rules are used to match raw and varied inventory data, which may be imprecise or incomplete, into normalized canonical representations. Software product, processor and device types each have their own canonical schema that enables them to be uniquely identified sufficient for the purposes of the 1E Catalog and its consumers. As a result each of them has a corresponding type of matching rule.
Metric column	The metric type for a license or maintenance entitlement. This may be one of: Type: Core Description: The metric for the license is related to the number of cores present on a device. For example, licenses for **Microsoft SQL database** are related to the number of cores on the server where **Microsoft SQL** is installed.

Term	Definition	
	Device	The metric for the license is for devices. For example licenses for **Microsoft Visio** are on a per device basis. This is the default type.
	Other	This can be used to reference your own license metric type.
	Processor	The metric for the license is related to the number of processors for a device. For example, licenses for certain **Oracle** products are related to the number of processors on the server where the **Oracle** product is installed.
	PVU	The metric for the license is related to the Processor Value Unit present on a device. For example. licenses for **IBM** products are related to the **Processor Value Unit (PVU)** for the device where the IBM product is installed.
	User	The metric for the license is related to the users for the product. For example, **Microsoft Office 365** licenses are related to users and not the devices the software is running on.
Mnt Qty column	The **Mnt Qty** column is displayed on the Summary Report page. The **Mnt Qty** column shows the number of maintenance licenses related to each Entitlement int the table.	
Non-Compliant column	The **Non-Compliant** column is displayed on the Summary by Installs page. This column provides a count of the non-compliant installations for the product.	
Normalization	The process of taking raw inventory data and successfully assigning canonical representations for the software products, processors and devices contained in that data by matching with the 1E Catalog.	
Other Metric	A field in both the New License page and New Maintenance page. This field is only enabled if **Other** is selected in the **Metric Type** for entitlements and allows you to enter a metric that is not covered by the basic **Metric Type** options.	

Term	Definition
Physical Host column	The **Physical Host** column is displayed on the following pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page The Physical Host, if any, where the software in the License Demand report is installed.
Price per Unit (USD) column	This column is displayed on the Usage Summary page. The **Price per Unit (USD)** shows the cost in USD for each license of a product.
Primary User column	The **Primary User** column is displayed on the **Device Detailed** table on the Summary by Installs page. This column displays the user name for the primary user on a device.
Processor Value Unit (PVU)	A license metric used for IBM products. This value is used by AppClarity to calculate license demand for IBM products. A Processor Value Unit (PVU) is a unit of measure used to differentiate licensing of software on distributed processor technologies (defined by Processor Vendor, Brand, Type and Model Number). IBM currently define a processor, for purposes of PVU-based licensing, to be each processor core on a chip (socket).
Processors column	The **Processors** column is displayed on the following pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page Displays the number of processors available on the mainboard for the device where the software is installed.

Term	Definition
Product	A product refers to an item that has a known vendor, title, version and edition (VTVE). In AppClarity this is restricted to software products.
Product SKU column	The **Product SKU** column is displayed on the Licenses / Maintenances page. A SKU (pronounced 'skue') is an identification, usually alphanumeric, of a particular product that allows it to be tracked for inventory purposes. In AppClarity, via the 1E Catalog, a SKU is associated with the license metrics and use rights associated with a particular software product purchase.
Quantity column	The **Quantity** column is displayed on the Licenses / Maintenances page. The **Quantity** column displays the number of licenses covered by the entitlement.
Rarely Used column	This column is displayed on the Usage Summary page. The **Rarely Used** column shows the number of installations for each product that have been reported as being rarely used.
Rarely Used Reclaim Action column	Displays the action that will be taken by a reclaim policy for software with a usage category of rarely used. Please refer to Usage categories for more details.
Reclaim Count column	This column is displayed on the Savings page. A count of the number of reclaims performed by applying this policy.
Reclaim Polici	The **Reclaim Policies** column is displayed on the License Summary page.

Term	Definition
es column	This column provides a count of the reclaim policies that have been associated with the product. If this number is greater than zero it becomes a link to the filtered to show the associated reclaim policies.
Reclaim policy	A reclaim policy is used to define how to reclaim specific software from specific devices under specific circumstances. There are two general types of reclaim possible: reclaims which are mandatory and reclaims where the user on the device can choose whether the reclaim goes ahead or not. Reclaim policies can also be tied to specific management groups to target specific devices.
Reclaim Savings column	This column is displayed on the Savings page. The sum of the estimated savings made by applying this reclaim policy.
Reclaimable toggle	This toggle is displayed on the Usage Summary page. The **Reclaimable** toggle adds a filter when it's turned on that filters the table to only display the products that have a reclaim policy associated with them.
Remaining column	The **Remaining** column is displayed on the Summary by Installs page. Shows the number of licenses remaining for a particular entitlement after subtracting the **Consumed** licenses consumed from the **Total License Units**.
Renewal Due (In Days) chart	The **Renewal Due (In Days)** chart is displayed on the Summary Report page. This chart shows the number of entitlement renewals that are due within certain numbers of days in the selected Entitlements repository. 
Term	Definition
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box: Repository	A repository is an SLA Platform term defining a container for specific types of data. There are three types of repository in AppClarity: Inventory (included with SLA Platform) Entitlement Compliance
Risk(Unknown) column	This column displays an indicator for the compliance risk associated with the product. This is based on whether there are certain aspects of the product that are unknown to AppClarity and therefore it cannot determine with certainty the product's compliance status.
Selected Mgmt Grp Policies column	This column is displayed on the Usage Summary page. The **Selected Mgmt Grp Policies** column shows the number of reclaim policies for a product in the currently selected Management Group.
SAM manager	The SAM manager ensures that the SAM team is properly managing their work priorities and creates, validates and distributes reports.
SAM report viewer	The SAM report viewer is a project manager, contract manager or team lead in the BU, who wants to know the costs of the entitlements used in their projects and to validate their compliance with licenses.
SAM team	The SAM team manage entitlement modifications as needed, based on the day-to-day business operations.

Term	Definition
Software Asset Management (SAM)	SAM is the process by which organizations collect data about entitlements, installation and usage of software and the devices the software runs on, how they use that data to ensure that the organization understands whether they are in compliance with their software licenses and if they are using their software assets efficiently. This data, and the tools used to manage the data, must be controlled and protected because the data is company confidential.
Software with conflicting policies toggle	This toggle is displayed on the Usage Summary page. The **Software with conflicting policies** toggle adds a filter when it's turned on that filters the table to only display the products that have reclaim policies that conflict.
Select all button	When AppClarity pages contain a **Select all** button this can be used to check all the checkboxes on the first column of a table, thereby selecting all the items currently displayed in the table.
Site-defined entry	Is an extension to the 1E catalog, which is a matching rule or canonical representation, added by a 1E Catalog curator using their on-site copy of the 1E Catalog.
Sockets column	The **Sockets** column is displayed on the following pages: Microsoft Core License Demand - Detailed Report page IBM Processor Value Unit (PVU) License Demand - Detailed Report page Oracle Processor License Demand - Detailed Report page Red Hat Socket Demand - Detailed Report page Displays the number of processor sockets available on the mainboard for the device where the software is installed.

Term	Definition
Spend (%) column	The **Spend (%)** column is displayed on the Summary Report page. The **Spend (%)** column shows the percentage of the overall spend for each Entitlement in the selected Entitlement repository. The complete bar represents the overall spend, the blue bar indicates the % spend for this Entitlement and the grey bar shows the % remainder.
Start Date column	The **Start Date** column is displayed on the Licenses / Maintenances page.The **Start Date** column shows the date the entitlement will start.
Status column	This column is displayed on the Reclaim History page. This displays the status for the reclaim policy. Status: Failed uninstall no retry — Description: A mandatory policy was run but failed to uninstall the software from the end-user's device. Status: Uninstalled — Description: A mandatory policy was run successfully and uninstalled the software from the end-user's device. Status: User Deferred — Description: For an opt-out reclaim policy the end-user has selected to defer the uninstallation of the software. Status: User OptOut Accept — Description: For an opt-out reclaim policy the end-user selected to keep the software, provided a reason and the AppClarity administrator accepted that reason. Status: User Remove Now — Description: For an opt-out reclaim policy the end-user has selected the Remove this software now button.
Status filter	These are displayed on the Licenses / Maintenances page and Agreements page. The Status filters are displayed in the top-right of the page and let you filter the table according to the status of the items in the table.

Term	Definition
	Clicking on an icon filters the table to display only items with that status, as described in the following table. Icon / Description Filters to show only items in Draft. Filters to show only items in Draft with errors. Filters to show only items in Draft with warnings. Filters to show only items that are Published.
Status icons	These are displayed on the Licenses / Maintenances page and Agreements page. The icon indicates the status of the entitlement or agreement: Icon / Description Draft. Draft with errors. Draft with warnings. Published.
Stock Keeping Unit (SKU)	A SKU (pronounced 'skue') is an identification, usually alphanumeric, of a particular product that allows it to be tracked for inventory purposes. In AppClarity, via the 1E Catalog, a SKU is associated with the license metrics and use rights associated with a particular software product purchase. SKUs are in widespread use throughout the software industry, where publishers refer to their software using a SKU. The SKU gets added to most purchase orders to indicate the software or package being bought. Even small differences between two software titles are indicated by different SKUs. The SKU also indicates the license metrics and maintenance terms associated with the purchase and any additional use rights covered by the purchased license. AppClarity uses the SKU data to automatically:

Term	Definition
	Prefill the settings in an entitlement with the product details, license metrics, and basic maintenance terms that are indicated by the SKU Set the additional use rights that are part of the license indicated by the SKU
Title	The title portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Visio** or **Nomad**.
Title chart	The **Title** chart is displayed on the Summary Report page. This chart shows the breakdown and numbers for the top 5 software Titles according to their total Entitlements costs in the selected Entitlements repository. Title column	The **Title** column in AppClarity pages display information related to the vendor of a product. Depending on the context this may show different things: On entitlement pages this will show:The title portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement is for. For example, **Visio** or **Nomad**. On the License Position page and License Summary page this will show:The title portion of the vendor, title, version and edition attributes that are used to identify which software product the compliance status relates to. On the Reclaim History page and the Savings page this will show:The title portion of the vendor, title, version and edition attributes that are used to identify which software product the reclaim policy was applied to.
Top 10 Saving Opportunities	This chart shows the top ten products that offer the best savings opportunities in USD. It is calculated by multiplying each product's unit price and the sum of unused and rarely used installations. The bar at the bottom shows the total opportunity in USD split into unused and rarely used installations.

Term	Definition
($) chart	Top 5 Software Categories by Installs chart	This chart shows the top five categories according to the numbers of installations. This chart disregards Operating Systems and Internet Browser categories. Total Consumed column	The **Total Consumed** column is displayed on the Summary by Installs page.Shows the number of licenses consumed by installations from the total available for this product.
Total Cost column	The **Total Cost** column is displayed on the Summary Report page. The **Total Cost** column displays the total cost for the number of licenses and maintenances covered by each entitlement in the table.
Total Devices	The **Total Devices** column is displayed on the License Summary page.This column provides a total count of the devices where the product is installed. This may be different from the **Total Installs** column as some software may be installed more than once on a device.

Term	Definition
column	
Total Installs column	The **Total Installs** column is displayed on the License Summary page.This column provides a total count of the installations for the product. This may be different from the **Total Devices** column as some software, such as Microsoft SQL Server, may be installed more than once on a device.This column is displayed on the Usage Summary page.The **Total Installs** column shows the total number of installations for each product.
Total License Available column	The **Total License Available** column is displayed on the Summary by Installs page .Shows the total number of licenses available for this product from all the entitlements related to it.
Total License Units column	The **Total License Units** column is displayed on the Summary by Installs page.Shows the total number of licenses units available from an entitlement.
Total Licensed Units column	The **Total Licensed Units** column is displayed on the License Position page.Shows the total number of license units available from entitlements related to the product.
Total Units Consumed column	The **Total Units Consumed** column is displayed on the License Position page.Shows the total number of available license units that have been consumed by product installations.
Total Users	The **Total Users** column is displayed on the License Summary page.This column provides the total users accessing the software across all these devices.

Term	Definition
column	
Type column	The **Type** column is displayed on the Licenses / Maintenances page. The **Type** column displays the type of the entitlement in the table. This can be either **License** or **Maintenance**.
Underutilized Installs column	The **Underutilized Installs** column is displayed on the License Summary page. This column provides a count of the installations for the product where the product is rarely used or unused.
Unknown Installs column	The **Unknown Installs** column is displayed on the License Summary page. This column provides a count of the installations for the product where there are details that are unknown, thereby implying a risk for compliance calculation. The **Licensed Software** column displayed on the **License Demand** table for each of the following License Demand and License Demand - Detailed Reports:

License Demand Report	License Demand Detailed Report
Microsoft Core License Demand page	Microsoft Core License Demand - Detailed Report page
IBM Processor Value Unit (PVU) License Demand page	IBM Processor Value Unit (PVU) License Demand - Detailed Report page
Oracle Processor License Demand page	Oracle Processor License Demand - Detailed Report page
Red Hat Socket Demand page	Red Hat Socket Demand - Detailed Report page

This column provides a count of the installations for the software titles that are part of the License Demand report where there are details that are unknown, thereby implying a risk for compliance calculation.

Unreporte	This column is displayed on the Usage Summary page.

Term	Definition
d column	The **Unreported** column shows the number of installations for each product where no recent usage data has been reported.
Unreported Reclaim Action column	Displays the action that will be taken by a reclaim policy for software with a usage category of unreported. Please refer to Usage categories for more details.
Unselect all button	When AppClarity pages contain an **Unselect all** button this can be used to uncheck all the checkboxes on the first column of a table, thereby unselecting all the items currently displayed in the table.
Unused column	This column is displayed on the Usage Summary page. The **Unused** column shows the number of installations for each product that have been reported as not being used.
Unused Reclaim Action column	Displays the action that will be taken by a reclaim policy for software with a usage category of unused. Please refer to Usage categories for more details.
Usage categories	There are four usage categories: used, rarely used, unused and unreported. Usage categories... See Usage categories in Tachyon documentation for more detail. **Device Inventory Date** = maximum of device inventory dates for the consolidated device

Term	Definition

Last Usage Date = maximum of product usage date for the consolidated installation

End of Sync Date = maximum of device inventory dates and maximum usage dates excluding dates in the future

	Device Inventory Date (relative to End of Sync Date)	No Device Inventory Date				
Device Inventory Date < 30 days	Device Inventory Date >30 days	Device Inventory Date > End of Sync				
Last Usage Date (relative to End of Sync Date)	No Last Usage Date					
All Usage on Device > 30 days old since Device	Last Usage Date > End of Sync Date	<=30 days	31-89 days	>=90 da	Device usage	No Device Us

Term	Definition											
	Inventory			ys		age						
	Product Usage across estate	No Product Usage across estate										
	Install Date	Null	**Unreported** - Device stopped reporting usage	**Unreported** - Invalid Usage date	**Used**	**Rarely Used**	**Unused**	**Unused**	**Unreported** - No Product Usage	**Unreported** - No Device Usage	**Unreported** - Device inventory date too old	**Unreported** - Invalid Device inventory date	**Unreported** - No Device inventory date
	< 7 Days	**Unreported** - Recently installed										
	>=7 Days	**Unused**										
	In the future	**Unreported** - Invalid install date										
Usage Cate	The Usage Category chart is displayed on the Usage Summary page.											

Term	Definition
gory chart	This chart shows the distribution of installations into the three usage categories: User, Rarely Used and Unused as a percentage of the total installations that reported usage. The bar at the bottom shows the number of installations with reported versus unreported usage as a percentage of the total number of installations. Used column	This column is displayed on the Usage Summary page. The **Used** column shows the number of installations for each product that have been reported as being used.
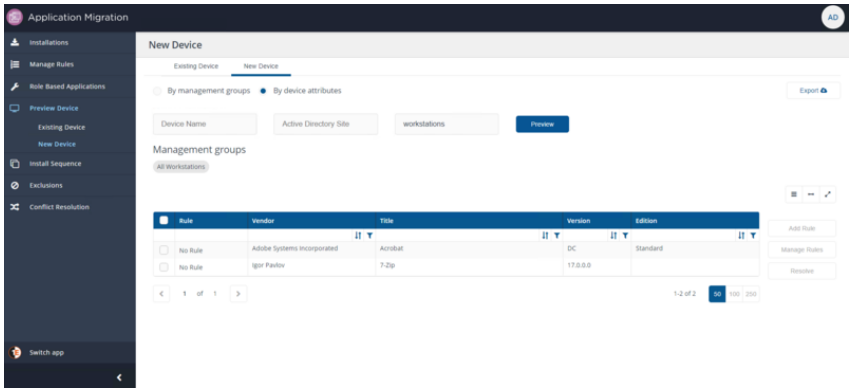
Used Reclaim Action column	Displays the action that will be taken by a reclaim policy for software with a usage category of used. Please refer to Usage categories for more details.
Vendor	The vendor portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **Microsoft Corporation** or **1E**.
Vendor chart	The **Vendor** chart is displayed on the Summary Report page. This chart shows the breakdown and numbers for the top 5 Vendors according to their total Entitlements costs in the selected Entitlements repository.

Term	Definition
	Vendor column	The **Vendor** column in AppClarity pages display information related to the vendor of a product. Depending on the context this may show different things: On entitlement pages this will show:The vendor portion of the vendor, title, version and edition attributes that are used to identify which software products the entitlement or agreement is for. For example, **Microsoft Corporation** or **1E**. On the License Position page and License Summary page this will show: The vendor portion of the vendor, title, version and edition attributes that are used to identify which software product the compliance status relates to. On the Savings page this will show: The vendor portion of the vendor, title, version and edition attributes that are used to identify which software product the reclaim policy was applied to.
Vendor, title, version and edition	The vendor, title, version and edition attributes are used to identify software products and to determine whether specific installations are related to that product.
Version	The version portion of the vendor, title, version and edition attributes that are used to identify software products. For example, **11.0.3216.5614** or **6.3.100.0**. See also Colloquial version.
Version column	The version column in AppClarity pages display information related to the version of a product. Depending on the context this may show different things: On reclaim policy pages this will show: On reclaim policy pages the version column shows the version string set for the policy. This may display a single version. On the

Term	Definition
	Precedence page this will show: The version portion of the vendor, title, version and edition attributes for the product that the reclaim policy applies to. On the Reclaim History page this will show: The version portion of the vendor, title, version and edition attributes that are used to identify which software product the reclaim policy was applied to.
VTVE	An AppClarity abbreviation for the vendor, title, version and edition of a software product.

11 Application Migration

Application Migration intelligently automates the migration of applications during a Configuration Manager OS deployment. Using migration rules (defined by an administrator), previously installed applications can be reinstalled, upgraded or replaced with an alternative during an OS deployment task sequence.



11.1 Introducing Application Migration

Application Migration intelligently automates the migration of applications during a Configuration Manager OS deployment. Using migration rules (defined by an administrator), previously installed applications can be reinstalled, upgraded or replaced with an alternative during an OS deployment task sequence.

These rules can include usage criteria, allowing you to choose to only install previously installed applications if they were being used, or perhaps replace a rarely used application with a less costly alternative. This functionality enables applications to be actively rationalized during an OS migration exercise, standardizing on products and versions and reclaiming unused software.

Application Migration uses a custom Configuration Manager task sequence step. Tachyon provides inventory data from Configuration Manager, normalized through the 1E Catalog, that it uses to determine the applications installed and used on each computer.

The **1E Application Migration** task sequence step is added to an existing OS Deployment Task Sequence. This step calls the Application Migration API on the Tachyon Server to return a list of Configuration Manager Applications and Packages that need to be installed, based on the source computer's inventory and applicable Application Migration rules. The Applications and Packages are installed using the standard Configuration Manager **Install Application** and **Install Package** steps, each configured to install based on dynamic variables defined in the **1E Application Migration** step. For details, please refer to Using Application Migration in a task sequence.

11.2 Implementing Application Migration

Information for preparing, installing and upgrading Application Migration.

11.2.1 Design Considerations

Information that will help you design and plan the implementation of Application Migration in your organization.

11.2.1.1 Options for using Application Migration

To install migrated applications and packages in the Refresh and Replace OS Deployment scenarios, Application Migration provides a custom action that must be added to your task sequences to supplement the **Install Application** and **Install Package** actions.

You can use these actions in your own task sequences, as described in Using Application Migration in a task sequence, and deploy them using Software Center or other means.

You can further simplify your processes and end-user experience by using 1E Shopping self-service features, where users use the Shopping web portal to start their own OS upgrades and migrations. The Wizards allow users to see a list of applications that are currently installed and the corresponding applications that will be installed as a result of applying the defined Application Migration rules.

In each case:

Shopping OSD Wizard (Applications to reinstall page).

Shopping WSA Wizard (Applications page).

For users requesting a self-service OS migration from the Shopping Web:

they cannot choose the applications to reinstall during a self-service OS migration.

if you previously used the AppMapping feature and have migrated to Application Mapping, users will see a list of their previously shopped for apps in My Software.

For administrators shopping on behalf of others:

on the Reinstall tab, the option to choose specific application to be reinstalled on machines is not available.

on the Select New Apps tab, only applications that come with the new OS are listed and the option to select additional applications as part of this deployment is not available.

OSD mapping rules and OSD machine mapping details are not available.

Note

Shopping documentation is now available on our new site .

11.2.1.2 Preparing Tachyon platform 8.1

Application Migration 8.1 requires Tachyon platform 8.1.

Current status	Option
Tachyon platform is *not* installed.	Use Tachyon setup to install Tachyon platform. We recommend installing Application Migration at the same time, but you can install it later. Please refer to: Planning for Tachyon and Installing Tachyon for details on preparing for and installing the platform. Installation includes an extract from Tachyon setup for installing Application Migration.
You have an older version of Tachyon platform and Application Migration already installed.	Use Tachyon setup to install Tachyon platform 8.1. You must choose to install Application Migration 8.1 at the same time. Please refer to: Planning for Tachyon and Upgrading Tachyon Platform for details on preparing for and upgrading to Tachyon platform. Installation includes an extract from Tachyon setup for installing Application Migration.
If you are using Application Migration 2.5 on SLA Platform 3.3 and now want to upgrade to Application Migration 8.1.	Upgrade your existing SLA Platform 3.3 to Tachyon platform 5.2 first, then upgrade to Tachyon platform. Upgrading Tachyon Platform When you perform each upgrade, ensure you also install Application Migration at the same time, using Tachyon setup. If you are using Nomad, then you must also review Upgrading Nomad, before upgrading Tachyon platform. This is because Tachyon platform 5.2 and later replaces ActiveEfficiency with Content Distribution. When upgrading, you will need to consider the following choice to ensure your existing Application Migration Task Sequence steps and Shopping integration settings will continue to work after the upgrade. Either modify your existing Task Sequences (TS).

Current status	Option
	Ensure the Tachyon Platform (Master Stack) website provides the same binding(s) used by existing TS. The choice depends on which DNS Names you want to use. Please refer to DNS Names. When Using Application Migration in a task sequence, your Application Migration TS step includes **Web Server Base URL**, which uses a server or DNS Name, and either HTTP or HTTPS. Tachyon platform 5.2 and later, allows you to specify an additional (alternate) HTTPS binding during setup. Please refer to Website configuration. By default, Tachyon setup creates the following bindings:

Reference	Default binding	What you can do during Setup
HTTP	HTTP - platform server name (eg. ACME-TCN01.ACME.LOCAL) - Port 80	You can change the port. For example change it to 8080 to match the default HTTP port used by SLA Platform 3.3. If for any reason you want to keep HTTP port 80 for other purposes, you can manually add an HTTP binding to the website after installation. If your TS uses a different host header, then you can specify this during setup.
Main HTTPS	HTTPS - DNS Name (included in the web server certificate) - port 443	You can change the DNS Name and port, for example to 8443 to match the default HTTPS port used by SLA Platform 3.3. We recommend you do not change this binding just for the benefit of Application Migration. This is because this binding is typically used by administrators to connect to the platform

Current status	Option	
		website, and also for platform clients if the server has Response Stack components (Switch and Background Channel). If you do not wish to edit your TS then we recommend you use the Alternate HTTP binding during Setup, or manually create an additional HTTPS binding after installation.
Alternate HTTPS	Optional HTTPS - DNS Name (included in the web server certificate) - port 443	You can optionally configure the Alternate HTTPS binding during Setup, for the TS to connect to. This is the recommended choice if you do not wish to edit your existing TS. If you need to use the Alternate HTTPS binding for other purposes, then you can manually create an additional HTTPS binding after installation.

If SLA Platform was configured to use HTTPS it is likely that you will need to generate a new Web Server certificate for Tachyon platform that meets the additional requirements of the platform, please refer to Web Server certificate for more information.

> **Note**
>
> Tachyon setup 8.1 includes 1E Catalog 8.1, and expects Catalog to be installed on the Tachyon platform server. If your existing SLA Platform system has a remote Catalog server, then you will need to consider relocating it. Relocation probably means changing your firewall and whitelist settings. Please refer to Requirements: Whitelisting connections to 1E Cloud.

AI Powered Auto-curation

This feature was introduced in Tachyon 5.x. Using the AI Powered Auto-curation feature, you'll be able to increase the total amount of normalized software in your Inventory repositories. This is done using AI that integrates with the inventory consolidation

process. By using AI, your organization will benefit from significant numbers of normalized software and a reduced manual effort needed to normalize software.

For details of additional hardware requirements, please refer to AI Powered Auto-curation.

Note

The Web Service used by Application Migration is provided by the Platform web application of the Tachyon website. This is configured by default to use Windows Authentication and its clients do not need to provide client certificates.

11.2.2 Requirements

Application Migration is implemented as an application that runs on the Tachyon platform, which includes SLA and 1E Catalog components. Please refer to Installing Tachyon for more details. Application Migration is licensed through the platform. You will require a license file including Application Migration. Refer to License requirements for more information.

11.2.2.1 Accounts needed to install Application Migration

11.2.2.1.1 Installing Application Migration on Tachyon platform

The user installing Application Migration on the platform needs the following permissions:

Have local admin rights on your Tachyon server.

Be an existing platform user with the **Full Administrator** role.

Note

For a new installation of Tachyon, the only account that exists in Tachyon will be the **installation account**, which by default is assigned to the Tachyon role listed above. You will need to add users and assign roles to them.

When upgrading from SLA Platform, SLA users are migrated to Tachyon, but are not assigned to any roles. You will need to assign users to appropriate roles in Tachyon.

For steps on viewing existing users and adding a new user in Tachyon Platform 8.1, please refer to the Users and Groups page.

Warning

When installing Tachyon or upgrading from SLA Platform, do not install Tachyon using an **installation account** that you also intend for using and administrating Tachyon and Application Migration. The Tachyon **installation account** is purposefully given limited capabilities, which can't be easily edited later.

A recommended workaround for this is to add the **installation account** to an AD security group, and then assign the security group to appropriate roles in Tachyon, for example Full Administrator.

11.2.2.1.2 Installing 1E Task Sequence Tools

The 1E Task Sequence tools are installed on the Configuration Manager site server, SMS provider and any devices on which the Configuration Manager console is installed.

The user installing **1E Task Sequence Tools** needs the following permissions:

Have **local admin rights** on the device you are installing on.

Be a **Full Administrative user** in Configuration Manager.

11.2.2.1.3 Service Accounts

Details of platform service accounts are included in Service accounts.

The SQL Login that is used by the Tachyon server web applications and services depends on whether the SQL Server is remote from the Tachyon server or is local, as described in the following table.

Installation scenario	Service account SQL Login
Server is remote from SQL.	The computer account of the remote server. For example **ACME\ACME-TCN01$**
Server and SQL are local.	The local network service account, **NT AUTHORITY\NETWORK SERVICE**

> **Note**
>
> Before upgrading Tachyon, or installing or upgrading Consumer applications like Application Migration or AppClarity, the SQL Login must be granted the following rights to support Database Snapshot of the 1E Catalog and SLA databases, to restore them if an error occurs:

dbcreator rights on the SQL database instance hosting the 1E Catalog database.

dbcreator rights on the SQL database instance hosting the SLA databases.

During installation, setup will always:

Attempt to create the SQL Login.

Grant it **db_owner** permission on each of the Tachyon databases.

Remove the **db_owner** permissions when installation is completed.

11.2.2.2 Accounts needed to use Application Migration

Tachyon platform uses Role-based Access Control to associate users with the tasks that they are required to perform. The **Application Migration Administrator** role is the only role associated with Application Migration. Other platform roles are required in order to complete some post-installation setup and ongoing management of the platform necessary for Application Migration to

function, but not considered part of the day-to-day operation of an Application Migration administrator.

> **Note**
>
> The user that installed Tachyon (the Tachyon Installation Account) is assigned the Permissions Administrator role so can be used to add other users and assign roles to them, but you cannot add or change the roles assigned to the original Tachyon Installation Account. It is therefore important to install Tachyon with an account that will NOT be using Application Migration (or any other platform applications for that matter) after installation.

> **Note**
>
> If you upgraded SLA Platform 3.3 to Tachyon platform 8.1, all previously defined users will be present in the platform, but will not be assigned any security roles. You will need to assign the appropriate roles after upgrading the platform.

There are three types of users that are involved in the setup and operation of Application Migration.

11.2.2.2.1 Platform administrator roles

These are users who can manage users, connectors, management groups and other common components in the platform. These users are typically set up after installing the platform and can be added at any time by other platform administrators (specifically users with the **Full Administrator** or **Group Administrator** role).

Application Migration is a platform application and has a dependency on certain platform components, such as Users, Connectors and optionally Management Groups, Tasks associated with these components would typically be performed by a platform administrator (a user with the **Full Administrator** role). In smaller organizations, or organizations only using the platform for Application Migration, it is likely that the same one or two people will be responsible for managing all aspects of the platform as well as managing Application Migration. In this scenario, it is likely that those users would be assigned the **Full Administrator** role in the platform. Other organizations may be using several platform applications and may want to restrict the number of users that have the **Full Administrator** role.

Refer to Users and Groups page for details on how to add users and assign security roles in the platform.

11.2.2.2.2 Application Migration Administrators role

These are platform users who can use the Application Migration application for day-to-day operation.

In order to use Application Migration, users must be added and assigned the **Application Migration Administrator** role in the platform. This role is added to the platform when Application Migration is installed, so you will need to install Application Migration first, then add users and assign them to the **Application Migration Administrator** role as required.

Alternatively, you can create your own custom role, which must have the following permissions assigned as a minimum.

Name	Type	Permissions
Connector	Connector	Execute.
Process log	Process log	Read.
Repository: Inventory	Repository: Inventory	Read, Write, EvaluateManagementGroups, Populate.
Inventory	Inventory	Read.
Inventory: Association	Inventory: Association	Read, Write, Delete.
Repository: Application migration	Repository: Application migration	Read, Write, Delete, Archive, Populate.
ProviderConfiguration	ProviderConfiguration	Read.
ProviderOperationLog	ProviderOperationLog	Read.

11.2.2.2.3 Task Sequence step user

This is the account specified in the Application Migration Task Sequence step used to connect to the Application Migration API (one of the SLA Provider API). It must be a platform user, but it does not require any specific roles to be assigned.

It can be either a dedicated user account or the Configuration Manager Network Access Account.

11.2.2.3 Supported Platforms

11.2.2.3.1 Tachyon server components

Note

Application Migration requires Tachyon platform. Only the Tachyon Master Stack is required, a Response Stack is not required unless you also want to use the platform's real-time features. Because Application Migration is an application on the platform, the list of Supported Platforms for Application Migration is identical to Tachyon platform.

For full details, refer to Tachyon Platform 8.1 - Supported Platforms

11.2.2.3.2 System Center Configuration Manager connector

The list below shows the versions of Configuration Manager supported by Tachyon Platform 8.1, please refer to System Center Configuration Manager connector for detailed prerequisites and configuration.

SCCM CB 2203

SCCM CB 2111

SCCM CB 2107

SCCM CB 2103

SCCM CB 2010

11.2.2.3.3 1E Client

Note

This version of Application Migration requires 1E Client 8.x with the Shopping client enabled. Shopping client provides WSA features.

Refer to Supported Platforms for details about:

Windows clients

macOS clients

Linux clients

Solaris clients.

11.2.2.3.4 PowerShell

PowerShell 4.0 or later, is required by the Application Migration Task Sequence step. The step executes in a Configuration Manager OS deployment task sequence after the new OS is installed.

11.2.2.4 1E Companion Products

Supported versions of 1E companion products that Application Migration features depend on.

Products and features that Application Migration depends on	Supported versions of companion products	
Tachyon platform	Required by all Application Migration features. The platform Master Stack installation is required with the System Center Configuration Manager connector enabled. The Tachyon Response Stack is only required if you will be using additional platform real-time features outside of Application Migration.	Tachyon Platform 9.0 and later
1E Client	1E Client, with Shopping client enabled, needs to be deployed to devices if using Application Migration with	1E Client 24.5 Long-Term

Products and features that Application Migration depends on	Supported versions of companion products	
	1E Shopping and Windows Self-service Assistant (WSA). 1E Client, with platform client enabled, does not need to be deployed to devices unless platform real-time features are required by other 1E applications.	Service Branch (LTSB) if using platform v9.1 1E Client 9.0

Supported versions of 1E companion products with features that depend on Application Migration.

Products and features that depend on Application Migration	Supported versions of companion products	
Shopping	Self-service OS deployment integrated with Application Migration. Optional feature.	Shopping 6.1 Shopping 6.0 (with hotfixes)

11.2.2.5 Networking

11.2.2.5.1 Firewall

Port	Traffic	Notes	Configurable
TCP 80 (HTTP)	Inbound/Outbound	Used by the website hosting the SLA Operations Provider API for HTTP traffic.	Yes, during installation.
TCP 443 (HTTPS)	Inbound/Outbound	Used by the website hosting the SLA Operations Provider API for all HTTPS traffic. A web server certificate is required.	Yes, during installation.

Note

Previous versions of the SLA Platform used port 8080 by default for HTTP communication. If you are upgrading from SLA Platform 3.3 to platform 8.1 or later, you should retain the port settings currently used by SLA Platform by defining the port on the Web Site Configuration page of platform setup.

For full details of communications, please refer to Communication Ports.

11.2.3 Installation

11.2.3.1 Installing Application Migration

Application Migration is installed through Tachyon platform setup. The **Select Configuration** section of platform setup allows you to choose whether to install AppClarity. Refer to Tachyon Setup.

11.2.3.2 Relicensing Application Migration

Licensing of Application Migration and later is handled through the platform. You will no longer need to license Application Migration using the installer. Refer to the Tachyon Setup for details about license requirements.

11.2.3.3 Installing the 1E Task Sequence tools

The 1E Task Sequence Tools installer extends the Configuration Manager Task Sequence Editor, adding the Application Migration step that can be added to OS deployment task sequences. This step executes during the OS deployment, calling an Application Migration API that returns a list of Configuration Manager Applications and Programs to be installed on the computer being deployed.

Install the 1E Task Sequence Tools on the following systems:

The Configuration Manager Primary Site server. In a multi-site hierarchy, install it on the CAS and each primary site.

If any site has one or more remote SMS Providers, install it on each remote SMS Provider server.

Any remote Configuration Manager console systems that are used to edit task sequences.

Version 2.5.300 of the 1E Task Sequence tools installer is included in the Windows Serving Suite 4.1 download zip, and in its own download zip, which can be downloaded from the 1E Support Portal.

To install the 1E Task Sequence Tools:

Start a command prompt with elevated rights and run the following command-line from the location the installer was downloaded:

```
msiexec /i 1ETaskSequenceTools.msi /l*v C:\Temp\TSTools-Install.log
```

On the **Welcome screen**, click **Next**.

On the **License Agreement screen**, accept the terms of the agreement and click **Next**.

On the **Ready to Install screen**, click **Next**.

On the **Completion screen**, click **Finish**.

11.2.3.3.1 Reviewing 1E Task Sequence Tools installation

To review your Task Sequence Tools installation:

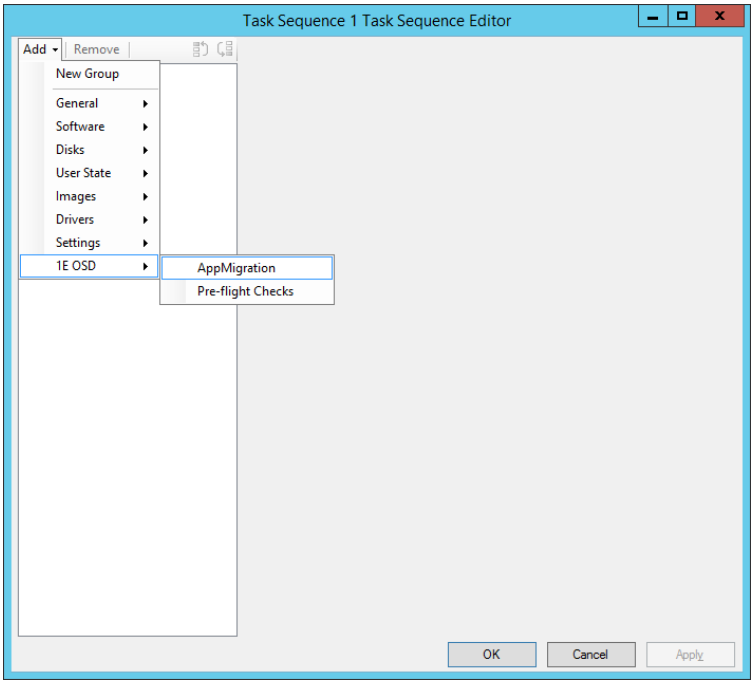
From your **Configuration Manager console**, choose the **Software Library workspace**.

Expand the **Operating Systems folder** and select **Task Sequences**.

Right-click any task sequence and from the context menu, choose **Edit**.

In the **Task Sequence Editor** dialog, click **Add** (located top left in the dialog) and ensure that the **1E OSD** group appears and it contains the **AppMigration** Task Sequence step, as shown in the picture opposite.

Exit the **Task Sequence Editor** without making any change by clicking **Cancel** .



11.2.4 Post-install configuration

Steps to configure Tachyon platform after installation of Application Migration.

11.2.4.1 Application Migration roles

Assign users to roles as described in Requirements: Accounts needed to install Application Migration.

The **Application Migration Administrators** role does not exist in the platform until Application Migration is installed. Add this role to all users that need to configure and operate Application Migration.

Platform administrator roles are required to perform the tasks described on this page.

11.2.4.2 Enable Auto Install for Configuration Manager Applications and Packages

Application Migration uses the **Install Application** and **Install Package** steps in a Task Sequence to install migrated applications and packages. These Task Sequence steps are dependent on the relevant checkbox (auto install flag) being enabled for *each* application and package:

Allow this application to be installed from the Install Application task sequence action without being deploye d

Allow this program to be installed from the Install Package task sequence action without being deployed.

If a checkbox is not enabled, the software installation will fail for that application or package. An administrator can enable this checkbox for each application and package by using either of the following methods:

in Configuration Manager during or after creating each application and package.

using the **Auto Install** feature in Application Migration when creating application associations, rules or Role Based Application sets.

For information about where to manually enable the checkbox for applications and packages in Configuration Manager, please refer to Using Application Migration in a Task Sequence: Auto Install for Configuration Manager Applications and Packages.

11.2.4.2.1 Auto install configuration

To use the **Auto Install** feature, you'll first need to configure the following providers in the **Settings** application of Tachyon platform:

Set Auto-Install option in SCCM

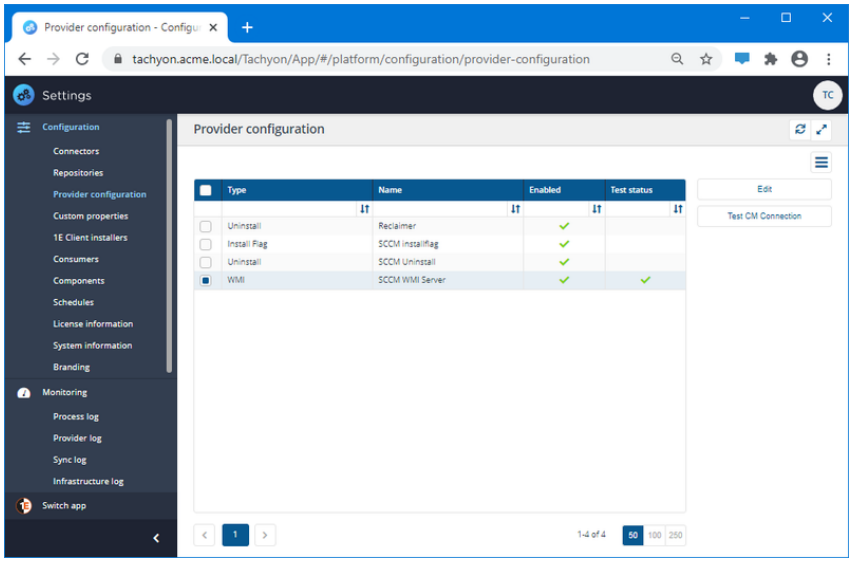
SCCM WMI Server

First grant the user account you want to use to configure provider related details with the role **Provider Configuration Administrators**. This role allows you to Update, delete and view provider configurations.

Once you have granted the **Provider Configuration Administrators** role, login to Tachyon platform with the user account and enable the providers.

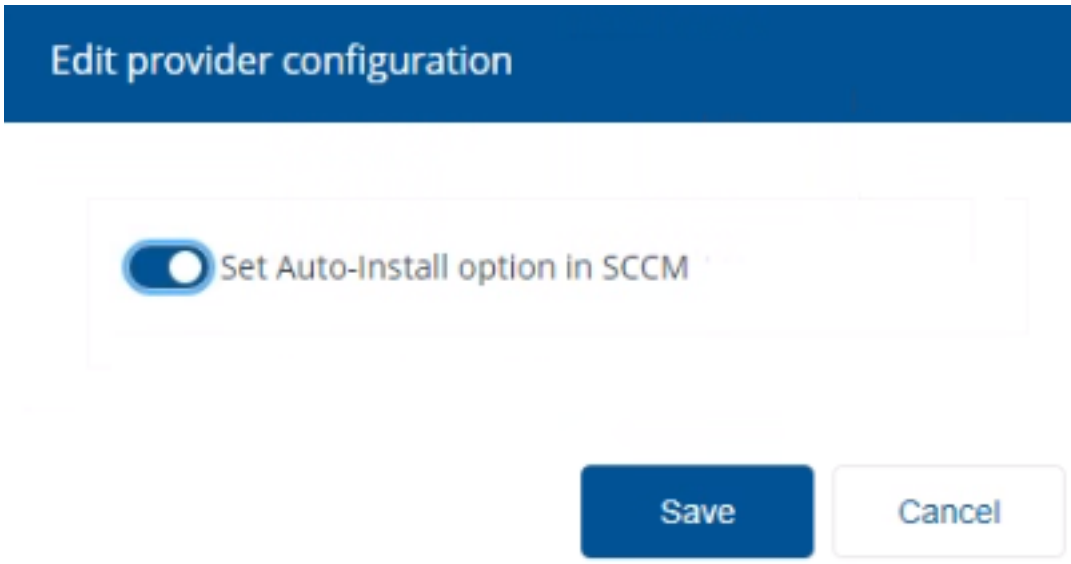
> **Note**
>
> Before you can enable the provider configuration, make sure you have configured a System Center Configuration Manager connector. If you do not have a System Center Configuration Manager connector the SCCM providers will not be visible. Refer to System Center Configuration Manager connector.

> **Warning**
>
> If these providers are not configured correctly, the **Auto Install** status icon in the Migration Rules page may remain spinning, if the appliaction or program has not had its auto install flag already enabled manually outside of Application Migration.



11.2.4.2.2 The Set Auto-Install option in SCCM provider

The **Set Auto-Install option in SCCM** provider is used by the **Auto Install** feature, and must be enabled to allow Application Migration to enable relevant checkboxes (flags) in Configuration Manager applications or packages.



To set the provider configuration:

Navigate to **Settings→Provider configuration**.

Select the provider with the name **Set Auto-Install option in SCCM** and click **Edit**.

In the **Edit provider configuration** popup, toggle this control to on (to the right) to enable **Set Auto-Install option in SCCM**.

Click **Save**.

11.2.4.2.3 Enabling SCCM WMI Server

The WMI provider holds the connection details of the Configuration Manager server.

To set the provider configuration:

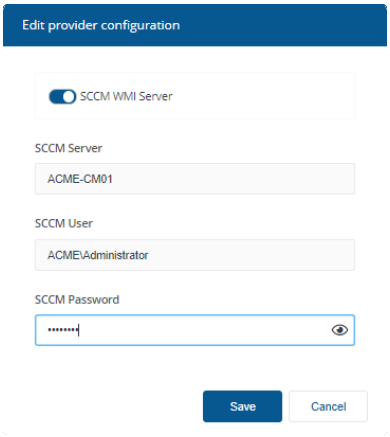
Navigate to **Settings→Provider configuration**.

Select **SCCM WMI Server** and click **Edit**.

In the **Edit provider configuration** popup, slide the **SCCM WMI Server** toggle to on and complete the displayed form using the following information as guidance:

Field	Description
SCCM WMI Server	Toggle this control to on (to the right) to enable the **SCCM WMI Server**.
SCCM Server	Enter the name of the Configuration Manager server. In our example this is **ACME-CM01**. In a Microsoft Endpoint Configuration Manager hierarchy, this would be the CAS.
SCCM User	The credentials for provider **SCCM WMI Server** may differ from those used for your System Center Configuration Manager (SCCM) connector. Make sure the credentials used here have SCCM administrator rights. SCCM Uninstall must be run under an account that's a member of the **dbcreator** server role on the database server where the SCCM database is hosted, in our example this would be **CM_CM1** on **ACME-SQL01**. The **SCCM User** account in our example is **ACME\Administrator**.
SCCM Password	The password for the **SCCM User** account.

When you have entered the correct information, click **Save**.



11.2.4.2.4

11.2.4.2.4.1 Testing SCCM WMI Server

As the SCCM WMI Server provider defines how all the SCCM providers access Configuration Manager - you should test the details and credentials you have entered as soon as the provider has been saved.

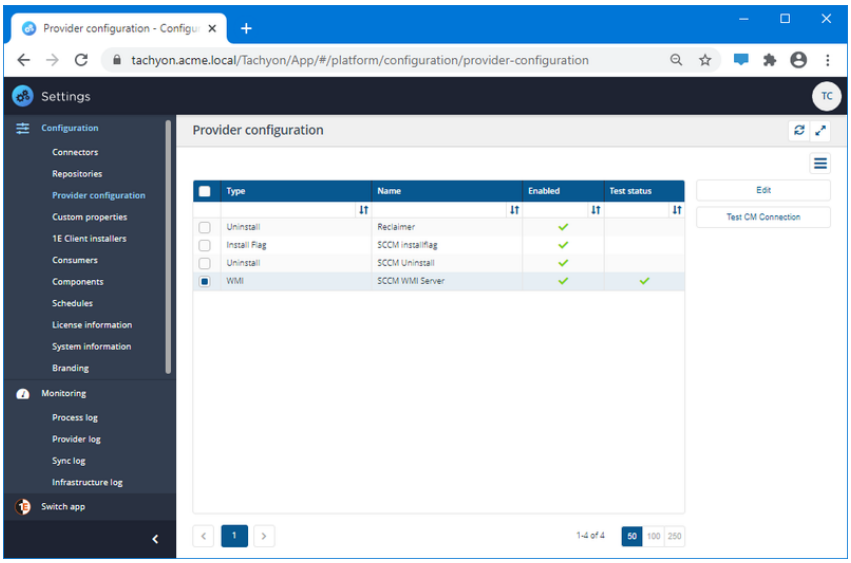
Navigate to **Settings→Provider configuration**.

Select the provider with the name **SCCM WMI Server.**

Click on the **Test CM Connection** button, this button is enabled when only the **SCCM WMI Server** provider has been selected.

A test will be scheduled to run. When the test has completed successfully a green checkmark appears in the **Test status** column for the **SCCM WMI Server** row in the table, as shown in the picture opposite.

If the test fails you will need to recheck the details and credentials you have provided, making sure that the selected account has necessary permissions as described in Enabling SCCM WMI Server.



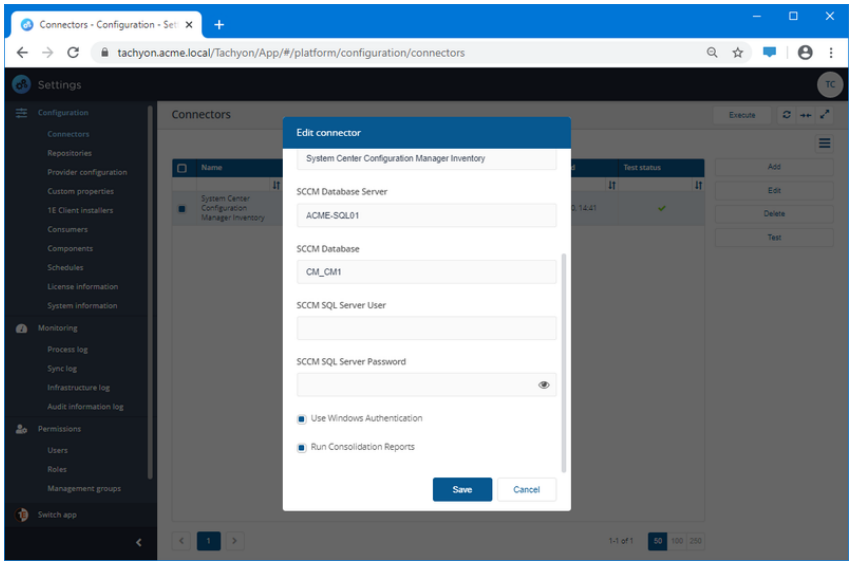
11.2.4.3 Configure a System Center Configuration Manager inventory connector

Application Migration requires software inventory and application configuration data from Configuration Manager. To get this data, Application Migration uses the Tachyon platform **System Center Configuration Manager Connector** to populate an Inventory repository. By default, Application Migration uses the **Default Inventory** repository.

To perform this task you will need to be logged into the platform as a user with the Connector Administrator role. Connectors are configured from the **Settings** app. Refer to System Center Configuration Manager connector.

> **Note**
>
> The platform can collect inventory data from other data sources using different connectors. However, Application Migration requires the Configuration Manager connector to be used as this connector also collects details of Configuration Manager Applications, Packages and Programs that are used to install migrated applications when the Configuration Manager Task Sequence is executed.

When setting up the connector you should check the **Run Consolidation Reports** option in the **Edit connector** popup. Doing this ensures that every report needed to display data in Application Migration will be run when the inventory connector is executed. If you do not do this, you can always run the consolidation actions independently of the connectors, as described in Executing the consolidation actions independently.



11.2.4.3.1 Execute the System Center Configuration Manager inventory connector

Once the System Center Configuration Manager inventory connector has been added it needs to be executed to synchronize the data from Configuration Manager into Application Migration. To do this you'll need to be logged into Tachyon platform as a user with the Application Migration Administrator role, or any other role that includes permission to execute a connector.

Note

Connectors can be executed in the **Settings** app from either the **Configuration**→Connectors page or the **Monitoring**→Process Log page. The steps below use the **Process Log** page as Application Migration Administrators have access to this page but not the Connectors page.

To execute the connector:

From the **Settings** app, go to the **Monitoring**→Process Log page.

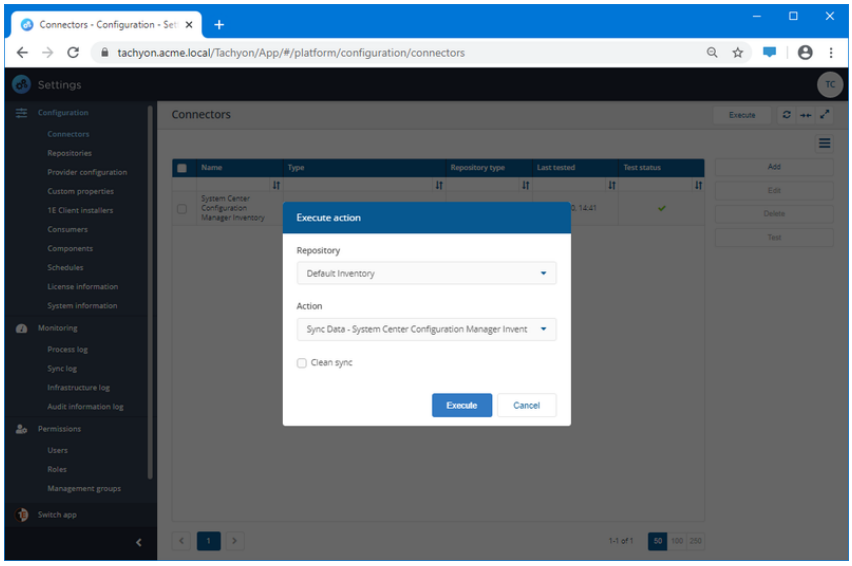
Click on the **Execute** button on the top right of the page.

Select the inventory repository in the **Execute action** popup. Typically, this will be the **Default Inventory** repository, unless other Inventory repositories have been created specifically for use by Application Migration.

Select the **Sync Data** action for the System Center Configuration Manager connector.

Click on the **Execute** button in the **Execute action** popup.

The picture shows the **Execute action** popup with the **Default Inventory** selected and the **Sync Data - System Center Configuration Manager Inventory** action selected.



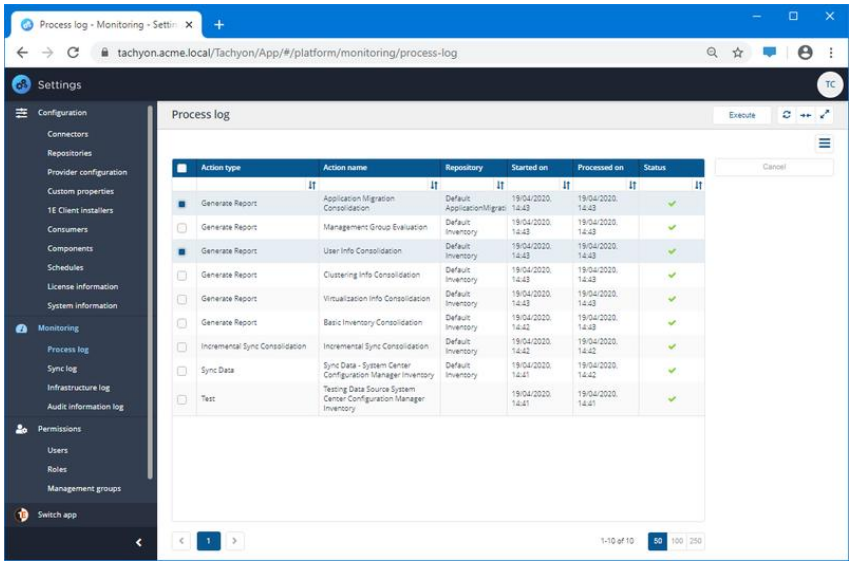
11.2.4.3.2 View the Process log

When the connector is executed, the progress of the synchronization can be checked in the **Settings** app from the **Monitoring→Process log** page. To perform this task you will need to be logged into the platform as a user with the **Application Migration Administrator** role, or any other role that includes permission to view the **Process Log**.

The picture shows the **Monitoring**→**Process log** page where the data sync using the System Center Configuration Manager Inventory connector was executed.

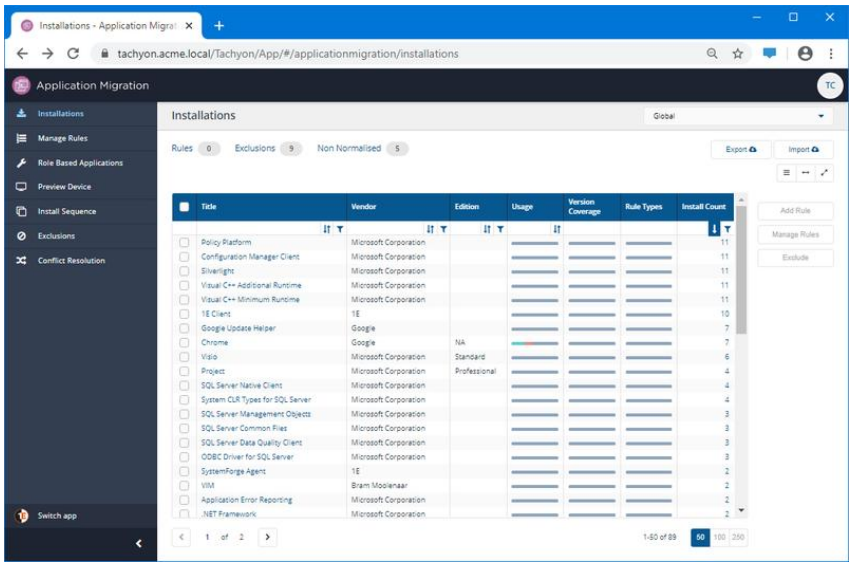
Note

A number of other steps follow the initial sync, including the **Basic Inventory Consolidation** report and the **Application Migration Consolidation** report, as highlighted. These reports were run automatically after the data sync as the option to Run Consolidation Reports was checked when the connector was added. The Application Migration Consolidation report is the last step in getting the data ready for Application Migration.



11.2.4.3.3 View data on the Application Migration Installations page

Once the reports have been run you will be able to see data in the Application Migration app on the **Installations** page, as shown.



11.2.4.3.4 Scheduling the connector to keep data synchronized

The process above executes a single, on-demand synchronization of data from Configuration Manager into Application Migration. You should schedule the connector to execute regularly to

keep the data in Application Migration up to date, ensuring new devices, new software installations and software removals are correctly reported.

To perform this task you will need to be logged into Tachyon platform as a user with the **Schedule Administrator** role. The **Application Migration Administrator** role does not have the required permissions to schedule connectors. Refer to Schedules page.

11.2.4.4 Executing the consolidation actions independently

There are scenarios where you would want to execute the consolidation reports separately from an inventory synchronization, for example you may have a number of inventory connectors connecting into different data sources. In this case you would want to perform all the synchronizations before executing the consolidation actions.

There are two consolidation actions you need to execute for Application Migration:

Basic Inventory Consolidation.

Application Migration Consolidation.

11.2.4.4.1 Executing the Basic Inventory Consolidation action

The **Basic Inventory Consolidation** report can be run independently of the **Settings** app:

Clicking the **Execute** button in either the **Configuration**→**Connectors** or **Monitoring**→**Process log** pages.

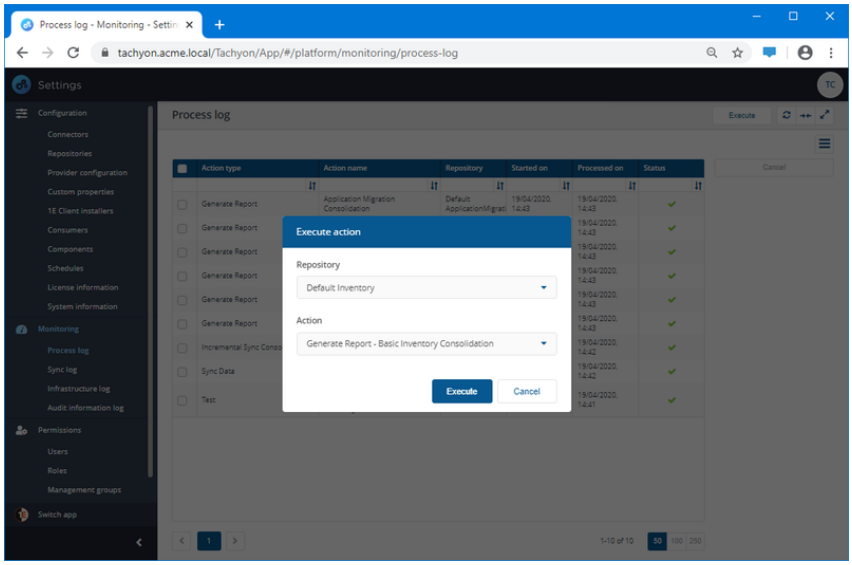
> **Note**
>
> Users assigned the **Application Migration Administrator** role will only be able to run the Basic Inventory Consolidation report from the **Process Log** page.

Selecting an Inventory repository.

Selecting the **Generate Report - Basic Inventory Consolidation** action.

Clicking the **Execute** button in the **Execute action** popup.

> **Note**
>
> Running the Basic Inventory Consolidation report will also run the Application Migration Consolidation report.



11.2.4.4.2 Executing the Application Migration Consolidation action

You may want to run the Application Migration Consolidation report independently after deleting a Management Group or fixing an orphaned Application Migration rule to update the data in the Application Migration UI.

The **Application Migration Consolidation** report can be run independently of the **Settings** app:

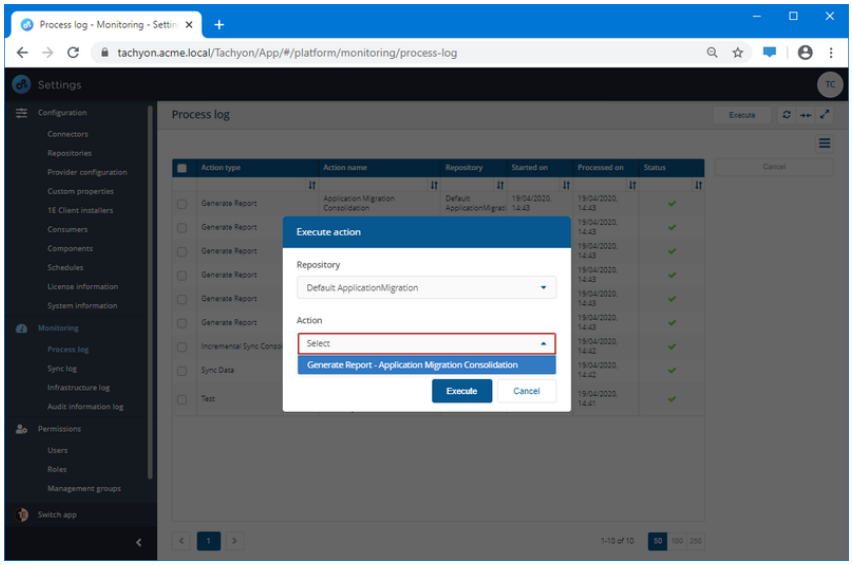
Clicking the **Execute** button in either the **Configuration→Connectors** or **Monitoring→Process log** pages.

> **Note**
>
> Users assigned the **Application Migration Administrator** role will only be able to run the Basic Inventory Consolidation report from the **Process Log** page.

Selecting an Application Migration repository.

Selecting the **Generate Report - Application Migration Consolidation** action.

Clicking the **Execute** button in the **Execute action** popup.



11.2.5 Upgrading Application Migration

How to upgrade Application Migration and Task Sequence tools in various scenarios.

11.2.5.1 Upgrading to Application Migration 8.1

Application Migration is installed through Tachyon setup. Refer to Tachyon Setup.

Web site configuration in Tachyon setup

If upgrading SLA Platform 3.3 to Tachyon platform 8.1, you must first upgrade to Tachyon platform 5.2 first.

When configuring **Website Configuration** in Tachyon setup, you should specify the current SLA Platform configuration (host header and HTTP / HTTPS ports) settings. For example, if SLA Platform 3.3 was installed with the default settings (HTTP on port 8080 and HTTPS on 8443), you should set the HTTP Port to 8080 and HTTPS Port to 8443 in the Website Configuration page of the setup wizard.

If a Host Header was used for SLA Platform, ensure the same host header is used for Tachyon platform. This will ensure your existing Application Migration Task Sequence steps and Shopping integration settings will continue to work after the upgrade, will prevent integration errors with the existing Catalog website (refer to Known issues) and will also ensure other websites installed in the Default Website will continue to be accessible using the server FQDN in the URL.

If SLA Platform was configured to use HTTPS, it is likely that you will need to generate a new Web Server certificate for Tachyon platform that meets the additional requirements of the platform. Refer to Web Server Certificate.

11.2.5.1.1 Upgrading Tachyon Platform

If you are currently running Application Migration on Tachyon Platform, you will need to upgrade to Tachyon Platform 8.1 and include Application Migration. Please refer to Upgrading Tachyon Platform for details.

11.2.5.2 Managing platform users

Tachyon setup will migrate users defined in SLA Platform 3.3 during the upgrade. However, these users will not be granted any permissions in the platform. After upgrading from SLA Platform 3.3, you should add at least one user to the **Global Administrators** role (this should have been done if you followed the platform post-installation steps). This can be a user which was present in SLA Platform v3.3 or it can be an altogether new user. After this initial upgrade and configuration, either the installation user or the Global Administrator can add/remove users.

If you were previously using Application Migration 2.5 on platform versions 4.1, or 3.0 on 5.0, the existing user permissions that you defined in the platform to enable users to use Application Migration will remain.

Whatever upgrade path was taken, after upgrading to platform v5.2 you will need to assign the **Application Migration Administrators** role to users that will be working with Application Migration to ensure they have the necessary permissions to complete all tasks associated with the day-to-day operation of Application Migration.

In some cases, the same users may need to perform tasks in the platform, such as configuring connectors or creating Management Groups and using them to synchronize data from Configuration Manager, running various consolidation reports and managing Management Groups. Refer to Requirements: Accounts needed to use Application Migration.

> **Note**
>
> The user account defined in the Application Migration Task Sequence step to connect to Application Migration during Task Sequence execution only needs to be defined as a User in Tachyon platform. This user will be migrated / retained when upgrading, so no further action is required. This account does not require the Application Migration Administrator security role, or any other security role.

11.2.5.3 Upgrading 1E Task Sequence Tools

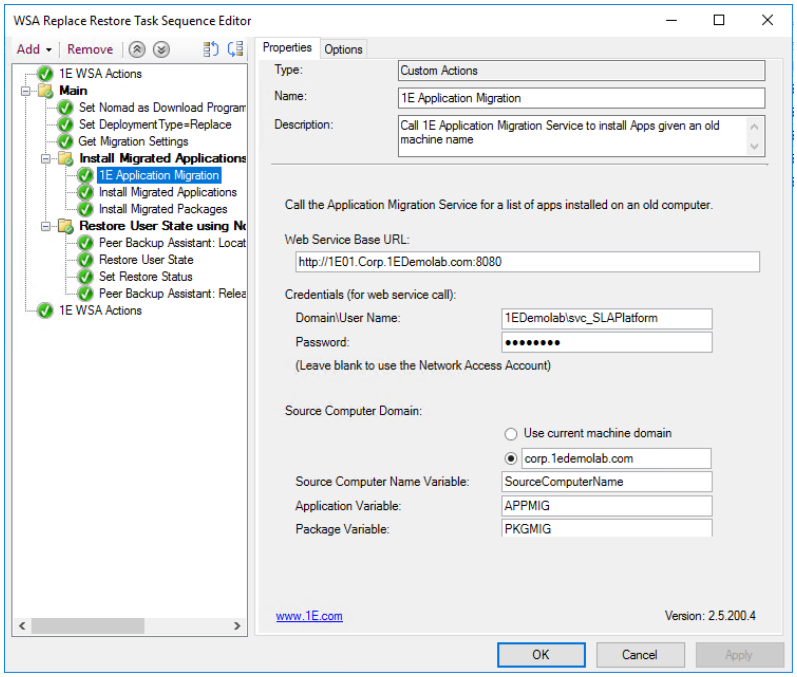
If you have a version of 1E Task Sequence Tools older than 2.5.300 installed, you should upgrade to the version for your platform release. To upgrade the 1E Task Sequence Tools, follow the instructions under the Installation: Installing the 1E Task Sequence tools heading using the latest version of *1ETaskSequenceTools.msi*.

After the upgrade, existing task sequences that included the Application Migration step will continue to work, provided you have not changed the Base URL of the SLA Platform or Tachyon platform server.

The **Properties** page for the step will reflect the layout for the version of the **1E Task Sequence Tools** in which the step was originally added to the Task Sequence.

> **Note**
>
> You should replace the Application Migration step in existing Task Sequence in due course by removing the existing Application Migration step and adding a new one in its

place. If you do not do that, you will not benefit from the fixes and improvements introduced in the latest version.



11.3 Using Application Migration

You can use the Application Migration pages to manage the migration of applications from one system, or one version of a system to another.

11.3.1 Getting started with Application Migration

An outline of the steps you need to take after installing Application Migration to get you migrating applications through your OS Deployment Task Sequences.

11.3.1.1 Introduction

Migrating applications with Application Migration involves working with Application Migration and Configuration Manager.

Application Migration is used to identify the applications that are installed in your environment and to create migration rules that define how each application should be migrated. It is also used to define sets of applications required by specific roles (Role-based application sets) and to preview the results of a migration on a specific device.

Configuration Manager automates the installation of the required applications (based on migration rules and role-based application sets) in a Task Sequence. The **Application Migration** Task Sequence step returns a list of Configuration Manager Applications and Packages that need to be installed, which are then installed through the **Install Application** and **Install Package** Task Sequence steps.

Note

Application Migration can only upgrade or migrate an application if the target application and version (the one you want to upgrade *to*) is packaged for deployment in Configuration Manager. This guide assumes you already have the applications you need packaged in Configuration Manager.

11.3.1.2 The Application Migration navigation panel

The Application Migration navigation panel has a number of items that let you perform different functions related to configuring and running Application Migration.

Menu item	Description
Installations	On the Installations page you can view installed applications in your environment, see how frequently they're used, and whether migration rules exist. You can also create and modify migration rules and exclude applications you're not interested in. Refer to Using the Installations page.
Manage Rules	Migration rules are used to define what happens to previously installed applications during an OS deployment. These rules can include usage criteria, allowing you to choose to only install previously installed applications if they were being used, or perhaps replace a rarely used application with a less costly alternative. Refer to Managing migration rules.
Role Based Applications	A Role Based Application Set defines a set of applications that should be installed on a computer for a user performing a particular role, or perhaps working at a particular location. Refer to Role Based Application Sets.
Preview Device	Before deploying the OS Deployment Task Sequence, you can preview the effect that Application Migration will have on the software installed on a device. This can be for existing or new build devices. This is done from **Preview Device**, where you can see the following menu items: **Existing Device**: Post-migration application status for existing computers undergoing an in-place upgrade or a computer refresh. **New Device**: Applications to be installed on new-build computers by Management Groups or device attributes. Refer to Previewing post-OS migration application states.
Install Sequence	In some cases, when some applications are installed together, they need to be installed in a certain order. You can do this in Application Migration by adding applications that have specific installation order constraints to the Install Sequence. Refer to Setting the Install Sequence for applications.

Menu item	Description
Exclusions	Products can be excluded from consideration by Application Migration, helping you to focus on the important products and minimizing effort during the Application Migration workflow. Refer to Managing product exclusions.
Conflict Resolution	Conflicts arising from having more than one migration rule for a computer belonging to more than one management group can be easily resolved before the migration takes place. Refer to Viewing and resolving migration rule conflicts.

11.3.1.3 Getting started with Application Migration

The recommended approach to get started with Application Migration is:

Configure Tachyon Providers to support the Auto Install feature. Refer to Post-install configuration.

Set up Tachyon platform to synchronize inventory data and Application/Package information from Configuration Manager. The inventory data is automatically normalized by the 1E Catalog into consistent Vendor, Title, Version and Edition (VTVE) identifiers and is used to show what applications are installed in your environment. Application and Package information imported from Configuration Manager is used to define the 'target' application in a migration rule to be installed by Configuration Manager. Refer to Post-install configuration.

Set up users and assign the appropriate roles in the Tachyon platform. All users that will be working with Application Migration must be added to the Tachyon platform and assigned the Application Migration Administrator role. Refer to Requirements: Accounts needed to use Application Migration.

Normalize the imported Configuration Manager Applications and Packages by associating them with a Vendor, Title, Version and Edition from the 1E Catalog. This makes it easier later on when defining migration rules, although the association for a particular application can also be defined when you create the migration rule. Refer to Manage associations.

Work through the installations in your environment from the Installations page and define migration rules. As you review each application, you can:

Exclude it if it is not an application you want to migrate (e.g. it is an application that is included in your base build, or is a runtime library or other component that is always installed through another application installation).

Create a migration rule to define how the application should be migrated (e.g. upgraded, replaced or retained).

> **Note**
>
> There will typically be thousands of software titles in your environment. The Installations page in Application Migration will display the most commonly installed applications at the top, so you can focus on these as you work your way down the list. You can also filter the list by title or vendor if you want to start by defining rules for a few specific applications.
>
> Refer to Using the Installations page.

Update your Configuration Manager OS Deployment Task Sequences to include the Application Migration step. Application migration occurs on a device when a Task Sequence is executed that has the 1E Application Migration step included. Refer to Using Application Migration in a task sequence for details.

Preview the expected results of Application Migration on a device. Before deploying an Application Migration Task Sequence to a device, you can see what effect Application Migration will have on the applications currently installed on a given device by Previewing post-OS migration application states.

Deploy the Application Migration Task Sequence to devices. Deploy your updated Task Sequences as required to upgrade or reinstall Windows, or to transfer the data and applications from an old device to a new one.

Once you are familiar with the above process, you can start to investigate the following features of Application Migration.

Creating exceptions for specific departments or locations. In some cases, you may have a migration rule for an application that you want to apply to most devices but require a different rule for the same application on a specific group of devices (e.g. a department or location. For example, you may want to upgrade AutoCAD 2018 to AutoCAD 2019 everywhere except in the Seattle office, where they need to retain AutoCAD 2018 as they are working with a client on the older version. You can do this in Application Migration by

Creating Management Groups in the Tachyon platform that correspond to the departments or locations for which exceptions are required. Refer to the Management Groups - tutorial.

Creating a Global migration rule in Application Migration. By default, migration rules are Global unless a specific Management Group is selected when the rule is created.

Creating the exceptional migration rule for the appropriate Management Group. Selecting the Management Group from the drop-down on the **Installations** page will filter the list of installations to show only the software installed on the devices in the selected Management Group. It also means that any rules that are added from that view apply only to the selected Management Group. Refer to Using the Installations page for more information on creating the migration rules from the Installations page. You can also create rules limited to specific Management Groups from the Manage Rules page (refer to Managing migration rules for more information). However, it is easier to create a migration rule from the Installations page as the selected application's Vendor, Title, Edition, and Version are pre-populated in the Edit Rule form.

Installing sets of Applications based on the user's department or location. In addition to migrating applications that were previously installed on a device, Application Migration can be used to install pre-defined application sets onto a device based on the department or location that the device is in, You can do this in Application Migration using the Role-based Application Sets feature by:

Creating Management Groups in the Tachyon platform that correspond to the departments or locations for which application sets are to be required. Refer to the Management Groups - tutorial.

Creating one or more Role-based Application sets and adding them to the appropriate Management Group. Refer to Role Based Application Sets.

Installing applications in a specific order. Application Migration normally installs applications in the Task Sequence in no particular order. In some cases, when some applications are installed together they need to be installed in a certain order. You can do this in Application Migration by adding the applications that have specific installation order constraints to the Application installation sequence. Refer to Setting the Install Sequence for applications.

11.3.2 Using the Installations page

On the Installations page you can view installed applications in your environment, see how frequently they're used, and whether migration rules exist. You can also create and modify migration rules and exclude applications you're not interested in.

11.3.2.1 Using the Installations page

You use the Installations page to view applications installed in your estate and create migration rules for them. The page lists Applications by Title, Vendor and Edition, ordered by **Install Count** in descending order, with the most commonly installed applications are at the top of the page. Typically, you'll work your way down the list of applications, either adding a migration rule to define how that application should be migrated or excluding the application. Alternatively, you can use the column filters to search for specific applications you want to migrate and apply rules to the filtered list.

From the Installations page you can create a migration rule for all versions of a selected application, or you can drill down by clicking the application title to see all versions of the application and create more granular rules for specific versions.

Refer to Managing migration rules for more information on creating and managing migration rules.

11.3.2.1.1 Page elements

The following items are displayed on the Installations page:

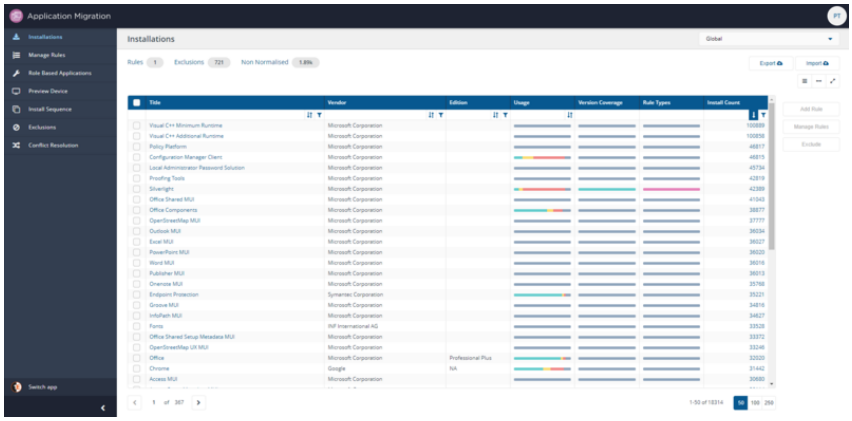
Option	Description
Management Group	By default, the Installations page shows the global view of software installations across your entire estate. If you've defined one or more Management Groups, selecting a Management Group from the drop-down displayed in the top-right of the page will filter the view to show software installed on devices in that Management Group. If you add migration rules from the Installations page with a specific Management Group selected, the rule will only apply to installations in that Management Group and will not affect installations outside that Management Group. **Note** Management Groups are containers used to group devices and the software installed on those devices. Management Groups are defined using configurable rules that look at various properties of the devices and their installed software, these are then evaluated to determine the group membership. This means that Management Group membership adapts to changes to the devices and software in your environment.

Option	Description
Title controls	The title area includes information on your current rules, exclusions and non-normalised products. It also includes buttons to export and import rules to and from a spreadsheet.

Control	Description
Rules	Displays the number of existing rules associated with a particular Management Group. Follow the link to Add, Edit or Delete existing rules. For more details, please refer to: Managing migration rules: Adding Migration Rules Managing migration rules: Modifying an existing rule Managing migration rules: Deleting an existing rule.
Exclusions	Displays excluded items. Excluded items are not associated with any Management Group. Follow the link to view the exclusions. Please refer to Managing product exclusions for more details.
Non-Normalized	Displays the number of items which have not yet been normalized against the Catalog. Follow the link to resolve the unmatched items.
Export	Creates and downloads a spreadsheet in **.xlsm** format that has all your installed applications to enable you to create new rules to associate with them without having to be online.
Import	When you have created the new rules for your applications, import the file, which may be in **.xlsx** or **.xlsm** format, so that Application Migration can implement the new rules.

Add Rule	Allows you to add a new migration rule for the selected application.

Option	Description
Manage Rules	Allows you to manage existing migration rules for the selected application.
Exclude	Allows you to exclude the selected application if you're not interested in it for application migration purposes. For example, runtime libraries, drivers, and applications included in your core OS build, or components that are installed by another application that will be migrated.



11.3.2.1.2 Installations table

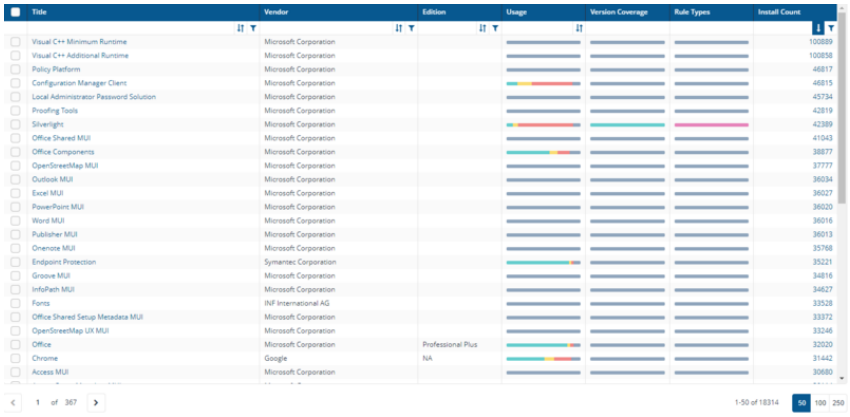
The Installations table lists the applications installed in your estate. All versions of a given **Title**, **Vendor** and **Edition** are consolidated into a single row. Clicking on the **Title** displays a popup with version-specific data.

By default, the list is ordered in descending order by the **Install Count** , so the most prolific applications are displayed at the top. Each application has indicators showing how frequently the application is used and whether there are any migration rules to cover it. This allows you to focus on the most commonly installed and used applications which do not have migration rules.

The following table describes each column.

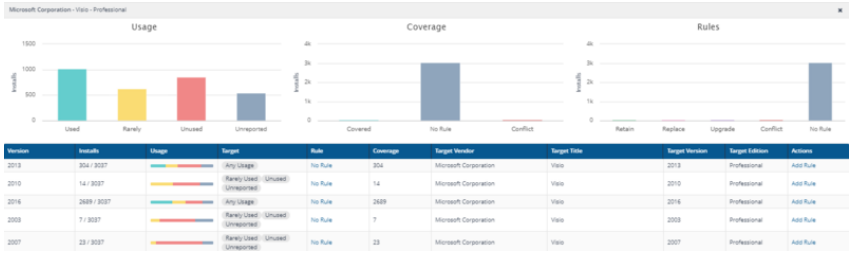
Colum name	Description
Title	Product title.
Vendor	Product vendor.
Edition	Product edition.
Usage	A usage summary for that product. Hover your mouse over the bar to view the installation count in each usage state.

Colum name	Description
Version Coverage	A summary of installations of the product that are covered by one or more migration rules. Hover your mouse over the bar to see what is **Covered** , has **No Rule** os is in **Conflict** . If the bar is completely grey there are no migration rules defined for the application.
Rule Types	A summary of the migration rule types defined for that product. Hover your mouse over the bar to see the count of each type. If the bar is completely grey there are no migration rules defined for that application.
Install Count	The total number of installations for that product across your estate.



11.3.2.1.3 Viewing Installation details

You can click on a specific title to see clearer representations of **Usage**, **Coverage**, **Rules**, and details for each application version. In this view you can create a version-specific migration rule by clicking the **Add Rule** link in the **Actions** column. In our example, we've chosen Visio Professional.



The table below describes the three charts in the top panel.

Panel	Description
Usage	Hover your mouse over the column to see the number of **Used**, **Rarely**, **Unused** and **Unreported** installations.

Panel	Description
Coverage	Hover your mouse over the column to see the number of installations that are **Covered** by a rule, have **No Rule** coverage, or have a rule **Conflict**.
Rules	Hover your mouse over the column to see the number of installations that Application Migration will **Retain**, **Replace** or **Upgrade**, or installations for which there is a rule **Conflict** or **No Rule**.

The detail table below the charts shows the following information for each version:

Column name	Description
Version	Version of the product.
Installs	The number of installations of that version out of the total of all installed versions, for example, 304/3017.
Usage	A usage summary for that version. Hover your mouse over the bar to see the count of installations in each usage state.
Target	Indicates the usage states that apply to that version as defined in the rule in the same row. If there are different rules for different usage states of the same software version, these would be shown as separate rows, each indicating the usage states defined in the rule in the same row.
Rule	Indicates the type of migration rule applying to that version. Clicking on the link in this column reveals the Management Groups including installations of the version.
Coverage	Indicates how many installations of that version covered by the rule indicated in the Rule column.
Target Vendor	Indicates the vendor of the application that this version will be migrated to by the rule indicated in the same row.
Target Title	Indicates the title of the application this version will be migrated to by the rule shown in the same row.
Target Version	Indicates the version of the application this version will be migrated to by the rule shown in the same row.

Column name	Description
Target Edition	Indicates the edition of the application this version will be migrated to by the rule shown in the same row.
Actions	**Add Rule** allows you to create a rule for this specific version. When you click the **Add Rule** link in this column, you'll be taken to the **Add Rule** page in **Manage Rules**. The source **Vendor**, **Title**, **Version** and **Edition** will be pre-populated with the version of the application in the same row.

11.3.2.2 Filtering results

You can filter the results of the **Installations** table by **Title**, **Vendor**, **Edition**, **Usage** or **Install Count** columns. For example, to narrow the results of the installed applications to show only Microsoft Visio Professional:

Click on the filter icon

just beneath the header row in the **Title** column.

From the dropdown menu choose **contains** and type Visio.

Click **Apply**.

Repeat for the **Edition** column, choosing **contains** and typing professional.

Click **Apply**.

This will restrict the list of displayed applications to Visio Professional.

11.3.3 Managing migration rules

11.3.3.1 Introduction to migration rules

Migration rules are used to define what happens to previously installed applications during an OS deployment. These rules can include usage criteria, allowing you to choose to only install previously installed applications if they were being used, or perhaps replace a rarely used application with a less costly alternative.

A migration rule comprises the following elements.

Migration rule element	Description
Rule type	Defines whether the rule will retain, upgrade or replace an application. An application will be removed during an OS wipe-and-load or device replacement if there is no rule defined.
Source Application	Defines the application, identified by Vendor, Title, Version and Edition, that is to be migrated.
Target Application	Defines the application, identified by Vendor, Title, Version and Edition, that will be installed in place of the source application. For retain rules, the Target Application is the same as the Source Application. For upgrade rules, the Target Application is a different version of the Source Application.
Usage	Defines whether the source application will be migrated if it is used, rarely used, unused or any combination of these states. You can create multiple rules for the same Source Application with different usage settings. For example, you may want to retain an application if it is being used, but replace it with a cheaper alternative if it is not being used.
Association	Defines the Configuration Manager Application or Package and Program that will install the Target Application. The association of a Configuration Manager Application or Package and Program with a Vendor, Title, Version and Edition can be made ahead of creating migration rules through Manage associations in Inventory, or while defining the rule.

About Vendor, Title, Version and Edition

Application Migration identifies each application by Vendor, Title, Version and Edition as defined in the 1E Catalog. Some publishers use a 'colloquial version', such as 'Office 2019' or 'Acrobat Reader DC', to identify a broad major release, in addition to the full version that changes with each update. Where the 1E Catalog has a colloquial version defined for a given application, the Source Application and Target Application definitions in a migration rule will use the colloquial version. In some cases an application may have a mix of full versions and colloquial versions (typically when the adoption of colloquial versions came later in the product life cycle). Application Migration also includes the concept of a 'readable version', which is simply the full version truncated to the first two parts of the full version number (e.g. 16.0) to make managing rules easier.

When defining an Upgrade or Replace rules, the Source Application can be defined using a colloquial version (if available), readable version or full version. These rule types can also use a wild card (e.g. * or 16.*), which is useful for creating a single rule that will upgrade *any* version of an application to another version, or replace *any* version of an application with a different application.

If the selected Vendor, Title and Edition has already been associated with an Application or Package and Program in Configuration Manager, those associated versions will appear in bold at the top of the Version drop-down list when defining the target of any Migration rule or application in a Role-based Application set.

11.3.3.2 Understanding behavior of migration rules in different OS deployment scenarios

Migration rules will behave differently depending on the type of OS deployment being performed, If the existing OS is being reinstalled ('wipe-and-load'), or a new OS is being installed on a replacement device and you are using Application Migration to migrate applications from an old device, all migration rules will be applied. Any previously installed applications for which no migration rule has been defined will not be migrated (effectively these applications will be 'removed', although technically they are simply not reinstalled in the new OS. Replace rules will install the replacement (target) application in the new OS and the original (source) application will not be installed, so the application is effectively replaced in the new OS.

An In-place upgrade behaves differently, as the disk is not wiped during an in-place upgrade, so the previously installed applications remain installed after the upgrade. For this reason, any rules defined to retain an existing application are ignored by Application Migration during an in-place upgrade as the application will be retained anyway. Upgrade rules will be applied, and in most cases the installation of the later version will simply upgrade the previously installed application. However, in some cases, installing a later version of an application on a device that has an older version installed may result in both versions being installed 'side-by-side' - this all depends on how the vendor has implemented their installer.

Rules defined to replace an application will result in both the original (source) application and the replacement (target) application being installed during an in-place upgrade. This is because Application Migration does not actually remove the source applications when replacing an application. However, you can use Application Supersedence in Configuration Manager (refer to https://docs.microsoft.com/en-us/mem/configmgr/apps/deploy-use/revise-and-supersede-applications for details on how to configure Application Supersedence to have Configuration Manager uninstall the replaced (source) application when the replacement (target) application is installed.

11.3.3.3 Migration Rules and Management Groups

By default, migration rules are Global - they apply to all devices in your organization. In some cases you may want to define different migration rules for an application on different devices. For example, you may want to upgrade AutoCAD 2018 to AutoCAD 2019 everywhere except in the Seattle office, where they need to retain AutoCAD 2018 as they are working with a client on the older version. If you have Management Groups defined in the platform, you can create rules that apply globally or to a specific Management Group. Management Group migration rules take precedence over Global migration rules, so in our example, you would create a Global rule to upgrade AutoCAD to 2019 and a Management Group rule for the Seattle Management Group to retain the 2018 version. Devices in the Seattle Management Group will apply the Management Group rule, not the Global rule,

It is possible for a device to exist in multiple Management Groups, so it is also possible for conflicts to arise, where a device is in multiple Management Groups, each with different rules defined. If this occurs, the rule will be shown as a Conflict on the Installations page that must e resolved in order for any rule to apply during OS deployment. Refer to Viewing and resolving migration rule conflicts.

11.3.3.4 Adding Migration Rules

Migration rules can be added from the Installations page or the Manage Rules page.

11.3.3.4.1 Adding rules for installed applications

Typically, you will work from the Installations page to identify an installed application that you want to migrate, selecting it and clicking the **Add Rule** button. This will take you to the Add Rule page, but will pre-populate the Source Application Vendor, Title and Edition according to the application you selected in the Installations page. If you want to create a rule for a specific version of an application, from the Installations page click on the application title to view the installed versions and click the **Add rule** link in the **Action** column for the version you want to migrate. Again, this will take you to the Add Rule page, but with the Source Application Version pre-populated along with the Vendor, Title and Edition.

> **Note**
>
> You will not be able to add a rule for a specific version if that version and usage combination is already covered by another rule, for example a wild-card upgrade rule.

The following pages provide step-by-step instructions for adding different types of rules from the Installations page.

Retain - Adding a rule to retain an application

Upgrade - Adding a rule to upgrade an application

Replace - Adding a rule to replace an application.

11.3.3.4.2 Auto Install for Migration Rules

Application Migration uses the **Install Application** and **Install Package** steps in a Task Sequence to install migrated applications and packages. These Task Sequence steps are dependent on the relevant checkbox (auto install flag) being enabled for *each* application and package:

Allow this application to be installed from the Install Application task sequence action without being deployed.

Allow this program to be installed from the Install Package task sequence action without being deployed.

If a checkbox is not enabled, the software installation will fail for that application or package. An administrator can enable this checkbox for each application and package by using either of the following methods:

in Configuration Manager during or after creating each application and package.

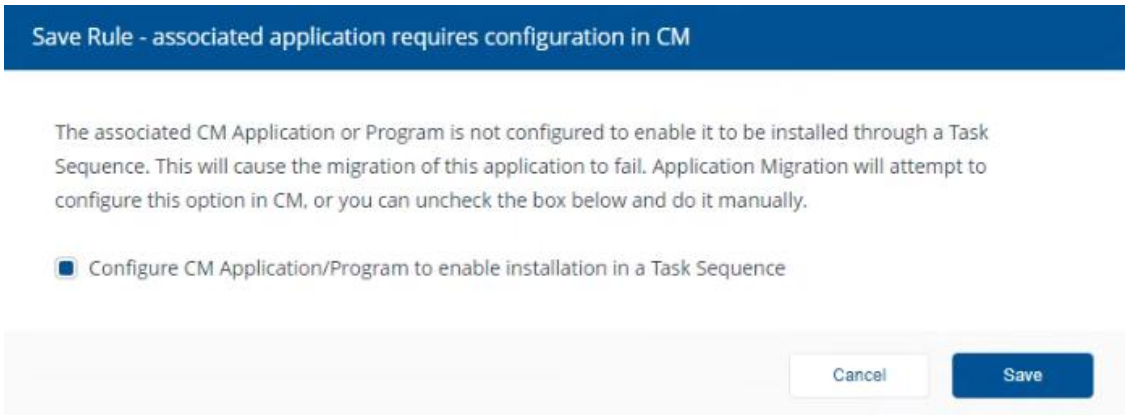
using the **Auto Install** feature in Application Migration when creating application associations, rules or Role Based Application sets.

For information about manually enabling these checkboxes for Configuration Manager applications and packages. Refer to Using Application Migration in a Task Sequence: Auto Install for Configuration Manager Applications and Packages.

> **Note**

Application Migration's **Auto Install** feature is able to read the checkbox (auto install flag) for applications and programs, but in order for Application Migration to enable them for you, you'll need to configure related providers in the Settings application of the platform. These should already be configured as a post-installation step. Refer to Post-install configuration.

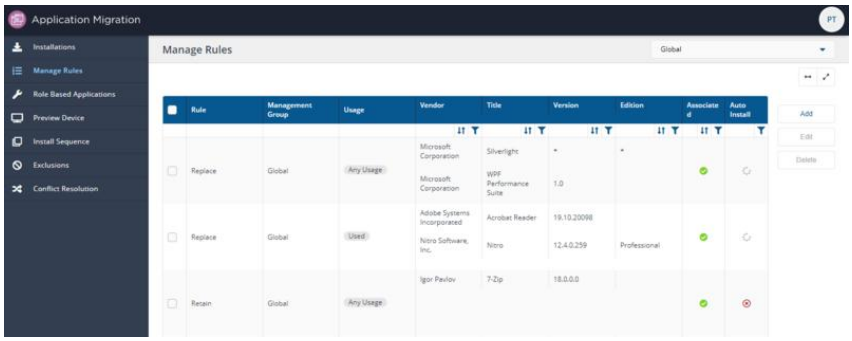
When you save the migration rule, and the Auto Install flag is not already enabled for the associated Application or Program, then you will see the popup shown opposite. You should enable **Configure CM Application/Program to enable installation in a Task Sequence** and click **Save**. The Auto Install status will then change from red to green. Status values are described in the table below.



On the **Manage Rules** page, the **Auto Install** column displays a status for each migration rule. Our example shows two different types of status, **In-Progress** and **Not Checked**.

Auto Install status	Description
Checked	Green tick. Auto install flag for Configuration Manager application or package program is set.
Not Checked	Red cross. Auto install flag for Configuration Manager application or package program is not set.
In-Progress	Spinning. Application Migration has triggered an operation which attempts to set the auto install flag of Configuration Manager application or package program. If the status permanently spins then it is likely that your administrator has not configured the providers in **Settings**. Once they have been configured, the setting will be applied and the icon will change from spinning to green.

Auto Install status	Description
Failed	Red warning triangle. Application Migration triggered an operation which failed while trying to set the auto install flag of Configuration Manager application or package program.
Not Applicable	A rule has broken association and the application migration report is not run.



Note

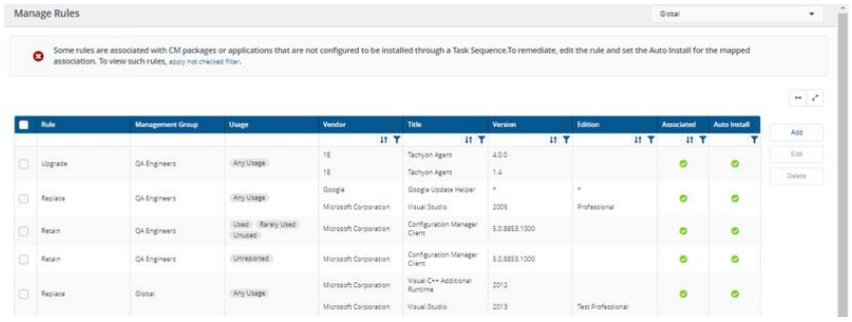
If a rule has **Auto Install** unchecked, you will be prompted to edit that rule and set **Auto Install** to enabled. You can view this type of rule by filtering the **Auto Install** column by **Not Checked**.

You will also see a similar message on the following Application Migration pages and a prompt to take action if the Auto Install is unchecked:

Installation

Preview Device→Existing Device

Preview Device→New Device.



11.3.3.4.3 Adding rules for applications that are not reported as installed

The Installations page can be used to add migration rules for applications that are already installed in your estate. If you want to add a migration rule for an application that is not yet reported as installed on any devices in your estate, you will need to use the Manage Rules page.

From the Application Migration navigation menu on the left, select **Manage Rules.**

In the Manage Rules page, click **Add** (top right).

In the New Migration page screen, choose the rule type (**Upgrade application**, **Replace application** or **Retain application as is**) for the new rule.

If you choose to upgrade the application:

In **Source A**pplication , choose the **Vendor**, **Title**, **Version** and **Edition**.

Choose a **Usage** category (**Any Usage**, **Used**, **Rarely Used**, **Unused or Unreported)** the application must meet in order to be upgraded during the migration. If the application does not meet the criteria, it will not be installed.

In **Target Application,** choose the **Version** and **Edition** to upgrade to.

If you choose to replace the application:

In **Source A**pplication , choose the **Vendor**, **Title**, **Version** and **Edition**.

Choose a **Usage** category (**Any Usage**, **Used**, **Rarely Used**, **Unused or Unreported)** the application must meet in order to be upgraded during the migration. If the application does not meet the criteria, it will not be installed.

In **Target Application,** choose the **Vendor, Title**, **Version** and **Edition** in this order and choose the attributes for the replacement product.

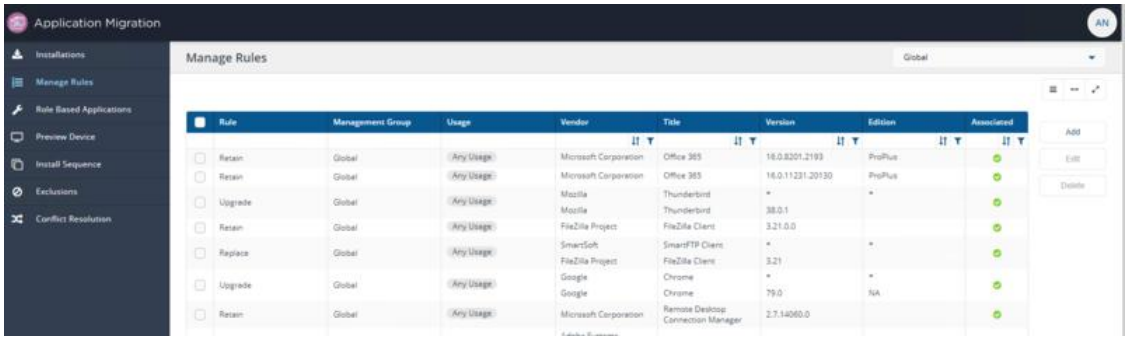
If you choose to retain the application as is:

In **Source A**pplication , choose the **Vendor**, **Title**, **Version** and **Edition**.

Choose a **Usage** category (**Any Usage**, **Used**, **Rarely Used**, **Unused or Unreported)** the application must meet in order for it to be retained during the migration. If it does not meet the usage criteria, it will not be installed.

Associate the target with a Configuration Manager package or application.

Click **Save** and close.



11.3.3.5 Modifying an existing rule

Migration rules are modified from the Manage Rules page. For convenience, you can access the Manage Rules page from the Installations page by selecting an application then clicking the Manage Rules button. This will take you to the Manage Rules page, filtered to show the rule(s) for the selected application, Alternatively you can go to the Manage Rules page to view all migration rules and manually select the rule you want to modify, In either case, from the Manager Rules page select the rule and click the Edit button.

In this example, we are going to modify the existing retain Acrobat Reader migration rule by:

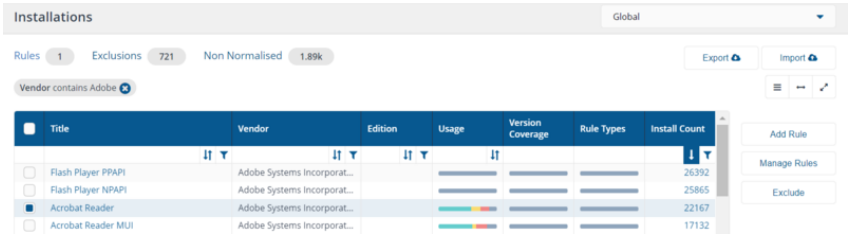
Changing its behavior from retain to replace.

Replacing all instances of Acrobat Reader with Nitro Reader.

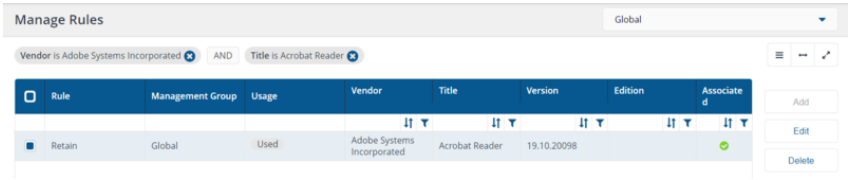
To modify the existing retain rule for Acrobat Reader:

On the Installations page, on the Vendor column click the filter icon

and narrow the results down with the criteria: **Vendor contains Adobe**.

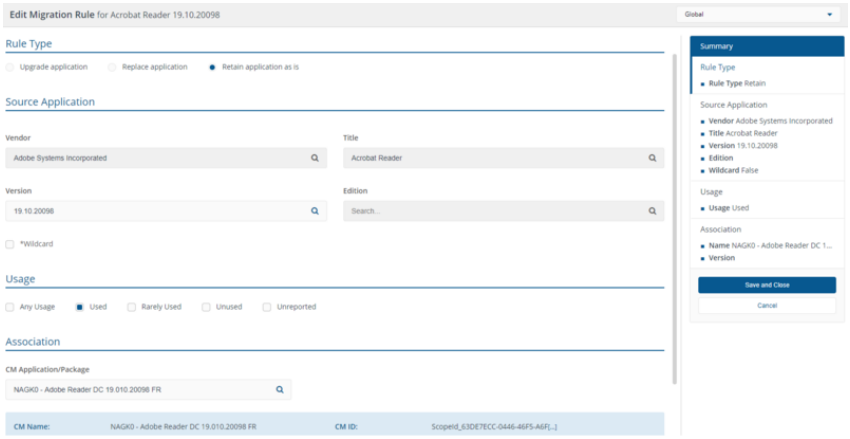


In the table, locate and select Acrobat Reader, then click the **Manage rules** button.



On the Manage Rules screen, select the rule and click **Edit**.

In the Edit Migration Rule screen, the original rule configuration is displayed.



Click **Replace application** to change its behavior and under this, choose the attributes for the replacement application by clicking:

Vendor and from the list, select **Nitro Software, Inc.**

Title and from the list, choose **Nitro.**

Version and from the list choose **12.4.0.259.**

Associate the target with an existing Configuration Manager Application/Package.

Click **Save** and close.

On the Application Migration page, the migration rule for Adobe Acrobat is updated from **Retain** to **Replace.**

11.3.3.6 Deleting an existing rule

Migration Rules are deleted from the Manage Rules page. For convenience, you can access the Manage Rules page from the Installations page by selecting an application then clicking the Manage Rules button. This will take you to the Manage Rules page, filtered to show the rule(s) for the selected application, Alternatively you can go to the Manage Rules page to view all migration rules and manually select the rule you want to delete, In either case, from the Manager Rules page select the rule and click the Delete button.

In our example, we are going to delete an existing rule for Acrobat Reader.

To delete an existing rule for Acrobat Reader:

On the Installations page, on the Vendor column click the filter icon

and narrow the results down with the criteria: **Vendor contains Adobe**.

In the table, locate and select Acrobat Reader then click the **Manage rules** button.

On the Manage Rules screen, select the rule to be deleted and click **Delete**.

You will be prompted to confirm your actions.

Click **Delete** to remove the rule.

11.3.3.7 Exporting and importing migration rules

You can export your installed applications to an Excel format file that can be worked on offline, with template columns that let you define new migration rules. Once you've finished defining the rules you can then import them back into Application Migration.

Refer to Working offline on migration rules for more information.

11.3.3.8 Adding a rule to retain an application

A retain migration rule reinstalls exactly the same version of the application during the migration.

In this tutorial, we'll create a rule that retains 7-Zip 18.

To do this:

On the **Installations** page in the **Title** column click the filter icon

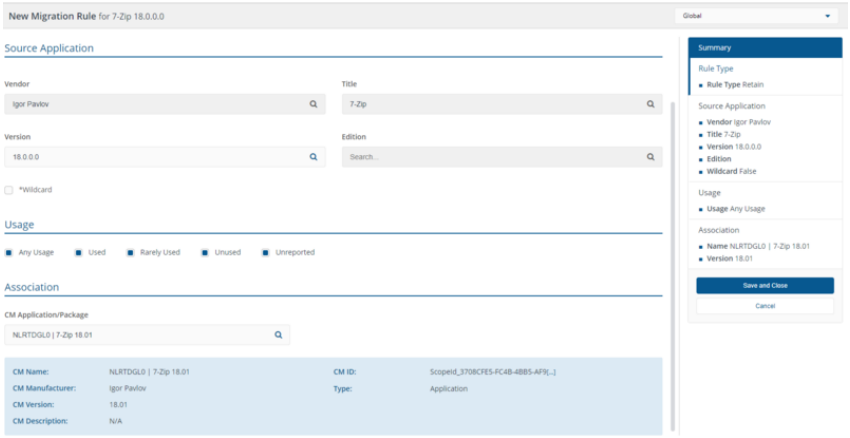
and narrow the results down with the criteria: **Title contains 7-Zip**.

Click the title to expand the list of installed versions. Click the **Add rule** link in the Action column in the row of the version you want to retain.

Note

As Retain rules typically apply to a specific version, adding the rule from the specific version in the UI in this manner will pre-populate the version in the migration rule.

On the **New Migration Rule** page, choose **Retain application as is** for the behavior of the rule.



As we want to retain all instances of 7-Zip regardless of usage, in **Usage** check **Any Usage**.

Because this version of 7-Zip is not already associated with a Configuration Manager package or application, you must add the association. In the **Association** section, choose the 7-Zip 18.0.0.0 **CM Application/Package** from the search field.

Click **Save** and **Close.**

On the **Manage Rules** page In **Title,** search for 7-Zip to view a summary of the rule you just created.

11.3.3.9 Adding a rule to replace an application

A replace migration rule replaces an application with an alternative. This is useful for standardizing on common tools such as file compression applications.

In this tutorial, we are going to create a rule that replaces any version of WinZip with 7-Zip (specifically 16.14).

To do this:

On the **Installations** page, on the **Vendor** column click the filter icon

and narrow the results down with the criteria: **Vendor contains WinZip**.

Check the checkbox in the left-hand column for WinZip and click **Add rule**.

On the **New Migration Rule** page, choose **Replace application** for the behavior of the rule.

In **Source Application**, the attributes for WinZip are already populated and the wildcard box is automatically checked.

As we want to replace all instances of WinZip, in **Usage** check **Any Usage**.

In **Target Application** click field (in bold) and then choose the following values:

Vendor - Igor Pavlov.

Title - 7-Zip.

Version - 16.14.

As this 7-ZIP is not already associated with a Configuration Manager package or application, you must make the association for it to be installed.

In the **Association** section, choose the 7-Zip 16.14 **CM Application/Package** from the search field.

Click **Save** and **Close.**

On the **Manage Rules** page In **Title,** search for 7-Zip to view a summary of the rule you just created.

11.3.3.10 Adding a rule to upgrade an application

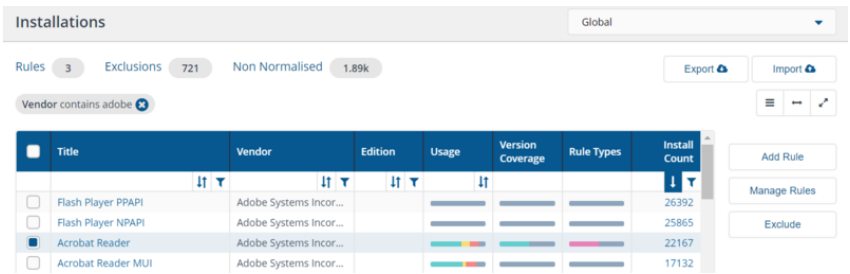
An upgrade migration rule upgrades an existing application to a newer version.

11.3.3.10.1 Adding upgrade rules

To do this:

On the **Installations** page, on the **Vendor** column click the filter icon

and narrow the results down with the criteria contains **Adobe**.



Click the checkbox in the left-hand column for Acrobat Reader and click **Add rule**.

On the **New Migration Rule** page, choose **Upgrade application** for the behavior of the rule.

In **Source Application**, the attributes for Acrobat Reader are already populated and the wildcard box is automatically checked.

As we want to upgrade all instances of Adobe Acrobat 9 to Adobe Acrobat DC, in **Usage** check **Any Usage**.

In **Target Application** click **Version** and choose the following value DC.

As this version of Adobe Acrobat DC Reader is not already associated with a Configuration Manager package or application, you must make the association for it to be installed.

In **Association**, **CM Application/Package**from the list of applications, choose Adobe Acrobat Reader DC.

Click **Save** and **Close.**

On the **Manage Rules** page In **Title,** search for Adobe Acrobat Reader DC to view a summary of the rule you just created.

11.3.3.10.1.1 What happens in upgrade scenarios where the currently installed version of the application is later than the target application?

In upgrade rules where the source version is specified as a wild card, it is possible that versions of the source application in the upgrade rule, that are already installed on the client devices, actually have a later version than the target specified in the upgrade rule.

In versions prior to Application Migration 3.1, the upgrade rule would try to replace the source application already installed on the client device with an earlier target application version, which would result in one of the following possibilities:

the application would be downgraded

the application would remain at the later version and the Application Migration rule would fail

the application in the upgrade rule would be installed in parallel with the existing later version.

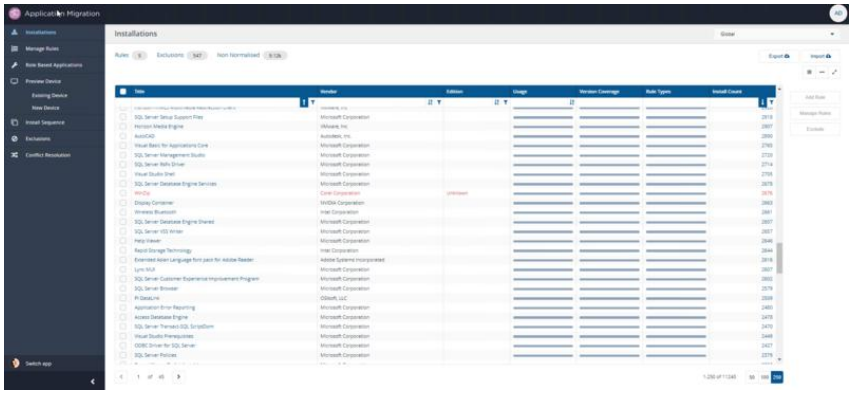
To remedy these unpredictable and unwanted results, in Application Migration 3.1, if an upgrade rule tries to downgrade an application then it will be ignored.

11.3.3.11 Viewing and resolving migration rule conflicts

Conflicts arising from having more than one migration rule for a computer belonging to more than one management group can be easily resolved before the migration takes place.

It's likely that you'll encounter conflicts where two or more migration rules exist for a computer that belongs to more than one Management group, refer to Management Groups page. Under these circumstances, the migration will fail to take place unless you resolve the conflict.

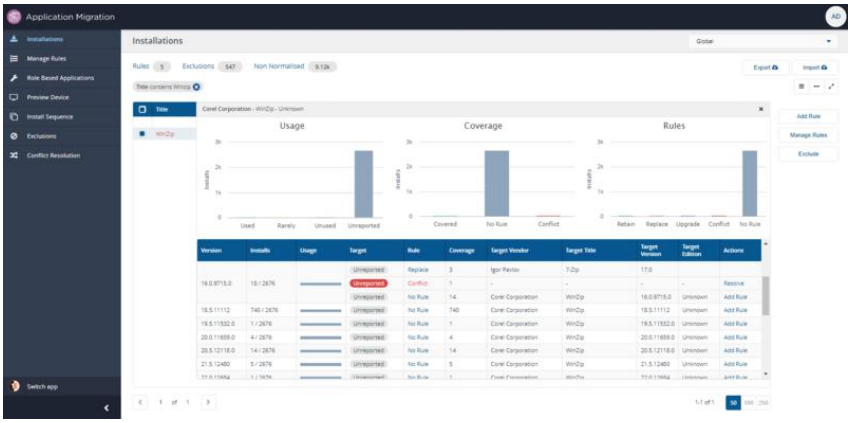
Conflicts are highlighted in red on the **Installations** screen. In our example, there's a conflict for WinZip.



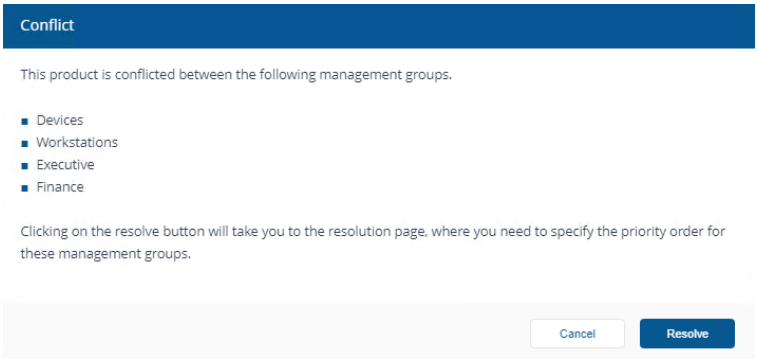
11.3.3.11.1 Viewing a migration rule conflict

To view the migration rule conflict:

Click on the link in the **Title** column to show the drawer view for the software.



Click on **Resolve** in the **Actions** column to display a **Conflict** popup screen showing the Management Groups the computer is a member of that are causing the conflict. In our example these groups are:



Clicking on **Resolve** takes you to the **Conflict Resolution** page, where you can specify the priority order for these Management groups and resolve a migration rule conflict. The next section Resolving a migration rule conflict explains how you can do this.

11.3.3.11.2 Resolving a migration rule conflict

Clicking on **Resolve** in a **Conflict** popup takes you to the **Conflict Resolution** page where you can add and prioritize Management groups to avoid migration rule conflicts.

The priority list for management groups decide which rules apply in a conflict. A common example of this would be when a device happens to be in more than one management group. In this case, management groups higher up in the priority list will have their rules applied first to such devices. To do this:

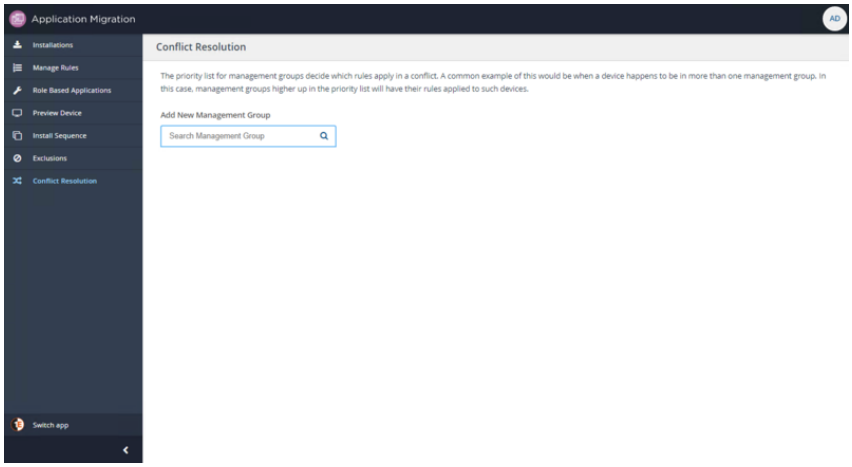
Use the **Add New Management Group** to search for and add the Management groups you want to prioritize, in our example these groups are:

Devices

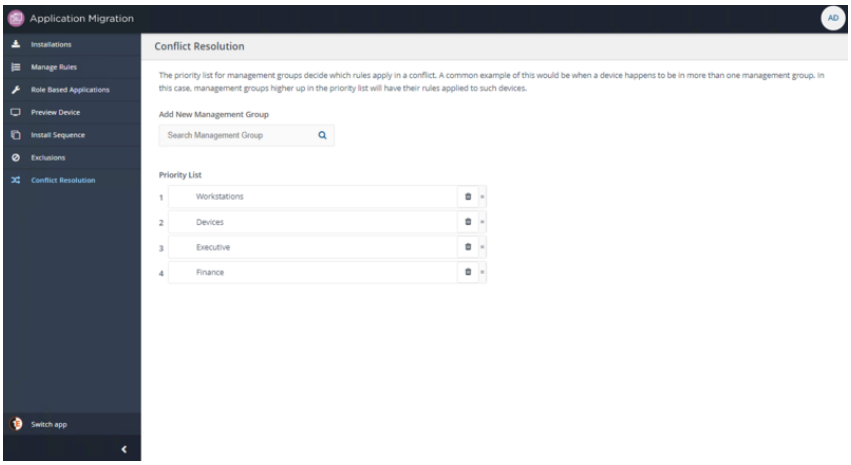
Workstations

Executive

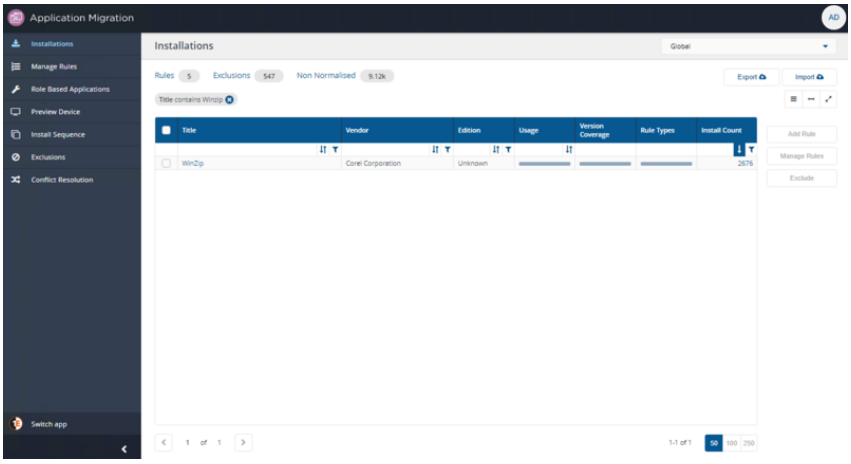
Finance.



In the **Priority List**, arrange the Management groups using drag and drop based on your order of precedence.



Check the **Installations** screen to confirm the conflict is now resolved. In our example, by setting an order of priority for our Management groups, WinZip now shows without the conflict warning.

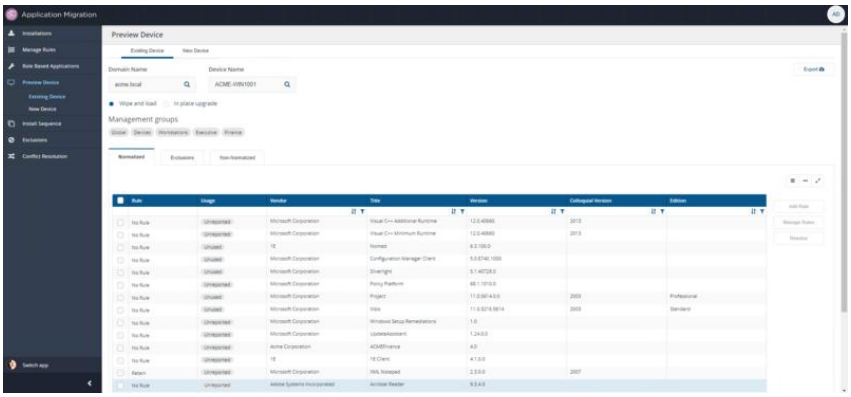


By following this process Application Migration decides which of your **Vendor, Title, Version, Edition (VTVE)** rules should take priority if there's a migration rules conflict.

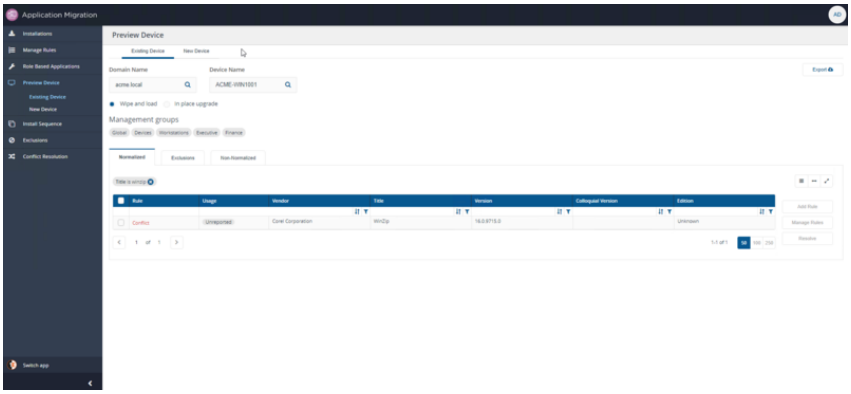
11.3.3.11.3 Using Preview Device to resolve conflicts

In addition to viewing and resolving Migration Rule conflicts from the **Installation** screen, you can also view and resolve conflicts from the **Preview Device** screen by searching for individual computers.

Click on **Preview Device** and then **Existing Device** screen.



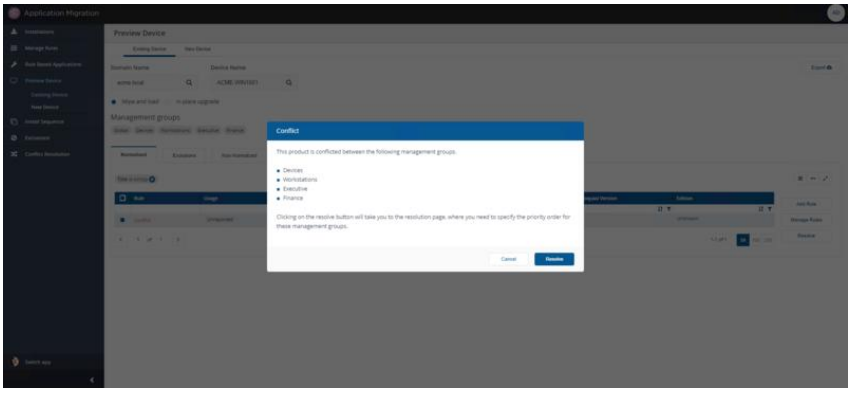
In the **Domain Name** field start typing the name of the Domain where the computer is located, in our example this is **ACME.LOCAL**.



In the **Device Name** filed start typing the name of the computer you want to check, in our example we selected **ACME-WIN1001**.

All the Management groups this computer is a member of are displayed, as are the rules that apply to software installed on that computer. In this example we know there's a conflict related to WinZip, so we have filtered the view to just show this Title.

To resolve the conflict, select the title and click **Resolve**.



Clicking **Resolve** takes you to the **Conflict Resolution** page where you can add and prioritize Management groups to avoid migration rule conflicts as described in Resolving a Migration Rule Conflict.

11.3.3.12 Working offline on migration rules

You can export your installed applications to an Excel format file that can be worked on offline, with template columns that let you define new migration rules. Once you've finished defining the rules you can then import them back into Application Migration.

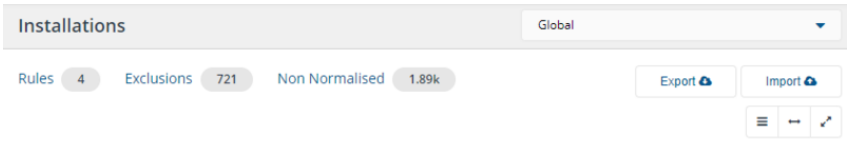
11.3.3.12.1 Exporting your installed applications

To simplify the process for creating new application migration rules, use the export feature – it creates a spreadsheet that has all your installed applications to enable you to create new rules to associate with them without having to be online. Existing rules cannot be modified with this process.

When you have added new rules to the spreadsheet, simply import it back to Application Migration and have your new migration rules implemented.

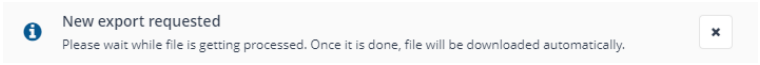
To get an export of your installed applications:

Under the **Applications Migration** menu, click **Installations**.



On the **Installations** page, click **Export** on the top right of the page.

A prompt is displayed while the export takes place. The default download location is the local computer downloads folder.



When the export is complete, you can retrieve the file (*`Application Migration.xlsm`*) from the **Downloads** folder.

11.3.3.12.1.1 What you get with the export

> **Note**
>
> The export includes all inventoried applications from the current view, but will not include any existing rules. To use this feature effectively, filter the display page to include vendors or applications for which you have not already defined rules for, then export it so you can define rules for these installations.

The properties of the exported Application Migration spreadsheet are:

Column	Optionality	Default value	Notes
RuleType	Mandatory		Pick-list to identify the type of migration rule. You must have a value for this column or it results in an error when we pre-flight the input during the import. Values are: Replace Upgrade Retain.
CurrentVendor		Pre-populated	Vendor of the product to be migrated. Pick-list of vendors from the 1E Catalog.

Column	Optionality	Default value	Notes
CurrentTitle		Pre-populated	Title of the product to be migrated. Pick-list of titles available from that vendor.
CurrentVersion		Pre-polulated	Version of the product to be migrated. An asterisk (*) denotes all versions – dot (.) format or colloquial versions.
CurrentEdition		Pre-populated	Edition of the product to be migrated.
ManagementGroup	Mandatory	Global	The Management group the product is associated with. You must have a value for the column or it results in an error when we pre-flight the input during the import.
Usage	Mandatory	Any Usage	Usage category for the product to be migrated. You must have a value for this column or it results in an error when we pre-flight the input during the import. Values are: Any Usage Used Rarely Used Unused Unreported Used | Rarely Used Used | Unused Used | Unreported Rarely Used | Unused Rarely Used | Unreported Unused | Unreported

Column	Optionality	Default value	Notes
			Used | Rarely Used | Unused Used | Rarely Used | Unreported Used | Unreported | Unused Rarely Used | Unused | Unreported.
TargetVendor			Vendor of the product for the migration rule. Pick-list of vendors from the 1E Catalog.
TargetTitle			Title of the product for the migration rule. Pick-list of titles available from the TargetVendor.
TargetVersion			Version of the product for the migration rule. Can be in a dot format or colloquial versions.
TargetEdition			Edition of the product for the migration rule.
ApplicationType	Mandatory		Configuration Manager package/application associated with the target product. You must have a value for this column or it results in an error when we pre-flight the input during the import. Values are: Application Package.
Application/PackageName			Application name of the Configuration Manager package/application associated with the target application.
Application/PackageId			Application ID of the Configuration Manager package/application associated with the target application. Displayed as:

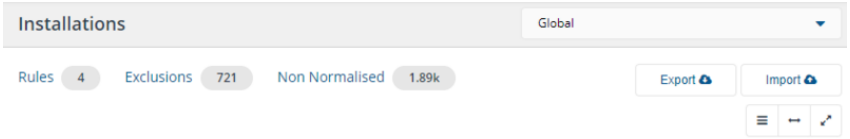
Column	Optionality	Default value	Notes
			Plain text field for Application application type Pick-list for Package application type. There may be multiple packages with the same name and if you choose one of these, you will also choose the PackageId to identify it.
ProgramName			Program name of the Configuration Manager package associated with the target application. Relevant only if ApplicationType = Package
ImportResult			Post-import, for each row, it will display Added, Failed or Skipped.
ImportLog			Post-import, for each row, it will display the reason why the record could not be processed if ImportResult was Failed or Skipped.

11.3.3.12.2 Importing your application rules file

When you have created the new rules for your applications, import the file so that Application Migration can implement your new rules. Ensure you have met the mandatory requirements (refer to the What you get with the export table on this page) before you import your file to avoid non-critical errors being reported.

To import the file:

Under the **Application Migration** menu, click **Installations**.



On the **Installations** screen, click **Import**.

On the **Upload migration rules screen**, click **Choose** file.

Locate your updated import file and click **Open**.

You'll see a prompt as the upload takes place.

When the upload completes, the results are displayed and an import file is automatically downloaded to the **Downloads** folder on your local computer. Refer to the table below for the In-flight validation used.

Click **Close** and locate the file to address any reported issues.

11.3.3.12.2.1 In-flight validation

When you import your migration rules, we run an in-flight validation on your spreadsheet and only create the migration rules when they pass our tests.

Validation on	Checks	Import result	Error message	Remedial action
Rule types	RuleType is mandatory and must must be one of: Replace Upgrade Retain.	Failed	Rule type must be valid.	Provide a valid rule type.
If the rule type is Retain, SourceVersion and SourceEditions cannot	Failed	Rules of Retain type cannot have wildcard rules.	Do not use wildcard characters in source version or source edition.	

Validation on	Checks	Import result	Error message	Remedial action
contain wildcard characters.				
Two duplicate rules must not be present in import file.	Skipped	Another rule for this application, usage and management group already exists in the import file.	Delete one of the rules.	
Rules must be unique for source product, usage and management group. Creating a duplicate rule will throw an error.	Skipped	Another rule for this application, usage and management group already exists in the database.	Delete the rule from the import file as it already exists. If you want to update the rule, please visit the website.	
Rules cannot override an existing Configuration Manager association for a target product.	Failed	The target product in this row is already associated with another CM Application/Package. CM associations cannot be overridden through the import file feature. Please overwrite the CM association through the product user interface."	Assign the same association to the target product as it exists in the database. If you want to update the SCCM association, please visit the website.	

Validation on	Checks	Import result	Error message	Remedial action
Vendor	SourceVendor must not be empty.	Failed	Source Vendor must not be empty.	Provide a valid source vendor.
Title	SourceTitle must not be empty. It is required for a replace rule.	Failed	Source Title must not be empty.	Provide a valid source title.
Version	SourceVersion must not be empty. It must have the minimum value of a.b and must be in one of these formats: a.b, a.b., a.b.c.d, a.*, a.b.*,a.b.c.*, * You cannot use the wildcard character as part of a version, for example a.*.b, a.b.*.c, *.a	Failed	Source Version must not be empty.	Provide a valid source version.
If the rule type is Retain, SourceVersion and cannotcontain wildcard characters.	Failed	Rules of Retain type cannot have wildcard rules.	Do not use wildcard characters in source version.	
TargetVersion must not be empty. It must have the minimum value of a.b and must be in one of these	Failed	Target Vendor, Title or Version is missing.	Provide a valid target version.	

Validation on	Checks	Import result	Error message	Remedial action
formats:a.b, a.b., a.b.c.d.				
Edition	If the rule type is Retain, SourceEditions cannotcontain wildcard characters.		Rules of Retain type cannot have wildcard rules.	Do not use wildcard characters in source edition.
Combination of Vendor, Title, Version and Edition	The combination of SourceVendor, SourceTitle,SourceVersion and SourceTitle must have an equivalent item in the 1E Catalog.	Failed	Source Vendor, Title, Version and Edition has not matching entry in the 1E Catalog.	Select a valid source product.
Combination of Vendor, Title, Version	The combination of TargetVendor, TargetTitle and TargetVersion must not be empty and must have an equivalent item in the 1E Catalog.	Failed	Target Vendor, Title, Version, Edition has no matching entry in the 1E Catalog.	Select a valid target product.
TargetVendor, Target Title and Target Version must not be empty as these values are required for a Replace rule type.	Failed	Target Vendor, Title or Version is missing.	Provide valid target vendor, target title and target vendor for the Replace rule type.	
TargetVersion must not be empty as it is required for	Failed	Target Vendor, Title or Version is missing.	Provide a valid target version for the Upgrade rule type.	

Validation on	Checks	Import result	Error message	Remedial action
an Upgrade rule type.				
Management group	Management group must not be empty. By default, the Global management group is always present.	Failed	Management group name is not valid.	Select a valid Managemen t group.
Usage	Usage is mandatory and must be one of: Unreported Unused Rarely Used Used Any Usage.	Failed	Selected usage is not valid.	Select a valid usage.
Application types	ApplicationType must not be empty and must be one of: Package Application.	Failed	ApplicationTyp e is not valid.	Enter a valid application type.
The Package or Application must already exist in Configuration Manager.	Failed	Associated CM Package or Application is invalid.	Enter a valid Configuration Manager Package or Application.	

11.3.3.13 Managing Configuration Manager association alerts

Application Migration users will see alerts on specific pages that identify orphaned applications - when one or more rules or applications in an application set reference Configuration Manager objects that no longer exist, or where the Configuration Manager association has been deleted.

11.3.3.13.1 What are associations?

Applications and Packages in Configuration Manager are identified by a name and optionally publisher and version arbitrarily determined by the Configuration Manager administrator that created them. The platform uses a standard format of Vendor, Title, Version and Edition to identify applications.

The **Manage Associations** section of Inventory enables an administrator to effectively normalize the Applications and Packages imported from Configuration Manager by associating them with a Vendor, Title, Version and Edition defined in the 1E Catalog. These associations are then used to define migration rules in Application Migration, refer to Managing migration rules and reclaim rules in AppClarity.

11.3.3.13.2 What happens if an association is broken?

You will be notified when some rules are associated with Configuration Manager packages or applications that no longer exist on the following pages:

Manage Rules.

Installations.

Role Based Applications.

To manage associations, the Inventory repository used by your application must be populated by a **System Center Configuration Manager** connector that collects details of Applications and Packages defined in Configuration Manager.

There are two reasons why an association could be broken:

Someone has explicitly changed or deleted the association on the Manage associations page.

Someone has explicitly changed or deleted the source package or application the association depended on from Configuration Manager. In this case, the impact will only be seen after the **System Center Configuration Manager** connector sync has run.

Notifications will appear after the **Application Migration Consolidation** action has run.

For how associations and connectors work, refer to Manage associations and System Center Configuration Manager connector.

For managing rules in Application Migration, refer to Managing migration rules.

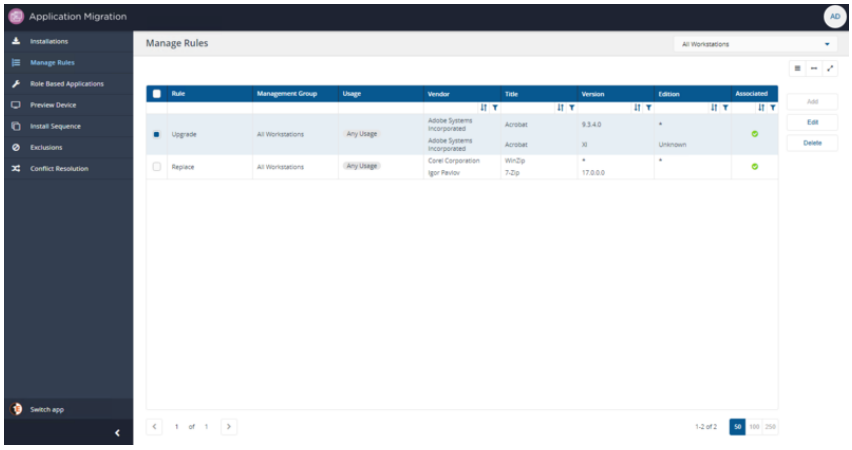
11.3.3.13.3 Managing association alerts

Manage Rules page

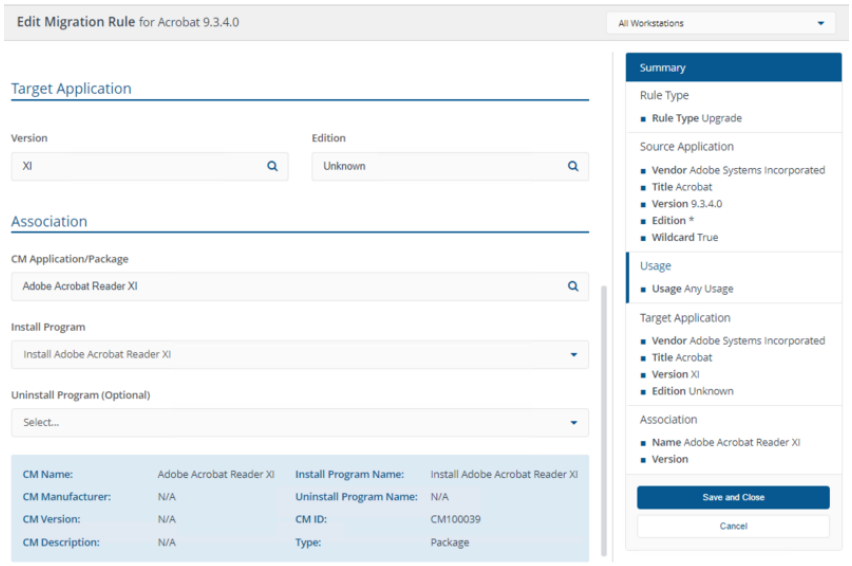
In this example we have a Rule to upgrade computers in the **All Workstations** Management Group from Adobe Acrobat version 9.3.4.0 to Adobe Acrobat XI.

To upgrade Adobe Acrobat version 9.3.4.0, the migration rule has an association with a Configuration Manager package for Adobe Acrobat Reader XI which has a Configuration Manager package ID of **CM ID - CM100039**.

Manage Rules page:



Configuration Manager Association:



Viewing associations between Configuration Manager and products

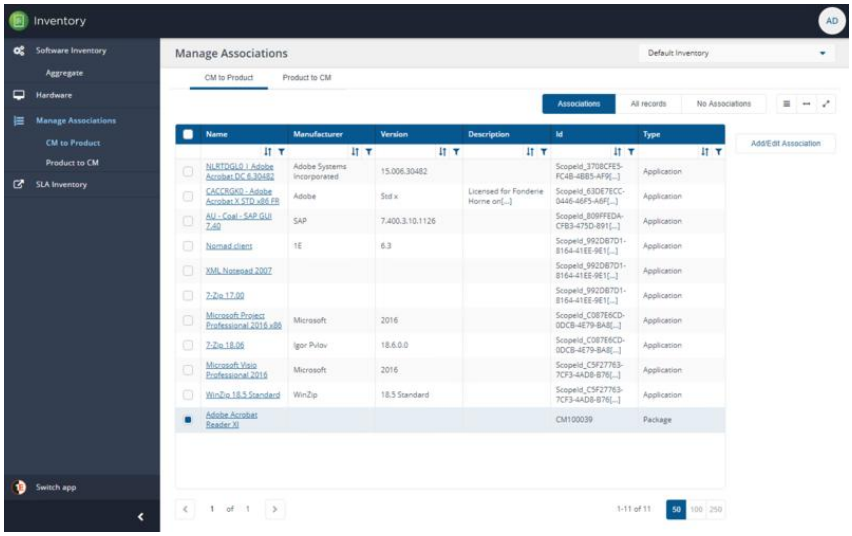
Associations between products and Configuration Manager packages and applications are managed in the Inventory Application.

In our example, we can view the Adobe Acrobat Reader XI associations by switching to the Inventory app and then on the **Manage Associations** page, viewing **CM to Product**, selecting **Adobe Acrobat Reader XI** and clicking **Add/Edit Association**.

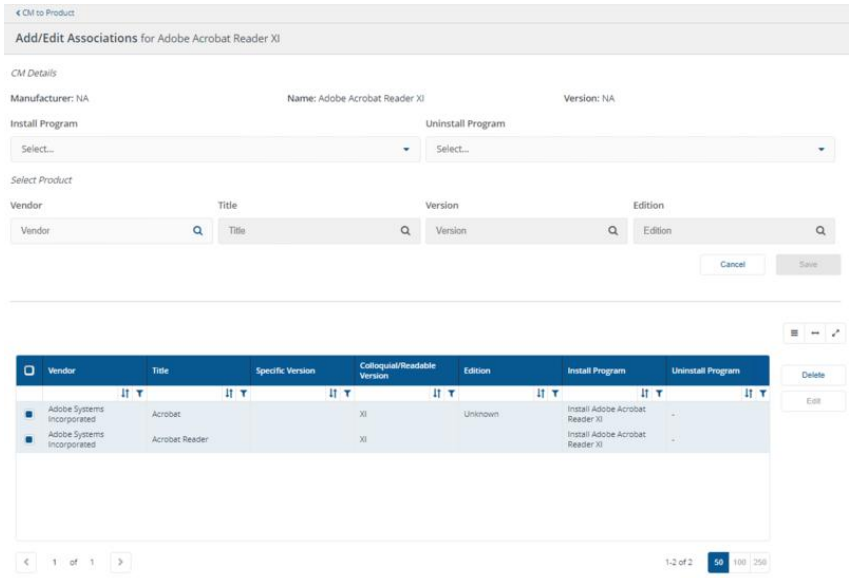
On the **Add/Edit Associations** for **Adobe Acrobat Reader XI** we can see that Adobe Acrobat Reader XI is associated with the correct application in Configuration Manager.

To find out more about how the Inventory Application works, please refer to Introducing Inventory.

Manage Associations page:



Add/Edit Associations for Adobe Acrobat XI:



When an alert is generated

If the Configuration Manager association is no longer present because, for example either the associated Configuration Manager application or package has been deleted from Configuration Manager. Or the Configuration Manager association has been deleted in Application Migration. You will see an alert.

In our example, the Adobe Acrobat XI package gets deleted from Configuration Manager. At the point of deletion Application Migration does not know the package is gone.

It is after the next **Generate Report - Application Migration Consolidation** runs and the **Manage Rules** page gets refreshed, that you will see an alert.

> **Tip**
>
> It's good practice to schedule the regular synchronization of data from Configuration Manager into Application Migration using the System Center Configuration Manager inventory connector.

You should schedule the connector to execute regularly to keep the data in Application Migration up to date, ensuring new devices, new software installations, and software removals are correctly reported.

To perform this task you will need to be logged into the Tachyon portal as a user with the Schedule Administrator role. The Application Migration Administrator role does not have the required permissions to schedule connectors.

Refer to the Schedules page for details on how to schedule a connector.

Note

To fully understand how to:

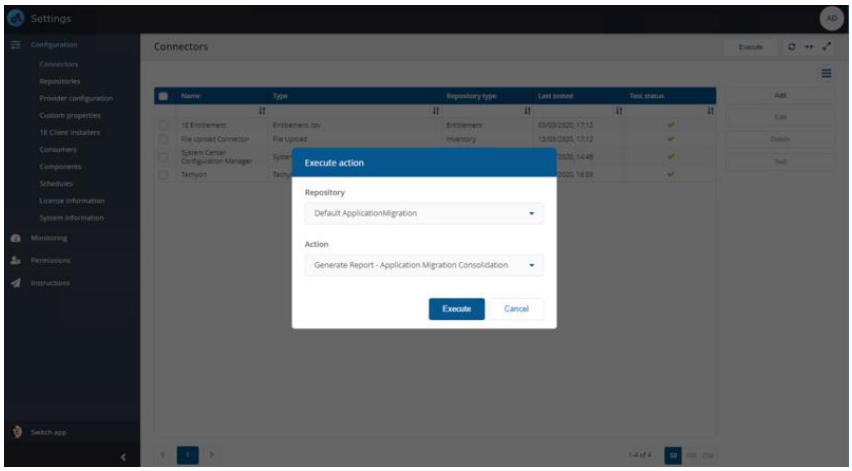
Get data into Application Migration from Configuration Manager.

Keep data synchronized between Application Migration and Configuration Manager.

Execute consolidation actions independently.

Please refer to Post-install configuration.

Generate Report - Application Migration Consolidation:



What the alerts look like

You will see an alert displayed in a banner at the head of the page indicating there are one or more rules associated with Configuration Manager packages or applications that no longer exist. In the **Associated** column there will be a warning symbol indicating which specific rule has a missing association.

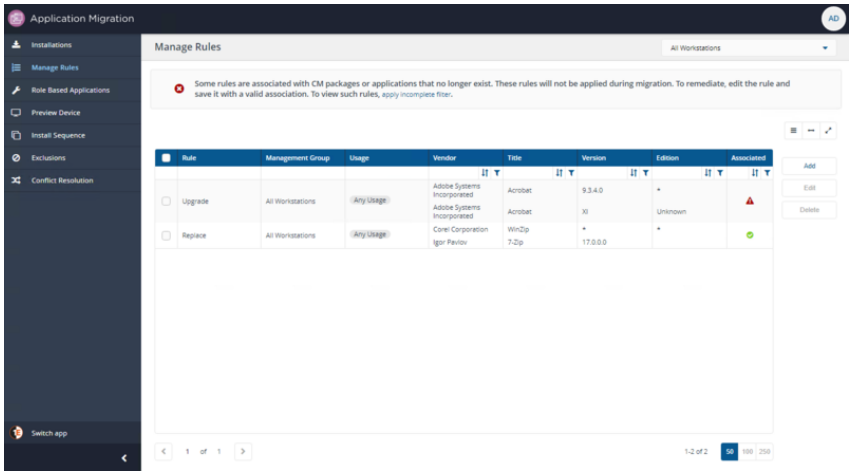
Using the **apply incomplete filter** link in the warning banner you can apply a filter to display incomplete rules and then remediate them by investigating and fixing the missing associations.

For example, if a package has been removed from Configuration Manager, you would need to either recreate or re-import this package in Configuration Manager. You could also adopt your migration rule to include a package that is still present in Configuration Manager.

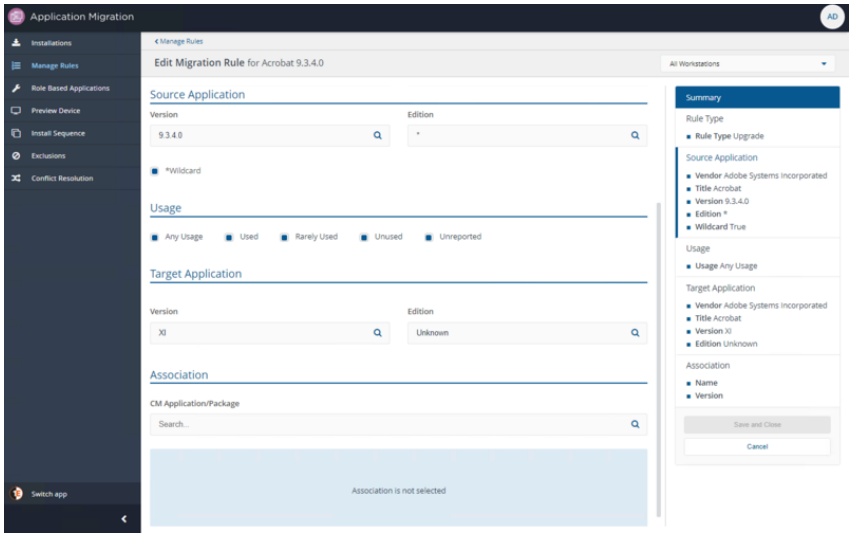
Or, if the package is present in Configuration Manager and only the association was removed, then you will need to recreate the appropriate associations for your rule to work correctly.

For more details about adding, modifying and deleting migration rules in Application Migration please refer to Managing migration rules.

Refreshed Manage Rules page:



Configuration Manager associations are no longer present:



11.3.4 Managing product exclusions

Products can be excluded from consideration by Application Migration, helping you to focus on the important products and minimizing effort during the Application Migration workflow.

11.3.4.1 What are exclusions?

The list of products in 1E Catalog is quite substantial and contains items such as security updates, service packs, hotfixes, drivers, etc which are not useful if you are compiling application migration rules. There may also be applications that you do not use in your organization, for example Cisco Jabber has no value to you if you are committed to Skype for Business as your instant messenger.

You most likely will not want to create migration rules for these types of applications and the Exclusions feature helps reduce the level of noise you have to navigate. Excluded applications are based on vendor, title and edition and fall into two categories.

11.3.4.1.1 System driven exclusions

These exclusions (typically service packs, hotfixes, security updates, etc.) are automatically managed by Application Migration – they are filtered out when you run the Application Migration consolidation report or when its next synchronization event takes place. The algorithm looks for these sub strings to build an exclusions list:

security update for

update for

visual c++ redistributable

Multi-Targeting Pack

service pack

language pack

integration pack

targeting pack

developer pack

boosterpack

codec pack

clipartpack

compatibility pack

hotfix for

integration package

visual j# redistributable

mui pack

Windows Server

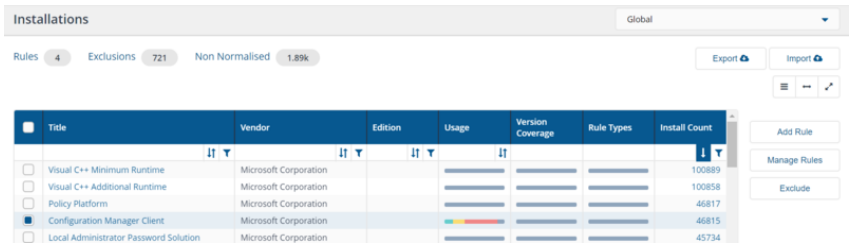
Windows.

11.3.4.1.2 User driven exclusions

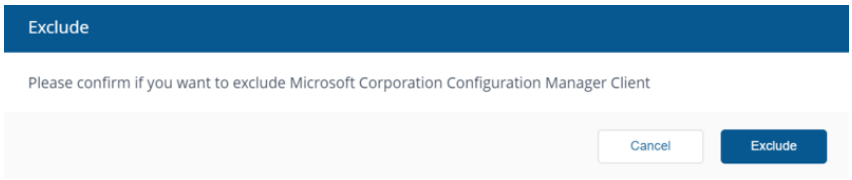
User driven exclusions (typically those that have no relevance to your organization) are those you specifically choose to exclude. For example, if you choose to exclude Microsoft SQL Server Compact edition, all versions for that product will be excluded, however other SQL Server editions will be unaffected.

11.3.4.2 Adding to the list of exclusions

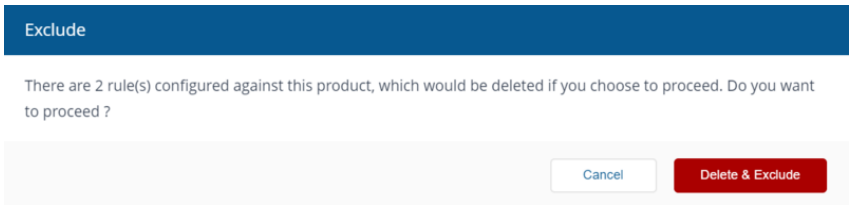
To exclude an application, on the **Installations** page, locate the application you want and click **Exclude**. Click the filter icon to narrow down the list if necessary.



You can exclude applications irrespective of whether they have migrations rules associated with them or not. You will be prompted to confirm your actions. If there are rules associated with the application, the prompt will notify you of the number of rules associated with it and to confirm your intentions to exclude the application.



In this case the popup button text will be changed to be **Delete & Exclude** and the color will change to red indicating that there are consequences for the action. The associated rules are deleted if you proceed.



Multiple applications can be selected and excluded at the same time.

There are now four scenarios for excluding applications:

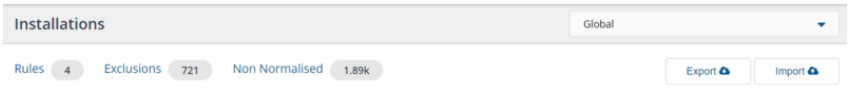
Scenario	Behavior
Excluding a single application with no associated rules.	An **Exclude** popup is displayed that shows the name of the application.
Excluding a single application with associated rules.	An **Exclude** popup that shows the name of the application and a count of the associated rules.
Excluding multiple applications with no associated rules.	An **Exclude** popup is displayed that shows the number of applications being excluded.

Scenario	Behavior
Excluding multiple applications with associated rules.	An **Exclude** popup is displayed that shows the number of applications being excluded an a count of all the associated rules for all of those applications.

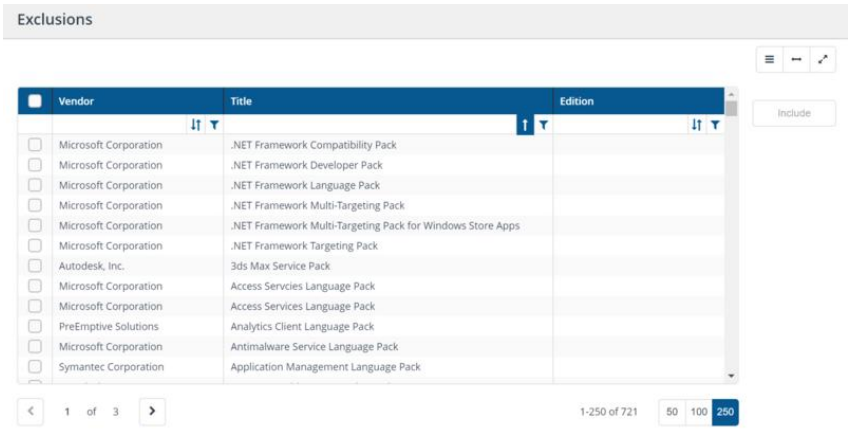
11.3.4.3 Reviewing your exclusions

To view a list of your exclusions:

On the **Installations** page (the number after the exclusions link indicates the total number of excluded products). Clicking the Exclusions link takes you to the Exclusions page.



The list of exclusions on the Exclusions screen are sorted by **Vendor**, **Title** and **Edition**.



To include an excluded application so that it can be part of your application migration strategy, locate the application and check the checkbox to select it, click **Include**. Click the filter icon

to narrow down the displayed list if necessary. Follow-up by adding a migration rule to this included application, for more information refer to Managing your rules.

11.3.5 Previewing post-OS migration application states

Before deploying the OS Deployment Task Sequence, you can preview the effect that Application Migration will have on the software installed on a device. This can be for existing or new build devices. This is done from **Preview Device**, where you can see the following menu items:

Menu item	Description
Existing Device	Post-migration application status for existing computers undergoing an in-place upgrade or a computer refresh.
New Device	Applications to be installed on new-build computers by Management Groups or device attributes.

Applications not subject to migration rules behave differently depending on the type of OS deployment, as follows:

Computer refresh also known as **wipe and load** - applications for which no migration rule exists will be removed, that is not reinstalled when the new OS is installed)

In-place upgrade - applications for which no migration rule exists are retained, as in-place upgrade does not remove any applications

Computer replacement - if the device is being replaced and either a Computer Association defined in Configuration Manager or the 1E Windows Self-service Assistant is being used for the replacement, applications for which no migration rule exists will not be installed on the new device. To preview the results of a replacement, select the old device and the Wipe-and-load option.

New devices - for completely new computers you can use the Preview Device feature to see which Role-based Applications will be installed on a new device. As the new device does not exist, you need to either select the specific Management Group that the computer *will* exist in once it is built, or define the attributes (name, AD Site or OU, or any combination of these) that the computer *will* have when it is built.

11.3.5.1 Previewing applications installed on existing devices post-migration

When you preview a computer, you'll be able to see the following information:

Management groups associated with the computer

Products installed on the computer along with their usage statistics

Migration rule statuses:

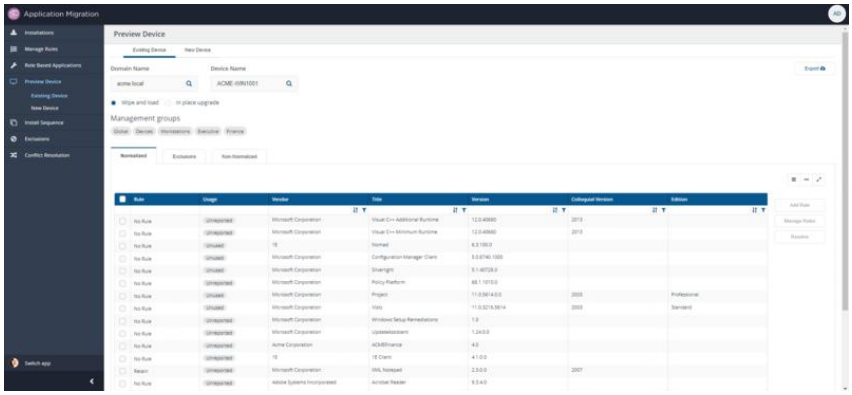
No rule – if a rule has not been set up

Retain, Replace, Upgrade rules – if they are set up

Conflict – if there are conflicting rules for that particular product.

Excluded applications on the computer

Applications on the computer which have not been normalized.

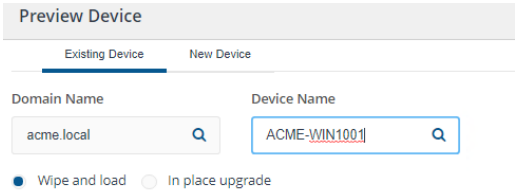


To get a post-migration preview of an existing computer:

Under the **Preview** Device menu click **Existing** Device .

Choose the type of deployment you want - **Wipe and Load** or **In-place upgrade**.

In both **Domain Name** and **Device Name** fields, start typing a name and a list matching your string is dynamically displayed for you to choose from.



11.3.5.1.1 Behavior of the post-migration preview screen and table

In our example, we are going to preview the **Wipe and load** post-migration application state for **ACME-WIN1001** which is in the **ACME.local** domain.

When we selected ACME-WIN1001 as **Device Name**, the Global, Devices, Workstations, Executive and Finance Management Groups are identified. ACME-WIN1001 is member of all these Management groups. If a computer is a member of more than one Management Group, they will be identified under the **Management groups** heading. Below this heading, is the details table which is made up of three tabs:

Normalized

Exclusions

Non-Normalized.

11.3.5.1.2 Normalized

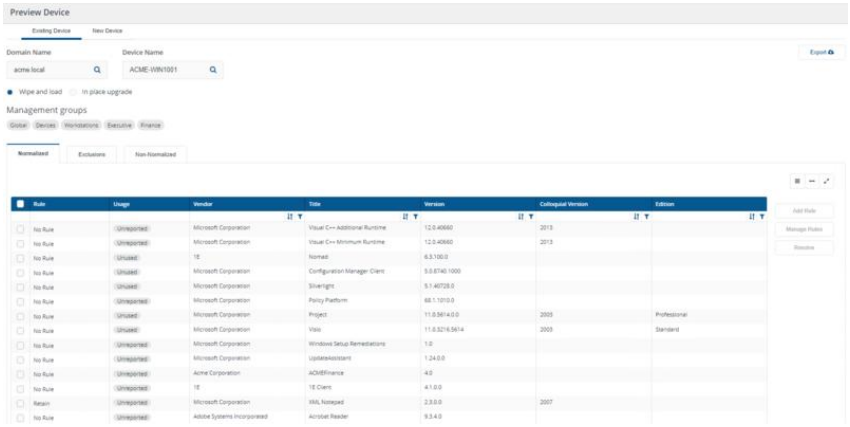
The Normalized tab displays a list of applications installed on ACME-WIN1001 which have a corresponding item in the 1E Catalog. The table in this tab displays a preview of the post-OS application migration state for a **Wipe and load** deployment. For each application in the table, you will be able to identify:

Rules associated with it under the **Rules column.**

Usage statistics

Details about the application in the **Vendor**, **Title**, **Version**, **Colloquial Version** and **Edition** columns

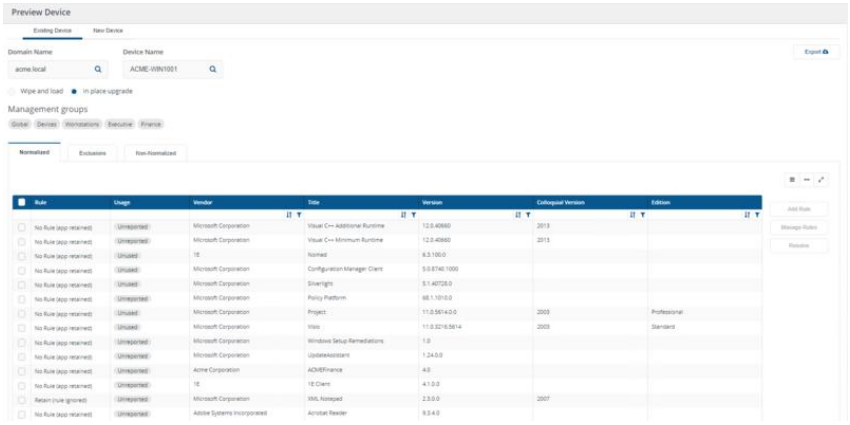
Options to **Add Rule**, **Manage Rules** or **Resolve** conflicts.



If we had chosen to preview the **In-place upgrade** post-migration application state forACME-WIN1001 notice the following changes where an application is:

Subject to a **Retain** rule for the **Wipe and load deployment**, (In the example shown this is XML Notepad, the second row from the bottom) the rule is ignored and the **application is not installed** for the **In-place upgrade** as all installed applications are retained anyway during an in-place upgrade.

Not subject to a rule (**No rule**) for the **Wipe and load** deployment, it is **retained** (last row) for the **In-place deployment** as all installed applications are retained anyway during an in-place upgrade.

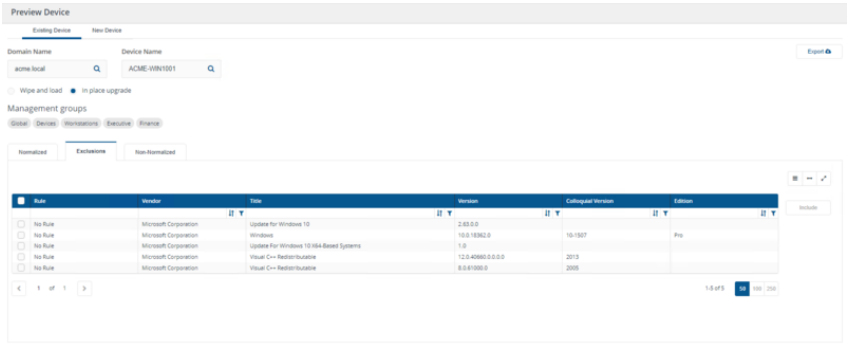


11.3.5.1.3 Exclusions

The Exclusions tab displays all excluded products for the computer ACME-WIN1001.

The list of products in 1E Catalog is quite substantial and contains items such as security updates, service packs, hotfixes, drivers, etc which are not useful if you are compiling application migration rules. There may also be applications that you do not use in your organization, for example Cisco Jabber has no value to you if you are committed to Skype for Business as your instant messenger.

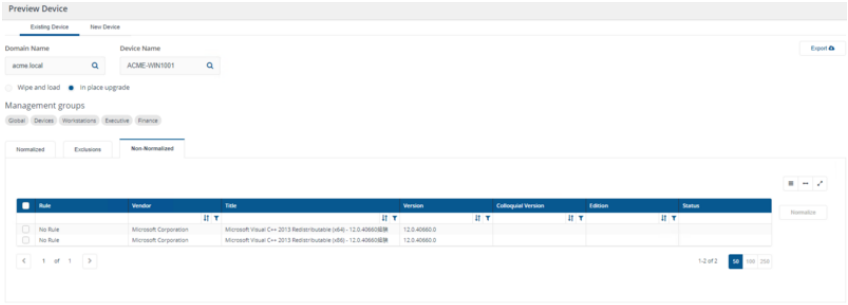
Please refer to Managing product exclusions for more details.



11.3.5.1.4 Non-normalized

The Non–normalized tab displays all unmatched source applications for ACME-WIN1001. You can add an item from this list to the Catalog by selecting it and clicking **Normalize**.

Normalization is a Platform function that refers to the process of finding (or not finding) a match rule in 1E Catalog, then deduplicating and rationalizing the information using Platform logic, and publishing the information on the 1E Catalog UI. Partial Matching for example does not have a match rule in 1E Catalog but it's still normalized and published on the UI using Platform logic.



11.3.5.2 Previewing applications to be installed on new devices

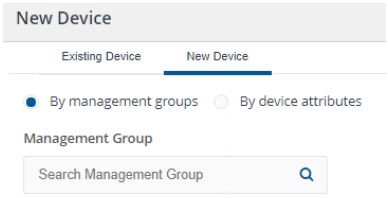
As well as previewing the post-migration status for existing computers that are subject to an in-place upgrade or a computer refresh, you can preview applications that will be installed on new devices. This allows you to modify application rules or applications associated with Role Based Applications Sets before carrying out your production builds.

This feature works by evaluating the combination of rules assigned to a particular Management Group and the rule-based application sets you create and associate with those Management Groups.

To preview applications to be installed on new-build computers:

Under the **Preview** Device menuclick **New** Device .

Click **New Device**.



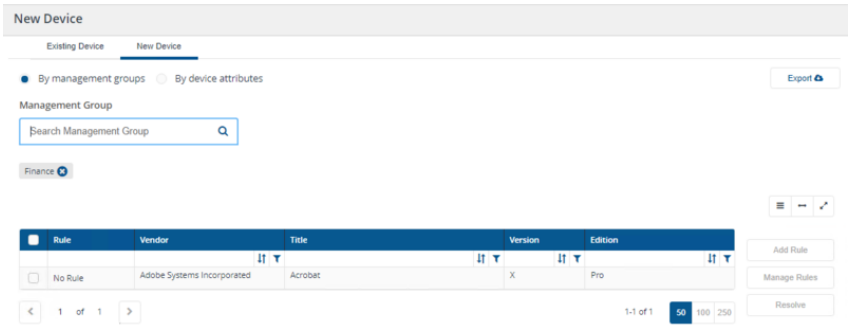
You can view the new computer two ways:

By management groups

By device attributes.

11.3.5.2.1 By management groups

On the **New Device** screen, select **By management groups.**



In **Management Group** start typing the name of a Management Group. A list matching your search string is displayed for you to choose from.

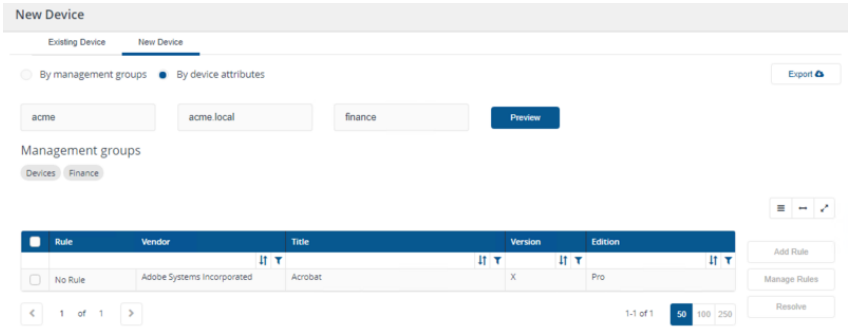
The table shows applications that will be installed on new builds complying with the rules assigned to that Management Group and the Role-based Application Sets you create and associate with it.

You can choose more than one Management Group to preview. If the list of applications is incorrect, you can update the Role-Based Application Set you created and run the preview again.

You can also add and manage Application Migration rules from this view for any of the listed applications by clicking **Add Rule.**

11.3.5.2.2 By device attributes

On the **New Device** screen select **By device attributes.**



You only need to know the details of any one of the three attributes to retrieve the list of applications for installation on new builds:

Device Name

Active Directory Site

Organizational Unit.

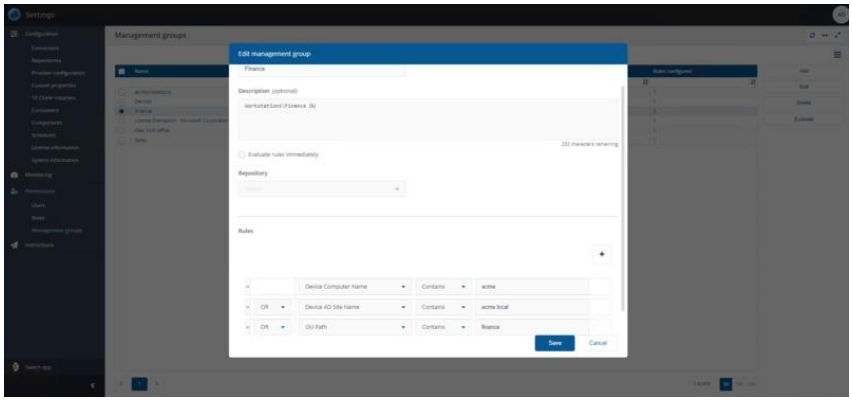
For example:

We created the **Finance** Management group with the following rules:

Device name contains **acme**

Active Directory Site name is **acme.local**

Organizational Unit is **finance**.



On the **Preview Machine screen**, we start typing the name of a computer, the AD site or the OU. In our illustration, we have populated the computer attribute fields with the values from the rule we created for the **Finance** Management group.

The table shows applications that will be installed on new builds complying with the rules assigned to that Management Group and the Role-based Application Sets you create and associate with it.

For more information about Management groups and how to use them, please refer to Management Groups page.

11.3.5.3 Exporting device preview information

You can export the device preview information to an Excel spreadsheet using the **Export** button at the top-right of the interface. This information can be presented to end-users to give them some indication of the software that will be present on their device post-OS migration.

The information in the exported file is described in the following tables for **Existing Devices** and **New Devices**:

11.3.5.3.1 Existing Devices

The information in the exported file, **ExistingDeviceWipeAndLoad.xlsx** is described in the following tables for **Existing Devices** (one per sheet in the Excel file):

The Normalized sheet

Column	Description
Rule	List to identify the type of migration rule. Values are: Replace Upgrade Retain No Rule.
Usage	Usage category for the product to be migrated. Values are: Any Usage Used Rarely Used Unused Unreported Used | Rarely Used Used | Unused Used | Unreported Rarely Used | Unused Rarely Used | Unreported Unused | Unreported

Column	Description
	Used | Rarely Used | Unused Used | Rarely Used | Unreported Used | Unreported | Unused Rarely Used | Unused | Unreported.
Source Vendor	Vendor of the product to be migrated.
Source Title	Title of the product to be migrated.
Source Version	Version of the product to be migrated. An asterisk (*) denotes all versions – dot (.) format.
Source Colloquial Version	Version of the product to be migrated, colloquial version.
Source Edition	Edition of the product to be migrated.
Target Vendor	Vendor of the product for the migration rule.
Target Title	Title of the product for the migration rule.
Target Version	Version of the product for the migration rule. Can be in a dot format or colloquial versions.
Target Edition	Edition of the product for the migration rule.

The Exclusions sheet

Column	Description
Rule	List to identify the type of migration rule. Values are: Replace Upgrade Retain No Rule.

Column	Description
Vendor	Vendor of the product to be excluded.
Title	Title of the product to be excluded.
Version	Version of the product to be excluded. An asterisk (*) denotes all versions – dot (.) format.
Colloquial Version	Version of the product to be excluded, colloquial version.
Edition	Edition of the product to be excluded .

The Non-Normalized sheet

Column	Description
Rule	List to identify the type of migration rule. Values are: Replace Upgrade Retain No Rule.
Vendor	Vendor of the product to be migrated.
Title	Title of the product to be migrated.
Version	Version of the product to be migrated. An asterisk (*) denotes all versions – dot (.) format.
Colloquial Version	Version of the product to be migrated, colloquial version.
Edition	Edition of the product to be migrated.

11.3.5.3.2 New Devices

The information in the exported file, **NewDeviceByDeviceAttributes.xlsx** is described in the following table for **New Devices** :

Sheet1

Column	Description
Rule	List to identify the type of migration rule. Values are: Replace Upgrade Retain No Rule.
Source Vendor	Vendor of the product to be migrated.
Source Title	Title of the product to be migrated.
Source Version	Version of the product to be migrated. An asterisk (*) denotes all versions – dot (.) format or colloquial versions.
Source Edition	Edition of the product to be migrated.
Target Vendor	Vendor of the product for the migration rule.
Target Title	Title of the product for the migration rule.
Target Version	Version of the product for the migration rule. Can be in a dot format or colloquial versions.
Target Edition	Edition of the product for the migration rule.

11.3.6 Role Based Application Sets

A Role Based Application Set defines a set of applications that should be installed on a computer for a user performing a particular role, or perhaps working at a particular location.

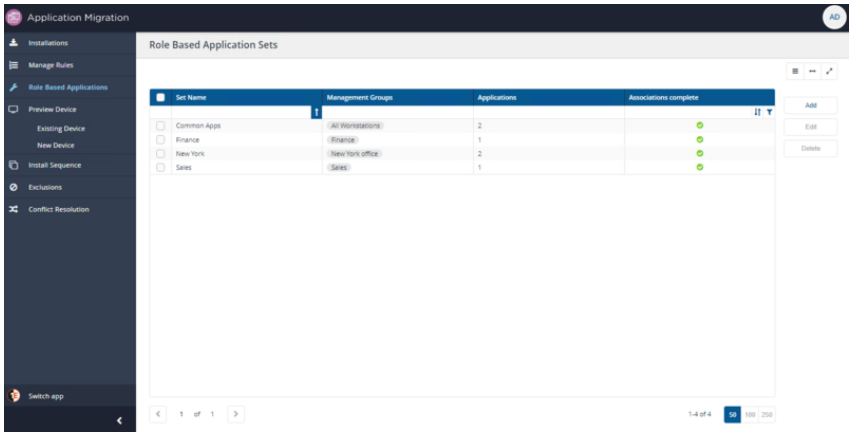
Role Based Application Sets are primarily designed to be used when building a new computer, where there are no applications to be migrated but there is a base set of applications the new user needs. They can also be applied when rebuilding, upgrading or replacing a computer, so the user gets the applications defined for their role plus any applications migrated as a result of migration rules.

11.3.6.1 How Role Based Application Sets work

Before defining Role Based Application Sets, you will need to create Management groups in Tachyon platform corresponding to the roles or locations that your Application Sets will apply to. Management groups can be defined using AD Site, OU or Computer Name. You can use partial matching of computer name in a Management group definition if your computer naming convention includes identifiers for location or department.

Role-based Application Sets are built by defining the name of the set and the Management groups the set is associated with, you then add applications to the set. You can preview the results of Role-based Application Sets on a computer from the Preview Device page in Application Migration. At deployment time, the Application Migration step in the Task Sequence returns the list of applications that need to be installed based on matching of the computer name, Organizational Unit (OU) and Active Directory (AD) site of the computer being deployed.

If a computer meets the criteria of multiple Management groups, the combination of all applicable application sets applies. If two or more applicable application sets include different versions or editions of the same application (vendor and title), Application Migration will attempt to install all versions / editions. The end result on the computer will depend on the behavior of the vendor's installers - for example, if they support side-by-side installation of multiple versions - and may be affected by Application Supersedence rules in Configuration Manager.



To read more about:

Management groups, refer to Management Groups page

How to create and manage Role-based Application Sets, refer to Managing Role-based Application Sets.

> **Note**
>
> Migration rules are applied to Role Based Application Sets before the results are returned.
>
> For example, if your application set includes Visio 2013 but there is a rule applicable to the computer being deployed that upgrades Visio 2013 to Visio 2016, Application Migration will return Visio 2016 in the list of applications to be installed.

11.3.6.2 Working with Role Based Application Sets

The following examples show the behavior of Role-based Application Sets, based on the following Management groups:

Management group name	Included applications	Membership criteria	Members
All Workstations	Adobe Acrobat DC Standard 7-Zip 17.0.0.0	Workstations OU	ACME-WIN1001, ACME-WIN1002, ACME-WIN701, ACME-WIN702, ACME-WIN802
Sales	Microsoft Project Professional 2016	Workstations\Sales OU	ACME-WIN702
Finance	SAP GUI 7.4.0	Workstations\Finance OU	ACME-WIN802
New York office	WinZip 18.5.0 Standard XML Notepad 2007	New York AD site	ACME-WIN1003

11.3.6.2.1 Simple implementation of a Role Based Application Sets

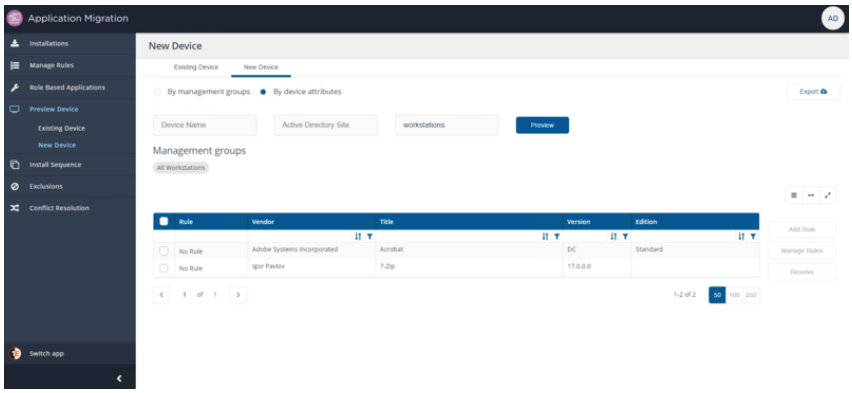
In the following example, a Role Based Application Set named Common Apps has been created for the **All Workstations** Management group.

The set includes Adobe Acrobat DC Standard and 7-Zip 17.0.0.0. Because the **All Workstations** Management group includes all computers in the Workstations OU, any new computer that's added to the Workstations OU in the Task Sequence will have Adobe Acrobat DC and 7-Zip 17.0.0.0 installed.

You can use the preview **New Device** view to determine what applications will be installed when a new computer is built. Application Migration can determine which Management groups it will belong to based on how it will be configured during the OS deployment.

On **Preview Device**, the administrator selects **New Device** then selects **By device attributes**. The admin knows the new computer will be added to the Workstations OU, so enters Workstations in the OU field to find the corresponding Management group which is All Workstations.

The results show the Management groups the computer will belong to based on the attributes entered. This defines the applications that will be installed on that computer, in this case Adobe Acrobat DC Standard and 7-Zip 17.0.0.0 from the Common Apps set.



Please refer to Previewing post-OS migration application states for details about what the applications on a device will look like after OS migration.

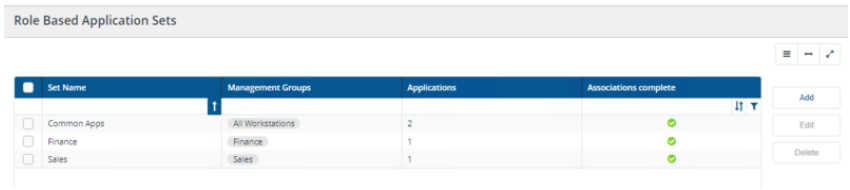
> **Note**
>
> It's possible to associate a Role Based Application Set with multiple Management groups. For example, we could have used the Sales and Finance Management Groups instead of All Workstations.

Applying multiple Role-based Application Sets

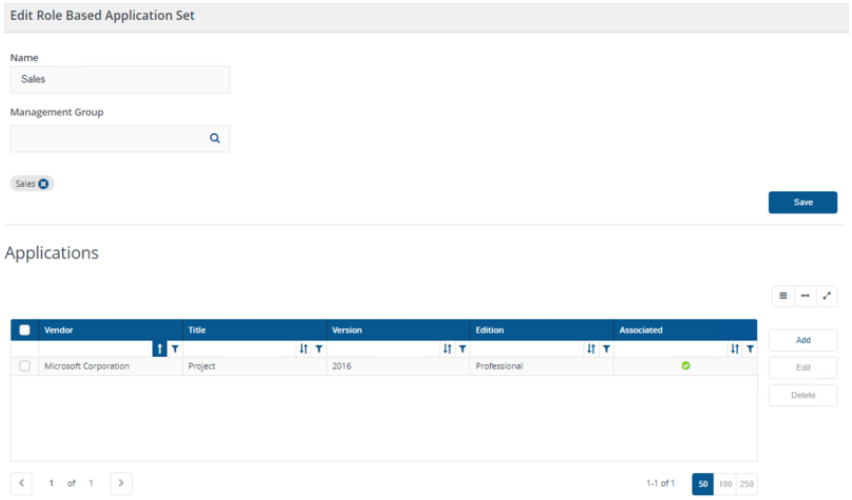
It's possible for a computer to exist in multiple Management Groups and have multiple Role-based Application Sets applied to it.

For example, the Sales Management group includes computers in the Sales OU and the All Workstations Management group includes computers in the Workstations OU.

Because the Sales OU is a child of the Workstations OU, a computer in the Sales OU will also be in the Workstations OU. A computer built in the Sales OU will be included in both All Workstations and Sales Management groups and have the Common Apps and Sales applications installed.

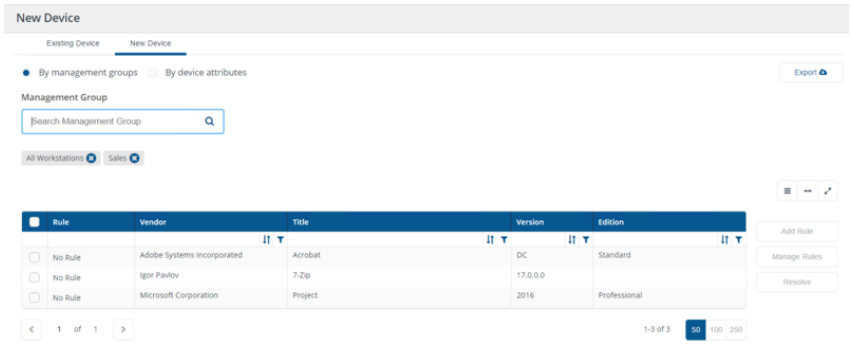


The Sales applications set includes just Microsoft Project Professional 2016



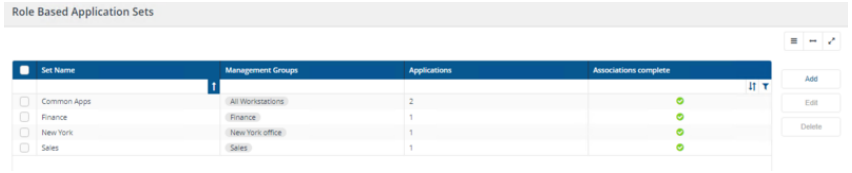
The Preview page does not allow you to select multiple OUs when viewing results **by device attributes**. Instead, you can view **By management groups** and select multiple management groups, as shown in the example.

Using the **By management groups** view, you can see that a computer built in the Workstations\Sales OU will get Adobe Acrobat Standard, 7-Zip 17.0.0.0 and Project Professional 2016.

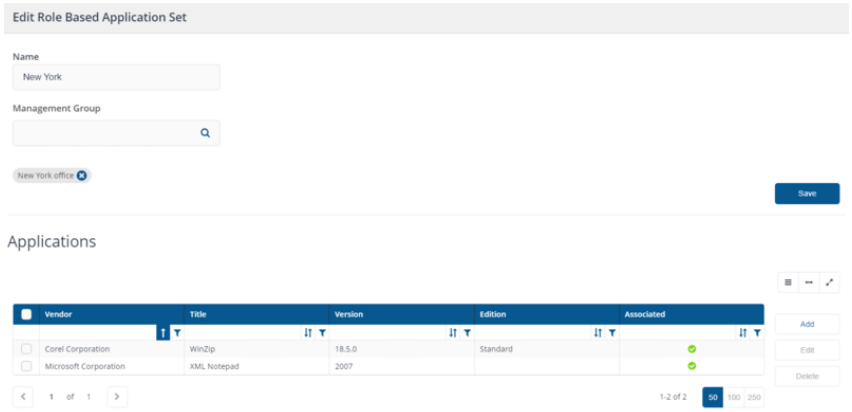


11.3.6.2.2 How Migration Rules modify applications installed using Role-based Application Sets

The following example shows how migration rules can change applications defined in a Role-based Application Set. In this example, we'll add a Role Based Application Set for the New York office Management group.



The New York office application set includes WinZip 18.5.0 and XML Notepad 2007.



As the New York Management Group is based on the New York AD site, we can use device attributes to preview what applications would be installed on a computer that was built in New York in the Workstations OU.

Although the New York Office application set included WinZip, a migration rule has been defined to replace WinZip with 7-Zip, so a computer build in New York in the Workstations OU (All workstations Management Group) will have these applications installed:

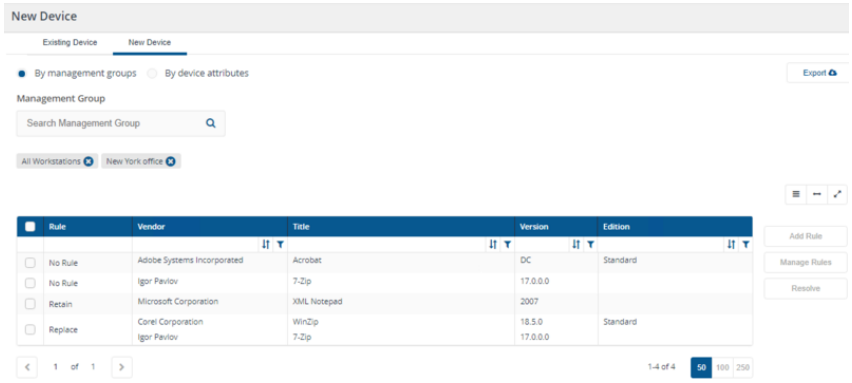
Adobe Acrobat DC Standard

XML Notepad 2007

7-Zip 17.0.0.0.

Role-based Application Sets are likely to be defined in the early stages of Application Migration implementation and may not be updated frequently, whereas migration rules are likely to be updated more frequently as new application versions are released.

The behavior of Role-based Applications ensures the latest rules are applied to Role-based Application Sets. This means you can be sure that new computers are built with the current set of applications even if the Role-based Application Set has not been reviewed for some time.



11.3.6.2.3 Auto Install for Configuration Manager Applications and Packages

Application Migration uses the **Install Application** and **Install Package** steps in a Task Sequence to install migrated applications and packages. These Task Sequence steps are dependent on the relevant checkbox (auto install flag) being enabled for *each* application and package:

Allow this application to be installed from the Install Application task sequence action without being deployed

Allow this program to be installed from the Install Package task sequence action without being deployed.

If a checkbox is not enabled, the software installation will fail for that application or package. An administrator can enable this checkbox for each application and package by using either of the following methods:

in Configuration Manager during or after creating each application and package,

using the **Auto Install** feature in Application Migration when creating application associations, rules or Role Based Application sets.

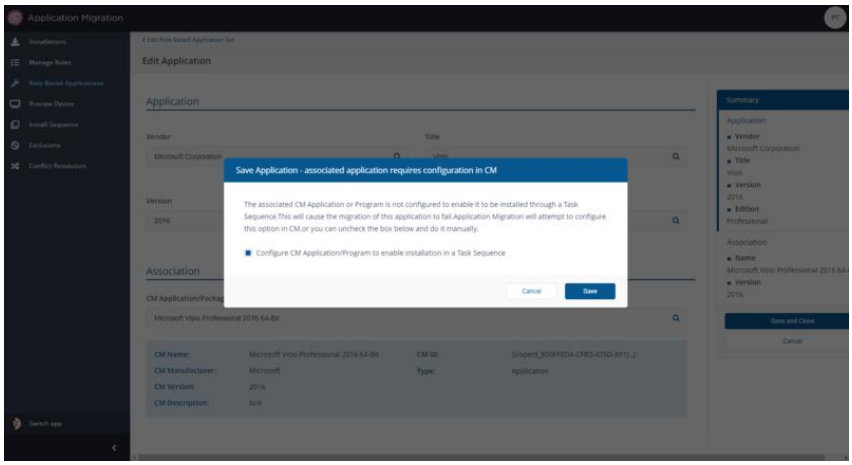
For information about manually enabling these checkboxes for Configuration Manager applications and packages, please refer to Using Application Migration in a Task Sequence: Auto Install for Configuration Manager Applications and Packages.

> **Note**
>
> Application Migration's **Auto Install** feature is able to read the checkbox (auto install flag) for applications and programs, but in order for Application Migration to enable them for you, you'll need to configure related providers in the Settings application of the platform. These should already be configured as a post-installation step. Refer to Post-install configuration.

11.3.6.2.3.1 How Auto Install works with Role Based Application Sets

Once the provider configuration is configured, you can enable the relevant Configuration Manager checkboxes
Allow this application/program to be installed from the Install Application/Package task sequence action without being deployed for Configuration Manager applications/packages associated with a Role Based Application set.

When you create or edit an application or package in a Role Based Application set rule you will be prompted to check **Configure CM Application/Program to enable installation in a Task Sequence** when you click **Save and close**.

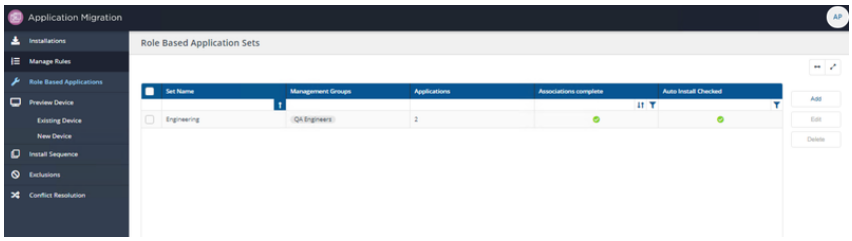


The current state of the Auto Install flag for a Role Based Application set can be seen on the Role Based Application Sets page, as shown in the example.

The **Auto Install Checked** column can have either of the following values:

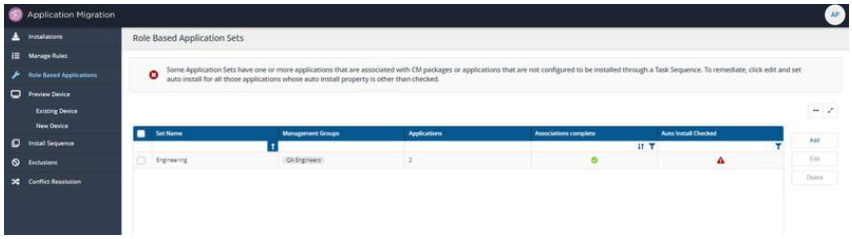
Yes - all applications in the set have auto install value checked

No - at least one of the applications have auto install value other than checked.



Note

If Role Based Application set has an application with the Auto Install unchecked, you will be prompted to edit that rule and set the Auto Install to enabled. You can view this type of rule by filtering the **Auto Install** column by **Not Checked**.

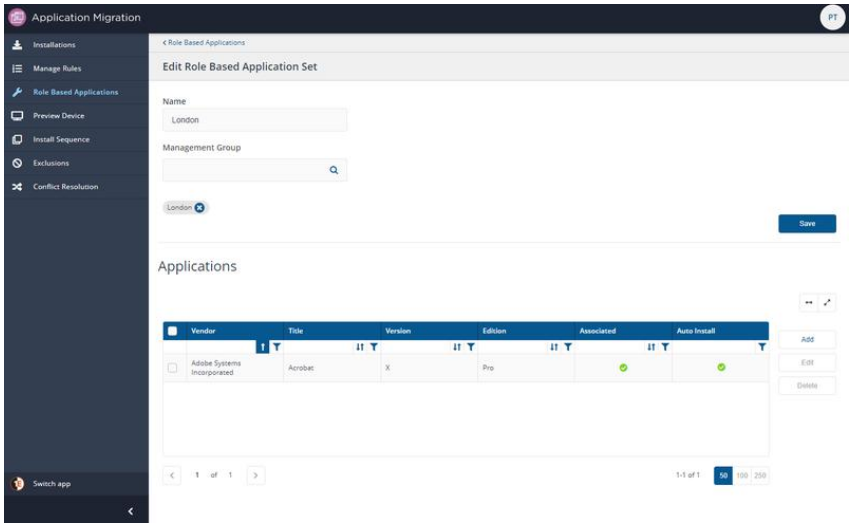


The current state of the Auto Install flag for individual applications of a Role Based Application set can be seen while editing a Role Based Application set as shown opposite.

The **Auto Install** column displays a status for each migration rule. Our example shows two different types of status, **In-Progress** and **Not Checked**.

Auto Install status	Description
Checked	Auto install flag for Configuration Manager application or package program is set.
Not Checked	Auto install flag for Configuration Manager application or package program is not set.
In-Progress	Application Migration has triggered an operation which attempts to set the auto install flag of Configuration Manager application or package program.

Auto Install status	Description
Failed	Application Migration triggered an operation which failed while trying to set the auto install flag of Configuration Manager application or package program.
Not Applicable	A rule has a broken association and the application migration report is not run.



Note

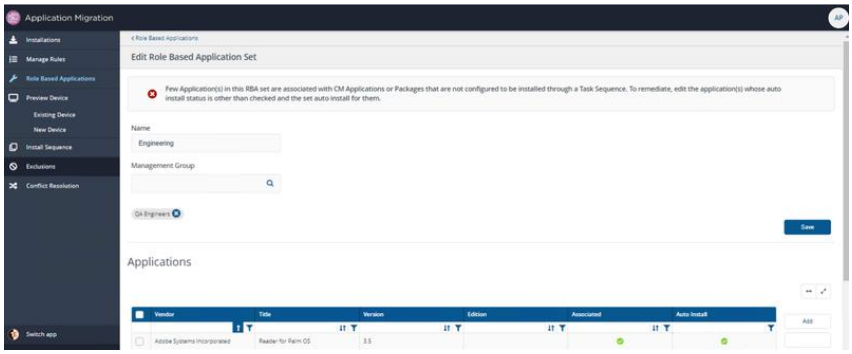
If an application in a Role Based Application set has the Auto Install unchecked, you will be prompted to edit that rule and set the Auto Install to enabled.

You will also see a similar message on the following Application Migration pages and a prompt to take action if the Auto Install is unchecked:

Installation

Preview Device→Existing Device

Preview Device→New Device.



11.3.6.3 Managing Role-based Application Sets

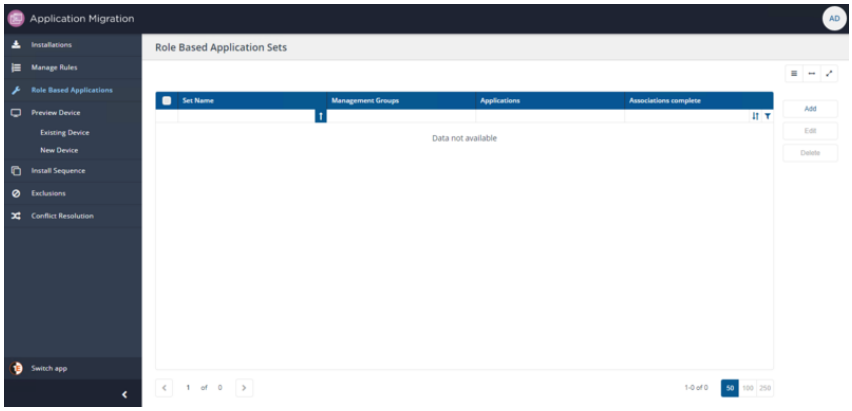
You can add, edit and delete Role-based Applications Sets from the **Role Based Application Sets** page.

11.3.6.3.1 Adding a Role-based Application Set

The process for creating a new Role-based Application Set is:

Create and save the application set.

Associate the applications to this particular application set.



To create a new Role-based Application Set:

Choose **Role Based Applications** from the navigation menu.

Click **Add**.

Under**New Role Based Application Set**:

In**Name**, enter a name for this particular set.

In**Management Group**, start typing the name of the management group you want the set associated with – a list matching your string is dynamically generated for you to choose from.

If there are more management groups you want to associate with this particular set, repeat step b.

Click **Save**.

In the Applications section, click **Add**.

On the **Add Application** screen:

Populate the **Vendor**, **Title**, **Version** and **Edition** fields. As you start typing in the **Vendor** and **Title** fields, a list matching your string is dynamically generated for you to choose from. In our example, we are adding Adobe Acrobat to the application set we just created.

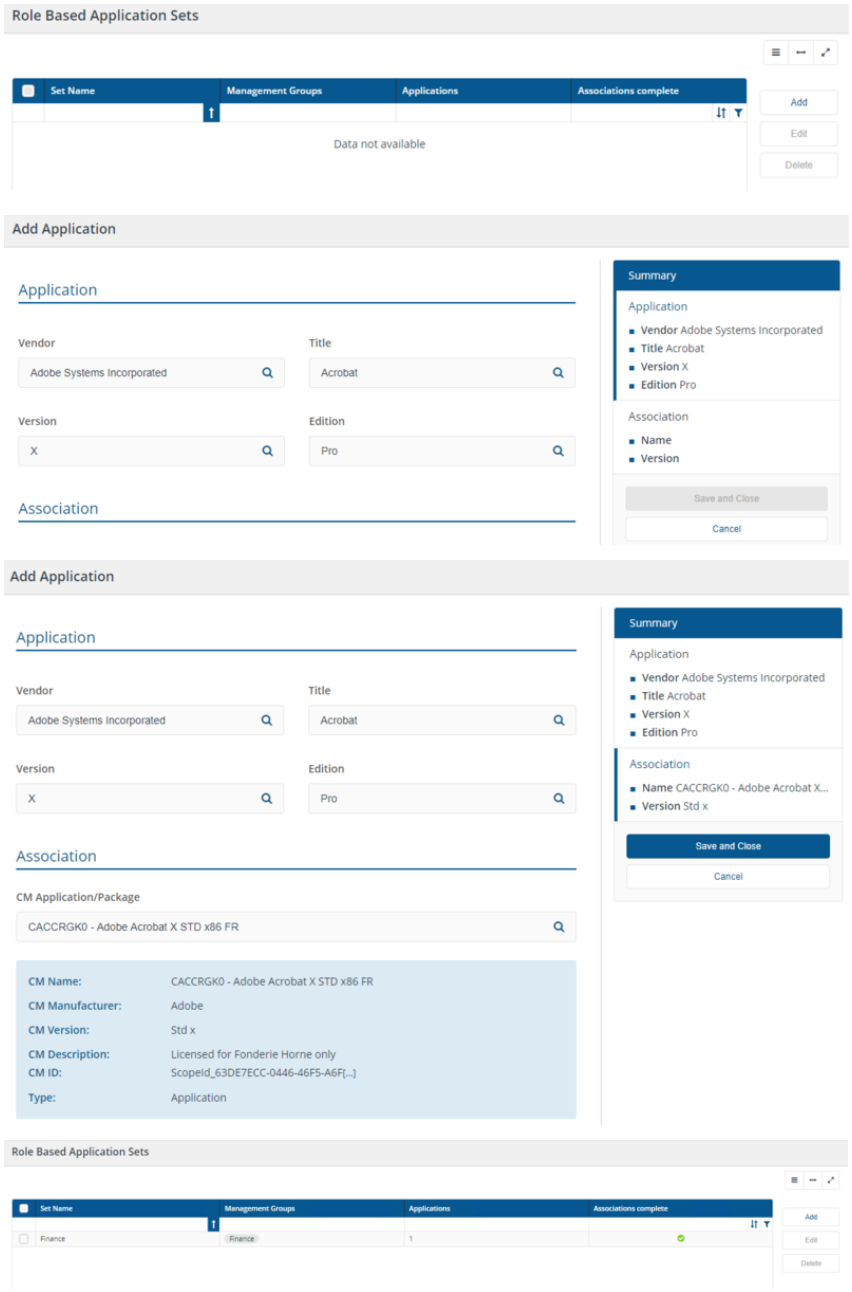
With the **Vendor** and **Title** fields populated, click the **Version** and **Edition** fields respectively for a list to choose from.

In **Association**, click **CM Application/Package**.

In the **CM Application/Package** field, select the application you want from the list.

Click **Save and Close.**

Click **Role Based Applications** in the left-hand menu to view the **Role Based Application Set**.



11.3.6.3.2 Editing an existing Role-based Application Set

To edit an existing Role-based Application Set:

From the **Application Migration** menu, choose **Role Based Applications**.

On the **Summary** screen, locate the set you want from the list, select it and click **Edit**.

On the **Edit set** screen, choose the attributes you want to modify.

To modify the attributes for the application set if you want to:

Update the existing **Name**, place your cursor in the filed and update it

Add a new management group, start typing the name of the management group in **Management Group** – a list matching your string is dynamically generated for you to choose from

Remove an existing management group, click the delete icon next to a management group

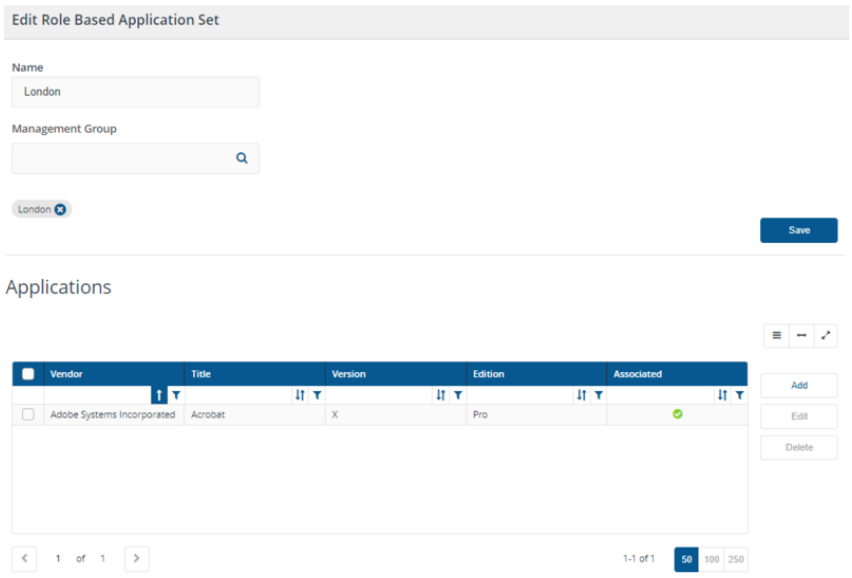
Click **Save** when you have finished.

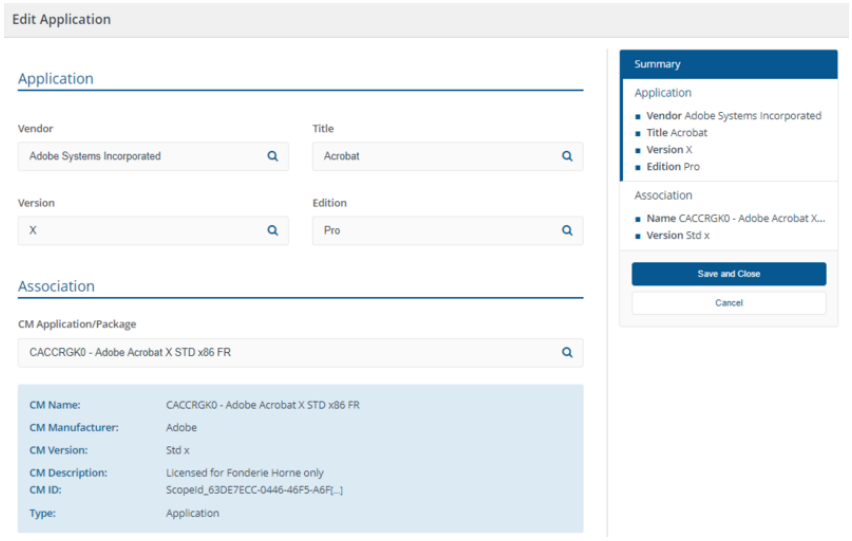
In the Applications section, modify the attributes for the associated applications:

Locate the application you want from the list, select it and click **Edit**

On the **Edit Application** screen, update the details

Click **Save and Close**.





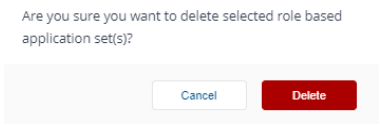
11.3.6.3.3 Deleting an existing application set

To delete an existing application set:

From the **Application Migration** menu, choose **Role Based Applications**.

Locate the set you want from the list, click **Delete**.

Confirm your actions.



11.3.7 Setting the Install Sequence for applications

In some cases, when some applications are installed together, they need to be installed in a certain order. You can do this in Application Migration by adding applications that have specific installation order constraints to the Install Sequence.

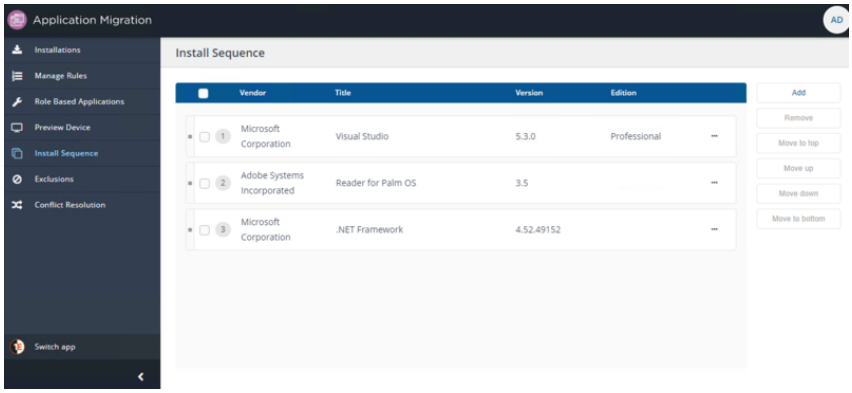
11.3.7.1 Introduction

In previous versions of Application Migration, the order in which applications were installed was not set. In some cases, if certain applications are installed together, they must be installed in a particular order or sequence. This requirement may also apply when multiple versions of the same application are to be installed side-by-side.

In the case where migration rules or role-based applications result in multiple versions of the same application to be installed, Application Migration will automatically install these in order of ascending version. In the case where certain different applications need to be installed in a certain order, users can now define a sequence in which applications should be installed.

For example, a new computer needs setting up with Visual Studio and .Net Framework. In previous versions of Application Migration, if it attempted to install Visual Studio before .Net Framework, the installation would fail.

On the **Install Sequence** page, users can now define that .Net Framework should be installed before Visual Studio.



Note

Install sequence is different from application dependency:

Install sequence - means that *if* applicable migration rules or role-based application sets result in these identified applications being installed together, they will be installed in the defined order or sequence

Application dependency - means that *every time* a certain application is installed, one or more other applications must be installed first. Application dependencies must be defined on the Application or Program in Configuration Manager, independent of Application Migration.

11.3.7.2 Using the Install Sequence page

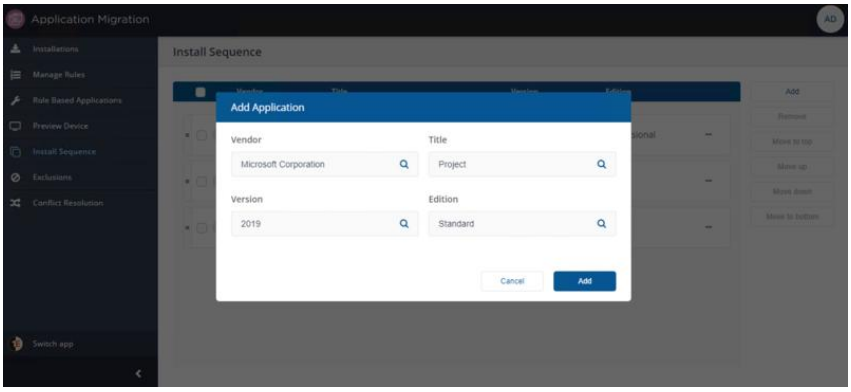
Users can add, remove or reorder applications on the Install Sequence page.

11.3.7.2.1 Adding an application

To add an application:

Click on the **Add** button to open the **Add Application** popup.

On the **Add Application** popup, fill the Vendor, Title, Version and Edition fields then click **Add** to save.



Note

When adding an application for installation sequencing, be sure to define the Vendor, Title, Version and Edition exactly as defined in the migration rule or role-based application set that will install the application. For example, if you add 7-Zip v9.20.0.0 but have a migration rule that will install v9.20 (readable version), the sequencing will not apply to that migration rule and 7-Zip would be installed after all specifically sequenced applications.

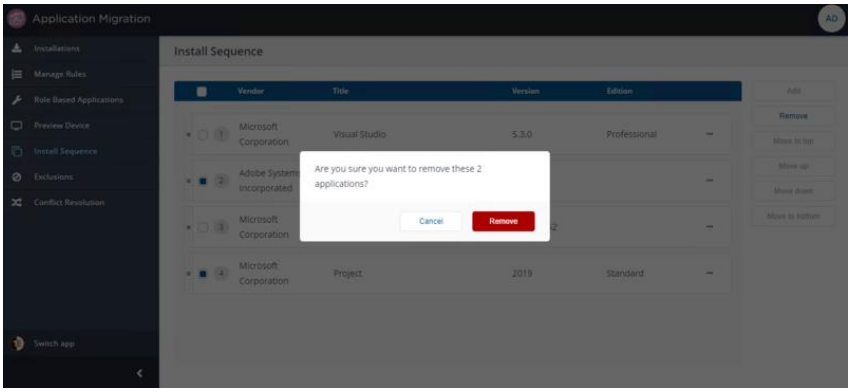
The application is added to the end of the sequence.

11.3.7.2.2 Removing an application

To remove one or more applications:

Select the applications.

Click **Remove**, a popup to confirm the removal will appear.



Click **Remove** to remove the selected applications.

11.3.7.2.3 Move an application to the top

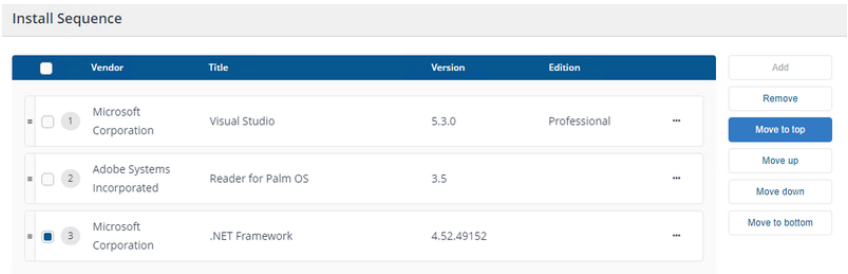
To move an application to the top:

Select the application, for example .NET Framework.

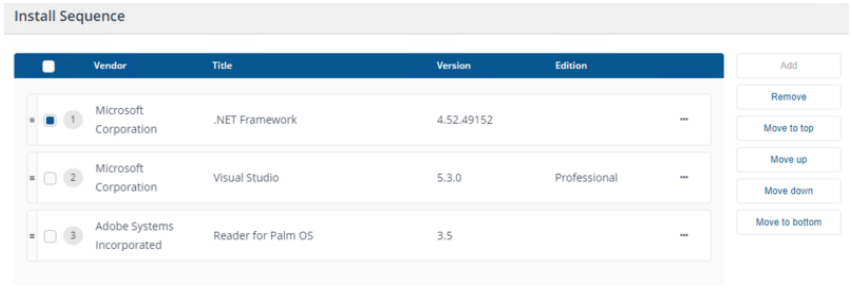
Click the **Move to top** button.

The application will be moved to the top of the sequence.

Before moving the application:



After moving the application:



11.3.7.2.4 Move an application to the bottom

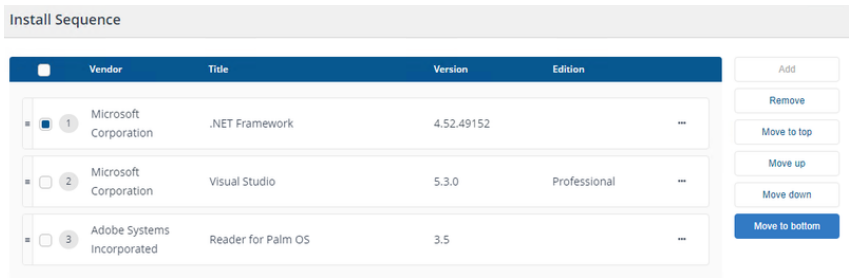
To move an application to the bottom:

Select the application, for example .NET Framework.

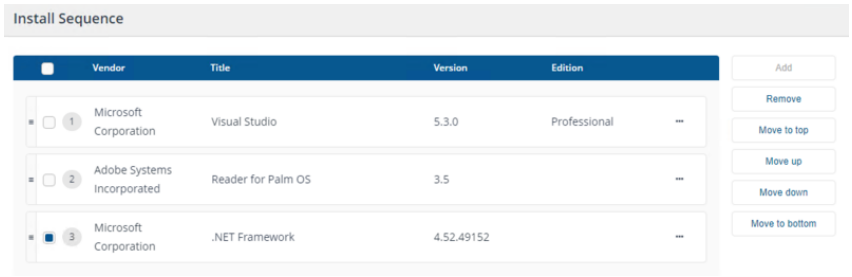
Click the **Move to bottom** button.

The application will be moved to the bottom of the sequence.

Before moving the application:



After moving the application:



11.3.7.2.5 Move an application up one spot

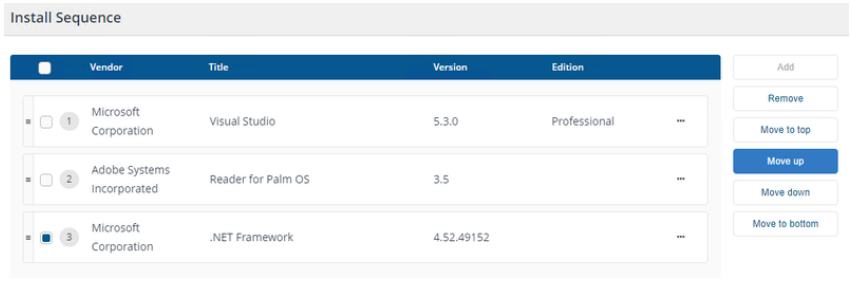
To move an application up one spot:

Select the application, for example .NET Framework.

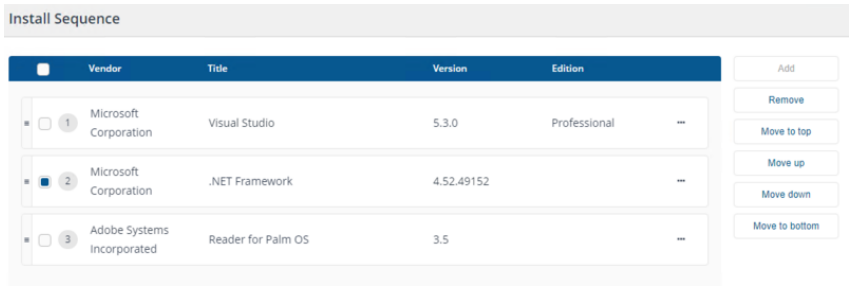
Click the **Move up** button.

The application will be moved one spot up in the sequence.

Before moving the application:



After moving the application:



11.3.7.2.6 Move an application down one spot

To move an application down one spot:

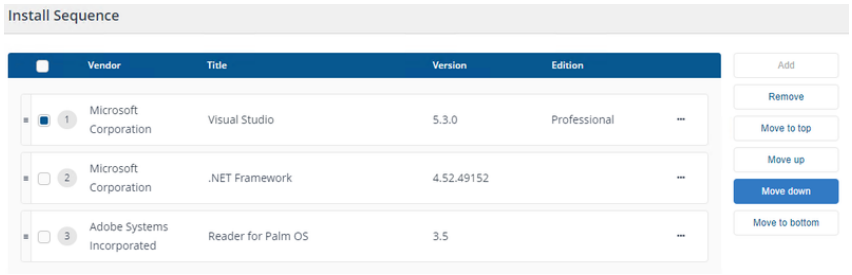
Select the application, for example Visual Studio.

Click the **Move down** button.

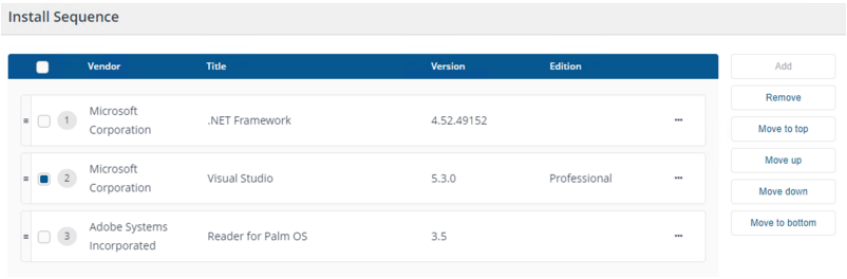
The application will be moved one spot down in the sequence.

> **Note**
>
> Users can only move one application at a time. Selecting multiple applications will disable the movement buttons.

Before moving the application:



After moving the application:

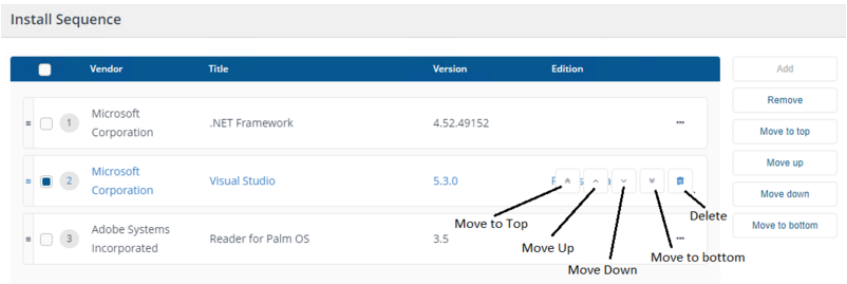


11.3.7.2.7 Move an application directly to the desired spot

A user can also move an application to the desired spot by simply dragging the application.

11.3.7.2.8 Alternate controls for operations

All the above operations (excluding the add operation) have shortcuts on each application row. These controls are visible by hovering over the ellipses.



11.3.7.3 Application Ordering

When the Application Migration step is executed in a Configuration Manager Task Sequence, applications will be sorted according to the following algorithm:

Applications added in the Install Sequence page are sorted in the ascending order of the install sequence.

Remaining applications are sorted as follows:

If any application (defined by Vendor, Title and Edition) has multiple versions to be installed and the migration rule or application set defines a full or readable version, these applications will be installed in ascending version order.

Applications with colloquial versions are not sorted at all but appear after applications with full or readable versions.

> **Note**
>
> To order versions in ascending order, Application Migration attempts to convert the version number defined in the target of the migration rule or role-based application set into a 10-part version number. For a version to successfully convert into a 10-part version, it should be separated by dots and each part should be a non-negative integer. There should be a minimum of 2 and a maximum of 10 parts separated by dots.

For example, if we have the following applications which are to be installed on a machine:

Vendor	Title	Version	Version Type	Edition
Microsoft Corporation	Visual Studio	2013	Colloquial	Professional
Microsoft Corporation	Visual Studio	2010	Colloquial	Professional
Microsoft Corporation	Visual Studio	2015	Colloquial	Professional
Microsoft Corporation	Visual Studio	2017	Colloquial	Professional
Microsoft Corporation	Visual Studio	1.12.47.803	Full	Professional
Microsoft Corporation	Visual Studio	1.11	Readable	Professional
Microsoft Corporation	Visual Studio	a.b.c.d	Full	Professional

and we have the following applications defined in the Install Sequence:

Install Sequence	Vendor	Title	Version	Edition
1	Microsoft Corporation	Visual Studio	2010	Professional
2	Microsoft Corporation	Visual Studio	2013	Professional

The the final order of applications will be:

Vendor	Title	Version	Edition	Comment
Microsoft Corporation	Visual Studio	2010	Professional	Defined in the Install Sequence page
Microsoft Corporation	Visual Studio	2013	Professional	Defined in the Install Sequence page
Microsoft Corporation	Visual Studio	1.11	Professional	1.11 converted to 10-part version is 1.11.0.0.0.0.0.0.0.0, which comes before the 10-part version 1.12.47.803.0.0.0.0.0.0
Microsoft Corporation	Visual Studio	1.12.47.803	Professional	1.12.47.803 converted to 10-part version is 1.12.47.803.0.0.0.0.0.0, which comes

Vendor	Title	Version	Edition	Comment
				after the 10-part version 1.11.0.0.0.0.0.0.0
Microsoft Corporation	Visual Studio	2015	Professional	Colloquial versions are not sorted
Microsoft Corporation	Visual Studio	2017	Professional	Colloquial versions are not sorted
Microsoft Corporation	Visual Studio	a.b.c.d	Professional	Considered as a colloquial version as a.b.c.d cannot be converted into a 10-part version

Note

If the applications defined in the Install Sequence use a combination of Configuration Manager Applications and Package/Programs, the installations may not follow the expected order. This is because in a Task Sequence, all Configuration Manager Applications are installed in one step and all Packages are installed in a different step.

For example, if in the above example, Visual Studio 2010 was installed using a Package/Program and Visual Studio 2013 was installed using an Application, then if the Install Package step in the Task Sequence was positioned after the Install Applications, Visual Studio 2013 would be installed first (with the Install Application step) followed by Visual Studio 2010 (with the Install Package step).

11.3.8 Using Application Migration in a task sequence

The actual process of migrating applications is performed during an OS deployment task sequence in Configuration Manager.

Application Migration uses a custom task sequence action that calls an Application Migration API. The API gets a list of Configuration Manager Applications and Packages that need to be installed on a computer based on previously installed software titles (determined through inventory) and the migration rules applying to those titles.

Task Sequence Tools Upgrade

When upgrading task sequence tools, you must remove the old **1E Application Migration** step and add the same step again in affected Task Sequences. Otherwise, the latest changes will not be accessible and may not work.

11.3.8.1 Testing the API and getting device details

You can test the API and observe the results for a specific computer from a browser with the following by replacing **<WebServiceBaseURL >**, **<Domain>**, and **<MachineName>** with the necessary details:

```
<WebServiceBaseURL>/platform/api/applicationmigration/getApplicationsToBeInstalled/?domainName=<Domain>&machineName=<MachineName>
```

where:

<WebServiceBaseURL> may be either of the host headers configured for Tachyon platform. See Web Service Base URL below for a more detailed description.

<domain> and **<MachineName>** specify the computer you are checking the results for.

Browsing to the URL returns a JSON file with a list of Applications and Packages that will be installed on the specified device when the task sequence executes.

This list is used to populate two series of task sequence variables (one for Applications and the other for Packages) that can be used by the standard Configuration Manager Install Application and Install Package steps to dynamically install each application and package returned by the API.

11.3.8.2 Modern Authentication support for TS Tools 2.6

Important

This feature is only available in 1E platform v9.1.

In 1E platform v9.1, the Authentication Proxy has been deprecated. In previous platform versions, the Authentication Proxy invoked the Application Migration TS API. From 1E 9.1, the Background Channel Proxy is employed to access the TS API by using the client computer certificate.

Upgrading earlier versions of the 1E Toolkit

Note

The 1E Toolkit v9.1 has been modified to remove its dependency on 1E Authentication Proxy and no longer supports it. As a result, if you are using a version of 1E Toolkit dependent on Authentication Proxy, you will not be able to upgrade to v9.1. You will need to uninstall your installed version of 1E Toolkit and install 1E Toolkit v9.1 where you can point to the 1E Platform URL instead of Authentication proxy URL.

Installed Version	Requires Authentication Proxy	Upgrade to 9.1
v8.1	No	Yes
v9.0	Yes	Reinstall

Configuring Background Channel Proxy

To call the TS API from 1E TS Tools, you must configure the Background Channel service web.config. You can do this by either, adding the entry manually or by using our PowerShell script.

Editing the web.config manually

In the manual web.config update, you should replace *your-host* in the *targetURL* with the value for your environment.

```
<ProxiedServers>
<Targets>

..
<add name="ApplicationMigrationTaskSequence" enabled="true" targetURL="https://
your-host/platform/api/applicationmigration/getApplicationsToBeInstalled" timeo
utSeconds="15" clientCertificateForTarget="" useWindowsAuthenticationForTarget=
"false" useServerTokenAuthenticationForTarget="true" deviceAuthentication="Cert
ificate" forwardCertificateFromDevice="false" loggingLevel="off" />
..

</Targets>

</ProxiedServers>
```

Editing the web.config using PowerShell

Run the script using PowerShell, and provide the SLAPlatform base url: *. \AddReclaimerBGProxy.ps1 https://{host}/Platform*

```
param(
    [Parameter(Mandatory = $true, HelpMessage = "Enter SLA platform base URL e.
g. : tachyon.testlab.com/platform or https://tachyon.testlab.com/platform")]
    [ValidateNotNullOrEmpty()]
    [string] $SLAPlatformBaseURL,

    [Parameter(Mandatory = $false, HelpMessage = "Path to web.config of the bac
kground channel web.config")]
    #[ValidateNotNullOrEmpty()]
    [string] $FilePath = "C:\Program Files\1E\Tachyon\Background\Web.config",

    [Parameter(Mandatory = $false, HelpMessage = "Enter the key Name to be used
in the Web.Config")]
    #[ValidateNotNullOrEmpty()]
    [string] $BGPKeyName = "ApplicationMigrationTaskSequence"
)

# load the XML from the web.config
$xml = New-Object XML
$xml = [xml](Get-Content $FilePath)

Write-Host "Using SLA platform base URL :"$SLAPlatformBaseURL
Write-Host "Using FilePath BG Web.config :"$FilePath
Write-Host "Using BGP Key Name:"$BGPKeyName

if (![System.IO.File]::Exists($FilePath)) {
    Write-Error "File doesnot exists with path $FilePath"
```

```
    return;
}

if ($xml.SelectNodes("//configuration/ProxiedServers").Count -eq 0) {
    Write-Host "Proxied Servers doesnot exists.";
    Write-Host "Adding Proxied Servers in Configuration";
    $proxiedServers = $xml.CreateElement("ProxiedServers")
    $proxiedServers.AppendChild($xml.CreateElement("Targets"))
    $xml.configuration.AppendChild($proxiedServers);
}
$SLAPlatformBaseURL=$SLAPlatformBaseURL.TrimEnd('/')
$nodes = $xml.SelectNodes("//configuration/ProxiedServers/Targets/add[@name='$B
GPKeyName']")
if ($nodes.count -eq 0) {
    #<add name="ApplicationMigration" enabled="true" targetURL="https://stalyon
.ntl.local:443/platform/api/applicationmigration/getApplicationsToBeInstalled"
timeoutSeconds="15"
    #clientCertificateForTarget="" useWindowsAuthenticationForTarget="false" us
eServerTokenAuthenticationForTarget="true"
    #deviceAuthentication="Certificate" forwardCertificateFromDevice="false" lo
ggingLevel="off" />
    Write-Host "Adding $BGPKeyName to ProxiedServers Targets."
    $setting = $xml.CreateElement('add')
    $setting.SetAttribute('name', $BGPKeyName)
    $setting.SetAttribute('enabled', 'true')
    $setting.SetAttribute('targetURL', $SLAPlatformBaseURL + '/api/applicationm
igration/getApplicationsToBeInstalled')
    $setting.SetAttribute('timeoutSeconds', '15')
    $setting.SetAttribute('clientCertificateForTarget', '')
    $setting.SetAttribute('useWindowsAuthenticationForTarget', 'false')
    $setting.SetAttribute('useServerTokenAuthenticationForTarget', 'true')
    $setting.SetAttribute('deviceAuthentication', 'Certificate')
    $setting.SetAttribute('forwardCertificateFromDevice', 'false')
    $setting.SetAttribute('loggingLevel', 'off')

    $xml.SelectNodes("//configuration/ProxiedServers/Targets")[0].AppendChild($
setting)
}
else {
    Write-Host "Updating the  $BGPKeyName in ProxiedServers Targets. "
    $setting = $nodes[0];
    $setting.SetAttribute('enabled', 'true')
    $setting.SetAttribute('targetURL', $SLAPlatformBaseURL + '/api/applicationm
igration/getApplicationsToBeInstalled')
    $setting.SetAttribute('timeoutSeconds', '15')
    $setting.SetAttribute('clientCertificateForTarget', '')
    $setting.SetAttribute('useWindowsAuthenticationForTarget', 'false')
    $setting.SetAttribute('useServerTokenAuthenticationForTarget', 'true')
    $setting.SetAttribute('deviceAuthentication', 'Certificate')
    $setting.SetAttribute('forwardCertificateFromDevice', 'false')
```

```
    $setting.SetAttribute('loggingLevel', 'off')
}
Write-Host "Saving to file inprogress.";
$xml.Save($FilePath)

Write-Host "Successfully updated the Web.config of Background channel for Proxy
."
```

Recreate your Application Migration Task Sequence step

To enable Modern Authentication, review your previous task sequences that used the Application Migration Task Sequence step; otherwise, they will not function correctly.

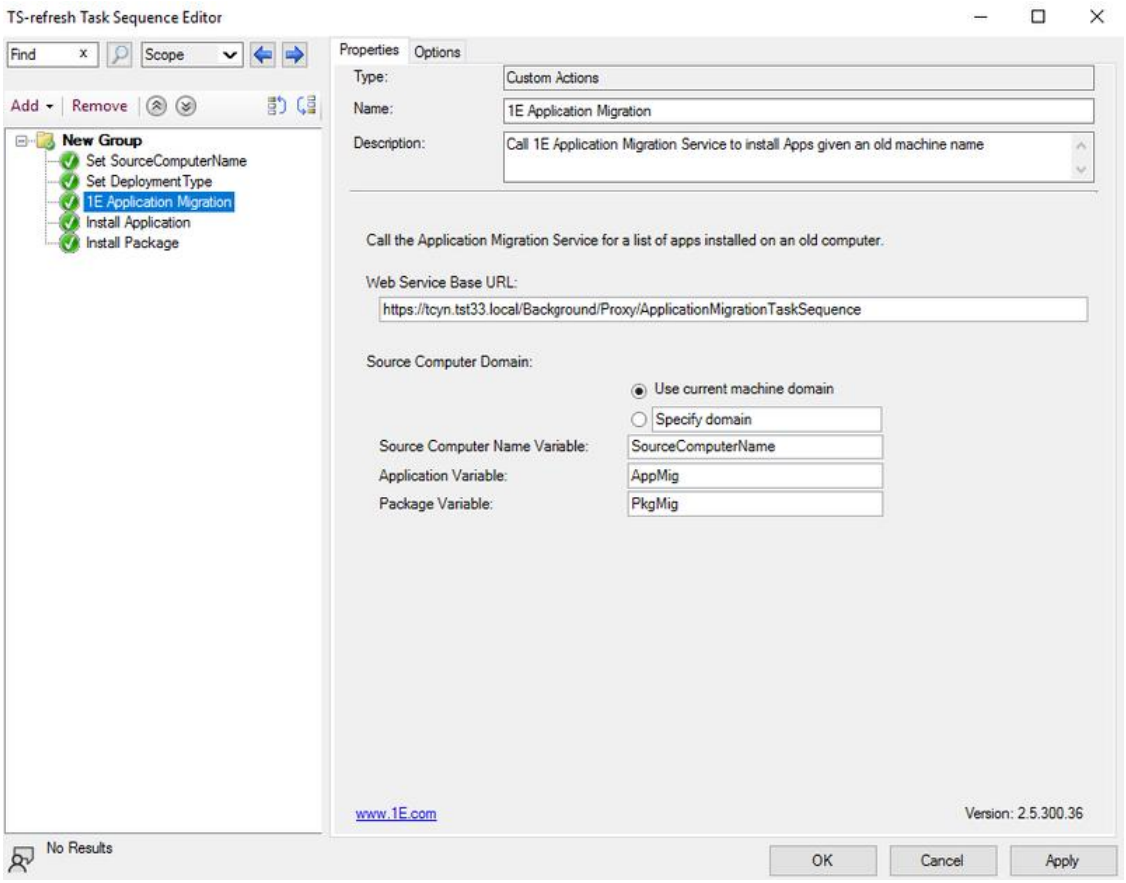
> **Note**
>
> You must have already applied the Application migration 9.1 hotfix, and configured the background channel proxy before following the guidance in this section.

Install Task Sequence Tool version 2.6.

Add a new Application Migration Task Sequence step immediately after your existing Application Migration Task Sequence step.

Transfer the values from the old step to populate your newly added Application Migration Task Sequence step. Ensure the **Web Service Base URL** value is
`https://{host}/Background/Proxy/ApplicationMigrationTaskSequence`

> **Important**
>
> Please note that if the name attribute value **ApplicationMigrationTaskSequence** is included in the background channel web configuration for the task sequence, the URL should remain unchanged as shown above. Otherwise, you should adjust the name according to the value specified in the web configuration.

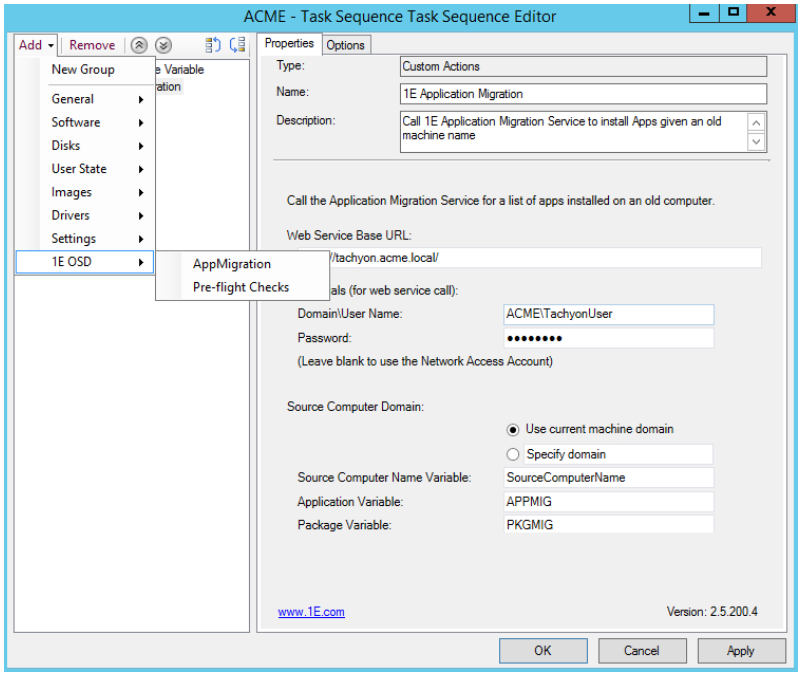


Remove the old Application Migration Task Sequence step.

Validate your updated Task Sequence by running it on a test computer.

11.3.8.3 Configuring the Application Migration Task Sequence step

The **AppMigration** action is used to create the **1E Application Migration** Task Sequence step, and has the following properties.



Web Service Base URL

Note

1E 9.1 users refer to Modern Authentication support for TS Tools 2.6 for changes to this section.

You can connect either using HTTP or HTTPS. In either case, the URL will be based on the settings made on the **Website Configuration** screen of the Tachyon setup program. Refer to Website configuration.

For example, if your platform server FQDN is **ACME-TCN01.ACME.LOCAL** and your platform DNS alias is **TACHYON.ACME.LOCAL**, and these have been configured as the host headers on the **Website Configuration** screen of the platform setup program, then you can use either of the following:

http://ACME-TCN01.ACME.LOCAL

https://TACHYON.ACME.LOCAL

If you have specified a custom port on the **Website Configuration** screen of the platform setup program, then this should also be added to the URLs:

http://ACME-TCN01.ACME.LOCAL:8080

https://TACHYON.ACME.LOCAL:8443

Credentials (for Web service call)

The username and password used to call the Application Migration API. This account must already exist as user on Tachyon platform.

If the **Domain\User Name** and **Password** are left empty, the Configuration Manager Network Access Account is used to fetch data from Application Migration (to use this option the Network Access Account must be added as a platform user).

Source Computer Domain

In most cases, the **Source Computer Domain** will be the same domain that the OS is being deployed in. If you are migrating computers from one domain to another through the OS deployment process, you must select the **Specify Domain** option and enter the Fully Qualified Domain Name of the originating domain, as this will be the domain that the computer belongs to in the platform from previous inventory.

Source Computer Name Variable

The name of the task sequence variable that is used to store the source computer name (the computer from which applications are being migrated).

> **Note**
>
> By default, the **Source Computer Name Variable** property is set to **SourceComputerName**. If the specified variable does not exist, the Application Migration step uses the current computer name as the source computer name.
>
> If you are using Nomad (included in Windows Servicing Suite) and have included the Get migration settings step in the task sequence, that step will set the **SourceComputerName** variable as follows:

In a **Computer Replace** scenario:

When the restore Task Sequence executes on the new computer, **Get Migration Settings** sets the **SourceComputerName** variable to the source computer defined in the **Computer Association** in Configuration Manager.

If the Task Sequence is initiated through the **Windows Servicing Assistant**, you do not need to create a **Computer Association**. **Get Migration Settings** sets the **SourceComputerName** variable to the name of

	the source computer selected by the user in the Windows Servicing Assistant. In a **Computer Refresh** scenario, the **SourceComputerName** variable is set to the current computer name. If you are adding the Application Migration step to an **In-place Upgrade** Task Sequence, set the **Source Computer Name Variable** to **_SMSTSMachineName** and do not use **Get Migration Settings**.
Application Variable	The base variable name which this task sequence step uses to define the Configuration Manager Applications to be installed. This is used to define the base variable in a later **Install Application** step that is configured to install applications according to a dynamic variable list. For example, if **Application Variable** is set to *APPMIG*, this step will dynamically set variables *APPMIG01*, *APPMIG02* etc. corresponding to the applications to be installed dictated by the application migration rules applied to the specified source computer.
Package Variable	The base variable name which this task sequence step uses to define the Configuration Manager Packages to be installed. This is used to define the base variable in a later **Install Package** step that is configured to install packages according to a dynamic variable list. For example, if **Package Variable** is set to *PKGMIG*, this step will dynamically set variables *PKGMIG001*, *PKGMIG002* etc. corresponding to the packages to be installed dictated by the application migration rules applied to the specified source computer.

11.3.8.4 Example

The following example illustrates how to add the Application Migration step to an existing OS Deployment task sequence. Your own task sequence may differ, but the general positioning of these steps is where Install Application steps would normally be placed (after **Install Updates** and before the **Restore User Files**).

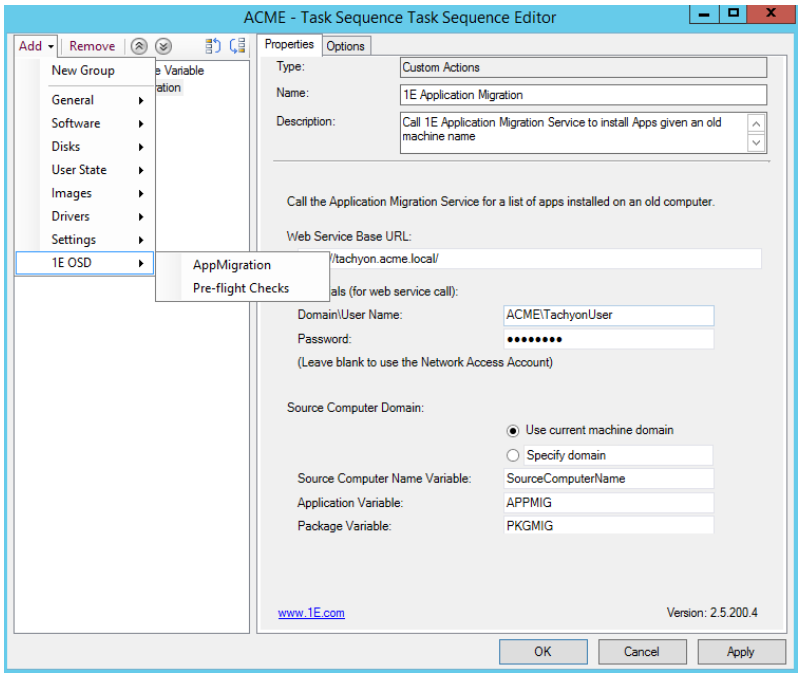
From the **Configuration Manager console**, select the **Software Library workspace**.

Expand the **Operating Systems** folder and select **Task Sequences**.

Right-click the task sequence that Application Migration is to be added to and from the context menu, select **Edit**.

11.3.8.4.1 Application Migration step

Choose **Add > 1E OSD > AppMigration**.



On the **Properties tab**, enter the following details.

> **Note**
>
> 1E 9.1 users refer to Modern Authentication support for TS Tools 2.6 for changes to this section.

In **Web Service Base URL**, enter the location for the platform, for example http://tachyon.acme.local/

Under **Credentials (for Web service call)** enter the **Domain\User Name** and **Password** for the platform user you want to use.

Source Computer Domain in most cases the source computer domain will be the same domain that the OS is being deployed in. If you are migrating computers from one domain to another through the OS deployment process, you must select the Specify Domain option and enter the Fully Qualified Domain Name of the originating domain, as this will be the domain that the computer belongs to in the platform from previous inventory.

In **Source Computer Name Variable** leave the value at its default *SourceComputerName*.

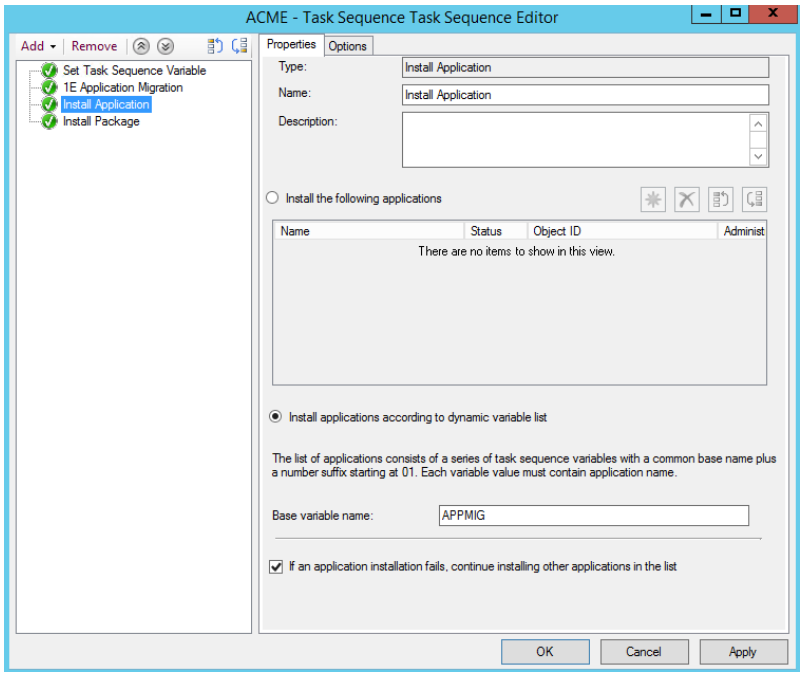
In **Application Variable** choose the base variable that is used to define the dynamic applications. In our example, it is *AppMig*.

In **Package Variable** choose the base variable that is used to define the dynamic packages. In our example, it is *PkgMig*.

Click **Apply**.

11.3.8.4.2 Install Application step

Choose **Add > Software > Install Application**.



On the **Properties tab**:

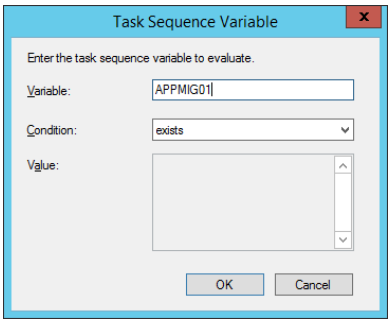
Select the **Install applications according the dynamic variable list** option.

In **Base variable name**, enter the application variable. In our example, it is *AppMig* (see step 5 above).

If you want the task sequence to continue installing other applications in the event if an application install fails, select the **If an application installation fails, continue installing other applications in the list** option.

On the **Options tab**:

Click **Add Condition** and enter condition to check if Task Sequence Variable **APPMIG01** exists (or the application variable you defined in the 1E Application Migration step with **01** appended).



Click **Apply**.

11.3.8.4.3 Install Package step

Choose **Add→Software→Install Package**.

On the **Properties tab**:

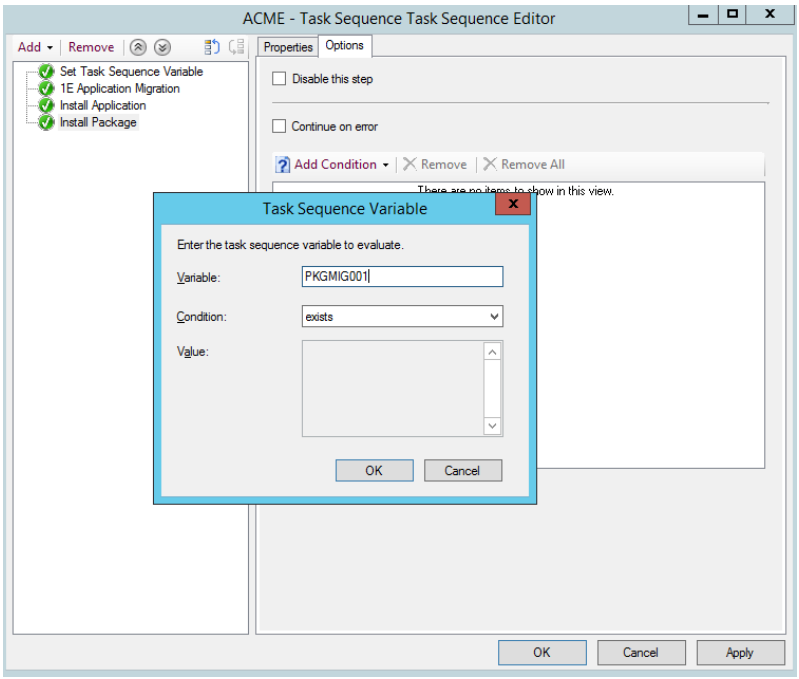
Select the **Install software packages according to dynamic variable list** option.

In **Base variable name**, enter the package variable name used in the 1E Application Migration step. In our example, it is *PkgMig* (see step 6 above).

If you want the task sequence to continue installing other applications in the event if an application install fails, select the **If installation of a software package fails, continue installing other packages in the list** option.

On the **Options tab**:

Click **Add Condition** and enter the condition to check if the task Sequence Variable **PKGMIG001** exists (or the package variable you defined in the 1E Application Migration step and append **001** to it). Click **OK** to save the condition.



Click **Apply** to save the changes to the Task Sequence step.

11.3.8.5 Task sequence variables used by Application Migration

There are five task sequence variables used by Application Migration:

Source Computer Name Variable - the name of the task sequence variable that is used to store the source computer name (the computer from which applications are being migrated), as described above

Application Variable - the base variable name used for Applications, as described above

Package Variable - the base variable name used for Packages, as described above

Role Base Application Sets variable - optional, the variable named **IncludeRoleBasedAppsForExistingPC** must be set to **true** if you are using Role Based Application Sets, described below

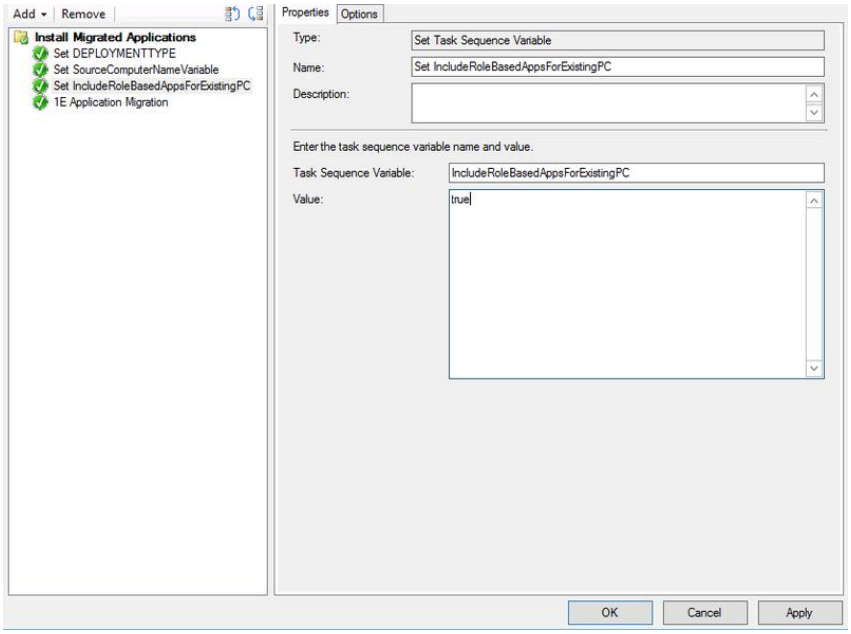
Deployment Type variable - the variable named **DeploymentType** must be set to one of the following values, and must be set prior to the **1E Application Migration** step

Value	Description of DeploymentType variable
Refresh	Also known as Wipe-and-Load, the data on the computer is backed up, the disk is wiped, a new OS is installed and applications are installed subject to their respective migration rules. If no application migration rule exists for an application, it will not be installed.
Replace	Data and applications are migrated from one computer to another. Applications that are migrated to the new computer are subject to the application migration rules for the source computer. If no application rule exists for an application, it will not be installed on the new computer.
InPlace	Windows setup is executed on an existing computer to upgrade the OS. The disk is not wiped, so existing data and installed applications are preserved. In this instance, Application Migration will install only applications that are subject to a replace or upgrade migration rules. Retain rules are ignored.
NewComputer	Also known as bare-metal, this is a new build computer where no applications or data are being migrated. However, you can use the Role Based Application Sets feature to install applications on new computers.

11.3.8.6 Using migration rules and Role Based Application Sets

Role Based Application Sets can optionally be used in each of the deployment scenarios. A Role Based Application Set defines a set of applications that should be installed on a computer for a user performing a particular role, or perhaps working at a particular location.

For this to work, the task sequence must contain the variable **IncludeRoleBasedAppsForExistingPC** set to a value of **true**, as shown.



Note

When using **IncludeRoleBasedAppsForExistingPC** with a value of **true** for role-based application sets, the **DeploymentType** variable must be set appropriately in the task sequence before the **1E Application Migration** step.

11.3.8.7 Auto Install for Configuration Manager Applications and Packages

Application Migration uses the **Install Application** and **Install Package** steps in a Task Sequence to install migrated applications and packages. These Task Sequence steps are dependent on the relevant checkbox (auto install flag) being enabled for *each* application and package:

Allow this application to be installed from the Install Application task sequence action without being deployed.

Allow this program to be installed from the Install Package task sequence action without being deployed.

If a checkbox is not enabled, the software installation will fail for that application or package. An administrator can enable this checkbox for each application and package by using either of the following methods:

in Configuration Manager during or after creating each application and package.

using the **Auto Install** feature in Application Migration when creating application associations, rules or Role Based Application sets.

Note

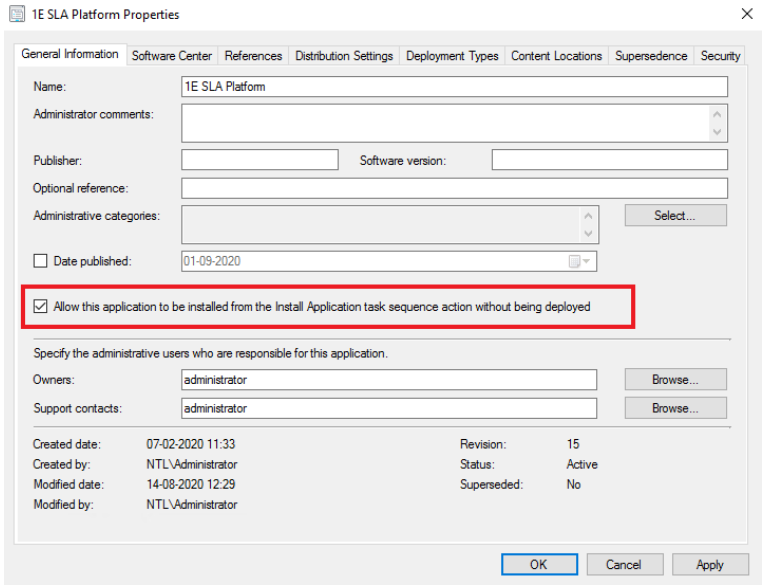
Application Migration's **Auto Install** feature is able to read the checkbox (auto install flag) for applications and programs, but in order for Application Migration to enable them for you, you'll need to configure related providers in the **Settings** module of

Tachyon platform. These should already be configured as a post-installation step. For configuration details, please refer to Post-install configuration.

Refer to Managing migration rules: Auto Install for Migration Rules and Role Based Application Sets: Auto Install for Configuration Manager Applications and Packages.

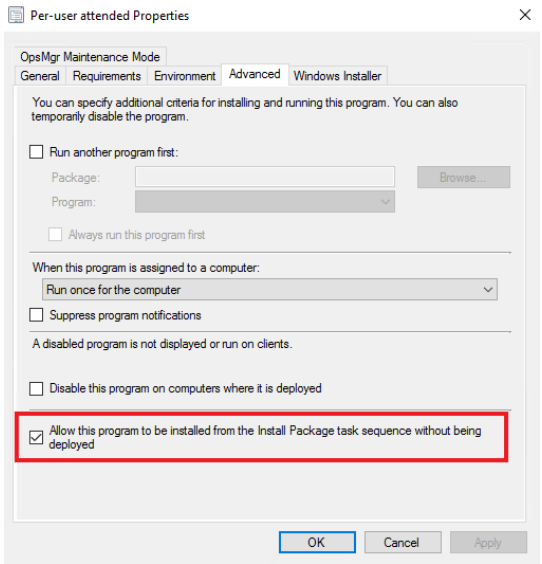
11.3.8.7.1 Applications

The checkbox is located on the **General Information** tab of the **Properties** window for a Configuration Manager Application as shown.



11.3.8.7.2 Packages

The checkbox is also present on the **Advanced** tab of the **Properties** window of a Configuration Manager Package program as shown.



11.3.8.8 Support for Computer Replacement scenario

If you intend to use Application Migration to migrate applications from an old computer to a new computer (**Replace** scenario), you may need to include the Get migration settings step in your Task Sequences. The Get Migration Settings Task Sequence step retrieves information from a Computer Association in Configuration Manager so it can determine the source computer when installing applications on the new computer. It is currently distributed with Nomad and is added to the Task Sequence Editor by installing NomadBranchTools.msi. Please refer to Installing Nomad Branch Tools for more information.

11.4 Troubleshooting

A general methodology for investigating issues as well as identifying key issues and their resolutions.

11.4.1 The technical support process

Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

11.4.1.1 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

11.4.1.1.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

11.4.1.1.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

11.4.1.1.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

11.4.1.2 Log files

11.4.1.2.1 Tachyon Server log files

For any issue, please provide a zip containing log files from the following locations:

%ALLUSERSPROFILE%\1E\Catalog*.log

%ALLUSERSPROFILE%\1E\ContentDistribution*.log

%ALLUSERSPROFILE%\1E\Platform Consumers*.log

%ALLUSERSPROFILE%\1E\SLA Platform*.log

%ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

%ALLUSERSPROFILE%\1E\Licensing*

Please refer to the Tachyon Platform 8.1 - Log files page for more details.

11.4.1.2.2 1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

11.4.1.2.3 Nomad client log

%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles\NomadBranch.log

11.4.1.2.4 WakeUp client log

%ALLUSERSPROFILE%\1E\Agent\WakeUpAgt.log

11.4.1.2.5 Shopping WSA client log

%ALLUSERSPROFILE%\1E\Client\WSA.log

11.4.1.2.6 Task Sequence errors

All the errors which occur in task sequence will be logged into **smsts** log in client machine, where the task sequence is targeted.

11.4.2 Known issues

Lists of the current known issues with implementing, configuring, and using Application Migration.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

11.4.2.1 Issues with installation and upgrades

Issue	Description	Workaround
Unable to close the Application Migration installer by clicking **Finish** button on final screen.	This happens if any of the checkboxes on the Finish screen have been checked before clicking 'Finish' button.	Either close the opened log files. Or do not check the checkboxes on the Finish screen to open a log file.
After upgrade, user may find some rules might not get applied on preview device screens (Existing/New).	A target product in the migration rule was removed/updated in the database due to de-duplication logic in basic inventory consolidation.	Whichever rule is NOT being applied should be updated to change the value of vendor, title, version or edition value of the product.
Revision number of Application Migration app version shown on the Tachyon Portal landing page might not match with its corresponding Control Panel ARP entry.		To know the correct version of Application Migration please refer to ARP entry only.
Application Migration Administrators role is visible in the list of Tachyon system roles even when Application Migration is not installed.	Role Based Access control (RBAC) related information doesn't get removed from the Tachyon Master databasewhen Application Migration is uninstalled	

11.4.2.2 Issues using Application Migration

Issue	Description	Workaround
Any Tachyon user can see Application Migration in the Switch app menu and open the application even if the Application Migration Administrators role is not assigned to the user.	This is because the user's permissions are tested inside the application. Although a user can start the application they cannot use it unless assigned to the Application Migration Administrators role.	
Version search on Add rule screen times out or is incomplete.	A search may be incomplete if the user clicks anywhere on the screen while a large version list is being populated. Examples of large version lists are Chrome and SQL Server which each have over 9000 entries.	Don't click anywhere on screen while versions are being loaded.
Excluding a product having '--' (two successive hyphens) in Vendor, Title or Edition will not delete the migration rules linked to the product being excluded. For example, suppose you try to exclude 'M*Modal Fluency Direct -- Dermatology Recognizer' from 'MModal IP LLC'. If there are any migration rules linked to this product then their count will not be shown on the warning pop-up. Also, the linked migration rules will not get deleted when exclusion is done.	This is due to an existing bug in SLA Platform related to handling of special characters.	All the migration rules linked to the product being excluded need to be deleted manually from 'Manage Rules' screen.
When viewing the process log under Monitoring menu in the Settings app, the **Status** column doesn't refresh on its own to show	This is a known intermittent issue in the portal.	To refresh the screen you click the refresh icon in top right corner of the screen to view the latest status as shown in below screenshot:

Issue	Description	Workaround
the most recent status of any report being run.		The export to excel feature from the installations view doesn't work while using Tachyon portal on Internet Explorer 11 and shows the following error message box:  You might also notice that the icons don't get downloaded on Internet Explorer 11.	This is due to default security settings of the browser which are very strict with respect to downloads.	To resolve this error, you need to ensure that following settings are set to **Enable**. 
Issue	Description	Workaround
The Application Migration Consolidation report doesn't run when the Basic Inventory Consolidation report is executed. This can happen when Application Migration repository is not correctly mapped to a valid inventory repository.	This happens when the linking of Inventory repository pointed by Application Migration repository is broken for some reason. The mapping of a healthy association can be seen in MapProjectProject table in the screenshot below: 	It is not possible to fix the linking from the web portal so this need to be fixed directly in the database. We need to ensure that Source IDs (SourceProjectID and SourceInstanceID) representing inventory repository , and Destination IDs(DestinationInstanceID, DestinationProjectID) representing Application Migration repository should match in the MapProjectProject table for the inventory repository for which IsFavorite flag is 1.
When using Application Migration v3.0 on Tachyon v5.1, CM application cannot be mapped to a VTVE while creating a rule or adding an application to role based sets.		Map the VTVE & CM application in inventory screen and it can be used while creating a rule or adding an application.

11.4.2.3 Issues with installing and using Task Sequence Tools

Issue	Description	Workaround
An error message "No HTTP resource was found.." error message is appearing in SMSTS logs when an Application Migration task sequence runs which causes the task sequence to fail.	This is an intermittent issue which is most often caused by issues in the environment.	

Issue	Description	Workaround
The 1E Application Migration step is not saved when added to an existing OSD task sequence and clicking Apply.	When you add the Application Migration step to an existing OS Deployment task sequence and click Apply, the step is not saved and may appear with a red X symbol.	Save the step by clicking OK instead.
Role-Based Applications not installed when IncludeRoleBasedAppsForExistingPC=true but DEPLOYMENTTYPE is not explicitly set	If the DEPLOYMENTTYPE TS variable is not explicitly set, the 1E Application Migration step will set it to Refresh but does not take into account IncludeRoleBasedAppsForExistingPC being true.	Set DEPLOYMENTTYPE variable before 1E Application Migration step.

11.5 Reference

Application Migration 8.1 reference material.

11.5.1 Installer properties

A list of the Windows installer properties for the Application Migration installers.

11.5.1.1 Application Migration

A table of the Windows installer properties for the Application Migration installer.

> **Warning**
>
> Tachyon Setup is the only supported method of installing, upgrading, and patching a Tachyon server.
>
> Installation using standalone **msi** or **msp** files is not supported unless advised by 1E, which may be necessary in complex installations, using non-interactive (quiet/silent) command-lines, and may require further post-install configuration steps.
>
> **Note**
>
> Mandatory properties must be provided when installing using a command-line.

The installer file is: **ApplicationMigration.msi**

Property	Default	Mandatory	Description
PLATFORMBASEURL	n/a	Yes	The URL used to access the Tachyon Portal website. You can connect either using HTTP or HTTPS. In either case, the URL will be based on the settings made on the **Website Configuration** screen of the Tachyon Setup program. Please refer to Website configuration for more details. For example, if your Tachyon server FQDN is **ACME-TCN01.ACME.LOCAL** and your Tachyon DNS alias is **TACHYON.ACME.LOCAL**, and these have been configured as the host headers on the **Website Configuration** screen of the Tachyon Setup program, then either of the following URLs can be used: http://ACME-TCN01.ACME.LOCAL https://TACHYON.ACME.LOCAL If you have specified a custom port on the **Website Configuration** screen of the Tachyon Setup program, then this should also be added to the URLs. For example: http://ACME-TCN01.ACME.LOCAL:8080 https://TACHYON.ACME.LOCAL:8443

Ensure all steps on the Requirements page have been completed before installation.

See Installation for more details about installations.

Ensure all Requirements have been met before installation.

Please refer to Installation: Installing Application Migration for more details about interactive and non-interactive installations.

11.5.1.2 1E Task Sequence tools

The installer file for 1E Task Sequence tools is: **1ETaskSequenceTools.msi**

There are no installer properties.

Install the 1E Task Sequence Tools on the following systems:

The Configuration Manager Primary Site server. In a multi-site hierarchy, install it on the CAS and each primary site.

If any site has one or more remote SMS Providers, install it on each remote SMS Provider server

Any remote Configuration Manager console systems that are used to edit task sequences.

Please refer to Installation: Installing the 1E Task Sequence tools for more details.

11.5.2 1E task sequence actions

In addition to the custom task sequence actions listed on this page, you may see additional custom action depending on the 1E OSD Tools that you have installed:

BIOS TO UEFI 1.4 - 1E OSD task sequence actions

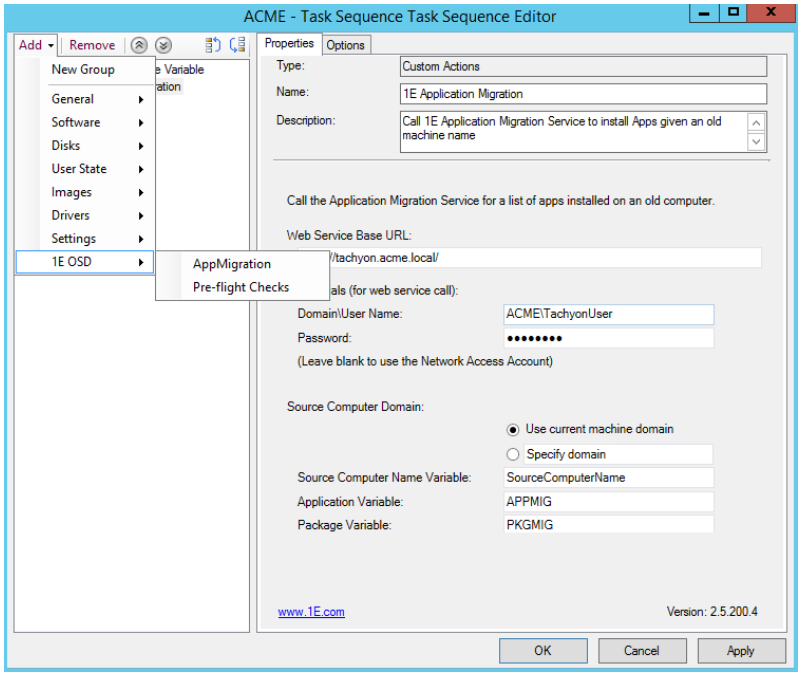
1E OSD task sequence actions

Please click on a heading below for more information about a custom task sequence action and its configuration.

11.5.2.1 AppMigration

11.5.2.1.1 AppMigration Task Sequence action

Application Migration uses a custom task sequence action that calls an Application Migration API. The API gets a list of Configuration Manager Applications and Packages that need to be installed on a computer based on previously installed software titles (determined through inventory) and the migration rules applying to those titles.



For details of how to use this action in a Task Sequence please refer to Using Application Migration in a task sequence.

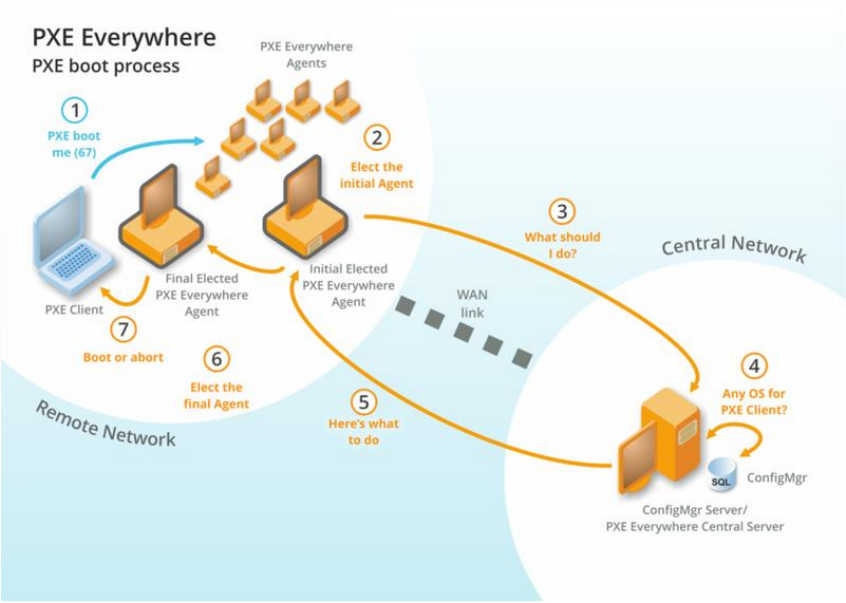
11.5.2.2 Get migration settings

This action is available with 1E Nomad OSD Tools. It provides support for encryption in PBA. Also enables PBA to be used for computer replacement scenarios. This task can be configured to run under either the capture phase or the restore phase. Its behavior differs depending on which phase it's run under.

For full details, refer to Get Migration Settings.

12 PXE Everywhere

PXE Everywhere allows computers to automatically boot up into Windows PE, which then allows a Windows Operating System to be installed.



12.1 Introducing PXE Everywhere

An introduction to the features of PXE Everywhere, what it does, how it can benefit your organization, and a high-level explanation of the PXE Everywhere architecture.

PXE Everywhere allows computers to automatically boot up into Windows PE, which then allows a Windows Operating System to be installed. The following deployment scenarios are supported:

Installing a Windows OS image for the first time (the 'New Computer' scenario, sometimes known as 'bare-metal')

Installing a Windows OS image when the current OS is not bootable (often referred to as 'break-fix')

Installing a Windows OS image when the current OS can be wiped and there is no requirement to retain user data (for example, when preparing a previously used computer for a new user).

Typically this is achieved using either USB media or booting directly from the network using the Pre-Execution Environment (PXE) code built in to the network adapter. Booting from the network requires one or more PXE servers to be implemented that serve the Windows PE boot image to the booting PXE client. Implementing PXE in Configuration Manager requires DPs with the PXE role enabled. To avoid PXE clients downloading the Windows PE boot image (anything upwards of 200MB) over the WAN, DPs need to be located wherever you need to use PXE. It is unlikely that you have Distribution Points in every location, especially if you are using 1E Nomad to eliminate remote Distribution Points. As PXE requests are broadcast on the local subnet, if there is no PXE server on the local subnet you need to configure IP helpers on routers to forward the PXE requests to the PXE server. The PXE client will then try to download the Windows PE boot image from the PXE server over the WAN, which can take hours on slow links and provides no bandwidth management.

PXE Everywhere addresses this issue by implementing a lightweight PXE server (the PXE Everywhere agent) on computers, enabling you to eliminate Configuration Manager PXE servers and instead make every computer (or as many as you want) on the network a potential PXE server. Each subnet therefore has one or more PXE servers available to serve the Windows PE boot image so there is no router configuration required unless DHCP Snooping is enabled, and the Windows PE boot image is not downloaded over the WAN. The boot image can be staged on the PXE Everywhere agent machines using Nomad, which ensures the boot image can be safely transferred to remote subnets ahead of deployments without slowing down other traffic on the network.

When a PXE client boots up, the PXE request is intercepted by each of the PXE Everywhere agents. These agents then elect one agent to check with Configuration Manager to see if there are any OS deployments targeted at the booting PXE client. If so, the PXE Everywhere agents will then hold a second election to determine which PXE Everywhere agent should respond to the booting PXE client. The elected agent sends the response and the booting PXE client downloads the boot image from the elected agent. PXE Everywhere supports booting BIOS and UEFI systems. It integrates with Configuration Manager and works with your existing OS Deployment Task Sequences.

12.1.1 Support for networks with DHCP Snooping enabled

DHCP Snooping is a network security measure implemented in network switches that stops DHCP packets from being forwarded to switch ports that are not authorized. The intention of this security measure is to prevent rogue DHCP servers from issuing IP addresses to devices on the network. A side effect of this measure being enabled is that PXE requests, which are a form of DHCP request, are also blocked. This prevents 1E PXE Everywhere from functioning as expected, as peers are no longer able to receive or respond to PXE requests as their switch ports are not authorized.

With PXE Everywhere 4.0, it is possible to set up one or more 'responders' that are connected to switch ports authorized to receive and respond to DHCP requests. The responder is simply a PXE server that provides the initial boot loader (as this is around 50K in size, it is safe to transfer over the WAN). As PXE clients will not be on the same subnet as the Responder, it is necessary to configure DHCP Relay agents on routers (known as IP helpers in Cisco terminology) to forward DHCP (including PXE) requests from each subnet to the Responder, in addition to any existing DHCP servers that you have configured. The Responder will discard any DHCP packets that are not PXE requests.

When the responder receives a PXE request, it responds with a boot loader that the booting PXE client downloads. The boot loader then broadcasts a new PXE request on a custom UDP port that is not blocked by the DHCP Snooping filter on the switch. The PXE Everywhere agents on the subnet are configured to listen on

the custom port and can therefore continue to function as normal - electing an agent to check for active deployments and respond with an offer of the appropriate boot image - unobstructed by DHCP Snooping.

12.1.2 PXE Everywhere components

PXE Everywhere includes the following components:

PXE Everywhere Central Server. PXE Everywhere Central is a web service that the PXE Everywhere Agents contact to determine if the booting PXE client requires a boot image. It does this by checking the Configuration Manager database to determine if there are any OS Deployment Task Sequences deployed to the booting PXE client (identified by that client's MAC address and SMBIOS GUID). The web service component of the PXE Everywhere Central Service can be installed on any IIS server that has good connectivity to the Configuration Manager Database server (it can be installed on the Configuration Manager site server if IIS is installed). PXE Everywhere Central also includes boot image tools, which can be installed on any system that has the Configuration Manager Console installed. To install, please refer to Installing PXE Everywhere Central.

PXE Everywhere Agent. PXE Everywhere Agent is a client module of the 1E Client (introduced in 1E Client 5.1 for PXE Everywhere v4.0). It is installed on all (or as many as you want) computers. It establishes a lightweight PXE service which listens for PXE boot requests broadcast on the local subnet. By default, the Agent listens on port 67, but will listen instead on port 2067 if the Agent has been configured to run in an environment that has DHCP Snooping enabled. When intercepted the agents will initiate an election and the elected agent will check, via the PXE Everywhere Central server, if there are any OS Deployment Task Sequences deployed to the booting PXE client. If so, the Agents will initiate a second election to determine the best agent to serve the Windows PE boot image to the booting PXE peer. The elected agent then responds to the booting PXE client with an offer of the boot image, which the PXE client then downloads over TFTP and boots into to start the Task Sequence. To install, please refer to Installing PXE Everywhere Agents.

PXE Everywhere Responder. PXE Everywhere Responder has its own installer (introduced in v4.0). It is only required to support networks that have DHCP Snooping enabled. DHCP snooping prevents PXE Everywhere Agents from receiving or responding to PXE requests on the standard UDP ports (67 & 68). As the PXE code built into the network adapter always broadcasts PXE requests on UDP port 67, it is necessary to load a custom boot loader from an authorized source (the PXE Everywhere Responder) that can then broadcast another request on the custom UDP port that is not blocked by the network switch and on which the Agents are configured to listen. Once the PXE Everywhere Agents intercept these requests on the custom port, the functionality of the agents remains the same as if DHCP snooping were not enabled. The network routers (IP helpers) must be configured to forward DHCP packets to the Responder and DHCP Snooping must be configured on network switches to authorize the Responder to receive and respond to DHCP requests. Booting PXE clients will always download the custom, light-weight boot loader (51KB) from the Responder but will download the much larger Windows PE boot image from a local peer. You can implement a single PXE Everywhere Responder for all clients, or you may prefer to implement regional or more localized Responders throughout your network. In either case, you will need to configure router IP helpers wherever DHCP Snooping is used, ensuring that the network configuration enables the designated Responder to receive and respond to PXE requests generated by PXE clients. To install, please refer to Installing PXE Everywhere Responder.

12.1.3 How it works

After PXE Everywhere installation and setup, during operation the PXE-booting of machines runs through the following sequence, as illustrated in the picture opposite:

PXE Boot me (67) - When the PXE client boots, it performs the normal DHCP request to get an IP address and also sends a normal PXE request

Elect the initial Agent - The PXE Everywhere Agents on the local subnet intercept the PXE request and elect a candidate for servicing the request.

What should I do? - The elected Agent contacts the PXE Everywhere Central Server to find out whether the PXE client should be served a boot image.

Any OS for PXE Client? - The PXE Everywhere Central Server checks the Configuration Manager database to see if there are any OS deployment task sequences deployed to the PXE client matching its MAC address and / or SMBIOS GUID.

Here's what to do - If a task sequence deployment is found, the PXE Everywhere Central Server replies to the elected Agent with the boot image ID referenced in the task sequence and information whether the deployment is mandatory or not. If more than one deployment is found, the last one is used. If no deployments are found, the Central Server indicates so in the reply.

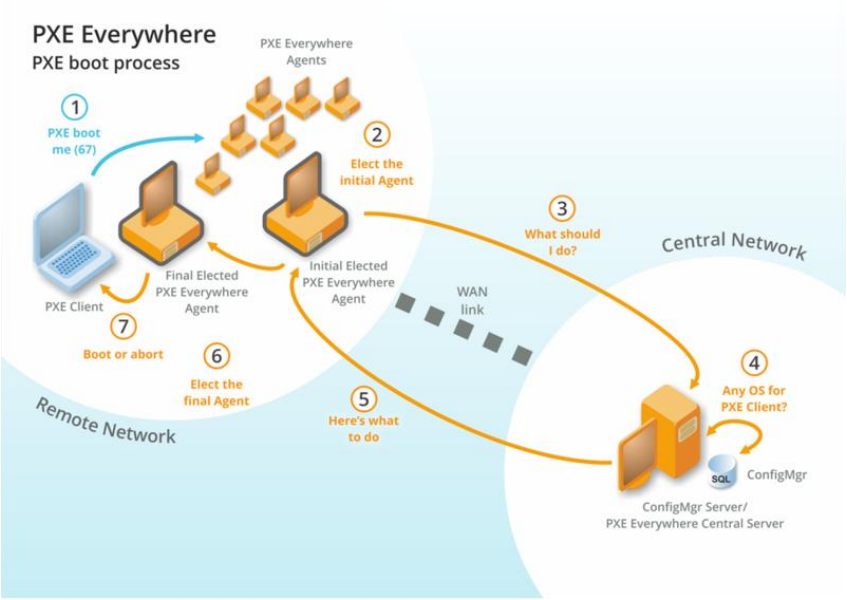
Elect the final Agent - Upon receiving the reply, the elected Agent holds a second election in the subnet to choose an Agent that will boot the PXE client. If an Agent other than itself wins the second election, the information received from Central Server is passed on to it.

Boot or abort - The winner of the second election boots responds to the PXE client which boots as follows:

If a mandatory deployment was found, the PXE client is booted using the WinPE boot image referenced in the deployed task sequence

If non-mandatory deployment was found, the PXE client is presented with an option to boot using a WinPE boot image, requiring user interaction at the machine

If no deployments were found, the PXE-boot is aborted allowing the PXE client to boot to a local OS, if any.



When DHCP Snooping is enabled on the network, the above process changes slightly, as illustrated in the picture opposite:

PXE Boot me (67) - When the PXE client boots, it performs the normal DHCP request to get an IP address and also sends a normal PXE request.

Router forwards the request - The PXE request is forwarded to the PXE Everywhere Responder by an IP helper configured on the router.

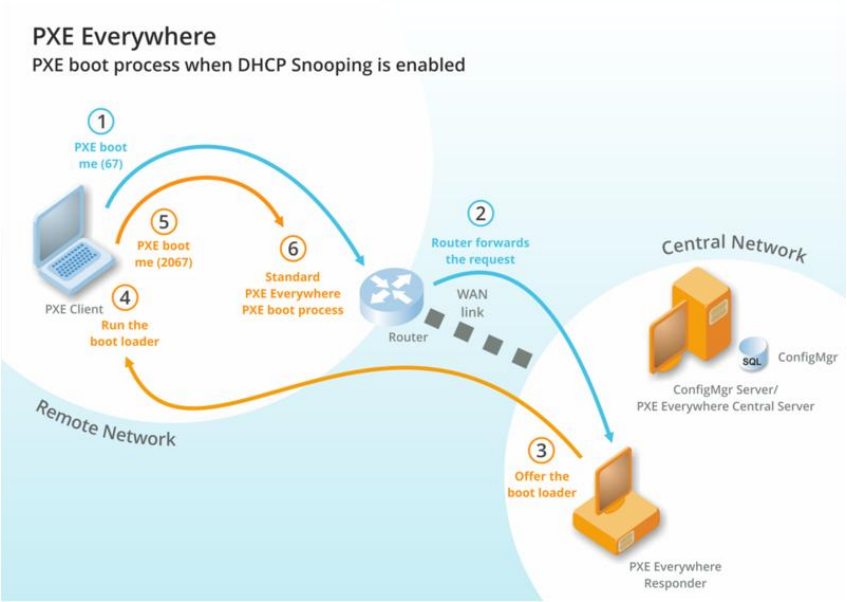
Offer the boot loader - The PXE Everywhere Responder offers the PXE client the appropriate (BIOS or UEFI) boot loader.

Run the boot loader - The PXE client downloads the boot loader from the PXE Everywhere Responder and executes it.

PXE boot me (2067) - The boot loader broadcasts a new PXE request on the custom port (2067). The PXE Everywhere Agents are also configured to listen on this custom port.

Standard PXE Everywhere PXE boot process - From this point on the process follows from step 2 in the standard process detailed above.

Please refer to Design Considerations for further explanation of how to get PXE Everywhere ready for use.



12.2 Implementing PXE Everywhere

Everything you need to know about getting PXE Everywhere installed and running on your network. This section is structured in a way that leads you through a typical implementation project.

12.2.1 Design Considerations

What you will need to prepare in advance of implementing PXE Everywhere in your network. Typically, these are tasks that may take some time to organize, depending on how your organization works. A comprehensive list of installation and software requirements is provided in Requirements.

If you are upgrading PXE Everywhere, please review this page and then refer to Upgrading PXE Everywhere.

12.2.1.1 Network Configuration

When implementing PXE Everywhere, it must be the only PXE solution on each LAN used by your PXE clients. This means any existing PXE services on these LANs must be disabled, and any existing DHCP relays (IP helpers) that forward requests to PXE servers must also be disabled. DHCP relays (IP helpers) used for DHCP requests should be kept.

A working DHCP implementation is required. You must remove DHCP Scope Options (66, 67) you may have previously used in native Configuration Manager because they will conflict with PXE Everywhere.

By default, the Agent listens on port 67, but will listen instead on port 2067 if the Agent has been configured to run in an environment that has DHCP Snooping enabled. If Agents use a port other than 67, then support for DHCP Snooping option is assumed, and PXE Everywhere Responders must be configured to use that port. If DHCP Snooping is not being used, then Agents must use port 67, and you do not need to install Responders.

Ensure client and network firewalls are configured to support Requirements: Firewall Ports.

12.2.1.1.1 DHCP Snooping

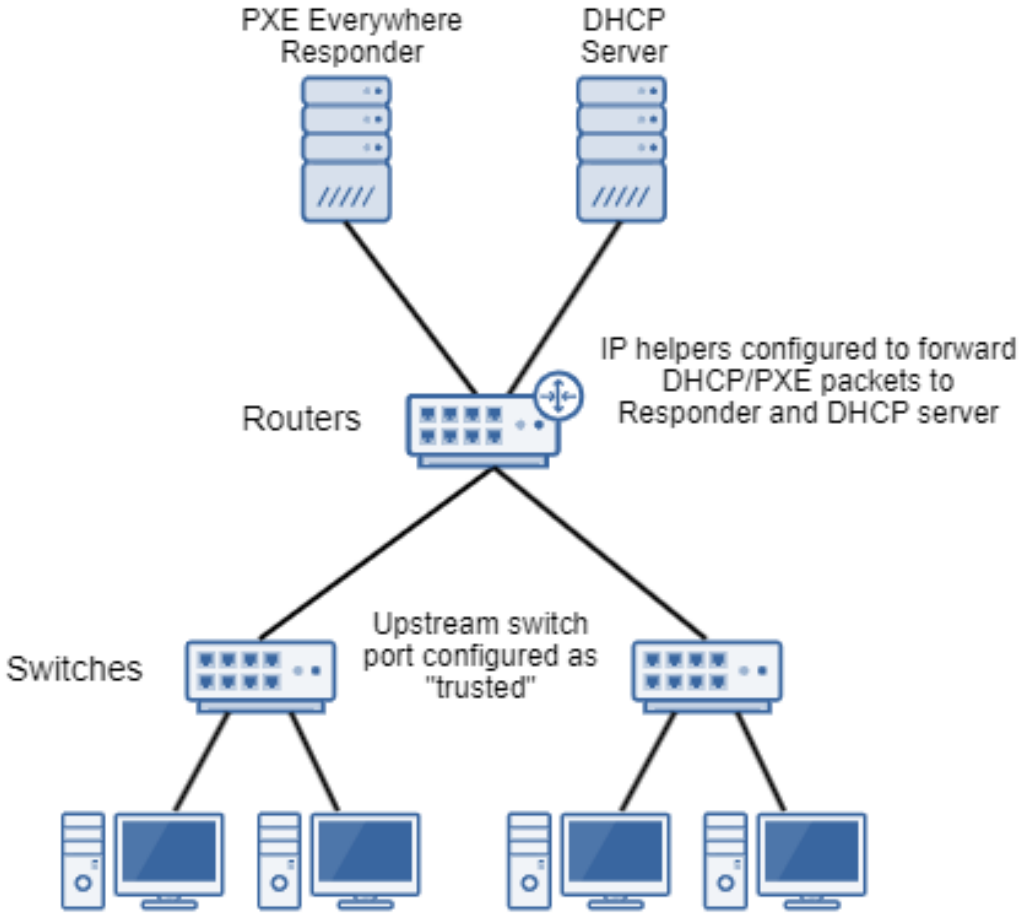
One or more PXE Everywhere Responders are required when network hardware or design prevents local DHCP traffic, for example when DHCP Snooping has been enabled. Your network devices may have other settings enabled which also prevent local DHCP. Therefore, you should test your network before proceeding and determine if you can reconfigure your network and/or install Responders.

> **Tip**
>
> One method of testing to see if local DHCP is blocked, is to put a network packet capture tool like Wireshark on a device you intend to use as PXE Everywhere Agent, start a capture and do a DHCP release/renew from another client on the same subnet. The capture tool must be in promiscuous mode. If you can see the DHCP traffic in the packet capture, then you probably do not need a Responder. If you don’t see any DHCP traffic then you will need to consider installing Responders.

If you decide to install PXE Everywhere Responders, you will need to configure network switches to allow the PXE Everywhere Responder to receive and respond to PXE requests on port 67. Typically, this requires configuring the switch port connected to the router as "trusted". Refer to the switch manufacturer's documentation for more details.

You will also need to configure DHCP Relays (IP helpers) on routers to forward DHCP/PXE packets to the PXE Everywhere Responder(s) in addition to any DHCP Relays you already have configured for the DHCP server(s).

PXE Everywhere Agents and Responders must use a common port, which is 2067 by default. All Agents and Responders must use the same port.



12.2.1.2 Infrastructure requirements

12.2.1.2.1 Microsoft System Center Configuration Manager

A working Configuration Manager system is required, with clients that are healthy and functioning properly.

To test PXE Everywhere, you will need a working OS deployment task sequence and at least one remote PXE Client.

Although Configuration Manager is recommended for deploying PXE Everywhere Agent and PXE Everywhere Responder, they have no dependency on Configuration Manager itself.

You will also use a Configuration Manager Task Sequence to stage the 1E PXE Everywhere boot images on each PXE Everywhere Agent computer.

12.2.1.2.2 PXE Everywhere Central server

This is a web application that the PXE Everywhere Agents use to determine if a PXE client should be served a boot image. In most cases, the only infrastructure required for PXE Everywhere is the PXE Everywhere Central server, in addition to a Configuration Manager site with at least one Distribution Point. During installation, the PXE Everywhere Central installer adds some stored procedures to the Configuration Manager database that are executed by the web application

when requested by PXE Everywhere Agents. In a multi-site hierarchy, the PXE Everywhere Central server should be connected to the CAS database server.

You will need to decide where to install it. You can install PXE Everywhere Central on a Configuration Manager site server, or on any other server that has IIS installed and has good connectivity to the Configuration Manager database, ideally equivalent to the connection that the site server has to its database. Suitable alternatives for hosting PXE Everywhere Central are ActiveEfficiency or Tachyon Platform server. By default, the PXE Everywhere web application will install under any website that has an HTTP binding using port 80. If there is more than one HTTP 80 binding, it will install under the first according to IIS Site order, which is **Default Web Site**, by default.

Please refer to Requirements for specific system requirements for the PXE Everywhere Central server, including Windows Server roles and features and Firewall Ports.

12.2.1.2.3 PXE Everywhere Agent

PXE Everywhere client provides a lightweight PXE server that responds to PXE boot requests from the local subnet and serves boot files to requesting PXE clients. It must therefore be installed on at least one client in each subnet where PXE booting is required, and preferably installed on all PCs in your environment, thereby providing maximum availability (redundancy) and scalability (load-balancing) for PXE boot requests.

To install PXE Everywhere Agent, you require the following:

At least 2MB of free disk space for the application, plus whatever size your boot images require (typically 130MB each).

Ensure client side firewalls have exceptions for the ports required by PXE Everywhere.

Antivirus exceptions

When upgrading, we recommend you update all versions of PXE Everywhere Agent running on a single subnet at the same time.

Refer to Requirements for other specific system requirements for the PXE Everywhere Agent.

For PXE clients to PXE boot into Windows PE, each PXE Everywhere Agent requires a boot image and supporting files. As this is a complex process, 1E recommends using Introducing 1E Client Deployment Assistant to configure and simultaneously deploy PXE Everywhere Agent with the boot image. CDA integrates with Configuration Manager to create packages and deployments. If you need to deploy boot images separately they are available in the Microsoft Windows Automated Deployment Kit (ADK) as described in Preparing and deploying 1E PXE Everywhere boot images.

> **Note**
>
> The PXE Everywhere Agent client module in 1E Client 5.1 and later does not require a license key. PXE Everywhere 4.0 does not require input of a license key, or relicencing when upgrading or updating. Customers are legally bound to use the software within the terms of the 1E software license agreement.

12.2.1.2.4 PXE clients

PXE clients are computers that will PXE boot into Windows PE and install or repair the Windows OS. They do not require PXE Everywhere to be installed on them.

The following are required for clients that need to PXE boot in order to install an operating system:

PXE must be enabled in the firmware settings. Refer to the hardware-specific documentation for details on how to enable PXE. You can also use the BIOS TO UEFI tool to enable UEFI PXE on Dell, Lenovo and HP systems in a Task Sequence.

Minimum hardware specification as required by the target operating system.

LAN connection 100Mbps or greater.

12.2.1.2.5 PXE Everywhere Responder

As described in DHCP Snooping above, if local DHCP traffic is blocked, for example by DHCP Snooping being enabled on your network switches, then you will need to implement at least one authorized PXE Everywhere Responder, preferably on a Server OS, and enable DHCP Snooping mode on Agents. Refer to Network Configuration above for additional network configuration required to support DHCP Snooping.

The Responder can be installed on a workstation OS, however for production environments it should be installed on a server OS, as all DHCP and PXE requests will be routed to this server (in addition to your existing DHCP servers). The Responder will simply discard DHCP requests and only process PXE requests. The Responder cannot be installed on an existing DHCP server.

> **Note**
>
> PXE Everywhere Responder cannot co-exist on the same computer as PXE Everywhere Agent, and are not supported together. Whilst it is possible to install them together, they will not work and will have issues such as failure to bind to ports.
>
> If you install 1E Client on the same computer then you must disable the client module for PXE Everywhere Agent. You can do this by adding

In most cases a single Responder will be sufficient. In larger environments, or environments where networks in different regions are managed by different parties, you can implement multiple PXE Everywhere Responders, each one managing different segments of your network. For example, you may choose to implement a Responder for each geographic region. This decision will often depend on your current network topology and how the network is currently managed.

To install PXE Everywhere Responder you require the following:

PXE Everywhere Responder is 64-bit only. A server OS is recommended.

Requires at least 2MB free disk space for the application

Ensure client side firewalls have exceptions for the ports required by PXE Everywhere.

See Anti-virus exceptions.

When upgrading, we recommend you update all versions of PXE Everywhere Agent running on a single subnet at the same time.

Refer to Requirements for other specific system requirements for the PXE Everywhere Responder.

When implementing PXE Everywhere in a network that has DHCP Snooping enabled, you will need to use and enable communication on custom UDP ports to allow the PXE client to communicate with the PXE Everywhere agents (the standard ports are blocked by the DHCP Snooping feature). By default, the custom UDP ports used in the initial boot loader served by the Responder are set to 2067 and 2068. To use different ports you must create the following registry values in*HKLM\Software\Wow6432Node\1E\PXELiteServer*on Responders, and ensure that the value of AltPxeServerPort is the same as used by DhcpPort on PXE Everywhere Agents. Do not change the value of DhcpPort on Responders.

Name	Type	Notes
AltPxeServerPort	REG_DWORD	This is the UDP port that the alternate boot loader will broadcast the custom PXE request on. The PXE Everywhere Agents must be configured to listen on this port, so it must be the same port defined by DHCPPORT when installing the PXE Everywhere Agent. If this registry setting does not exist then port 2067 is used.
AltPxeClientPort	REG_DWORD	This is the UDP port that the PXE Everywhere Responder will reply to the PXE client (alternate boot loader) on. If this registry setting does not exist then port 2068 is used.

Note

The PXE Everywhere Responder does not require a license key. PXE Everywhere 4.0 does not require input of a license key, or relicencing when upgrading or updating. Customers are legally bound to use the software within the terms of the 1E software license agreement.

12.2.2 Requirements

Software requirements that must be met in order for PXE Everywhere to be successfully installed and used.

12.2.2.1 Active Directory requirements

12.2.2.1.1 Installation account for PXE Everywhere Central

The account of the user that performs the PXE Everywhere Central installation must meet the following criteria, which can be temporary for installation only:

Must be a domain account (a local account cannot be used)

Must be assigned to the *Full Administrator* security role in Configuration Manager

Must have local admin rights (that is, the account is a direct or indirect member of the local Administrators group) on the server where you are installing PXE Everywhere Central

Must be assigned the sysadmin server role in the SQL Server instance which hosts the Configuration Manager database. This can be temporary during installation.

12.2.2.1.2 Installation account for PXE Everywhere Agent and PXE Everywhere Responder

Configuration Manager installs applications in the local system context, which is sufficient for the installation of the PXE Everywhere Agent and PXE Everywhere Responder.

If installed manually, the account used to install it must have local admin rights. That is, the account is a direct or indirect member of the local Administrators group) on the computer you are installing it on.

12.2.2.2 Microsoft ADK files

In addition to the binaries supplied by 1E, PXE Everywhere Agent requires a number of files that are distributed and licensed with the Microsoft Windows Automated Deployment Kit (ADK). The required files are listed in the table opposite, along with the location on the PXE Everywhere Agent that they need to be installed to.

As these files are licensed by Microsoft, 1E are unable to include them in the installation media. However, you can use the Introducing 1E Client Deployment Assistant to extract the required files from the ADK, create an installer transform and prepare an Application in Configuration Manager that will install the PXE Everywhere Agent with the appropriate settings and the additional Microsoft files.

The Windows Assessment and Deployment Kits (ADK) normally exist on the Configuration Manager CAS or Primary Site server, although they can be downloaded separately from the Microsoft website.

File	Destination Location (relative to TFTPROOT)
boot.sdi	*\boot.sdi*
abortpxe.com	*\boot\x86\abortpxe.com*
bootmgr.exe	*\boot\x86\bootmgr.exe*
pxeboot.com	*\boot\x86\pxeboot.com*

				is configured to support DHCP Snooping.	
Responder (PXEEverywhereResponder.exe)	67	BOOTP UDP	Inbound	Port 67 is the standard PXE discover port. A Responder is only required when DHCP Snooping is enabled, and listens for PXE requests from PXE clients on this port. See note below about DHCP Snooping and DHCP Relays.	No.
Responder (PXEEverywhereResponder.exe)	68	BOOTP UDP	Outbound	Port 68 is the standard PXE offer port. A Responder is only required when DHCP Snooping is enabled,	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				and responds to PXE clients with offers unicast on this port. See note below about DHCP Snooping and DHCP Relays..	
PXE client	67	BOOTP UDP	Outbound	Port 67 is the standard PXE discover port. PXE clients use this port to broadcast PXE discovers on the local subnet. If DHCP Snooping is being used these discovers are forwarded to a Responder. See note below about DHCP Snooping and	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				DHCP Relays. .	
PXE client	68	BOOTP UDP	Inbound	Port 68 is the standard PXE offer port. PXE Everywhere Agent broadcasts on this port with an offer in response to PXE discovers on the local subnet. If DHCP Snooping is being used, then Responders respond with offers on this port. See note below about DHCP Snooping and DHCP Relays..	No.
PXE client	69	BOOTP UDP	Outbound	Port 69 is the standard PXE TFTP port. A PXE client uses TFTP to	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				download the boot image from the elected PXE Everywhere Agent on the local subnet. This port is also used if PXE Everywhere is configured to support DHCP Snooping.	
PXE client	4011	UDP	Outbound	Port 4011 is the standard PXE port used by PXE clients to unicast a request to the PXE Everywhere Agent for the location of the TFTP boot image file, after the initial discover/offer. This port is not used if PXE Everywhere	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				is configured to support DHCP Snooping.	
PXE client	2067	BOOTP UDP	Outbound	If PXE Everywhere is configured to support DHCP Snooping, a custom port is used (default 2067) to perform a PXE request after the PXE client has downloaded a boot loader from a Responder. Only used if DHCP Snooping is being used, and PXE Everywhere has been configured to use this port.	Yes. DhcpPort is configured during installation of Agents. AltPxeServerPort is manually configured on Responders.

Component	Ports	Protocol	Direction	Usage	Configurable
PXE client	2068	BOOTP UDP	Inbound	If PXE Everywhere is configured to support DHCP Snooping, a custom port is used (default 2068) to respond to a PXE request after the PXE client has downloaded a boot loader from a Responder. Only used if DHCP Snooping is being used, and PXE Everywhere has been configured to use this port.	Yes. AltPxeClientPort is manually configured on Responders.

Note

PXE client ports do not need to be configured on the OS firewall because it is the network interface which is doing the communicating. However you may need to configure intervening network firewalls for communication beyond the local subnet.

PXE Everywhere Responders communicate only with PXE clients; they do not communicate with PXE Central, PXE Everywhere Agents, other Responders, or Configuration Manager.

Note

If DHCP Snooping is enabled on networks, then DHCP Relays (IP helpers) must be configured to forward PXE requests (discovers) from client VLANs to specific Responders on port 67 and return the responses (offers) on port 68.

If DHCP Snooping is not enabled, then all PXE-boot traffic is on the local subnet, except for communication between the elected PXE Everywhere Agent and the PXE Everywhere Central server, and DHCP Relays are not required to forward PXE requests.

Note

Ports used by PXE clients to communicate with DHCP servers are not included in the above table. Communication with DHCP servers occurs before a PXE client PXE-boots, and typically use their own DHCP Relays (IP helpers).

Ports used by PXE clients to communicate with ConfigMgr Site systems are not included in the above table. Communication with ConfigMgr occurs only after a PXE client has downloaded the WinPE boot image (referenced in the deployed task sequence) from a local PXE Everywhere Agent, and booted into WinPE to start the Task Sequence.

Ports used by ConfigMgr Administrator workstations to communicate with ConfigMgr Site systems are not included in the above table. ConfigMgr Console extensions for PXE Everywhere Admin Tools use the same ports as ConfigMgr Console.

12.2.2.5 Antivirus exceptions

PXE Everywhere functionality may be impaired by antivirus programs. Although we generally advise that no malware exclusions are used, it is justifiable in certain cases to isolate specific locations and files used by specific software. The following is a list of exclusions that could be added for PXE Everywhere Local, but before you implement them, make sure they are compatible with existing exclusions.

All PXE Everywhere component installations:

%SystemDrive%\ProgramData\1E\PXEEverywhere*.log & *.lo_

Additional exclusions required on PXE Everywhere Agents:

%SystemDrive%\Program Files\1E\Client\Extensibility\PXEEverywhere\CreateBcD.exe

%SystemDrive%\ProgramData\1E\PXEEverywhere\TftpRoot\boot.sdi

%SystemDrive%\ProgramData\1E\PXEEverywhere\TftpRoot\Boot\Fonts\wgl4_boot.ttf

%SystemDrive%\ProgramData\1E\PXEEverywhere\TftpRoot\Boot\x86\abortpxe.com

%SystemDrive%\ProgramData\1E\PXEEverywhere\TftpRoot\Boot\x86\Bootmgr.exe

%SystemDrive%\ProgramData\1E\PXEEverywhere\TftpRoot\Boot\x86\pxeboot.com

%SystemDrive%\ProgramData\1E\PXEEverywhere\TftpRoot\Boot\x86\pxeboot.exe

%SystemDrive%\ProgramData\1E\PXEEverywhere\TftpRoot\Images**.bcd

%SystemDrive%\ProgramData\1E\PXEEverywhere\TftpRoot\Images**.wim

12.2.3 Installing and Upgrading

How to install and upgrade PXE Everywhere components.

12.2.3.1 Installing PXE Everywhere Central

Using the PXE Everywhere Central installation wizard to check prerequisites, configure and install PXE Everywhere Central and/or PXE Everywhere Admin Tools.

12.2.3.1.1 The PXE Everywhere Central installer

The PXE Everywhere Central installer is included in the PXE Everywhere zip file that can be downloaded from the Nomad area of the 1E Support Portal.

Before you begin installation, please ensure you have reviewed Design Considerations and Requirements pages, and the installation steps below.

The installer is used to:

Install **PXE Everywhere Central** on any server that has IIS and other prerequisites installed

Install **PXE Everywhere Admin Tools** on any computer that has Configuration Manager Admin Console installed.

Both can be installed on a typical Configuration Manager site server.

A single instance of **PXE Everywhere Central** is required in any given environment. It can be installed on any server but must have good connectivity to the Configuration Manager database, preferably on the same subnet. The installer adds some stored procedures to the Configuration Manager database, where are used by the PXE Everywhere Central Web service whenever queried by PXE Everywhere Agents.

PXE Everywhere Admin Tools are required for preparing the Windows PE boot images for use by PXE Everywhere Agents, as described in Preparing and deploying 1E PXE Everywhere boot images. If you are only here to install the Admin Tools then you can skip to the PXE Everywhere Admin Tools installation steps.

12.2.3.1.2 Running the PXE Everywhere Central installer

Logon to the server using the PXE Everywhere Central installation account and then use the following instructions:

12.2.3.1.2.1 Installing PXE Everywhere Central with the wizard

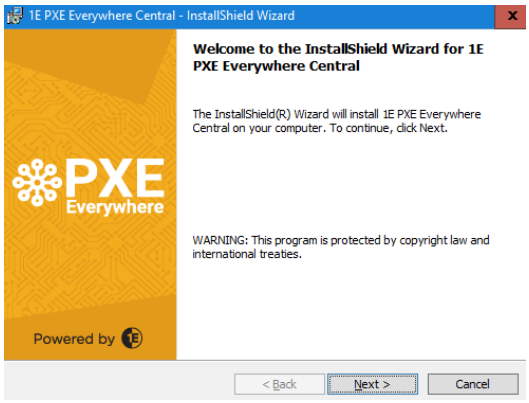
To install PXE Everywhere Central, start a command prompt with elevated rights, using **Run as administrator**, change directory to the location where you downloaded **PXEEverywhereCentral.msi** and run the following suggested command-line:

```
>msiexec /i PXEEverywhereCentral.msi /l*v PXEEverywhereCentral.log
```

12.2.3.1.2.1.1 Welcome to the InstallShield Wizard for 1E PXE Everywhere Central

This screen provides the version number for PXE Everywhere Central and outlines what the wizard will do.

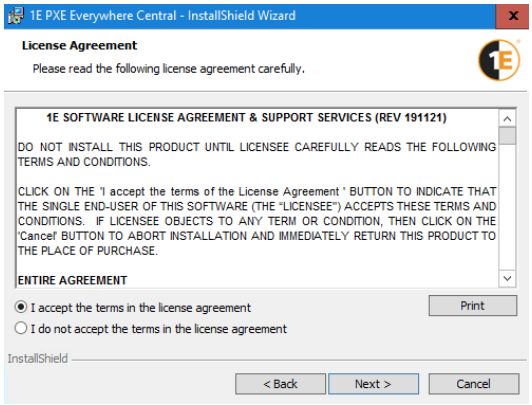
Click **Next** to go to the next screen.



12.2.3.1.2.1.2 License agreement

You must read and then accept this license information by checking the **I accept the terms in the license agreement** checkbox.

Click **Next** to go to the next screen.



12.2.3.1.2.1.3 PXE Everywhere Central Prerequisites

On this screen, background checks are run to ensure the prerequisites for successfully running the installer are met.

If all the checks have passed, click **Next** to got to the next screen. If any of the checks have failed, note them, exit the installer and add the missing ones to the computer where the installer is being run. When that is done re-run the installer and check that the prerequisites are now fully met before continuing.

> **Note**
>
> The features shown are dependent on what items are present on the computer, as described in the following table:

Conditions	Available Features
IIS present ConfigMgr Console on site server	Admin Tools PXE Everywhere Central WebService ConfigMgr Database stored procedure
IIS present No ConfigMgr Console	PXE Everywhere Central WebService ConfigMgr Database stored procedure
No IIS ConfigMgr Console on site server	Admin Tools

If the Configuration Manager Console is not present, you can still install PXE Everywhere Central, but you will need to install the Admin Tools on a computer that has the Configuration Manager Console installed.

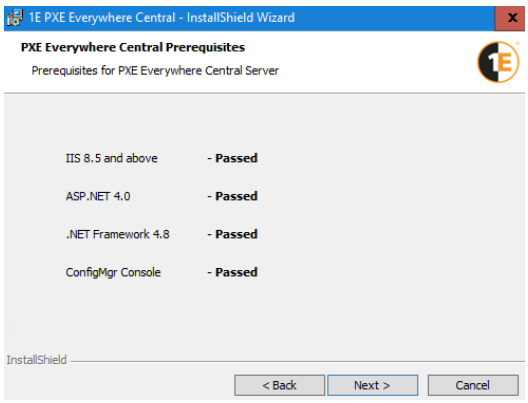
Note

Although the Admin Tools - specifically *UpdateBootImage.exe* - are not run directly from the Configuration Manager console, they will not work unless the following are both installed:

Configuration Manager console

Windows Assessment and Deployment Kit (ADK).

Installation of Admin Tools is shown in PXE Everywhere Admin Tools installation steps.



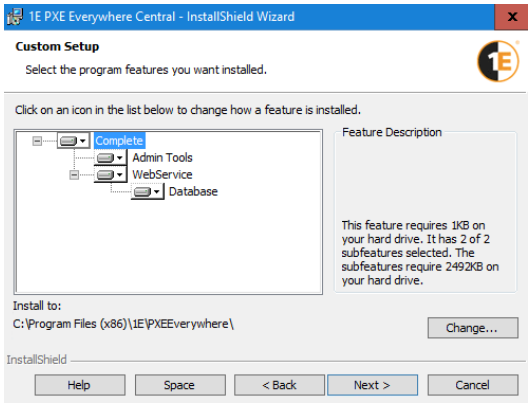
12.2.3.1.2.1.4 Custom Setup

On the **Custom Setup** screen, choose the features to install. As described above, the features available will correspond to whichever prerequisites have been met.

You can select which features are installed by clicking the drop-down against each feature and selecting the installation status from the context menu.

You can change the location for a particular feature by selecting it and clicking the **Change...** button. However, it is recommended that you install all features with the default location unless there is a good reason not to.

When you've finished selecting the components you want to install, click **Next** to continue.

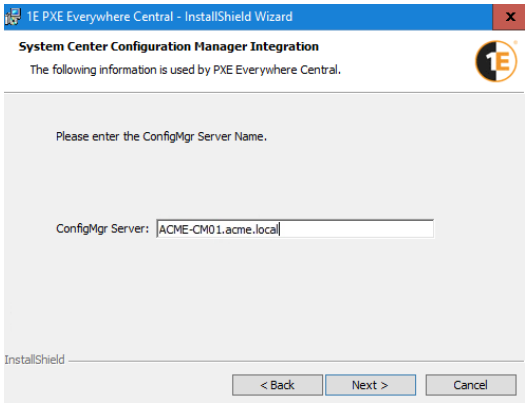


12.2.3.1.2.1.5 System Center Configuration Manager Integration

This screen is only displayed if the Configuration Manager console is not present on the server you are installing on.

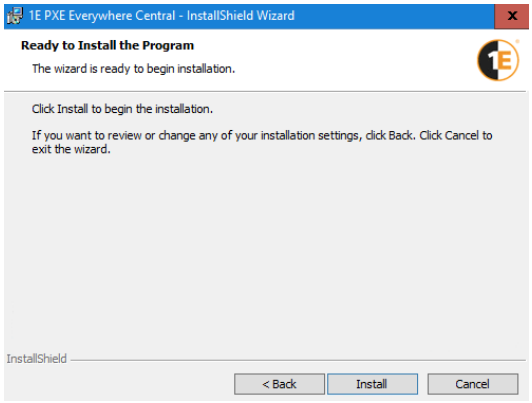
Here you must enter the location of the remote Configuration Manager site server. This can be the name or FQDN of the server where Configuration Manager Primary Site is installed. In a multi-site hierarchy enter the name or FQDN of the CAS site server.

When you click **Next** to continue the installer account credentials will be validated against the selected **ConfigMgr Server**.



12.2.3.1.2.1.6 Ready to Install the Program

Click **Install** to start the PXE Everywhere Central installation.

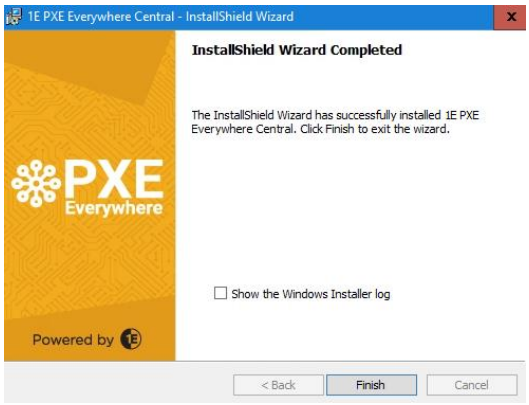


12.2.3.1.2.1.7 InstallShield Wizard Completed

This screen indicates whether the installation was a success or not. If any issues have been reported please refer to the troubleshooting section.

Here you can also optionally check to **Show the Windows Installer log**.

You can click **Finish** to close the installer.



12.2.3.1.2.2 PXE Everywhere Admin Tools installation steps

PXE Everywhere requires preparation of the Windows PE boot image. If PXE Everywhere Central is installed on the Configuration Manager site server or a server that has the Configuration Manager Console you have an option to install the **Admin Tools**, which includes a particular tool (**UpdateBootImage.exe**) that automates the preparation.

The **Admin Tools** can be installed on any computer with the Configuration Manager Console installed where you may want to prepare the Windows PE boot image for use by PXE Everywhere Agents.

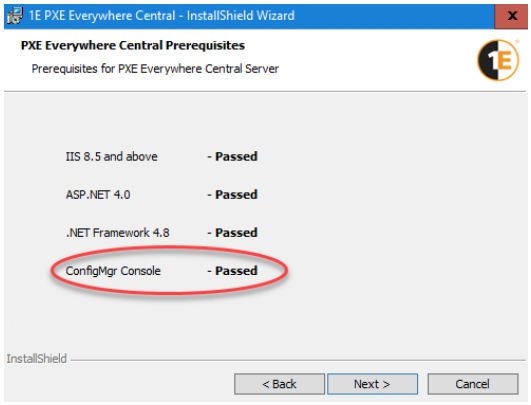
Run the PXE Everywhere Central installer as above, except for the following screens:

12.2.3.1.2.2.1 Prerequisites

On the **Prerequisites** screen, background checks are run to ensure the prerequisites for successfully running the installer are met.

To install the **Admin Tools** you need to confirm that the **ConfigMgr Console** prerequisite check has passed, the other prerequisites are not required for the **Admin Tools**.

Click **Next**.

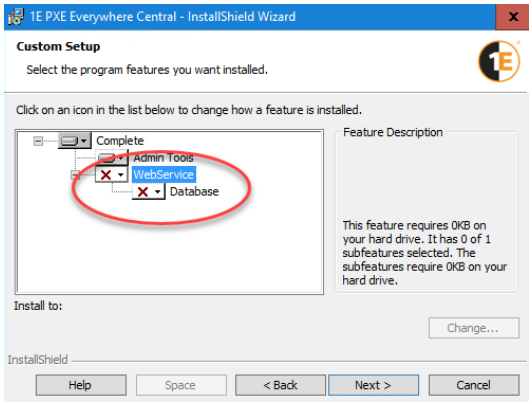


12.2.3.1.2.2.2 Custom Setup

On this screen ensure that the **Admin Tools** feature is the only selected feature. If other features are selected, change their install status to **This feature will not be available**.

Click **Next** when this has been confirmed.

Then click **Install** and allow installation to complete, then click **Finish**.



12.2.3.1.3 Next steps

To verify the PXE Everywhere Central installation, please refer to Verifying: PXE Everywhere Central.

To install the PXE Everywhere Responder, please refer to Installing PXE Everywhere Responder.

To install the PXE Everywhere Agents, please refer to Installing PXE Everywhere Agents.

To stage boot images on PXE Everywhere Agents, please refer to Preparing and deploying 1E PXE Everywhere boot images.

12.2.3.2 Installing PXE Everywhere Responder

Using the PXE Everywhere Responder installation wizard to check prerequisites, configure and install PXE Everywhere Responder. One or more PXE Everywhere Responders are required when network hardware or design prevents local DHCP traffic, for example when DHCP Snooping has been enabled. Please refer to Design Considerations: DHCP Snooping to determine if you need to

install Responders. Once you have decided you need them and have configured your network, please ensure you have reviewed all Requirements before installing.

The PXE Everywhere Responder installer is included in the PXE Everywhere zip file that can be downloaded from the Nomad area of the 1E Support Portal.

12.2.3.2.1 Running the PXE Everywhere Responder installer

Logon to the server using the PXE Everywhere Responder installation account and then use the following instructions:

12.2.3.2.1.1 Installing PXE Everywhere Responder with the wizard

The Responder is installed using the PXE Everywhere Responder installer: **PXEEverywhereResponder.msi**.

> **Note**
>
> Installing a PXE Everywhere Responder is a good choice whenever network hardware or design prevents local DHCP traffic, such as when DHCP snooping has been enabled.
>
> When deploying PXE Everywhere Agents for use with the PXE Everywhere Responder on a network you will need to configure them to use port 2067, which is the default used by the PXE Everywhere Responder, or a custom port if that has been set. Computers will also need an inbound firewall rule.

> **Note**
>
> The PXE Everywhere Responder and PXE Everywhere Agent cannot co-exist on the same computer and are not supported together. Whilst it is possible to install them together, they will not work and will have issues such as failure to bind to ports.
>
> To install a Responder on the same computer as 1E Client then you must disable the client module for PXE Everywhere Agent. For an existing installation of 1E Client, reconfigure the client by setting **Module.PXEEverywhere.Enabled=false**. When installing or upgrading 1E Client on a computer that has or will have a Responder, then you must add **MODULE.PXEEVERYWHERE.ENABLED=false** to the installer command line or edit the **mst** transform.

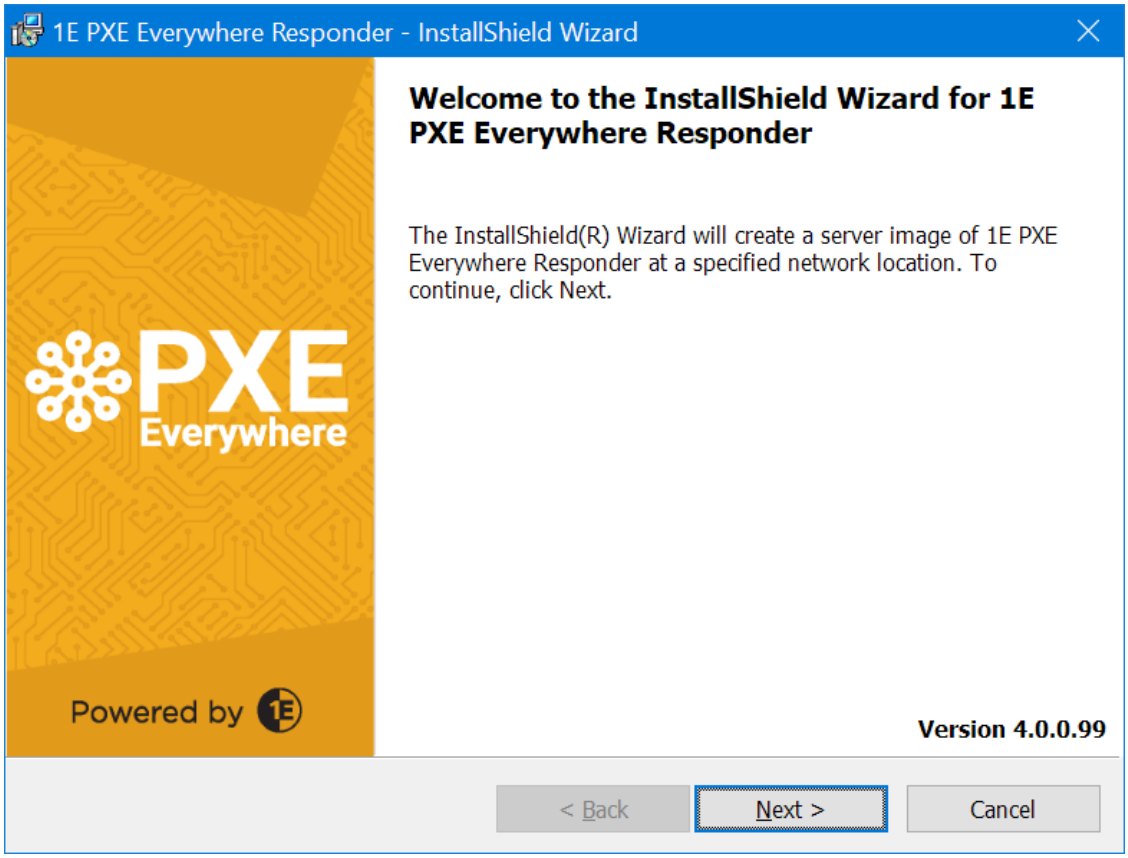
To install PXE Everywhere Responder, start a command prompt with elevated rights, using **Run as administrator**, change directory to the location where you downloaded **PXEEverywhereResponder.msi** and run the following suggested command-line:

```
msiexec /i PXEEverywhereResponder.msi /l*v PXEEverywhereResponder.log
```

12.2.3.2.1.1.1 Welcome to the InstallShield Wizard for 1E PXE Everywhere Responder

This screen provides the version number for PXE Everywhere Responder and outlines what the wizard will do.

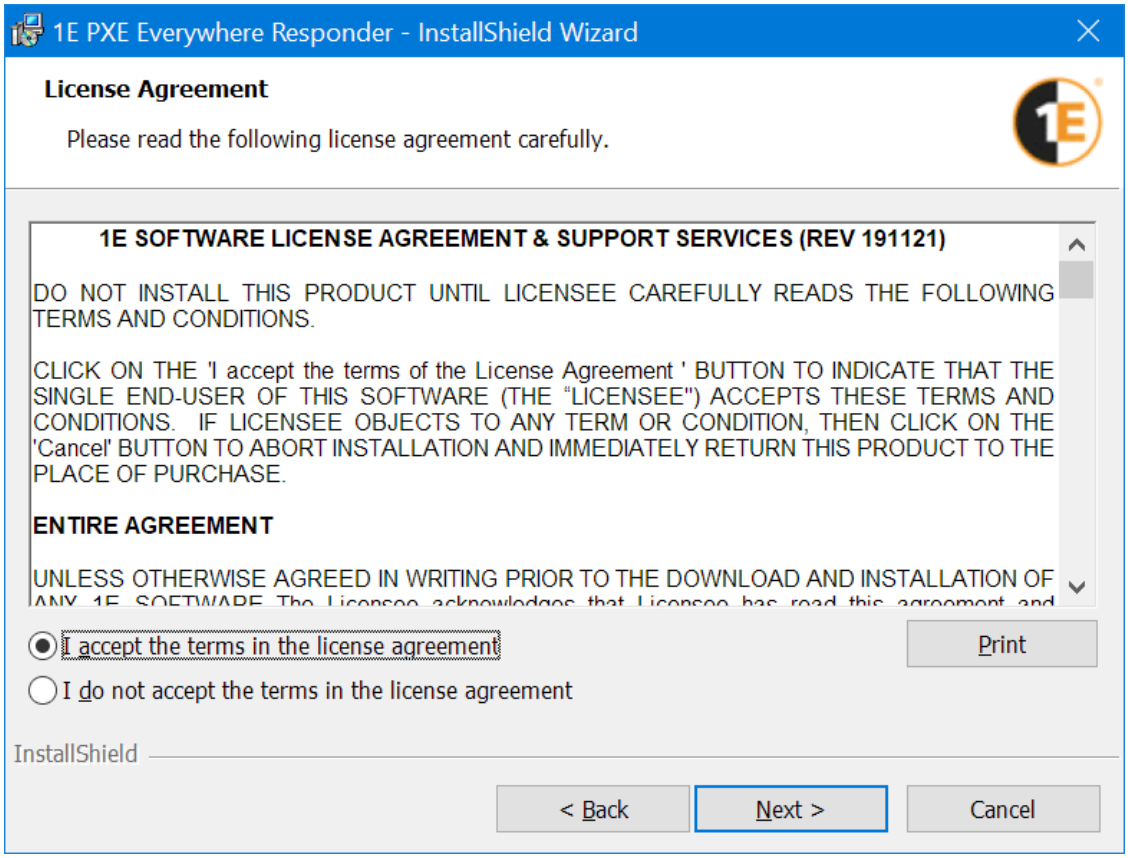
Click **Next** to go to the next screen.



12.2.3.2.1.1.2 License agreement

You must read and then accept this license information by checking the **I accept the terms in the license agreement** checkbox.

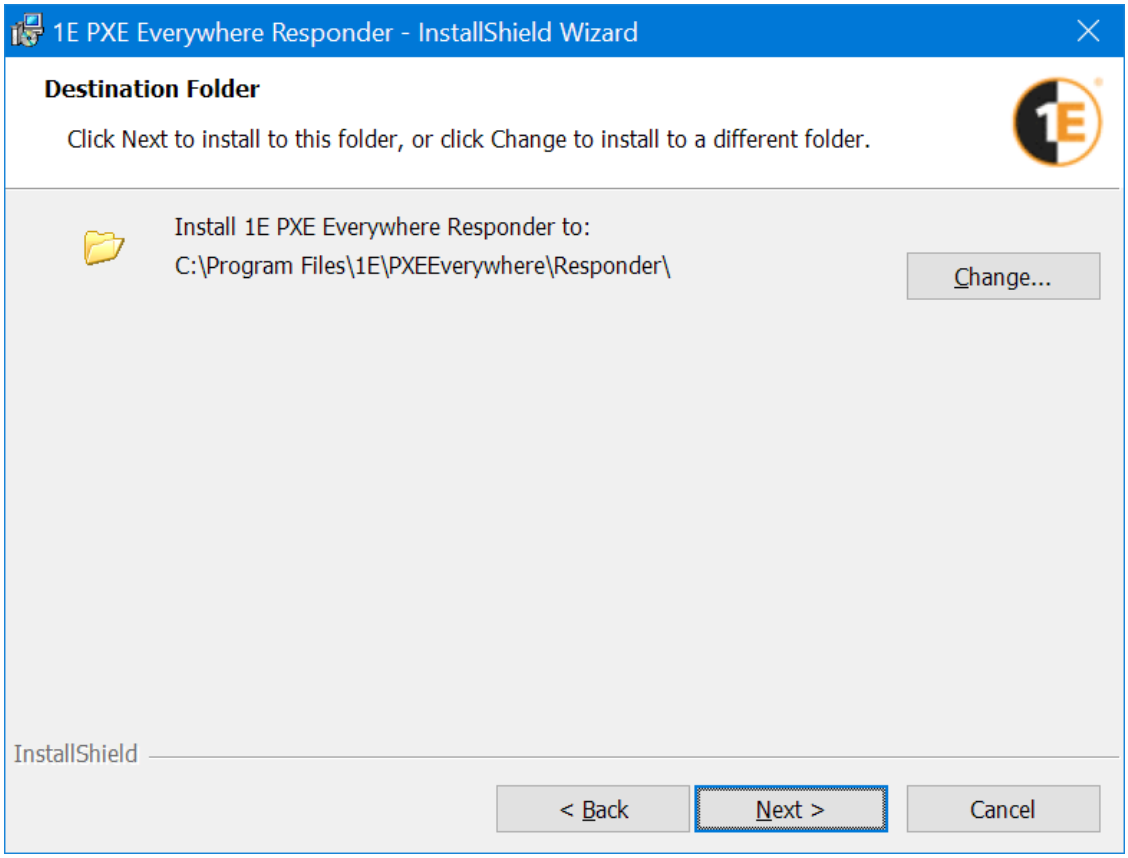
Click **Next** to go to the next screen.



12.2.3.2.1.1.3 Destination Folder

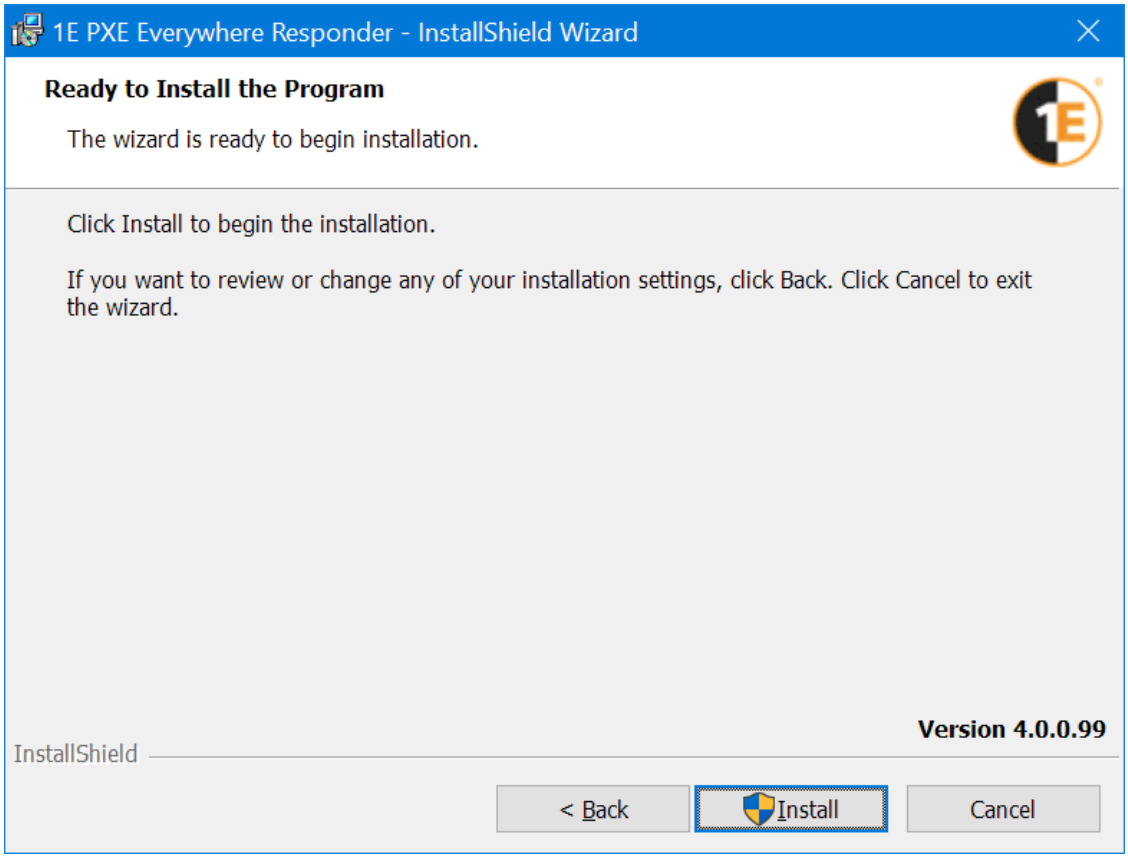
On this screen, you can set the destination folder for the installation. You can alter this from the default by clicking the **Change...** button and selecting a new folder.

Click **Next** to continue.



12.2.3.2.1.1.4 Ready to Install the Program

Click **Install** to start the PXE Everywhere Responder installation.

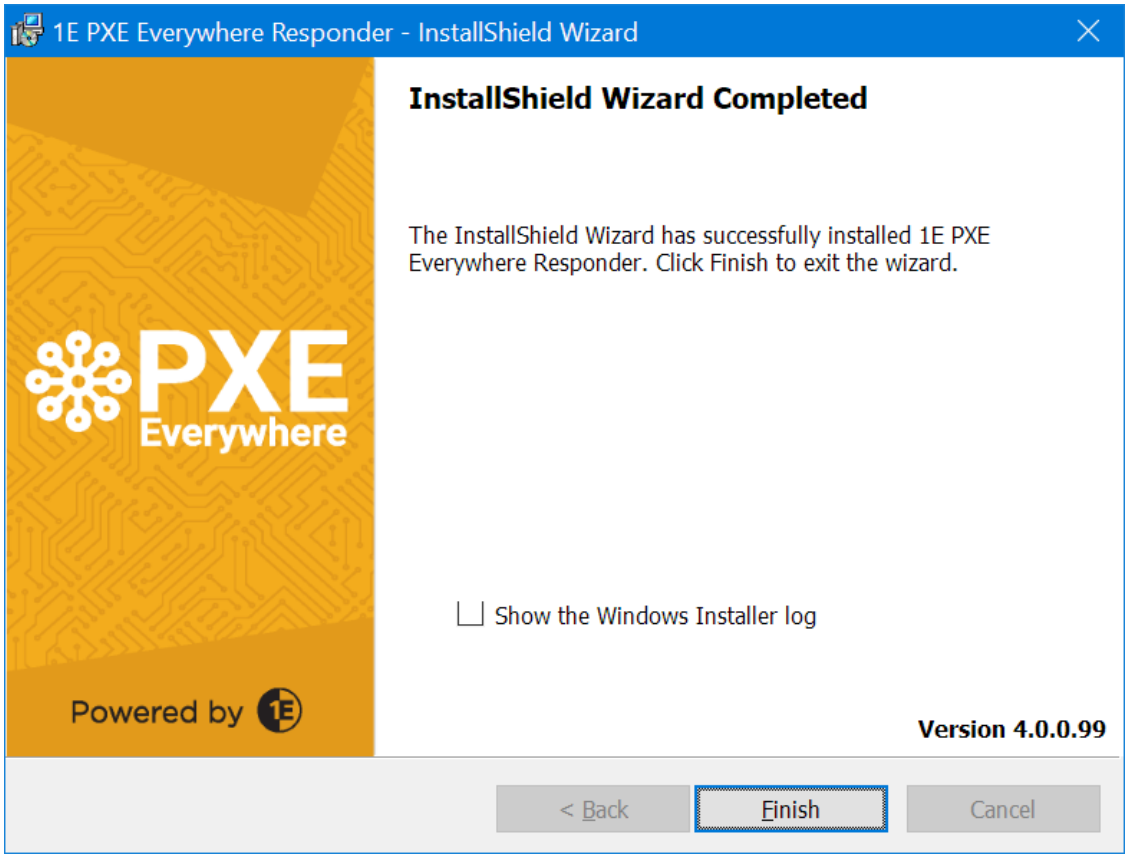


12.2.3.2.1.1.5 InstallShield Wizard Completed

This screen indicates whether the installation was a success or not. If any issues have been reported please refer to the troubleshooting section.

Here you can also optionally check to **Show the Windows Installer log**.

You can click **Finish** to close the installer.



12.2.3.2.1.2 Installing PXE Everywhere Responder without interaction

To install PXE Everywhere Responder without interaction, start a command prompt with elevated rights, using **Run as administrator** , change directory to the location where you downloaded **PXEEverywhereResponder.msi** and run the following suggested command-line:

```
msiexec /i PXEEverywhereResponder.msi /l*v PXEEverywhereResponder.log /qn
```

12.2.3.2.2 Next steps

To install the PXE Everywhere Central, please refer to Installing PXE Everywhere Central.

To install the PXE Everywhere Agents, please refer to Installing PXE Everywhere Agents .

Please refer to Verifying to verify your PXE Everywhere implementation.

12.2.3.3 Installing PXE Everywhere Agents

How to use the 1E Client Deployment Assistant (CDA) to create a Configuration Manager Applications to deploy PXE Everywhere Agents with Microsoft ADK files. Before you begin installation, please ensure you have reviewed Design Considerations and Requirements pages, and the installation steps below.

PXE Everywhere client provides a light-weight PXE server that responds to PXE boot requests from the local subnet and serves boot files to requesting PXE clients. It must therefore be installed on at least one client in

each subnet where PXE booting is required, and preferably installed on all PCs in your environment, thereby providing maximum availability (redundancy) and scalability (load-balancing) for PXE boot requests.

CDA is the recommended method of installing and upgrading PXE Everywhere Agent with Microsoft ADK files. The steps below are a summary of how you use CDA to deploy PXE Everywhere Agent with the Microsoft ADK files.

Please refer to Introducing 1E Client Deployment Assistant for full details of how to use CDA to deploy 1E Client with PXE Everywhere and optionally other 1E clients including Nomad, Shopping, WSA, Tachyon, WakeUp and NightWatchman. CDA is provided as a zip file that can be downloaded from the Nomad area of the 1E Support Portal.

If you are not using CDA, then you will need to:

Deploy the MSI separately and include PXE Everywhere Agent settings on the command-line or in an MST transform

Deploy ADK file as described in Deploying Microsoft ADK files.

Please ensure you have reviewed all Requirements before installing.

After you have deployed the Agent and ADK files, you will then need to prepare and deploy boot image(s) using Preparing and deploying 1E PXE Everywhere boot images.

12.2.3.3.1 Microsoft ADK files

In addition to the binaries supplied by 1E, PXE Everywhere Agent requires a number of files that are distributed and licensed with the Microsoft Windows Automated Deployment Kit (ADK). The required files are listed in the table opposite, along with the location on the PXE Everywhere Agent that they need to be installed to.

As these files are licensed by Microsoft, 1E are unable to include them in the installation media. However, you can use theIntroducing 1E Client Deployment Assistant to extract the required files from the ADK, create an installer transform and prepare an Application in Configuration Manager that will install the PXE Everywhere Agent with the appropriate settings and the additional Microsoft files.

The Windows Assessment and Deployment Kits (ADK) normally exist on the Configuration Manager CAS or Primary Site server, although they can be downloaded separately from the Microsoft website.

File	Destination Location (relative to TFTPROOT)
boot.sdi	*\boot.sdi*
abortpxe.com	*\boot\x86\abortpxe.com*
bootmgr.exe	*\boot\x86\bootmgr.exe*
pxeboot.com	*\boot\x86\pxeboot.com*
pxeboot.n12	*\boot\x86\pxeboot.n12*
bootmgfw.efi	*\boot\x86\bootmgfw.efi*

File	Destination Location (relative to TFTPROOT)
\boot\x64\bootmgfw.efi	
wgl4_boot.ttf (optional)	*\boot\fonts\wgl4_boot.ttf*

12.2.3.3.2 Installing PXE Everywhere Agents

The PXE Everywhere Agent is a client module in 1E Client, and is installed using the 1EClient installer (1EClient.msi).

> **Note**
>
> The PXE Everywhere Responder and PXE Everywhere Agent cannot co-exist on the same computer and are not supported together. Whilst it is possible to install them together, they will not work and will have issues such as failure to bind to ports.
>
> To install a Responder on the same computer as 1E Client then you must disable the client module for PXE Everywhere Agent. For an existing installation of 1E Client, reconfigure the client by setting **Module.PXEEverywhere.Enabled=false**. When installing or upgrading 1E Client on a computer that has or will have a Responder, then you must add **MODULE.PXEEVERYWHERE.ENABLED=false** to the installer command line or edit the **mst** transform.

12.2.3.3.2.1 Preparing a Configuration Manager Application for PXE Everywhere Agent using the 1E Client Deployment Assistant

The 1E Client Deployment Assistant (CDA) is used to create an Application in Configuration Manager that installs the PXE Everywhere agent with the appropriate settings and also adds the required Microsoft boot files from the Windows Automated Deployment Toolkit (ADK).

First download and extract the latest version of the1E Client Deployment Assistant (CDA) from the 1E Support Portal https://support.1e.com/.

Also check the 1E Support Portal to see if there are any Hotfixes for PXE Everywhere. Download the latest Accumulated Hotfix (Patch) and extract its MSP file to include in the CDA folder structure.

The following is a summary of steps described in PXE Everywhere settings but *only* for deploying PXE Everywhere Agent.

Right-click the extracted **1EClientDeploymentAssistant.exe** and select **Run as administrator**

On the **Welcome** screen click **Next**

On the **License Terms** screen accept the license and click **Next**

On the **ConfigMgr Connection** page

If you are running this on the CM site server select **Local ConfigMgr Site Server**

Otherwise, select **Remote ConfigMgr Site Server** and

Enter the site server name and username and password that should be used to connect to the CM site. In a multi-site hierarchy, enter the name of the CAS site server.

Click **Connect** to test the connection. Once connected, click **Next**

On the **General Settings** screen

Enter a UNC paths for Application Content Source and Package Content Source. The wizard will create a 1E\PXE Everywhere\4.0.x.x folder in these locations that will become the source for the CM Application Deployment Type.

Do not check the Distribute Content checkbox (we'll do that later). Click **Next**

On the **Agent Selection** screen, uncheck all products except **1E Client x.x** Click **Next**

On the **1E Client x.x** screen, uncheck **Create Package** and leave the remaining settings as is. Click **Next**

On the **Tachyon and the other client settings** screen, uncheck **Enable Tachyon** *and* all the other options. Click **Next**

On the **Nomad client settings** screen, uncheck **Enable Nomad** (which will disable all the other options). Click **Next**

On the **PXE Everywhere Settings** screen

Enter the location of the Windows ADK (the wizard needs to extract Microsoft files from the ADK and add them to the application source). If you are running the wizard on the CM site server, the ADK should be installed in C:\Program Files (x86)\Windows Kits\10\Assessment and Deployment Kit.

Modify the **PXE Everywhere Central web service URL**, replacing **pxe.contoso.com** with the FQDN of your PXE Everywhere Central web server

Check **Enable support for DHCP Snooping** *only* if you are also deploying PXE Everywhere Responders

Click **Next**

On the **Summary** screen, review the settings and click **Create**. The wizard will generate a transform MST file that includes all the custom properties and a CAB file that includes the files extracted from the ADK. It will then create a Collection, Application and Deployment in Configuration Manager.

When the wizard completes, click **Finish**

12.2.3.3.2.2 Verify Configuration Manager objects

Confirm that the application source files include the following, after which you can distribute to **Distribution Points**.

The 1E Client installer

An installer transform MST file

Files extracted from the Windows ADK.

In the Configuration Manager Admin Console, you should confirm that CDA has created:

An Application named **1E Client x.x**

A Collection named **1E Client x.x - Required**

Required Deployments for the 32-bit and 64-bit Deployment Types to the **1E Client x.x** Collection.

Please refer to Configuration Manager objects.

12.2.3.3.2.3 Deploying the 1E Client enabled PXE Everywhere Agent

You will need to distribute application source to Distribution Points.

Once distributed, simply add devices to the **1E Client x.x - Required** Collection in order to deploy the Agent to those devices.

12.2.3.3.3 Next steps

Please refer to Verifying to verify your PXE Everywhere implementation.

Prepare and deploy the boot image using Preparing and deploying the PXE Everywhere boot images.

12.2.3.4 Upgrading PXE Everywhere

Guidance for upgrading PXE Everywhere.

> **Note**
>
> The previous names **PXE Everywhere Local** and **PXELite** have been replaced by **PXE Everywhere Agent** which is a client module in **1E Client**. Please refer to Name changes introduced in PXE Everywhere 4.0 for full details including changes to log files.

Overview:

Review Requirements and read through the process below to understand what is involved.

Upgrade PXE Everywhere Central.

Upgrade or install PXE Everywhere Responders to support subnets where DHCP is blocked.

Deploy 1E Client with PXE Everywhere enabled.

Update Task Sequences.

> **Note**
>
> If you are implementing DHCP Snooping for the first time, at the same time as upgrading an existing implementation of PXE Everywhere, then:

please refer to guidance provided in Design Considerations - Infrastructure requirements regarding deployment of PXE Everywhere Responder(s) and configuring additional DHCP Relays (IP helpers)

on computers where 1E Client with PXE Everywhere module is installed, you must change the inbound firewall port from 67 to 2067 (or different custom port)

please refer to Known issues: Issues installing PXE Everywhere Responder regarding:

PXE Everywhere Agent and PXE Everywhere Responder are not supported on the same computer

Installing PXE Everywhere Responder on a legacy PXE Everywhere Agent that was previously installed with support for DHCP Snooping enabled - also see note below.

12.2.3.4.1 Upgrading to PXE Everywhere 8.1

The process for upgrading PXE Everywhere is:

On the PXE Everywhere Central server, perform any necessary pre-upgrade steps

Always make a backup of *web.config* file if any custom changes have been made to the default settings in it.

Ensure that any custom settings that have been modified in the PXELite Application pool are captured.

Create a backup of stored procedures deployed by the PXE Everywhere central installer if any custom changes are made to them.

Upgrade the PXE Everywhere Central components by following the steps described in Installing PXE Everywhere Central.

> **Note**
>
> Different versions of PXE Everywhere Central cannot co-exist on the same server.

Perform any necessary post-upgrade steps

Restore the backup of *web.config* file if any custom changes were made to the default settings prior to upgrade.

Perform modifications to any custom settings that were modified in the PXELite Application pool prior to upgrade.

Restore the backup of customized stored procedures that were created prior to upgrade.

> **Note**
>
> Some changes mentioned above require an IIS reset before they come into effect.

Verify the PXE Everywhere Central functionality by following the steps described in Verifying - PXE Everywhere Central.

If you are implementing in an environment that has DHCP blocked (for example using DCP Snooping), and you have existing Responders, they can be upgraded using the steps for Installing PXE Everywhere Responder.

> **Note**
>
> PXE Everywhere Responder v4.0 and later has its own installer, which can be used to upgrade the **Static Responders**. Previous versions of Responders (also known as Static Responders) are legacy PXE Everywhere Agents configured in Responder mode, with its DHCP Port fixed at 67.
>
> The PXE Everywhere Responder can also be used to upgrade a **normal Agent** to function as a new Responder. A known issue exists *if* the previous Agent had support for DHCP Snooping enabled. Then you will need to forcibly change its DHCP port back

to 67 by including DHCPPORT=67 as a command-line installer property when installing the Responder. You can optionally include this installer property when installing or upgrading other scenarios.

Upgrade all the PXE Everywhere Agents to the latest version by following the steps for Installing PXE Everywhere Agents.

Note

All Agents on a subnet must be upgraded together. Different versions of PXE Everywhere Agent cannot co-exist on the same subnet.

Warning

Introducing 1E Client Deployment Assistant is the recommended method of installing and upgrading PXE Everywhere Agent.

If you deployed the legacy PXE Everywhere Agent using a previous version of Client Deployment Assistant (CDA) then you should upgrade using the latest version of CDA. If you upgrade a CDA installation using the MSI, for example in a test lab, then the boot files (ADK files and boot image) will not be migrated to the new location used by the 1E Client's PXE Everywhere Agent, and you will need to deploy the ADK files and boot image as post-install tasks, as described in Deploying Microsoft ADK files.

Update any Task Sequences used to stage 1E PXE Everywhere boot images, with the new path for running **CreateBCD.exe**.

Note

Please refer to Preparing and deploying 1E PXE Everywhere boot images. The legacy PXE Everywhere Agent was only x86 therefore had different paths for x64 and x86 platforms. PXE Everywhere Agent in 1E Client has separate installers for x86 and x64, and only uses one path, and does not require any OS conditions. Existing Task Sequences will have two stage boot image steps:

Stage boot image (x64 systems)

Stage boot image (x86 systems)

Edit the Task Sequence (or a clone) as follows:

Delete one of the above steps, and edit the other remaining step

Change its name to **Stage boot image**

Change the command line as shown in the table below

Remove the existing conditions - click **Options** tab and **Remove All**

Click **OK** to save the Task Sequence

Platform	Legacy	New command-line
x64	"%ProgramFiles(x86)%\1E\PXE Lite\Server\x64\CreateBcd.exe"	"%ProgramFiles%\1E\Client\Extensibility\PXEEverywhere\CreateBcd.exe"
x86	"%ProgramFiles%\1E\PXE Lite\Server\i386\CreateBCD.exe"	

Deploy the updated/cloned Task Sequence to the 1E Client Collection as described in Preparing and deploying 1E PXE Everywhere boot images: Deploy the Task Sequence to stage a boot image.

You do not need to update boot images.

Update other OS Deployment Task Sequences to use the new 1E PXE Everywhere boot images.

12.2.3.4.2 Next steps

Please refer to Verifying to verify your PXE Everywhere implementation.

Prepare and deploy the boot image using Preparing and deploying 1E PXE Everywhere boot images.

12.2.3.4.3 Name changes introduced in PXE Everywhere 4.0

	PXE Everywhere Central	PXE Everywhere Responder	PXE Everywhere Agent			
MSI Name	PXELiteCentral.msi	PXE EverywhereCentral.msi	PXELiteLocal.msi	PXEEverywhereResponder.msi	PXELiteLocal.msi	1EClient.msi

	PXE Everywhere Central	PXE Everywhere Responder	PXE Everywhere Agent			
Program Files folder	1E\PXE Lite	1E\PXE Everywhere	1E\PXE Lite\Server	1E\PXEEverywhere\Responder	1E\PXE Lite\Server	1E\Client\Extensibility\PXEEverywhere
ProgramData Folder	1E\PXELite	1E\PXEEverywhere	1E\PXELite	1E\PXEEverywhere	1E\PXELite	1E\PXEEverywhere
Log File Name	WebService.log	WebService.log	PXELiteServer.log	PXEEverywhereResponder.log	PXELiteServer.log	PXEEverywhere.log
HKLM\SOFTWARE Registry	1E\PXELiteCentral	1E\PXELiteCentral	1E\PXELiteServer	1E\PXELiteServer	1E\PXELiteServer	1E\PXEEverywhere
Service Display name	n/a	n/a	1E PXE Lite Server	1E PXE Everywhere Responder	1E PXE Lite Server	1E Client
Service name	n/a	n/a	PXELite Server	PXEEverywhereResponder	PXELite Server	1EClient

12.2.4 Verifying

Basic verification tests for PXE Everywhere.

12.2.4.1 Log files

PXE Everywhere component	Folder	Log file
1E Client	C:\ProgramData\1E\Client	1E.Client.log
PXE Everywhere Central	C:\ProgramData\1E\PXELite	WebService.log

PXE Everywhere component	Folder	Log file
PXE Everywhere Responder	C:\ProgramData\1E\PXEEverywhere	PXEEverywhereResponder.log
PXE Everywhere Agent	C:\ProgramData\1E\PXEEverywhere	PXEEverywhere.log

Please also refer to Upgrading PXE Everywhere: Name changes introduced in PXE Everywhere 4.0.

If the issue is related to PXELite boot media creation/updating using CreateBootImage.exe then please provide:

C:\Program Files (x86)\Microsoft Configuration Manager\AdminConsole\AdminUILog\CreateTsMedia.log

If the issue is related to the deployment of PXELite boot image into the TFTP folder of PXELite agent then please provide:

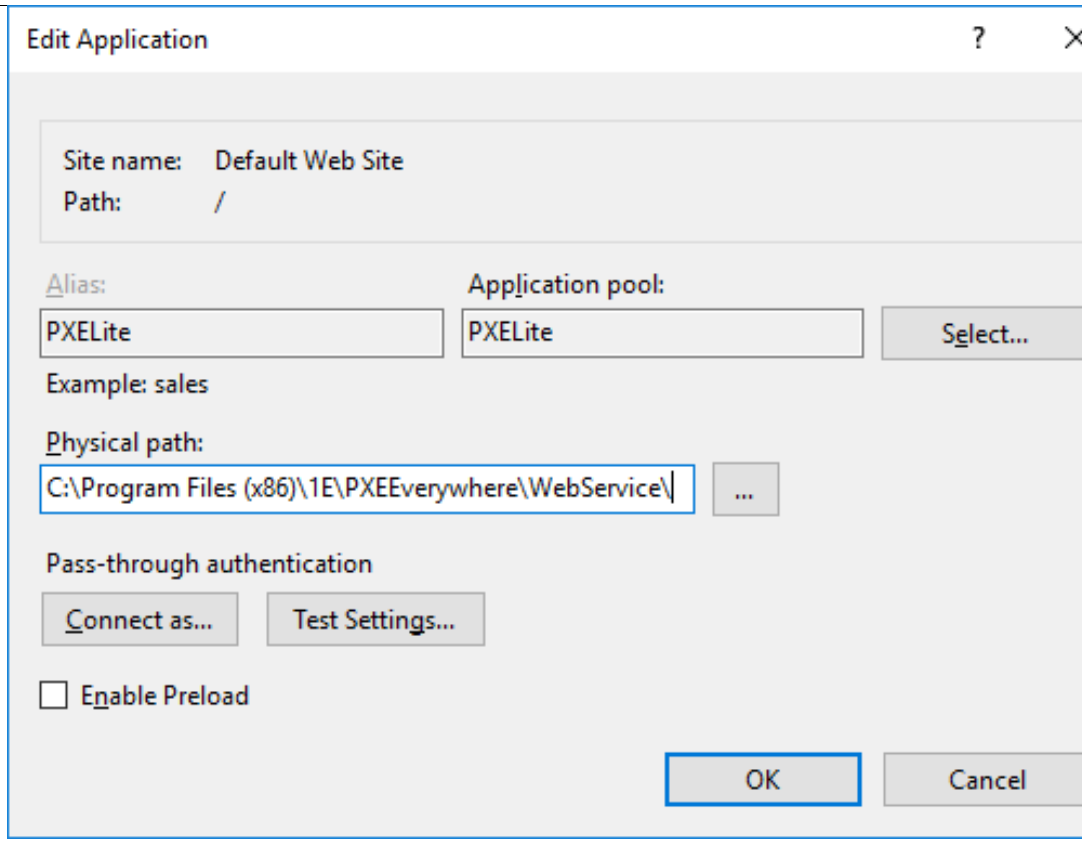
C:\ProgramData\1E\PXElite\CreateBCD.log

12.2.4.2 PXE Everywhere Central

If you get unexpected errors when using PXE Everywhere the following simple checks can be performed to confirm that the installation has been successful and that the appropriate permissions are present for the network service account:

Checks	Notes
PXE Everywhere installation directory	PXE Everywhere Central is a 32-bit application, and is only supported on the 64-bit server OS listed in Requirements. By default will install its files to the following location on 64-bit systems: `C:\Program Files (x86)\1E\PXEEverywhere`
Web Application and Application pool	Under **Default Web Site**, check that there is a web application named **PXELite**. Its physical path is the PXE Everywhere ***WebService*** directory in the PXE Everywhere installation directory. Its application pool is also called **PXELite** and uses the *NetworkService* identity.

Checks	Notes



Web service

You can use the PXE Everywhere configuration web service to check for correct installation. To do this run the following steps on the server where the PXE Everywhere website is installed:

Browse to *http://localhost/PXELite/PXELiteConfiguration.asmx*. You should see a **PXE Everywhere configuration** web page.

Click **GetVersion** and select **Invoke**. You should see a new browser window with the result of the version query listed - note the version number and reference this when contacting 1E support.

Checks	Notes

	The above test can also be performed using the following PowerShell commands:
	`$pxecentral = "localhost";`
	`$pxeLite = New-WebServiceProxy -uri "http://$pxecentral/pxelite/PXELiteConfiguration.asmx?wsdl";`
	`$pxeLite.GetVersion();`

web.config	The *web.config* file is located in the following directory: `C:\Program Files (x86)\1E\PXEEverywhere\WebService` The *web.config* file *<connectionStrings>* section specifies the location of the Configuration Manager database. Ensure that this is correctly set.
Log file	The *web.config* file stores information about the location of the log file, which is typically: `C:\ProgramData\1E\PXEEverywhere\WebService.log` Review the log file for errors.
Configuration Manager Database	During the installation of PXE Central, the following stored procedures are added to the Configuration Manager database: **1E_GetPXEAction** **1E_ProcessNBSMessage** To allow these stored procedures to be executed by the PXE Lite Application Pool running on the PXE Central Server, the installer also creates a new SQL login as a user of the Configuration Manager database. The name of the SQL login depends on where PXE Everywhere Central is installed in relation to the Configuration Manager database.

Checks	Notes
	NT AUTHORITY\NETWORK SERVICE- if PXE Everywhere Central is installed on the same sever as the Configuration Manager database **<DOMAIN>\<SERVER$>**- if installed on a different server, then DOMAIN\SERVER$ is the name of the server on which PXE Everywhere Central is installed This SQL Login is not assigned any roles on the ConfigMgr database, but is explicitly granted the following privileges on the 1E stored procedures and other objects in the database:

Type	Name	Permission(s)
Stored Procedure	**dbo.1E_GetPXEAction**	Execute
Stored Procedure	**dbo.1E_ProcessNBSMessage**	Execute
Stored Procedure	dbo.spProcessNBSMessage	Execute
Table	dbo.SetupInfo	Select
Table	dbo.UnknownSystem_DISC	Select

Note

When a PXE Everywhere Agent receives a PXE boot request from a peer, it will contact the PXE Everywhere Central web service, which in turn will execute the 1E_GetPXEAction stored procedure in the ConfigMgr database to determine if a Task Sequence has been advertised to the PXE-booting client, returning the results to the PXELite Local computer.

1E_GetPXEAction is responsible for returning the ConfigMgr OfferID (AdvertID, DeploymentID), BootImageID and whether the offer is mandatory or not. 1E_ProcessNBSMessage is used to set the PXE flag for required deployments. This is so that if PXE is the first in the boot order, it will not go into a perpetual PXE reboot loop.

PXE Everywhere Boot Action	The following test confirms the connection between PXE Everywhere Central and Configuration Manager. First, you need to confirm the test workstation is a known client in ConfigMgr and read its properties to get its MAC Address.

Checks	Notes

	Run the following PowerShell command using the workstation MAC Address, toreport whether it is targeted by a Task Sequence.
	
	Specify the IPv4 MAC Address in the format "A1-B2-C3-D4-E5-F6". If you are running the test on the PXE Everywhere Central server, then specify the server name as *localhost*, otherwise specify the FQDN of the server or its DNS Alias.
	
	`$macAddress = "<macaddress>"`
	`$pxecentral = "<PXE_Everywhere_Central_Servername_or_Alias>";`
	`$pxeLite = New-WebServiceProxy -uri "http://$pxecentral/pxelite/PXELiteConfiguration.asmx?wsdl";`
	`$pxeLite.GetBootAction("","$macAddress",[ref]$false)`
	
	If the workstation is not targeted, then a blank is returned.
	
	If the workstation is targeted, then the ConfigMgr package ID is returned for the boot image associated with the task sequence.

12.2.4.3 PXE Everywhere Agents

Ensure that PXE Everywhere Central is operational, and any Responders if you are using them.

Verify the PXE Everywhere Agent functionality:

Check the PXE Everywhere Agent logs, typically at *%PROGRAMDATA%\1E\PXEEverywhere*, and make sure there are no errors.

PXE boot a few test machines to ensure that PXE Everywhere is working properly.

Verify that boot files (Microsoft ADK files and 1E PXE Everywhere boot images) have been correctly deployed to PXE Everywhere Agents.

File	Destination Location (relative to TFTPROOT)
boot.sdi	*\boot.sdi*
abortpxe.com	*\boot\x86\abortpxe.com*
bootmgr.exe	*\boot\x86\bootmgr.exe*
pxeboot.com	*\boot\x86\pxeboot.com*
pxeboot.n12	*\boot\x86\pxeboot.n12*
bootmgfw.efi	*\boot\x86\bootmgfw.efi*

File	Destination Location (relative to TFTPROOT)
\boot\x64\bootmgfw.efi	
wgl4_boot.ttf (optional)	*\boot\fonts\wgl4_boot.ttf*

The 1E PXE Everywhere boot images should be found in an \Images folder relative to TFTPROOT.

Finally, target a PXE Client with an OS deployment task sequence (for example bare-metal), and observe the OS installation process end-to-end.

> **Note**
>
> When PXE booting a UEFI device in a non-mandatory deployment scenario, you may be presented with an option to
> **Press Enter to continue and Press F8 for Advanced boot menu**. However, the advanced boot menu options will not work for WinPE.

12.3 Using PXE Everywhere

How to administer and maintain the PXE Everywhere system. PXE Everywhere provides the ability to network boot PCs from peer PCs instead of Configuration Manager PXE Service Points (a Configuration Manager PXE Service Point is a Distribution Point with the PXE role enabled). Using PXE Everywhere removes the overhead of supporting dedicated PXE servers on branch networks.

12.3.1 Preparing and deploying 1E PXE Everywhere boot images

Steps for creating and staging 1E PXE Everywhere boot images.

All PXE Everywhere Agents require a x64 boot image at least, and another for x86 if you are also serving x86 platforms. These 1E boot images will be referenced in your OS Deployment Task Sequences, and are based on Configuration Manager boot images.

The following example process is for x64 but also applies to x86. Each boot image requires its own Task Sequence to stage it on *all* PXE Everywhere Agents. While 1E Client with PXE Everywhere Agent enabled has installers for x64 and x86, both platforms must be staged with both boot images, to serve both types of PXE client platform. You would only ignore x86 if you are sure you are not serving x86 platforms.

There are two main steps to configure a 1E PXE Everywhere boot image:

Creating the 1E PXE Everywhere boot images

Stage a 1E PXE Everywhere boot image.

12.3.1.1 Prerequisites

A computer with the **Configuration Manager console** and the **PXE Everywhere Admin Tools** installed.

Configuration Manager requires its Windows PE boot images to present a client authentication certificate. Configuration Manager automatically adds the certificate when deploying images to native Configuration

Manager PXE servers, but you need to manually add the certificate to each 1E PXE Everywhere boot image before deployment to PXE Everywhere Agents.

1E tool	Where to find it	What it does
UpdateBootImage	Included in the PXE Everywhere Admin Tools. The PXE Everywhere Admin tools can be installed using the PXE Everywhere Central installer, on any computer that has the Configuration Manager Admin Console. Please refer to Installing PXE Everywhere Central. The PXE Everywhere Central installer is provided in the **PXE Everywhere downlo ad zip** available from the Nomad download area of the 1E Support Portal.	This tool is used to update Windows PE boot images for use with PXE Everywhere. It uses the native Configuration Manager API to add a certificate, and update the **variables.dat** file included in the image. When the PXE client loads the boot image, the Configuration Manager executables load the encrypted variables file and attempt to connect to the specified Management Point.The tool takes advantage of a boot image reload feature introduced in Configuration Manager 1706 CB, which enables you reload the latest version of Windows PE (from the Windows ADK installation directory) into the boot image when you run the **Update Distribution Points** wizard. **Note** Whenever you reload the boot image while running the **Update Distribution Points** wizard, for example to replace a certificate that is about to expire, you must then re-run **UpdateBootImage.exe** to ensure the 1E components and settings are installed in the reloaded boot image. **Note** To include a client certificate, it must be provided as a PFX file in a Public Key Certificate Standard (PKCS #12) format, with private key exportable, and a known password. For details of CM certificates please refer to **Boot images for deploying operatin g systems** in PKI certificate requirements for System Center Configuration Manager

1E tool	Where to find it	What it does
		(https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/network/pki-certificate-requirements.
UpdateBootImage GUI	Included in the **PXE Everywhere download zip** with the installers for PXE Everywhere Central and Responder. **Note** Use v1.0.0.6 with PXE Everywhere 4.0	This tool provides a GUI where a user defines the parameters required by the **UpdateBootImage** tool. When executed it copies a command-line to the clipboard, which you then copy into an elevated command prompt and execute it. The tool is provided to reduce the chance of errors when typing in the long command-line required by the UpdateBootImage tool. The executable name is **1E.PS.UpdateBootImageGUI.exe** and requires .NET Framework 4.5 or later.
CreateBCD	Included in the installation of **1E Client** with PXE Everywhere enabled.	This tool is run by a **Stage boot image** Task Sequence on PXE Everywhere Agents to copy the 1E PXE Everywhere boot image referenced by the Task Sequence to the Images folder in the Agent's TFTPTOOT, configure a suitable TFTP Block Size, and create a boot configuration database on the Agent. CreateBCD only works within the context of a Configuration Manager task sequence. It will run outside a Task Sequence but have no effect. **Warning** **CreateBCD** does not validate the boot image - it will not detect a corrupt .wim file.

For full details of available command-line parameters for **UpdateBootImage.exe**, and **CreateBCD.exe** please refer to PXE Everywhere tools.

12.3.1.2 Creating the 1E PXE Everywhere boot images

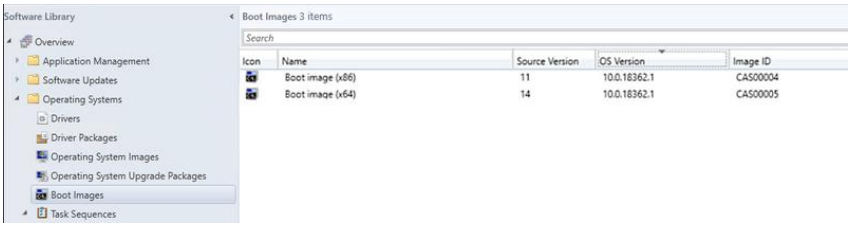
The 1E PXE Everywhere boot image is copied from an existing Configuration Manager boot image, and then modified using **UpdateBootImage** to add the required certificate, and configure other settings.

> **Note**
>
> In most environments only a x64 boot image will be required. If you are managing x86 devices you will also need to prepare a PXE Everywhere boot image for x86, by repeating all the steps for x86.

12.3.1.2.1 Copy an existing boot image

Use the following process to copy your existing production boot image ready for modification.

On the Configuration Manager site server, open the Configuration Manager Admin Console and from the **Software Library** workspace expand **Operating Systems > Boot Images**.



Right-click the current **Boot image (x64)** and select **Properties**, then select the **Data Source** tab to identify the location of the current boot image.

Open that location in Windows explorer and copy the boot.wim file to a folder in a shared location accessible to the CM site server (the location must be accessible using a UNC path and the folder should only contain the boot.wim file). If you have a content source share already created on the site server, that would be an ideal location to create the new folder and copy the boot.wim to.

> **Note**
>
> PXE Everywhere requires that the boot image is called **boot.wim** so you should ensure that your copy has this name.

In the Configuration Manager console, right-click the **Boot Images** node and select **Add Boot Image**.

In the **Add Boot Image Wizard** on the **Data Source** screen enter the UNC path to the copied boot image and click **Next**.

On the **General** screen, add the **Name** - for example **1E PXE Everywhere boot image (x64) -** version and any relevant comments you want to include and click **Next**.

On the **Nomad Settings** screen (if Nomad Branch Admin UI Extensions have been installed), select **Enable Nomad** and click **Next**.

Click **Next** on the following screens to complete the wizard.

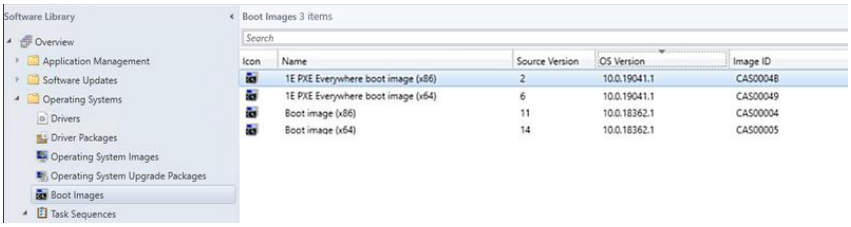
Right-click the new boot image and select **Properties**.

Select the **Drivers** tab and add any required network or storage drivers required to support your production systems, then click **OK**.

Right-click the new boot image and select **Distribute Content** to start the **Distribute Content Wizard**. Add the boot image to a local Distribution Point.

> **Note**
>
> This step is required before you can update the boot image with a certificate.

If you are serving x86 platforms, repeat the above steps to create boot image **1E PXE Everywhere boot image (x86)**.



> **Note**
>
> To inject a certificate into each boot image proceed with the steps under the heading Update a 1E PXE Everywhere boot image.
>
> Later you will create a deployment to Stage a 1E PXE Everywhere boot image on the PXE Everywhere Agents, so they can serve the PXE clients on their local subnets.

12.3.1.2.2 Update a 1E PXE Everywhere boot image

These update steps must be done on a computer that has the **Configuration Manager console** and the **PXE Everywhere Admin Tools** installed. The command-line uses **UpdateBootImage.exe** (installed with the **PXE Everywhere Central Admin Tools**) to mount the boot image, inject the client authentication certificate and unmount the boot image.

You will also need the certificate used for boot images, provided as a PFX file, and its password.

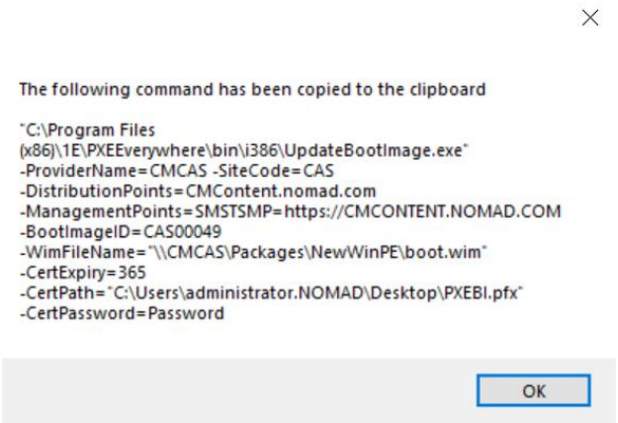
Extract the **UpdateBootImageGUI** tool and its supporting files from the download ZIP.

Open a command prompt (Run as Administrator), change the current directory to the ZIP extract folder, and run1E.PS.UpdateBootImageGUI.exe

Field	Details
SMSProvider Server	Enter the FQDN of the Configuration Manager Provider and hit the **Tab** key. Note that the **Site Code** field will now be populated with the site code.
Boot Image ID	Using the drop-down, select 1E PXE Everywhere boot image (x64) created earlier. Note the **WMI File Path\Name** field is automatically populated with the path to the **boot.wim** file.

Field	Details
Distribution Points	Select one of the Distribution Points that the boot image was previously added to.
Management Points	Select an available Management Point.
Certificate Expiry	Select an expiry date. This defaults to one year from today. This may be changed as required in a production environment. **Note** When the certificate is about to expire, this process will need to be repeated using a new certificate, and the updated boot images staged to all PXE Everywhere Agents.
PXEBoot Password	You can optionally set a boot password that would need to be entered by the user on the PXE client in order to load the Windows PE boot image and start any OS Deployment Task Sequence
Certificate Path	Enter the path to the PFX file that you exported earlier. This optional field is mandatory for injecting the certificate into the boot image.
Certificate Password	Enter the password for the specified PFX file. This optional field is mandatory!

Click the **Execute** button. The tool will display a dialog box similar to the following, indicating that the constructed **UpdateBootImage.exe** command line has been copied to the clipboard.



Start a command prompt (run as administrator)

paste the command line from the clipboard and execute

the process should complete within a couple of minutes and finish with **CreateBootMedia returns OK**.

Close the **UpdateBootImageGUI** program.

Return to the Configuration Manager console, right-click the new boot image and select **Update Distribution Points**. This will cause the boot image to be 'regenerated' and copied to the Distribution Point(s) that it was originally copied to.

If you are serving x86 platforms, repeat the above steps to update boot image **1E PXE Everywhere boot image (x86)**.

The 1E PXE Everywhere boot images are now ready to use in Task Sequences.

12.3.1.3 Stage a 1E PXE Everywhere boot image

Each PXE Everywhere boot image needs to be distributed to the PXE Everywhere Agents before they can be served to PXE clients. This is done using a custom Task Sequence that downloads the boot images then stages them in the TFTP folder structure from where the PXE client will download the relevant x64 or x86 boot image. Staging the boot images in the TFTP folder structure is done using **CreateBCD.exe**, which is installed on all PXE Everywhere Agents. CreateBCD.exe copies the deployed PXE Boot Image to the PXE Everywhere TFTP\Images folder and creates a boot configuration database (BCD file).

12.3.1.3.1 Create a Task Sequence to stage a 1E PXE Everywhere boot image

To distribute the boot image(s) to the correct locations on PXE Everywhere Agent computers, create a custom task sequence that will be deployed to the computers.

In the Configuration Manager console, from the **Software Library** work space, expand **Operating Systems**, right-click **Task Sequences** and from the context menu, choose **Create Task Sequence**.

On the first page of the **Create Task Sequence Wizard**, select **Create a new custom task sequence** and click **Next**.

> **Tip**
>
> **Nomad Settings** is only displayed when **Nomad Admin Console Extensions** is already installed on the Configuration Manager administration console computer you are using. If this is not present, then close the Configuration Manager Admin Console and install the Nomad Admin Console Extensions, and then create/edit the Task Sequence.
>
> If Nomad is installed on the Agent computers on which you'll be staging the boot image, then you should use Nomad to stage the boot images.

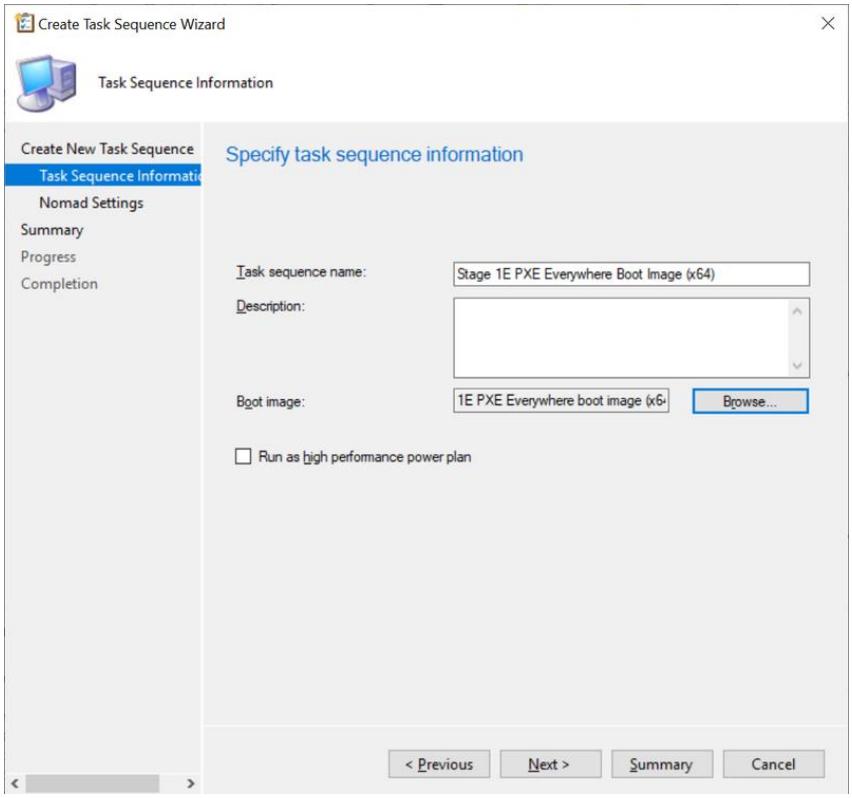
On the **Task Sequence Information** page, enter a suitable name for the Task Sequence, for example:

Stage 1E PXE Everywhere boot image (x64)

Stage 1E PXE Everywhere boot image (x86) - if you are serving x86 platforms

Click the **Browse** button and choose the boot image which you created earlier.

Click **Next**.

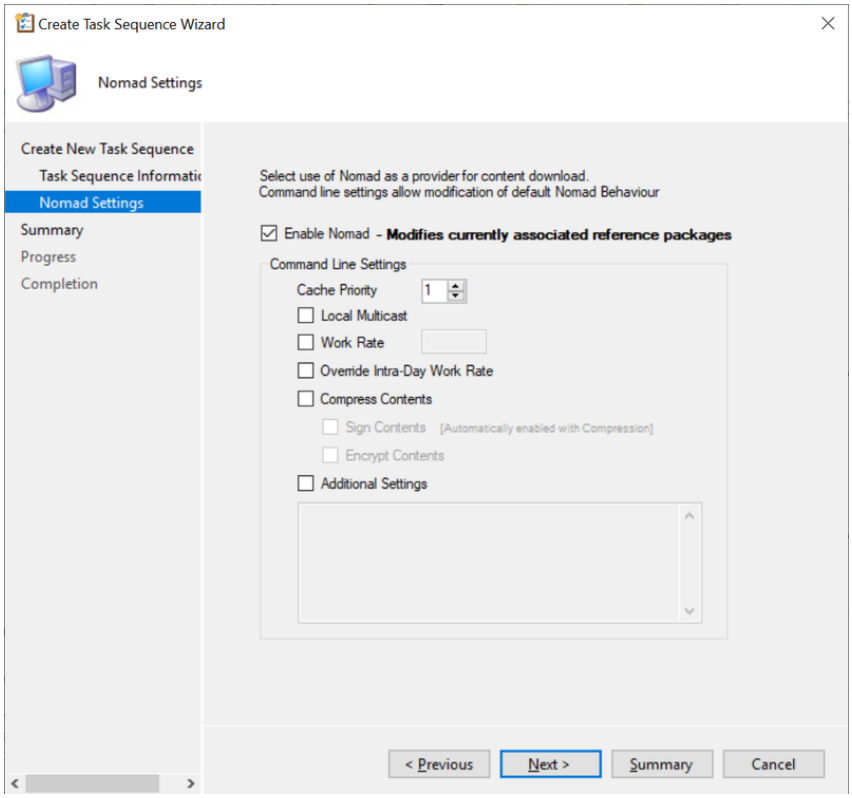


On the **Nomad Settings** page, select **Enable Nomad**.

> You may want to increase the **Cache Priority** from the default 1 to ensure the boot image remains in the cache if the cache is cleared to make space for other content.

Click **Next**.

> **Tip**
>
> Skip this step if you are not using Nomad.



On the **Summary** page click **Next**.

On the **Completion** page click **Close**.

Right-click the Task Sequence and select **Edit** to add tasks to the Task Sequence.

Add a task step to run **CreateBCD.exe** as follows.

From the Task Sequence editor, add a **Run Command Line** option with the following properties.

Property	Value
Name	Stage boot image
Command line	"%ProgramFiles%\1E\Client\Extensibility\PXEEverywhere\CreateBcd.exe" -tftpblocksize=8192

Tip

This command-line will work on x64 and x86 platforms, therefore you do not need to configure conditions.

If you are upgrading PXE Everywhere, you must remove the existing conditions - click **Options** tab and **Remove All**.

Legacy versions of PXE Everywhere Agent were x86 only, and required different command-lines for Agents on x64 and x86 platforms.

TFTP Block Size

Some hardware may not support block size values higher than 16384 bytes and hence may fail to PXE boot. We recommend you use a TFTP block size of 8192 bytes for best results.

An known issue has been observed on some Cisco switches when DHCP Snooping is enabled and a block size greater than 1471 is used. The issue is referenced in the following two Cisco bug reports. If you are affected by this Cisco issue, change the tftpBlockSize to 1471 or lower.

https://quickview.cloudapps.cisco.com/quickview/bug/CSCvk53444.

https://quickview.cloudapps.cisco.com/quickview/bug/CSCtw63707

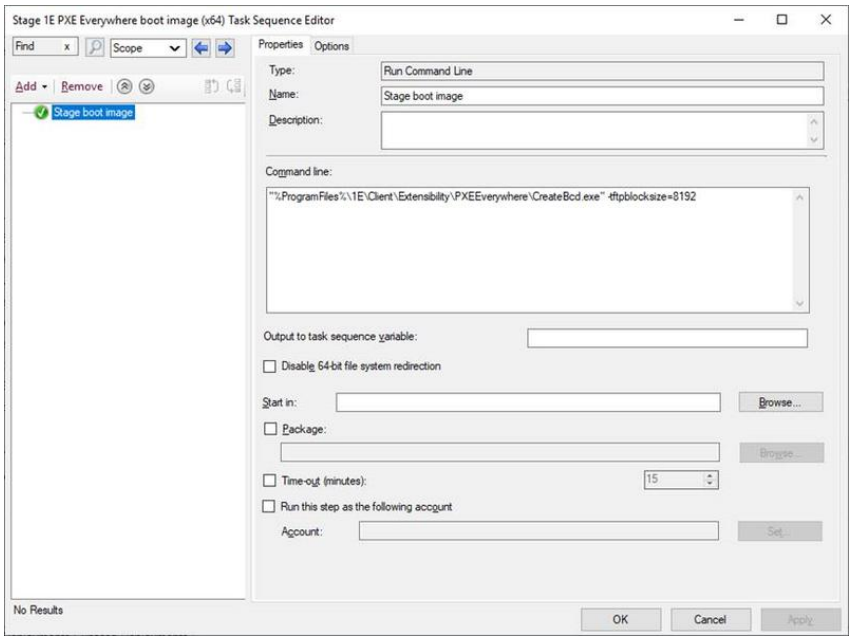
The issue may also be present in TP-Link switches.

The actual block size used for the tftp protocol is the lesser value of the **tftpBlockSize** and the **MaxBlockSize** registry values. Effectively, **MaxBlockSize** limits the **tftpBlockSize** specified in the **CreateBCD.exe** utility.

There is only one command-line switch for **CreateBCD.exe** which is used to set the **tftpBlockSize** for the RAMDisk (boot image). The notation for this is *`CreateBCD.exe -tftpBlocksize=blocksize`* where blocksize is measured in bytes.

Click **OK** to save the Task Sequence. The Task Sequence should now look like the picture opposite.

If you are serving x86 platforms, repeat the above steps to create Task Sequence **Stage 1E PXE Everywhere boot image (x86)**.



12.3.1.3.2 Deploy the Task Sequence to stage a boot image

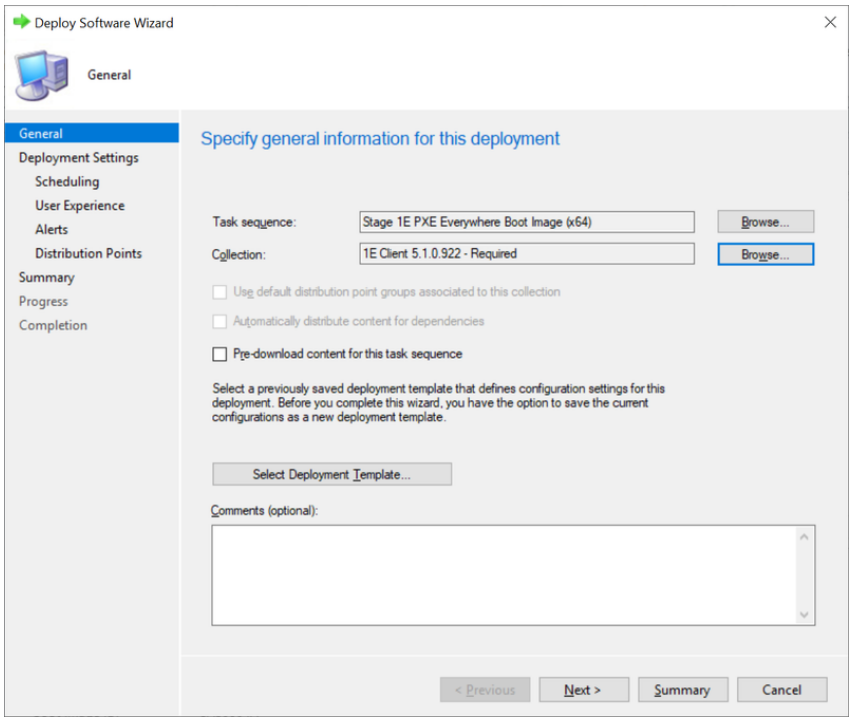
Each Staging Task Sequence must be deployed to all PXE Everywhere Agents. You will need to create a target Collection that includes all systems that have the 1E Client with PXE Everywhere enabled. You can use the same Collection that you used to deploy the 1E Client, such as the one

created by 1E Client Deployment Assistant (CDA). Or you can create a new Collection limited on the 1E Client Collection, or a query-based Collection.

From the Configuration Manager console, right-click the boot image staging Task Sequence and select **Deploy** to start the **Deploy Software Wizard**.

Browse for the target Collection - devices that already have 1E Client with PXE Everywhere enabled.

Click **Next**.

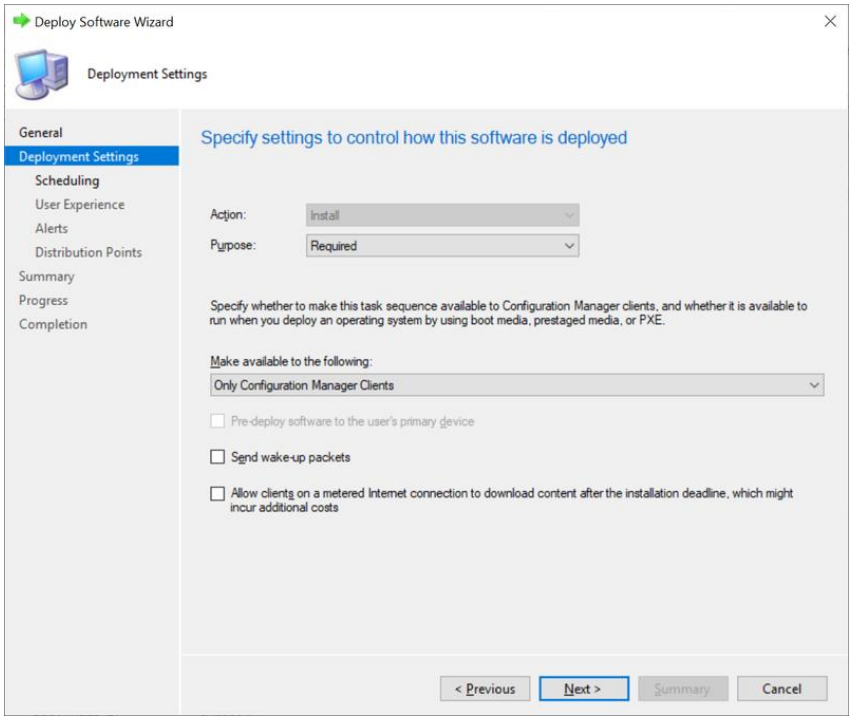


On the **Deployment Settings** page, change the purpose to **Required** and click **Next**.

On the **Scheduling** page, configure the assignment schedule according to your requirements and click **Next**.

On the **User Experience** page, uncheck **Show Task Sequence progress** and click **Next**.

On the **Alerts** page, click **Next**.



On the **Distribution Points** page under **Deployment options**, change the option to **Download all content locally before starting task sequence** is selected.

> This ensures that Nomad will download the PXE Everywhere boot image associated with the Task Sequence before executing the command lines to stage it in the TFTP folder.

Check the options:

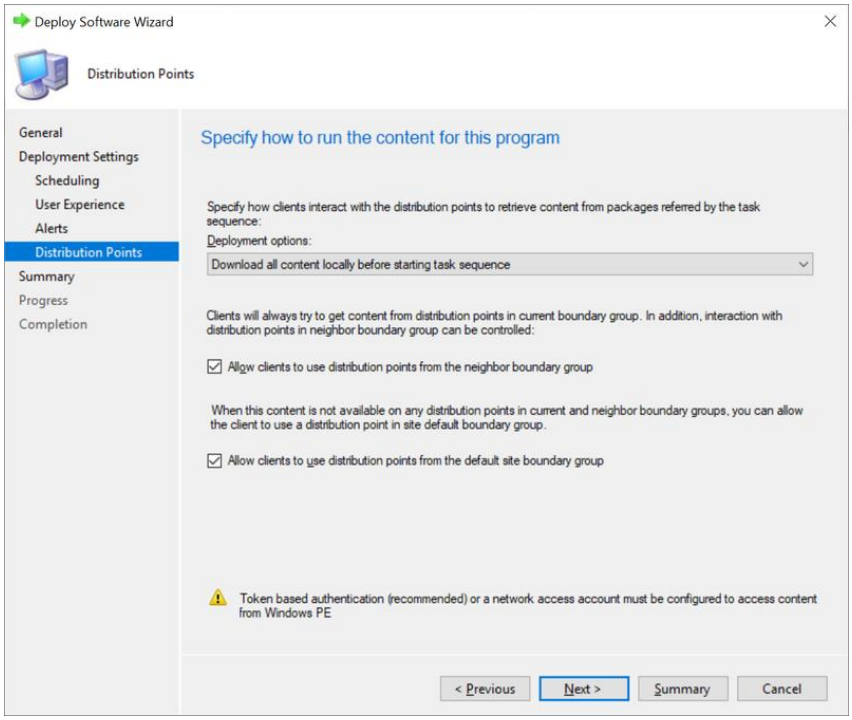
Allow clients to use distribution points from the neighbor boundary group

Allow clients to use distribution points from the default site boundary group

Click **Next**.

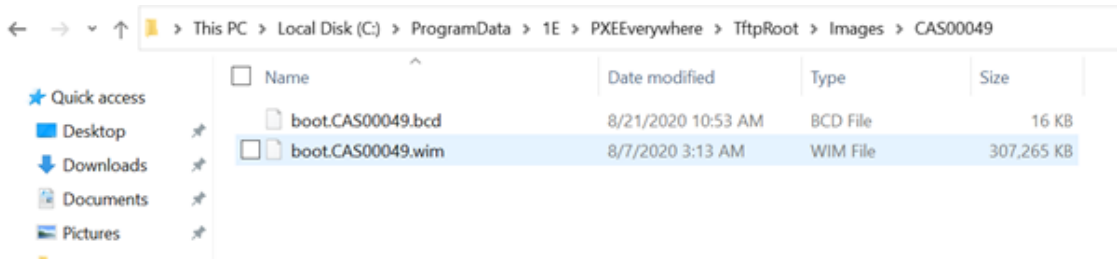
On the **Summary** page, click **Next**. When the wizard completes, click **Close**.

If you are serving x86 platforms, repeat the above steps to deploy **Stage 1E PXE Everywhere boot image (x86)**.



When Configuration Manager processes the Task Sequence on Agent computers, the associated boot image will be downloaded to the Nomad and CCM Client caches. The *CreateBCD.exe* utility copies the cached boot image file to the *C:\ProgramData\1E\PXEEverywhere\TFTPROOT\images* directory on the computer.

The picture opposite shows our example of the x64 image.



This PXE Everywhere Agent is now ready to serve the boot image to PXE clients.

Note

When PXE booting a UEFI device in a non-mandatory deployment scenario, you may be presented with an option to
Press Enter to continue and Press F8 for Advanced boot menu. However, the advanced boot menu options will not work for WinPE.

Please refer to Verifying for guidance on testing PXE Everywhere.

12.3.2 Deploying Microsoft ADK files

Steps for deploying Microsoft ADK files when not using 1E Client Deployment Assistant (CDA).

These steps are only required if you have installed PXE Everywhere Agent using the **1E Client** installer instead of using **1E Client Deployment Assistant (CDA)** which is the recommended method of including the Microsoft ADK files in the deployment of PXE Everywhere Agent.

A script similar to the one provided below was originally used for legacy versions of PXE Everywhere Agent and CDA which did not include the ADK files, and required the ADK files to be deployed as a post-installation task along with the 1E PXE Everywhere boot images.

12.3.2.1 Obtaining the Microsoft ADK files

In addition to the binaries supplied by 1E, PXE Everywhere Agent requires a number of files that are distributed and licensed with the Microsoft Windows Automated Deployment Kit (ADK).

As these files are licensed by Microsoft, 1E are unable to include them in the installation media. However, you can use the Introducing 1E Client Deployment Assistant to extract the required files from the ADK, create an installer transform and prepare an Application in Configuration Manager that will install the PXE Everywhere Agent with the appropriate settings and the additional Microsoft files.

The Windows Assessment and Deployment Kits (ADK) normally exist on the Configuration Manager CAS or Primary Site server, although they can be downloaded separately from the Microsoft website.

If you are not using CDA, then you must extract the files listed below from the Windows 10 ADK, and then deploy them to PXE Everywhere Agents.

boot.sdi

abortpxe.com

bootmgr.exe

pxeboot.com

pxeboot.n12

bootmgfw.efi

wgl4_boot.ttf

12.3.2.1.1 Script to extract the ADK files

The following example script can be used to extract the files from the Windows 10 ADK. It must be run on a standard Configuration Manager primary site server that has the Windows 10 ADK installed.

It extracts the required ADK files and copies them to the specified location.

If the script were saved as *ExtractADK.cmd* and you have created a folder called *C:\ADKFiles* to receive the extracted files, the command line syntax would be:

```
ExtractADK.cmd C:\ADKFiles
```

> **Note**
>
> The script assumes that ADK is installed in "C:\Program Files (x86)\Windows Kits\%WINVER%". For Windows 10, WINVER=10.

If you have ADK installed at in a different location then you will need to modify the script accordingly.

Click **Read more...** to view **ExtractADK.cmd** source or download the script Download ExtractADK.cmd...

```

12.3.2.2 Deploying the ADK files

The updated ADK files must be deployed to PXE Everywhere Agents, into their TFTPROOT directory, along with the 1E PXE Everywhere boot images.

Deploying 1E PXE Everywhere boot images is described in Preparing and deploying 1E PXE Everywhere boot images.

By default, TFTPROOT is %ALLUSERSPROFILE%\1E\PXEEverywhere\TftpRoot

The 1E PXE Everywhere boot images should be found in an \Images folder relative to TFTPROOT.

In addition to the binaries supplied by 1E, PXE Everywhere Agent requires a number of files that are distributed and licensed with the Microsoft Windows Automated Deployment Kit (ADK). The required files are listed in the table opposite, along with the location on the PXE Everywhere Agent that they need to be installed to.

File	Destination Location (relative to TFTPROOT)
boot.sdi	*\boot.sdi*
abortpxe.com	*\boot\x86\abortpxe.com*
bootmgr.exe	*\boot\x86\bootmgr.exe*
pxeboot.com	*\boot\x86\pxeboot.com*

\boot\x64\bootmgfw.efi	
wgl4_boot.ttf (optional)	*\boot\fonts\wgl4_boot.ttf*

12.4 Troubleshooting

A general methodology for investigating issues with PXE Everywhere, as well as identifying key issues and their resolutions.

For known issues relating to specific components, please refer to the respective troubleshooting pages:

Clients	Platform	Applications	Integration
1E Client	1E	Endpoint Automation	1E Core for ServiceNow
1E Client Deployment Assistant		Experience Analytics	1E ITSM Connect for ServiceNow
PXE Everywhere		Endpoint Troubleshooting	1E Service Catalog Connect for ServiceNow
		Writing 1E Instructions (1E SDK)	1E Virtual Assistant

12.4.1 1E Support contact details

12.4.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

12.4.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

US/Canada:	1-866-349-4032 (Toll-Free)
	1-917-339-2360 (Standard)
UK/Europe:	+44 (0)208 326 3499
India:	+91 120 402 4002
Australia:	+61 739 111 118

12.4.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation.

support@1e.com

12.4.1.4 For customers evaluating Nomad and PXE Everywhere

If you are evaluating Nomad and PXE Everywhere, please contact 1E if you need guidance.

12.4.2 The technical support process

Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

12.4.2.1 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

12.4.2.1.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

12.4.2.1.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

12.4.2.1.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

12.4.2.2 Log files

PXE Everywhere component	Folder	Log file
1E Client	C:\ProgramData\1E\Client	1E.Client.log
PXE Everywhere Central	C:\ProgramData\1E\PXELite	WebService.log
PXE Everywhere Responder	C:\ProgramData\1E\PXEEverywhere	PXEEverywhereResponder.log
PXE Everywhere Agent	C:\ProgramData\1E\PXEEverywhere	PXEEverywhere.log

Please also refer to Upgrading PXE Everywhere: Name changes introduced in PXE Everywhere 4.0.

If the issue is related to PXELite boot media creation/updating using CreateBootImage.exe then please provide:

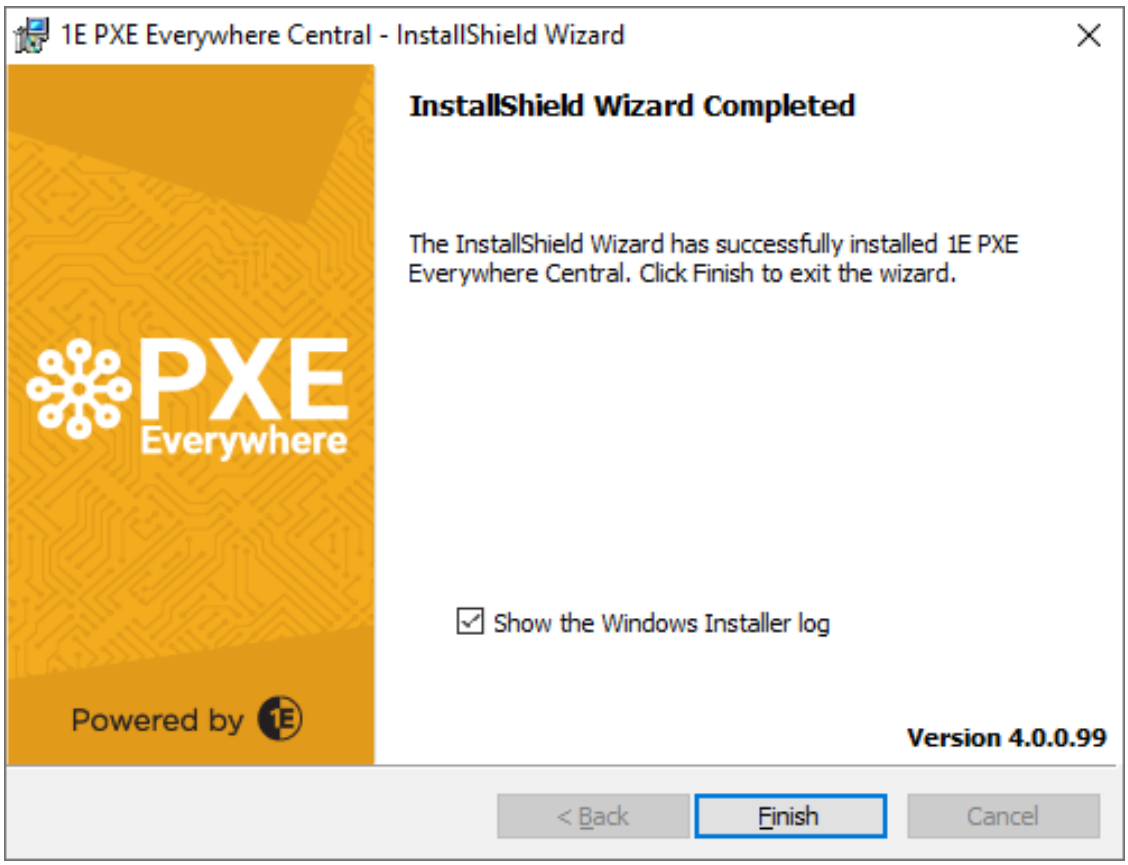
C:\Program Files (x86)\Microsoft Configuration Manager\AdminConsole\AdminUILog\CreateTsMedia.log

If the issue is related to the deployment of PXELite boot image into the TFTP folder of PXELite agent then please provide:

C:\ProgramData\1E\PXElite\CreateBCD.log

12.4.3 MSI Installer log

In case of problems during installation, each of the PXE Everywhere installers provide an option to view their installer log file at the end of the installation process. We recommend that you check the box and keep the log file handy until the installation has been validated. This way if there are any issues you can easily pass the installation log files on to the 1E Support department. Here is an example of the final page of the PXE Everywhere Central installer with the **Show the Windows Installer log** checkbox shown:



12.4.4 Known issues

Lists of the current known issues with implementing, configuring, using and upgrading PXE Everywhere.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

12.4.4.1 Issues using PXE Everywhere

Issue	Description	Workaround
UEFI PXE Boot Fails with error in the boot loader when a machine has more than one NIC	When machine has more than one Network Interface Card (NIC) and on performing PXE Boot from the secondary NIC card the PXE Boot will fail. This issue occurs only when you try boot from a NIC which is NOT the first NIC in the boot order.	If you boot from the first NIC the boot will complete without problem.

Issue	Description	Workaround
When Tftp session begins errors are noticed for file for which system cannot find the path specified	During PXE Boot UEFI firmwares requests few files however when not found boot still succeed.	These files are optional for the boot and not essential.
When a 1E PXE Everywhere boot image is created with blocksize values higher than 1471 bytes, TFTP transfers fail during PXE Boot	On Cisco and TPLink switches with DHCP Snooping enabled and block size value is higher than 1471 bytes PXE boot may fail. This is due a bug in the switch hardware itself. This issue does not occur when DHCP Snooping is off.	For details of how to change the block size used by TFTP, please refer to Preparing and deploying 1E PXE Everywhere boot images: TFTP Block Size.
CreateBCD.exe does not remove the *.prompt.bcd* files when it is re-run	The *boot.image_ID.prompt.bcd* and *boot.image_ID.prompt.bcd.LOG* files are not purged from the boot images under *TFTPROOT* when upgraded from previous versions.	Manually delete the log files.
Secure Boot won't work on Hyper-V (Gen-2) virtual machines.	PXE Booting Hyper-V (Gen-2) virtual machines with the Secure Boot option is not supported in PXE Everywhere.	None.
Command prompt crashes when arguments are passed to *UpdateBootImage.exe*	If you run a command prompt and pass arguments to *UpdateBootImage.exe*, it crashes the session.	Run the command prompt with elevated rights.
Create media fails when using UpdateBootImageGUI tool.	UpdateBootImageGUI does not throw an error when a site server is specified in the SMSProvider field which does not have a local SMS Provider. The command is generated successfully with the entered value of the site server name, however the create media fails.	
Temporary image file is left in the %temp% folder after UpdateBootImage.exe has executed successfully	During UpdateBootImage a temporary .WIM file is updated in %temp% folder. This image file is not deleted after a successful	Manually delete the image file.

Issue	Description	Workaround
	execution of UpdateBootImage.exe and can be removed manually.	

12.4.4.2 Issues installing PXE Everywhere Central

Issue	Description	Workaround
PXE Everywhere Central unattended installation succeeds even when prerequisites are not met.	PXE Central unattended installation creates an entry in Windows Program and Feature however, program files are not installed and the Web service is not created.	Ensure prerequisites are met when installing unattended.
While upgrading PXE Central to 3.2 or above from an older version where TLS 1.0 has been disabled, you get an exception - "Could not connect to Database"	While upgrading PXE Central to 3.2 or above from an older version TLS v1.0 has been disabled, you get an exception - "Could not connect to Database". You can ignore the error and click on ‘Next’ button, then installation would go through fine. That error occurs as a part of uninstallation of older version, when it tries to remove the stored procedures from DB. Since we don’t have TLS 1.2 support in old version, it fails to connect to DB.	Ignore the error and click on ‘Next’ button, then installation would go through fine.
After upgrading PXE Everywhere Central there are log files left in c:\programdata\1e\pxelite	From PXE Everywhere Central v4.0 onwards, the new default logpath is **c:\programdata\1e\pxeeverywhere**. The legacy logapth is **c:\programdata\1e\pxelite**. During upgrade the legacy log files are deliberately not deleted. This is partly to avoid contention with other legacy PXE Everywhere products installed on the computer, but also to avoid mixing old and new logs.	Manually delete the log files after all PXE Everywhere products have been upgraded.

12.4.4.3 Issues installing PXE Everywhere Responder

Issue	Description	Workaround

PXE Everywhere is not responding as expected. Log file shows messages similar to:
 	
`Error: failure to bind to 192.168.18228:69. The specified address is already in use`
`TFTP: retry in 1000ms`
`Error: failure to bind to 192.168.18228:4011. The specified address is already in use`
`DHCP: retry in 1000ms`
	PXE Everywhere Agent and PXE Everywhere Responder cannot co-exist on the same computer and are not supported together. Whilst it is possible to install them together, they will not work and will have issues such as failure to bind to ports.	Either uninstall PXE Everywhere Responder, or disable PXE Everywhere module in 1E Client. Then restart the computer, or restart the relevant service (PXE Everywhere or 1E Client).

Responder does not respond to Agents on port 67.	PXEEverywhereResponder.msi will upgrade legacy (3.2 or before) Responder and Agent if they exist, keeping the old registry settings. Upgrading a Responder will cause it to continue functioning as a Responder on port 67. Upgrading an Agent to a Responder will also allow it to function as a Responder, but if the Agent was previously configured to support DHCP Snooping then it will not be using port 67 and the Responder must be re-configured to use port 67.	Post-install fix is to reconfigure DhcpPort=67 on the Responder. Include DHCPPORT=67 as an installer property if you are upgrading legacy Agents to act as Responders.
After upgrading PXE Everywhere Responder there are log files left in c:\programdata\1e\pxelite	From PXE Everywhere Responder v4.0 onwards, the new default logpath is **c:\programdata\1e\pxeeverywhere**. The legacy logpath is **c:\programdata\1e\pxelite**. During upgrade the legacy log files are deliberately not deleted. This is partly to avoid contention with other legacy PXE Everywhere products installed on the computer, but also to avoid mixing old and new logs.	Manually delete the log files after all PXE Everywhere products have been upgraded.

12.4.4.4 Issues installing PXE Everywhere Agent in 1E Client

Issue	Description	Workaround

PXE Everywhere is not responding as expected. Log file shows messages similar to:
 	
`Error: failure to bind to 192.168.18228:69.`
`The specified address is already in use`
`TFTP: retry in 1000ms`
`Error: failure to bind to 192.168.18228:4011.`
`The specified address is already in use`
`DHCP: retry in 1000ms`
	PXE Everywhere Agent and PXE Everywhere Responder cannot co-exist on the same computer and are not supported together. Whilst it is possible to install them together, they will not work and will have issues such as failure to bind to ports.	Either uninstall PXE Everywhere Responder, or disable PXE Everywhere module in 1E Client. Then restart the computer, or restart the relevant service (PXE Everywhere or 1E Client).

PXE Everywhere Agent fails to connect to PXE Everywhere Central.	An incorrect URL has been specified during installation of PXE Everywhere Agent. The installer wizard does not validate the PXE Lite Central URL is provided during the PXE Lite Local GUI installation.	Ensure you specify the correct URL when installing PXE Everywhere Agent.
PXE Everywhere does not support RISC based architecture.	PXE Everywhere does not support RISC based architecture and therefore not able to PXE boot clients using RISC. For instance, architecture being used by Microsoft Surface Pro 10 LTE Models is ARM 64-BIT UEFI (11) which is a RISC architecture and *not* recognized by PXE Everywhere.	None.
PXE Everywhere Agent installation fails when an unprivileged user installs it after providing administrator credentials	PXE Everywhere Agent installation fails with error when an unprivileged user initiates PXE Everywhere Agent installation even after validating credentials after UAC prompt.	When installing the agent interactively, run the installer from a command prompt with elevated permissions.

Issue	Description	Workaround
(UAC prompted) for installation.		

12.4.5 Installation issues

Some issues when installing PXE Everywhere.

12.4.5.1 Log files

When you have issues, a first place to look is the log files.

PXE Everywhere component	Folder	Log file
1E Client	C:\ProgramData\1E\Client	1E.Client.log
PXE Everywhere Central	C:\ProgramData\1E\PXELite	WebService.log
PXE Everywhere Responder	C:\ProgramData\1E\PXEEverywhere	PXEEverywhereResponder.log
PXE Everywhere Agent	C:\ProgramData\1E\PXEEverywhere	PXEEverywhere.log

Please also refer to Upgrading PXE Everywhere: Name changes introduced in PXE Everywhere 4.0.

If the issue is related to PXELite boot media creation/updating using CreateBootImage.exe then please provide:

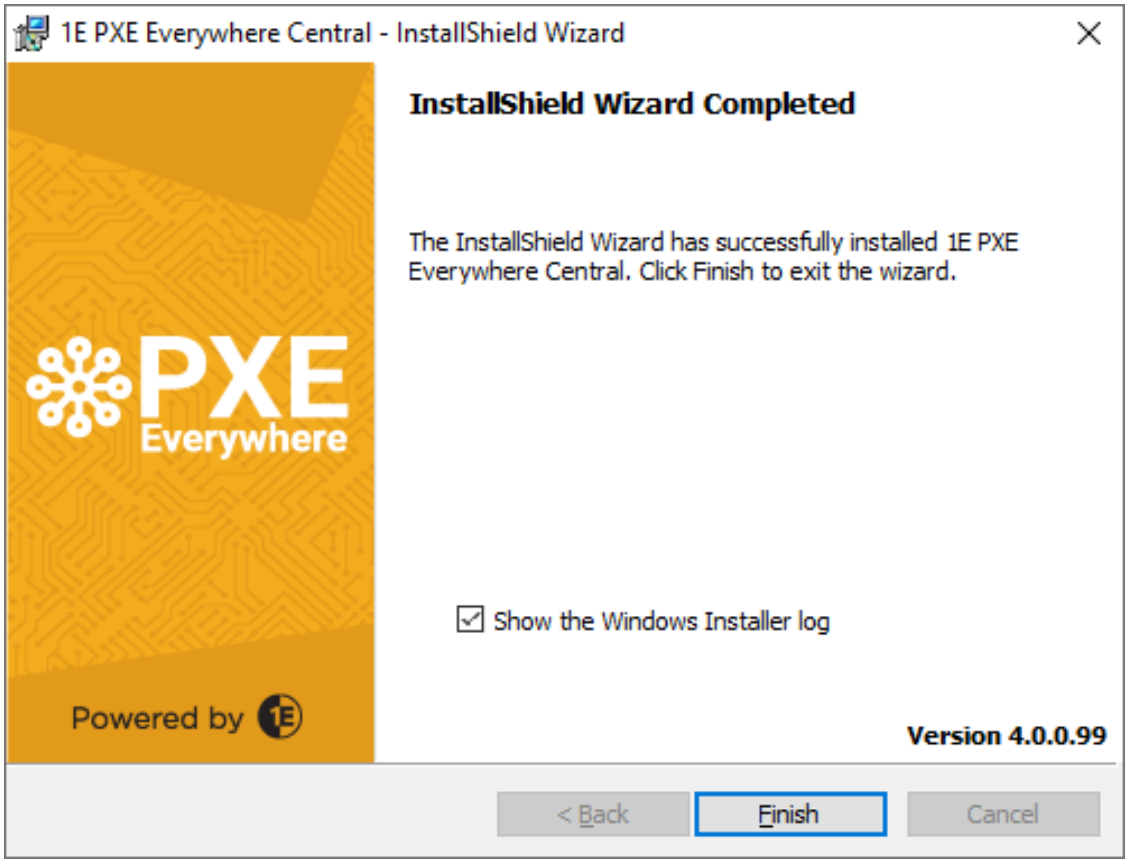
C:\Program Files (x86)\Microsoft Configuration Manager\AdminConsole\AdminUILog\CreateTsMedia.log

If the issue is related to the deployment of PXELite boot image into the TFTP folder of PXELite agent then please provide:

C:\ProgramData\1E\PXElite\CreateBCD.log

12.4.5.1.1 Windows Installer log

In case of problems during installation, each of the PXE Everywhere installers provide an option to view their installer log file at the end of the installation process. We recommend that you check the box and keep the log file handy until the installation has been validated. This way if there are any issues you can easily pass the installation log files on to the 1E Support department. Here is an example of the final page of the PXE Everywhere Central installer with the **Show the Windows Installer log** checkbox shown:



12.4.5.2 The installer takes 30 seconds (or more) to appear

Check to see if the computer has access to the Internet. The MSI files are digitally signed. This signature is verified during installation. Windows also checks to see whether the certificate used to generate the signature has been revoked. This requires Internet access, but will time out after 30 seconds.

Possible solutions are:

Allow this to happen. This does not affect the installation other than to delay by the time out period.

Connect the computer to the Internet.

Re-sign the MSI with your own key. Use one that is trusted by the computer, and does not need to access the Internet to find the certificate revocation list (CRL).

Please refer to Supported Platforms: Certificate limitations - signing certificates missing.

12.4.6 Resolving PXE Everywhere Agent issues

12.4.6.1 Legacy log files present after upgrading

After upgrading PXE Everywhere Central or PXE Everywhere Responder there are log files left in **c:\programdata\1e\pxelite**.

From PXE Everywhere v4.0 onwards, the new default logpath is **c:\programdata\1e\pxeeverywhere**. The legacy logpath is **c:\programdata\1e\pxelite**. During upgrade the legacy log files are deliberately not deleted. This is partly to avoid contention with other legacy PXE Everywhere products installed on the computer, but also to avoid mixing old and new logs. Please refer to Upgrading PXE Everywhere: Name changes introduced in PXE Everywhere 4.0.

You can manually delete the log files after all PXE Everywhere products have been upgraded.

12.4.6.2 Elections Not Working

A PXE Everywhere Agent responds to a PXE boot request and holds an election but no peer responds even though peers are present and the log looks like this:

```
PXEElection::hasResponse
Not replying to PXEClient DHCP DISCOVER from [18:03:73:28:53:34]
WARNING: Election timed out
Error hEvtDone 00000348 - The handle is invalid
DhcpListener::HandleRequest
```

This can happen for a number of reasons, but check that the firewall is not blocking the communications port used by PXE – for more detail please refer to PXE Everywhere Agent settings: CommsPort.

Furthermore, if the log file doesn't show any activity when you are PXE booting another local computer, check network access. Network features such as DHCP Snooping will prevent PXE Everywhere from being able to respond to PXE requests.

12.4.6.3 Bare-metal computer not able to PXE boot

In order to troubleshoot why a bare-metal computer is not PXE booting, open the PXE log file on the peer computer (that has PXE Everywhere installed) and look for a line similar to the following:

```
Configuration Service returned bootImageId = '', isMandatory = 0, clientSmbiosG
uid = '3119d64c-3540-11b2-a85c-c56de30503a2', clientMacAddress = '1E:1E:1E:CC:9
1:D8'
```

This log entry is the response back from PXE Central that describes what should be provided to the bare-metal computer, such as the Boot Image ID and if that is mandatory. If the Boot Image ID value is empty, then PXE Everywhere doesn't know what boot image to provide to the bare-metal computer. Ensure a Task Sequence (with associated boot image) has been correctly deployed to this bare-metal computer.

A failed PXE response - because their is no assigned boot image - looks like the following:

```
Completing MyElection Winner=PC0001 for=1E:1E:1E:CC:91:D8
Sending.. Election master PC0001(172.16.179.100) "1E:1E:1E:CC:91:D8" W=50ELCN
Election master from 172.16.179.100 Master=PC0001 for 1E:1E:1E:CC:91:D8
Configuration Service returned bootImageId = '', isMandatory = 0, clientSmbiosG
uid = '3119d64c-3540-11b2-a85c-c56de30503a2', clientMacAddress = '1E:1E:1E:CC:9
1:D8'
PxeResource::PxeResource xABORTx
ElectionMgr Removed 1E:1E:1E:CC:91:D8 from list
```

Another step is to ensure the correct boot image exists on the PXE Everywhere client computers.

The following log entries show that a boot image (for example PS10005E) has been correctly assigned to the bare-metal computer, but the PXE Everywhere client doesn't have the needed boot image pre-cached or available in the TFTPROOT folder. Ensure that you have distributed the boot image to the PXE Everywhere computers and executed the **CreateBCD.exe** tool. For more detail please refer to Preparing and deploying 1E PXE Everywhere boot images: Create a Task Sequence to stage a 1E PXE Everywhere boot image.

```
Client MAC:  1E:1E:1E:CC:91:D8
Client UUID: 3119d64c-3540-11b2-a85c-c56de30503a2
Client Arch: EfiBC (UEFI)
PxeResource::PxeResource
PxeElection::hasResponse PS10005E
WARNING: We are the master however we do not have the resource:'PS10005E'
Not replying to PXEClient DHCP DISCOVER from [1E:1E:1E:CC:91:D8]
```

12.4.6.4 PXE Central Web service is not accessible

If the PXE Everywhere Agent has been configured incorrectly, the PXE Everywhere Agent log will contain the following error:

```
PXEEverywhere Configuration endpoint: http://PXECENTRALSERVER/PXELite/PXELiteConfiguration.asmx

SOAP call failed: (null) 21/08/2020 20:02:10 816 (0x0330)

  Code:    29 (SOAP_HTTP_ERROR) (null) 21/08/2020 20:02:10 816 (0x0330)
```

If the PXE Web service on PXE Everywhere Central is not configured properly or is not running, the PXE Everywhere Agent log on the will contain the following error:

```
Code: -1 (Unknown)
```

Check the PXE Central installation. To resolve this, check that the PXE Web service URL is accessible and if it isn't:

Check that the PXE application pool is running in IIS

Check if there are any other issues preventing web access

12.5 Reference

All the reference information for PXE Everywhere.

12.5.1 Supported Platforms

A list of all the platforms supported by PXE Everywhere, and the software required to allow PXE Everywhere Central and Responders to be installed or to work.

Please refer to Common client requirements for details of **PXE Everywhere Agent** client module of the 1E Client.

Category	PXE Everywhere Central	PXE Everywhere Responder	Notes
Windows OS	Windows Server 2022 Windows Server 2019 Windows Server 2016	Windows Server 2022 Windows Server 2019 Windows Server 2016 Windows 10 CB 21H2 Windows 11 CB 21H2 Windows 10 CB 21H1 Windows 10 CB 20H2	**Will only install on** computers running one of these OS. **Note** Installing PXE Everywhere Central on domain controllers is not a supported configuration. **Note** A server OS is recommended for PXE Everywhere Responder.
Web servers	IIS 10	Not applicable.	For PXE Everywhere Central: You **must** have one of these Web server versions installed. The installer **must** be run on the system hosting the Web server as it deploys the PXELite website on it. Requires the following OS roles and features: Web Server (Web-Server) ASP.NET 4.5 or later (Web-Asp-Net45)
Runtime libraries	.NET Framework 4.8	Visual C++ 2013 Redistributable	You**must**have one of these .NET Framework versions installed to install PXE Everywhere Central PXE Everywhere Responder installer includes the redistributable package for Visual C++ 2013.

Category	PXE Everywhere Central	PXE Everywhere Responder	Notes
Boot Image OS	Windows Server 2022 Windows Server 2019 Windows Server 2016 Windows 10 CB 21H2 Windows 11 CB 21H2 Windows 10 CB 21H1 Windows 10 CB 20H2	Not applicable.	**UpdateBootImage.exe** is supported only on these client OS. The Admin Tools feature of the PXE Everywhere Central installer installs UpdateBootImage.exe , which uses the native Configuration Manager API used to generate boot media.
Configuration Manager	MECM CB 2303 MECM CB 2203 MECM CB 2111 MECM CB 2107 MECM CB 2103 MECM CB 2010	Not applicable.	You can install PXE Everywhere Central on a Configuration Manager site server, or on any other server with IIS installed and good connectivity to the Configuration Manager database, ideally equivalent to the connection the site server has to its database.

12.5.1.1 Constraints of Legacy OS

12.5.1.1.1

In this documentation, the following are referred to as legacy OS. Below are described some known issues for these OS.

1E does not provide support for 1E products on the following OS unless the OS is explicitly listed as being supported for a specific 1E product or product feature. This is because Microsoft has ended mainstream support for these OS or they are not significantly used by business organizations.

Windows XP *	**Windows Server 2003 ***
Windows Vista	**Windows Server 2008**
Windows 7	**Windows Server 2008 R2**
Windows 8.0	**Windows Server 2012**
Windows 8.1	**Windows Server 2012 R2**

> **Note**
>
> 1E Client 8.1 and later will not install on Windows XP and Windows Server 2003. Please contact 1E if you intend to continue using any of the other legacy OS. If you experience an issue, then please try replicating the issue on a supported OS.

For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.

12.5.1.1.2

Certificate limitations - expired root certificates

Ensure that your Root CA Certificates are up-to-date on clients and servers. The **Automatic Root Certificates Update** feature is enabled by default, but its configuration may have been changed or restricted by Group Policy **Turn off Automatic Root Certificates Update**.

If this GPO is enabled, then you will see *DisableRootAutoUpdate = 1 (dword)* in *HKLM\Software\Policies\Microsoft\SystemCertificates\AuthRoot.*

12.5.1.1.3

Certificate limitations - signing certificates missing

On Windows computers, the installation MSI files, and binary executable and DLL files of 1E software are digitally signed. The 1E code signing certificate uses a timestamping certificate as its countersignature. 1E occasionally changes its code signing certificate, and uses it for new releases and patches for older versions, as shown in the table(s) below.

Root Certificate Authorities are implicitly trusted to validate certificates, and their certificates must be correctly installed to do this. Your computers should already have the necessary **root CA** certificates installed, however this may have been prevented by your organization's security policies, or inability to connect to the

Internet, or they are legacy OS. In general this is not an issue because by default Windows allows software to be installed and run without validation, although you may see a warning or experience a delay. However, you *must* have relevant CA certificates installed if you are using 1E Client (which self-validates its own files), or your organization has applied more secure polices (for example UAC, AppLocker or SmartScreen).

Typical reasons for issues with signing certificate are:

If your organization has disabled **Automatic Root Certificates Update** then you must ensure the relevant **root CA** certificates are correctly installed on each computer

If computers do not have access to the Internet then you must ensure the relevant **root and issuing CA** certificates are correctly installed on each computer, numbered in the table(s) below.

The signature algorithm of the 1E code signing certificate is SHA256RSA. In most cases, the file digest algorithm of an authenticode signature is SHA256, and the countersignature is a RFC3161 compliant timestamp. The exception is on legacy OS (Windows XP, Vista, Server 2003 and Server 2008) which require the file digest algorithm of an authenticode signature to be SHA1, and a legacy countersignature.

12.5.2 Communication Ports

A list of communication ports used by PXE Everywhere. Useful, if needed, for network and device firewalls.

Although a computer with PXE Everywhere Agent installed can also be a PXE client, it cannot be both at the same time.

Component	Ports	Protocol	Direction	Usage	Configurable
Central	80	HTTP	Inbound	PXE Everywhere Agent communicating with the PXE Everywhere Central web application. Browser connections to the PXE Everywhere Central website to verify installation.	Yes, post-installation on the Central server, and during installation of Agents by configuring the URL. If HTTPS is required, please contact 1E for advice.

Component	Ports	Protocol	Direction	Usage	Configurable
Central	135 and 445 (initially)	WMI-DCOM TCP	Outbound	PXE Everywhere Central installer requires access to the Configuration Manager Site server, and to the server hosting the SMS Provider role. If there is only one SMS Provider, it is often on the Site server. In each case, TCP 135 and 445 are used to initiate communications and negotiate a dynamic RPC port. The dynamic range depends on the Windows OS version.	No.

Component	Ports	Protocol	Direction	Usage	Configurable
Central	1433	(See usage for protocol) TCP	Outbound	PXE Everywhere Central to access to the SQL database role for the selected Configuration Manager Site.	Depends on the Configuration Manager SQL Server instance. The Central installer determines the connection string by querying the Site's SMS Provider.
ConfigMgr Site Server (and SMS Provider)	135 and 445 (initially)	WMI (DCOM) TCP	Inbound	PXE Everywhere Central installer requires access to the Configuration Manager Site server, and each of the servers hosting the SMS Provider role. If there is only one SMS Provider, it is often on the Site server. In each case, TCP 135 and 445 are used to initiate communica	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				tions and negotiate a dynamic RPC port. The dynamic range depends on the Windows OS version.	
ConfigMgr Site SQL database	1433	(See usage for protocol) TCP	Inbound	PXE Everywhere Central to access to the SQL database role for the selected Configuration Manager Site.	Depends on the Configuration Manager SQL Server instance.
Agent (1E.Client.exe)	80	HTTP TCP	Outbound	PXE Everywhere Agent communicating with the PXE Everywhere Central web application.	Yes, post-installation on the Central server, and during installation of Agents by configuring the URL. If HTTPS is required, please contact 1E for advice.
Agent (1E.Client.exe)	2012	UDP	Inbound & outbound	Election process inter-communication between PXE	Yes, during installation of PXE Everywhere Agents using the MODULE.PXEEVERYWHERE.COMMSPORT installer property.

Component	Ports	Protocol	Direction	Usage	Configurable
				Everywhere Agents on a subnet.	
Agent (1E.Client.exe)	67 or 2067	BOOTP UDP	Inbound	Port 67 is the standard PXE discover port. PXE clients use this port to broadcast PXE discovers on the local subnet. PXE Everywhere Agents listen on this port for PXE discovers that are broadcast on the local subnet. If PXE Everywhere is configured to support DHCP Snooping, Agents use a custom port (default 2067) to listen for	Only the DHCP Snooping ports are configurable, and must be the same on all Agents and Responders.

Component	Ports	Protocol	Direction	Usage	Configurable
				PXE requests, instead of standard port 67.	
Agent (1E.Client.exe)	68 or 2068	BOOTP UDP	Outbound	Port 68 is the standard PXE offer port. PXE Everywhere Agent uses this port to respond with offers to PXE discovers on the local subnet. If PXE Everywhere is configured to support DHCP Snooping, Agents use a custom port (default 2068) instead of the standard port 68.	Only the DHCP Snooping ports are configurable, and must be the same on all Agents and Responders.
Agent (1E.Client.exe)	69	TFTP UDP	Inbound	Port 69 is the standard	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				PXE TFTP port. The PXE client downloads the boot image from the elected PXE Everywhere Agent using TFTP. This port is also used if PXE Everywhere is configured to support DHCP Snooping.	
Agent (1E.Client.exe)	4011	UDP	Inbound	Port 4011 is the standard PXE port used by PXE clients to communicate with a PXE Server after the initial discover / offer, to unicast a request for the location of the TFTP boot image file.	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				This port is not used if PXE Everywhere is configured to support DHCP Snooping.	
Responder (PXEEverywhereResponder.exe)	67	BOOTP UDP	Inbound	Port 67 is the standard PXE discover port. A Responder is only required when DHCP Snooping is enabled, and listens for PXE requests from PXE clients on this port. See note below about DHCP Snooping and DHCP Relays.	No.
Responder (PXEEverywhereResponder.exe)	68	BOOTP UDP	Outbound	Port 68 is the standard PXE offer port. A Responder	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				is only required when DHCP Snooping is enabled, and responds to PXE clients with offers unicast on this port. See note below about DHCP Snooping and DHCP Relays..	
PXE client	67	BOOTP UDP	Outbound	Port 67 is the standard PXE discover port. PXE clients use this port to broadcast PXE discovers on the local subnet. If DHCP Snooping is being used these discovers are forwarded to a Responder.	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				See note below about DHCP Snooping and DHCP Relays. .	
PXE client	68	BOOTP UDP	Inbound	Port 68 is the standard PXE offer port. PXE Everywhere Agent broadcasts on this port with an offer in response to PXE discovers on the local subnet. If DHCP Snooping is being used, then Responders respond with offers on this port. See note below about DHCP Snooping and DHCP Relays..	No.
PXE client	69	BOOTP UDP	Outbound	Port 69 is the	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				standard PXE TFTP port. A PXE client uses TFTP to download the boot image from the elected PXE Everywhere Agent on the local subnet. This port is also used if PXE Everywhere is configured to support DHCP Snooping.	
PXE client	4011	UDP	Outbound	Port 4011 is the standard PXE port used by PXE clients to unicast a request to the PXE Everywhere Agent for the location of the TFTP boot image file, after the initial	No.

Component	Ports	Protocol	Direction	Usage	Configurable
				discover/offer. This port is not used if PXE Everywhere is configured to support DHCP Snooping.	
PXE client	2067	BOOTP UDP	Outbound	If PXE Everywhere is configured to support DHCP Snooping, a custom port is used (default 2067) to perform a PXE request after the PXE client has downloaded a boot loader from a Responder. Only used if DHCP Snooping is being used, and PXE Everywhere has been	Yes. DhcpPort is configured during installation of Agents. AltPxeServerPort is manually configured on Responders.

Component	Ports	Protocol	Direction	Usage	Configurable
				configured to use this port.	
PXE client	2068	BOOTP UDP	Inbound	If PXE Everywhere is configured to support DHCP Snooping, a custom port is used (default 2068) to respond to a PXE request after the PXE client has downloaded a boot loader from a Responder. Only used if DHCP Snooping is being used, and PXE Everywhere has been configured to use this port.	Yes. AltPxeClientPort is manually configured on Responders.

Note

PXE client ports do not need to be configured on the OS firewall because it is the network interface which is doing the communicating. However you may need to configure intervening network firewalls for communication beyond the local subnet.

PXE Everywhere Responders communicate only with PXE clients; they do not communicate with PXE Central, PXE Everywhere Agents, other Responders, or Configuration Manager.

Note

If DHCP Snooping is enabled on networks, then DHCP Relays (IP helpers) must be configured to forward PXE requests (discovers) from client VLANs to specific Responders on port 67 and return the responses (offers) on port 68.

If DHCP Snooping is not enabled, then all PXE-boot traffic is on the local subnet, except for communication between the elected PXE Everywhere Agent and the PXE Everywhere Central server, and DHCP Relays are not required to forward PXE requests.

Note

Ports used by PXE clients to communicate with DHCP servers are not included in the above table. Communication with DHCP servers occurs before a PXE client PXE-boots, and typically use their own DHCP Relays (IP helpers).

Ports used by PXE clients to communicate with ConfigMgr Site systems are not included in the above table. Communication with ConfigMgr occurs only after a PXE client has downloaded the WinPE boot image (referenced in the deployed task sequence) from a local PXE Everywhere Agent, and booted into WinPE to start the Task Sequence.

Ports used by ConfigMgr Administrator workstations to communicate with ConfigMgr Site systems are not included in the above table. ConfigMgr Console extensions for PXE Everywhere Admin Tools use the same ports as ConfigMgr Console.

12.5.3 PXE Everywhere Central installer properties

Command-line installer properties that are available for an unattended installation for PXE Everywhere Central components.

Switch	Default value	Notes
CMSERVER		Mandatory. Sets the name of the Configuration Manager server
INSTALLDIR	C:\Program Files (x86)\1E\PXEEverywhere	The installation folder. PXE Everywhere Central is a 32-bit application, and is only supported on the 64-bit server OS.

Switch	Default value	Notes
INSTALLTYPE	COMPLETE	Type of installation. Values are: COMPLETE – installs the website, Configuration Manager database stored procedure and administration tools ADMINTOOLS – installs the administration tools only. A successful installation depends on Requirements being met.
LOGPATH	C:\ProgramData\1E\PXEEverywhere	The log folder used by the Web Service.

12.5.4 PXE Everywhere Responder settings

Configuration settings for PXE Everywhere Responder.

PXE Everywhere Responder is a 64-bit application, and its registry values exist under:
HKEY_LOCAL_MACHINE\SOFTWARE\1E\PXELiteServer

Note

Registry settings:

AltPxeClientPort | AltPxeServerPort | BindTo | Debug | DefaultBlockSize | DhcpPort | ElectionWaitSecs | ElectionWeight | EncryptionType | Flags | IgnoreGatewayAddress | IgnoreWireless | LogFileName | LogFormat | MaxLogFilesize | Mode | SessionTimeoutSecs | TftpRoot

Note

Installer properties:

DEBUG | DHCPPORT | ELECTIONWAITSECS | ELECTIONWEIGHT | USEFIPS | INSTALLDIR | LOGPATH | LOGFORMAT | MAXLOGFILESIZE | MODE | TFTPROOT

Registry name	Registry type	Installer property	Default value	Description
AltPxeClientPort	REG_DWORD	This value does not have an installer property.	Registry value is not created.	This is the UDP port that the PXE Everywhere Responder will reply to the PXE client

Registry name	Registry type	Installer property	Default value	Description
				(alternate boot loader) on. If this registry setting does not exist then port 2068 is used.
AltPxeServerPort	REG_DWORD	This value does not have an installer property.	Registry value is not created.	This is the UDP port that the alternate boot loader will broadcast the custom PXE request on. The PXE Everywhere Agents must be configured to listen on this port, so it must be the same port defined by DHCPPORT when installing the PXE Everywhere Agent. If this registry setting does not exist then port 2067 is used.
BindTo	REG_SZ	This value does not have an installer property.	Registry value is not created.	Comma-separated list of IP addresses which PXE Everywhere Responder listens for DHCP (PXE) and TFTP requests. If not present, PXE Everywhere Local listens on all IP addresses. Use this if there is more than

Registry name	Registry type	Installer property	Default value	Description
				one network interface.
Debug	REG_DWORD	**DEBUG**	1	The debug level. Leave this at *1* unless 1E Support recommends a change. The range is: *0x1*: Basic logging *0x4*: Extra "application-specific" logging *0x8*: Extra registry logging *0x10*: Increased general logging The following two bits will perform centralized logging via SOAP calls to the PXE Central Server: *0x1000*: Logs election results *0x2000*: Logs TFTP file transfer start and stop (includes statistics).
DefaultBlockSize	REG_DWORD	This value does not have an installer property.	Registry value is not created.	Default TFTP block size. 512 if not specified.

Registry name	Registry type	Installer property	Default value	Description
DhcpPort	REG_DWORD	**DHCPPORT**	67	For a new install, it is not necessary to use the DHCPPORT installer property on Responders, because DhcpPort must always be 67 (default). However, if you are upgrading a legacy PXE Everywhere Agent that has support for DHCP Snooping enabled, it will not be using DHCPPORT=67 and you will need to specify DHCPPORT=67 when upgrading it to be a Responder. If you are upgrading a legacy PXE Everywhere Responder (an Agent in Static Responder mode) to be a new PXE Everywhere Responder then it will retain DhcpPort=67 during the upgrade, and it is not necessary to use the DHCPPORT installer property.
ElectionWaitSecs	REG_DWORD	**ELECTIONWAITSECS**	1	Time (in seconds) to wait for responses

Registry name	Registry type	Installer property	Default value	Description
				to the election request before broadcasting the result. Can be any positive integer value above 0.
ElectionWeight	REG_DWORD	**ELECTIONWEIGHT**	50	When set, this manually created registry value determines the likelihood of the machine winning elections, all else being equal. The value must be between 0 and 99 inclusive. The higher the value the the higher the likelihood of winning. If no value is set, a default of 50 is used.
EncryptionType	REG_DWORD	**USEFIPS**	0	Use of FIPS compliant encryption for communications. You *must* use the same setting on all PXE Everywhere Agents. 0 – use default encryption 1 – use FIPS encryption

Registry name	Registry type	Installer property	Default value	Description
Flags	REG_DWORD	This value does not have an installer property.	Registry value is not created.	If set to ***1*** the DHCP listener adds an ASCII terminator character to the bootfile name in the DHCP acknowledgement message. Some HP machines require this. Any value other than **1** is treated as default 0.
IgnoreGatewayAddress	REG_DWORD	This value does not have an installer property.	Registry value is not created.	If set to any value other then ***0*** the DHCP listener ignores the gateway address. If not set then assumes default ***0*** .
IgnoreWireless	REG_DWORD	This value does not have an installer property.	0	If set to **1** then PXE Everywhere Agent does not bind on wireless adapters. Any value other than 1 is treated as default 0.
n/a		**INSTALLDIR**	%ProgramFiles%\1E\PXEEverywhere\Responder	Installation folder.
LogFileName	REG_SZ	**LOGPATH** **Note**	%ProgramData%\1E\PXEEverywhere\ PXEEverywhereResponder.log	The location of the PXE Everywhere Responder log file. The path is created if it does not exist.

Registry name	Registry type	Installer property	Default value	Description
		This property only specifies the location of the log file.		The logfile name is *PXEEverywhereResponder.log*
LogFormat	REG_DWORD	**LOGFORMAT**	1	Formatting depends on which bits are set: bit *0 (0x01)* use Configuration Manager-compatible format (default) bit *3 (0x08)* do no formatting bit *7 (0x80)* include milliseconds in the timestamp

Registry name	Registry type	Installer property	Default value	Description
MaxLogFilesize	REG_DWORD	**MAXLOGFILESIZE**	10485760	Maximum size for the log file in bytes. Once the file reaches the specified size, a copy is made with a *.lo_* extension in the same directory. A new log file will then be created. Default is 10485760 (10 MBytes).
Mode	REG_DWORD	**MODE**	3	Mode must be 3 – Responder mode
SessionTimeoutSecs	REG_DWORD	This value does not have an installer property.	Registry value is not created.	Timeout for the TFTP listener. 600 if not specified or 0 is specified. Can be any positive integer value.
TftpRoot	REG_SZ	**TFTPROOT**	*%ProgramData%\1E\PXEEverywhere\TftpRoot*	Location for the PXE Everywhere Responder *TFTPROOT* directory. **Warning** Do not change the location of TFTPROOT. If you need to do this then please

Registry name	Registry type	Installer property	Default value	Description
				contact 1E for guidance.

12.5.5 PXE Everywhere Agent settings

Installer and configuration settings for the PXE Everywhere Agent client module of the 1E Client supported only on Windows computers.

1E Client is available as 32-bit and 64-bit versions, and the correct version must be installed. This means the PXE Everywhere Agent registry location is the same for x86 and x64:

HKEY_LOCAL_MACHINE\SOFTWARE\1E\PXEEverywhere

Note

Registry settings:

AlwaysBootImageId | AlwaysIsMandatory | BindTo | CommsPort | ConfigServerAddress | Debug | DefaultBlockSize | DhcpPort | ElectionWaitSecs | ElectionWeight | EncryptionType | Flags | IgnoreGatewayAddress | IgnoreWireless | LogFileName | LogFormat | MaxBlockSize | MaxLogFilesize | Mode | ReserveSecs | SessionTimeoutSecs | TftpRoot

Note

Installer properties:

Module.PXEEverywhere.Enabled | MODULE.PXEEVERYWHERE.COMMSPORT | MODULE.PXEEVERYWHERE.CONFIGSERVERURL | MODULE.PXEEVERYWHERE.DEBUG | MODULE.PXEEVERYWHERE.DHCPPORT | MODULE.PXEEVERYWHERE.ELECTIONWAITSECS | MODULE.PXEEVERYWHERE.ELECTIONWEIGHT | MODULE.PXEEVERYWHERE.USEFIPS | MODULE.PXEEVERYWHERE.LOGPATH | MODULE.PXEEVERYWHERE.LOGFORMAT | MODULE.PXEEVERYWHERE.MAXLOGFILESIZE | MODULE.PXEEVERYWHERE.MODE | MODULE.PXEEVERYWHERE.RESERVESECS | MODULE.PXEEVERYWHERE.TFTPROOT

Note

Configuration file settings:

Module.PXEEverywhere.Enabled

12.5.5.1 PXE Everywhere Agent installation settings

This table lists the configuration settings visible in the PXE Everywhere screen during an interactive installation of the 1E Client. Other installer properties are available when using a command-line installation or a transform.

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

Installer property	Mandatory	Default value	Description
Module.PXEEverywhere.Enabled	No	false	Set this property to **true** to enable the PXE Everywhere Agent client module. The default value is false. **Note** If enabled, when the 1E Client starts it will attempt to automatically remove any previous installations of PXE Everywhere Agent. This setting does not have an associated registry entry and is stored in the 1E Client configuration file.
MODULE.PXEEVERYWHERE.CONFIGSERVERURL	Yes	http://SERVER/PXELite/PXELiteConfiguration.asmx	URL for the PXE Everywhere Central web service in the format: *http://SERVER/PXELite/PXELiteConfiguration.asmx* where *<SERVER>* is the name of the server (or FQDN) where the PXE Everywhere Central web service is installed. **Note** The http prefix to the URL is case-sensitive and must be entered

Installer property	Mandatory	Default value	Description
			in all lower case letters. The URL is not verified by the installer, so you will need to ensure that the correct URL is entered. This setting has an associated ConfigServerAddress registry value.
MODULE.PXEEVERYWHERE.USEFIPS	No	0	You must use the same FIPS encryption setting on all PXE Everywhere Agents. Use of FIPS compliant encryption for communications. 0 – use default encryption 1 – use FIPS encryption This setting has an associated EncryptionType registry value.
MODULE.PXEEVERYWHERE.DHCPPORT	No	67	This installer property is set to 2067 if **Enable DHCP Snooping support** is checked during an interactive installation of the 1E Client installer. This is the UDP port on which the PXE Everywhere Agent will listen for PXE requests. If DHCP Snooping is not being used, then this port must be 67 (default), and you do not need to install Responders.

Installer property	Mandatory	Default value	Description
			When manually installing the PXE Everywhere Agent, if the DHCP Snooping option is enabled in the installer UI, the default port is changed from 67 (43 hex) to 2067 (813 hex). If the MODULE.PXEEVERYWHERE.DHCPPORT installer property is used to specify a port other than 67, the installer UI assumes the DHCP Snooping option is enabled. If DHCP Snooping is being used, then DhcpPort on Agents must be the same value as AltPxeServerPort on Responders. The default value of AltPxeServerPort is 2067. If a value other than 2067 is specified as a custom port number on Agents, you will also need to manually create the AltPxeServerPort (and AltPxeClientPort) registry values on Responders. This setting has an associated DhcpPort registry value.

12.5.5.2 PXE Everywhere Agent registry settings

This table lists all registry setting and their associated installer properties.

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

Registry name	Registry type	Installer property	Mandatory	Default value	Description
AlwaysBootImageId	REG_SZ	This value does not have an installer property.	No	Registry value is not created.	A string value containing a valid package id of a boot image. If specified, do not get boot image ID from PXE Everywhere Central but use this one instead.
AlwaysIsMandatory	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	Whether the boot image is mandatory (value 1) or not (0). Only relevant in combination with *AlwaysBootImageId*.
BindTo	REG_SZ	This value does not have an installer property.	No	Registry value is not created.	Comma-separated list of IP addresses which PXE Everywhere Agent listens for DHCP (PXE) and TFTP requests. If not present, PXE Everywhere Local listens on all IP addresses. Use this if there is more than one network interface.
CommsPort	REG_DWORD	**MODULE.PXEEVERYWHERE.COMMSPORT**	No	2012	Used for UDP election broadcast messages, this must be opened in the Windows firewall.
ConfigServerAddress	REG_SZ	**MODULE.PXEEVERYWHERE.CONFIGSERVERURL**	Yes	http://SERVER/PXELite/PXELiteConfiguration.asmx	URL for the PXE Everywhere Central web service in the format:

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					http://SERVER/PXELite/PXELiteConfiguration.asmx where *<SERVER>* is the name of the server (or FQDN) where the PXE Everywhere Central web service is installed. **Note** The http prefix to the URL is case-sensitive and must be entered in all lower case letters. The URL is not verified by the installer, so you will need to ensure that the correct URL is entered.
Debug	REG_DWORD	**MODULE.PXEEVERYWHERE.DEBUG**	No	1	The debug level. Leave this at *1* unless 1E Support recommends a change. The range is: *0x1*: Basic logging *0x4*: Extra "application-specific" logging *0x8*: Extra registry logging

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					0x10: Increased general logging The following two bits will perform centralized logging via SOAP calls to the PXE Central Server: *0x1000*: Logs election results *0x2000*: Logs TFTP file transfer start and stop (includes statistics).
DefaultBlockSize	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	Default TFTP block size. 512 if not specified.
DhcpPort	REG_DWORD	**MODULE.PXEEVERYWHERE.DHCPPORT**	No	67	This is the UDP port on which the PXE Everywhere Agent will listen for PXE requests. If DHCP Snooping is not being used, then this port must be 67 (default), and you do not need to install Responders. When manually installing the PXE Everywhere Agent, if the DHCP Snooping option is enabled in the installer UI, the default port is changed from 67 (43 hex) to 2067 (813 hex). If the

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					MODULE.PXEEVERYWHERE.DHCPPORT installer property is used to specify a port other than 67, the installer UI assumes the DHCP Snooping option is enabled. If DHCP Snooping is being used, then DhcpPort on Agents must be the same value as AltPxeServerPort on Responders. The default value of AltPxeServerPort is 2067. If a value other than 2067 is specified as a custom port number on Agents, you will also need to manually create the AltPxeServerPort (and AltPxeClientPort) registry values on Responders.
ElectionWaitSecs	REG_DWORD	**MODULE.PXEEVERYWHERE.ELECTIONWAITSECS**	No	1	Time (in seconds) to wait for responses to the election request before broadcasting the result. Can be any positive integer value above 0.
ElectionWeight	REG_DWORD	**MODULE.PXEEVERYWHERE.ELECTIONWEIGHT**	No	50	When set, this manually created registry value determines the

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					likelihood of the machine winning elections, all else being equal. The value must be between 0 and 99 inclusive. The higher the value the the higher the likelihood of winning. If no value is set, a default of 50 is used.
EncryptionType	REG_DWORD	**MODULE.PXEEVERYWHERE.USEFIPS**	No	0	You must use the same FIPS encryption setting on all PXE Everywhere Agents.Use of FIPS compliant encryption for communications. 0 – use default encryption 1 – use FIPS encryption
Flags	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	If set to ***1*** the DHCP listener adds an ASCII terminator character to the bootfile name in the DHCP acknowledgment message. Some HP machines require this. Any value other than **1** is treated as default 0.acknowledgment
IgnoreGatewayAddress	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	If set to any value other than ***0*** the DHCP

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					listener ignores the gateway address. If not set then assumes default ***0*** .
IgnoreWireless	REG_DWORD	This value does not have an installer property.	No	0	If set to **1** then PXE Everywhere Agent does not bind on wireless adapters. Any value other than 1 is treated as default 0.
LogFileName	REG_SZ	**MODULE.PXEEVERYWHERE.LOGPATH** **Note** This property only specifies the location of the log file.	No	%ALLUSERSPROFILE%\1E\PXEEverywhere PXEEverywhere.log	The location of the PXE Everywhere log file. The path is created if it does not exist. The logfile name is *PXEEverywhere.log*
LogFormat	REG_DWORD	**MODULE.PXEEVERYWHERE.LOGFORMAT**	No	1	Formatting depends on which bits are set: bit *0 (0x01)* use Configuration Manager-compatible format (default) bit *3 (0x08)* do no formatting bit *7 (0x80)* include milliseconds in the timestamp

Registry name	Registry type	Installer property	Mandatory	Default value	Description
MaxBlockSize	REG_DWORD	**Note** This value does not have an installer property, but is configurable when deployed using 1E Client Deployment Assistant. Please refer to Installing PXE Everywhere Agents: Preparing a Configuration Manager Application for PXE Everywhere Agent using the 1E Client Deployment Assistant.	No	Registry value is not created.	Maximum value for the block size (in bytes). PXE Everywhere uses the system MTU to derive the size of TFTP packets. May require limiting when using VPN tunnels. In most cases, this value should not be altered. Default is 8192 (8 kbytes). **Note** The actual block size used for the TFTP protocol is the lesser value of the **tftpBlockSize** and the **MaxBlockSize** registry values. The **tftpBlockSize** value is specified in the **CreateBCD.exe** utility command-line, and does not have a registry entry or installer property.

Registry name	Registry type	Installer property	Mandatory	Default value	Description
MaxLogFilesize	REG_DWORD	**MODULE.PXEEVERYWHERE.MAXLOGFILESIZE**	No	10485760	Maximum size for the log file in bytes. Once the file reaches the specified size, a copy is made with a *.lo_* extension in the same directory. A new log file will then be created. Default is 10485760 (10 MBytes).
Mode	REG_DWORD	**MODULE.PXEEVERYWHERE.MODE**	No	2	Mode must be one of the following: 0 – no elections 1 – the election instigator becomes the master (only to be used for testing) 2 – with elections (default)
ReserveSecs	REG_DWORD	**MODULE.PXEEVERYWHERE.RESERVESECS**	No	60	Time (in seconds) an election result remains active. 60 if not specified or 0 is specified. Can be any positive integer value.
SessionTimeoutSecs	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	Timeout for the TFTP listener. 600 if not specified or 0 is specified. Can be any positive integer value.

Registry name	Registry type	Installer property	Mandatory	Default value	Description
TftpRoot	REG_SZ	**MODULE.PXEEVERYWHERE.TFTPROOT**	No	*%ALLUSERSPROFILE%\1E\PXEEverywhere\TftpRoot*	Location for the PXE Everywhere Agent *TFTPROOT* directory. If you change the location of *TFTPROOT*, you need to change the location that you copy the additional PXE boot files to.

12.5.6 PXE Everywhere tools

Reference for command-line options used by 1E tools. These tools are used for Preparing and deploying 1E PXE Everywhere boot images.

1E tool	Where to find it	What it does
UpdateBootImage	Included in the PXE Everywhere Admin Tools. The PXE Everywhere Admin tools can be installed using the PXE Everywhere Central installer, on any computer that has the Configuration Manager Admin Console. Please refer to Installing PXE Everywhere Central. The PXE Everywhere Central installer is provided in the **PXE Everywhere download zip** available from the Nomad download area of the 1E Support Portal.	This tool is used to update Windows PE boot images for use with PXE Everywhere. It uses the native Configuration Manager API to add a certificate, and update the **variables.dat** file included in the image. When the PXE client loads the boot image, the Configuration Manager executables load the encrypted variables file and attempt to connect to the specified Management Point. The tool takes advantage of a boot image reload feature introduced in Configuration Manager 1706 CB, which enables you reload the latest version of Windows PE (from the Windows ADK installation directory) into the boot image when you run the **Update Distribution Points** wizard. **Note** Whenever you reload the boot image while running the **Update Distribution Points** wizard, for example to replace a certificate

1E tool	Where to find it	What it does
		that is about to expire, you must then re-run **UpdateBootImage.exe** to ensure the 1E components and settings are installed in the reloaded boot image. **Note** To include a client certificate, it must be provided as a PFX file in a Public Key Certificate Standard (PKCS #12) format, with private key exportable, and a known password. For details of CM certificates please refer to **Boot images for deploying operating systems** in PKI certificate requirements for System Center Configuration Manager (https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/network/pki-certificate-requirements.
UpdateBootImage GUI	Included in the **PXE Everywhere download zip** with the installers for PXE Everywhere Central and Responder. **Note** Use v1.0.0.6 with PXE Everywhere 4.0	This tool provides a GUI where a user defines the parameters required by the **UpdateBootImage** tool. When executed it copies a command-line to the clipboard, which you then copy into an elevated command prompt and execute it. The tool is provided to reduce the chance of errors when typing in the long command-line required by the UpdateBootImage tool. The executable name is **1E.PS.UpdateBootImageGUI.exe** and requires .NET Framework 4.5 or later.
CreateBCD	Included in the installation of **1E Client** with PXE Everywhere enabled.	This tool is run by a **Stage boot image** Task Sequence on PXE Everywhere Agents to copy the 1E PXE Everywhere boot image referenced by the Task Sequence to the Images folder in the Agent's TFTPTOOT, configure a suitable

1E tool	Where to find it	What it does
		TFTP Block Size, and create a boot configuration database on the Agent. CreateBCD only works within the context of a Configuration Manager task sequence. It will run outside a Task Sequence but have no effect. **Warning** **CreateBCD** does not validate the boot image - it will not detect a corrupt .wim file.

12.5.6.1 UpdateBootImage

This tool is used to update Windows PE boot images for use with PXE Everywhere. It uses the native Configuration Manager API to add a certificate, and update the **variables.dat** file included in the image. When the PXE client loads the boot image, the Configuration Manager executables load the encrypted variables file and attempt to connect to the specified Management Point.

The format of the command-line is as follows:

```
UpdateBootImage.exe [-parameter=value]
```

The following table shows command-line parameters and their description.

Parameter	Required / Optional	Description
BootImageID	Required	The package ID of the PXE Everywhere boot image, as created above.
CertExpiry	Optional	Used to define the Certificate expiration in days, Default = 365 (1 Year), minimum of 1 day is enforced. **Note** CertExpiry is only needed for self-signed certificates. It is not needed for PKI certificates.
CertPassword	Required (HTTPS only)	The password used when the .PFX file was exported earlier from the MP, so that it can be imported into the boot image. Only required if using the HTTPS protocol.

Parameter	Required / Optional	Description
CertPath	Required (HTTPS only)	The full path of the .PFX file exported earlier, so that it can be imported into the boot image. Only required if using the HTTPS protocol.
DistributionPoints	Required	A distribution point where the newly created PXE boot image has been distributed. The FQDN of the distribution point can be used and this must match the Server Name used to create the Site System Server.

ManagementPoints	Required	This parameter is used to create boot media that span multiple sites/management points. This should be set to a list of FQDN for all possible management points separated by the * character. This parameter is required for creating PXE Everywhere boot media in Configuration Manager.
		
		For single Primary Site environments, use the static based media option, SMSTSMP, for example:
		
		`-ManagementPoints=SMSTSMP=http://mp.contoso.com`
		
		For multi-site hierarchies, use the dynamic media option, SMSTSLocationMPs and specify at least one MP from each site, for example:
		
		`-ManagementPoints=SMSTSLocationMPs=`
		`http://site1MP.consoto.com*`
		`http://site2MP.contoso.com`

MediaPassword	Optional	The password applied to protect the media – recommended if deploying to Unknown Computers.
ProviderName	Required	Usually the name of the Configuration Manager server that hosts the "SMS Provider" role.
SiteCode	Required	Configuration Manager site code.
WIMFileName	Required	The filename of the boot WIM that you created above.

12.5.6.2 CreateBCD

This tool is run by a **Stage boot image** Task Sequence on PXE Everywhere Agents to copy the 1E PXE Everywhere boot image referenced by the Task Sequence to the Images folder in the Agent's

TFTPTOOT, configure a suitable TFTP Block Size, and create a boot configuration database on the Agent.

CreateBCD only works within the context of a Configuration Manager task sequence. It will run outside a Task Sequence but have no effect.

The format of the the command-line is as follows:

```
CreateBCD.exe [-parameter=value]
```

The following table shows command-line parameters and their description.

Option	Required / Optional	Description
-tftpBlocksize=*blocksize*	Optional	Sets the RAMDisk tftp blocksize in bytes.

TFTP Block Size

Some hardware may not support block size values higher than 16384 bytes and hence may fail to PXE boot. We recommend you use a TFTP block size of 8192 bytes for best results.

An known issue has been observed on some Cisco switches when DHCP Snooping is enabled and a block size greater than 1471 is used. The issue is referenced in the following two Cisco bug reports. If you are affected by this Cisco issue, change the tftpBlockSize to 1471 or lower.

https://quickview.cloudapps.cisco.com/quickview/bug/CSCvk53444.

https://quickview.cloudapps.cisco.com/quickview/bug/CSCtw63707

The issue may also be present in TP-Link switches.

The actual block size used for the tftp protocol is the lesser value of the **tftpBlockSize** and the **MaxBlockSize** registry values. Effectively, **MaxBlockSize** limits the **tftpBlockSize** specified in the **CreateBCD.exe** utility.

There is only one command-line switch for **CreateBCD.exe** which is used to set the **tftpBlockSize** for the RAMDisk (boot image). The notation for this is *`CreateBCD.exe -tftpBlocksize=blocksize`* where blocksize is measured in bytes.

12.5.7 PXE Everywhere release information

12.5.7.1 PXE Everywhere 8.1 release information – last updated 11-August-2022

These release notes contain late-breaking information about PXE Everywhere that you need to have to successfully install and use the product. For the most up-to-date information, see the online release notes and Known issues.

12.5.7.1.1 New Features in PXE Everywhere 8.1

12.5.7.1.1.1 PXE Everywhere Central

Now requires .NET Framework 4.8

No other features or feature changes added in this release, but includes any hotfixes from previous versions.

12.5.7.1.1.2 PXE Everywhere Responder

No features or feature changes added in this release, but includes any hotfixes from previous versions.

12.5.7.1.1.3 PXE Everywhere Agent

PXE Everywhere Agent is a client module of 1E Client 8.1, available for x64 and x86 platforms

There are no other changes in this version other than hotfixes.

12.5.7.1.2 Online help

PXE Everywhere comes with online help that shows you how to install, configure and use the product. Click the following link to view the help:

PXE Everywhere documentation

For support queries, please:

Use https://support.1e.com/ where you can search the KB or submit a support case.

Contact support@1e.com.

12.5.7.1.3 Known issues

The current known issues related to the installation and running of PXE Everywhere can be found in the Troubleshooting Known issues page of the PXE Everywhere documentation.

12.5.7.2 PXE Release History

12.5.7.2.1 8.1.2.8 11 Mar 2022 Minor Release

New features:

PXE Everywhere Agent is a client module of 1E Client 8.1, available for x64 and x86 platforms.

There are no changes in this version other than hotfixes.

Contains fixes:

Q22058 - PXE Everywhere - Log4Net Vulnerability - CVE-2018-1285 (TFS 249422)

12.5.7.2.2 8.0.4.10 19 Oct 2021 Major Release

New features:

PXE Everywhere Agent is a client module of 1E Client 8.0, available for x64 and x86 platforms.

There are no changes in this version other than hotfixes.

Contains fixes:

Q21606 - Standardize Nomad date logging (TFS 231355)

12.5.7.2.3 4.0.100.22 3128 Jul 2020 Maintenance Release

New features:

PXE Everywhere Agent is now a client module of 1E Client 5.2 available for x64 and x86 platforms

Contains fixes:

Q21141 - PXE boot fails when the windows firewall is enabled (TFS 212739)

Q21358 - PXE boot may fail if multiple network cards are present in the system (TFS 215056)

Q21328 - Enabling the PXE Module in the 1E Client 5.1 creates an additional 1E.Client.log in C:/Temp folder (TFS 218205)

12.5.7.2.4 4.0.0.99 28 Jul 2020 Major Release

New features:

PXE Everywhere Agent is now a client module of 1E Client 5.1 available for x64 and x86 platforms

PXE Everywhere Static Responder (to support DHCP Snooping) now has its own installer

PXE Everywhere replaces PXELite name

UpdateBootImageGUI is included in the PXE Everywhere download zip

Contains fixes:

Q20742 - PXE Boot fails on Microsoft Surface Pro systems (TFS 195659)

Q20475 - UpdateBootImage.exe fails with Configuration Manager 1902 (TFS 175421)

12.5.7.2.5 3.2.0.56 20 Mar 2019 Major Release

New features:

Support for networks with DHCP Snooping enabled

Contains fixes:

Q20241 - Reusing the same NIC for multiple PXE initiated deployments in System Center Configuration Manager OSD (TFS - 26469)

Q20241 - PXE Central install does not function properly with ConfigMgr CAS database (TFS - 133118)

Q20241 - PXE Central does not provide BootID to devices where Unknown0=1 (TFS - 127155)

Q20235 - PXE Everywhere answers election requests on non-preferred network (TFS - 133541)

Q20235 - PXE Everywhere is not RFC 4578 compliant which may be causing PXE Boot failures (TFS - 143777)

Q20235 - PXE Agent licensing changes (TFS - 142988)

PXE Server returns the wrong adapter's IP in DHCP messages (TFS - 171559)

12.5.7.2.6 3.1.300.521 Mar 2017 Maintenance Release

Enhancements:

Support for Windows Server 2016

Support for Configuration Manager CB 1606 and CB 1610

12.5.7.2.7 3.1.200.4 02 Sep 2016 Maintenance Release

General enhancements

Contains fixes:

CreateBCD.exe filling-up Tftproot with all contents of C: (TFS - 53617)

12.5.7.2.8 3.1.100.46309 26 May 2016 Minor Release

Enhanced handling of PXE boots for machines that do not comply to the standard PXE protocol

Contains fixes:

PXE Everywhere service stops unexpectedly (TFS - 20300)

PXE Everywhere local host registry value "BindTo" does not work (TFS - 37665)

PXELite local consuming high CPU cycles on PCs and laptops (TFS - 42964)

12.5.7.2.9 3.0.0.9 10 Aug 2015 Major Release

New features:

Full compliance with Federal Information Processing Standards (FIPS)

Full support for Unified Extensible Firmware Interface (UEFI) devices.

Support for ConfigMgr 2012 SP2, ConfigMgr 2012 R2 SP1, Windows 10 and Windows Server 2012 R2

12.5.7.3 PXE Everywhere features by release

A list of features organized by the release they were implemented in. Links through to the features are provided for convenience.

12.5.7.3.1 New in PXE Everywhere 8.1

12.5.7.3.1.1 PXE Everywhere Central

Now requires .NET Framework 4.8

No other features or feature changes added in this release, but includes any hotfixes from previous versions.

12.5.7.3.1.2 PXE Everywhere Responder

No features or feature changes added in this release, but includes any hotfixes from previous versions.

12.5.7.3.1.3 PXE Everywhere Agent

PXE Everywhere Agent is a client module of 1E Client 8.1, available for x64 and x86 platforms

There are no other changes in this version other than hotfixes.

12.5.7.3.2 PXE Everywhere 8.0 features

12.5.7.3.2.1 PXE Everywhere Central

No features or feature changes added in this release, but includes any hotfixes from previous versions.

12.5.7.3.2.2 PXE Everywhere Responder

No features or feature changes added in this release, but includes any hotfixes from previous versions.

12.5.7.3.2.3 PXE Everywhere Agent

PXE Everywhere Agent is a client module of 1E Client 8.0, available for x64 and x86 platforms

Bootshim.efi folder renamed from **BootPrograms** to **NetworkBootPrograms** (1E\Client\Extensibility\PXEEverywhere\NetworkBootPrograms)

There are no other changes in this version other than hotfixes.

12.5.7.3.3 PXE Everywhere 4.0 features

This 4.0.100 maintenance release contains the following new features:

PXE Everywhere Agent is now a client module of 1E Client 5.2, available for x64 and x86 platforms.

The main 4.0 release introduced the following new features:

PXE Everywhere Agent is now a client module of 1E Client 5.1 available for x64 and x86 platforms.

PXE Everywhere Responder (used to support DHCP Snooping) now has its own installer to replace Static Responder mode of the Agent, as described in Installing PXE Everywhere Responder, and has been recompiled as x64 instead of x86.

PXE Everywhere has replaced PXELite name throughout the product, with a few exceptions:

The PXE Everywhere website and Application Pool is still called **PXELite**

The registry root for PXE Everywhere Central is still **PXELiteCentral**

The registry root for PXE Everywhere Responder is still **PXELiteServer**.

UpdateBootImageGUI is included in the PXE Everywhere download zip.

12.5.7.3.4 PXE Everywhere 3.2 features

Introducing the Static Responder mode of PXE Everywhere Agent to support networks with DHCP Snooping enabled

12.5.7.3.5 PXE Everywhere 3.1 features

Support for Windows Server 2016

Support for Configuration Manager Current Branch

12.5.7.3.6 PXE Everywhere 3.0 features

Enhanced handling of PXE boots for machines that do not comply to the standard PXE protocol

Compliance with Federal Information Processing Standards (FIPS)

Support for Unified Extensible Firmware Interface (UEFI) devices.

Support for Configuration Manager 2012 SP2, Configuration Manager 2012 R2 SP1, Windows 10 and Windows Server 2012 R2

12.5.7.3.7 PXE Everywhere 2.3 features

Support for UEFI devices. There is a known limitation for this feature where non-mandatory deployments do not time-out. This would occur in an uncommon configuration where machines were configured so that the NIC card was the first device in the boot order. 1E is aware of the administrative challenge caused by this issue and the problem will be addressed in the next PXE Everywhere release, scheduled for Q2 2015.

12.5.7.3.8 PXE Everywhere 2.2 features

Support for Configuration Manager 2012 R2, Windows 8.1 and Windows Server 2012 R2

Support for setting RAMDisk (boot image) TFTP blocksize - new configurable **tftpblocksize** option in the **CreateBCD.exe** component

> **Note**
>
> This version addresses a vulnerability in the PXE Everywhere Local Host's use of Trivial File Transfer Protocol (FTFP). In earlier versions the TFTP server running on the remote host was vulnerable to a directory traversal attack that could have allowed an attacker to read arbitrary files on the remote host by pre-pending their names with directory traversal sequences. If you are running PXE Everywhere Local Host v2.1 in your environment, we recommend you upgrade all end-points to the latest version of the PXE Everywhere Local Host at your earliest convenience.

12.5.7.3.9 PXE Everywhere 2.1 features

Configuration Manager 2012 SP1 support

Windows 8 and Windows Server 2012 support

Boot image certificate expiration – new configurable option in the UpdateBootImage component

12.5.7.3.10 PXE Everywhere 2.0 features

Configuration Manager 2012 integration – the new version of PXE Everywhere integrates with Configuration Manager 2012 to apply boot images to PXE-booting bare metal machines.

Multiple PXE Everywhere Local Hosts – the new version of PXE Everywhere enables PXE support on all computers on a subnet which elect the most suitable host when a PXE boot request comes in.

Nomad integration – PXE Everywhere, in conjunction with Nomad, helps minimize WAN usage by ensuring that locally cached Packages are used wherever possible when deploying OS images.

12.5.8 Log files

Names and locations of log files created by PXE Everywhere components.

PXE Everywhere component	Folder	Log file
1E Client	C:\ProgramData\1E\Client	1E.Client.log
PXE Everywhere Central	C:\ProgramData\1E\PXELite	WebService.log
PXE Everywhere Responder	C:\ProgramData\1E\PXEEverywhere	PXEEverywhereResponder.log
PXE Everywhere Agent	C:\ProgramData\1E\PXEEverywhere	PXEEverywhere.log

Please also refer to Upgrading PXE Everywhere: Name changes introduced in PXE Everywhere 4.0.

If the issue is related to PXELite boot media creation/updating using CreateBootImage.exe then please provide:

C:\Program Files (x86)\Microsoft Configuration Manager\AdminConsole\AdminUILog\CreateTsMedia.log

If the issue is related to the deployment of PXELite boot image into the TFTP folder of PXELite agent then please provide:

C:\ProgramData\1E\PXElite\CreateBCD.log
