A NightWatchman Management Center server is required when implementing a WakeUp solution. Your 1E Account Team will explain whether your license also includes NightWatchman client features. 1E NightWatchman Agent is a separately installed client agent, that can optionally be used to help with power management of computers. It is not included in 1E Client, but is included in the Introducing 1E Client Deployment Assistantwhich assists with deploying Windows versions of 1E Client via Configuration Manager. As well as providing power management features, when 1E NightWatchman Agent is installed alongside the WakeUp client, it will optionally manage the computer returning to its original power state after being woken using 1E WakeUp and the computer is not busy, for example, installing patches.

Web WakeUp is an optional server component that is typically installed on the NightWatchman Management Center server. It is a web portal for users and administrators to search for computers to wake. It optionally provides a remote desktop link to the woken computer.

2.2.6.2 Client hardware requirements for WoL

To utilize Wake-On-LAN (WoL) technology, you need the following hardware configurations:

Hardware	Configuration
Network card	A network card that can support Wake-On-LAN. Your network card vendor can tell you if your network adapter supports Wake-On-LAN. If it does, it must be configured to enable remote wake-up. Some adapter drivers are disabled by default within the operating system.
System BIOS	Wake-On-LAN must be enabled in the system BIOS. This option can usually be found in the Boot menu of the BIOS configuration program. Some BIOS have a 'Maximum Power Savings' or 'Low Power S5' option, which should be disabled in order to allow some power to the network card.
Power management	APM or ACPI should be enabled, otherwise, the user of the machine should ensure that it is powered off by hitting the off button after shutdown.

A quick way to tell if a system is Wake-On-LAN ready is to power down the system and then look at the network adapter display LED's. If the lights are still on, then chances are that the system is OK. Windows must have been powered down gracefully (either off or asleep) in order for it to prepare the network card for WOL.

Tip

Please contact 1E if you require guidance with WoL configuration on Windows operating systems and enterprise vendor hardware including Dell, HP and Lenovo computers.

2.2.6.3 1E NightWatchman Agent

If you are deploying WakeUp as part of a NightWatchman Enterprise power management solution then you will also need to consider 1E NightWatchman Agent requirements.

2.2.6.4 Firewall Ports

Please refer to NightWatchman Enterprise communication ports.

2.3 Installing 1E Client

How to deploy 1E Client..

1E Client provides Tachyon features and modules for Nomad, PXE Everywhere, Shopping/WSA, and WakeUp.

2.3.1 Deploying 1E Client on Windows

Guidance for deploying 1E Client onto **Windows** computers, including installation and uninstallation.

If you are upgrading Tachyon Agent or other 1E Client agents to 1E Client, then please consult Upgrading 1E Client.

If you are reconfiguring 1E Client, then please refer to Reconfiguring 1E Client.

2.3.1.1 Requirements

Please review Planning for 1E Client pages. After installation, please review the Verifying page.

For details of supported OS platforms, please refer to Common client requirements page.

The guidance below is for deployment on Windows devices. For other platforms, please refer to Deploying 1E Client on macOS and Deploying 1E Client on Linux.

Note

1E Client does not have a license key. Even so, you must adhere to the terms of your license agreement.

2.3.1.1.1 Deployment choices

You must decide how you will configure the 1E Client and deploy to devices.

Note

For more information about configuring 1E Client properties during and after installation, please refer to 1E Client configuration settings and installer properties.

Use your existing software deployment tool to deploy 1E Client, for example, Microsoft System Center Configuration Manager. Some organizations may require the 1E Client to be packaged prior to deployment. The Introducing 1E Client Deployment Assistant is designed to help install Windows versions of 1E Client and other 1E agents using Configuration Manager. It includes template transform files for each combination of client/agent for 32-bit and 64-bit platforms, and automatically creates collections and deployments in Configuration Manager, so that you only need to populate the collections.

Tip

CDA is the recommended method of deploying 1E Client on Windows if your organization uses Configuration Manager. It is a wizard that guides you through common settings for clients and deployments, and provides additional options that the installers do not.

CDA is available as a zip file which you can download from the 1E Support Portal.

You use the CDA wizard to do the following:

- Create a MST transform file for each MSI containing your chosen settings
- Create a text file that contains the command-line for deploying each MSI
- Optionally allow deployment of an MSP patch file for each MSI
- Optionally connect to Microsoft Endpoint Configuration Manager to:
  - Create applications and packages
  - Create deployments and collections for the applications
  - Distribute source files to Distribution Points.

The CDA wizard creates an answer file that records the chosen settings (the wizard uses a template answer file that controls the default settings seen in the wizard).

You can download the latest Accumulated Hotfix MSP for each client, from the 1E Support Portal. The CDA zip that you download may already contain an MSP file for each client. You should remove this if you have alternate methods of deploying patches.

If you are using Configuration Manager, you must run the CDA Wizard on a computer that has the Configuration Manager console installed. Windows ADK (with WinPE add-on) is also required locally if CDA is used to configure a deployment of PXE Everywhere.

Windows installation account

The 1E Client installer installs a service as local system, therefore the installation account for Windows clients must be capable of being elevated in order to run the installer. The simplest way of achieving this is for the account to have full local administrator rights (as a member of the localgroup administrators, either directly or indirectly).

2.3.1.2 Preparation

1E Client installation files are available for download from https://support.1e.com/.

1E Client should be installed on all Windows clients. You must use the correct installer file according to the Windows architecture of the device:

- **1E.Client-x64.msi** is for 64-bit architectures
- **1E.Client-x86.msi** is for 32-bit architectures.

Pending Reboots

Please ensure you allow for a reboot, especially for mission-critical servers. After installing the 1E Client, the computer may request a reboot that appears to be caused by 1E Client, but is actually caused by a pending reboot from a previous software or patch installation. Pending reboots and notifications can occur up to several hours after installation, depending on policies in your organization, such as Computer Restart settings for Configuration Manager clients.

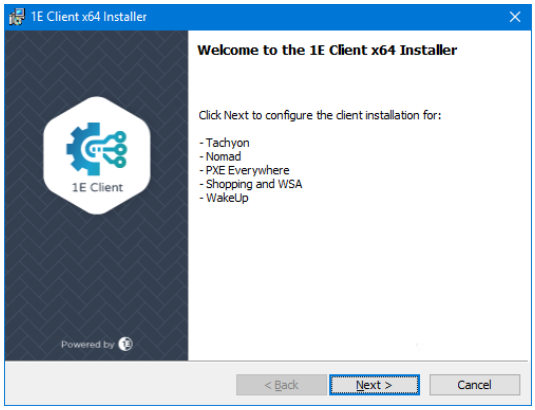
2.3.1.3 Installing the 1E Client interactively

When running the MSI directly or using a command line, please ensure the installation account has the required permissions as described in Installing the 1E Client interactively

The following panels describe each screen of the 1E Client installer.

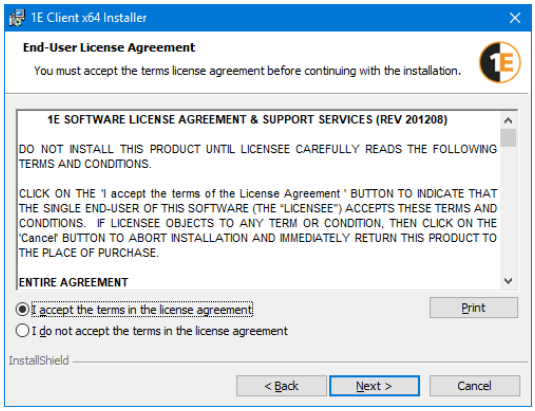
2.3.1.3.1 Welcome

The welcome screen, just click **Next** to continue.



2.3.1.3.2 End-User License Agreement

You must read and then accept this license information by clicking
I accept the terms in the license agreement before you can continue with the installation. Once this is done click **Next**.



2.3.1.3.3 Installation Folder

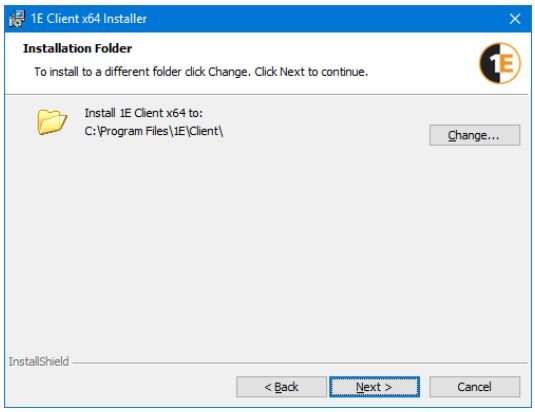
The next screen lets you to choose the folder where the 1E Client will be installed:

By default, this is set to:

`%programfiles%\1E\Client\`

But you can browse to a new folder using the **Change...** button.

Once the desired folder has been set you click the **Next** button to continue to the next screen.



2.3.1.3.4 Tachyon

On this screen you configure how the 1E Client connects with the Tachyon platform. If you are installing the 1E Client only to support Nomad, Shopping or WakeUp and do not have the Tachyon platform installed, uncheck the **Enable Tachyon** checkbox and click **Next**.

Setting	Description
Enable Tachyon	Check this box to enable Tachyon.
Switch	Sets the name and port of the server where the Tachyon Switch is located. The default port is 4000.

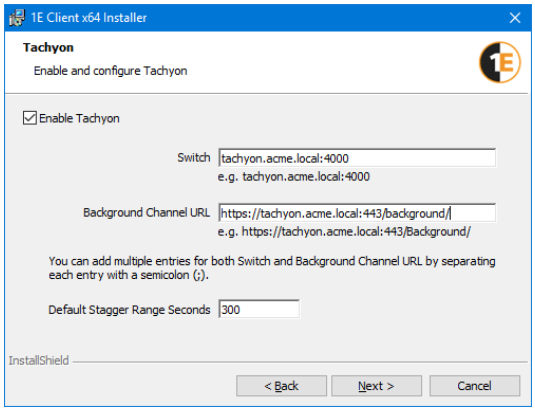
Setting	Description

	If Tachyon and Nomad client features are not required then the connection to Tachyon platform is not required, and both **Switch** and **BackgroundChannelUrl** settings must be set to **none** when doing a non-interactive (silent/quiet) install using installer properties on a command-line or in a MST transform file. When doing an interactive install then you must uncheck the **Enable Tachyon** checkbox.
	
	Client features are not required if the 1E Client is being installed only to support PXE Everwhere, Shopping, or WakeUp. They are only required for Nomad if using Nomad features of the Tachyon platform.
	
	To connect to the Tachyon platform then **Switch** will have one or more entries in the format:
	
	`Switch=<SwitchName>:<SwitchPort>`
	
	<SwitchName> is the DNS Name FQDN for one or more Switches. This is the same as the following except in a custom configuration where the Switch is installed on its own:
	
	• HTTPS Host Header specified on the *Website Configuration* screen of the Tachyon Server installer, which is the HTTPS binding for the Tachyon Web Site
	
	• Same as <BackgroundChannelServer>
	
	• DNS Name specified in the Tachyon Server's Web Certificate.
	
	<SwitchPort> is the Port number, which has default value of 4000. Any other port number is used only in a complex configuration if advised by 1E.
	
	In systems where there are multiple DNS Names, there will be multiple entries using a semi-colon (;) as the delimiter between entries. For example:
	
	`Switch=tachyon.acme.local:4000;tachyon.acme.com:4000`

Background Channel URL	Sets the fully qualified URL that the 1E Client will use to connect to the Tachyon background channel used to transfer large content. If the Tachyon server has been installed to use a

Setting	Description
	custom port for the background channel, the port number must be specified in the URL, for example https://tachyon.acme.local:8443/Background. If Tachyon and Nomad client features are not required then the connection to Tachyon platform is not required, and both **Switch** and **BackgroundChannelUrl** settings must be set to **none** when doing a non-interactive (silent/quiet) install using installer properties on a command-line or in a MST transform file. When doing an interactive install then you must uncheck the **Enable Tachyon** checkbox. Client features are not required if the 1E Client is being installed only to support PXE Everwhere, Shopping, or WakeUp. They are only required for Nomad if using Nomad features of the Tachyon platform. To connect to the platform then **BackgroundChannelUrl** will have one or more entries in the format: `BackgroundChannelUrl=https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/` **<BackgroundChannelServer>** is the DNS Name FQDN of the server, which is the same as the: • HTTPS Host Header specified on the *Website Configuration* screen of Tachyon Setup, which is the HTTPS binding for the Tachyon website • Same as <SwitchName> • DNS Name specified in the Tachyon Server's Web Certificate. **<BackgroundChannelPort>** is the Port number, which is the same as: • The HTTPS Port specified on the *Website Configuration* screen of Tachyon Setup, which is the HTTPS binding for the Tachyon website • If using the default HTTPS port 443, the port can be omitted from the URL.

Setting	Description
	In systems with multiple server and multiple DNS Names, there will be multiple entries on one line using a semi-colon (;) as the delimiter between entries. For example: `BackgroundChannelUrl=https://tachyon.acme.local:443/Background/;https://tachyon.acme.com:443/Background/`
Default Stagger Range Seconds	Sets the scope for the random delay used by the 1E Client to prevent overburdening the Tachyon Background Channel. Some operations (including HTTPS downloads from the BackgroundChannel) are randomly time-staggered across Tachyon platform clients. This property dictates the upper-limit on the default randomization period in seconds. Range is 0 to 3600. Default is 300. Use **0** to instruct Tachyon platform client not stagger operations by default. **Note** Do not change this value unless advised by 1E. Only use 0 or a low value in systems that support less than 500 clients. **Note** **Note** This setting is not used for HTTPS downloads from the BackgroundChannel if NomadContentDownloadEnabled is **true**, because Nomad does the bandwidth management.



2.3.1.3.5 Nomad

When using Nomad with Configuration Manager you must enable Nomad on Configuration Manager clients and Distribution Points. The 1E Client Nomad module replaces the NomadBranch client from previous versions of Nomad. You can also use the Nomad client with Tachyon to improve the efficiency of content downloads.

Setting	Description
Enable Nomad	Check this box to enable Nomad. Nomad is used to support efficient content download for Configuration Manager and Tachyon. For Tachyon, its Nomad content download feature is enabled by default but only used if Nomad is enabled. **Note** If Nomad is enabled, when the 1E Client starts it will upgrade any previous installation of the NomadBranch client.
Enable 1E Platform features	Check this box to let you configure the Single-Site Download (SSD) options and WakeUp integration.

Options	Enabled
Content Registration only	This configures Nomad to use **Single Site Download** to *provide* content to peers by registering the content it has in its cache in Content Distribution on the Tachyon platform. In the registry SSDEnabled is set to 2 and ContentRegistration is set to 1. This also allows content to be reported in Nomad app dashboards and Device View. Typically, content registration should be enabled, unless there is a specific reason for a computer not to be a master. Content Registration is automatically disabled in WinPE.

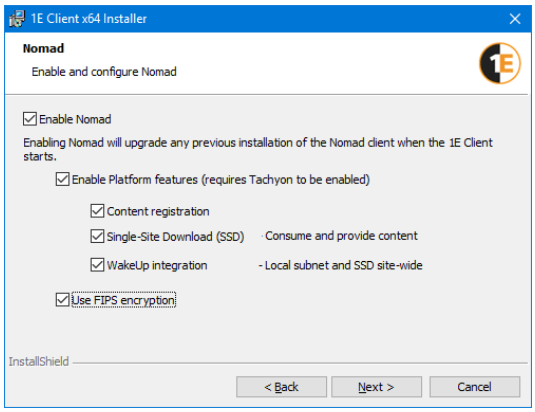
Setting	Description	
	Single-Site Download (SSD) only	This configures Nomad to use **Single Site Download** and *consume* content hat has been registered in Nomad on the Tachyon platform. SSD is used as a fallback if the client is unable to find content on the local subnet. In the registry SSDEnabled is set to 1 and ContentRegistration is set to 1. Nomad queries Nomad on the Tachyon platform asking for peers that have registered content.
	Both enabled	This configures Nomad to use **Single Site Download** so that it can both *consume and provide* content, as well as report in the Nomad app and Device View. In the registry, SSDEnabled is set to 3 and ContentRegistration is set to 1. This is the recommended configuration unless there is a specific reason for a computer not to be a master. Content Registration is automatically disabled in WinPE.
	Neither enabled	The client does not participate in **Single Site Download** activities and does not report content details to Nomad. In the registry, SSDEnabled is set to 0 and ContentRegistration is set to 0. **Enable 1E Platform features** has no effect, and is ignored.

Setting	Description
	If you need to enable reporting but prevent the Nomad client from acting as an SSD provider, then use installer properties or mst transform files to configure MODULE.NOMAD.SSDENABLED and MODULE.NOMAD.CONTENTREGISTRATION. For more information about SSD, please refer to Single Site Download (SSD). **Options** / **Enabled** **WakeUp integration** — If you check **WakeUp integration** but not **Single Site Download (SSD)**, any attempt to wake-up peers with particular content will only be on the local subnet. If **Single Site Download (SSD)** is also checked, Nomad will try to wake peers with particular content in neighboring subnets on the site if peers on the local subnet do not wake. **Note** The Platform settings are only available if you have enabled Tachyon. **Note** These settings do not affect other Platform features such as Pre-caching.
Use FIPS encryption	Checking to **Use FIPS Encryption** configures the Nomad module to use FIPS-encrypted encrypted communications. You must ensure that Nomad is configured with the same **FIPS encryption** setting on all your 1E Client.

Tip

If you are licensed to use Nomad, you should enable it if you have enabled Tachyon, so that Tachyon can take advantage of its content download features that intelligently manage bandwidth and use its peers when downloading content from Tachyon Background Channel and other HTTP/S sources.

You do not require Configuration Manager in order for Tachyon to use Nomad. For more information on this feature, please refer to Downloading client content and Nomad integration.

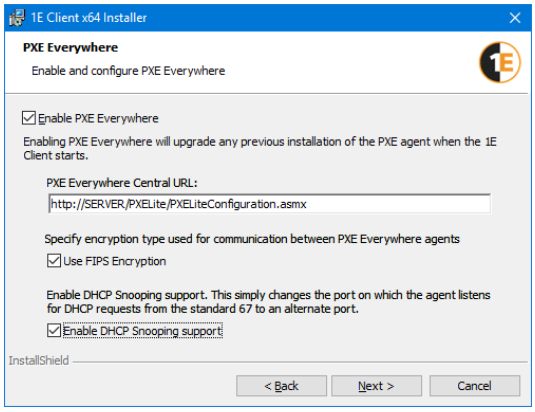


2.3.1.3.6 PXE Everywhere

If you are using PXE Everywhere 4.0, 8.0, 8.1 8.1 or later, you must enable PXE Everywhere. The 1E ClientPXE Everywhere Agent client module of the replaces the PXE Everywhere Agent from previous versions of PXE Everywhere.

Setting	Description
Enable PXE Everywhere	Check this box to enable PXE Everywhere Agent client module. **Note** If enabled, when the 1E Client starts it will attempt to automatically remove any previous installations of PXE Everywhere Agent. Other fields are only enabled if this checkbox is checked.
PXE Everywhere Central URL	URL for the PXE Everywhere Central web service in the format: *http://SERVER/PXELite/PXELiteConfiguration.asmx* where *<SERVER>* is the name of the server (or FQDN) where the PXE Everywhere Central web service is installed. **Note** The http prefix to the URL is case-sensitive and must be entered in all lower case letters. The URL is not verified by the installer, so you will need to ensure that the correct URL is entered.

Setting	Description
Use FIPS Encryption	Checking to **Use FIPS Encryption** configures the PXE Everywhere Agent module to use FIPS encrypted communications. You must ensure that PXE Everywhere is configured with the same **FIPS encryption** setting on all your 1E Client.
Enable DHCP Snooping support	Enable this option if your network uses DHCP Snooping. You will also need to implement one or more PXE Everywhere Responders as described in Design Considerations.



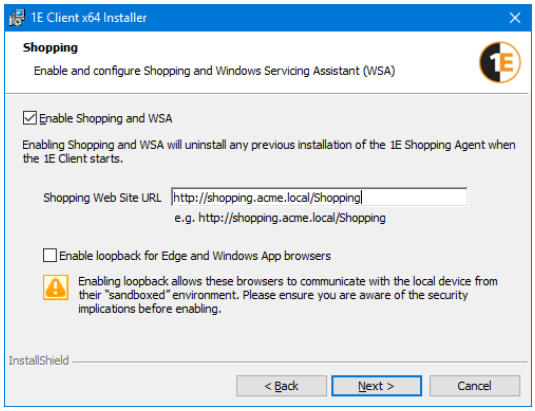
2.3.1.3.7 Shopping

If you are using Shopping 6.0 or later, you must enable Shopping. The 1E Client Shopping module replaces the Shopping Agent from previous versions of Shopping.

Setting	Description
Enable Shopping and WSA	Check this box to enable Shopping Integration and the Windows Servicing Assistant. Shopping must be enabled so that users of a computer can use the 1E Shopping self-service portal, the Windows Servicing Assistant, and the 1E Virtual Assistant. **Note** If enabled, when the 1E Client starts it will attempt to automatically remove any previous installations of the 1E Shopping Agent.

Setting	Description
Shopping Web Site URL	This field is only enabled if the **Enable Shopping and WSA** checkbox is checked. Example: *https://shopping.acme.local/Shopping* This is the URL of the Shopping Central website, comprising: • **scheme** - either http or https • **host header** - DNS Name FQDN - this is the host header configured for the Shopping website, which is normally a DNS Name FQDN • **port number** - you do not have to provide this if using default port 80 or 443 • **path** - this is always /Shopping. The URL is not verified by the installer, so you will need to ensure that the correct URL is entered.
Enable loopback for Edge and Windows App b rowsers	Enable this option if users will connect to the Shopping website using Edge or other Metro-style browsers. When users connect to the Shopping Portal, the website needs to get the latest details about the local computer. Shopping may already have details from the Configuration Manager database, but these need to be confirmed and updated. Browser standards only allow websites to get limited information about the user and computer, therefore the website needs to make loopback calls to the local computer via the Shopping client. The following browsers permit loopback calls by default:

Setting	Description
	• All versions of Chrome • All versions of Firefox • Non-Metro UI based Internet Explorer browsers (including legacy Internet Explorer). If your Shopping users are using **Edge** and **Metro Internet Explorer** browsers, you must enable a **Loopback Exemption** to allow these browsers to make loopback calls. Exemption affects the browser as a whole and is not just restricted to the Shopping website. Before enabling this option, check your corporate security policy and be aware of the implications of allowing access between browsers and the local machine. By enabling loopback, you are only setting the Edge/Metro Internet Explorer browsers to the same level of security as other browsers which allow this setting already. If you are running an unattended install, you can use **MODULE.SHOPPING.LOOPBACKEXEMPTIONENABLED** for all OS but it only works on Windows 8, 8.1, 10 and Windows Server 2012 R2 and later. Shopping client only allows inbound connections to **localhost (127.0.0.1)** which prevents remote access.



2.3.1.3.8 WakeUp

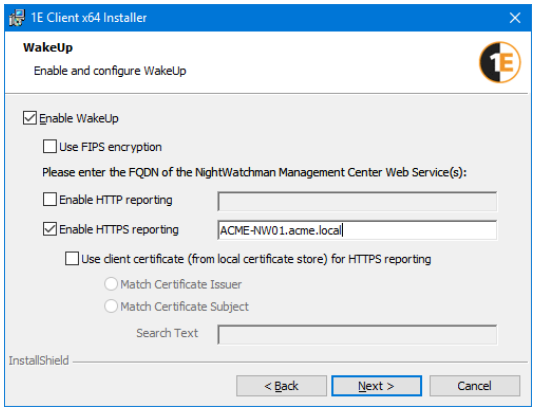
If you are using version 7.2.500 or later of NightWatchman Management Center or WakeUp Server you must install the 1E Client with this option enabled on client devices and on WakeUp server. The 1E Client WakeUp module replaces the WakeUp Agent from previous versions of the 1E Agent.

Setting	Description
Enable WakeUp	Check this box to enable WakeUp integration. WakeUp integration is required to enable 1E WakeUp capabilities on this device. **Note** If WakeUp Integration is enabled, when the 1E Client starts it will attempt to automatically remove any previous installation of the 1E WakeUp Agent. The 1E NightWatchman Agent is not affected.
Use FIPS encryption	Checking **Use FIPS Encryption** configures the WakeUp module to use FIPS encrypted communications. You must ensure that the NightWatchman Management Center, WakeUp Server and 1E NightWatchman Agent

Setting	Description
	components are all set to the same option.
Enable HTTP reporting	Check this box if the NightWatchman Management Center Web Service is configured to use HTTP and you want communications from the WakeUp module to use HTTP. Do not use this option when installing on a WakeUp Server. When checked you must set the DNS Name FQDN for the server hosting the NightWatchman Management Center Web Service in the edit field provided.
Enable HTTPS reporting	Check this box if the NightWatchman Management Center Web Service is configured to use HTTPS and you want communications from the WakeUp module to use HTTPS. Do not use this option when installing on a WakeUp Server. When checked you must set the DNS Name FQDN for the server hosting the NightWatchman Management Center Web Service in the edit field provided.
Use client certificate (from local certificate store) for HTTPS reporting	This checkbox is only enabled when the **Enable HTTPS reporting** checkbox is checked. You will need to check this option if the NightWatchman Management Center Web Service has been configured to request a client certificate.

Setting	Description
	The certificate is retrieved from the local certificate store and is found by providing a certificate issuer or certificate subject search text. The first certificate found that matches the text will be used to authenticate the client with the NightWatchman Management Center Web Service.
Match Certificate Issuer	This option is only enabled when the **Use client certificate for HTTPS reporting** checkbox is checked. When selected this option sets the search in the local certificate store to match against the certificate issuer field of the certificate.
Match Certificate Subject	This option is only enabled when the **Use client certificate for HTTPS reporting** checkbox is checked. When selected this option sets the search in the local certificate store to match against the certificate subject field of the certificate.
Search Text	This option is only enabled when the **Use client certificate for HTTPS reporting** checkbox is checked. When enabled this edit field should be set to the search text used to locate and retrieve the client certificate from the local certificate store. This will be matched against either the certificate issuer or the certificate

Setting	Description
	subject, depending on which option has been selected above.



Note

When installing on client devices, enable HTTP or HTTPS reporting in order for NightWatchman Management Center to track which subnet the client device is on when it powers down. The WakeUp module reports back subnet changes more frequently than the NightWatchman Agent.

WakeUp Server must be installed before installation of the WakeUp client. If WakeUp client is installed first the WakeUp Server installer only provides the WakeUp Administration console installation option.

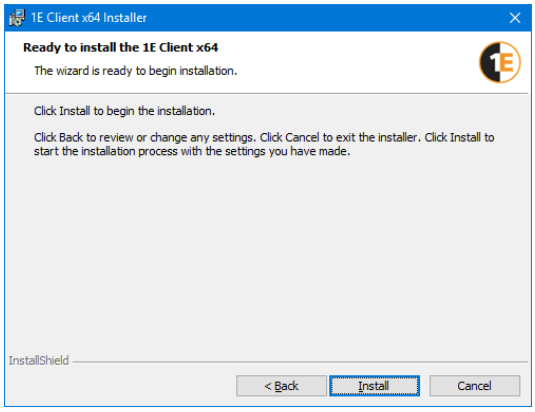
When installing on a WakeUp Server, do **not** enable HTTP or HTTPS reporting, because that prevents the server from appearing as a client in the NightWatchman Management Center Admin Console. This will only disable Agent reporting whilst the WakeUp Server itself should have reporting enabled for reporting statistics.

Warning

Enter the DNS Name FQDN for the server hosting the NightWatchman Management Center Web Service, do not enter the full URL.

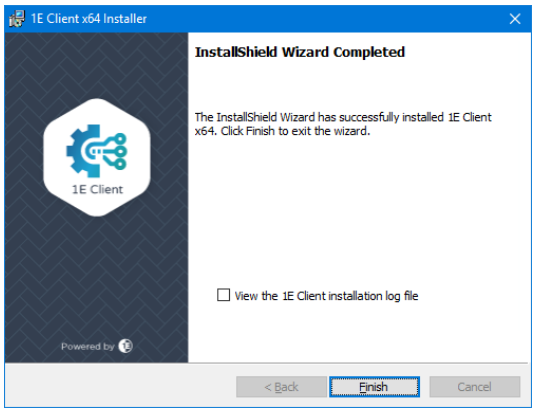
2.3.1.3.9 Ready to Install the 1E Client

Once you have finished entering all the settings, you can begin the installation by clicking on the **Install** button on this screen.



2.3.1.3.10 InstallShield Wizard Completed

After the attempted installation the **InstallShield Wizard Completed** screen will display the results and give you the option to **View the 1E Client installation log file**. To exit the installer click the **Finish** button.



2.3.1.4 Installing the 1E Client by command-line

In most cases the 1E Client will be installed in quiet mode from the command line using a software deployment tool such as Configuration Manager.

Because the expected length of the 1E Client installer command line is likely to exceed the limit imposed by Configuration Manager you will need to use MST transform file(s) for this to work. Please contact your packaging team if you need help creating transform files.

The Introducing 1E Client Deployment Assistant is designed to help install Windows versions of 1E Client and other 1E agents using Configuration Manager. It includes template transform files for each combination of client/agent for 32 and 64-bit platforms, and automatically creates collections and deployments in Configuration Manager so that you only need to populate the collections.

The installer properties listed on this page are for the options visible in the interactive installer above:

- 1E Client - common settings
- Tachyon platform client
- Nomad client

- PXE Everywhere Agent
- Shopping client
- WakeUp client.

Additional installer properties are available for:

- Platform features of the 1E Client
- Content Distribution client settings
- /document/preview/647626#UUID-07a4d117-b2a9-8325-0e8e-1d3649997dc4
- Shopping client settings
- Wakeup client settings.

Some Command-line examples are also provided below.

2.3.1.4.1 1E Client

The following are common settings for the 1E Client.

Installer property	Description
INSTALLDIR	Sets the installation folder. This value is not stored in the 1E Client configuration file. This value is stored as **InstallationDirectory** in the Windows registry under HKLM\SOFTWARE\1E\Client\ and must not be changed. Some client modules that run on Windows store their registry settings under their own keys in HKLM\SOFTWARE\1E. **Note** This installer property is for Windows only.

2.3.1.4.2 Tachyon platform client

When installing the full 1E Client (to be used with the Tachyon platform), the following are typical installer properties to use. Additional installer properties are described on the Platform features of the 1E Client page.

As with other Windows installers, uninstallation will leave behind any files, folders and registry entries that were created after installation.

Installer property	Description

BACKGROUNDCHANNELURL	If Tachyon platform and Nomad client features are not required then the connection to Tachyon Platform is not required, and both **Switch** and **BackgroundChannelUrl** settings must be set to **none** when doing a non-interactive (silent/quiet) install using installer properties on a command-line or in a MST transform file. When doing an interactive install then you must uncheck the **Enable Tachyon** checkbox.
	
	Tachyon client features are not required if the 1E Client is being installed only to support PXE Everwhere, Shopping, or WakeUp. They are only required for Nomad if using Nomad features of the Tachyon platform.
	
	To connect to the Tachyon platform then **BackgroundChannelUrl** will have one or more entries in the format:
	
	`BackgroundChannelUrl=https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/`
	
	<BackgroundChannelServer> is the DNS Name FQDN of the server, which is the same as:
	
	• the HTTPS Host Header specified on the *Website Configuration* screen of Tachyon Setup, which is the HTTPS binding for the Tachyon website
	
	• the same as <SwitchName>, refer to #UUID24ef0cf654c33163e98e9dc427464c32_id_Deploying1EClientonWindowsSWITCHSWITCH for details
	
	• the DNS Name specified in the Tachyon Server's Web Certificate.
	
	<BackgroundChannelPort> is the Port number, which is the same as:
	
	• the HTTPS Port specified on the *Website Configuration* screen of Tachyon Setup, which is the HTTPS binding for the Tachyon website
	
	• if using the default HTTPS port 443, the port can be omitted from the URL.
	
	In systems with multiple server and multiple DNS Names, there will be multiple entries on one line using a semi-colon (;) as the delimiter between entries. For example:
	
	`BackgroundChannelUrl=https://tachyon.acme.local:443/Background/;https://tachyon.acme.com:443/Background/`

Installer property	Description

SWITCH	If Tachyon and Nomad client features are not required then the connection to Tachyon platform is not required, and both **Switch** and **BackgroundChannelUrl** settings must be set to **none** when doing a non-interactive (silent/quiet) install using installer properties on a command-line or in a MST transform file. When doing an interactive install then you must uncheck the **Enable Tachyon** checkbox.
	
	Tachyon platform client features are not required if the 1E Client is being installed only to support PXE Everwhere, Shopping, or WakeUp. They are only required for Nomad if using Nomad features of the platform.
	
	To connect to the Tachyon platform then **Switch** will have one or more entries in the format:
	
	`Switch=<SwitchName>:<SwitchPort>`
	
	<SwitchName> is the DNS Name FQDN for one or more Switches. This is the same as the following except in a custom configuration where the Switch is installed on its own:
	
	• the HTTPS Host Header specified on the *Website Configuration* screen of the Tachyon Server installer, which is the HTTPS binding for the Tachyon Web Site
	
	• the same as <BackgroundChannelServer>, refer to #UUID24ef0cf654c33163e98e9dc427464c32_id_Deploying1EClientonWindowsBACKGROUNDCHANNELURLBACKGROUNDCHANNELURL for details
	
	• the DNS Name specified in the Tachyon Server's Web Certificate.
	
	<SwitchPort> is the Port number, which has default value of 4000. Any other port number is used only in a complex configuration if advised by 1E.
	
	In systems where there are multiple DNS Names, there will be multiple entries using a semi-colon (;) as the delimiter between entries. For example:
	
	`Switch=tachyon.acme.local:4000;tachyon.acme.com:4000`

DEFAULTSTAGGERRANGESECONDS	Some operations (including HTTPS downloads from the BackgroundChannel) are randomly time-staggered across Tachyon clients. This property dictates the upper limit on the default randomization period in seconds.

Installer property	Description
	Range is 0 to 3600. Default is 300. Use **0** to instruct Tachyon client not stagger operations by default. **Note** Do not change this value unless advised by 1E. Only use 0 or a low value in systems that support less than 500 clients. **Note** **Note** This setting is not used for HTTPS downloads from the BackgroundChannel if NomadContentDownloadEnabled is **true**, because Nomad does the bandwidth management.

Note

The BACKGROUNDCHANNELURL and SWITCH properties are mandatory. If you want to install the 1E Client with the 1E Client modules for Shopping or WakeUp enabled, and the full Tachyon platform infrastructure has not been installed, you should set both of these properties to **none**.

However, note that during an upgrade of **Tachyon Agent**, you must enable the connection to the Tachyon platform, therefore you must define the BACKGROUNDCHANNELURL and SWITCH properties.

Disabling the connection to the Tachyon platform is presently only possible for new installations of the 1E Client. If you wish to disable the connection following an upgrade, you must reconfigure the 1E Client once the upgrade has been completed. For more detail please refer to Reconfiguring 1E Client after installation.

2.3.1.4.3 Nomad client

When installing the 1E Client to support Nomad 7.0 or later, the following installer properties are available. Additional installer properties are described on the Content Distribution client settings page.

As with other Windows installers, uninstallation will leave behind any files, folders and registry entries that were created after installation.

Installer property	Description
MODULE.NOMAD.ENABLED	Nomad is used to support efficient content download for Configuration Manager and Tachyon. For Tachyon, the Nomad content download feature is enabled by default.

Installer property	Description
	Note If Nomad is enabled, when the 1E Client starts it will upgrade any previous installation of the NomadBranch client.
MODULE.NOMAD.PLATFORMURL	This installer property is no longer supported. The Nomad installer determines the location of servers from the platform client. Specifically, it communicates with Response Stack Switches and Background Channel.
MODULE.NOMAD.CONTENTREGISTRATION	Set to 1 to enable the Nomad client to act as a content provider across subnets when using **Single Site Download**.
MODULE.NOMAD.SSDENABLED	Set to 1 to enable **Single-site download**, which requires Tachyon platform with Nomad. If you enable both **Single-Site Download** and **Content Registration** then Nomad will make its own content available to other Nomad peers. If you enable **Single-Site Download** but not **Content Registration** then Nomad will be able to fetch downloads from registered peers on other subnets but will not make its own content available.
MODULE.NOMAD.WAKEUPENABLED	Set to 1 to enable **WakeUp integration**, which requires an ActiveEfficiency Server. If you enable **WakeUp integration** but not **Single Site Download**, any attempt to wake-up peers with particular content will only be on the local subnet. If **Single Site Download** is also checked, Nomad will try to wake peers with particular content in neighboring subnets on the site if peers on the local subnet do not wake.
MODULE.NOMAD.USEFIPS	Set to 1 to configure the Nomad module to use FIPS encrypted communications.

Installer property	Description
	You must ensure that Nomad is configured with the same **FIPS encryption** setting on all your 1E Client.

Note

Previous versions of Nomad required a license key (installer property PIDKEY). 1E Client and the Nomad client module do not require a license key. Even so, you must adhere to the terms of your license agreement.

2.3.1.4.4 PXE Everywhere Agent

When installing the 1E Client to support PXE Everywhere 8.1 or later, the following installer properties are available.

Installer property	Description
MODULE.PXEEVERYWHERE.ENABLED	Set this property to **true** to enable the PXE Everywhere Agent client module. The default value is false. **Note** If enabled, when the 1E Client starts it will attempt to automatically remove any previous installations of PXE Everywhere Agent.
MODULE.PXEEVERYWHERE.CONFIGSERVERURL	URL for the PXE Everywhere Central web service in the format: *http://SERVER/PXELite/PXELiteConfiguration.asmx* where *<SERVER>* is the name of the server (or FQDN) where the PXE Everywhere Central web service is installed. **Note** The http prefix to the URL is case-sensitive and must be entered in all lower case letters. The URL is not verified by the installer, so you will need to ensure that the correct URL is entered.
MODULE.PXEEVERYWHERE.USEFIPS	You must use the same FIPS encryption setting on all PXE Everywhere Agents. Use of FIPS compliant encryption for communications. • 0 – use default encryption

Installer property	Description
	• 1 – use FIPS encryption.
MODULE.PXEEVERYWHERE.DHCPPORT	This installer property is set to 2067 if **Enable DHCP Snooping support** is checked during an interactive installation of the 1E Client installer. This is the UDP port on which the PXE Everywhere Agent will listen for PXE requests. If DHCP Snooping is not being used, then this port must be 67 (default), and you do not need to install Responders. When manually installing the PXE Everywhere Agent, if the DHCP Snooping option is enabled in the installer UI, the default port is changed from 67 (43 hex) to 2067 (813 hex). If the MODULE.PXEEVERYWHERE.DHCPPORT installer property is used to specify a port other than 67, the installer UI assumes the DHCP Snooping option is enabled. If DHCP Snooping is being used, then DhcpPort on Agents must be the same value as AltPxeServerPort on Responders. The default value of AltPxeServerPort is 2067. If a value other than 2067 is specified as a custom port number on Agents, you will also need to manually create the AltPxeServerPort (and AltPxeClientPort) registry values on Responders, refer to #UUIDc24be1a07329bf137cee4da9b75a3a1a_id_PXEEverywhereRespondersettingsAltPxeClientPort.

2.3.1.4.5 Shopping client

When installing the 1E Client to support Shopping v5.5 or later, the following installer properties are available.

Installer property	Description
MODULE.SHOPPING.ENABLED	Shopping must be enabled so that users of a computer can use the 1E Shopping self-service portal, the Windows Servicing Assistant, and the 1E Virtual Assistant. **Note** If enabled, when the 1E Client starts it will attempt to

Installer property	Description
	automatically remove any previous installations of the 1E Shopping Agent.
MODULE.SHOPPING.SHOPPINGCENTRALURL	Example: *https://shopping.acme.local/Shopping* This is the URL of the Shopping Central website, comprising: • **scheme** - either http or https • **host header** - DNS Name FQDN - this is the host header configured for the Shopping website, which is normally a DNS Name FQDN • **port number** - you do not have to provide this if using default port 80 or 443 • **path** - this is always /Shopping.
MODULE.SHOPPING.LOOPBACKEXEMPTIONENABLED	Optional. Default value is **false**. Set this value to **true** if users are likely to use Microsoft Edge or other Metro browsers to access the Shopping website. The Shopping client requests this value from the Shopping Central website (admin console setting: Loopback exemption enabled). If the client fails to connect to the website, it defaults to using this local setting and retries later.

2.3.1.4.6 WakeUp client

When installing the 1E Client to support the WakeUp component of NightWatchman Enterprise v7.3 or later, the following are typical installer properties to use. Additional installer properties are described on the /document/preview/647736#UUID-b588cdab-ae07-3331-ceb1-c8c6ed63aa1e page.

Installer property	Description
MODULE.WAKEUP.ENABLED	Set this property to **true** to enable the WakeUp client module. The default value is **false**. Enabling this will also cause any installation of the 1E Agent's WakeUp component to be uninstalled the first time the 1E Client is started, leaving the NightWatchman component if that was installed. **Note** When **true** then you must also specify either the name of the NightWatchman Management Center reporting server, or that reporting is turned off. For details of these and all other installer properties please refer to /document/preview/647736#UUID-b588cdab-ae07-3331-ceb1-c8c6ed63aa1e.
MODULE.WAKEUP.USEFIPS	Set to **1** to force the WakeUp agent to use a FIPS-compliant algorithm for: • WakeUp Reporting to the **NightWatchman Management Center Web Service** by setting **UseFipsComplianceEncryption** registry value to 1. • Communication between WakeUp Agents and WakeUp Servers. It will override the MODULE.WAKEUP.ENCRYPTIONLEVEL installer property and set the **EncryptionLevel** registry value to 3. If enabled, then all components in the NightWatchman and WakeUp system must have FIPS enabled. EncryptionLevel and FIPS settings used by WakeUp do not affect other 1E Client communications.
MODULE.WAKEUP.REPORTING	Enables WakeUp reporting. Sets whether the Agent sends reporting messages to the **NightWatchman Management Center Web Service**. May be set to one of the following values: • **ON** – reporting is enabled and messages are forwarded to the NightWatchman server. It is mandatory to specify one of the following:

Installer property	Description
	MODULE.WAKEUP.REPORTINGSERVER or MODULE.WAKEUP.SECUREREPORTINGSERVER • **OFF** – no information is reported to the server. **Tip** When installing the 1E Client on a WakeUp Server, set **MODULE.WAKEUP.REPORTING=OFF** so that the server does not appear as a client in the NightWatchman Management Center Admin Console. This will only disable Agent reporting whilst the WakeUp Server will have reporting enabled for reporting statistics.
MODULE.WAKEUP.REPORTINGSERVER	Set this parameter to the FQDN (recommended) or NetBIOS name of the server hosting the NightWatchman Management Center Web Service. **Warning** Mandatory when WakeUp reporting is enabled (default) and using **HTTP** for communications. **Tip** If **HTTP** is not using standard port 80 then specify the port number as part of the server name: MODULE.WAKEUP.REPORTINGSERVER="ACMESERVER.ACME.COM:8080"
MODULE.WAKEUP.SECUREREPORTINGSERVER	Set this parameter to the FQDN (*required*) or NetBIOS name of the server where the NightWatchman Management Center Web Service component secure site has been installed. **Warning** Mandatory when WakeUp reporting is enabled (default) and using **HTTPS** for communications. **Tip** If **HTTPS** is not using standard port 443 then specify the port number as part of the server name: MODULE.WAKEUP.SECUREREPORTINGSERVER="ACMESERVER.ACME.COM:7433"

Installer property	Description
MODULE.WAKEUP.CERTISSUER	Specify the text used to search for a client certificate in the client certificate store. Either MODULE.WAKEUP.CERTISSUER or MODULE.WAKEUP.CERTSUBJECT is mandatory when all the following are true: • **HTTPS** communications is being used • MODULE.WAKEUP.SECUREREPORTINGSERVER is configured • SSL Settings for the **NightWatchman Management Center Web Service** is configured to require a client certificate. If this property is used, it will use the first certificate it finds where the specified text matches the certificate's Issuer CN.
MODULE.WAKEUP.CERTSUBJECT	Specify the text used to search for a client certificate in the client certificate store. Either MODULE.WAKEUP.CERTISSUER or MODULE.WAKEUP.CERTSUBJECT is mandatory when all the following are true: • **HTTPS** communications is being used • MODULE.WAKEUP.SECUREREPORTINGSERVER is configured • SSL Settings for the **NightWatchman Management Center Web Service** is configured to require a client certificate. If this property is used, it will use the first certificate it finds where the specified text matches the certificate's Subject CN.

2.3.1.4.7 Command-line examples

When installing 1E Client, you should include **/l*vx** for verbose logging to a log file. The following examples also use **/qn** for a non-interactive (silent/quiet) installation.

2.3.1.4.7.1 Example command-line using a MST transform file

```
msiexec /i 1E.Client-x64.msi TRANSFORMS="1EClient.mst" /qn /l*vx C:\Windows\temp\1EClient-install.log
```

An MST typically only works with a specific version of an MSI, therefore you should test before using an old MST file. An MST may work with both 32 and 64-bit versions of an MSI, provided the MST does not contain any transforms that are platform-specific. Please contact your packaging team if you need help creating transform files.

The Introducing 1E Client Deployment Assistant is designed to help install Windows versions of 1E Client and other 1E agents using Configuration Manager. It includes template transform files for each combination of client/agent for 32 and 64-bit platforms and automatically creates collections and deployments in Configuration Manager so that you only need to populate the collections.

2.3.1.4.7.2 Example which enables only Tachyon client

Example Windows 1E Client installer command-line with only the 1E Client features enabled, other client modules are not enabled. Tachyon uses HTTPS only.

```
msiexec /i 1E.Client-x64.msi SWITCH="tachyon.acme.local:4000" BACKGROUNDCHANNELURL="https://tachyon.acme.local:443/Background/" /qn /l*vx C:\Windows\temp\1EClient-install.log
```

2.3.1.4.7.3 Example which enables only Nomad client

Example Windows 1E Client installer command-line with only **Nomad** module enabled, which also requires Tachyon client features to be enabled. Tachyon uses HTTPS only.

```
msiexec /i 1E.Client-x64.msi SWITCH="tachyon.acme.local:4000" BACKGROUNDCHANNELURL="https://tachyon.acme.local:443/Background/" MODULE.NOMAD.ENABLED=true MODULE.NOMAD.CONTENTREGISTRATION=1 MODULE.NOMAD.SSDENABLED=1 /qn /l*vx C:\Windows\temp\1EClient-install.log
```

2.3.1.4.7.4 Example which enables only PXE Everywhere Agent

Example Windows 1E Client installer command-line with only **PXE Everywhere Agent** client module enabled, and Tachyon features disabled (by setting SWITCH and BACKGROUNDCHANNELURL to none). PXE Everywhere uses only HTTP.

```
msiexec /i 1E.Client-x64.msi SWITCH=none BACKGROUNDCHANNELURL=none MODULE.PXEEVERYWHERE.ENABLED=true MODULE.PXEEVERYWHERE.CONFIGSERVERURL="http://pxecentral.acme.local/PXELite/PXELiteConfiguration.asmx" /qn /l*vx C:\Windows\temp\1EClient-install.log
```

2.3.1.4.7.5 Example which enables only Shopping client

Example Windows 1E Client installer command-line with only **Shopping client** module enabled, and Tachyon features disabled (by setting SWITCH and BACKGROUNDCHANNELURL to none). Ensure you use HTTP or HTTPS as appropriate.

```
msiexec /i 1E.Client-x64.msi SWITCH=none BACKGROUNDCHANNELURL=none MODULE.SHOPPING.ENABLED=true MODULE.SHOPPING.SHOPPINGCENTRALURL="https://appstore.acme.loca
```

```
l/shopping" MODULE.SHOPPING.LOOPBACKEXEMPTIONENABLED=true /qn /l*vx C:\Windows\
temp\1EClient-install.log
```

2.3.1.4.7.6 Example which enables only WakeUp client

Example Windows 1E Client installer command-line with only **WakeUp client** module enabled, and Tachyon features disabled (by setting SWITCH and BACKGROUNDCHANNELURL to none).

```
msiexec /i 1E.Client-x64.msi SWITCH=none BACKGROUNDCHANNELURL=none MODULE.WAKEU
P.ENABLED=true MODULE.WAKEUP.REPORTINGSERVER="nwmserver.acme.local" /qn /l*vx C
:\Windows\temp\1EClient-install.log
```

2.3.1.5 Sysprep and OS images

The following steps are required if the 1E Client will be included in an OS image.

1. Stop the 1E Client service.
2. Stop the NomadBranch service (if Nomad is enabled).
3. Delete the logs folder and its contents. Default is **%ALLUSERSPROFILE%\1E\Client**
4. Delete the registry key and its contents **HKLM\SOFTWARE\1E\Client**
5. Delete the registry key and its contents **HKLM\SOFTWARE\1E\Common**
6. Other registry keys for clients may exist. Please refer to their product documentation for details of sysprepping them.
   - HKLM\SOFTWARE\1E\NightWatchman
   - HKLM\SOFTWARE\1E\NomadBranch
   - HKLM\SOFTWARE\1E\PXEEverywhere
   - HKLM\SOFTWARE\1E\WakeUpAgt
   - HKLM\SOFTWARE\1E\WSA

You can disable the services during image preparation and re-enable it as an OS Deployment step. The folder and registry keys will be automatically re-created when the services are restarted after the OS is deployed.

> **Note**
>
> By default, the OS resolves %ALLUSERSPROFILE% to **C:\ProgramData**

If you have 1E WakeUp client module enabled, or 1E NightWatchman Agent installed, then please refer to Installing the 1E NightWatchman Agent for Windows: The 1E NightWatchman Agent, Sysprep and diskimaging.

2.3.1.6 Uninstalling 1E Client

2.3.1.6.1 Manual uninstallation

1E Client can be uninstalled manually by using Windows Apps and Features (appwiz.cpl). A reboot is not normally required.

2.3.1.6.2 Disabling a feature or client module

Please refer to Reconfiguring 1E Client for examples of how to use the **-reconfigure** command-line to reconfigure the 1E Client.

2.3.1.6.3 Uninstallation using the Windows Installer

1E Client can be uninstalled automatically by using a Windows Installer command line, where the {product code} is dependent on the version of the 1E Client. The example below also includes switches that prevent prompting and restart and creates a log file.

```
msiexec /x {BF6F5FA9-64C8-4B72-A6B6-14A582BF96B8} /qn /norestart /l*vx C:\Windo
ws\temp\1EClient-uninstall.log
```

2.3.1.6.4 Tidy up after uninstallation

After the uninstallation of 1E Client, the following is left behind. As with other Windows installers, uninstallation will leave behind any files, folders, and registry entries that were created after installation.

Location	Artifacts	Recommendation
Installation folder	None.	
Logs folder	Log files remain. Please refer to Log files for log file locations of 1E Client and its client modules.	The log files can be deleted or renamed. If not deleted, then a new installation that uses the same logs folder will continue to use the old log file.
Client\Persist folder remains.	Leave this folder which contains status information about current instructions. The Persist folder should be deleted only if you do not intend re-installing the 1E Client with Tachyon enabled, or when preparing OS images, refer to Sysprep and OS images for details.	

Location	Artifacts	Recommendation
Tachyon client registry	HKLM\SOFTWARE\1E\Client\Persist	This registry exists if the Tachyon platform client feature of the 1E Client is enabled. It is used to keep a record of hash values for its persistent storage files, which includes status information about current instructions. This registry key should be deleted only if you do not intend re-installing the 1E Client with Tachyon enabled, or when preparing OS images, refer to Sysprep and OS images for details.
Nomad Cache	%ALLUSERSPROFILE%\1E\NomadBranch	The folder should be deleted only if you do not intend re-installing the 1E Client with Nomad enabled. Downloaded content is retained so that if the Nomad client is re-enabled it will be scanned and re-registered, to make it available for peer sharing with other Nomad clients.

Note

HKLM\SOFTWARE\1E\Common and HKLM\SOFTWARE\1E\NightWatchman are used by the 1E NightWatchman Agent, previously part of the 1E Agent.

2.3.2 Deploying 1E Client on macOS

Guidance for deploying 1E Client onto **macOS** devices, including installation and uninstallation. Only the Tachyon features of 1E Client are available on macOS.

2.3.2.1 Requirements

- Please review Planning for 1E Client pages. After installation, please review the Verifying page.
- For details of supported OS platforms, please refer to Common client requirements page.
- Guidance provided below is for installation on macOS.

Note

1E Client does not have a license key. Even so, you must adhere to the terms of your license agreement.

2.3.2.1.1 Deployment choices

You must decide how you will configure the 1E Client and deploy to devices. Deploying the 1E Client is normally achieved using your existing software deployment tool.

Note

For more information about configuring the 1E Client properties during and after installation, please refer to 1E Client configuration settings and installer properties.

2.3.2.1.2 Non-Windows installation account

To install the 1E Client on a non-Windows client the installation account must have privileges to run the **sudo** command.

2.3.2.1.3 Certificate files

Each Tachyon client device requires a **.pfx** certificate file. Please refer to Client certificates for steps to create and use the **.pfx** file.

The 1E Client for macOS needs to have the storage of the client authentication certificate and the public certificates for the chain of trust for the Tachyon Switch.

If you have configured Tachyon Server to require client certificates then each device requires a certificate with the following properties, so the client can be authenticated by the Tachyon Switch.

1. Issued by a trusted Certificate Authority (CA)
   - The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the client
   - If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the client
   - If either of these CA certificates is different from those used by the Tachyon Web Server, they will need to be exported and imported on the Tachyon Web Server
   - Most organizations have automated distribution of these CA certificates to clients and servers, using Group Policy for example.
2. Has at least the following Enhanced Key Usage:
   - Client Authentication.

3. Has at least the following Key Usage:
    - Digital Signature
    - Key encipherment.
4. Has a private key:
    - For workgroup and non-Windows devices, the **private key must be exportable**
5. Revocation information is included:
    - References at least one CRL Distribution point that uses HTTP
6. Has a Subject Name of type Common Name (**CN=<computername>**) or Subject Alternative Name (**DNS Name=<computername>**) where <computername> depends on the type of device:
    - On domain-joined Windows PCs this must be the **computername FQDN** of the computer, for example, **W701.ACME.LOCAL**
    - On workgroup Windows PCs and non-Windows devices, this must be the computername of the computer - as returned by the **hostname** command, for example on Windows PC this could be **W701**, and on a Mac this could be **MAC01.local**.

Note

Tachyon clients and Switches use OpenSSL and its validation process to verify certificates.

2.3.2.2 Client certificates

The 1E Client for macOS needs to have the client authentication certificate and the public certificates for the chain of trust for the Tachyon Switch in the System key chain.

First, you need to issue a certificate and create the **.pfx** file.

2.3.2.2.1 Key Store method

The client certificate, and Certificate Authority (CA) certificate(s) for the Switch certificate, are stored within the **macOS Key Store**.

2.3.2.2.1.1 Obtain and import Certificate Authority (CA) certificates

You can skip this step if the Certificate Authority (CA) certificates used by the client and the Switch are the same, and are included in the client certificate.

If the client certificate does not contain the CA certificates for itself, *or* the CA certificates used by the Switch, then the individual CA certificates will need to be obtained and imported into the macOS Key Store as follows:

1. Obtain Certificate Authority (CA) certificates as individual **.cer** files.
    a. They must be exported individually because when presented with a bundle of certificates the Keychain Access UI only imports the last one it encounters.

b. Use Microsoft's Manage Computer Certificates (MMC) to export as a **.cer** file using base-64 encoded X.509 format.

2. Copy the certificate .cer file(s) onto the macOS device.

3. Open Finder and double-click on each .cer file in turn to import each certificate into the macOS Keychain store. Or use File→Import Items... directly from Keychain Access.

4. Open Keychain Access; the certificates should appear under the system keychain.

5. If required, move (by dragging) each newly imported certificate to the System keychain, to ensure that it is trusted by all users and local system processes including the 1E Client which will run on this macOS machine.

6. Starting with the root CA certificate, if it is shown as not trusted, double-click to open. At the top left, above the Details section, expand the Trust section and ensure that When using this certificate Always Trust is selected and save the changes.

If you experience problems importing certificates using the Keychain Access app, for example if it reports error -25294 and *CSSM_CODE_MEMORY_ERROR*, an alternative way of importing public certificates and trusting them is to use the security command line tool. For example:

```
sudo security add-trusted-cert -d -r trustRoot -k /Library/Keychains/System.keychain <certificate.cer>
```

2.3.2.2.1.2 Create a client certificate for each macOS device

Each macOS device requires its own client certificate. Below is a guide for using a Microsoft Certificate Authority (CA) to issue a client certificate, then exporting it ready for installation on the device.

First, create a new Certificate template on your Certificate Authority by making a duplicate of either the Computer or Workstation template and configuring it with at least the following properties:

- General - use a suitable name such as **Tachyon Devices** and validity period.
- Request Handling - Allow private keys to be exported.
- Subject Name - Allow information to be supplied in the certificate request, rather than being built from Active Directory information.
- Extensions - Application Policies should contain only Client Authentication.
- Security - ensure relevant users and computers will be able to request certificates.

Please refer to Client Certificates for more information on client certificate requirements.

Once the new template is created on the Certificate Authority (CA), issue it.

Using the issued template, request a certificate for a target device, and export it in .pfx form and remember the password. The certificate and associated private key should be exported, together with all extended properties, except *include all certificates in the certification path if possible and Enable certificate privacy*.

Warning

The Subject Name of the certificate must be the host name of the mac device. You will supply this value during enrollment. To find the host name of the mac open Finder and click the Apple icon in the upper left. Select System Preferences - Sharing - Screen Sharing. Below the computer name field you will see "Computers on your local network can access your computer at:" this value will be your host name. It must be typed exactly as displayed in the certificate request (case-sensitive and including any special characters).

2.3.2.2.1.3 Install a client certificate on each macOS device

To install a client certificate on each macOS device follow the instructions below.

1. Copy the client certificate onto the macOS device.
2. Open Keychain Access and from its File menu select **Import Items,** then navigate to the certificate. Double-click it and enter its password when prompted, then the client certificate and its associated private key should appear under the login keychain. Alternatively, double-click on the **.pfx** file in the Finder.
3. Copy the client certificate and its associated private key separately under the System keychain.
4. Allow access to the private key for the 1E Client by following these instructions:
5. Open the Keychain Access app, either by pressing command-space and searching for keychain or from the Finder app, top left select Go > Utilities and double click to invoke the Keychain Access app.
6. Locate the private key of the Tachyon Agent within the System keychain.
7. The private key will appear under its associated public certificate.
8. Ensure the private key is present in the System keychain.
9. Double-click the private key and select the Access Control tab.
10. Ensure **Confirm before allowing access** is selected and then add the Tachyon Agent binary to the **Always allow access by these applications**; adding the 1E Client by its path name, which is typically /Library/Application Support/1E/Client/1E.Client

Warning

The Keychain Access app cannot be guaranteed to always refresh its view following, for example, an update of access control permission. However, after exiting the app, killing the process */Applications/Utilities/Keychain Access.app/Contents/MacOS/Keychain Access* and then restarting the app, will ensure the Keychain Access view will correctly display the contents of the Key Store.

An alternative approach to using the Keychain Access app is to import the **.pfx** file using the command-line security command:

```
sudo security import <download location>/<macOSpfx>.pfx -k /Library/Keychains/System.keychain -t agg -f pkcs12 -P <password> -T '/Library/Application Support/1E/Client/1E.Client'
```

This command imports a client certificate and the associated private key (termed **an identity** on macOS) from a **.pfx** file to a <keychain> as an aggregated type in PKCS #12 format using the specified password and giving access to the 1E Client.

> **Warning**
>
> When upgrading the 1E Client, by default the new version will not automatically be granted access to the private key in the Key Store. You can either repeat the import process during upgrade, or avoid the overhead by using the command-line security command with the import -A flag instead of -T . Please note that Apple do not recommend this approach as it is considered less secure. For more information on the security command please refer to the macOS page: https://ss64.com/osx/security-export.html.

If you do not grant correct access to the client certificate's private key, and the 1E Client debug logging is configured the log will show that it cannot obtain the client certificate's private key because the user name or passphrase entered is not correct.

2.3.2.3 Preparation

1E Client installation files are available for download from https://support.1e.com/.

Installation source files for non-Windows are available in a zip file called **1EClient-Non-Windows.v8.1.x.x.zip**

Within the zip, **1E Client for macOS** is provided as an Apple Disk Image file, such as **1e.client-macOS_v8.1.x.x.dmg**.

> **Warning**
>
> 1E Client for macOS is written for Intel and supported on Apple devices using Intel processors. It is also supported on Apple devices using the M1 chip, provided you have installed Rosetta 2, which is included with Big Sur. 1E Client is a daemon (not an app), therefore, during installation or running it will not prompt for Rosetta 2, which does not get installed on-demand.
>
> You only need to install Rosetta 2 once, using one of the following commands, but repeating the command will safely reinstall it. The second version of the command requires root permission. Attempting to install on an Intel device will issue a harmless "unrecognized option" usage message.

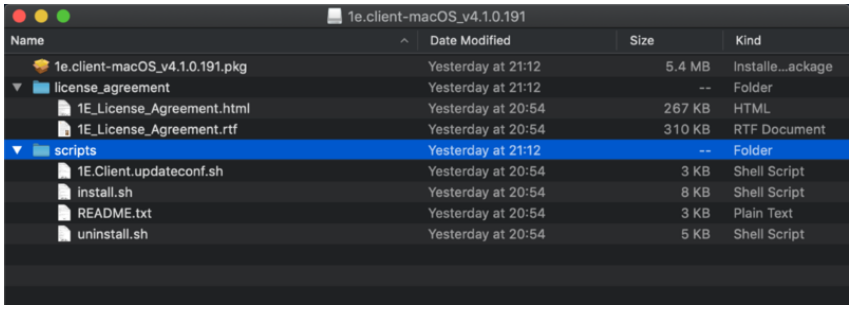
```
/usr/sbin/softwareupdate --install-rosetta
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

Once the **dmg** file is copied to macOS, double-click on the **dmg** file to automount it under **/Volumes** and display it in a Finder window, as shown.

If you wish, you can script this using all or parts of the following example:

```
mkdir ~/Downloads/1e.client
cd ~/Downloads/1e.client
wget https://<<serverURL>>/1e.client-macOS_v8.1.x.x.dmg
hdiutil attach 1e.client-macOS_v8.1.x.x.dmg
```

The last line of the output of the **hdutil** command will show the location of the mount point, which is likely to be **/Volumes/image.1e.client-macOS_v8.1.x.x**



2.3.2.4 Installation

To install the macOS 1E Client perform **only one** of the following three options:

1. Use the **install.sh** script provided under the scripts directory, to install and configure the client, as shown in the pictures:
   - Copy the script to a separate directory together with the package you wish to use for installation or upgrade.
   - Invoke **install.sh** script to install, configure and start the 1E Client, giving the Switch host and port as the first parameter and the Background Channel URL as the second:

     ```
     sudo ./install.sh tachyon.acme.local:4000 https://tachyon.acme.local/Background
     ```

     Note

     This method will start the client, but connection to the Tachyon Switch will fail unless the client has the necessary certificates, as described in Client certificates below.
2. Install the package file from a command window to install using defaults. The **-target** is the volume mount point, not the path in the file system at which it will be installed.

   ```
   sudo installer -pkg /path/to/pkg/1e.client-macOS_v8.0.x.x.pkg -target /
   ```
3. Double-click on the package (.pkg) file within the Finder window to install using defaults.

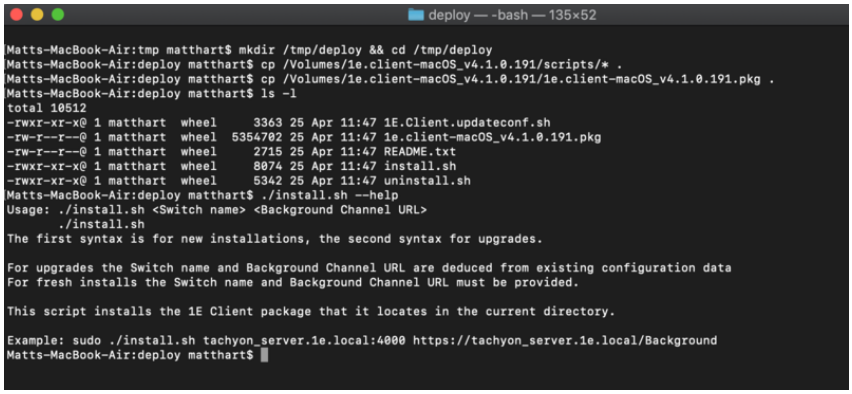
Note

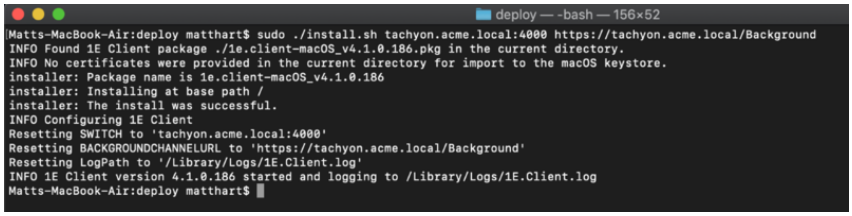
For options 2 and 3, you will need to reconfigure the 1E Client either using the **1E.Client.updateconf.sh** script or by editing the **/etc/1E/Client/1E.Client.conf** file, as described in Reconfiguration.

You will also need to provide the necessary client certificates, as described in Client certificates, and then start the client.

After installation, you can unmount the **dmg** using the following command:

```
hdiutil eject /Volumes/image.1e.client-macOS_v8.0.x.x
```





2.3.2.5 Reconfiguration

You will need to use the **1E.Client.updateconf.sh** script if you want to reconfigure the client, or you installed 1E Client using the previous installation options.

The **pkg** installation package for macOS includes a bash script called **1E.Client.updateconf.sh**. The configuration properties for the Switch and Background Channel are mandatory, therefore assuming they are on the same Tachyon Server which has a DNS Name FQDN **tachyon.acme.local** then the post-installation command line would be similar to the following but all on one command line. The second Switch and Background Channel can be removed if a DMZ server is not used. Single quotes avoid escape characters and are necessary to allow the use of the **;** character.

```
sudo sh '/Library/Application Support/1E/Client/1E.Client.updateconf.sh'
'/Library/Application Support/1E/Client/1E.Client.conf'
SWITCH='tachyon.acme.local:4000;tachyon.acme.com:4000'
BACKGROUNDCHANNELURL='https://tachyon.acme.local:443/Background/;https://tachyo
n.acme.com:443/Background/'
```

Please refer to 1E Client configuration settings and installer properties for a list of other configuration properties that can be appended to the above command-line.

2.3.2.6 Starting the 1E Client

To load and start the 1E Client use the command:

```
sudo launchctl load -w /Library/LaunchDaemons/com.1e.pkg.1E.Client.plist
```

> **Note**
>
> The client starts automatically if the switch and background URL are passed in the installation command as parameters as well as after client upgrade.

If it is necessary to stop the 1E Client use the command:

```
sudo launchctl unload /Library/LaunchDaemons/com.1e.pkg.1E.Client.plist
```

If the 1E Client should fail to start correctly please check:

- **sudo launchctl list | grep -i 1e** - to confirm the service is actually running. It should appear as **com.1e.pkg.1E.Client**
- **/Library/Logs/1E.Client.Daemon.log** - shows any service start errors
- **tail -f /Library/Logs/1E.Client.log** - shows the current operation of the 1E Client.
- If necessary raise the **/Library/Application Support/1E/Client/1E.Client.conf** to **LoggingLevel=debug** using a suitable text editor such as vi and then restart the 1E Client.

2.3.2.7 Uninstallation

To uninstall the 1E Client from a macOS device invoke the *uninstall.sh* script from within a sudo bash script. *uninstall.sh* is available within the scripts directory of the Apple Disk Image (dmg) file of the macOS 1E Client.

Alternatively, enter the following commands inside a sudo bash shell:

```
bash$ cd /Library
bash$ pkgutil --only-files --files com.1e.pkg.1E.Client | tr '\n' '\0' | xargs
-n 1 -0 rm
bash$ pkgutil --forget com.1e.pkg.1E.Client
```

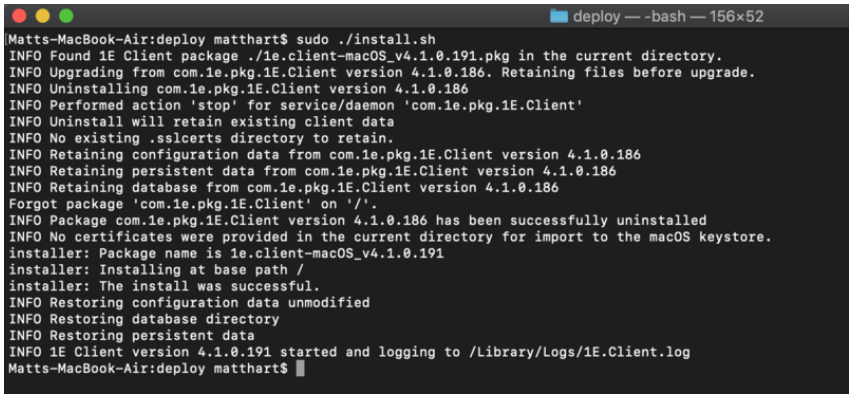
2.3.2.8 Upgrading

The **install.sh** script can be used for upgrading as well as installing. The bash script will deduce parameters from the existing configuration so no parameters are necessary, as shown in the picture.

If the installation of the macOS 1E Client is performed by double clicking on the latest .pkg file, then the new 1E Client will install successfully, but the contents of 1E.Client.conf will be reset to their default settings. To ensure that existing 1E.Client.conf settings are preserved across a 1E Client upgrade, please use the install.sh script.

When upgrading the 1E Client, by default the new version will not automatically be granted access to the private key in the Key Store. You can either repeat the import process during the upgrade or avoid the overhead by using the command-line security command with the import -A flag instead of -T . Please note that Apple does not recommend this approach as it is considered less secure. For more information on the security command please refer to the macOS page: https://ss64.com/osx/security-export.html.

If you do not grant correct access to the client certificate's private key, and the 1E Client debug logging is configured the log will show that it cannot obtain the client certificate's private key because the user name or passphrase entered is not correct.



2.3.3 Deploying 1E Client on Linux

Guidance for deploying 1E Client onto **Red Hat Enterprise Linux** devices, including installation and uninstallation. Only the platform features of 1E Client are available on Linux and other non-Windows OS.

2.3.3.1 Requirements

Please review Planning for 1E Client pages. After installation, please review the Verifying page.

For details of supported OS platforms, please refer to Common client requirements page.

Guidance provided below is for installation on Red Hat Enterprise.

> **Note**
>
> 1E Client does not have a license key. Even so, you must adhere to the terms of your license agreement.

2.3.3.1.1 Deployment choices

You must decide how you will configure the 1E Client and deploy to devices. Deploying the 1E Client is normally achieved using your existing software deployment tool.

> **Note**
>
> For more information about configuring the 1E Client properties during and after installation, please refer to 1E Client configuration settings and installer properties.

2.3.3.1.2 Non-Windows installation account

To install the 1E Client on a non-Windows client the installation account must have privileges to run the **sudo** command.

2.3.3.1.3 Certificate files

Each platform client device requires a **.pfx** certificate file. Please refer to Deploying 1E Client on macOS, for steps to create and use the **.pfx** file. For Linux devices, the client does not use proprietary certificate stores. Instead, the client requires the certificate exists as a .PFX file in the client installation folder structure.

If you have configured Tachyon Server to require client certificates (Client certificates) then each device requires a certificate with the following properties, so the client can be authenticated by the Tachyon Switch:

1. Issued by a trusted Certificate Authority (CA):
   - The certificate for the Root CA in the Certification Path must exist in the Trusted Root CA store of the client.
   - If the issuing CA is not the Root CA then the certificate for the issuing CA and any intermediate CA in the Certification Path must exist in the Intermediate CA store of the client.
   - If either of these CA certificates is different from those used by the Tachyon Web Server, they will need to be exported and imported on the Tachyon Web Server.
   - Most organizations have automated distribution of these CA certificates to clients and servers, using Group Policy for example.
2. Has at least the following Enhanced Key Usage
   - Client Authentication.
3. Has at least the following Key Usage
   - Digital Signature
   - Key encipherment.
4. Has a private key
   - For workgroup and non-Windows devices, the **private key must be exportable**
5. Revocation information is included.
   - References at least one CRL Distribution point that uses HTTP.
6. Has a Subject Name of type Common Name (**CN=<computername>**) or Subject Alternative Name (**DNS Name=<computername>**) where <computername> depends on the type of device:
   - On domain-joined Windows PCs this must be the **computername FQDN** of the computer, for example **W701.ACME.LOCAL**
   - On workgroup Windows PCs and non-Windows devices, this must be the computername of the computer - as returned by the **hostname** command, for example on Windows PC this could be **W701**, and on a Mac this could be **MAC01.local**

Note

Tachyon clients and Switches use OpenSSL and its validation process to verify certificates.

2.3.3.2 Preparation

1E Client installation files are available for download from https://support.1e.com/.

Installation source files for non-Windows are available in a zip file called **1EClient-Non-Windows.v8.1.x.x.zip**

2.3.3.3 Installation

The basic command to install an RPM package is **rpm -i <package_file>**. Although RPM, by design, does not support configuration during installation (with the Linux recommended approach to configure after installation) - the 1E Client does in fact support configuration through the use of environment variables. These can be easily set in a bash command line by one or more space-separated name=value pairs preceding the install command. So, if the RPM package file name is **1e.client-RHEL_8.3_x64_v8.0.4.261.rpm** and the Tachyon Server (assuming that the switch and the background channel are both installed on the Tachyon Server) has the DNS Name FQDN tachyon.acme.local then the command to run would be:

```
sudo SWITCH=tachyon.acme.local:4000 BACKGROUNDCHANNELURL=https://tachyon.acme.local:443/Background/ rpm -i 1e.client-RHEL_8.3_x64_v8.0.4.261.rpm
```

Please refer to 1E Client configuration settings and installer properties for a list of other configuration properties that can be configured in the same way.

> **Note**
>
> The correct case for each property must be used when entering the Linux installer command.

> **Note**
>
> When the package starts to install you may notice that the **ldconfig** command generates a warning saying that a
> **.py file is not an ELF file - it has the wrong magic bytes at the start**.
>
> This is because **ldconfig** assumes all files in **/usr/lib** are ELF files, and that file is a python file.
>
> You can safely ignore this warning.

After the package is installed the application configuration files will be installed to the following directory:

```
/etc/1E/Client
```

After running the Linux RPM package the client is installed and started as a daemon (service).

The client certificate **Tachyon.pfx** and a **cacert.pem** file are required in the hidden directory: */etc/1E/Client/.sslcerts*

If **Tachyon.pfx** contains the same certificate trust chain as the Tachyon Switch, then **cacert.pem** is optional. This is because the client will have already cached the public certificates when it parses **Tachyon.pfx** and **cacert.pem** will be duplicating the public certificate information. If **Tachyon.pfx** is using a different certificate trust chain from the Tachyon Switch, then **cacert.pem** is always required.

2.3.3.4 Reconfiguration

Please refer to 1E Client command-line parameters if you would like to see details of other CLI commands.

Note

This method is suitable for 1E Clientreconfiguring all settings on non-Windows devices because only platform client features are available and all settings are stored in the 1E Client configuration file.

Example:

```
/usr/sbin/1E.Client -reconfigure Switch=ACME-DMZ01.ACME.LOCAL:4000 BackgroundCh
annelUrl=https://ACME-DMZ01.ACME.LOCAL:443/Background/ -restart
```

2.3.3.5 Client certificates

Each client device requires its own certificate, which must be created as a **.pfx** file.

2.3.3.5.1 Using OpenSSL to create the .pfx file

Each non-Windows device requires its own certificate. Below is a guide for using a Microsoft CA to issue a certificate (which is the same for Windows computers), then exporting it and using OpenSSL to prepare it before installing it on a non-Windows device.

First, you will need to have created a new Certificate template on your Certificate Authority by making a duplicate of either the Computer or Workstation template and configuring it with at least the following properties:

- **General** - use a suitable name such as **Tachyon Devices** and validity period
- **Request Handling** - Allow private keys to be exported
- **Subject Name** - Allow information to be supplied in the certificate request, rather than being built from Active Directory information
- **Extensions** - Application Policies should contain only Client Authentication
- **Security** - ensure relevant users and computers will be able to request certificates.

Once the new template is created on the CA, issue it.

Using the issued template, request a certificate for a target device, and export it in **.pfx** form and remember the password.

The target device requires a copy of the basic **cacert.pem** and the **.pfx** file with its password removed. You can do this using the following steps. Use the relevant OpenSSL version for the OS. OpenSSL is normally available by default on Linux and Mac devices. If you want to follow these steps on Windows, you will need to download the open-source version appropriate to your OS.

1. First, extract the certificate:

   ```
   openssl pkcs12 -clcerts -nokeys -in <YourPKCSFile>.pfx -out certificate.c
   rt
   ```

2. Second, the CA key:

   ```
   openssl pkcs12 -cacerts -nokeys -in <YourPKCSFile>.pfx -out ca-cert.ca
   ```

3. Now, the private key:

   ```
   openssl pkcs12 -nocerts -in <YourPKCSFile>.pfx -out private.key -passout
   pass:TemporaryPassword
   ```

4. Remove the passphrase:

   ```
   openssl rsa -in private.key -out new.key -passin pass:TemporaryPassword
   ```

5. Put things together for the new PKCS-File (on Windows, **type** can be used instead of **cat**):

   ```
   cat new.key > PEM.pem
   cat certificate.crt >> PEM.pem
   cat ca-cert.ca >> PEM.pem
   ```

6. And create the new **.pfx** file, when prompted for a password ensure that you enter an empty password (that is press enter when prompted for the password and confirmation without entering any text):

   ```
   openssl pkcs12 -export -nodes -CAfile ca-cert.ca -in PEM.pem -out Tachyon
   .pfx
   ```

Now you have a new PKCS12 key file without a passphrase on the private key part. This **Tachyon.pfx** file and the **cacert.pem** file, must be placed in one of the following locations - depending on the OS. These are hidden folders.

2.3.3.5.2 Storing the .pfx on the client

The client certificate file (**Tachyon.pfx**), and Certificate Authority (CA) certificate(s) for the Switch certificate (**cacert.pem** file) are stored in the hidden directory:

/etc/1E/Client/.sslcerts

If the client certificate:

- (**Tachyon.pfx**) uses the same certificate trust chain as the Tachyon Switch, then **cacert.pem** is optional. This is because the client will have already cached the public certificates when it parses **Tachyon.pfx**.
- (**Tachyon.pfx**) uses a different certificate trust chain from the Tachyon Switch, then **cacert.pem** is always required.

2.3.3.6 Uninstallation

The following command-line can be used to uninstall the 1E Client on Linux:

```
sudo rpm -e 1e.client
```

Uninstallation will leave behind files, folders and registry entries that were created after installation:

Location	Artifacts	Recommendation
Installation folder	None.	
Logs folder	Log files remain.	The log files can be deleted or renamed. If not deleted, then a new installation that uses the same logs folder will continue to use the old log file.
Client\Persist folder remains.	You should keep the **Persist** folder, which contains status information about current instructions, only if you intend to re-install the 1E Client.	

2.3.4 Deploying 1E Client on Solaris

Note

1E Client is no longer available for Solaris, but 1E may reintroduce it, if there is sufficient demand.

2.3.5 Reconfiguring 1E Client

The 1E Client will be installed with the configuration required at the time. After the initial installation, it may be necessary to reconfigure the 1E Client. For example, you may want to enable a module that was not enabled when the client was first installed. This page provides guidance on changing the configuration of the 1E Client after the initial installation and configuration.

1E Client installers include a **template configuration file** that contains the more important settings with default values that match hard-coded default values. The configuration file is updated during installation and named **1E.Client.conf** in the installation folder along with the 1E Client executable.

After installation, configuration file settings can be managed using 1E Client reconfiguration, Explorer configuration instructions, Guaranteed State policies, Configuration Manager baselines or other means. Registry settings can also be managed by Windows Group Policy.

This page describes how to use Configuration Manager Configuration Baselines to reconfigure the 1E Client, which applies only to Windows devices. For non-Windows devices please see Reconfiguring on non-Windows devices.

Please refer to 1E Client configuration settings and installer properties for a summary, and links to further pages with more details.

2.3.5.1 Understanding how 1E Client settings are managed

You can enable or disable 1E Client features using the **1E.Client.exe -reconfigure** command line interface described in Example command-lines for reconfiguring the 1E Client below. Once enabled, additional configuration is likely to be required.

- All 1E Client and Shopping/WSA configuration settings can be modified using the **1E.Client.exe -reconfigure** command line interface.
- All Nomad and most of WakeUp configuration settings are managed in the registry, so must be addressed in addition to enabling the module using the **1E.Client.exe -reconfigure** command.

The table below summarizes which settings can be modified after installation using **1E.Client.exe -reconfigure** and which require modification in the registry. If you are using Configuration Manager, registry settings are best managed using Configuration Baselines.

Client / module	Set with 1E.Client.exe -reconfigure	Set in registry
1E Client	All Platform features of the 1E Client	None
Shopping/WSA	All Shopping client settings	None
WakeUp	Module.WakeUp.Enabled Module.WakeUp.ManageFirewallRules	All other /document/preview/647736#UUID-b588cdab-ae07-3331-ceb1-c8c6ed63aa1e
Nomad	Module.Nomad.Enabled	All other Content Distribution client settings
PXE Everywhere	Module.PXEEverywhere.Enabled	All other PXE Everywhere Agent settings

Installer Properties and registry values

Installer properties allow configuration of the 1E Client during installation. While there is generally a one-to-one mapping of Installer property to registry value, the Installer properties are all prefixed with MODULE.<PRODUCT> whereas registry values are not. Aside from the prefix in Installer property names, in some cases the registry value name is different from the installer property name. When configuring the Nomad and WakeUp client module registry settings, be careful to refer to the registry value names in the above settings links rather than the Installer property names.

2.3.5.2 Using Configuration Manager to enable and reconfigure the 1E Client after installation

The 1E Client can be configured after installation using a Configuration Manager Configuration Baseline. The following template Configuration Items have been prepared and are available to be downloaded and imported into Configuration Manager.

You can download the set of template Configuration Items available here **1EClientCIs.zip** and unzip to a working directory accessible from a CM console.

Note

The current version of 1EClientCIs.zip does not support changes to PXE Everywhere.

CI Name	Description
Enable and Configure Shopping module in 1E Client	PowerShell script CI that detects if Shopping module is enabled. If not, the remediation script will enable and configure the Shopping module using the **1E.Client.exe -reconfigure** command and restart the 1E Client for the settings to take effect. The following settings are applied by the script. • Module.Shopping.Enabled=true • Module.Shopping.ShoppingCentralUrl=https://<<FQDN>>/shopping • Module.Shopping.LoopbackExemptionEnabled=True You will need to modify the remediation script as described in the process below this table with the FQDN of your Shopping host (typically a DNS alias for the Shopping website host header). You may also want to disable the Loopback Exemption (set it to false).
Configure Tachyon client in 1E Client	PowerShell script CI that detects if the Switch and Background Channel have been defined. If not, the remediation script will configure these settings using the **1E.Client .exe -reconfigure** command and restart the 1E Client for the settings to take effect. The following settings are applied by the script. • Switch=<SERVERFQDN>:4000 • BackgroundChannelUrl=https://<SERVERFQDN>:443/Background/ You will need to modify the remediation script as described in the process below this table with the FQDN of your Tachyon host (typically a DNS alias for Tachyon server). Note that the Tachyon client cannot actually be enabled or disabled. It is an intrinsic part of the 1E Client and is always enabled. If you are not using the Tachyon platform, you install 1E Client with the SWITCH and BACKGROUNDCHANNELURL properties set to NONE.

CI Name	Description
Enable Nomad module in 1E Client	PowerShell script CI that detects if the Nomad module is enabled. If not, the remediation script will enable the Nomad module using the **1E.Client.exe -reconfigure** command and restart the 1E Client for the settings to take effect. There are no settings in this remediation script that need to be modified for Content Distribution.
Enable WakeUp module in 1E Client	PowerShell script CI that detects if WakeUp module is enabled. If not, the remediation script will enable the WakeUp module using the **1E.Client.exe -reconfigure** command and restart the 1E Client for the settings to take effect. There are no settings in this remediation script that need to be modified for WakeUp
Nomad Registry Settings	Registry Value CI that includes commonly configurable Nomad registry settings with their default values. You will need to modify these if your Nomad design requires any non-default configuration settings. **Tip** The zip does not contain all registry settings for Nomad. You can create your own Configuration Item for the Nomad module using Nomad Baseline Wizard.
WakeUp 7.3 Registry Settings	Registry Value CI that includes all commonly configurable WakeUp 7.3 registry settings with their default values. You will need to modify these at a minimum to define the SerivceURL (the URL of the AFWebService) and any non-default WakeUp configuration settings required by your design.

To configure the 1E Client after installation:

1. Import template Configuration Items
    a. Download the set of template Configuration Items available here **1EClientCIs.zip** and unzip to a working directory accessible from a CM console
    b. Start the CM console and open the **Assets and Compliance** workspace
    c. Expand the **Compliance Settings** folder, right-click **Configuration Items** and select **Import Configuration Data** to start the **Import Configuration Data Wizard**
    d. From the **Import Configuration Data Wizard Select Files** page, click **Add...** and browse to the files extracted from 1EClientCIs.zip. You can select to import all files, or select only those relevant to the modules you want to enable and configure right now, using the above table for reference. Click **Open** to import the selected files
    e. As the Configuration Items have not been signed you will be prompted to confirm that you want to import them - click **Yes** to import each file, then click **Next**

f. On the **Summary** page click **Next** to import the Configuration Items

g. On the **Confirmation** page click **Close**.

Supported Platforms

After importing the Configuration Items, double-click each in turn to view the CI properties and review the Supported Platforms tab to ensure all Operating Systems you currently manage are selected. For example, if you are managing Windows Server 2019 with CM CB 1902 or later, you will need to select Windows Server 2019.

2. If you want to configure **Tachyon**

   a. Double-click the **Configure Tachyon client in 1E Client** Configuration Item to edit its properties

   b. Click on the **Settings** tab, then double-click the **Configure Tachyon client in 1E Client** setting

   c. From the **General** tab of the **Configure Tachyon client in 1E Client Properties** dialog box, select the **Edit Script** button under **Remediation Script (optional)**

   d. In the script editor, replace <SERVERFQDN> with the FQDN of your Tachyon server for both the Switch and BackgroundChannelUrl. If you are using custom ports, then modify these accordingly too, then click **OK** to save and close the script editor.

   e. Click **OK** on the remaining dialog boxes to save the updated CI and return to Configuration Items in the CM console.

3. If you want to configure **Shopping**

   a. Double-click the **Enable and Configure Shopping module in 1E Client** configuration Item to edit its properties

   b. Click on the **Settings** tab, then double-click the **Enable and Configure Shopping module in 1E Client** setting

   c. From the **General** tab of the **Enable and Configure Shopping module in 1E Client Properties** dialog box, select the **Edit Script** button under **Remediation Script (optional)**

   d. In the script editor, replace <<FQDN>> with the FQDN of your Shopping web server (typically this is a DNS alias for the Shopping website host header), then click **OK** to save and close the script editor

   e. Click **OK** on the remaining dialog boxes to save the updated CI and return to Configuration Items in the CM console.

4. If you want to configure **WakeUp**, there are no changes required to the Enable WakeUp module in 1E Client CI, but you will need to modify the WakeUp 7.3 Registry Settings CI as follows:

   a. Double-click the **WakeUp 7.3 Registry Settings** configuration Item to edit its properties

   b. Click on the **Compliance Rules** tab and review the values defined for each of the registry values. To modify any of these, double-click the item and in the **Edit Rule** dialog box, define the value that should be used:

- If the AFWebService website is using HTTP, replace the <SERVERFQDN> in the **ServiceUrl (HTTP)** setting with the FQDN of the web server and ensure the **ServiceUrl (HTTPS)** value is blank
- If the AFWebService website is using HTTPS, blank the **ServiceUrl (HTTP)** value and replace the <SERVERFQDN> in the **ServiceUrl (HTTPS)** setting
- When using HTTPS you must also define either **CertIssuer** or **CertSubject** setting.

c. Click **OK** to save the properties and return to Configuration Items in the CM console.

5. If you want to configure **Nomad**, there are no changes required to the Enable Nomad module in 1E Client CI, but you will need to modify the Nomad 7.0 Registry Settings CI as follows:

   a. Double-click the **Nomad 7.1 Registry Settings** configuration Item to edit its properties

   b. Click on the **Compliance Rule**s tab and review the values defined for each of the registry values. To modify any of these, double-click the item and in the **Edit Rule** dialog box, define the value that should be used. If you are using ActiveEfficiency you will need to replace the <<AEServerFQDN>> in the **PlatformUrl** setting with the FQDN of the ActiveEfficiency web server

   c. Click **OK** to save the properties and return to Configuration Items in the CM console.

6. Create a baseline to configure the 1E Client to include the required Configuration Items as follows:

   a. Right-click **Configuration Baselines** and select **Create Configuration Baseline**. Enter a suitable name and description.

   b. Click the **Add** button and select Configuration Items from the drop-down list. Select the Configuration Items as follows:

      - To configure **Tachyon** with this baseline, select the **Configure Tachyon Client in 1E Client** CI and click **Add**
      - To configure **Shopping**, select the **Enable and Configure Shopping module in 1E Client** CI and click **Add**
      - To configure **WakeUp**, select the **Enable WakeUp module in 1E Client** and **WakeUp 7.3 Registry Settings** CIs and click **Add**
      - To configure **Nomad**, select the **Enable Nomad module in 1E Client** and **Nomad 7.0 Registry Settings** CIs and click **Add**

   c. When you have added all the CIs you want to include, click **OK** to save and close the **Add Configuration Items** dialog box, then click **OK** to close the Create Configuration Baseline dialog box.

7. Deploy the Configuration Baseline to systems with the 1E Client installed

   a. Right-click the Configuration Baseline created in the previous step and select **Deploy**

   b. In the **Deploy Configuration Baselines** dialog box check the option **Remediate noncompliant rules when supported**

c. Click the **Browse...** button and select a Collection to deploy the baseline to (typically you would use the same Collection that was targeted with the initial 1E Client installation deployment)

d. Modify the scheduling according to your preferences and click **OK**.

Clients in the targeted Collection will start to apply the Configuration Baseline after the next machine policy refresh. You can check the compliance status periodically Configuration Baselines view in the console.

2.3.5.3 Example command-lines for reconfiguring the 1E Client

After installing the 1E Client, it may be necessary to enable additional modules, disable modules, or change configuration settings. For example, the 1E Client may have been initially installed just for the Shopping or WakeUp modules and you now want to use the full 1E Client with the Tachyon Platform, or conversely you may have deployed the 1E Client without the Shopping module enabled and subsequently implemented Shopping and therefore need to enable the Shopping module. These scenarios can be managed using the **1E.Client.exe -reconfigure** command-line interface, so it is easy to implement using software distribution tools such as Configuration Manager.

Please refer to 1E Client command-line parameters if you would like to see details of other CLI commands.

Warning

You can change only configuration file settings using this method, you must use other methods to change registry settings. For further guidance, please refer to Reconfiguring 1E Client.

Note

Any name=value pair can be added to the configuration file, no validation is done. If a key with the name does not already exist in the configuration file, it will be added to the file and a warning output (in case the name has been misspelled).

2.3.5.3.1 Reconfiguring on Windows devices

The **-reconfigure** command-line option changes the settings in the **1E.Client.conf** configuration file. These changes are only available from Tachyon instructions when the 1E Client service is running. Use the **-restart** option on the command line to restart the service after the configuration changes have been made. Note that the restart will be delayed by a random duration (based on the Tachyon client reconnection interval) to disperse the load as clients connect to Tachyon, NightWatchman or Shopping servers on startup.

Tachyon client - to configure Tachyon feature settings if the 1E Client was initially installed with only the Shopping, WakeUp or Nomad client modules enabled, execute the following command line:

```
"%ProgramFiles%\1E\Client\1E.Client.exe" -reconfigure Switch=tachyon.acme.local
:4000 BackgroundChannelUrl=https://tachyon.acme.local/Background -restart
```

The above command can be extended to reconfigure any Tachyon settings because they are all stored in the 1E Client configuration file.

Nomad client - to enable the Nomad client module on a deployed 1E Client, execute the following command line:

```
"%ProgramFiles%\1E\Client\1E.Client.exe" -reconfigure Module.Nomad.Enabled=true
```

The above command only enables the Nomad client module, which is the only Nomad setting in the 1E Client configuration file. The command does not configure registry settings necessary for using ActiveEfficiency. You can update the registry using commands such as:

```
REG ADD HKLM\Software\1E\NomadBranch\ActiveEfficiency /v PlatformUrl /t REG_SZ
/d https://aeserver.acme.local/ActiveEfficiency
```

PXE Everywhere client - to enable the PXE Everywhere client module on a deployed 1E Client, execute the following command line:

```
"%ProgramFiles%\1E\Client\1E.Client.exe" -reconfigure Module.PXEEverywhere.Enab
led=true
```

The above command only enables the PXE Everywhere client module, which is the only PXE Everywhere setting in the 1E Client configuration file. The command does not configure registry settings necessary for connecting to the PXE Everywhere Central server. You can update the registry using commands such as:

```
REG ADD HKLM\Software\1E\PXEEverywhere /v ConfigServerAddress /t REG_SZ /d http
://SERVER.acme.local/PXELite/PXELiteConfiguration.asmx
```

Shopping client - to enable the Shopping client module on a deployed 1E Client, execute the following command line:

```
"%ProgramFiles%\1E\Client\1E.Client.exe" -reconfigure Module.Shopping.Enabled=t
rue Module.Shopping.ShoppingCentralUrl=http://appstore.acme.local/shopping -res
tart
```

The -reconfigure method can be used for all Shopping client settings because they are all stored in the 1E Client configuration file. If required, add Shopping client settings=true.

WakeUp client - to enable the WakeUp client module on a deployed 1E Client, execute the following command line:

```
"%ProgramFiles%\1E\Client\1E.Client.exe" -reconfigure Module.WakeUp.Enabled=tru
e Module.WakeUp.ManageFirewallRules=true
```

The above command only enables the WakeUp client module and enables Windows firewall rules. These are the only WakeUp settings in the configuration file. The command does not configure registry settings necessary for reporting to the NightWatchman Management Center server. You can update the registry using commands such as:

```
REG ADD HKLM\Software\1E\WakeUpAgt\Reporting\HTTP /v ServiceUrl /t REG_SZ /d ht
tp://nwmmc.acme.local/AFWebService/PostMessage.aspx
```

2.3.5.3.2 Reconfiguring on non-Windows devices

Please refer to 1E Client command-line parameters if you would like to see details of other CLI commands.

> **Note**
>
> This method is suitable for 1E Clientreconfiguring all settings on non-Windows devices because only platform client features are available and all settings are stored in the 1E Client configuration file.

On Linux and Solaris:

```
/usr/sbin/1E.Client -reconfigure Switch=ACME-DMZ01.ACME.LOCAL:4000 BackgroundCh
annelUrl=https://ACME-DMZ01.ACME.LOCAL:443/Background/ -restart
```

On macOS:

```
cd /Library/Application Support/1E/Client # Do not prefix cd with sudo
./1E.Client -reconfigure Switch=ACME-DMZ01.ACME.LOCAL:4000 BackgroundChannelUrl
=https://ACME-DMZ01.ACME.LOCAL:443/Background/ -restart
```

2.3.5.3.3 Starting and Stopping the 1E Client from the command line

On Windows devices, you can start, stop and restart the 1E Client from the command-line, as an alternative to using the Windows Services console UI. Please refer to 1E Client command-line parameters for more details.

On Linux, Solaris and macOS devices, you can start, stop and restart the 1E Client from the command-line.

2.3.6 Verifying

Links to other 1E product documentation to verify or troubleshoot their features that are dependent on the 1E Client.

- Tachyon platform: Verifying.
- Nomad: /document/preview/675710#UUID-ed88d585-22d1-0311-3246-8f71845db40c.
- PXE Everywhere: Verifying.
- Shopping: /document/preview/723100#UUID-b7e84337-1c0b-c10e-1146-03d4a06bc15e.
- NightWatchman Enterprise: /document/preview/712264#UUID-0e963042-5df7-7f6d-737e-0e98ab02ed2e.

2.3.6.1 General verification of the 1E Client

1. Confirm the 1E Client service is running.
2. Ensure you know which client features are enabled - review the **<INSTALLDIR>\1E\Client\1E.Client.conf** file.
3. Review the log files for errors.

1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

1E Client logs on macOS

/Library/Logs/1E.Client.Daemon.log (shows any service start errors)

/Library/Logs/1E.Client.log (shows the current operation of the 1E Client)

1E Client logs on other non-Windows platforms

/var/log/1E/Client/1E.Client.log

Nomad client log

%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles\NomadBranch.log

PXE Everywhere Agent log

%ALLUSERSPROFILE%\1E\PXEEverywhere\PXEEverywhere.log

Shopping WSA client log

%ALLUSERSPROFILE%\1E\Client\WSA.log

WakeUp client log

%ALLUSERSPROFILE%\1E\Agent\WakeUpAgt.log

> **Note**
>
> By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

2.4 Upgrading 1E Client

Guidance for upgrading Tachyon and other legacy 1E agents to 1E Client. This page contains detailed steps for upgrading Tachyon Agent and a summary of considerations for upgrading other legacy agents. The 1E Client contains clients for 1E products and solutions, and their upgrade documentation should be consulted before upgrading their clients and agents.

When upgrading a 1E product or solution, you should upgrade its server infrastructure first. For more information, please refer to the following:

- Upgrading Nomad - from 7.1 onwards you will be replacing ActiveEfficiency Server with Tachyon Platform, which includes Content Distribution

- Upgrading PXE Everywhere
- NightWatchman Enterprise - Upgrading NightWatchman Enterprise
- Shopping - Upgrading to Shopping
- Upgrading Tachyon Platform.

Note

Upgrading from earlier versions of 1E Client to 8.1 simply requires deploying the new version, using the same or different configuration settings.

Please refer to:

- Deploying 1E Client on Windows
- Deploying 1E Client on macOS
- Deploying 1E Client on Linux
- Deploying 1E Client on Solaris

If you are upgrading any legacy 1E agents then please read sections below.

Please refer to Reconfiguring 1E Client for how to reconfigure the 1E Client after it has been deployed.

2.4.1 1E Client versions

2.4.2 Upgrading legacy 1E agents to 1E Client 8.1

Before deploying the 1E Client you need to decide which:

- Client modules to enable.
- Client modules are new and what their settings should be.
- Legacy agents will be upgraded and replaced.
- Legacy agents will remain.

1E Client contains the following client modules which are only supported on Windows OS:

- **Nomad client** module - replaces Nomad Branch client.
- **PXE Everywhere Agent** module - replaces PXE Everywhere Agent (also known as PXELite and PXE Everywhere Local).

- **WakeUp client** module - replaces the WakeUp Agent component of 1E Agent, but does not affect 1E NightWatchman Agent.
- **Shopping client** module - replaces the Shopping Agent and also includes a feature called Windows Servicing Assistant (WSA).

Note

Non-Windows platforms support **Tachyon** features only.

Note

If a client module is enabled, it replaces the legacy version if present. Existing settings are retained unless individual setting are set during deployment.

The client upgrade process is the same as the interactive and command-line installation processes described in Deploying 1E Client on Windows.

When 1E Client is installed with one or more client modules enabled then if the older version of the legacy client is already installed then it is replaced with the current configuration settings retained unless overridden by new settings. The replacement process is not strictly an MSI upgrade because the 1E Client actually uninstalls the old product or component when the 1E Client service starts, not during installation of the 1E Client, and will only do this if the corresponding client module is enabled. First the 1E Client service copies registry values and re-instates them after uninstallation so they can be used by the client module.

Note

If legacy Agents have been deployed as Applications in Configuration Manager, you should define supersedence on each Application that installs the new version so that it supersedes the previous versions. This is *very important* as it prevents attempts at downgrading Tachyon, Nomad, WakeUp or Shopping clients through **Application Deployment Enforcement** if there are still active deployments for the previous versions.

Supersedence is the recommended way of preventing downgrades because other methods are not guaranteed, such as disabling old deployments (may be temporarily re-enabled), or using Exclude Collections (collection memberships can change).

1E NightWatchman Agent is unaffected by 1E Client, but is included in Introducing 1E Client Deployment Assistant) with the 1E Client, which also includes the WakeUp client, as described below.

The 1E Client Deployment Assistant is designed to help install Windows versions of 1E Client and other 1E agents using Configuration Manager. It includes template transform files for each combination of client/agent for 32 and 64-bit platforms, and automatically creates collections and deployments in Configuration Manager, so that you only need to populate the collections.

2.4.2.1 Nomad client

1E Client includes the Nomad client which is a replacement for the legacy Branch client that is installed on client computers, and on Distribution Points if Configuration Manager is used. Both new and legacy versions of the Nomad client are also known as the Nomad Branch client.

The client upgrade process is the same as the interactive and command-line installation processes described in Deploying 1E Client on Windows.

Please refer to Upgrading Nomad for more detail about upgrading the Nomad infrastructure. From Nomad 7.1 onwards you will be replacing ActiveEfficiency Server with Tachyon platform.

Upgrading Nomad may also require updates to existing Task Sequences. Existing Nomad Task Sequence steps will continue to work after the upgrade, but it may be necessary to remove and replace them after the upgrade to implement any fixes or improvements included in the new version.

2.4.2.2 PXE Everywhere Agent

1E Client includes the PXE Everywhere Agent which is a replacement for the legacy PXE Everywhere Agent (also known as PXELite and PXELocal) that is installed on client computers, and on Distribution Points if Configuration Manager is used.

The client upgrade process is the same as the interactive and command-line installation processes described in Deploying 1E Client on Windows.

Please refer to Upgrading to PXE Everywhere 8.1 for more detail about upgrading the PXE Everywhere infrastructure.

Upgrading PXE Everywhere will also require updates to existing Task Sequences to use updated boot images.

2.4.2.3 1E Agent, NightWatchman and WakeUp Agents

When upgrading 1E Agent that has both WakeUp and NightWatchman enabled and you require continuity of WakeUp features, then first deploy the **1E Client** with WakeUp client module enabled, and then deploy the **1E NightWatchman Agent**.

The legacy 1E Agent installer is replaced by two new installers:

- WakeUp Agent component of legacy 1E Agent is replaced by **1E Client** (with its WakeUp client module enabled)
- NightWatchman Agent component of the legacy 1E Agent is replaced by **1E NightWatchman Agent**.

The following occurs when upgrading a computer that has a legacy version of 1E Agent installed (with NightWatchman and/or WakeUp Agent enabled):

New client	What happens to the existing client when upgraded
1E NightWatchman Agent	Deploying **1E NightWatchman Agent** upgrades the legacy NightWatchman Agent component of 1E Agent and uninstalls the legacy WakeUp Agent component if installed. This process maintains the WakeUp registry, to be used by the WakeUp client module of the 1E Client if installed later. The **1E NightWatchman Agent** can only be installed on Windows workstation OS and *not* on server OS.

New client	What happens to the existing client when upgraded
1E Client	Deploying **1E Client** (with its WakeUp client module enabled) causes the legacy 1E Agent WakeUp component to be uninstalled the first time the 1E Client is started, leaving intact the NightWatchman Agent component if that was installed. The **1E Client** (with WakeUp client module enabled) can be installed on Windows workstation OS *and* on server OS. It *must* also be installed on **WakeUp Server** servers, which must be upgraded to WakeUp Server 7.3 or later.

Please refer to the following for more detailed steps for upgrading from **1E Agent**:

- Deploying 1E Client on Windows
- NightWatchman Enterprise 7.3 - Upgrading to 1E NightWatchman Agent 7.3.

You can use the Introducing 1E Client Deployment Assistant to assist with the deployment of **1E Client** and **1E NightWatchman Agent** using Configuration Manager.

Please refer to NightWatchman Enterprise 7.3 - Upgrading NightWatchman Enterprise for more details about upgrading the server infrastructure for **NightWatchman Enterprise** and **WakeUp Server**.

2.4.2.4 Shopping Agent

1E Client includes the Shopping client which is a replacement for the legacy Shopping Agent that is installed on client computers.

The client upgrade process is the same as the interactive and command-line installation processes described in Deploying 1E Client on Windows.

Please refer to Shopping 6.1 - Upgrading to Shopping for more detail about upgrading the Shopping infrastructure.

2.5 Troubleshooting

A general methodology for investigating issues with the 1E Client, as well as identifying key issues and their resolutions.

For known issues relating to specific components, please refer to the respective troubleshooting pages:

Clients

- 1E Client
- 1E Client Deployment Assistant

Platform

- 1E

Applications

- Endpoint Automation
- Experience Analytics
- Endpoint Troubleshooting

Integration

- 1E Core for ServiceNow
- 1E ITSM Connect for ServiceNow

- PXE Everywhere
- Writing 1E Instructions (1E SDK)
- 1E Service Catalog Connect for ServiceNow
- 1E Virtual Assistant

2.5.1 1E Support contact details

2.5.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

2.5.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

- US/Canada: 1-866-349-4032 (Toll-Free)
  1-917-339-2360 (Standard)
- UK/Europe: +44 (0)208 326 3499
- India: +91 120 402 4002
- Australia: +61 739 111 118

2.5.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation.

support@1e.com

2.5.2 The technical support process

1. Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

2. Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

3. If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

2.5.2.1 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

2.5.2.1.1 Version details

- The OS, version number, and patch level for:
  - Tachyon Servers
  - 1E Client
  - Configuration Manager - if used
  - Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.
- For Nomad and Shopping, please provide OS, version number, and patch level for:
  - Configuration Manager DPs
  - Nomad extensions used on Configuration Manager Consoles
  - ActiveEfficiency Server.

2.5.2.1.2 Environmental details

- If there were any recent changes made to your configuration
- The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

2.5.2.1.3 Problem details

- When did the issue occur, ensure log files cover this period
- The scope of the issue – did it affect a particular geographical location, group of users, or client machines
- Details of any self-help troubleshooting steps you carried out
- In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

2.5.2.2 1E Client log files

1E Client logs on Windows

1E Client logs on macOS

1E Client logs on other non-Windows platforms

Nomad client log

PXE Everywhere Agent log

Shopping WSA client log

WakeUp client log

> **Note**
>
> By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

2.5.3 Client issues

Troubleshooting common issues that you may be having with the installation and configuration of the Nomad.

If for any reason you are unable to install it, then please review the Planning for 1E Client.

When installing interactively, please confirm you are logged on using an account that has local Administrator rights.

You can troubleshoot installation issues by reviewing the installation log file. On Windows, start an Administrative command prompt and use a msiexec command line including a log file as described in Installing the 1E Client by command-line.

If your problem is not identified on this page, then please review the relevant client section on the Known issues page.

Please ensure you have run through the verification steps on the relevant pages:

- Tachyon Verifying
- Nomad /document/preview/675710#UUID-ed88d585-22d1-0311-3246-8f71845db40c
- PXE EveryWhere Verifying
- Shopping - Troubleshooting
- NightWatchman Enterprise - Troubleshooting.

2.5.3.1 Client certificate issues

If the Tachyon Server has been configured to require client certificates, clients must be running on devices where a valid device certificate has been applied. If this is not the case, the following symptoms will appear:

- The device where the client is running will not be able to connect to the Tachyon Server

- A warning similar to the following will appear in the **Tachyon.Switch.Host.log** file (the default location for all the Tachyon Server logs is **%AllUsersProfile%\1E\Tachyon** folder on the server where Tachyon Server is installed):

  ```
  WARN  - Error receiving data from [tachyon.test.local]:4000 : An establis
  hed connection was aborted by the software in your host machine
  ```

- On the Tachyon client device, you will see an error similar to the following in the **1E.Client.log** file (the default location for the 1E Client log is **%AllUsersProfile%\1E\Client** folder on the device where the client is installed):

  ```
  Received WS message: SwitInfo{"SwitchId":1,"SwitchName":"","WorkerNum":0,
  "SlotNum":3,"DisconnReason":"No Certificate"}
  ```

If you find log entries similar to these appearing in the log files, you can check that Tachyon is working correctly for the device by manually requesting a device certificate. If the device can then connect to the Tachyon Server, you should contact your network PKI administrator.

Note

Each client/agent in 1E Client uses certificates independently of each other.

Platform clients search for a client certificate so they can be authenticated by Tachyon servers.

Nomad clients search for a suitable client certificate so they can be authenticated by CM Distribution Points, and for use with Peer to Peer sharing. They can optionally use Nomad CertIssuer/CertSubject configuration settings to help find suitable certificates.

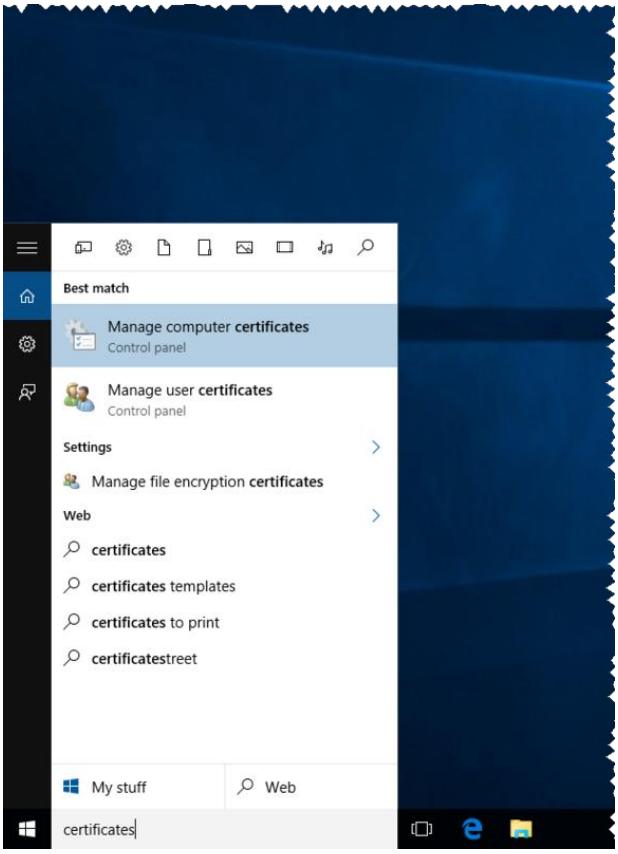
Shopping and WakeUp clients each have their own CertIssuer/CertSubject configuration settings that determine which client authentication certificate they each use. These are only needed if their websites have an HTTPS binding that is configured to require certificates.

PXE Everywhere Agent does not use client authentication certificates.

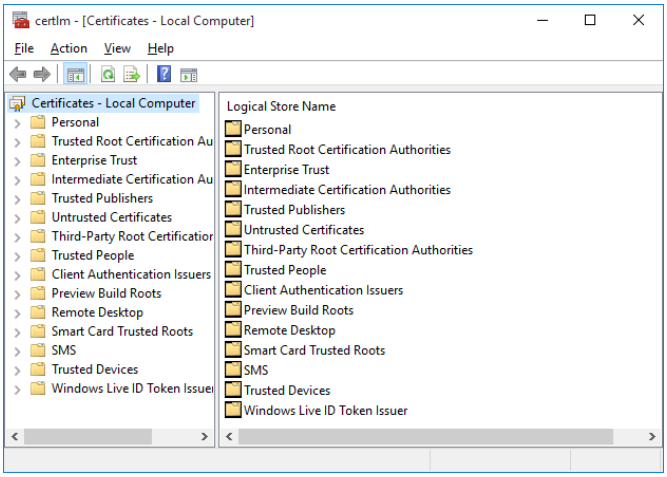
2.5.3.1.1 Manually requesting a device certificate on Windows 10

The following steps show the manual process of requesting a certificate (enrolling) for the computer on which the platform client is installed. Although these instructions cover Windows 10 the general approach of using the Certificates MMC snap-in can be extrapolated to cover most Windows Operating Systems.

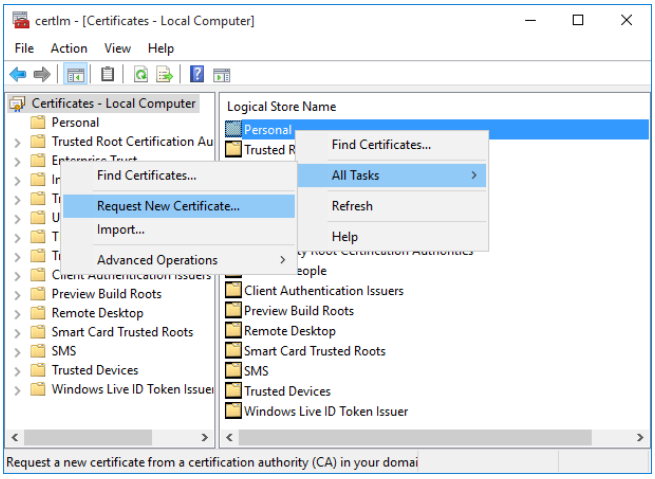
1. Run the certificate mmc snap-in. For example, by finding the **Manage computer certificates** application, as shown in the following picture.



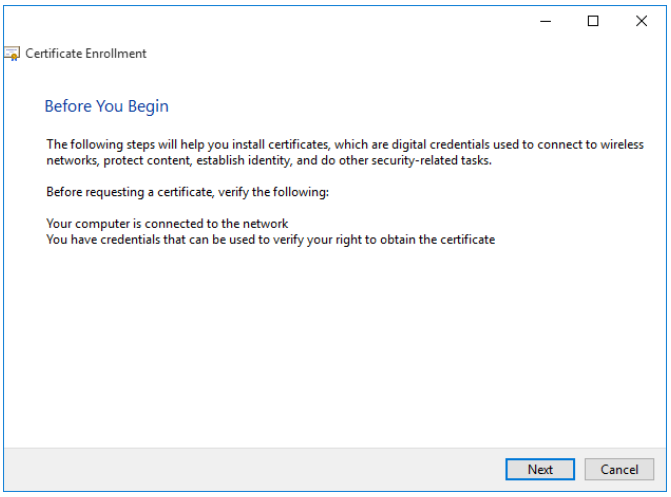
2. Doing this displays the certlm MMC snap-in, as shown in the following picture.



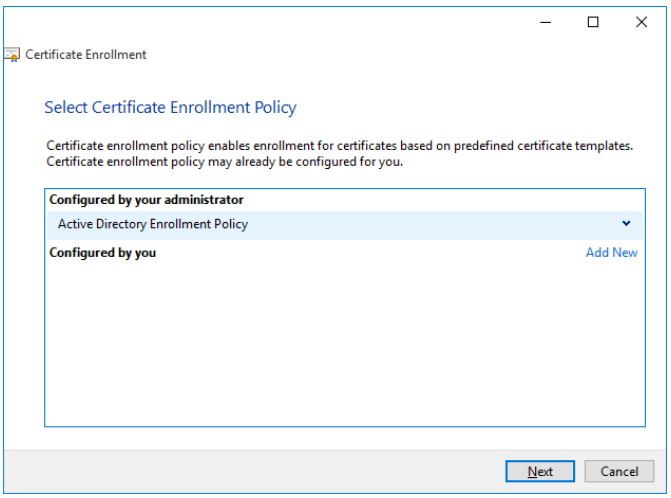
3. Right-click on the Personal folder and select the **All Tasks**->**Request New Certificate...** menu option from the right-click menu, as shown in the following picture.



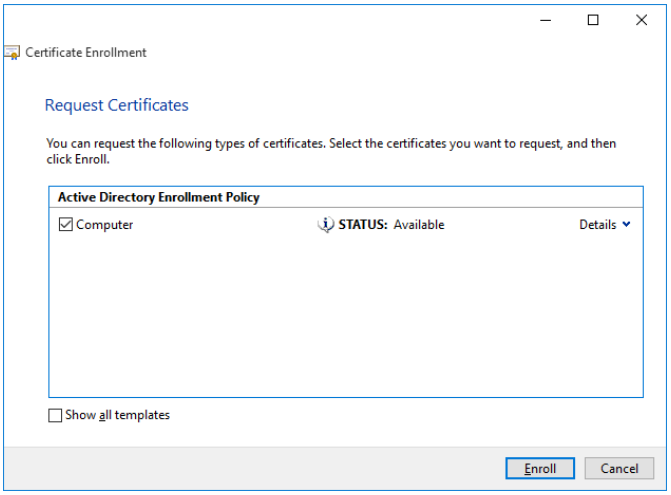
4. Doing this displays the Certificate Enrollment wizard. On the **Before You Begin** screen click **Next** to continue.



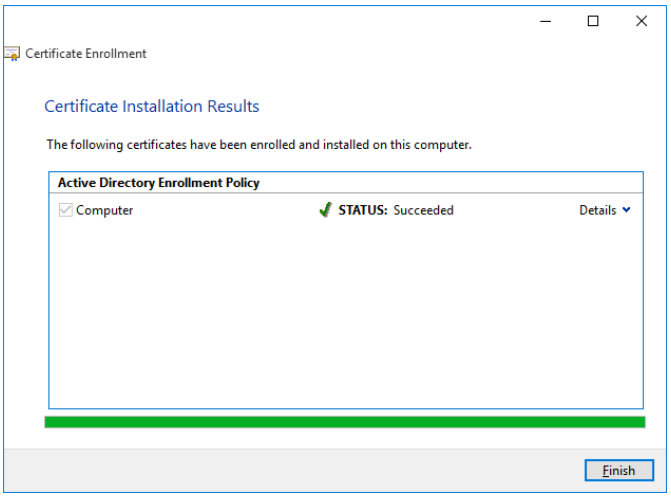
5. On the **Select Certificate Enrollment Policy** screen select the **Active Directory Enrollment Policy** option, as shown in the following picture.



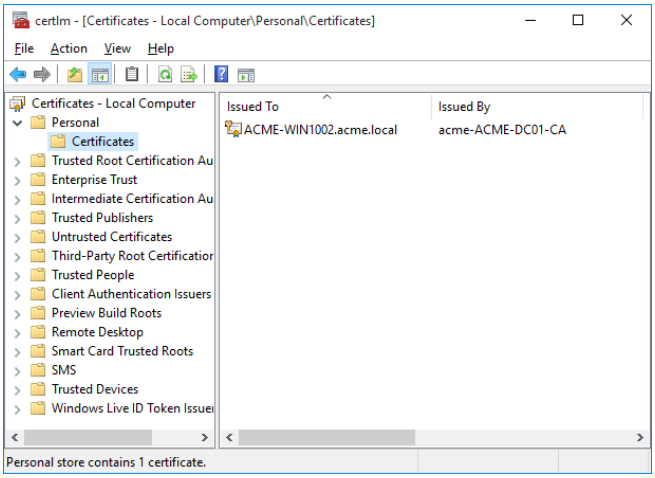
6. On the **Request Certificates** screen select the **Computer** certificate checkbox, as shown in the following picture, then click the **Enroll** button.



7. The **Certificate Installation Results** screen shows whether the certificate has been installed correctly. When it has, as shown in the following picture, click **Finish** to exit the wizard.



8. Once the wizard has completed you should see the new certificate under the **Personal->Certificates** folder, as shown in the following example.



2.5.3.2 Enabling SHA-512 to work with TLSv1.2

Tachyon uses TLSv1.2. On new installations of some Windows OS, SHA-512 is disabled when using TLSv1.2, as described in KB2973337. This means Windows cannot use TLSv1.2 with certificates that have a SHA-512 signature hash algorithm, including those in the certification path (trust chain).

One method of seeing whether your installation is affected, is when Chrome browser refuses to connect to a website, but Internet Explorer allows the connection. Unlike Chrome, if Internet Explorer cannot use TLS 1.2 it will downgrade to TLS 1.0 or 1.1 if enabled in the Advanced tab of Internet Options. If you disable these check-boxes then Internet Explorer will refuse to connect. This issue occurs only when one or more certificates in the trust chain is using SHA-512 as a signature hash algorithm.

To resolve this, you must install relevant updates on each OS as described in the KB, which may already be installed by Windows Updates. However, you may not have updated a new installation, for example in a lab. The table below is a guide only, and you should read KB2973337 first and apply prerequisite updates. A restart is required after each update.

OS	Update	Prerequisites
Windows 10 and later OS	Not applicable	
Windows 8.1 and Server 2012 R2	KB2975719	KB2919442 then KB2919355
Windows 8 and Server 2012	KB2975331	KB2993651
Windows 7 and Server 2008 R2	KB2973337	
Windows XP and Server 2003	KB968730	

2.5.3.3 1E Digital Signing Certificates

As described in Digital signing certificates, the root signing certificate is **DigiCert High Assurance EV Root CA** and the root timestamping certificate is

DigiCert Assured ID Root CA. These must exist in the **Trusted Root Certification Authorities** store, which contains a replica of the **Third-Party Root Certification Authorities** store.

Issue

If the relevant certificates are not available on a Windows computer, then the 1E Client will stop shortly after starting up, and the **1E.Client.log** file will show an error similar to the following.

```
INFO  - Loading providers...
ERROR - Unable to verify signature for 'C:\Program Files\1E\Client\Extensibilit
y\1E.Client.Provider.Cli.dll'
ERROR - Unable to verify signature for 'C:\Program Files\1E\Client\Extensibilit
y\1E.Client.Provider.Http.dll'
ERROR - Unable to verify signature for 'C:\Program Files\1E\Client\Extensibilit
y\1E.Client.Provider.Json.dll'
ERROR - Unable to verify signature for 'C:\Program Files\1E\Client\Extensibilit
y\1E.Client.Provider.Nomad.dll'
ERROR - Unable to verify signature for 'C:\Program Files\1E\Client\Extensibilit
y\1E.Client.Provider.PowerShell.dll'
ERROR - Unable to verify signature for 'C:\Program Files\1E\Client\Extensibilit
y\1E.Client.Provider.Registry.dll'
ERROR - Unable to verify signature for 'C:\Program Files\1E\Client\Extensibilit
y\1E.Client.Provider.TcpIp.dll'
ERROR - Unable to verify signature for 'C:\Program Files\1E\Client\Extensibilit
y\1E.Client.Provider.Wmi.dll'
```

Cause

This occurs when 1E Client is unable to validate the code signing signature of the executables or libraries. This can happen if one or more of the following is true:

- the trusted root certificate of the countersignature is missing from the Windows **Trusted Root Certification Authorities** certificate store - this may be because **Automatic Root Certificates Update** is disabled
- other certificates in the trust path are missing, and Windows is unable to connect to the Internet and dynamically download them during validation.

In either case, the failure to download trusted certificates may be due to the computer being disconnected from the Internet, for example in a lab.

The issue can also affect installation and patching because MSI and MSP files are also countersigned, but that depends on your organizations security policies for software installation.

The issue may not be apparent until after installation, when restarting and not able to connect to the Internet, for example if the computer has been moved into lab.

The root CA certificates are normally automatically provided by Microsoft's Update Root Certificates feature, however this may not be present for legacy OS. You can tell if the root CA certificate is present as follows:

- view the properties of the **1E.Client.exe** file
- select the **Digital Signatures** tab

- select the sha1 signature and click Details (this may take some time to respond while Windows is trying to check the certificate revocation)
- click **View Certificate**
- select the **Certification Path**
- if you do not see **Digicert** at the top of the certification path, then you do not have the root CA certificate

In a lab environment that is not connected to the Internet, the computer may not be able to automatically obtain intermediate CA certificates.

Resolution

Ensure that your Root Certificates are up-to-date. The Update Root Certificates feature is enabled by default but its configuration may have been changed or restricted by Group Policy. You may see *DisableRootAutoUpdate = 1 (dword)* in *HKLM\Software\Policies\Microsoft\SystemCertificates\AuthRoot.*

If disconnected from the Internet, then manually import the certificates for:

- Root CA into the **Third-Party Root Certification Authorities** store or **Trusted Root Certification Authorities** store.
- Issuing CA into the **Intermediate Certification Authorities** certificate store.

You can distribute certificates to client computers by using Group Policy, as described in https://docs.microsoft.com/en-us/windows-server/identity/ad-fs/deployment/distribute-certificates-to-client-computers-by-using-group-policy.

The table below applies to software and hotfixes released in 2020.

2020	Signing certificate	Timestamping certificates
Certificate	1E Limited	TIMESTAMP-SHA256-2019-10-15 ***and*** DigiCert Timestamp Responder
Issuing CA	**DigiCert EV Code Signing CA (SHA2)** Thumbprint: 60ee3fc53d4bdfd1697ae5beae1cab1c0f3ad4e3	**DigiCert SHA2 Assured ID Timestamping CA** Thumbprint: 3ba63a6e4841355772debef9cdcf4d5af353a297 ***and*** **DigiCert Assured ID CA-1** Thumbprint: 19a09b5a36f4dd99727df783c17a51231a56c117

2020	Signing certificate	Timestamping certificates
Root CA	**DigiCert High Assurance EV Root CA** Thumbprint: 5fb7ee0633e259dbad0c4c9ae6d38f1a61c7dc25	**DigiCert Assured ID Root CA** Thumbprint: 0563b8630d62d75abbc8ab1e4bdfb5a899b24d43

2.5.4 Known issues

Lists of the current known issues with implementing, configuring, using and extending Tachyon.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

2.5.4.1 Tachyon

Please refer to Troubleshooting for issues with other components of Tachyon.

2.5.4.1.1 Client installation issues on Windows

Issue	Description	Workaround
1E Client installed on Windows 11 device reports Operating System value as "Windows 10 21H2"	1E Client installed on Windows 11 device reports Operating System value as "Windows 10 21H2".	None
1E Client UI runs even when the Tachyon module is not enabled (e.g. Nomad only install)	Installing the 1E Client without enabling the Tachyon Module (only Nomad or Shopping module is enabled) enables and displays the survey notifications in 1E Client notification icon.	In order to suppress this, the Module.Interaction.Enabled=false can be set in the config file on the 1E Client or use the corresponding MSI property (i.e. MODULE.INTERACTION.ENABLED=false).
TemporaryDirectory config does not work properly with non-ASCII in the path and the	The error is seen if the TEMPORARYDIRECTORY MSI property for the 1E Client contains a non-ASCII value such as "c:\tâ,¬mp\acme€" and the directory exists.	Please provide a path that only uses ASCII values.

Issue	Description	Workaround
following is seen in 1E.Client.logs: `ERROR - Temporary directory: Cannot create file in overriding path 'c:\tâ,¬mp\acme€'; using default location`	The same applies if this is added directly to 1E.Client.conf.	
Manually uninstall of 1E Client using Programs and Features displays dialog "The setup must update files or services that cannot be updated while the system is running. If you choose to continue, a reboot will be required to complete the setup."	Running the 1E Client MSI manually with the Remove option displays the following: "The setup was unable to automatically close all requested applications. Please ensure that the applications holding the files in use are closed before continuing with the installation." These messages appear as the services that are about to be removed are running, but the 1E Client handles the shutdown so this message can be ignored. Silent uninstall does not present this issue.	None
1E Client installer adds the Nomad registry settings even when the Nomad module is NOT enabled during installation. If someone deletes	1E Client installer creates the majority of the Nomad registry values because the service does not create them all and Nomad does not tolerate the absence of all the settings that the service does not create. If these settings are deleted and the Nomad module is enabled later, then Nomad is unable to function correctly.	In such a scenario, 1E Client will need to be reinstalled with a new set of properties / transform that enables the Nomad module with the appropriate configuration.

Issue	Description	Workaround
those registry settings and enables the Nomad module later, Nomad will not function correctly.		
When upgrading an existing 1E Client, none of the manually added configuration file properties in the *.conf file have been retained.	1E Client does not retain any configuration file property values that have been added as the upgrade process currently only checks the default values that exist in the old Tachyon.Agent.conf or new 1E.Client.conf. This includes the Module.Inventory.ProcessUsage.Enabled=false values that was included in Tachyon Agent v4.0. After an upgrade this configuration file property will no longer appear and 1E Client uses the default (true).	The additional configuration file property values need to be added to the 1E.Client.conf file if they are required. Please refer to Tachyon client settings for list of the available configuration options.
When upgrading an existing 1E Client that has been installed to a non-default installation directory, installation folder reverts to the default path.	If the previous Tachyon Agent was installed anywhere other than the default location "%ProgramFiles%\1E\Tachyon\Agent", then the Installation folder in the wizard will revert to the new default path "%ProgramFiles%\1E\Client". The same applies to silent upgrades where the Tachyon Agent was installed to another path, the installation folder will revert to the default unless the required directory is specified using INSTALLDIR.	Please upgrade by specifying the required Installation folder in the wizard or using the installer property: INSTALLDIR
Repair installation of the 1E Client	A repair of the 1E Client will retain the existing configuration file and any non-default settings. However, if the	To rectify this, either run an instruction to configure a relevant

Issue	Description	Workaround
does not keep previous configuration changes and some Nomad registry settings will have BLANK values.	configuration file had been deleted, then a repair will not be able to apply previous settings and will use default settings. Also a repair will set any properties passed in the command line, but will leave some Nomad properties like KnownMobileDevices and LocalCachePath as blank.	setting, or re-install the 1E Client using desired settings. Use a 1E Client configuration instruction in Explorer for centralized post-installation configuration. Please contact 1E if you require the Product Pack that has this instruction.
Potential blue screen of death (BSOD) with Windows 7 SP1 and Tachyon inventory capture.	If Tachyon inventory is enabled on Windows 7 SP1 (without updates) there is the potential for BSOD issues on systems using out of date Windows drivers. Microsoft investigated the issue and confirmed the **usbccgp.sys** driver has a potential issue where it can fail to complete a power IRP in a timely manner.	Microsoft recommends the following fix: 1. Update the **usbccgp.sys** driver as follows: • – Update the **usbccgp.sys** driver by installing update KB3125574. Prerequisites: To apply this update, you must first install: • – Service Pack 1 for Windows 7 or Windows Server 2008 R2: KB976932 – April 2015 servicing stack update for Windows 7 and Windows Server 2008 R2: KB3020369 2. Update **tdx.sys** to 6.1.7600.21050 to address TDI driver response issues as per: KB2028827

Issue	Description	Workaround
Tachyon features of the 1E Client cannot read private key for a Trusted Platform Module (TPM) protected certificate.	The client uses the Windows certificate store but is currently unable to access the private key of a client certificate that is protected using the Windows Trusted Platform Module (TPM). This issue was seen when a customer used Microsoft Intune for client certificate deployment and the Simple Certificate Enrollment Protocol (SCEP) certificate profile included 'Enroll to Trusted Platform Module (TPM) KSP'. The 1E Client was unable to extract a handle to the private key in the Windows Certificate Store; 'NCryptExportKey failed with 0x8009000a' (NTE_BAD_TYPE) was reported as an error in the 1E Client log.	Use a client certificate that is not protected using Windows Trusted Platform Module (TPM). Examples of Microsoft cryptography providers that do not use TPM are: • Microsoft Enhanced (RSA and) AES Cryptographic Provider • Microsoft RSA/SChannel Cryptographic Provider • Microsoft Enhanced Cryptographic Provider • Microsoft Software Key Storage Provider (CNG). Also, Microsoft Software Key Storage Provider is the only CNG provider supported by this version of the client.

2.5.4.1.2 Client connection issues

Issue	Description	Workaround
1E Client fails to connect to the Switch with following error: ERROR - Failed to connect to tachyon.acme.local: invalid padding (138)	During the establishment of an https connection between the client and the Switch, the client receives and verifies the Switch certificate. This is received from the Switch as an X.509 certificate chain, from which the 1E Client will extract the Switch's public key and verify the certificate chain. On a successful SSL handshake where the CRL is checked, it will report both the serial number of each certificate as it walks the chain and the Authority Key Id (AKID) of the CA that issued that certificate. This is stored in the 1E Client	Delete the cached certificate entries in the 1E Client persistent storage (default location is C:\ProgramData\1E\Client\Persist) and restart the 1E Client.

Issue	Description	Workaround
	persistent storage and re-used until it has expired. If the 1E Client connects to another Switch where the certificate chain is different (e.g. CA certs have been re-issued), the 1E Client may log the following warning since there is a mismatch of the Authority Key Id (AKID) saved in the persistent storage from previous CA: WARN - X509: error:04067072:rsa routines:rsa_ossl_public_decrypt:padding check failed WARN - X509: error:0D0C5006:asn1 encoding routines:ASN1_item_verify:EVP lib WARN - X509: error:1416F086:SSL routines:tls_process_server_certificate: certificate verify failed	
Non-Windows clients may disconnect due to the keep-alive period being too high.	Clients on Non-Windows may disconnect if the keep-alive period is too high. Non-Windows clients need to have a maximum keep-alive time of 4 minutes (240s).	The keep-alive time needs to be updated in the 1E.Client.conf file: *ConnectionKeepaliveTimeInSecondsMin* should be set to 120 (default) and *ConnectionKeepaliveTimeInSecondsMax* should be set to 240 (default is 600). These settings can be set during installation or changed post-install.
A client does not start and the 1E Client log shows: ERROR - Certificate Verification failed : CRL path validation error.	The client will not connect if it is unable to create a trust chain, despite having the correct root CA certificates. This is due to the local computer certificate store containing "CrossCA" certificates.	Please ensure the client certificate store does not contain any "CrossCA" certificates in the local Trusted Root or Intermediate CA stores.

Issue	Description	Workaround
This occurs even when CRLChecks=soft.		
The client is unable to start on the Root CA.	A client attempting to run on a Root CA server will log the following error: WinTrustVerify returns 0x800b010a (CERT_E_CHAINING) “A certificate chain could not be built to a trusted root authority” A Root CA sits at the top of the public key infrastructure (PKI), there are no higher authorities, and so it effectively self-signs its certificates, which Tachyon is specifically prevented from using.	It is not good security practice to have a Root CA online therefore do not install the Tachyon client. You could configure your system to not use client certificates.
Resetting Hyper-V Agents can cause the Switch to become unresponsive and log erroneously.	Powering off or resetting a guest Hyper-V virtual machine without shutting it down, can cause the Switch to refuse connections from the client when it restarts, and the Switch starts spurious logging.	To rectify this issue restart both the Switch and the 1E Client service.
The client fails to start and the 1E Client log shows errors relating to Certificate Revocation List (CRL).	See Tachyon client settings. An error is logged if CRLChecks=hard and the client is unable to locate a valid HTTP-based CRL Distribution Point for a certificate. An error is logged if CRLChecks=soft and the client is able to get a CRL from the CRL DP, but the CRL indicates revocation of the device certificate or a certificate in its trust path. The client requires a valid SSL certificate presented by each server it connects to.	If the machine is not be able to contact a HTTP-based CRL Distribution Point, please ensure *CRLChecks=soft within* the *1E.Client.conf* file. This will prevent the client from failing in the event of being unable to locate a CRL Distribution Point

Issue	Description	Workaround
	This includes any Switch, Background Channel or other HTTPS server from which the client downloads content. The client does not connect to a server if it knows a certificate is invalid. CRLs are obtained by contacting the CRL Distribution Point(s) whose URL is embedded within the certificates. At present, the client supports only HTTP-based CRL Distribution Points. It ignores any non-HTTP CRL DPs that may be included in a certificates, such as file or LDAP, and does not support OCSP.	
Enabling, disabling, adding or removing network adapters on the 1E Client Server computer will cause issues with Switches issuing instructions or unable to use features like "Export All Results".	The 1E Client Server Core web applications have access restricted by the IIS feature **IP Address and Domain Restrictions**. All connections are denied, except for local connections. Changing adapter configuration after installation can cause the entries in the IIS feature to become incorrect and cause issues with 1E Client Server. If for example the IPv6 address assigned is different from the one which was installed by 1E Client, then Tachyon.Workflow.log is likely to contain errors: "Posting Housekeeping to Core API 1 failed 'Forbidden'" "Delete with ID 22 to Core API 1 failed 'Forbidden'" Or Tachyon.ConsumerAPI.log may have "Data export fail" errors when attempting to "Export All Results".	Please update entries in the **IP Address and Domain Restriction** feature of the CoreInternal and the Core website to include all local IP v6 and v6 addresses. Please refer to IP Address and Domain Restrictions.

2.5.4.1.3 Client issues specific to non-Windows

Issue	Description	Workaround
Microsoft InTune cannot be used to deploy the 1E Client package for macOS.	By design, Microsoft InTune can only be used to deploy macOS packages to the /Applications folder. However, the 1E Client must be installed to /Library/Application Support since that is a secure location, writable only by root. Also the associated launch property list file must be installed under /Library/LaunchDaemons.	Use an alternative deployment method for the 1E Client macOS package.
The 1E Client on macOS may not be able to validate the switch certificate if there is a cacert.pem in the .sslcerts folder that does not contain the relevant list of CA public keys. The following is logged: ERROR - Either the Switch certificate or the client certificate is not trusted, use the 1E Client debug log setting to obtain	If the 1E Client for macOS finds a valid cacert.pem in the hidden directory: */Library/Application Support/1E/Client/.sslcerts*, then the Keychain Access is not checked. This cacert.pem is then used to validate the trust chains for the client certificate the client will submit and also the Switch certificate received. The client will be unable to connect to the Switch if it does not contain the relevant list of CA public keys to do the validation.	Ensure the cacert.pem contains all the public keys for all the intermediate CAs, up to and including the Root CA required. Alternatively, remove the cacert.pem if the 1E Client for macOS is to use the certificates from the Keychain Access.

Issue	Description	Workaround
certificate details.		

2.5.4.2 Nomad

Please refer to /document/preview/675710#UUID-ed88d585-22d1-0311-3246-8f71845db40c for issues with other components of Nomad.

2.5.4.2.1 Client installation issues

Issues	Description	Workaround
1E Client installer adds Nomad registry settings even when Nomad module is NOT enabled while installation. If someone deletes those registry settings and enables the module later, Nomad won't function correctly.	The installer is currently creating the majority of Nomad registry values because the service doesn't create them all and Nomad doesn't tolerate the absence of all the settings that the service doesn't create. If someone deletes those settings and enables the Nomad module later, Nomad won't function correctly.	In such a scenario, we recommend reinstalling the 1E Client with a new set of properties / transform that enables the Nomad module. This will be fixed in a future release of 1E Client.
On Windows XP, 1E.Client.log displays a warning "Unsupported OS version. Will not install Nomad." however the very next log lists that "Module 'Nomad' has been installed".	Nomad is not supported on Windows XP therefore when 1E Client is installed with the Nomad module, the module is not enabled, and the Nomad Branch service is not installed.	None.
Nomad may be downgraded by active Application deployments in CM, which may cause	If there is an active Application deployment in CM of an earlier version of Nomad, clients that have been upgraded with	To avoid this situation, always define Application Supersedence on the 1E Client Application such that it supersedes any Applications that install previous versions

Issues	Description	Workaround
issues with behaviour of the 1E Client Nomad module.	the 1E Client with the Nomad module enabled may be downgraded when the Application Enforcement cycle runs. In this scenario, if the Nomad module is subsequently disabled in the 1E Client, the Nomad service will be removed. This is because once the Nomad module has been enabled, it is not aware nor does it check for older versions. If the Nomad module is subsequently disabled, the service is removed as the Nomad module believes it is not longer required.	of Nomad (and the 1E Client when introducing new versions of the 1E Client). To resolve this issue should it occur, first address the Application Supersedence to prevent it from recurring. Then run the following command from the 1E Client installation directory on the affected devices. *1E.Client.exe -reconfigure MODULE.NOMAD.ENABLED=false -restart & 1E.Client.exe -reconfigure MODULE.NOMAD.ENABLED=true -restart* This will disable the Nomad module and remove the Nomad service, then re-enable the Nomad module, which will, in turn, uninstall the earlier version of Nomad and install the Nomad module. The settings defined by the earlier Nomad install will be migrated - these may differ from the settings with which the Nomad module was initially configured.
1E Nomad Branch and 1E Client Health services may be stopped if upgrading to Nomad 8.0 if previous version of Nomad installer is no longer in source folder or the Windows Installer cache.	The 1E Client installer stops the 1E Nomad Branch and 1E Client Health services if the Nomad module is enabled. The 1E Client installation completes successfully, after which the Nomad module attempts to uninstall the older version of Nomad. The uninstallation fails as Windows Installer cannot find the original source installer. The Nomad module is not enabled and the Nomad and Client	In this scenario, to immediately restore Nomad functionality simply start the services. To fix it completely you will need to remediate the installer source for the old version of Nomad on the affected client, then run the following command from the 1E Client installation directory to restart the 1E Client service. *1E.Client.exe -restart*

Issues	Description	Workaround
	Health services remain stopped.	
Uninstalling 1E Client doesn't delete Nomad's P2P server certificate.	When P2PEnabled value was set to 79 then NomadBranch server certificate does not get deleted after uninstallation.	
NomadBranch - 1E Client - Creation of Nomad COM object failed with 0x80070424	Install the latest build with Nomad. Creation of Nomad COM object failed with 0x80070424-	Disable the Nomad module and restart the 1E Client service. Enable Nomad again and restart the 1E Client service. Nomad should install successfully.
Nomad users see the 1E Client UI in the device system tray even when the Tachyon module is not enabled.	The 1E Client UI runs despite only the Nomad or Shopping modules being installed, without the Tachyon feature enabled.	None.

2.5.4.3 PXE Everywhere

Please refer to Troubleshooting for issues with other components of PXE Everywhere.

2.5.4.3.1 Client installation issues

Issue	Description	Workaround

PXE Everywhere is not responding as expected. Log file shows messages similar to:
 	
`Error: failure to bind to 192.168.18228:69.`
`The specified address is already in use`
`TFTP: retry in 1000ms`
`Error: failure to bind to 192.168.18228:40`
	PXE Everywhere Agent and PXE Everywhere Responder cannot co-exist on the same computer and are not supported together. Whilst it is possible to install them together, they will not work and will have issues such as failure to bind to ports.	Either uninstall PXE Everywhere Responder, or disable PXE Everywhere module in 1E Client. Then restart the computer, or restart the relevant service (PXE Everywhere or 1E Client).

Issue	Description	Workaround
11. The specified address is already in use DHCP: retry in 1000ms		
PXE Everywhere Agent fails to connect to PXE Everywhere Central.	An incorrect URL has been specified during installation of PXE Everywhere Agent. The installer wizard does not validate the PXE Lite Central URL is provided during the PXE Lite Local GUI installation.	Ensure you specify the correct URL when installing PXE Everywhere Agent.
PXE Everywhere does not support RISC based architecture.	PXE Everywhere does not support RISC based architecture and therefore not able to PXE boot clients using RISC. For instance, architecture being used by Microsoft Surface Pro 10 LTE Models is ARM 64-BIT UEFI (11) which is a RISC architecture and *not* recognized by PXE Everywhere.	None.
PXE Everywhere Agent installation fails when an unprivileged user installs it after providing administrator credentials (UAC prompted) for installation.	PXE Everywhere Agent installation fails with error when an unprivileged user initiates PXE Everywhere Agent installation even after validating credentials after UAC prompt.	When installing the agent interactively, run the installer from a command prompt with elevated permissions.

2.5.4.4 WakeUp

2.5.4.4.1 Client installation issues

Issue	Description	Workaround
No issues known.		

2.5.4.5 Shopping and WSA

Please refer to Shopping 6.1 - Troubleshooting for issues with other components of Shopping, and WSS 4.1 - Troubleshooting.

2.5.4.5.1 Client installation issues

Issue	Description	Workaround
Shopping module does not send machine details on a TLS enabled Windows 7 environment	The Shopping module in the Tachyon 3.2 Agent fails to send machine details on a TLS enabled Windows 7 (32 and 64 bit) environment.	
Firefox prompts you to restart the browser when connecting to the Shopping website. After restarting you are no longer prompted.	Firefox must be restarted to allow changes made by Shopping client to take effect. The Shopping Console has a setting for WSA**Firefox support enabled**. The Shopping client module reads this setting from Shopping Web and if enabled (default is true) then it does the following: • Creates a certificate chain of a CA certificate and a leaf certificate signed by the CA certificate • Configures Firefox to import certificates from the standard Windows certificate store (by default Firefox uses its own certificate store). This Console setting for WSA is only required if using Firefox and HTTPS because Firefox is stricter in which certificates it accepted on an HTTPS connection and by default uses its own certificate store. The WSA setting can be disabled in the Shopping Console if only using other browsers, or not using HTTPS. 1E Client log shows entries: *INFO - Added '1E Ltd CA Certificate' certificate to ROOT certificate store* *INFO - Added '1E Ltd localhost Certificate' certificate to MY certificate store*	If you are using Shopping HTTPS then use Internet Explorer or Chrome browsers to login to Shopping. If you are using Firefox browsers with a Shopping HTTTPS website then you will need this. If you are using Shopping HTTP website then you can disable the Shopping Console setting for WSA **Firefox support enabled**.

2.6 Reference

All the list type information, such as installer properties, in alphabetical lists etc.

2.6.1 1E Client configuration settings and installer properties

Settings are available in the 1E Client configuration file, with details of which settings are mandatory or optional during installation, and which settings can be re-configured post-installation.

1E Client installers include a **template configuration file** that contains the more important settings with default values that match hard-coded default values. The configuration file is updated during installation and named **1E.Client.conf** in the installation folder along with the 1E Client executable.

After installation, configuration file settings can be managed using 1E Client command-line parameters, Explorer configuration instructions, Guaranteed State policies, Configuration Manager baselines, or other means. Registry settings can also be managed by Windows Group Policy.

2.6.1.1 1E Client installer zips

Zip files for **1E Client** installers can be downloaded from the https://support.1e.com/. The following installer zips are available and contain the following files, where **8.0.x.xxx** is a specific build:

1EClient.v8.0.x.xxx.zip	1EClient_Non-Windows.v8.x.x.xxx.zip
• Release Information.html • **1EClient-x64.msi** • **1EClient-x86.msi** • Licenses.txt	• Release information.html • **1e.client-CentOS_8_x64_v8.x.x.xxx.rpm** • **1e.client-Debian_10.4_x64_v8.x.x.xxx.deb** • **1e.client-Fedora_34_x64_v8.x.x.xxx.rpm** • **1e.client-macOS_v8.x.x.xxx.dmg** • **1e.client-macOS_v8.x.x.xxx.pkg** • **1e.client- openSUSE_Leap_15.2_x64_v8.x.x.xxx.rpm** • **1e.client-RHEL_7.9_x64_v8.x.x.xxx.rpm** • **1e.client-RHEL_8.5_x64_v8.x.x.xxx.rpm** • **1e.client-SLES_15.2_x64_v8.x.x.xxx.rpm** • **1e.client-Ubuntu_18.04_x64_v8.x.x.xxx.deb** • Licenses.txt

Please refer to Supported Platforms for details of supported OS versions and their prerequisites.

2.6.1.2 Deploying the 1E Client

2.6.1.2.1 Windows computers

When deploying 1E Client to Windows devices you can install using the MSI interactively but this only allows you to specify some configuration settings. You can configure these and some other settings using installer properties on the command line or in one or more MST transform files.

The Introducing 1E Client Deployment Assistant is designed to help install Windows versions of 1E Client and other 1E agents using Configuration Manager. It includes template transform files for each combination of client/agent for 32 and 64-bit platforms, and automatically creates collections and deployments in Configuration Manager so that you only need to populate the collections.

Please refer to:

- Installing the 1E Client interactively
- Installing the 1E Client by command-line.

2.6.1.2.2 Non-Windows devices

Please refer to:

- Deploying 1E Client on macOS
- Deploying 1E Client on Linux
- Deploying 1E Client on Solaris.

2.6.1.2.3 1E Client settings

Configuration settings can be set during or after installation, depending on the platform, as described in the table below. Installer command-lines are described in Deploying 1E Client on Windows.

Platform	Notes
Windows	• Some settings may be set during installation and others can only be set in the configuration file • Setting names is not case sensitive • You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line. • Nomad, PXE Everywhere, and WakeUp client modules have settings that are stored in the registry instead of the configuration file.
Linux	• Settings may be set during installation or modified in the configuration file • Setting names is not case-sensitive.

Platform	Notes
Mac and Solaris	• Settings must be set after installation using the supplied bash script • Setting names is not case-sensitive.

The following applies to all configuration settings that are stored in the 1E Client configuration file:

- They can be reconfigured after installation either manually or as described in 1E Client command-line parameters
- Property names and values are not case-sensitive, but the convention is to store them in mixed-case
- If you omit a mandatory property or its value, the 1E Client will not start
- If you omit an optional property or its value, the 1E Client will use the default value instead.

2.6.1.3 1E Client configuration file location and name

The 1E Client is controlled via the 1E Client configuration file **1E.Client.conf** which resides in the installation folder along with the 1E Client executable.

The default installation location used for the different OS supported by the 1E Client are given in the following table:

OS	Default install location
Windows	**%ProgramFiles%\1E\Client**
Linux and Solaris	**/etc/1E/Client**
Mac	**'/Library/Application Support/1E/Client'**

Note

The configuration file uses ASCII encoding.

A comment line starts with the # symbol.

2.6.1.4 Installer properties and configuration settings

The following are alphabetical lists of all **installer properties** and **configuration settings** for 1E Client modules and features.

Those **installer properties** listed in mixed case are stored in the 1E Client configuration file, and those listed in UPPERCASE are stored in the registry. Where relevant, the locations of Windows registry settings are provided.

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Note

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

2.6.1.5 1E Client settings

Installer and configuration settings for 1E Client which affect all client features and modules.

Note

Installer properties:

DataRoot | INSTALLDIR | LogPath | TemporaryDirectory

Note

Configuration file settings:

DataRoot | LogPath | TemporaryDirectory

Please refer to the following pages when deploying 1E Client.

- Deploying 1E Client on Windows
- Deploying 1E Client on macOS
- Deploying 1E Client on Linux
- Deploying 1E Client on Solaris
- Reconfiguring 1E Client
- Verifying

1E Client installers include a **template configuration file** that contains the more important settings with default values that match hard-coded default values. The configuration file is updated during installation and named **1E.Client.conf** in the installation folder along with the 1E Client executable.

After installation, configuration file settings can be managed using 1E Client command-line parameters, Explorer configuration instructions, Guaranteed State policies, Configuration Manager baselines or other means. Registry settings can also be managed by Windows Group Policy.

2.6.1.5.1 1E Client settings

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

Setting	Default	Description
DataRoot	%ALLUSERSPROFILE%\1E\Client	Sets the root directory under which the Client will create the **DBs** and **Persist** subfolders and hence the locations of the databases and persistent storage within the local file system. If the specified directory doesn't exist it will be created. Local System (SYSTEM) requires at least modify rights on the directory. If the specified directory is invalid, or cannot be used, the 1E Client will log an error and refuse to start. For example if the directory name is a file, non-existent volume, or SYSTEMdoes not have permission. If not specified, the default is the **%ALLUSERSPROFILE%\1E\Client** directory. This is also the default location of client log files, which are not affected by this setting. The location and name of the 1E Client log file is determined by the LogPath setting. Please refer to Log files for details of other client log files. **Note** By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\ **Note** This setting is for Windows only. It is ignored on non-Windows platforms, without warnings or errors logged. Do not use this setting unless required, for example if security software unavoidably conflicts with 1E Client.

Setting	Default	Description
INSTALLDIR	%ProgramFiles%\1E\Client	Sets the installation folder. This value is not stored in the 1E Client configuration file. This value is stored as **InstallationDirectory** in the Windows registry under HKLM\SOFTWARE\1E\Client\ and must not be changed. Some client modules that run on Windows store their registry settings under their own keys in HKLM\SOFTWARE\1E. **Note** This installer property is for Windows only.
LogPath	**1E Client logs on Windows** %ALLUSERSPROFILE%\1E\Client\1E.Client.log **1E Client logs on macOS** /Library/Logs/1E.Client.Daemon.log (shows any service start errors) /Library/Logs/1E.Client.log (shows the current operation of the 1E Client) **1E Client logs on other non-Windows platforms** /var/log/1E/Client/1E.Client.log	The **LogPath** setting is stored in the **1E.Client.Conf** file and determines the full path and filename of the 1E Client log file. The 1E Client log is shared by: • 1E Client • Tachyon client features • Shopping client module (only available on Windows OS) To change the logging level, please refer to LoggingLevel in the 1E.Client.CONF file. The following are not configurable in this version: • Maximum size of 5MB • 5 rollover files numbered 1 (newest) to 5 (oldest) with the

Setting	Default	Description
		rollover number included as n.log **Note** By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\ The LogPath setting is not used by Nomad, PXE Everywhere, and WakeUp client modules. For a fresh install they use their defaults, and for upgrades they re-use what is in their registry. In each case these can be over-ridden by installer properties described in Content Distribution client settings, PXE Everywhere Agent settings, and /document/preview/647736#UUID-b588cdab-ae07-3331-ceb1-c8c6ed63aa1e. Shopping WSA also has its own configuration file. Please refer to Log files for more details.
TemporaryDirectory	*(none)*	The **TemporaryDirectory** setting is stored in the **1E.Client.Conf** file specifying the directory path below which the 1E Client and its subprocesses will create temporary files and subdirectories. The following table shows the OS-specific defaults used if the setting is omitted, blank, or invalid. The default is recommended. Platform: Windows; Environment Variable(s): TMP; Default: *%windir%\Temp* which is the

Setting	Default	Description		
			TEMP	default *%TEMP%* location for SYSTEM.
		Linux	TMPDIR	/tmp

Tip

Using this setting to specify a non-default value is only necessary if the OS default location is not suitable. For example, some security software forbids scripts being run from certain locations. Or you want to simplify configuration of Windows anti-virus and malware software to the same location as 1E logfiles.

The specified directory:

- Must be an absolute path appropriate for the OS
- Must already exist - it will not be created
- Must be writable by the 1E Client (SYSTEM on Windows, root on Linux)

If any of these criteria is not satisfied then the 1E Client and subprocess falls back to using the default temporary directory.

If the value is validated successfully then environment variables are set so that subprocesses inherit the same temporary directory.

Warning

Setting	Default	Description
		The path can only contain ASCII characters but that is not validated. Unicode characters are not supported. **Note** The 1E Client itself creates a subdirectory under the specified path called ***1e.client*** which it uses for its own temporary files and directories. Subprocesses invoked by the 1E Client, such as commands, PowerShell scripts, etc. create their temporary files directly under the specified path. **Note** This setting was introduced in a v5.0 hotfix.

2.6.1.6 Platform features of the 1E Client

Configuration file settings, and their installer properties, for the platform features of the 1E Client.

Note

Configuration file settings and installer properties:

Note

Some configuration file settings do not have equivalent installer properties. These are indicated in the tables below.

Note

- Core settings common to Windows and non-Windows platforms:
  - AuthenticationPolicy | BackgroundChannelUrl | ConnectionKeepaliveTimeInSecondsMin | ConnectionKeepaliveTimeInSecondsMax | ConnectionRetryTimeInSecondsMin | ConnectionRetryTimeInSecondsMax | ConnectionTimeout | CRLChecks | DefaultStaggerRangeSeconds | EnablePayloadCompression | LoggingLevel | LogPath | PolicyEnabled | SSL | Switch | WorkerThreads

- Core settings for Windows only:
  - NomadContentDownloadEnabled | NomadContentDownloadTimeoutSecs
- Interaction module settings (only supported on Windows):
  - Module.Interaction.Enabled | Module.Interaction.ActiveSessionThresholdSeconds | Module.Interaction.CompanyName | Module.Interaction.DoNotDisturb | Module.Interaction.IdleSessionThresholdMinutes | Module.Interaction.ITSM.ServiceNow.CreateIncidents | Module.Interaction.ITSM.ServiceNow.Enabled | Module.Interaction.ITSM.ServiceNow.GoBackDays | Module.Interaction.ITSM.ServiceNow.Url | Module.Interaction.LogSessionNotificationReadiness | Module.Interaction.MinimumMinutesAfterLogonBeforePrompt | Module.Interaction.MinimumMinutesAfterSessionActivationBeforePrompt | Module.Interaction.MinimumMinutesBetweenPrompts | Module.Interaction.NotificationIcon | Module.Interaction.PeriodsBeforeUiLaunch | Module.Interaction.PeriodsBeforeUiLaunchTimeout | Module.Interaction.Port | Module.Interaction.ResponseAuditsBeforeTidy | Module.Interaction.ResponseRetentionRows | Module.Interaction.SampleExclusionList | Module.Interaction.SampleUserInteraction | Module.Interaction.SnoozeTimeMinutes | Module.Interaction.Theme
- Inventory module settings:

  - Additional settings common to Windows and non-Windows platforms that are only available in the Configuration file, not as installer properties:

- CRLTimeoutInSeconds | FastReconnectTimeInSeconds | SelectRowsLimit

Additional Windows installer properties that are not available in the Configuration file: TAGS

1E Client installers include a template configuration file that contains the more important settings with default values that match hard-coded default values. The configuration file is updated during installation and named **1E.Client.conf** in the installation folder along with the 1E Client executable.

After installation, configuration file settings can be managed using 1E Client command-line parameters, Tachyon Explorer configuration instructions, Guaranteed State policies, Configuration Manager baselines or other means. Registry settings can also be managed by Windows Group Policy.

2.6.1.6.1 Windows installer properties

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

The following table shows Windows installer properties for the Tachyon client, that are not available in the client configuration file. They can be set only during installation, by specifying on the command line or in a **mst** transform file.

Installer property	Default	Description
TAGS	*(empty)*	Configures one or more device and freeform tags, either on the msiexec command-line in or in a **mst** transform file. For more information about transform files please refer to Advanced configuration. The format of the installer property is: [*]<Tag1>=<Value1>|[*]<Tag2>=<Value2>|…|[*]<Tagn>=<Valuen> Where: • **<Tag>** is the name of a tag. The name must be prefixed with an asterisk ***** if it is a device tag • **<Value>** is the value for that tag. Use the pipe | delimiter when specifying more than one tag. For example, the following would be added to the command-line to set a device tag **Department=Finance** and a freeform tag **Persona=Clerk**

Installer property	Default	Description

- TAGS="*Department=Finance|Persona=Clerk"

Double-quotes - these are recommended when using a command line, as shown in the above example, and required if any tag values have spaces. Double quotes are not required in a **mst** transform.

This optional installer property is only available *during* installation or upgrade of 1E Client on Windows OS. It is not available in the client configuration file. To configure device and freeform tags *after* installation, you must use Tachyon instructions, as described in Tagging client devices.

Note

You can only use the device tags in the coverage feature of Explorer, if you have also added the tag in the Device Tags page in Tachyon Platform Settings.

2.6.1.6.2 Settings for platform features of the 1E Client

The following table shows 1E Client settings for Tachyon platform features; all are included in the template configuration file except where indicated.

Note

Tachyon client must be enabled to use platform or Content Distribution features of the Tachyon Platform.

If neither Tachyon platform or Content Distribution client features are not required then the connection to Tachyon Platform is not required, and both **Switch** and **BackgroundChannelUrl** settings must be set to **none** when doing a non-interactive (silent/quiet) install using installer properties on a command-line or in a **mst** transform file.

When doing an interactive install then you must uncheck the **Enable Tachyon** checkbox. Platform features are not required if the 1E Client is being installed only to support basic Content Distribution, PXE Everywhere, Shopping, or WakeUp.

Core setting	Installation default	Description
AuthenticationPolicy	Required	Determines whether the Tachyon client presents a certificate when authenticating with a Switch. A Switch will reject a connection if configured to **require certificates from clien**

Core setting	Installation default	Description
		ts and a client does not present a valid certificate. The value must be set to one of the following. The default value is set to **Required**. **Note** The default applies to new installations of the 1E Client. Upgrades from a previous version always retain the existing setting as defined in 1E.Client.conf. **Value** — **Description** none — Do not present a certificate. This option is not visible when installing the 1E Client interactively, but can be configured using a command-line installer property. optional — Present a certificate if a suitable one exists. If none exists continue with the connection anyway. This is the default value.

Core setting	Installation default	Description	
			This option is useful if you are deploying the 1E Client before you have deployed certificates. Switches can be configured so they do not require client certificates, but if you did not select that option during installation then you can change the server setting.
		required	Present a certificate if a suitable one exists, otherwise fail the connection.
BackgroundChannelUrl	*(none)*		If Tachyon and Content Distribution client features are not required then the connection to Tachyon Platform is not required, and both **Switch** and **BackgroundChannelUrl** settings must be set to **none** when doing a non-interactive (silent/quiet) install using installer properties on a command-line or in a MST transform file. When doing an interactive install then you

Core setting	Installation default	Description
		must uncheck the **Enable Tachyon** checkbox. Tachyon client features are not required if the 1E Client is being installed only to support PXE Everwhere, Shopping, or WakeUp. They are only required for Content Distribution if using Content Distribution features of the Tachyon Platform. To connect to the Tachyon platform then **BackgroundChannelUrl** will have one or more entries in the format: `BackgroundChannelUrl=https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/` **<BackgroundChannelServer>** is the DNS Name FQDN of the server, which is the same as: • the HTTPS Host Header specified on the *Website Configuration* screen of Tachyon Setup, which is the HTTPS binding for the Tachyon website • the same as <SwitchName> • the DNS Name specified in the Tachyon Server's Web Certificate

Core setting	Installation default	Description
		<BackgroundChannelPort> is the Port number, which is the same as: • the HTTPS Port specified on the *Website Configuration* screen of Tachyon Setup, which is the HTTPS binding for the Tachyon website • if using the default HTTPS port 443, the port can be omitted from the URL In systems with multiple server and multiple DNS Names, there will be multiple entries on one line using a semi-colon (;) as the delimiter between entries. For example: `BackgroundChannelUrl=https://tachyon.acme.local:443/Background/;https://tachyon.acme.com:443/Background/` Multiple DNS Names may exist in complex systems where there are multiple servers, Switches, and devices on different networks, such as the Internet as well as the corporate network. Each time Tachyon needs to download content, it will try each entry in turn, starting at the first, until it is able to download or stops trying and reports an error.

Core setting	Installation default	Description
ConnectionKeepaliveTimeInSecondsMin	600 (10 minutes)	Determines the time in seconds for the Tachyon client to wait between sending a keep-alive messages to the Switch. Tachyon client will wait a random amount of time between the two values set as minimum and maximum. Range is 0 to 900 seconds (No keepalive to 15 minutes).
ConnectionKeepaliveTimeInSecondsMax	840 (14 minutes)	
ConnectionRetryTimeInSecondsMin	30 (seconds)	Determines the time in seconds the Tachyon client waits before trying to reconnect to a Switch after a connection failure. The Tachyon client tries once for each Switch in the list of Switches, and if it fails to connect then it waits before trying again. The wait is a random amount of time between the two values set as minimum and maximum. Range is 5 to 86400 (5 seconds to 24 hours). See also FastReconnectTimeInSeconds.
ConnectionRetryTimeInSecondsMax	900 (15 minutes)	
ConnectionTimeout	30 (seconds)	The maximum time in seconds that can elapse between the Tachyon client initialising the

Core setting	Installation default	Description
		connection with a Switch and having a fully established websocket. Range is 1 to 60.
CRLChecks	soft	Determines whether Tachyon client does Certificate Revocation List (CRL) checking for: • the certificate it presents to the Switch when requesting a connection (see also AuthenticationPolicy, which determines whether Tachyon clients present a certificate or not) • the certificate received from the Switch when requesting a connection • the certificate received from the Background Channel server before attempting to download content • the certificate received from any other HTTPS-based endpoint from which Tachyon client downloads content • the certificates used for digital signing of 1E Client executables (typically the certificate is found in

Core setting	Installation default	Description
		the Trusted Publishers Store) The value must be set to one of the following. The default value is set to **soft**. Value — Description off — No CRL checking is performed by the 1E Client. soft — This is the default. Full CRL checking is performed by the 1E Client for each certificate in the list above. However if a CRL Distribution Point (CDP) is unreachable then only a warning will be reported. A certificate error occurs if a CDP is available and the CRL cannot be retrieved or refreshed, or the certificate is revoked. hard — Full CRL checking is performed by the 1E Client for each certificate in the list above. If a certificate error occurs then Tachyon client stops

Core setting	Installation default	Description
		processing the request. A certificate error occurs if a CDP is not available, or the CRL cannot be retrieved or refreshed, or the certificate is revoked. If a certificate error occurs then Tachyon client will not proceed, or will not start in the case of a digital signing certificate error. **Note** By default, the Switch will reject the connection if it cannot check a certificate presented by Tachyon client. Please contact your 1E Account Team if you need help with configuring Switches if you are unable to use CRL checking.
CRLTimeoutInSeconds **Note** This setting does not have an equivalent Windows Installer property and is not in the template	3 (seconds)	The maximum time in seconds that is allowed to elapse whilst the Tachyon client attempts to download a Certificate Revocation List (CRL) from a CRL Distribution Point. The range is 1 to 10 seconds.

Core setting	Installation default	Description
configuration file.		
DefaultStaggerRangeSeconds	300 (5 minutes)	Some operations (including HTTPS downloads from the BackgroundChannel) are randomly time-staggered across clients. This property dictates the upper-limit on the default randomization period in seconds. Range is 0 to 3600. Default is 300. Use **0** to instruct Tachyon client not stagger operations by default. **Note** Do not change this value unless advised by 1E. Only use 0 or a low value in systems that support less than 500 clients. **Note** This setting is not used for HTTPS downloads from the BackgroundChannel if NomadContentDownloadEnabled is **true**, because Nomad does the bandwidth management.
EnablePayloadCompression	true	Determines whether the client should attempt to compress payloads when responding to instructions, if it looks like

Core setting	Installation default	Description
		compression would be beneficial. Must be set to **true** or **false**.
FastReconnectTimeInSeconds **Note** This setting does not have an equivalent Windows Installer property and is not in the template configuration file.	15 (seconds)	During machine wakeup, following a machine sleep or hibernation, the first reconnect attempt to the Switch will occur in <FastReconnectTimeInSeconds> seconds. This value is configurable between 5 and 60 seconds. For the majority of Windows devices the default value of 15 seconds is more than adequate for the Windows network stack to stabilise on wakeup. On non-Windows platforms this property is currently ignored. See also ConnectionRetryTimeInSecondsMin/Max.
LoggingLevel	Info	Determines how much logging information is generated. This may be set to one of the following values. The default value is **info**. Value — Description **Error** — Only outputs errors. An error is a serious problem, typically requiring

Core setting	Installation default	Description
		operator intervention of some sort to restore full functionality. **Warn** Outputs errors and warnings. A warning indicates a potential problem, where the system can nonetheless function without intervention. **Info** Outputs general information in addition to the errors and warnings. This is the default. **Debug** Outputs debugging information in addition to all the previous levels. **Trace** Outputs the maximum information available. Used only in exceptional circumstances as it will generate huge amounts of logging output. **Warning** Logging levels should only be changed from **info**

Core setting	Installation default	Description
		only if requested by 1E Support and reset to **info** after investigation is complete.
LogPath **Note** This setting is shared with the 1E Client.	**1E Client logs on Windows** %ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client) %ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log **1E Client logs on macOS** /Library/Logs/1E.Client.Daemon.log (shows any service start errors) /Library/Logs/1E.Client.log (shows the current operation of the 1E Client) **1E Client logs on other non-Windows platforms** /var/log/1E/Client/1E.Client.log	The **LogPath** setting is stored in the **1E.Client.Conf** file and determines the full path and filename of the 1E Client log file. The 1E Client log is shared by: • 1E Client • Tachyon client features • Shopping client module (only available on Windows OS) To change the logging level, please refer to LoggingLevel in the 1E.Client.CONF file. The following are not configurable in this version: • Maximum size of 5MB • 5 rollover files numbered 1 (newest) to 5 (oldest) with the rollover number included as n.log **Note** By default, Windows resolves %ALLUSERS PROFILE% as C:\ProgramData\ See Log files for more details about 1E Client logs.

<table>
<tr><th>Core setting</th><th>Installation default</th><th>Description</th></tr>
<tr><td>NomadContentDownloadEnabled</td><td>true</td><td>The Content Distribution integration feature is for Windows clients only. The feature is enabled if this value is set to true and Content Distribution is running on the device. There is no dependency on Configuration Manager which Content Distribution also integrates with.

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>false</td><td>• Tachyon client waits a randomized stagger period defined by its DefaultStaggerRangeSeconds setting, and then downloads content from the specified Background Channel.
• Tachyon client retains modules and extensibles that it has downloaded, but does not retain instruction scripts after they have been run. Any</td></tr>
</table>
</td></tr>
</table>

Core setting	Installation default	Description
		instruction that requires a script or other file will download the latest version each time the instruction is run.
	tru e	• Tachyon client immediately requests Content Distribution to download content from the specified HTTP source, such as the **Background Channel**. Content Distribution behaves in the same way as it does with Configuration Manager by ensuring the latest version of content is obtained and electing a master to perform the actual download. • Content Distribution maintains its own cache of downloaded

Core setting	Installation default	Description
		content which avoids the need for repeat downloads over the WAN, and provides content to peers that require the same resources which avoids peer devices having to download over the WAN.
NomadContentDownloadTimeoutSecs	600 (10 minutes)	The Content Distribution integration feature is only for Windows computers. If this feature is enabled, and requested content is not provided within the timeout period, The Tachyon client will fall back to downloading directly from the Background Channel The most likely reason for a timeout is if Content Distribution is busy downloading other content. The range is 10 to 3600 (1 hour). **Note** On all non-Windows platforms this property defaults to 0 and is ignored.

Core setting	Installation default	Description
PolicyEnabled	true	Determines if the Policy feature of the Tachyon client is enabled (**true**) or not (**false**). The Policy feature is responsible for downloading, evaluating and reporting on policy rules defined in the Guaranteed State application on the Tachyon platform. If set to **true** then you must also configure settings for Switch and Background Channel. Must be set to **true** or **false**.
SelectRowsLimit **Note** This setting does not have an equivalent Windows Installer property, but *is* in the template configuration file.	100000 (10^5)	Limits the number of rows returned by a SELECT expression. The principle is that if there is more than this number of rows then something has gone wrong. This limit prevents an unexpectedly excessive amount of both data and CPU usage. The range is 1 to 1000000000 (10^9). The default value is 100000 (10^5). **Note** It is *not* considered an execution error if the limit is reached, although a warning will be written to the 1E Client log.
SSL	TLSv1.2	Determines which security protocol the Tachyon client uses when connecting to

<table>
<tr><th>Core setting</th><th>Installation default</th><th>Description</th></tr>
<tr><td></td><td></td><td>Switches and Background Channel.

SSL must be set to one of the following values:

<table><tr><th>Value</th><th>Description</th></tr><tr><td>TLSv1.2</td><td>TLS version 1.2 is a cryptographic protocol aimed at securing the network transport layer, and has recently been adopted by all the major browsers. It is considered to be more secure than SSLv3. This is the default.

Warning
Always use the default TLSv1.2 unless advised by 1E.</td></tr></table></td></tr>
<tr><td>Switch</td><td>(none)</td><td>If Tachyon and Content Distribution client features are not required then the connection to Tachyon Platform is not required, and both Switch and BackgroundChannelUrl settings must be set to none when doing a non-interactive (silent/quiet) install using installer properties on a</td></tr>
</table>

Core setting	Installation default	Description
		command-line or in a MST transform file. When doing an interactive install then you must uncheck the **Enable Tachyon** checkbox. Tachyon client features are not required if the 1E Client is being installed only to support PXE Everwhere, Shopping, or WakeUp. They are only required for Content Distribution if using Content Distribution features of the Tachyon Platform. To connect to the Tachyon platform then **Switch** will have one or more entries in the format: `Switch=<SwitchName>:<SwitchPort>` **<SwitchName>** is the DNS Name FQDN for one or more Switches. This is the same as the following except in a custom configuration where the Switch is installed on its own: • the HTTPS Host Header specified on the *Website Configuration* screen of the Tachyon Server installer, which is the HTTPS binding for the Tachyon Web Site • the same as <BackgroundChannelServer>

Core setting	Installation default	Description
		• the DNS Name specified in the Tachyon Server's Web Certificate. **<SwitchPort>** is the Port number, which has default value of 4000. Any other port number is used only in a complex configuration if advised by 1E. In systems where there are multiple DNS Names, there will be multiple entries using a semi-colon (;) as the delimiter between entries. For example: `Switch=tachyon.acme.local:4000;tachyon.acme.com:4000` Multiple DNS Names may exist in complex systems where there are multiple servers, Switches, and devices on different networks, such as the Internet as well as the corporate network. When the Tachyon client attempts to find a Switch, it will try each entry in turn, starting at the first. If all attempts fail Tachyon restarts the connection process after a period determined by ConnectionRetryTimeInSecondsMin/Max.
WorkerThreads	2	Determines the number of threads that will execute instructions concurrently. This property enables instructions

Core setting	Installation default	Description
		to be run simultaneously and prevents long running instructions from blocking others. Range is 1 to 8. 1 means all instructions are run sequentially on the same thread.

2.6.1.6.3 Interaction module settings

This section describes configuration settings for the **Real-Time Control Center** and **1E Client UI** (User Interaction) features provided by the Interaction module.

1E Client, while running, continuously captures details of certain user activity, such as which window is in the foreground on the user's desktop, and when the user is interacting (keyboard and mouse activity) with that window. Data is regularly written into a local, compressed and encrypted **persistent storage tables**, that are accessible using Interaction methods. The whole process is designed to minimize impact on device performance, storage and security.

The Interaction module is supported only on Windows OS (not Windows XP, Vista or other legacy OS). The 1E Client UI, which is launched by the Interaction module, requires Microsoft .NET Framework.

Configuration setting	Installation default	Description
Module.Interaction.Enabled **Note** This interaction setting is in the template configuration file.	true	Set this setting to **true** to enable the Interaction module. Default value is **true**. Must be set to **true** or **false**.
Module.Interaction.ActiveSessionThresholdSeconds	2	This setting is used to ensure that if the user is currently busy interacting, then focus will not be stolen from the user to display a notification. Notification display will only be considered if the user stopped interaction at least Active

Configuration setting	Installation default	Description
		Session Threshold Seconds before. Active Session Threshold Seconds is configurable between 0 and 30.
Module.Interaction.CompanyName	1E Ltd.	The organization name that is displayed in the header of the **Real-Time Control Center** and other **1E Client UI** dialogs. Can be set by the installer.
Module.Interaction.DoNotDisturb **Note** This interaction setting is in the template configuration file.	false	Set **true** to enable **Do not disturb**, and stop notifications after startup. Surveys sent to this device will respond as Timed out. Set **false** to disable **Do not disturb**, and show notifications after startup. In each case, if the **Module.Interaction.NotificationIcon** setting is true, the user can still use the notification area icon to enable or disable notifications. However, each time the user signs in, the **Do not disturb** mode will be reset.
Module.Interaction.IdleSessionThresholdMinutes	30	To ensure that notifications only appear when the user is present, this threshold specifies that notifications should not be displayed if more than the configured number of idle minutes has elapsed.

Configuration setting	Installation default	Description
		Idle Session Threshold Minutes is configurable between 1 and 1440.
Module.Interaction.ITSM.ServiceNow.CreateIncidents	false	If set to **true**, and ServiceNow integration is enabled, then users can create new incident tickets. (New in 8.0)
Module.Interaction.ITSM.ServiceNow.Enabled	false	Enable ServiceNow integration. This feature shows ServiceNow ticket information in the **Real-Time Control Center**. This feature also requires the following: • Module.Interaction.Enabled to be set to true • Module.Interaction.ITSM.ServiceNow.Url to be configured with the URL of the ServiceNow instance.
Module.Interaction.ITSM.ServiceNow.GoBackDays	30	Sets how far back to look for tickets that changed state to inactive (closed, resolved or cancelled). By default, the **Real-Time Control Center** shows all active tickets for the user. The user can also choose to view inactive tickets that have changed state during this period. The range is 1 to 365.

Configuration setting	Installation default	Description
		Only used if Module.Interaction.ITSM.ServiceNow.Enabled is **true**. Can be set by the installer. (New in 8.0)
Module.Interaction.ITSM.ServiceNow.Url	*(none)*	The URL to a ServiceNow instance, for example https://acme12345.service-now.com. Only used, and required, if Module.Interaction.ITSM.ServiceNow.Enabled is **true**. Can be set by the installer. (New in 8.0)
Module.Interaction.LogSessionNotificationReadiness	false	If set to **true**, the 1E Client will log an INFO message to indicate that a given user session is ready for notifications. If set to **false**, this information will be logged only at TRACE level. Intended for troubleshooting purposes only.
Module.Interaction.MinimumMinutesAfterLogonBeforePrompt	60	To ensure that notifications don't appear too soon after logon, this setting specifies the minimum time in minutes that must elapse after the user has been logged onto a session before notifications can appear. Minimum Minutes After Logon Before Prompt is configurable between 1 and 1440.

Configuration setting	Installation default	Description
Module.Interaction.MinimumMinutesAfterSessionActivationBeforePrompt	15	To ensure that notifications don't appear immediately after session unlock or reconnect, this setting specifies the minimum time in minutes that must elapse since the user session has been reactivated before notifications can appear. Minimum Minutes after Session Activation Before Prompt is configurable between 1 and 1440.
Module.Interaction.MinimumMinutesBetweenPrompts	60	To ensure that notifications don't appear too frequently, this setting specifies the minimum time in minutes since a notification was displayed before another notification will appear. Minimum Minutes Between Prompts is configurable between 1 and 1440.
Module.Interaction.NotificationIcon **Note** This interaction setting is in the template configuration file.	true	If set to **true**, a notification area icon will appear when the Client UI is running. If set to **false**, the icon will not be visible. Users may see notification popups, but will not be able to: • select User Sentiment surveys from the menu

Configuration setting	Installation default	Description
		• use the **Do not disturb** option
Module.Interaction.PeriodsBeforeUiLaunch	2	Specifies how many time periods to wait before launching the 1E Client UI, typically a launch time period is 5 seconds. Periods Before UI Launch is configurable between 1 and 120.
Module.Interaction.PeriodsBeforeUiLaunchTimeout	12	Specifies how many time periods may elapse before it is considered that the 1E Client UI has failed to launch, typically a launch time period is 5 seconds. Periods Before UI Launch Timeout is configurable between 1 and 24.
Module.Interaction.Port **Note** This interaction setting is in the template configuration file.	7766	The port number used for communication between the 1E Client service and 1E Client UI. Port is configurable between 100 and 65535.
Module.Interaction.ResponseAuditsBeforeTidy	100	This setting defines how frequently responses should be pruned to retain only the most recent responses. A response audit typically occurs each time a user responds to a notification, where a response includes

Configuration setting	Installation default	Description
		dismissing or snoozing a notification. Response Audits Before Tidy is configurable between 10 and 1000.
Module.Interaction.ResponseRetentionRows	5000	This setting ensures that the 1E Client only retains the most recent responses, with this value indicating how many responses should be retained. Response Retention rows is configurable between 100 and 50000.
Module.Interaction.SampleExclusionList	*(none)*	A comma-separated list of process names that are excluded from User Interaction sampling. Case is not significant. Only used if Module.Interaction.SampleUserInteraction is **true**. When User Interaction sampling is enabled, the Interaction module uses regular sampling to determine the responsiveness of application windows on the user's desktop. If the foreground window's process name has any of these values as a substring then it is excluded from the interactivity test.
Module.Interaction.SampleUserInteraction **Note**	true	Set to **true**, to enable User Interaction sampling.

Configuration setting	Installation default	Description
This interaction setting is in the template configuration file.		The Interaction module uses regular sampling to determine the responsiveness of application windows on the user's desktop, and will also track user keyboard and mouse input to determine the level of activity.
Module.Interaction.SnoozeTimeMinutes	15	This setting specifies the time in minutes that must elapse before a notification can be considered for re-display, after the user clicked on the **Later** button, or it had timed out. Snooze Time Minutes is configurable between 1 and 1440.
Module.Interaction.Theme	*(none)*	Specifies a theme that should be applied to the notifications. Can be one of: **Light**, **Dark** or **HighContrast**. If a value is not provided, the 1E Client UI will automatically determine the most appropriate theme based on the user's Windows desktop settings.

2.6.1.6.4 Inventory module settings

This section describes configuration settings for the Tachyon Activity Record feature provided by the Inventory module.

The Tachyon client, while running, continuously captures details of certain activities and events as they happen, similar to Windows Task Manager or Perfmon. During startup, the Tachyon client is able to detect some events that occurred when it was not running. Data is regularly written into a local, compressed and encrypted **persistent storage tables**, that are accessible to SCALE as SQL tables. The Tachyon client periodically

aggregates data in order to minimize the amount of storage required, so that each capture source has a live, hourly, daily and monthly table. The whole process is designed to minimize impact on device performance, storage and security. Please refer to /document/preview/737017#UUID-41152f15-7fd9-e142-94e1-9f86562abb75 for details of what data is captured and how to query these tables.

Other than **Module.Inventory.Enabled**, these Inventory module settings are not included in the template configuration file, and therefore use default values. To set any other value for these the setting must be added to the configuration file.

There are no SCALE methods available in the inventory module for creating instructions.

2.6.1.6.4.1 Capture sources

The table below lists the capture sources supported by the **Tachyon Activity Record** feature (also known as the Inventory module) and on which OS they are supported. The source name is used in each of the Capture source settings.

Source Name	Description	Windows	macOS	Linux	Solaris
ARP	ARP cache entries - the Inventory module captures the results of cached IP address to physical address resolutions	3.2	n/a	n/a	n/a
BootPerformance	Windows boot performance metrics.	8.0	n/a	n/a	n/a
DeviceInteraction	User session input metrics (keyboard and mouse activity).	5.1	n/a	n/a	n/a
DevicePerformance	Device performance metrics for device performance by interrogating Windows Performance Counters. These metrics cover disk, memory, network and processor performance. This capture source is required by the **Experience** application.	5.0	n/a	n/a	n/a
DeviceResourceDemand	Disk, network, memory, and processor performance metrics.	5.1	n/a	n/a	n/a
DNS	DNS resolution queries - the Inventory module captures whenever a DNS address is resolved	2.1	2.1	n/a	n/a

Source Name	Description	Windows	macOS	Linux	Solaris
OperatingSystemPerformance	Performance metrics for OS - the metrics executable runs every 4 hours by default This capture source is required by the **Experience** application.	5.0	n/a	n/a	n/a
PerformanceEvent	Distinct events which may be of relevance when diagnosing performance or end-user experience issues.	5.0	n/a	n/a	n/a
Process	Process execution - the Inventory module captures whenever a process starts on the device	2.1	2.1	2.1	2.1
ProcessStabilization	The time taken for a process execution to be considered stable whenever a monitored process starts on the device	3.2	n/a	n/a	n/a
ProcessUsage	A daily summary of the launches and terminations of processes. The Process Usage capture source is required by the **Tachyon Powered Inventory** feature (Tachyon connector). **Note** Process Usage capture can generate high disk I/O while capturing process usage on virtual machine hosts with guests starting at the same time.	3.2	n/a	n/a	n/a
SensitiveProcess	Performance metrics for sensitive processes - the metrics executable runs every 4 hours by default	5.0	n/a	n/a	n/a

Source Name	Description	Windows	macOS	Linux	Solaris
	This capture source is required by the **Experience** application.				
Software	Software installs/uninstalls/presence - the Inventory module captures whenever software is installed/uninstalled, and also captures which software is present on a device	2.1	2.1	2.1	2.1
SoftwareInteraction	Software process responsiveness and duration of active interaction.	5.1	n/a	n/a	n/a
SoftwarePerformance	Performance metrics for software - Software performance polling is every 10 seconds by default This capture source is required by the **Experience** application. Aggregated with SoftwarePerformance data: • SoftwarePerformance.DiskUsage - Disk related metrics for each running process • SoftwarePerformance.ProcessNetworkUsage - Network related metrics for each running process.	5.0	n/a	n/a	n/a
TCP	Outbound TCP connections - the Inventory module captures whenever an outbound TCP connection is made	2.1	2.1	2.1	n/a
UserUsage	A daily summary of all the logons and logoffs of users. This capture source is required by the **Tachyon Powered Inventory** feature (Tachyon connector).	3.2	n/a	n/a	n/a

2.6.1.6.4.2 Global capture settings

The table below lists configuration properties that affect all capture sources.

Inventory module setting	Installation default	Description
Module.Inventory.Enabled **Note** This is the only inventory setting in the template configuration file.	true	Determines whether the **Tachyon Activity Record** feature is enabled or disabled. Must be set to **true** or **false**. Must be set to true if using the **Tachyon Powered Inventory** feature (Tachyon connector). If set to **true**, individual capture sources can be enabled or disabled by setting **Module.Inventory.<source>.Enabled** to **true** or **false**. If set to **false** , this setting takes precedence over individual capture source settings with all being disabled.
Module.Inventory.NoEventTracing **Note** This setting does not have an equivalent Windows Installer property and is not in the template configuration file.	false	Controls whether the Inventory module will, on Windows, use a polling-based mechanism to capture data instead of event-based. The Inventory module will use Windows operating system events to capture data, if the host operating system supports it. If this setting is **true**, the Inventory module will instead use a polling-based approach to capture data. This setting is ignored on other operating systems.

Inventory module setting	Installation default	Description
Module.Inventory.AggregationIntervalSeconds **Note** This setting does not have an equivalent Windows Installer property and is not in the template configuration file.	60 (seconds)	Determines the frequency, in seconds, at which the Inventory module will write the capture buffers to the live and aggregated tables. More frequent aggregations will make captured data available for querying sooner, at the cost of more processing on the device. Range is 30 to 600 (10 minutes).

2.6.1.6.4.3 Capture source settings

The table below lists the 8 settings used to configure each capture source. The relevant <source> name needs to be included in each of the setting names (not case-sensitive):

ARP | BootPerformance | DeviceInteraction | DevicePerformance | DeviceResourceDemand | DNS | OperatingSystemPerformance | PerformanceEvent | Process | ProcessStabilization | ProcessUsage | SensitiveProcess | Software | SoftwareInteraction | SoftwarePerformance | TCP | UserUsage

Note

The following settings do not have an equivalent Windows Installer property and are not in the template configuration file.

Capture source setting	Installation default	Description
Module.Inventory.<source>.Enabled Not available for capture source: • SoftwareInteraction	true (all sources)	Controls whether this capture source is active (**true**) and will capture data. To disable capture of this data, use **false**. **Note** Disabling the **Tachyon Activity Record** feature by setting **Module.Inventory.Enabled** to **false**, takes precedence over individual capture source settings.

Capture source setting	Installation default	Description
		The Process Usage capture source is required by the **Tachyon Powered Inventory** feature (Tachyon connector). **Note** Process Usage capture can generate high disk I/O while capturing process usage on virtual machine hosts with guests starting at the same time.
Module.Inventory.<source>.BufferSize Not available for capture sources: • DevicePerformance • DeviceResourceDemand • SoftwarePerformance	1000 (all sources)	Determines the maximum number of capture entries held in memory during an aggregation period. The Inventory module will store data in memory prior to writing it to disk (as determined by the **Module.Inventory.AggregationIntervalSeconds** setting described above). This setting controls the size of the capture buffer available for this data. If this capture buffer is exceeded, older entries will be discarded to make room for newer ones. For example, based on the default values, if more than 1000 DNS lookups occur within 60 seconds. A higher value will allow the Inventory module can capture higher volumes of events at the cost of additional memory use.

Capture source setting	Installation default	Description
		Range is 100 to 10000.
Module.Inventory.<source>.PollIntervalSeconds Not available for capture sources: • DNS • Process • ProcessStabilization • ProcessUsage • TCP • UserUsage	30 (all sources except Software and OperatingSystemPerformance) 120 (2 minutes for Software) 300 (5 minutes for OperatingSystemPerformance)	Determines the frequency, in seconds, at which the capture source will poll for data. This setting is ignored if the Inventory module is using an event-based mechanism to capture data. A lower value (more frequent polls) is likely to capture more data at the cost of additional processing overhead on the device. Range is 5 to 600 (10 minutes) for all sources except for OperatingSystemPerformance which can go up to 86400 (1 day).
Module.Inventory.<source>.AggregationsBeforeGroom	3 (all sources)	Determines the number of aggregation cycles that should occur before old data is removed (groomed) from the Inventory module's live disk-based store. See the three Retention settings below. The Inventory module will store captured data for a limited time before removing it. This setting determines how frequently the grooming operation will be performed. The clean-up operation happens every N aggregation cycles. A lower value (more frequent deletion) will remove old data more quickly at the cost of

Capture source setting	Installation default	Description
		additional processing overhead on the device. Range is 1 to 50.
Module.Inventory.<source>.LiveRetention	5000 (all sources)	Determines the maximum number of capture entries that will be stored in the Inventory module's live disk-based storage. The Inventory module stores detailed (non-aggregate, live) capture entries on disk, as well as aggregated capture entries per hour, day and month (see below). This setting determines the limit of the detailed entries. When the limit is reached, older entries are deleted to make room for newer ones. A higher value allows storage of a longer period of detailed entries at the cost of additional disk space on the device. Storing more data will also cause queries on that data to take longer. Range is 100 to 50000.
Module.Inventory.<source>.HourlyRetention	24 (all sources)	Determines the maximum number of hours/days/months for which aggregated data will be kept in the Inventory module's disk-based storage. The Inventory module will discard data from its hourly/daily/monthly store to make room for newer data.

Capture source setting	Installation default	Description
		A higher value allows a longer record of data to kept at the cost of additional disk space on the device. Storing more data will also cause queries on that data to take longer. Note that these settings are independent of one another – for example, it is not necessary to specify an “hourly” value of 24 or greater to be able to capture “daily” values. A value of zero means “disable data aggregation at this resolution”. Again, since the settings are independent, it is valid to disable hourly data aggregation yet keep daily and monthly aggregation active. Range is 0 (disabled) to 100.
Module.Inventory.<source>.DailyRetention	31 (90 days for ProcessUsage and UserUsage for 5.1 and later)	
Module.Inventory.<source>.MonthlyRetention	12 (all sources)	

2.6.1.6.4.4 Settings unique to specific capture sources

Note

The following settings do not have an equivalent Windows Installer property and are not in the template configuration file.

Capture source setting	Installation default	Description
Module.Inventory.ProcessStabilization.Fuzziness	5	Modifies the margins within

Capture source setting	Installation default	Description
		which a process is considered stable. The default is 5, and the range is 1 to 66 inclusive. This setting should be left unchanged.
Module.Inventory.ProcessStabilization.MonitoredProcesses		This is a comma separated, case insensitive list of executable names (with extensions) of any processes that require stabilization monitoring. By default, this is not set and therefore process stabilization monitoring is disabled. The list should not exceed 15 executables.
Module.Inventory.ProcessUsage.VerboseLogging	false	Enables or disables Process Usage log messages, which typically appear for each data capture refresh. ProcessUsage is used by the Tachyon Powered Inventory feature.
Module.Inventory.UserUsage.VerboseLogging	false	Enables or disables User Usage log messages, which typically appear for

Capture source setting	Installation default	Description
		each data capture refresh. UserUsage is used by the Tachyon Powered Inventory feature.

2.6.1.7 Content Distribution client settings

Installer properties and configuration file settings for the Content Distribution client module of the 1E Client, which is supported only on Windows computers.

Note

Installer properties:

Module.Nomad.Enabled | MODULE.NOMAD.AUTHENTICATEDUSERS | MODULE.NOMAD.BLOCKSIZE | MODULE.NOMAD.CACHECLEANCYCLEHRS | MODULE.NOMAD.CACHECLEANSUBNETLOOKUP | MODULE.NOMAD.CACHEPATH | | MODULE.NOMAD.CACHESTATESYNCINTERVALMINUTES | MODULE.NOMAD.CERTISSUER | MODULE.NOMAD.CERTSUBJECT | MODULE.NOMAD.COMPATIBILITYFLAGS | MODULE.NOMAD.CONTENTPROVIDERONWIFI | MODULE.NOMAD.CONTENTREGISTRATION | MODULE.NOMAD.DEBUG | MODULE.NOMAD.DOREPORTINGENABLED | MODULE.NOMAD.DOWNLOADTIMEOUT | | MODULE.NOMAD.DPCACHECLEANUPENABLED | MODULE.NOMAD.DPNOTAVAILABLECODES | MODULE.NOMAD.ENFORCEQUOTAS | MODULE.NOMAD.GENERATEWEREVENTS | MODULE.NOMAD.HAACKTIMEOUTMINS | MODULE.NOMAD.LOCALSSDSTAGGER | MODULE.NOMAD.LOGNAME | MODULE.NOMAD.LOGPATH | MODULE.NOMAD.MADCAPSCOPE | MODULE.NOMAD.MAXALLOCREQUEST | MODULE.NOMAD.MAXCACHEDAYS | | MODULE.NOMAD.MAXCACHEDAYSTHRESHOLD | MODULE.NOMAD.MAXCACHESIZEMB | MODULE.NOMAD.MAXCONCURRENCY | MODULE.NOMAD.MAXDEVICESFROMAE | MODULE.NOMAD.MAXELECTIONRESPONSELOGGING | MODULE.NOMAD.MAXIMUMMEGABYTE | MODULE.NOMAD.MAXLOGSIZE | MODULE.NOMAD.MAXPACKAGEFAST | MODULE.NOMAD.MAXPACKAGERAS | MODULE.NOMAD.MAXPACKAGESLOW | MODULE.NOMAD.MAXPACKETSPERSECOND | MODULE.NOMAD.MAXPRECACHEDAYS | MODULE.NOMAD.MAXSTATUSFREQUENCY | | MODULE.NOMAD.MAXSTUCKCOUNT | MODULE.NOMAD.MAXSUCACHEDAYS | MODULE.NOMAD.MULTICASTSUPPORT | MODULE.NOMAD.NOHARDLINK | MODULE.NOMAD.NOMADINHIBITEDADSITES | MODULE.NOMAD.NOMADINHIBITEDSUBNETS | | MODULE.NOMAD.P2PDISQUALIFYMAXNUMPEERS | | MODULE.NOMAD.P2PDISQUALIFYMAXWINDOWMINS | MODULE.NOMAD.P2PENABLED | MODULE.NOMAD.P2PHTTPPORT | MODULE.NOMAD.P2PHTTPSPORT | MODULE.NOMAD.P2PPORT | MODULE.NOMAD.P2PSSLSETTINGS | MODULE.NOMAD.PERCENTAVAILABLEDISK | MODULE.NOMAD.PERMITTEDLSZSHARES | MODULE.NOMAD.PERMITUNCACHED | MODULE.NOMAD.PLATFORMURL | MODULE.NOMAD.POSTCOMPLETETIMEOUTHOURS | MODULE.NOMAD.PRECACHEPOLLBATCHSIZE | MODULE.NOMAD.PRECACHEPOLLMINUTES |

Note

Configuration file settings:

Module.Nomad.Enabled

Note

The Content Distribution client module of 1E Client replaces the legacy NomadBranch component of Content Distribution.

When the 1E Client starts, and the Content Distribution client module is enabled, it will only initialize the Content Distribution client module if the OS version is a supported Windows version. The 1E Client will automatically remove any previous installation of NomadBranch, keeping relevant NomadBranch registry settings.

The 1E Client Content Distribution client module is not supported on:

- Non-Windows devices
- Legacy OS (that is OS which Microsoft no longer support including XP, Vista, Server 2008 etc.)

1E Client installers include a **template configuration file** that contains the more important settings with default values that match hard-coded default values. The configuration file is updated during installation and named **1E.Client.conf** in the installation folder along with the 1E Client executable.

After installation, configuration file settings can be managed using 1E Client command-line parameters, Explorer configuration instructions, Guaranteed State policies, Configuration Manager baselines or other means. Registry settings can also be managed by Windows Group Policy.

The following table shows the supported installer properties for the Content Distribution client module of the 1E Client.

Note

Each installer property listed below has a link to its corresponding registry value page.

2.6.1.7.1 Nomad client settings

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

<table>
<tr><th>Installer property</th><th>Description</th></tr>
<tr><td>Module.Nomad.Enabled</td><td>Set this property to true to enable the Nomad client module. The default value is false.

Note
If enabled, when the 1E Client starts, it will attempt to automatically remove any previous installations of Nomad Branch.

This setting does not have an associated Nomad registry entry and is stored in the 1E Client configuration file.</td></tr>
<tr><td>MODULE.NOMAD.AUTHENTICATEDUSERS</td><td>Determines which of the built-in security groups is granted read-only permissions to the Nomad cache.

<table>
<tr><th>Registry value</th><th>Default value</th><th>Notes</th></tr>
<tr><td>AuthenticatedUsers</td><td>1</td><td>Grants read-only access to the Nomad cache as follows:

• 0 – Everyone built-in security group and the SMSNomadP2P& Nomad share account. This is the least restrictive option and is not valid with HTTP or HTTPS protocol and is treated as 2 (only the SMSNomadP2P& Nomad share account)

• 1 – Authenticated Users built-in security group and the SMSNomadP2P& Nomad share account

• 2 – Only the SMSNomadP2P& Nomad share account. This account has also been added to NTFS permission settings.</td></tr>
</table>
</td></tr>
</table>

Installer property	Description
	Unauthorised HTTP requests to access the caches are met with a 403 status code. The Nomad share has more information about share permissions and NTFS security. The difference between Authenticated Users and Everyone depends on the OS version, but in general Everyone includes Authenticated Users plus Guest.
MODULE.NOMAD.BLOCKSIZE	Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder. Click here to expand... Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder. **Note** Any change to this value requires a manual service restart before it can take effect.

2.6.1.7.1.1 BlockSize

Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder.

Note

Any change to this value requires a manual service restart before it can take effect.

Registry value	Default value	Notes	Installer property
BlockSize	131072(128KB)	Must be between 4096(4KB) to 4194304(4MB) inclusive. • The default block size is 128KB	MODULE.NOMAD.BLOCKSIZE

Installer property	Description
	• The maximum block size is 4MB • Multicast environments can only use the default block size. If you define a larger value for multicast environments, Nomad automatically resets it to the default. • Clients use the block size defined in the registry and ignore the values from the LSZ

The Dynamic Block Size (DBS) feature increases block size on high-bandwidth links to get maximum efficiency, and reduces it on low-bandwidth links to reduce the impact. Using DBS, Nomad is able to automatically decide the appropriate block size for a given link bandwidth and also adjust it as needed during the download if the link conditions change. As a result, Nomad is far more efficient and faster on all types of connection bandwidths while retaining its minimal impact on other link traffic.

Note

DBS is enabled or disabled by configuring Bit 25 in the CompatibilityFlags registry. Setting Bit 25 disables DBS and clearing Bit 25 enables DBS.

In Nomad 7.0 onwards, the DBS feature is turned off by default for new installations, and not changed for upgrades.

Installer property	Description

Prior to v6.3 the default value of BlockSize registry setting was 32KB (0x8000). From v6.3 onwards the default is 128KB (0x20000).

The installer automatically sets this to 128KB for both fresh installs and upgrades from previous versions. The only exceptions to this are:

- It will use the specified value if the BLOCKSIZE property is used in the installation command line or in a MST transform, when doing a fresh install or upgrade
- It will retain the previous value of BLOCKSIZE if it was set to anything other than 32KB (the older default), when doing an upgrade.

Registry value	Default value	Notes
BlockSize	131072(128KB)	Must be between 4096(4KB) to 4194304(4MB) inclusive. • The default block size is 128KB • The maximum block size is 4MB • Multicast environments can only use the default block size. If you define a larger value for multicast environments, Nomad automatically resets it to the default. • Clients use the block size defined in the registry and ignore the values from the LSZ

The Dynamic Block Size (DBS) feature increases block size on high-bandwidth links to get maximum efficiency, and reduces it on low-bandwidth links to reduce the impact. Using DBS, Nomad is able to automatically decide the appropriate block size for a given link bandwidth and also adjust it as needed during the download if the link conditions change. As a result, Nomad is far more efficient and faster on all types of connection bandwidths while retaining its minimal impact on other link traffic.

Note

Installer property	Description
	DBS is enabled or disabled by configuring Bit 25 in the CompatibilityFlags registry. Setting Bit 25 disables DBS and clearing Bit 25 enables DBS. In Nomad 7.0 onwards, the DBS feature is turned off by default for new installations, and not changed for upgrades. Prior to v6.3 the default value of BlockSize registry setting was 32KB (0x8000). From v6.3 onwards the default is 128KB (0x20000). The installer automatically sets this to 128KB for both fresh installs and upgrades from previous versions. The only exceptions to this are: • It will use the specified value if the BLOCKSIZE property is used in the installation command line or in a MST transform, when doing a fresh install or upgrade • It will retain the previous value of BLOCKSIZE if it was set to anything other than 32KB (the older default), when doing an upgrade.
MODULE.NOMAD.CACHECLEANCYCLEHRS	Determines the number of hours between automatically running the Nomad cache cleaner. Click here to expand... Determines the number of hours between automatically running the Nomad cache cleaner.

Registry value	Default value	Notes
CacheCleanCycleHrs	0 (turned off)	The first automatic cache clean runs randomly between 10 to 60 mins of service start up. Subsequent cache clean cycles run after the number of hours specified. 0 means feature turned off. No cache cleaning cycle would run. Changing this registry entry performs an internal restart. The minimum value is 4. The maximum value is 168 (Once a week)

Installer property	Description
	Please refer to Cache management for details about other cache management settings.
MODULE.NOMAD.CACHECLEANSUBNETLOOKUP	If enabled, sets the cache clean subnet lookup. Click here to expand... If enabled, sets the cache clean subnet lookup.

Registry value	Type	Default value	Notes
CacheCleanSubnetLookup	REG_DWORD	1	Before deleting content, Nomad checks if it is on any other client in the same subnet, and will only delete local content if the same is present on at least one other client on the same subnet. To disable subnet lookup, set the value to 0. Its value can be 0 or 1. The default value is 1, subnet lookup is enabled. New setting introduced in 8.0. Please refer to Cache management for details about other cache management settings.

Installer property	Description
MODULE.NOMAD.CACHEPATH	Determines the value of : • NomadBranch\LocalCachePath - the location of local Nomad package cache Click here to expand LocalCachePath... The location of local Nomad package cache. Registry value: LocalCachePath Default value: %ALLUSERSPROFILE%\1E\NomadBranch\ Notes: There are two registry values called LocalCachePath that are used by Nomad. • The LocalCachePath REG_SZ registry value under the HKLM\Software\1E\NomadBranch key sets the path to the local Nomad package cache. • The LocalCachePath REG_SZ registry value under the HKLM\Software\1E\NomadBranch\NMDS key sets the path to the PBA package cache. The path is created if it does not exist. If the drive letter does not exist, and it is not possible to create the specified path, *%TEMP%* is used. Default values are dependent on OS. **Known issue fixed in latest accumulated hotfix**

Installer property	Description

The value for the installer property CACHEPATH requires a trailing backslash \. When Nomad is installed on a DP this location is also used for the LSZFiles vDir folder. If LocalCachePath does not contain a trailing backslash, then:

- the LSZFILES folder is incorrectly created (LocalCachePathLSZFILES instead of LocalCachePath\LSZFILES)
- IIS vDIR points to wrong folder (LocalCachePathLSZFILES instead of LocalCachePath\LSZFILES)
- LSZGEN fails because it is attempting to store LSZ files to non-existent path (LocalCachePath\LSZFILES)

PBA cache is also derived from the same installer property MODULE.NOMAD.CACHEPATH, but it is stored in the registry value> CachePath in the NomadBranch\NMDS registry key.

- NomadBranch\NMDS\CachePath - the location of the base peer backup assistant (PBS) share where user data is copied to

Click here to expand CachePath...

This value holds the location of the base peer backup assistant (PBS) share where user data is copied to.

Installer property	Description

Registry value	Default value	Notes
CachePath	<NomadCachePath>\NMDS	This REG_SZ registry value is found under the PBA registry key NomadBranch\NMDS. This parameter relies on the folder it points to as being configured as a share. In normal circumstances, this should not be modified from the default value. The MODULE.NOMAD.CACHEPATH installer property also used to configure the location of the Nomad cache, which is stored in the registry value LocalCachePath. The location of the PBA cache is derived from the MODULE.NOMAD.CACHEPATH property, and is stored in the registry value CachePath in the NomadBranch\NMDS registry key.

MODULE.NOMAD.CACHESTATESYNCINTERVALMINUTES

Ensures the cache state of a device held on ContentDistribution is in sync with locally held data. This setting controls the **Content Registration Sync Cycle** feature.

Registry value	Default value	Notes
CacheStateSyncIntervalMinutes	1440 (1day)	Range: from 60 to 525600 (1Year).

The **Content Registration Sync Cycle** is available in the following versions of 1E Client, where the Nomad client registers pending and failed content registrations with ActiveEfficiency or Tachyon Platform. Please refer to Single Site Download: Improved resilience of content registration.

Installer property	Description
	• Nomad 8.0 in 1E Client 5.2 - uses Content Distribution in Tachyon Platform • Nomad 7.1 in 1E Client 5.2 - uses Content Distribution in Tachyon Platform • Nomad 7.0.200 in 1E Client 5.1 - uses ActiveEfficiency • Nomad 7.0.100 in 1E Client 5.0 - uses ActiveEfficiency • Nomad 7.0 in 1E Client 4.1 - uses ActiveEfficiency
MODULE.NOMAD.CERTISSUER	Defines one or more certificate issuers that Nomad will use to select the appropriate PKI certificate for the: • Configuration Manager (CM) client authentication certificate - used when downloading over HTTPS from Distribution Points and when communicating with Management Points during pre-caching • Nomad Server Authentication certificate - used to share content between peers over HTTPS • Client Authentication certificate - used for certificate-based client authentication when sharing content between peers over HTTPS. In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without needing to specify CertIssuer (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details). You should use CertIssuer if the CM client is not using PKI certificates and there are multiple Client Authentication certificates issued by different Certificate Authorities in the store, and if there is a chance some of those certificates may not be trusted by other peers or CM site systems. Click here to expand... Defines one or more certificate issuers that Nomad will use to select the appropriate PKI certificate for the: • Configuration Manager (CM) client authentication certificate - used when downloading over HTTPS from Distribution Points and when communicating with Management Points during pre-caching • Nomad Server Authentication certificate - used to share content between peers over HTTPS

Installer property	Description

- Client Authentication certificate - used for certificate-based client authentication when sharing content between peers over HTTPS.

In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without needing to specify CertIssuer (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details). You should use CertIssuer if the CM client is not using PKI certificates and there are multiple Client Authentication certificates issued by different Certificate Authorities in the store, and if there is a chance some of those certificates may not be trusted by other peers or CM site systems.

Registry value	Default value	Notes
CertIssuer	" "	Set this value to the name of the certificate issuer (Certificate Authority (CA)) that Nomad should use to select the appropriate PKI certificate. A case-insensitive substring-within-a-string match is performed. If you have multiple CAs you can specify a: • Common sub-string (e.g. "CORPCA" would work for certificates issued by CORPCA1 or CORPCA2) • Comma-separated list of certificate issuers (both exact names or substrings are acceptable values). For example, "DigiCert,Thawte,Verisign" would work for certificates issued by DigiCert, DigiCert EV, Thawte or Verisign. If you are only using HTTPS for downloading from an HTTPS DP (That is, not using HTTPS for peer-to-peer data transfer) you can leave this blank and set CertSubject instead.

MODULE.NOMAD.CERTSUBJECT	Defines one or more certificate subject names that Nomad uses to select the appropriate PKI certificate for authentication with Configuration Manager (CM) site systems configured to use HTTPS. It does not affect certificate selection for

Installer property	Description

client authentication certificates used for peer-to-peer authentication or for selection of server authentication certificates.

In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without the need to specify CertSubject (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details).

Click here to expand...

Defines one or more certificate subject names that Nomad uses to select the appropriate PKI certificate for authentication with Configuration Manager (CM) site systems configured to use HTTPS. It does not affect certificate selection for client authentication certificates used for peer-to-peer authentication or for selection of server authentication certificates.

In most cases Nomad will be able to identify a suitable certificate in the Local Computer Personal certificate store without the need to specify CertSubject (refer to Peer copy over HTTP or HTTPS: Certificate Selection for more details).

Registry value	Default value	Notes
CertSubject	" "	For downloads over HTTPS from the Distribution Point, set either the CertIssuer or CertSubject registry values. Set this value to the subject name of the certificate that Nomad should use to select the appropriate PKI certificate. The match has the following properties: • case-insensitive • a substring search is done, so if the text is set to ACME it will return certificates where ACME appears anywhere in the certificate's subject. If you have multiple valid subject names you can specify a: • Common sub-string, for example "contoso.com" would work for certificates that have contoso.com anywhere in the subject name

Installer property	Description
	• Comma-separated list of subject names or sub-strings, for example, you can specify multiple subject domain suffixes, for example "contoso.com,abc.in". For the installer property, configure either MODULE.NOMAD.CERTISSUER or MODULE.NOMAD.CERTSUBJECTinstaller properties for HTTPS downloads.
MODULE.NOMAD.COMPATIBILITYFLAGS	Determines different compatibility settings which relate to specific customer related functionality and should not generally be changed from the default value under normal conditions, unless advised.The installer property must be set to sum of the integer values for the required bits. For example, to disable hash value checking (1) and DelegatedLSZ checks and errors (131072), run *msiexec /i 1E.Client-x64.msi MODULE.NOMAD.COMPATIBILITYFLAGS=131073 [other properties] /qn* on the installer command-line. Click here to expand... Determines different compatibility settings which relate to specific customer related functionality and should not generally be changed from the default value under normal conditions, unless advised.

Registry value	Default value	Notes
CompatibilityFlags	0x1E18000A (504889354)	For Nomad in full OS, the registry value is set to the sum of the values for the required bits.  The default value combines the following settings: • *Bit 1 - 0x00000002* - Enable longer values for hashes

Installer property	Description

- *Bit 3 - 0x00000008* - Fix wrong IPs in election messages
- *Bit 19 - 0x00080000* - Enable full hash generation for SIS content on DPs
- *Bit 20 - 0x00100000* - Abort download on the Nomad client if an LsZ has mismatch is detected
- *Bit 25 - 0x02000000* - Turn off Dynamic Block Size
- *Bit 26 - 0x04000000* - Enable download of Windows 10 Express File Updates
- *Bit 27 - 0x08000000* - Enable download of Software Updates (including Windows 10 feature updates) from Microsoft Update - see note
- *Bit 28 - 0x10000000* - Enable support for byte-range downloads (e.g. Office 365 or delta content for updates) from Microsoft Update - see note

First bit is bit 0. The default in binary is: 0001 1110 0001 1000 0000 0000 0000 1010

Support for downloading updates from Microsoft Update

Setting bits 27 and/or 28 will enable Nomad to download content from Microsoft Update if the update has been deployed with Configuration Manager and the option
If software updates are not avail

Installer property	Description	
		able on distribution point in current, neighbor or site boundary, download content from Microsoft Update has been enabled on the Download Settings tab of the deployment. Nomad will not be used to download updates from Microsoft Update if the update is requested outside of a Configuration Manager Software Update Deployment (e.g. when using Windows Update for Business). **Note** Prior to 1E Client 4.1 (Nomad 7.0) the default was 0x00180000 (1572864): • *Bit 19 - 0x00080000* - Enable full hash generation for SIS content on DPs • *Bit 20 - 0x00100000* - Abort download on the Nomad client if an LsZ has mismatch is detected
0x00100002 (1048578)	For the task sequence action **Install and configure Nomad in Windows PE**, the registry value is set to the sum of the values for the required bits.  The default value combines the following settings: • *Bit 1 - 0x00000002* -	

Installer property	Description
	Enable longer values for hashes • *Bit 20 - 0x00100000* - Abort download on the Nomad client if an LsZ has mismatch is detected **Note** *Bit 1 - 0x00000002* (Enable longer values for hashes) is mandatory. The installer property must be set to sum of the values for the required bits, and given in decimal notation. For example, the following installer command-line uses: • *Default- 0x1E18000A* • *Bit 0 - 0x00000001* - Never check hashes of downloaded content • *Bit 17 - 0x00020000* - Disable DelegatedLSZ

Installer property	Description

checks and errors

- *Sum - 0x1E1A000B* (505020427)

```
> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.COMPATIBILITYFLAGS=505020427 [other properties] /qn
```

Bit	Hex	Decimal	Description
0	*0x0001*	1	Never check hashes of downloaded content.
1	*0x0002*	2	Enable longer values for hashes. This value is auto-enabled when the Configuration Manager client is detected. You must manually configure this setting on any DP that does not have the Configuration Manager client installed. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this was disabled (0) by default.
2	*0x0004*	4	Calculate CRCs as files are downloading.
3	*0x0008*	8	Fix wrong IPs in election messages. On multi-homed machines sometimes the IP from a wrong adapter can get sent in the election messages resulting in peers failing to connect to the master. Enabling this flag causes Nomad to correct such IPs at the

Installer property	Description			
				time when messages are received and thus prevent master connectivity issues.
	4	*0x0010*	16	Determines compatibility with Nomad v3.x caches. Set this option once all Nomad v3.x installations have been upgraded.
	5	*0x0020*	32	Disable all RDC data generation.
	6	*0x0040*	64	Keep Packages that failed the CRC test during P2P or download from DP.
	7	*0x0080*	128	Prevent computers using wireless connections from becoming fill-in multicast masters.
	8	*0x0100*	256	Include LinkLocal IPv4 addresses.
	9	*0x0200*	512	Include LinkLocal IPv6 addresses.
	11	*0x0800*	2048	RESERVED
	12	*0x1000*	4096	Do not automatically jump from HTTP to HTTPS during download from DP.
	13	*0x2000*	8192	Always use HTTPS. (Use this setting when Configuration Manager is configured to use HTTPS-only communication for downloading content from Distribution Points)
	14	*0x4000*	16384	RESERVED
	15	*0x8000*	32768	RESERVED
	16	*0x00010000*	65536	RESERVED (this flag is no longer used; previously this flag disabled a workaround for the issue described in Nomad post-installation tasks: IIS request filtering)

Installer property	Description		
17	*0x00020000*	131072	Disable DelegatedLSZ checks and errors.
18	*0x00040000*	262144	Disable partial download when App-V streaming, i.e. download entire application.
19	*0x00080000*	524288	Enable full hash generation for SIS content when an LsZ file is generated on a DP. If this is not enabled, SIS content is trusted, and corrupted content may be downloaded. Enabled by default.
20	*0x00100000*	1048576	Abort download on the Nomad client if an LsZ hash mismatch is detected. If this is not set, when a Nomad client detects a hash mismatch it will re-request LsZ generation on the DP then try again, and get stuck in a loop if the SIS content is corrupt. Must be set on clients if Bit 19 is set on DPs. Enabled by default.
25	*0x02000000*	33554432	Turn off Dynamic Block Size. This flag is set by default, which means Dynamic Block Size is disabled by default. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this bit was off, meaning **Dynamic Block Size** was enabled by default.
26	*0x04000000*	67108864	Enable download of Windows 10 Express update files. Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20144 for NomadBranch 6.3.201.
27	*0x08000000*	134217728	Enable download of full file software updates from Microsoft Update when

Installer property	Description
	deployed through Configuration Manager. Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20246 for NomadBranch 6.3.201.
	28 *0x10000000* 268435456 Enable download of byte-range software updates (e.g. Express updates, O365 updates) from Microsoft Update when deployed through Configuration Manager. Enabled by default. **Note** This is a new setting in 1E Client 4.1 (Nomad 7.0) and Q20246 for NomadBranch 6.3.201.
	30 *0x40000000* 1073741824 Enable SoftwareUpdate metadata validation. This is not enabled by default. It can be used to resolve rare issues related to SoftwareUpdates where the contents could be updated without any change in its ID or version. Please refer to Resolving SoftwareUpdate metadata validation for more details. **Note** This is a new setting in 1E Client 5.1 (Nomad 7.0.200).
MODULE.NOMAD.CONTENTPROVIDERONWIFI	Determines whether a device on a WLAN can become content provider. By default, only devices connected to a LAN can become content providers when using Single Site Download (SSD). **Note** This setting is only applicable to SSD and has no effect on P2P content transfers on the local subnet. Click here to expand...

Installer property	Description

Determines whether a device on a WLAN can become content provider. By default, only devices connected to a LAN can become content providers when using Single Site Download (SSD).

Note

This setting is only applicable to SSD and has no effect on P2P content transfers on the local subnet.

Registry value	Default value	Notes
ContentProviderOnWifi	0	Values are: • 0 – Only devices connected to a LAN can be content providers • 1 – Devices connected to any network (including WLANs) can be content providers

MODULE.NOMAD.CONTENTREGISTRATION

Determines if content in Nomad's cache (packages, applications, software updates, boot images, etc.) is registered with Content Distribution. Content registration is necessary if a host is to be available as a Single Site Download (SSD) provider or can be woken up if a Nomad peer requires the content locally.

Click here to expand...

Determines if content in Nomad's cache (packages, applications, software updates, boot images, etc.) is registered with Content Distribution. Content registration is necessary if a host is to be available as a Single Site Download (SSD) provider or can be woken up if a Nomad peer requires the content locally.

Registry value	Default value	Notes
Platform\ContentRegistration	0	To enable content registration, update the value to 1 – it is found under the Platform\ContentDistribution To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED

Installer property	Description
	installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED is specified during installation, the registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for SSDEnabled and ContentRegistration, in addition to enabling the Tachyon client. The ContentDistribution registry setting is found under the Platform key. • Nomad app provides visibility of content distribution activity • Single Site Download (SSD) • Single Site Peer Backup Assistant (SSPBA) • High Availability Peer Backup Assistant (HAPBA) • Get Migration Settings task sequence action used to manage computer associations • Nomad Pre-caching • Nomad Download Pause. In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to

Installer property	Description
	be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the 1EClient.conf file).
MODULE.NOMAD.DEBUG	The level of messages logged in the Nomad logs for debugging purposes. The installer property must be set to sum of the integer values for the required bits. For example, to set all three supported debug levels, run: *`msiexec /i 1E.Client-x64.msi MODULE.NOMAD.DEBUG=25 [other properties] /qn`* on the installer command-line. Click here to expand... The level of messages logged in the Nomad logs for debugging purposes.

Registry value	Default value	Notes
Debug	0x09 (9)	See the table below for customer supported values. The default is a combination of *`0x01`* (Minimal logging) and *`0x08`* (Registry changes). For example, to set maximum debugging, set bit 0, 3 and 4, which is a value of 0x19 hexadecimal or 25 decimal. Values on the installer command-line must be provided in decimal. So to set maximum debugging you would use the following installer command-line: `> msiexec /i 1E.Client-x64.msi DEBUG=25 [other properties] /qn`

Bit	Hex	Decimal	Description
0	0x01	1	Minimal logging.
1	0x02	2	RESERVED

Installer property	Description				
		2	0x04	4	RESERVED
		3	0x08	8	Registry changes.
		4	0x10	16	Additional debugging (should only be used if requested by 1E support).
MODULE.NOMAD.DOREPORTINGENABLED	Enables Delivery Optimization monitoring and reporting if ContentRegistration is enabled. Click here to expand... Enables Delivery Optimization monitoring and reporting if ContentRegistration is enabled.				

Registry value	Default value	Notes
DeliveryOptimizationReportingEnabled	0	Enables monitoring of Delivery Optimization downloads and reporting them to Tachyon Platform (ContentDistribution). Delivery Optimization monitoring and reporting is only supported in versions of Windows Server 2019 and Windows 10 Version 1909 onwards. When it is enabled, DO download events get written to .etl files in the Nomad cache folder, for example: NomadDo-20210325-182415.etl. And aggregated information about the downloads gets writtern

Installer property	Description
	to sqlite files **Do.db** and **DoDownloadMonitor.db** in LocalDb folder inside Nomad cache folder.
MODULE.NOMAD.DOWNLOADTIMEOUT	Sets the timeout in seconds after which a job will be cancelled if the download has not been successful. Click here to expand... Sets the timeout in seconds after which a job will be cancelled if the download has not been successful.
MODULE.NOMAD.DPCACHECLEANUPENABLED	Delete all obsolete LSZ files on the DP where the associated content is no longer present in ContentLib. Click here to expand... Delete all obsolete LSZ files on the DP where the associated content is no longer present in ContentLib.

Registry value	Default value	Notes
DownloadTimeout	0	This parameter is associated with the distribution point resilience feature and is used in conjunction with the *RecycleDPDelay* registry value. If a value greater than zero is set, the download timeout will either use this or the Configuration Manager setting depending on which is the smaller value. When the timeout is reached, the job package download is cancelled and a success is sent to the Configuration Manager client with the *ERROR_MAXDURATION* timeout error sent as the package status message. The default is to use the Configuration Manager setting (28 days by default).

Installer property	Description

Registry value	Default value	Notes
DpCacheCleanupEnabled	0 (turned off)	This entry controls the cached LSZ files cleaning feature. When turned on, this feature deletes all LSZ files in a Distribution Point (DP) cache where the associated content is not present in ContentLib. The following table describes the values this entry may be set to: Value: 0 — The feature is turned off. This is the default. Value: 1 (or greater) — The feature is turned on. Please refer to Cache management for details about other cache management settings.

MODULE.NOMAD.DPNOTAVAILABLECODES

Determines which error codes will cause Nomad to retry a download using an alternative distribution point.

For example, the following would set Nomad to the default value on the 1E Client installer command-line:`> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.DPNOTAVAILABLECODES="0x205A,0x205D" [other properties] /qn`

Click here to expand...

Determines which error codes will cause Nomad to retry a download using an alternative distribution point.

Installer property	Description

Registry value	Default value	Notes
DPNotAvailableCodes	0x205A, 0x205D	This registry entry contains a comma-separated list of return codes, see Nomad return codes for a list of the possible ones. If Nomad encounters one of these during download it will attempt a retry from an alternative DP. It gets the list of possible DPs from Configuration Manager. The two return codes set as default are the only ones that are applicable to DP availability: • 0x205A – in valid special package path (set using *--pp*) • 0x205D – DP path not found Under normal circumstances, you would not change this from the default value. You may want to not allow failover to an alternative DP altogether, in which case you would set the value to " " in the registry. Or you may only want to failover if the DP path was not found, in which case you would set the value to 0x205D only. This installer property should be set to a string containing the comma-separated hex values. For example the following sets Nomad to failover to the next DP only when the DP path was not found: *> msiexec /i 1E.Client-x64.msi DPNOTAVAILABLECODES="0x205D" [other properties] /qn*

MODULE.NOMAD.ENFORCEQUOTAS	Determines whether Windows Disk Quotas (if configured) are enforced on the PBA share defined inCachePath. Click here to expand...

Installer property	Description

Determines whether Windows Disk Quotas (if configured) are enforced on the PBA share defined in CachePath.

Registry value	Default value	Notes
EnforceQuotas	0x0 (0)	Enables quotas to be enforced but requires Windows Disk Quotas to be configured. If the size specified in the NMDS_POLL request causes the quota to be exceeded, the request fails and you get disk full error. This registry value is found under the PBA registry key NomadBranch\NMDS.

MODULE.NOMAD.GENERATEWEREVENTS

Determines whether Windows Error Reporting memory dumps should be sent to Microsoft Winqual.

Click here to expand...

Determines whether Windows Error Reporting memory dumps should be sent to Microsoft Winqual.

Registry value	Default value	Notes
GenerateWEREvents	1	If enabled and if Nomad experiences an unexpected failure, a dialog is displayed prompting the user to send the debug information to Winqual which is forwarded to 1E for continued quality improvements. Values are: • 0 disables this feature • 1 enables this feature

MODULE.NOMAD.HAACKTIMEOUTMINS

The time-out period in minutes for the Peer Backup Assistant - High Availability (deprecated) (PBA-HA) task sequence action. If a machine running this action does not receive an acknowledgement message within this period from the PBA host performing the additional backups, the action will fail.

Click here to expand...

Installer property	Description

The time-out period in minutes for the Peer Backup Assistant - High Availability (deprecated) (PBA-HA) task sequence action. If a machine running this action does not receive an acknowledgement message within this period from the PBA host performing the additional backups, the action will fail.

Registry value	Default value	Notes
HAACKTimeoutMins	20	Applies to synchronized backups only. The PBA tost sends the acknowledgement messages back to the machine running the task sequence approximately every 5% of the synchronized copy. This registry value is found under the PBA registry key NomadBranch\NMDS.

MODULE.NOMAD.LOCALSSDSTAGGER

Sets the site SSD query stagger duration (seconds).

Click here to expand...

Sets the site SSD query stagger duration (seconds).

Deployments to large numbers of clients (30,000 or more) generate significant network traffic from 1E Client to Content Distribution that may result in IIS 503 Overload errors on the server, causing content registrations and SSD requests to fail. LocalSsdStagger allows an elected subnet master to wait for a random configurable time before making a local SSD request. All peers in the subnet participating in the election would also synchronize and wait for the same time before copying from master machine.

Registry value	Type	Default value	Notes
LocalSsdStagger	REG_DWORD	5	Sets the local SSD query stagger duration in seconds. The stagger is 0 (disabled) by default. The maximum value that can configured is 600 seconds (10 minutes).

Installer property	Description
	There is no SSD staggering in WinPE. Local SSD happens when only when network broadcast is disabled. **Note** Please consult 1E before changing this value. This setting works in conjunction with SiteSsdStagger.
MODULE.NOMAD.LOGNAME	Name of the Nomad log file. This value is preserved upon upgrade. This property is combined with MODULE.NOMAD.LOGPATH to create registry value LogFileName. The default value is *NomadBranch.log*
MODULE.NOMAD.LOGPATH	Location of the Nomad log file. The path will be created if it does not exist. This value is preserved upon upgrade. Default values are dependent on OS. This property is combined with MODULE.NOMAD.LOGNAME to create the registry value LogFileName. The default location is: *%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles*
MODULE.NOMAD.MADCAPSCOPE	The MADCAP scope for multicast. Click here to expand... The MADCAP scope for multicast. **Warning** The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes
MultiCastMADCAPScope	SMSNomad	Values may be set using either of the formats in the table below.

Installer property	Description

Format	Description
<ScopeName>	*<ScopeName>* is the name of a scope defined in the DHCP (if you are using the Microsoft implementation of MADCAP). Use this format if you have multiple MADCAP servers. This method uses the time to live settings for the scope.
<MADCAP_ServerIP> *<MADCAP_Scope_IP>* *<TTL>*	• *<MADCAP_ServerIP>* is the IP address of a specific MADCAP server • *<MADCAP_ScopeIP>* is the starting IP address for a MADCAP scope defined in the DHCP (if you are using the Microsoft implementation of MADCAP) • *<TTL>* is the time to live for the multicast packets **Note** Using a TTL greater than 1 is not recommended unless you have ensured that multicast traffic cannot leak back upstream through any intervening routers. The valid range for TTL is a number between 1 and 255

Nomad is also capable of performing control multicast without a MADCAP server installation on the network. In order to use this feature, the *<MADCAP_ServerIP>* must be set to *0.0.0.0*. For example, the following supports MADCAP server not being present, with a scope of *239.0.9.0* and a time to live of *3*.

```
0.0.0.0,239.0.9.0,3
```

MODULE.NOMAD.MAXALLOCREQUEST	Sets the maximum amount of space in MB that can be requested by each PBA client. Click here to expand...

Installer property	Description

Sets the maximum amount of space in MB that can be requested by each PBA client.

Registry value	Default value	Notes
MaxAllocRequest	0xC8 (200)	Located under the PBA registry key NomadBranch\NMDS.

MODULE.NOMAD.MAXCACHEDAYS

When the Nomad cache cleaner runs, delete any application or package content that last triggered Nomad elections before the specified number of days ago.

Click here to expand...

When the Nomad cache cleaner runs, delete any application or package content that last triggered Nomad elections before the specified number of days ago.

Registry value	Default value	Notes
MaxCacheDays	0 (turned off)	Set to delete application or package content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only application or package content that have triggered elections recently will be kept in the cache. 0 means that application and package content will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.

MODULE.NOMAD.MAXCA

This is the maximum number of days content is present on a client.

Click here to expand...

<table>
<tr><th>Installer property</th><th>Description</th></tr>
<tr><td>CHEDAYSTHRESHOLD</td><td>This is the maximum number of days content is present on a client.
<table>
<tr><th>Registry value</th><th>Type</th><th>Default value</th><th>Notes</th></tr>
<tr><td>MaxCacheDaysThreshold</td><td>REG_DWORD</td><td>0</td><td>This is the maximum number of days content is present on a client. If it's not zero, then content will be deleted without any other checks once it reaches the threshold. If the threshold has a value greater than zero and less than 30, Nomad uses the threshold of 30 days and creates an associated log.

Default value is 0.

New setting introduced in 8.0.

Please refer to Cache management for details about other cache management settings.</td></tr>
</table></td></tr>
<tr><td>MODULE.NOMAD.MAXCACHESIZEMB</td><td>Provided for backward compatibility only – use PercentAvailableDisk instead. The value (in bytes) for the maximum size the cache is allowed to grow to, before automatic cache cleaning takes place.

Click here to expand...

Provided for backward compatibility only – use PercentAvailableDisk instead. The value (in bytes) for the maximum size the cache is allowed to grow to, before automatic cache cleaning takes place.</td></tr>
</table>

Installer property	Description

Registry value	Default value	Notes
MaxCacheSizeMB	0	There is no maximum value for this property. This method for determining the maximum size of the cache is an alternative to PercentAvailableDisk: • If PercentAvailableDisk has a value greater than zero set its method will be used to control the cache size. • If MaxCacheSizeMB is set to a value greater than zero and PercentAvailableDisk is set to zero thenMaxCacheSizeMB will be used as the method for determining the maximum size of the Nomad cache.

MODULE.NOMAD.MAXCONCURRENCY

Sets the maximum number of concurrent PBA sessions that may be in use on the host.

Click here to expand...

Sets the maximum number of concurrent PBA sessions that may be in use on the host.

Registry value	Default value	Notes
MaxConcurrency	0x3 (3)	Located under the PBA registry key NomadBranch\NMDS.

MODULE.NOMAD.MAXDEVICESFROMAE

The maximum number of devices with the content that Nomad can retrieve from Content Distribution in one call.

Click here to expand...

The maximum number of devices with the content that Nomad can retrieve from Content Distribution in one call.

Installer property	Description

Registry value	Default value	Notes
MaxDevicesFromAE	10	The maximum number of devices (i.e. machines) with the content (package, application or software update) that Nomad can retrieve from Content Distribution in one call. The maximum value is 20.

MODULE.NOMAD.MAXELECTIONRESPONSELOGGING

Defines the number of election responses Nomad will write to the log for a given election.

Click here to expand...

Defines the number of election responses Nomad will write to the log for a given election.

Registry value	Default value	Notes
MaxElectionResponseLogging	By default this REG_DWORD value is not present and all election responses are logged.	Add this REG_DWORD value and set it to the number of responses that Nomad should log for any given election. Setting the value to 0 effectively turns off logging of any election responses.

Note

The value of MaxElectionResponseLogging specifies the number of election replies to be logged per election request. As an example, if MaxElectionResponseLogging = 5 and there are two election requests for the same package at different times, a maximum of 5 election responses will be logged for each elections (up to 10 election replies in total). If there are two concurrent election requests for the same package, the number of maximum election replies logged may vary from 5 to 10. In general, if MaxElectionResponseLogging = *n* and if there are *m* concurrent election requests for the same package, the number of maximum election replies logged may vary from *n* to *m***n*.

Installer property	Description
MODULE.NOMAD.MAXIMUMMEGABYTE	The maximum amount of space (in MB) that can be used for all the PBA shares combined on the host. Click here to expand... The maximum amount of space (in MB) that can be used for all the PBA shares combined on the host. Registry value: MaximumMegaByte Default value: 0 Notes: A non-zero value enables PBA share. This registry value is located under the PBA registry key NomadBranch\NMDS.
MODULE.NOMAD.MAXLOGSIZE	The maximum size (in bytes) of the Nomad log file. Default is 5MB. Click here to expand... The maximum size (in bytes) of the Nomad log file. Default is 5MB. Registry value: MaxLogFileSize Default value: 5242880 Notes: When the log file reaches this size, it is renamed with a *.LO_* extension and a new *.LOG* file is created. The *.LO* file is overwritten each time. **Note** The default has been increased from 1048576 (1MB) to 5242880 (5MB) for Nomad 7.0 onwards (1E Client 4.1). **Note** The installer property name is different to the registry name.
MODULE.NOMAD.MAXPACKAGEFAST	The maximum size (in bytes) of a package that Nomad attempts to cache on a Fast LAN (>500 kbps) connection. Click here to expand...

Installer property	Description
	The maximum size (in bytes) of a package that Nomad attempts to cache on a Fast LAN (>500 kbps) connection. Registry value: MaxPackageSizeFastLAN Default value: 0 Notes: Works in conjunction with the RunUncachedPermittedFastLAN registry value. **Note** The installer property name is different to the registry name.
MODULE.NOMAD.MAXPACKAGERAS	The maximum size (in bytes) of a package that Nomad will attempt to cache on a RAS (<55 kbps) connection. Click here to expand... The maximum size (in bytes) of a package that Nomad will attempt to cache on a RAS (<55 kbps) connection. Registry value: MaxPackageSizeRAS Default value: 0 Notes: **Note** The installer property name is different to the registry name.
MODULE.NOMAD.MAXPACKAGESLOW	Maximum size (in bytes) of a package that Nomad attempts to cache on a Slow LAN (55-500 kbps) connection. Click here to expand... Maximum size (in bytes) of a package that Nomad attempts to cache on a Slow LAN (55-500 kbps) connection.

Installer property	Description

Registry value	Default value	Notes
MaxPackageSizeSlowLAN	0	**Note** The installer property name is different to the registry name.

MODULE.NOMAD.MAXPACKETSPERSECOND

The maximum rate at which multicast packets are sent.

Click here to expand...

The maximum rate at which multicast packets are sent.

Warning

The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes
MaxPacketsPerSecond	800	Modify this value with caution. If packets are sent too fast, machines will drop packets and multicast will not be effective - too slow and multicast works, but slowly. The default value is indicative of how this should be set.

MODULE.NOMAD.MAXPRECACHEDAYS

When the Nomad cache cleaner runs, delete any pre-cached content that last triggered Nomad elections before the specified number of days ago.

Click here to expand...

When the Nomad cache cleaner runs, delete any pre-cached content that last triggered Nomad elections before the specified number of days ago.

Installer property	Description

Registry value	Default value	Notes
MaxPreCacheDays	0 (turned off)	Set to delete pre-cached content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only pre-cached content that has triggered elections recently will be kept in the cache. 0 means that pre-cached content will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.

MODULE.NOMAD.MAXSTATUSFREQUENCY

he minimum interval (in seconds) between sending transfer progress status messages, thereby governing the overall maximum frequency for sending the messages.

Click here to expand...

he minimum interval (in seconds) between sending transfer progress status messages, thereby governing the overall maximum frequency for sending the messages.

Registry value	Default value	Notes
MaxStatusFrequency	3600	Works in conjunction with the ++sm setting on the Nomad properties tab and the StatusMsgEvents registry values.

MODULE.NOMAD.MAXSTUCKCOUNT

Registry value to hold an integer determining the number of times Nomad attempts to copy content and gets stuck before aborting.

Click here to expand...

Installer property	Description

Registry value to hold an integer determining the number of times Nomad attempts to copy content and gets stuck before aborting.

If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this.

Registry value	Default value	Notes
MaxStuckCount	100	The number of times Nomad attempts to copy content after failure (such as network outages, incomplete LSZ files, hash mismatches, election issues, connecting with peers) before it aborts the operation. The range is 3 to 1000, but if the value is less than 3 or greater than 1000, it sets to the default of 100. **Warning** The MaxStuckCount value is an internal NomadBranch registry value. You should not change this value unless advised by 1E.

Do not use unless advised by 1E.

MODULE.NOMAD.MAXSUCACHEDAYS

When the Nomad cache cleaner runs, delete any software updates that last triggered Nomad elections before the specified number of days ago.

Click here to expand...

When the Nomad cache cleaner runs, delete any software updates that last triggered Nomad elections before the specified number of days ago.

Registry value	Default value	Notes
MaxSUCacheDays	0 (turned off)	Set to delete software updates that last triggered Nomad elections before the

Installer property	Description
	specified number of days from the date the cache cleaner runs. This ensures that only software updates that have triggered elections recently will be kept in the cache. 0 means that software updates will not be deleted automatically when the cache cleaner runs. Please refer to Cache management for details about other cache management settings.
MODULE.NOMAD.MULTICASTSUPPORT	The behavior of local multicast. Click here to expand... The behavior of local multicast. **Warning** The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.

Registry value	Default value	Notes
MulticastSupport	0x0 (0)	All machines in a single branch must be configured using the same value for this parameter. If you are not using multicast, deploy the Nomad branch agent with the MULTICASTSUPPORT property set to 0 to reduce the noise in Nomad logs. Prior to Nomad 7.0 multicast was enabled (0x1) by default. Now it is disabled (0x0) by default.

Installer property	Description

Bit	Hex	Decimal	Description
	0x0	0	**No Multicast**– disables the feature.
0	0x1	1	**Data Only Multicast** – choose this for a standard Nomad multicast. Data refers to the content of the downloaded package. Nomad control communications are broadcast as normal on the local subnet. Select this option for standard functionality.
1	0x2	2	**Control Only Multicast** – control information refers to the communications between Nomad enabled machines, especially for elections. This may be used if there is more than one subnet in a single location to enable a single Nomad master to be elected for all the subnets.
	0x3	3	**Control and Data Multicast** – data and control information is multicast. Select this option if a branch has multiple subnets connected by high speed routers.

MODULE.NOMAD.NOHARDLINK

Determines whether hard links are used between the Nomad cache and the Configuration Manager cache.

Click here to expand...

Determines whether hard links are used between the Nomad cache and the Configuration Manager cache.

Registry value	Default value	Notes
NoHardlink	0	Values are: • 0 – hard links are used. The Nomad cache will link to the Configuration Manager cache

Installer property	Description
	so only a single copy of a package is held locally. • 1 – hard links are not used and results in the content being double-cached For more detail about the Nomad Cache please refer to Nomad cache.
MODULE.NOMAD.NOMADINHIBITEDADSITES	Prevents Nomad from calling an election when it is connected to a specified AD site, meaning that each Nomad client on the listed AD sites will automatically become a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content. Click here to expand... Prevents Nomad from calling an election when it is connected to a specified AD site, meaning that each Nomad client on the listed AD sites will automatically become a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content.

Registry value	Default value	Notes
NomadInhibitedADSites	(empty)	A comma-separated list for each AD site to be inhibited. Useful for sites with: • a local DP • a VPN without isolation For example, to inhibit three AD sites called site1, site2 and site3: `site1,site2,site3` Please refer to Design Considerations: Inhibiting subnets and sites.

Installer property	Description
MODULE.NOMAD.NOMAD	Prevents Nomad from calling an election when it is connected to a specified IP subnet, meaning that each Nomad client on the IP subnet automatically

Installer property	Description
INHIBITEDSUBNETS	becomes a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content. Click here to expand... Prevents Nomad from calling an election when it is connected to a specified IP subnet, meaning that each Nomad client on the IP subnet automatically becomes a Nomad master. This prevents P2P sharing, as each master downloads its own copy of the content. Registry value: NomadInhibitedSubnets Default value: (empty) Notes: A comma-separated list of each subnet to be inhibited in CIDR notation. Useful for sites with either of the following: • a local DP • a VPN without isolation For example, to isolate two subnets: `10.2.0.0/16,192.168.9.0/24` Please refer to Design Considerations: Inhibiting subnets and sites.
MODULE.NOMAD.P2PDISQUALIFYMAXNUMPEERS	Defines the max number of devices which a device will disqualify during a peer-to-peer copy. Click here to expand... Defines the max number of devices which a device will disqualify during a peer-to-peer copy. If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this. Registry value: P2PDisqualifyMaxNumPeers Default value: 5 Notes: A device does not further disqualify a peer if it has disqualified

Installer property	Description
	P2PDisqualifyMaxNumPeers number of peers within last P2PDisqualifyMaxWindowMins minutes. **Warning** The P2PDisqualifyMaxNumPeers value is an internal NomadBranch registry value. You should not change this value unless advised by 1E. Do not use unless advised by 1E.
MODULE.NOMAD.P2PDISQUALIFYMAXWINDOWMINS	Defines the max number of minutes within which a device will disqualify a peer during a peer-to-peer copy. Click here to expand... Defines the max number of minutes within which a device will disqualify a peer during a peer-to-peer copy. If you update the registry, you must restart the Nomad service for you changes to take effect. We recommend backing up your registry before you do this.

Registry value	Default value	Notes
P2PDisqualifyMaxWindowMins	60	A device does not further disqualify a peer if it has disqualified P2PDisqualifyMaxNumPeers number of peers within last P2PDisqualifyMaxWindowMins minutes. **Warning** The P2PDisqualifyMaxWindowMins value is an internal NomadBranch registry value. You should not

Installer property	Description
	change this value unless advised by 1E. Do not use unless advised by 1E.
MODULE.NOMAD.P2PENABLED	Determines how the Nomad cache is accessed. Please refer to Nomad cache for more details. The installer property must be set to sum of the integer values for the required bits. For example, the following would set Nomad to use connectionless P2P on the 1E Client installer command-line: *> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.P2PENABLED=6 [other properties] /qn* Click here to expand... Determines how the Nomad cache is accessed. Please refer to Nomad cache for more details.

Registry value	Default value	Notes
P2PEnabled	9	The default (Hex 0x0009) configures P2P to use SMB and Net Literal Names. You can set more than one option at the same time by combining the bit values. See the table below for details. **Note** We recommend restarting the Nomad Branch service when you modify this parameter.

Bit	Hex	Decimal	Notes
0	0x0001	1	(Default) Use the SMB protocol to share its own cache, and create the NomadSHR file share upon the start of the Nomad service, unless the CustomShare option has been enabled in SpecialNetShare. When

Installer property	Description			
				P2PEnabled is set in addition to Bit 5 (use HTTP) or Bit 6 (use HTTPS), Nomad will attempt to use HTTPS/HTTP and will fall-back to SMB if HTTPS/HTTP is unavailable on other peers. To disable SMB P2P, set this bit to 0.
		1	0x0002	2	Enable connectionless P2P server.
		2	0x0004	4	Enable connectionless P2P client.
		3	0x0008	8	(Default) Use Net Literal Names when connecting to P2P shares. This causes Nomad to use the Nomad master's IP address when connecting to the share and is recommended when running wirelessly.
		4	0x0010	16	Use FQDN when connecting to P2P shares. Recommended when using a multi-forest environment where computers from different forests may be present in the same subnet. This requires that reverse lookup for IP addresses is correctly configured and running. If this is not available Nomad will revert to using the IP address for connecting to the P2P shares.
		5	0x0020	32	Use the HTTP protocol to share its own cache and access other caches.
		6	0x0040	64	Use the HTTPS protocol to share its own cache and access other caches.
MODULE.NOMAD.P2PHTTPPORT	The HTTP port to use for peer copy. Click here to expand... The HTTP port to use for peer copy.				

Installer property	Description

Registry value	Default value	Notes
P2PHttpPort	5080	Default HTTP port to use for peer copy. If you are using a custom port, ensure that all agents use the same custom port.

MODULE.NOMAD.P2PHTTPSPORT

The HTTPS port to use for peer copy.

Click here to expand...

Registry value	Default value	Notes
P2PHttpsPort	5443	Default HTTPS port to use for peer copy. If you are using a custom port, ensure that all agents use the same custom port.

MODULE.NOMAD.P2PPORT

Port used to broadcast election messages, for connectionless cache access and package status broadcasts.

Click here to expand...

Port used to broadcast election messages, for connectionless cache access and package status broadcasts.

Registry value	Default value	Notes
P2P_Port	1779	

MODULE.NOMAD.P2PSSLSETTINGS

Defines server and client authentication options when using HTTPS for P2P content transfer (i.e. P2PEnabled 0x60 option is set).

Click here to expand...

Defines server and client authentication options when using HTTPS for P2P content transfer (i.e. P2PEnabled 0x60 option is set).

Installer property	Description

Registry value	Default value	Notes
P2PSslSettings	0	The default value (0) configures Nomad to use a self-signed certificate for server authentication and disables certificate-based client authentication. P2PSslSettings is a numeric value where, when represented in binary, each bit represents a configurable option as defined in the table below. You can combine these options to derive the required value, for example setting P2PSslSettings to 3 (0x1 + 0x2) configures Nomad to use a PKI certificate for server authentication and also enables certificate-based authentication. These options are only applicable if the HTTPS protocol has been enabled in the P2PEnabled setting. If you are using PKI certificates you must deploy the certificates to all clients before enabling this option. Refer to Peer copy over HTTP or HTTPS for further details on using HTTPS and associated authentication.

Bit	Hex	Decimal	Notes
0	0x0001	1	If not set (0), use self-signed certificate for server (Master) authentication If set (1), use PKI certificate for server (Master) authentication
1	0x0002	2	Enables certificate-based client authentication (Requires a PKI client authentication certificate)

Note

Installer property	Description
	If this option is enabled and the Configuration Manager client is using self-signed client authentication certificates (or Nomad is being used outside of CM), you should specify CertIssuer to ensure Nomad uses the intended certificate.
MODULE.NOMAD.PERCENTAVAILABLEDISK	The limit on the Nomad cache. Specified as a percentage of the available disk space, it controls the automatic cache cleaning to ensure that the cache does not grow to a size whereby the percentage of available disk space is less than this value. Click here to expand... The limit on the Nomad cache. Specified as a percentage of the available disk space, it controls the automatic cache cleaning to ensure that the cache does not grow to a size whereby the percentage of available disk space is less than this value.

Registry value	Default value	Notes
PercentAvailableDisk	10	By default, the cache will not grow such that less that #UUID146b7586a8d378aba88bc74a4d10ae9110 % of total disk space is available. The maximum value is 80. The cache will not grow beyond 20% of the total available disk space. This method for determining the maximum size of the cache is provided as an alternative to MaxCacheSizeMB: • If PercentAvailableDisk is greater than zero, its method is used to control the cache size • IfMaxCacheSizeMB is greater than zero and PercentAvailableDisk is zero, then MaxCacheSizeMB is used as the method for determining the maximum size of the Nomad cache.

Installer property	Description
MODULE.NOMAD.PERMITTEDLSZSHARES	Restricts Nomad LSZ file generation requests to a list of permitted package source locations. Click here to expand... Restricts Nomad LSZ file generation requests to a list of permitted package source locations.

Registry value	Default value	Notes
PermittedLSZShares	SMSPKG*$ SMS_DP_SMSPKG*$	A list of comma-separated package source locations. Enables increased security and is only used by the Nomad client installed on a distribution point. Nomad LSZ file generation requests will only be completed if the content location is listed. If you are using additional package source locations, you must manually add these to this registry value. *PermittedLSZShares* can incorporate wildcard characters to provide flexible naming convention support. If you leave the registry value blank, security checks on package source locations are not carried out. **Note** When Configuration Manager (specifically Distribution Point servers) is configured to use HTTPS only, you must also add *NOCERT_SMS_DP_SMSPKG*$* and CCMTOKENAUTH_SMS_DP_SMSPKG*$ to the PermittedLSZShares registry value.

<table>
<tr><th>Installer property</th><th>Description</th></tr>
<tr><td>MODULE.NOMAD.PERMITUNCACHED</td><td>Determines where the download package is run from under certain conditions.

Click here to expand...

Determines where the download package is run from under certain conditions.

<table>
<tr><th>Registry value</th><th>Default value</th><th>Notes</th></tr>
<tr><td>RunUncachedPermittedFastLAN</td><td>0</td><td>Works in conjunction with MaxPackageSizeFastLAN (which needs to contain a value value greater than zero). Values are:

• 0 – do not run package from the distribution point.

• 1 – run package directly from the distribution point if there is either insufficient disk space to create the cache, or the maximum package threshold is exceeded but the connection is fast (>500kbps).

To ensure that the un-cached mode works correctly, set the Program Environment Properties to include the Drive mode/Require drive letter option.</td></tr>
</table>
</td></tr>
<tr><td>MODULE.NOMAD.PLATFORMURL</td><td>The URL of the Tachyon Platform, specifically the Tachyon Background Channel, which provides a reverse proxy for the Content Distribution component of Tachyon Platform. Usually of the form https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/

Click here to expand...</td></tr>
</table>

Installer property	Description

Note

Platform features are now enabled by using the BackgroundChannelUrl instead of PlatformURL.

The URL of the Tachyon Platform, specifically the Tachyon Background Channel, which provides a reverse proxy for the Content Distribution component of Tachyon Platform. Usually of the form *https://<BackgroundChannelServer>:<BackgroundChannelPort>/Background/*

Registry value	Default value	Notes
PlatformURL	(empty)	Located under the following registry keys, depending on the component. • For *NomadBranch*, it is found under *HKLM\Software\1E\NomadBranch\Platform* • For *NomadBranchAdminUIExt* on 64-bit machines, it is found under *HKLM\Software\Wow6432Node\1E\NomadAdminUI\Platform* • For *NomadBranchAdminUIExt* on 32-bit machines, it is found under *HKLM\Software\1E\NomadAdminUI\Platform* **Warning** Do not configure this registry setting, it is automatically configured on service startup. To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED is specified during installation, the registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for SSDEnabled and ContentRegistration, in

Installer property	Description
	addition to enabling the Tachyon client. The ContentDistribution registry setting is found under the Platform key. • Nomad app provides visibility of content distribution activity • Single Site Download (SSD) • Single Site Peer Backup Assistant (SSPBA) • High Availability Peer Backup Assistant (HAPBA) • Get Migration Settings task sequence action used to manage computer associations • Nomad Pre-caching • Nomad Download Pause. In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the 1EClient.conf file).
MODULE.NOMAD.POSTCOMPLETETIMEOUTHOURS	The duration (in hours) after which the PBA share is deleted from the host. Click here to expand... The duration (in hours) after which the PBA share is deleted from the host.

Registry value	Default value	Notes
PostCompleteTimeoutHours	0xA8 (168)	Only applies to a PBA share after the NMDS_COMPLETE command has been run for it, otherwise the PreCompleteTimeoutHours value will apply. The intention is that an incomplete share will only be available for a short period of time,

Installer property	Description
	defined in PreCompleteTimeoutHours. Once the NMDS_COMPLETE command is sent, it will be fixed for this longer time. When the share is deleted the folder and associated user will be removed. This registry value is found under the PBA registry key NomadBranch\NMDS.
MODULE.NOMAD.PRECACHEPOLLBATCHSIZE	The number of notifications a client processes in one pre-cache poll cycle. Click here to expand... The number of notifications a client processes in one pre-cache poll cycle. Registry value: PrecachePollBatchSize Default value: 20 Notes: Range is 1 to 500. If the value is greater than 500, it defaults to 500. If you set the value to 0, it defaults to 20.
MODULE.NOMAD.PRECACHEPOLLMINUTES	The interval (in minutes) between Nomad polling Content Distribution for new pre-cache jobs. Click here to expand... The interval (in minutes) between Nomad polling Content Distribution for new pre-cache jobs. Registry value: PrecachePollMinutes Default value: 0x5A0 (1440) Notes: Nomad clients normally start their polling cycle when the service starts-up, with a random delay to minimize the possibility of concurrent polls from different clients.

Installer property	Description
	The range is 60 - 525600 (1 year). 0 disables polling
MODULE.NOMAD.PRECOMPLETETIMEOUTHOURS	The duration (in hours) after which PBA share is deleted from the host. Click here to expand... The duration (in hours) after which PBA share is deleted from the host.

Registry value	Default value	Notes
PreCompleteTimeoutHours	0x3 (3)	Located under the PBA registry key NomadBranch\NMDS, it only applies to a PBA share after the NMDS_POLL command has been run, but not the NMDS_COMPLETE command. The intention is that an incomplete share will only be available for a short period of time. When the share is deleted the folder and associated user is removed.

Installer property	Description
MODULE.NOMAD.RECYCLEDPDELAY	The delay (in seconds) before restarting retries from the first DP after the whole list of available DPs have been tried. Click here to expand... The delay (in seconds) before restarting retries from the first DP after the whole list of available DPs have been tried.

Registry value	Default value	Notes
RecycleDPDelay	600	It is associated with the distribution point resilience feature and is used in conjunction with DownloadTimeout. The default equates to 10 minutes.

Installer property	Description
MODULE.NOMAD.RANDOMIZEREMOTEPATHS	Allows you to enable and disable the remote paths randomization for CM and pre-cache jobs. Click here to expand... Allows you to enable and disable the remote paths randomization for CM and pre-cache jobs. When Nomad begins content download, its content is pulled from the same distribution point by every client. For example, If a site has four Distribution Points (DP), the first one in the list is always used for downloading. In a very large environment, this can put an unnecessary load on a single DP. Using**RandomizeRemotePaths**Nomad can randomize the content location list.

Registry value	Type	Default value	Notes
RandomizeRemotePaths	REG_DWORD	0	By default, RandomizeRemotePaths is not present in the Nomad registry hive. To change the value, you need to create it and set your desired value. You can enable and disable the remote paths randomization for either Configuration Manager (CM) or pre-cache jobs using the following bits:

Bit	Hex	Decimal	Notes
0	0x0001	1	Enable remote paths randomization for CM jobs.

Installer property	Description				
		1	0x0002	2	Enable remote paths randomization for Pre-cache jobs.

MODULE.NOMAD.SIGSFOLDER

The path to the Configuration Manager signature files.

Click here to expand...

The path to the Configuration Manager signature files.

Registry value	Default value	Notes
SigsFolder	C:\SMSSIG$	Relates to RDC integration and must point to the folder where the signature files are held for Configuration Manager. Wildcards are not allowed. For example: `E:\SMSSIG$` When it is not set, Nomad assumes that signature files location as *`C:\SMSSIG$`*, if it exists.

MODULE.NOMAD.SITESSDSTAGGER

Sets the site SSD query stagger duration (seconds).

Click here to expand...

Sets the site SSD query stagger duration (seconds).

Deployments to large numbers of clients (30,000 or more) generate significant network traffic from 1E Clients to ContentDistribution that may result in IIS 503 Overload errors on the server, causing content registrations and SSD requests to fail. SiteSsdStagger allows an elected subnet master to wait for a random configurable time before making a site SSD request. All peers in the subnet participating in the election would also synchronize and wait for the same time before copying from master machine.

Installer property	Description

Registry value	Type	Default value	Notes
SiteSsdStagger	REG_DWORD	0	Sets the site SSD query stagger duration in seconds. The stagger is 0 (disabled) by default. The maximum value that can configured is 300 seconds (5 minutes). There is no SSD staggering in WinPE. Site SSD happens when broadcast is enabled or if local SSD is enabled and it does not return any devices from ActiveEfficiency. **Note** Please consult 1E before changing this value. This setting works in conjunction with LocalSsdStagger.

MODULE.NOMAD.SITESSDMINPACKAGESIZEKB

Allows you to configure a minimum content size before making an SSD request.

Click here to expand...

Allows you to configure a minimum content size before making an SSD request.

Registry value	Type	Default value	Notes
SiteSSDMinPackageSizeKB	REG_DWORD	0	The default value is 0 which can be changed after installation when it will be an installer property. There is no lower limit for this key, upper limit

Installer property	Description
	is 10240. If the registry value is greater than 10240, the agent will only consider 10240 and will log a warning. Size of content is first taken from Job data, if that's not available it's taken from the LST file, if it's not present there, this key is ignored and an SSD request is made irrespective of size. **Note** This check is for site SSD, not for local SSD.
MODULE.NOMAD.SPECIALNETSHARE	Sets various special feature options related to the Nomad share. The installer property must be set to sum of the integer values for the required bits. For example, to use the computer$ account for access to the Nomad share, and have custom share permissions, you would set the value for the SpecialNetShare registry entry to 129 (0x81 hex). This is shown in the following 1E Client installer command-line: `> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.SPECIALNETSHARE=129 [other properties] /qn` Click here to expand... Sets various special feature options related to the Nomad share.

Registry value	Default value	Notes
SpecialNetShare	0x2060 (8288)	You can set more than one option at the same time by combining the bit values. For example, to have custom share permissions and use the machine account for access to the Nomad share,

Installer property	Description

set the value for SpecialNetShare to 129 (decimal value 1+128 or 0x0081 hex). See The Nomad share for more detail on configuration and security.

The default value in different versions has changed, based on feedback. Upgrading does not change the value unless explicitly set.

Nomad version	Default in MSI
Nomad 8.0 (1E Client 8.0)	0x2060 (8288) • Bit 5: Disables broadcast of download statistics • Bit 6: Enable Nomad FanOut • Bit 13: Use HTTP/S or SMB
Nomad 7.1 (1E Client 5.2) Nomad 7.0 (1E Client 4.1 to 5.1)	0x2020 (8224) • Bit 5: Disables broadcast of download statistics • Bit 13: Use HTTP/S or SMB
Nomad 6.x	0x0000 (0) • No special features enabled.

The default used in all versions of Client Deployment Assistant (and earlier Endpoint Agent Installer) is 0x2070 (8304):

Installer property	Description
	• Bit 4: Enable Nomad hidden share as NomadSHR$ • Bit 5: Disables broadcast of download statistics • Bit 6: Enable Nomad FanOut • Bit 13: Use HTTP/S or SMB

Bit	Hex	Decimal	Description
	0x0000	0	No special features enabled.
0	0x0001	1	Custom Share Permissions: Administrators configure and manage custom share permissions. The service doesn't create the *NomadSHR* share on start-up, leaving the administrator to manually create it and set the permissions. It is also not deleted when the service stops and therefore existing share permissions are preserved.
1	0x0002	2	Enables support for IPv6: If the network supports both IPv6 and IPv4, enable support for both – set bit 1 but not bit 2.
2	0x0004	4	Disables support for IPv4: If the network supports only IPv6, disable IPv4 and set both bit 1 and bit 2.
3	0x0008	8	RESERVED
4	0x0010	16	The Nomad share is hidden and named *NomadSHR$*. When using a hidden share, all Nomad installations must be configured to use this option. See The Nomad share for more detail on configuration and security.
5	0x0020	32	Disables broadcast of download statistics. By default, this is disabled. If enabled, Nomad

Installer property			Description
			broadcasts download statistics to all peers when a download is complete. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this was enabled (0) by default, now it is disabled (1) by default.
	6	0x0040	64	Enables Nomad FanOut.
	7	0x0080	128	The machine account is used when connecting to a peer client. The SMSNomadP2P& account is not created. Please refer to The Nomad share: Use Machine Account. **Note** Will not work if peers exist in untrusted domains or workgroups.
	8	0x0100	256	RESERVED
	9	0x0200	512	RESERVED
	10	0x0400	1024	RESERVED
	11	0x0800	2048	RESERVED
	12	0x1000	4096	RESERVED (deprecated)
	13	0x2000	8192	Use HTTP/S or SMB. Ensure that this is set if Nomad integration is used by Tachyon. HTTP/S is automatically used if CM client is detected. **Note** Prior to 1E Client 4.1 (Nomad 7.0) this was disabled (0) by default, now it is enabled (1) by default. This setting should be enabled in baseline or other policies.

Installer property	Description			
	14	0x4000	16384	Web LSZ generation: enables the Nomad client on Configuration Manager standalone DPs to handle LSZ file generation requests coming from HTTP/HTTPS enabled clients. Used when Nomad clients are configured with either of the following enabled: • Bit13 (0x2000) – Use HTTP/S or SMB • Bit 15 (0x8000) – Use HTTP/S only, not SMB When enabled, the Nomad distribution point client creates a virtual folder called *LSZFILES*. The permissions for this are copied from the Configuration Manager *SMS_DP_SMSPKGX$* share. By default, access to the LSZFILES folder requires SSL to be enabled. This is the case for Internet facing scenarios where local client access certificates will ensure authentication. If you are using HTTP instead of HTTPS, manually disable SSL on the LSZFILES web folder in order for the Nomad LSZ file generation process to work. Only needs to be enabled when using HTTP or HTTPS on standalone DPs; it is not required on site server DPs because Nomad automatically configures Web LSZ generation on them.
	15	0x8000	32768	Use HTTP/S only, not SMB: enables the Nomad client to download content using HTTPS or HTTP depending on the content location provided by Configuration Manager or Tachyon. The Nomad client will not use SMB to download content when this is enabled.
MODULE.NOMAD.SSDENABLED	Enables Single Site Download (SSD). The installer property must be set to sum of the integer values for the required bits. For example, the following will turn the complete SSD functionality on.			

Installer property	Description

```
> msiexec /i 1E.Client-x64.msi MODULE.NOMAD.SSDENABLED=3 [other properties] /qn
```

Click here to expand...

Enables Single Site Download (SSD).

Registry value	Default value	Notes
SSDEnabled	0	You can set more than one option at the same time by combining the bit values. For example, to enable clients to fetch downloads using SSD and provide them to peers, set the value to 3 (decimal value 1+2 or 0x3). To enable clients to fetch downloads using site and local SSD and provide them to peers, set the value to 7. To enable SSD when you install Nomad, you must specify the MODULE.NOMAD.SSDENABLED installer property and ensure the Tachyon client is enabled by specifying SWITCH and BACKGROUNDCHANNELURL installer properties. If MODULE.NOMAD.SSDENABLED is specified during installation, the registry value of ContentRegistration is automatically set to 1. If you want to enable SSD as a provider after installation, then you also need to configure the registry values for SSDEnabled and ContentRegistration, in addition to enabling the Tachyon client. The ContentDistribution registry setting is found under the Platform key. • Nomad app provides visibility of content distribution activity • Single Site Download (SSD) • Single Site Peer Backup Assistant (SSPBA) • High Availability Peer Backup Assistant (HAPBA)

Installer property	Description

- Get Migration Settings task sequence action used to manage computer associations
- Nomad Pre-caching
- Nomad Download Pause.

In legacy versions of Nomad, Platform features were provided using ActiveEfficiency. This required the PlatformURL setting to be configured. This is no longer required. You will see that the PlatformURL registry is used, but this is configured automatically by Nomad on startup by querying the value that the Tachyon client is using (stored in the 1EClient.conf file).

If your network is running over a WLAN or have devices on a wireless network you want to be content providers, set ContentProviderOnWifi=1.

Bit	Hex	Decimal	Description
	0x0	0	SSD is disabled, the Nomad client takes no part in the SSD on the site.
0	0x1	1	SSD is enabled and the Nomad client fetches downloads using SSD. This setting on its own (without provider mode set) should be used with sensitive server weighting. Provider mode is where a peer gets content from another peer but cannot serve it (it cannot act as a master).
1	0x2	2	SSD is enabled and the Nomad client provides downloads to peers. Enabling this bit causes Nomad to register content with Content Distribution. In practice, this is unlikely to be used on its own. This is automatically disabled for WinPE installations (because cached content is only temporary).

Installer property	Description		
	2	0x4	4

Local SSD is enabled and the Nomad client fetches downloads from a local client (also known as a subnet peer master - the term used for local devices which have content but cannot be located during the normal election process because network broadcasts have been disabled) within the subnet.

The local SSD feature was introduced to supplement site SSD for clients on networks such as wireless where broadcasts are disabled, to prevent each client becoming its own master and downloading direct from the DP. In a SSD enabled environment, a master queries Content Distribution to get a list of devices on other subnets within the site that have content. With local SSD enabled, the master also queries for devices having content within local subnet. If any local peers with content are available, then the master downloads from them, otherwise it attempts to download from Site peers (other subnets in the site), and if the master still cannot find any peers, it downloads the content direct from the DP.

In version 7.0 and later, a master skips using local SSD if it sees broadcast messages from peers. This means clients in mixed network environments can be configured with the same SSDEnabled setting (with Local SSD enabled) and clients can move seamlessly between networks. When on a wireless network (where broadcasts are typically disabled) local SSD can be used. On LAN networks (where broadcasts are typically allowed) local SSD would be skipped because a master is elected and sees broadcast activity from peers.

This setting should only be used if networks have broadcasts being disabled (for example wireless networks) and clients are forced to download from the DP as they can't participate in an election.

Local SSD requires that a peer on the local subnet be configured to provide downloads to peers, that is at least one client on the subnet must be configured with Bit 1 enabled. To maintain consistency with typical

Installer property	Description
	Nomad peer sharing behavior where local SSD is not required, configure all clients with *SSDEnabled=7*. You'll also want to set ContentProviderOnWifi=1. When enabled, the elected master: 1. Queries Content Distribution to get a list of local devices having the content. 2. Queries each of those devices to check if they are available and have the content. The list is ordered by percentage of content the device holds. 3. Repeats the same process for devices on other subnets (existing SSD feature). 4. Stores a list of subnets as well as site devices in memory. 5. Cycles through the list in the following order: a. Subnet peer master (fetched from list of local devices from Content Distribution) b. Site master c. DP. To distinguish between a master derived from Content Distribution and an election, the log records: *Connection::SetDownloadSource = SubnetPeer* (an elected peer) instead of *Connection::SetDownloadSource = Peer* (an SSD peer master).
MODULE.NOMAD.SSPBAENABLED	Enables the use of Single Site functionality for PBA data stores. See Single Site peer backup assistant for more details. Click here to expand... Enables the use of Single Site functionality for PBA data stores. See Single Site peer backup assistant for more details.

Installer property	Description

Registry value	Default value	Notes
SSPBAEnabled	0	Has a dependency on the Tachyon Platform PlatformURL. Values are: • 0 – disables single-site integration with ContentDistribution • 1 – enables single-site integration with ContentDistribution

MODULE.NOMAD.STATUSMSGEVENTS

Determines which Nomad events are reported using Configuration Manager status messages.

Click here to expand...

Determines which Nomad events are reported using Configuration Manager status messages.

Registry value	Default value	Notes
StatusMsgEvents	0x0	Nomad can send status messages through Configuration Manager based on specific download events which appear in its deployment status. They are provided mainly for advanced troubleshooting purposes, or for custom reporting solutions. From v7.1 onwards, they are no longer required for the Nomad Dashboard which now gets its status events directly via the Platform Content Distribution feature. However, you may have custom reporting in Configuration Manger that also use these messages, and you can configure this setting accordingly for this purpose. These messages are controlled by the StatusMsgEvents registry value. This is a *REG_SZ* string data type and the format of the parameter

Installer property	Description

must be a 64-bit value. Status messages are only sent when there is an active deployment.

> **Warning**
>
> Status message events should be used with caution as they could impact your Configuration Manager environment when scaled up to tens of thousands of machines.

For example, to set the request started, request completed, started copy and master changed events, update the StatusMsgEvents registry value to *0x80002060*.

- 0x0000000001 – SNO_EVT_START
- 0x0000000002 – SNO_EVT_STOP

- 0x4000000000 – SNO_EVT_MAX_EVENTID

SNO_EVT_FINALSTATS notes

For success reporting, this message provides feedback on the status of the download. For example, it can show how much data was received using multicast as opposed to peer-to-peer copying. Turning this message on creates an

Installer property	Description

extra status message per machine for each deployment. The format of the status message is:

```
Evt_FinalStats MD100067 1 170 59195038 1
70 59195038 0 59195038 0 0
```

Configuration Manager status messages are made up of insertion strings. The strings for the final stats event are:

InstrStr0	Nomad event string (internal reference)	N/A
InstrStr1	Package Id and Package version	MD100067 1
InstrStr2	Total number of files in package	170
InstrStr3	Total number of package bytes	59195038
InstrStr4	Number of files which are cached	170
InstrStr5	Bytes which are cached	59195038
InstrStr6	Bytes coped from a peer agent (P2P)	0
InstrStr7	Bytes copied from the DP	59195038
InstrStr8	Bytes received via local multicast	0
InstrStr9	Bytes received from a central multicast	0

Installer property	Description
	If the package is already cached and is re-deployed with an unchanged package version, the final stats message will not be re-sent.
MODULE.NOMAD.SUCCESSCODES	A list of Nomad return codes that are translated as success to the Content Transfer Manager (CTM) component of the Configuration Manager client. Click here to expand... A list of Nomad return codes that are translated as success to the Content Transfer Manager (CTM) component of the Configuration Manager client. **Registry value:** SuccessCodes **Default:** 0x206b, 0x2077, 0x103, 0xffffffff, 0x1, 0x70, 0x2050, 0x2051, 0x2052, 0x2053, 0x2054,0x2055, 0x2056, 0x2057, 0x2058, 0x205a, 0x205b, 0x205c, 0x205d, 0x205e, 0x2060, 0x2061,0x2062, 0x2063, 0x2064, 0x2065, 0x2066, 0x2067, 0x2068, **Notes:** This REG_SZ value contains a comma-delimited list of possible Nomad return codes that should be treated as a success and thereby prevent Configuration Manager from attempting to download the content itself or use another Alternate Content Provider (ACP). Any code returned by Nomad that is not on the list will be treated as a failure and trigger the Configuration Manager client to attempt to download the content using alternate means. Nomad also sends a status message to the Configuration Manager site containing its return code. Strictly speaking the Nomad return codes are actually internal status codes, Nomad will only ever return success or failure to the Content Transfer Manager (CTM) component of the Configuration Manager client. When CTM receives a success it passes control to the ExecMgr component of the Configuration Manager client, which attempts to execute the deployment. ExecMgr will fail if Nomad did not download the content and make it available in the Configuration Manager cache. In this case, ExecMgr sends a status message

Installer property	Description		
		0x2069, 0x209A	(e.g. failed deployment) back to the Configuration Manager site. If Nomad generates a return code that is not in the list, it passes a fail to the CTM component which causes the Configuration Manager client to try downloading the content itself using BITS, or use another Alternate Content Provider (ACP). This process may itself succeed or fail depending on the conditions that resulted in the original Nomad return code, and may have an undesirable impact on the network. **Note** The special code 0x9999 can be added to the list, or used on its own, to cause Nomad to always return a success to CTM. As a consequence this code is also known as "prevent failover to BITS". **Note** The SuccessCodes list need not be modified under normal circumstances, other than to add or remove the 0x9999 code. The following table shows the possible Nomad return codes that can be set in the list: **Note** This list is subject to change with each release of Nomad, and provided for reference only.

Installer property	Description

Return Code	Description	
-1	0xFFFFFFFF	Reserved.
1	0x0001	Reserved.
112	0x0070	Insufficient disk space to create the cache.
259	0x0103	Reserved.
8272	0x2050	The download has been suspended by APM.
8273	0x2051	The user has cancelled this download.
8274	0x2052	Invalid command line.
8275	0x2053	Command-line execution failure.
8276	0x2054	Internal Error.
8277	0x2055	The package exceeds the threshold for a RAS connection.
8278	0x2056	The package exceeds the threshold for a Slow LAN connection.

Installer property	Description			
		8279	0x2057	The package exceeds the threshold for a Fast LAN connection.
		8280	0x2058	Reserved.
		8281	0x2059	Unknown transport. Returned when an attempt is made to download a Software Update from an Internet location (like Microsoft Updates).
		8282	0x205A	Invalid special package path (set using --pp).
		8283	0x205B	Incorrect file hash.
		8284	0x205C	Exited due to a kill request.
		8285	0x205D	DP path not found.
		8286	0x205E	The MaxBusyBackOff consecutive event threshold has been exceeded.
		8287	0x205F	The service has stopped.
		8288	0x2060	The advertisement has expired.
		8289	0x2061	Reserved.

Installer property	Description			
		8290	0x2062	This is an unlicensed version of Nomad.
		8291	0x2063	Invalid alternate cache path (set using --cp).
		8292	0x2064	No Configuration Manager job data found in WMI.
		8293	0x2065	Incorrect package hash.
		8294	0x2066	MaxDuration or execution runtime for this program has been exceeded.
		8295	0x2067	Reserved.
		8296	0x2068	Incorrect package version.
		8297	0x2069	Obsolete package version.
		8298	0x206A	The BlockSize has been changed during download.
		8299	0x206B	The "no progress" re-check threshold has been exceeded.
		8300	0x206C	The parent process has terminated.

Installer property	Description			
		8301	0x206D	Duplicate download for the package.
		8302	0x206E	The service was reset. This will occur if certain configuration parameters are changed during a download e.g. NomadInhibitedSubnets
		8303	0x206F	Nomad inhibited.
		8311	0x2077	Internal error LST incomplete.
		8346	0x209A	Client certificate missing. Nomad is configured to use certificate-based client authentication but was unable to find an appropriate certificate.
MODULE.NOMAD.SUPPORTWPAD	Provides support for Web Proxy Auto-Discovery Protocol (WPAD). Click here to expand... Provides support for Web Proxy Auto-Discovery Protocol (WPAD). Nomad always uses System level proxy if it has been set, irrespective of what SupportWPAD has been set to. SupportWPAD was introduced in v7.1 and when disabled it does not change the default behavior, which is: If system level proxy is set then use it, otherwise access directly without proxy. When SupportWPAD is enabled in Nomad, the behavior is:			

Installer property	Description

- If system level proxy is set then use it and do not try WPAD
- If system level proxy is not set then fetch automatic proxy using WPAD and use it
- If system level proxy is not set and failed to get automatic proxy using WPAD then try access directly without proxy.

How to know if a system level proxy has been set

```
netsh winhttp show proxy
```

Registry value	Default value	Notes
SupportWPAD	0	By default, the WPAD feature is disabled. To enable WPAD in Nomad, add registry key 'SupportWPAD' and set it to 1 at registry path HKLM/Software/1E/NomadBranch To enable or disable the WPAD feature in Nomad: • Disable WPAD set SupportWPAD = 0 • Enable WPAD set SupportWPAD= 1 (or non-zero value).

MODULE.NOMAD.USEFIPS

This installer property sets the Nomad EncryptionType registry entry.

Determines the type of encryption used by Nomad to encrypt its communications between Nomad peers.

Click here to expand...

Determines the type of encryption used by Nomad to encrypt its communications between Nomad peers.

Registry value	Default value	Notes
EncryptionType	0x0 (0)	Value are: • 0 – standard Nomad encryption • 1 – FIPS encryption

Installer property	Description
MODULE.NOMAD.WAKEUPBATCHSIZE	The maximum number of machines to wake up in a single call. Click here to expand... The maximum number of machines to wake up in a single call. **Warning** Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution. The wake-up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for the subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution, and a NightWatchman infrastructure. The feature is enabled during the installation of the NightWatchman Management Center. Please refer toIntroducing Nomad for requirements.

Registry value	Default value	Notes
WakeUpBatchSize	10	Sets the maximum number of machines to wake up in one call, for subnet and site separately. (So up to twice this number of requests is sent in total if WakeUp is enabled for both subnet and site.) The next batch is launched, if necessary, after a re-election (usually a periodic election). The value cannot be greater than MaxDevicesFromAE, and hence itself cannot be more than 20.

MODULE.NOMAD.WAKEUPENABLED	Enables WakeUp integration, see Integrating Nomad with WakeUp for more details.

Installer property	Description

Click here to expand...

Enables WakeUp integration, see Integrating Nomad with WakeUp for more details.

Warning

Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.

The wake-up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for the subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution, and a NightWatchman infrastructure. The feature is enabled during the installation of the NightWatchman Management Center. Please refer toIntroducing Nomad for requirements.

Registry value	Default value	Notes
WakeUpEnabled	0	Determines the status of the WakeUp integration. If configured by the installer, it is disabled (0) by default. If integration is enabled, Nomad attempts to wake up dormant hosts that are known to have the requested content in their caches. The integration has a dependency on the PlatformURL. To enable integration post-installation, for normal usage, set both bits 0 and 1 (0x3)

Bit	Hex	Decimal	Description
	0x0	0	Disables WakeUp integration.

Installer property	Description			
	0	0x1	1	Enables WakeUp integration only for the local subnet.
	1	0x2	2	Enables WakeUp integration only for the site.
		0x3	3	Enables WakeUp integration for the site and the local subnet.

MODULE.NOMAD.WAKEUPMINPACKAGESIZEMB

The minimum size of content (in megabytes) that will cause a request for a wakeup. See Integrating Nomad with WakeUp for more details.

Click here to expand...

The minimum size of content (in megabytes) that will cause a request for a wakeup. See Integrating Nomad with WakeUp for more details.

Warning

Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.

The wake-up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for the subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution, and a NightWatchman infrastructure. The feature is enabled during the installation of the NightWatchman Management Center. Please refer toIntroducing Nomad for requirements.

Registry value	Default value	Notes
WakeUpMinPackageSizeMB	1024	Any content below this size is downloaded from the DP as downloads from the DP for files this size will likely complete before any wakeups will have had a chance to finish. The value can be 0, in which

Installer property	Description
	case wakeups will always be attempted. For example, if it is set to 512 and size of the content downloaded is 500 MB, a wake-up request (to site or subnet) is not be sent. Similarly, if size of the content is 600 MB, then wake-up requests (to site and subnet, determined by WakeupEnabled) is be sent. **Note** For standalone downloads (using SMSNomad.exe) and under WinPE, there has no effect as the size of the content cannot easily be determined. Wake-up requests are always sent in these instances.
MODULE.NOMAD.WLANBLIPSECS	The duration for temporarily disabling a wireless connection when a wired LAN connection becomes available, to provide time for the OS and Nomad to switch to the LAN connection. This is useful for OS versions and drivers that do not automatically switch to a preferred wired connection. Click here to expand... The duration for temporarily disabling a wireless connection when a wired LAN connection becomes available, to provide time for the OS and Nomad to switch to the LAN connection. This is useful for OS versions and drivers that do not automatically switch to a preferred wired connection. Registry value: WLanBlipSecs Default value: 0 Notes: The value must be 20 seconds or more. Nomad provides extra stability by managing a machine's network connections as they move between a wireless and a wired LAN. Depending on the OS version or other factors, once an SMB or HTTP session is running on a wireless connection, it will remain on wireless even when a wired LAN becomes available. Nomad uses **WLanBlipSecs** to temporarily drop a wireless connection

Installer property	Description

	when it detects a wired LAN connection, to give time for the OS and Nomad to automatically switch to the LAN connection.
	
	For example, if a Nomad master was initiated when a machine was on a wireless connection and a wired connection subsequently became available, Nomad disables the wireless adapter for a long enough period to enable a switchover to the wired connection. As a result of this, the IP address and the share path will change and peers will log error messages until each peer re-establishes its connection to the master and the new share location.
	
	This feature is turned off by default.
	
	Note
	Other applications may be affected when switching from wireless to wired connection.
	
	Irrespective of the **WLanBlipSecs** setting, you can also control which service set identifier (SSID) Nomad connects to by managing a list. To do this, update the NomadBranch WLanProfileList registry value with a comma-delimited list of SSIDs or use the wildcard (*) character for any SSID.
	
	Examples:
	
	`WLanProfileList REG_SZ WIFIGAP,GUEST`
	`WLanProfileList REG_SZ *`

MODULE.NOMAD.WLANPROFILELIST	A list of wireless SSIDs to enable switching from wireless to wired LAN connections. Click here to expand... A list of wireless SSIDs to enable switching from wireless to wired LAN connections. Registry value: WLanProfileList Default value: Notes: A comma-delimited list of wireless SSIDs (* for any all) which enables Nomad to switch form wireless to a wired LAN connection when it becomes available.

2.6.1.8 PXE Everywhere Agent settings

Installer and configuration settings for the PXE Everywhere Agent client module of the 1E Client supported only on Windows computers.

1E Client is available as 32-bit and 64-bit versions, and the correct version must be installed. This means the PXE Everywhere Agent registry location is the same for x86 and x64:

- *HKEY_LOCAL_MACHINE\SOFTWARE\1E\PXEEverywhere*

Note

Registry settings:

AlwaysBootImageId | AlwaysIsMandatory | BindTo | CommsPort | ConfigServerAddress | Debug | DefaultBlockSize | DhcpPort | ElectionWaitSecs | ElectionWeight | EncryptionType | Flags | IgnoreGatewayAddress | IgnoreWireless | LogFileName | LogFormat | MaxBlockSize | MaxLogFilesize | Mode | ReserveSecs | SessionTimeoutSecs | TftpRoot

Note

Installer properties:

Module.PXEEverywhere.Enabled | MODULE.PXEEVERYWHERE.COMMSPORT | MODULE.PXEEVERYWHERE.CONFIGSERVERURL | MODULE.PXEEVERYWHERE.DEBUG | MODULE.PXEEVERYWHERE.DHCPPORT | MODULE.PXEEVERYWHERE.ELECTIONWAITSECS | MODULE.PXEEVERYWHERE.ELECTIONWEIGHT | MODULE.PXEEVERYWHERE.USEFIPS | MODULE.PXEEVERYWHERE.LOGPATH | MODULE.PXEEVERYWHERE.LOGFORMAT | MODULE.PXEEVERYWHERE.MAXLOGFILESIZE | MODULE.PXEEVERYWHERE.MODE | MODULE.PXEEVERYWHERE.RESERVESECS | MODULE.PXEEVERYWHERE.TFTPROOT

Note

Configuration file settings:

Module.PXEEverywhere.Enabled

1E Client installers include a **template configuration file** that contains the more important settings with default values that match hard-coded default values. The configuration file is updated during installation and named **1E.Client.conf** in the installation folder along with the 1E Client executable.

After installation, configuration file settings can be managed using 1E Client command-line parameters, Explorer configuration instructions, Guaranteed State policies, Configuration Manager baselines or other means. Registry settings can also be managed by Windows Group Policy.

2.6.1.8.1 PXE Everywhere Agent installation settings

This table lists the configuration settings visible in the PXE Everywhere screen during an interactive installation of the 1E Client. Other installer properties are available when using a command-line installation or a transform.

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

Installer property	Mandatory	Default value	Description
Module.PXEEverywhere.Enabled	No	false	Set this property to **true** to enable the PXE Everywhere Agent client module. The default value is false. **Note** If enabled, when the 1E Client starts it will attempt to automatically remove any previous installations of PXE Everywhere Agent. This setting does not have an associated registry entry and is stored in the 1E Client configuration file.
MODULE.PXEEVERYWHERE.CONFIGSERVERURL	Yes	http://SERVER/PXELite/PXELiteConfiguration.asmx	URL for the PXE Everywhere Central web service in the format: *http://SERVER/PXELite/PXELiteConfiguration.asmx* where *<SERVER>* is the name of the server (or FQDN) where the PXE Everywhere Central web service is installed. **Note** The http prefix to the URL is case-sensitive and must be entered in all lower case letters.

Installer property	Mandatory	Default value	Description
			The URL is not verified by the installer, so you will need to ensure that the correct URL is entered. This setting has an associated ConfigServerAddress registry value.
MODULE.PXEEVERYWHERE.USEFIPS	No	0	You must use the same FIPS encryption setting on all PXE Everywhere Agents. Use of FIPS compliant encryption for communications. • 0 – use default encryption • 1 – use FIPS encryption This setting has an associated EncryptionType registry value.
MODULE.PXEEVERYWHERE.DHCPPORT	No	67	This installer property is set to 2067 if **Enable DHCP Snooping support** is checked during an interactive installation of the 1E Client installer. This is the UDP port on which the PXE Everywhere Agent will listen for PXE requests. If DHCP Snooping is not being used, then this port must be 67 (default), and you do not need to install Responders. When manually installing the PXE Everywhere Agent, if the

Installer property	Mandatory	Default value	Description
			DHCP Snooping option is enabled in the installer UI, the default port is changed from 67 (43 hex) to 2067 (813 hex). If the MODULE.PXEEVERYWHERE.DHCPPORT installer property is used to specify a port other than 67, the installer UI assumes the DHCP Snooping option is enabled. If DHCP Snooping is being used, then DhcpPort on Agents must be the same value as AltPxeServerPort on Responders. The default value of AltPxeServerPort is 2067. If a value other than 2067 is specified as a custom port number on Agents, you will also need to manually create the AltPxeServerPort (and AltPxeClientPort) registry values on Responders. This setting has an associated DhcpPort registry value.

2.6.1.8.2 PXE Everywhere Agent registry settings

This table lists all registry setting and their associated installer properties.

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

Registry name	Registry type	Installer property	Mandatory	Default value	Description
AlwaysBootImageId	REG_SZ	This value does not have an installer property.	No	Registry value is not created.	A string value containing a valid package id of a boot image. If specified, do not get boot image ID from PXE Everywhere Central but use this one instead.
AlwaysIsMandatory	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	Whether the boot image is mandatory (value 1) or not (0). Only relevant in combination with *AlwaysBootImageId*.
BindTo	REG_SZ	This value does not have an installer property.	No	Registry value is not created.	Comma-separated list of IP addresses which PXE Everywhere Agent listens for DHCP (PXE) and TFTP requests. If not present, PXE Everywhere Local listens on all IP addresses. Use this if there is more than one network interface.
CommsPort	REG_DWORD	**MODULE.PXEEVERYWHERE.COMMSPORT**	No	2012	Used for UDP election broadcast messages, this must be opened in the Windows firewall.
ConfigServerAddress	REG_SZ	**MODULE.PXEEVERYWHERE.CONFIGSERVERURL**	Yes	http://SERVER/PXELite/PXELiteConfiguration.asmx	URL for the PXE Everywhere Central web service in the format: *http://SERVER/PXELi*

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					te/PXELiteConfiguration.asmx where *<SERVER>* is the name of the server (or FQDN) where the PXE Everywhere Central web service is installed. **Note** The http prefix to the URL is case-sensitive and must be entered in all lower case letters. The URL is not verified by the installer, so you will need to ensure that the correct URL is entered.
Debug	REG_DWORD	**MODULE.PXEEVERYWHERE.DEBUG**	No	1	The debug level. Leave this at *1* unless 1E Support recommends a change. The range is: • *0x1*: Basic logging • *0x4*: Extra "application-specific" logging

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					• *0x8*: Extra registry logging • *0x10*: Increased general logging The following two bits will perform centralized logging via SOAP calls to the PXE Central Server: • *0x1000*: Logs election results • *0x2000*: Logs TFTP file transfer start and stop (includes statistics).
DefaultBlockSize	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	Default TFTP block size. 512 if not specified.
DhcpPort	REG_DWORD	**MODULE.PXEEVERYWHERE.DHCPPORT**	No	67	This is the UDP port on which the PXE Everywhere Agent will listen for PXE requests. If DHCP Snooping is not being used, then this port must be 67 (default), and you do not need to install Responders. When manually installing the PXE Everywhere Agent, if the DHCP Snooping

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					option is enabled in the installer UI, the default port is changed from 67 (43 hex) to 2067 (813 hex). If the MODULE.PXEEVERYWHERE.DHCPPORT installer property is used to specify a port other than 67, the installer UI assumes the DHCP Snooping option is enabled. If DHCP Snooping is being used, then DhcpPort on Agents must be the same value as AltPxeServerPort on Responders. The default value of AltPxeServerPort is 2067. If a value other than 2067 is specified as a custom port number on Agents, you will also need to manually create the AltPxeServerPort (and AltPxeClientPort) registry values on Responders.
ElectionWaitSecs	REG_DWORD	**MODULE.PXEEVERYWHERE.ELECTIONWAITSECS**	No	1	Time (in seconds) to wait for responses to the election request before broadcasting the result. Can be any positive integer value above 0.

Registry name	Registry type	Installer property	Mandatory	Default value	Description
Election Weight	REG_DWORD	**MODULE.PXEEVERYWHERE.ELECTIONWEIGHT**	No	50	When set, this manually created registry value determines the likelihood of the machine winning elections, all else being equal. The value must be between 0 and 99 inclusive. The higher the value the the higher the likelihood of winning. If no value is set, a default of 50 is used.
EncryptionType	REG_DWORD	**MODULE.PXEEVERYWHERE.USEFIPS**	No	0	You must use the same FIPS encryption setting on all PXE Everywhere Agents.Use of FIPS compliant encryption for communications. • 0 – use default encryption • 1 – use FIPS encryption
Flags	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	If set to ***1*** the DHCP listener adds an ASCII terminator character to the bootfile name in the DHCP acknowledgment message. Some HP machines require this.

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					Any value other than **1** is treated as default 0.acknowledgment
IgnoreGatewayAddress	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	If set to any value other than ***0*** the DHCP listener ignores the gateway address. If not set then assumes default ***0*** .
IgnoreWireless	REG_DWORD	This value does not have an installer property.	No	0	If set to **1** then PXE Everywhere Agent does not bind on wireless adapters. Any value other than 1 is treated as default 0.
LogFileName	REG_SZ	**MODULE.PXEEVERYWHERE.LOGPATH** **Note** This property only specifies the location of the log file.	No	%ALLUSERSPROFILE%\1E\PXEEverywhere PXEEverywhere.log	The location of the PXE Everywhere log file. The path is created if it does not exist. The logfile name is *PXEEverywhere.log*
LogFormat	REG_DWORD	**MODULE.PXEEVERYWHERE.LOGFORMAT**	No	1	Formatting depends on which bits are set: • bit *0 (0x01)* use Configuration Manager-

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					compatible format (default) • bit *3 (0x08)* do no formatting • bit *7 (0x80)* include milliseconds in the timestamp
MaxBlockSize	REG_DWORD	**Note** This value does not have an installer property, but is configurable when deployed using 1E Client Deployment Assistant. Please refer to Installing PXE Everywhere Agents: Preparing a Configuration Manager Application for PXE Everywhere Agent using the	No	Registry value is not created.	Maximum value for the block size (in bytes). PXE Everywhere uses the system MTU to derive the size of TFTP packets. May require limiting when using VPN tunnels. In most cases, this value should not be altered. Default is 8192 (8 kbytes). **Note** The actual block size used for the TFTP protocol is the lesser value of the **tftpBlockSize** and the **MaxBlockSize** registry values. The **tftpBlockSize** value is specified in the

Registry name	Registry type	Installer property	Mandatory	Default value	Description
		1E Client Deployment Assistant.			**CreateBCD.exe** utility command-line, and does not have a registry entry or installer property.
MaxLogFilesize	REG_DWORD	**MODULE.PXEEVERYWHERE.MAXLOGFILESIZE**	No	10485760	Maximum size for the log file in bytes. Once the file reaches the specified size, a copy is made with a *.lo_* extension in the same directory. A new log file will then be created. Default is 10485760 (10 MBytes).
Mode	REG_DWORD	**MODULE.PXEEVERYWHERE.MODE**	No	2	Mode must be one of the following: • 0 – no elections • 1 – the election instigator becomes the master (only to be used for testing) • 2 – with elections (default)
ReserveSecs	REG_DWORD	**MODULE.PXEEVERYWHERE.RESERVESECS**	No	60	Time (in seconds) an election result remains active. 60 if not specified or 0 is

Registry name	Registry type	Installer property	Mandatory	Default value	Description
					specified. Can be any positive integer value.
SessionTimeoutSecs	REG_DWORD	This value does not have an installer property.	No	Registry value is not created.	Timeout for the TFTP listener. 600 if not specified or 0 is specified. Can be any positive integer value.
TftpRoot	REG_SZ	**MODULE.PXEEVERYWHERE.TFTPROOT**	No	*%ALLUSERSPROFILE%\1E\PXEEverywhere\TftpRoot*	Location for the PXE Everywhere Agent *TFTPROOT* directory. If you change the location of *TFTPROOT*, you need to change the location that you copy the additional PXE boot files to.

2.6.1.9 Shopping client settings

Installer properties and configuration settings for the Shopping client module of the 1E Client supported only on Windows computers. This module supports users connecting to the Shopping Portal, and provides the Windows Servicing Assistant (WSA).

> **Note**
>
> Installer properties and Configuration file settings:
>
> Module.Shopping.Enabled | Module.Shopping.AlternativeUrls | Module.Shopping.FirefoxSupportEnabled | Module.Shopping.InitializationFailureSleepSecs | Module.Shopping.LocalhostUrl | Module.Shopping.LoopbackExemptionEnabled | Module.Shopping.OrderTrackingEnabled | Module.Shopping.ShoppingCentralUrl | Module.Shopping.SsoEnabled

Enabling the Shopping client module allows the Windows Servicing Assistant (WSA) feature to be used. There are no additional settings required to enable or configure the WSA feature.

Configuration file settings are the same as the installer properties. There are no registry settings. Configuration file settings can be managed using 1E Client command-line parameters, Explorer configuration instructions, Guaranteed State policies, Configuration Manager baselines or other means.

> **Note**

When the 1E Client starts, if the Shopping module is enabled the 1E Client will automatically remove any previous installation of the 1E Shopping Agent.

The Shopping client module is not supported on:

- Non-Windows devices
- Legacy OS (that is OS which Microsoft no longer support, including XP, Vista, Server 2008 etc.)

2.6.1.9.1 Shopping client settings

The table below lists the settings required to enable the Shopping client required for integration with Shopping v5.5 or later. The Shopping client module must be enabled on all Windows computers that will connect to the Shopping self-service portal.

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

Shopping module setting	Installation default	Description
Module.Shopping.Enabled	false	Set the value to **true** to enable the Shopping module. The default value is **false**. Shopping must be enabled so that users of a computer can use the 1E Shopping self-service portal, the Windows Servicing Assistant, and the 1E Virtual Assistant. **Note** If enabled, when the 1E Client starts it will attempt to automatically remove any previous installations of the 1E Shopping Agent.
Module.Shopping.AlternativeUrls **Note**	(blank)	Optional. A list of URLs from which the Shopping module allows launching the WSA wizard. This setting is typically used to launch WSA from a ServiceNow application such as 1E Service Catalog Connect.

Shopping module setting	Installation default	Description
This setting is not in the template configuration file.		Multiple URLs should be separated by pipe characters. For example *https://dev123456.servicenow.com|https://dev987654.servicenow.com* The Shopping client requests this value from the Shopping Central website (admin console setting: AlternativeUrls). If the client fails to connect to the website, it defaults to using this setting and retries later.
Module.Shopping.FirefoxSupportEnabled **Note** This setting is not in the template configuration file.	(blank)	Optional. If this setting is not specified the value defaults to **false**. Set this value to **true** to enable support for the Firefox browser on HTTPS. If enabled, 1E Client Shopping module will create a CA certificate and a certificate with subject 'localhost' signed by the CA certificate and add those certificates to the Trusted Root Certification Authorities. This is required to allow launching the WSA wizard from third party websites like ServiceNow. The Shopping client requests this value from the Shopping Central website (admin console setting: Firefox support enabled). If the client fails to connect to the website, it defaults to using this local setting and retries later.
Module.Shopping.InitializationFailureSleepSecs **Note** This setting is not in the template configuration file.	30	This setting controls the time the client waits before attempting to connect to the website specified in Module.Shopping.ShoppingCentralUrl. If the client module fails to connect during startup, it does not initialize, and will retry at gradually increasing intervals until it is able to connect. Range is 10 to 900, default is 30. The log file may show this setting as InitializationRetryIntervalSecs.
Module.Shopping.LocalhostUrl **Note**	(blank)	Optional. The localhost URL used by the Shopping client module to listen for localhost API calls. For example: *https://localhost:8000/ShoppingClientAgent/MachineInfo*

Shopping module setting	Installation default	Description
This setting is not in the template configuration file.		The Shopping client sets the value of **LocalhostUrl** by calling a server API which returns the value of **1E Client loopback URL** setting in the Shopping Admin Console. However, if the device is in a workgroup, or **Module.Shopping.SsoEnabled** is set to true, or some other reason the API cannot be called, then **Module.Shopping.LocalhostUrl** must be set locally. If set locally, the local setting will override the server setting, and you must ensure it matches the value configured in the Shopping Admin Console. **LocalhostUrl** must be set to **https** if ShoppingCentralUrl is set to **https**, otherwise it can be **http** or **https**. ShoppingCentralUrl — LocalhostUrl http — http or https https — https When **LocalhostUrl** uses **https** the 1E Client Shopping client creates the following certificates on startup, and deletes them when shutting down: • a self-signed certificate issued to **1ECA** added to the machine's Trusted Root Certification Authorities (ROOT) store • a certificate issued by 1ECA issues to **localhost** added to the machine's Personal (MY) store. If using **https** and Firefox browsers are used, then Module.Shopping.FirefoxSupportEnabled must be set to **true**. Shopping client only allows inbound connections to **localhost (127.0.0.1)** which prevents remote access. See Information provided by the Shopping client below for details of localhost API calls.

Shopping module setting	Installation default	Description
Module.Shopping.LoopbackExemptionEnabled	false	Optional. Default value is **false**. Set this value to **true** if users are likely to use Microsoft Edge or other Metro browsers to access the Shopping website. The Shopping client requests this value from the Shopping Central website (admin console setting: Loopback exemption enabled). If the client fails to connect to the website, it defaults to using this local setting and retries later. When users connect to the Shopping Portal, the website needs to get the latest details about the local computer. Shopping may already have details from the Configuration Manager database, but these need to be confirmed and updated. Browser standards only allow websites to get limited information about the user and computer, therefore the website needs to make loopback calls to the local computer via the Shopping client. The following browsers permit loopback calls by default: • All versions of Chrome • All versions of Firefox • Non-Metro UI based Internet Explorer browsers (including legacy Internet Explorer) If your Shopping users are using **Edge** and **Metro Internet Explorer** browsers, you must enable a **Loopback Exemption** to allow these browsers to make loopback calls. Exemption affects the browser as a whole and is not just restricted to the Shopping website. Before enabling this option, check your corporate security policy and be aware of the implications of allowing access between browsers and the local machine. By enabling loopback, you are only setting the Edge/Metro Internet Explorer browsers to the same level of security as other browsers which allow this setting already. If you are running an unattended install, you can use **MODULE.SHOPPING.LOOPBACKEXEMPTIONENABLED** for all OS

Shopping module setting	Installation default	Description
		but it only works on Windows 8, 8.1, 10 and Windows Server 2012 R2 and later. Shopping client only allows inbound connections to **localhost (127.0.0.1)** which prevents remote access.
Module.Shopping.OrderTrackingEnabled **Note** This setting is not in the template configuration file. **Note** New in 1E Client 5.2 Accumulated Hotfix.	(blank)	Add this setting to the configuration file and set to false only if you want to override the Order Tracking feature enabled in the Shopping Admin Console, as described in Shopping Admin Console settings: Order Tracking Enabled. The Console setting, when set to true, globally enables the Order Tracking feature on all clients. You should only use this client setting to override the Console, to disable the feature on a subset of clients. **Tip** This client setting only affects the notification icon (and its popups), it does not affect Order Tracking emails, because they are controlled by the Shopping server. You can control which notifications and emails that users receive using the web administration settings described in Managing Order Tracking. **Note** When using Shopping 6.0, this setting is ignored, and the notification icon is not visible. When using Shopping 6.1 or later, this setting only applies if you have both of the following: • 1E Client 8.0 or 1E Client 5.2 **with the latest hotfix** • Tachyon integration enabled on the Shopping server - to support Shopping 6.1 features: Order Tracking and Tachyon instruction application.
Module.Shopping.ShoppingCentralUrl	(blank)	The URL that the Shopping client module uses to connect to the Shopping Central website.

Shopping module setting	Installation default	Description
		Example: *https://shopping.acme.local/Shopping* This is the URL of the Shopping Central website, comprising: • **scheme** - either http or https • **host header** - DNS Name FQDN - this is the host header configured for the Shopping website, which is normally a DNS Name FQDN • **port number** - you do not have to provide this if using default port 80 or 443 • **path** - this is always /Shopping. **Note** This setting is mandatory when **Module.Shopping.Enabled=true**. **Note** The Shopping client uses **ShoppingCentralUrl** to make the following API calls to obtain configuration settings from the Shopping Central website. <Module.Shopping.ShoppingCentralUrl>/WindowsServicingAssistant/GetTachyonAgentUrl • LocalhostUrl <Module.Shopping.ShoppingCentralUrl>/WindowsServicingAssistant/ModuleConfig • LocalhostUrl • AlternativeUrls • FirefoxSupportEnabled

Shopping module setting	Installation default	Description
		• Loopback ExemptionEnabled
Module.Shopping.SsoEnabled **Note** This setting is not in the template configuration file.	false	Optional. Default value is **false**. Set this value to **true** if environment uses Single Sign On authentication to access Shopping website. When set to true, the Shopping client does not try to connect to the Shopping website and just uses the setting **Module.Shopping.LocalhostUrl** to listen for localhost API calls. When set to true, the **Module.Shopping.LocalhostUrl** must be specified and matches the value configured in the Shopping Admin Console under 1E Client loopback URL settings. The above client request process allows 1E products like Virtual Assistant to use the loopback feature without installing a Shopping website. For example, setting *`Module.Shopping.SsoEnabled=true`* allows the client to use the local value of LocalhostUrl.

2.6.1.9.2 Information provided by the Shopping client

The following localhost API calls can be entered directly in a browser on a device that has the Shopping client module of the 1E Client enabled and correctly configured. If the Shopping Central website binding is **https** then the localhost URL can accept either **http** or **https**, otherwise it can only accept **http**.

When using an Edge or Metro versions of Internet Explorer browser, you must set **Module.Shopping.LoopbackExemptionEnabled=true**.

2.6.1.9.2.1 MachineId

The following table shows example details sent by the Shopping client to the Shopping Central server. The client makes a localhost API call **MachineId** API to get the details, and then uses a server API call to post them to the Shopping Central website, which creates or updates the

machine details in the Shopping database and returns the **MachineId** GUID from the database. Details are shown in the *1E.Client.log*.

This call is made when a user browses to the Shopping Web Portal, and the website uses the loopback feature to query the local computer.

You can test this by entering *https://localhost:8000/ShoppingClientAgent/MachineInfo/MachineId* directly in a browser.

Attribute	Description	Example
HostName	Computername	ACME-WIN1001
HostDomainName	Computer's NetBIOS Domain Name	ACME
AssignedSite	Configuration Manager client Site code	CM1
MacAddress	Computer's MAC Address	20-68-9D-5B-EB-73
OSVersion	OS Version	10.0.15063
OSArchitecture	OS Architecture	64-bit
OSRole	The role of the OS. Values are: • 1 – Workstation • 2 – Domain controller • 3 – Server • 175 - AVD (with latest hotfix)	1
SccmVersion	Configuration Manager client version	5.00.9012.1020
UniqueId	Configuration Manager client GUID	GUID:04804aed-922c-4a4b-9f41-eab6592e7d83
IntuneDeviceId	Intune Device Id	02c967b2-de4d-5ac1-859c-a15cb11b7638

Attribute	Description	Example
TenantId	Tenant Id	6babcaad-604b-40ac-a9d7-9fd97c0b779f
TenantName	Tenant Name	ACME
Fqdn	Fully Qualified Domain Name	ACME-WIN1001.ACME.LOCAL

2.6.1.9.2.2 Fqdn

The following example is JSON returned by the Shopping client when the **Fqdn** API call is made by Windows Servicing Assistant and 1E Virtual Assistant. Details are shown in the *1E.Client.log*.

You can test this by entering
https://localhost:8000/ShoppingClientAgent/MachineInfo/Fqdn into a browser.

```
{"Fqdn":"1EUKCOL1184.ACME.local"}
```

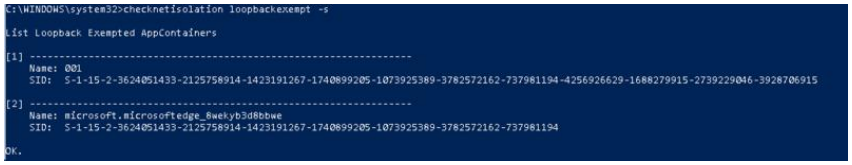
2.6.1.9.3 Checking loopback exemption on Microsoft Edge and Metro Internet Explorer browsers

The following is valid only for Windows 8.1 and Windows 10.

Open a **command-prompt as administrator** on the computer you want to check, then run the following command to verify that loopback exemption was enabled during installation of the 1E Client.

```
CheckNetIsolation LoopbackExempt -s
```

Output should be:



If either of these items are missing, you can manually add them by executing the following commands. Quotes may be required around the name of the app.

For IE:

```
CheckNetIsolation LoopbackExempt -a -n=windows_ie_ac_001
```

For Edge:

```
CheckNetIsolation LoopbackExempt -a -n=Microsoft.MicrosoftEdge_8wekyb3d8bbwe
```

Removing

The exemption from loopback restrictions can also be removed for all apps installed by using the following command:

```
CheckNetIsolation LoopbackExempt –c
```

More information

For more information from Microsoft about CheckNetIsolation please refer to: https://docs.microsoft.com/en-us/previous-versions/windows/apps/hh780593(v=win.10).

2.6.1.10 Wakeup client settings

Installer and configuration settings for the WakeUp client module of the 1E Client supported only on Windows computers.

Note

Note

Installer properties for Windows:

Module.WakeUp.Enabled | Module.WakeUp.ManageFirewallRules | MODULE.WAKEUP.ADDITIONALSUBNETS | MODULE.WAKEUP.AGENTTCPPORT | MODULE.WAKEUP.AGENTTO | MODULE.WAKEUP.ALLOWLASTMANSUSPEND | MODULE.WAKEUP.CERTISSUER | MODULE.WAKEUP.CERTSUBJECT | MODULE.WAKEUP.DEBUG | MODULE.WAKEUP.DELAYCYCLESMSSECS | MODULE.WAKEUP.ENCRYPTIONLEVEL | MODULE.WAKEUP.LASTMANENABLED | MODULE.WAKEUP.LOGFILENAME | MODULE.WAKEUP.LOGPATH | MODULE.WAKEUP.MAGICPACKETDELAY | MODULE.WAKEUP.MAGICPACKETPORT | MODULE.WAKEUP.MAXIMUMFILEAGESECS | MODULE.WAKEUP.MAXLOGFILESIZE | MODULE.WAKEUP.REFRESHHWINFOAFTERHOURS | MODULE.WAKEUP.REFRESHONSUBNETCHANGE | MODULE.WAKEUP.REPEATCOUNT | MODULE.WAKEUP.REPEATDELAY | MODULE.WAKEUP.REPORTING | MODULE.WAKEUP.REPORTINGSERVER | MODULE.WAKEUP.SECUREREPORTINGSERVER | MODULE.WAKEUP.SENDHARDWAREINFO | MODULE.WAKEUP.SPOOLDIR | MODULE.WAKEUP.STAYONFROMSTANDBYMINS | MODULE.WAKEUP.SUBNETOVERRIDE | MODULE.WAKEUP.TCPPORT | MODULE.WAKEUP.USEFIPS | MODULE.WAKEUP.WAKEDISPLAYAFTERSTANDBY | MODULE.WAKEUP.WURESULTDELAY

Note

Note

Configuration file settings:

Module.WakeUp.Enabled | Module.WakeUp.ManageFirewallRules

1E Client installers include a **template configuration file** that contains the more important settings with default values that match hard-coded default values. The configuration file is updated during installation and named **1E.Client.conf** in the installation folder along with the 1E Client executable.

After installation, configuration file settings can be managed using 1E Client reconfiguration, Explorer configuration instructions, Guaranteed State policies, Configuration Manager baselines or other means. Registry settings can also be managed by Windows Group Policy.

Note

The WakeUp client module of the 1E Client replaces the 1E Agent WakeUp components of the 1E Agent and 1E WakeUp Server.

If the WakeUp Server is configured in multi-agent mode (recommended) then the 1E Client must be installed with the WakeUp client module enabled on all in-scope devices.

When the 1E Client starts, and the WakeUp client module is enabled, it will only initialize the WakeUp client module if the OS version is Windows 7 or later. The 1E Client will automatically remove any previous installation of the WakeUp component from the 1E Agent, leaving behind the NightWatchman component, and keeping the WakeUp Agent registry settings. For NightWatchman v7.2.500 onwards the NightWatchman Agent has a separate installer, and its settings continue to be managed by the **NightWatchman Management Center Web Service**.

The WakeUp Server also requires a local WakeUp Agent, and therefore requires the 1E Client to be installed with the WakeUp client module enabled. The WakeUp Server is a 32-bit process and its registry entries are in the 32-bit WOW6432Node area. The 1E Client is a 64-bit process with its registry entries in the 64-bit area. When the 1E Client starts, if the WakeUp client module is enabled the 1E Client will automatically remove any previous installation of the WakeUp Agent component, leaving behind the WakeUp Server component, and moving the existing WakeUp Agent registry settings from the 32-bit to the 64-bit area of the registry.

WakeUp and the WakeUp client module of the 1E Client do not require a full Tachyon infrastructure; only the 1E Client is required, Tachyon Servers are not required. The full Tachyon infrastructure is required only if you are integrating NightWatchman with Tachyon.

The WakeUp client module of the 1E Client is not supported on:

- Non-Windows devices
- Legacy OS (that is OS which Microsoft no longer support including Windows XP, Vista, 7, Server 2008 etc.)

The following legacy WakeUp features from the 1E Agent do not exist in the WakeUp client module:

- 1E WakeUp Agent service - all WakeUp Agent features are now implemented as the WakeUp client module in the 1E Client service
- Computer Health feature - is now obsolete

2.6.1.10.1 WakeUp client installation settings

The table below lists the configuration properties required to enable the WakeUp client required for integration with NightWatchman Enterprise v7.2.500 or later.

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

1E Client configuration setting	Installation default	Description
Module.WakeUp.Enabled	false	Set this property to **true** to enable the WakeUp client module. The default value is **false**. Enabling this will also cause any installation of the 1E Agent's WakeUp component to be uninstalled the first time the 1E Client is started, leaving the NightWatchman component if that was installed. **Note** When **true** then you must also specify either the name of the NightWatchman Management Center reporting server, or that reporting is turned off. For details of these and all other installer properties please refer to /document/preview/647736#UUID-b588cdab-ae07-3331-ceb1-c8c6ed63aa1e.
Module.WakeUp.ManageFirewallRules	true	Set this property to **true** to enable the Windows firewall domain rule. The default value is **true**. A Windows firewall domain rule called **1E Client** is removed/added each time the 1E Client is stop/started.

2.6.1.10.2 WakeUp client registry settings

The table below lists additional settings for the WakeUp client module, which may be specified during installation of the 1E Client as Windows installer properties in upper-case. They are stored in the registry in mixed-case. They are not stored in the 1E Client configuration file, and **cannot** be reconfigured after installation using 1E Client command-line parameters. The registry values can be updated via group policy object (GPO) administrative templates or other means.

Note

The table indicates where installer properties have a different name to the registry setting. In some cases this is for backwards compatibility with previous 1E Agent installer properties.

In the descriptions below, the term WakeUp Agent is used to describe the WakeUp client module of the 1E Client. The terms Primary Agent and Alternate Agent are WakeUp roles.

Note

You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

Names of settings stored in the configuration file are not case-sensitive. Setting names stored in the registry may be case-sensitive and should be specified as shown.

Settings that have numeric values must be set using decimal integers, unless otherwise specified.

1E Client installer property	Installation default	Description	Registry name	Registry type
MODULE.WAKEUP.ADDITIONALSUBNETS	**Note** The registry value is not created unless the installation property is specified.	Used only in dedicated agent mode. It enables the dedicated WakeUp Agent to register to awaken multiple subnets. It requires that directed subnet broadcasts are enabled in the routers between the agent and remote subnets. It takes a comma delimited list of subnets. Its use and format are described in WakeUp documentation for NightWatchman Enterprise: Configuring network access control security.	\AdditionalSubnets	REG_SZ
MODULE.WAKEUP.AGENTTCPPORT **Note**	1776	The listening port used by the WakeUp Server to communicate with the WakeUp Agents. Default value is **1776** (decimal). **Note**	\AgentTCP_Port	REG_DWORD

1E Client installer property	Installation default	Description	Registry name	Registry type
The registry name is different to the installer property name (it has an underscore).		The **AgentTCP_Port** value must be different to the TCP_Port value, and must be the same for the WakeUp Server and all Agents.		
MODULE.WAKEUP.AGENTTO		Set to enable Dedicated Agent mode. This parameter should be set to the FQDN (recommended) or NetBIOS name of the WakeUp Server. Default is empty to enable Multi-Agent mode. Dedicated Agent mode does not have Multi-Agent features.	\AgentTo	REG_SZ
MODULE.WAKEUP.ALLOWLASTMANSUSPEND	1	Set to **0** if you want to allow a Primary or Alternate Agent to respect Microsoft power schemes and go to sleep. Set to **1** (default) to prevent a Primary or Alternate Agent going to sleep. **Note** The value of this property is the opposite to what its name implies.	\AllowLastManSuspend	REG_DWORD

1E Client installer property	Installation default	Description	Registry name	Registry type
MODULE.WAKEUP.CERTISSUER		Specify the text used to search for a client certificate in the client certificate store. Either MODULE.WAKEUP.CERTISSUER or MODULE.WAKEUP.CERTSUBJECT is mandatory when all the following are true: • **HTTPS** communications is being used • MODULE.WAKEUP.SECURERREPORTINGSERVER is configured • SSL Settings for the **NightWatchman Management Center Web Service** is configured to require a client certificate If this property is used, it will use the first certificate it finds where the specified text matches the certificate's Issuer CN.	\Reporting\HTTPS\CertIssuer	REG_SZ
MODULE.WAKEUP.CERTSUBJECT		Specify the text used to search for a client certificate in the client certificate store. Either MODULE.WAKEUP.CERTISSUER or MODULE.WAKEUP.CERTSUBJECT is mandatory when all the following are true:	\Reporting\HTTPS\CertSubject	REG_SZ

1E Client installer property	Installation default	Description	Registry name	Registry type
		• **HTTPS** communications is being used • MODULE.WAKEUP.SECURERREPORTINGSERVER is configured • SSL Settings for the **NightWatchman Management Center Web Service** is configured to require a client certificate If this property is used, it will use the first certificate it finds where the specified text matches the certificate's Subject CN.		
MODULE.WAKEUP.DEBUG	13	Sets the level of debug information output to the WakeUp Agentlog file. Default value is **13** (decimal). Range is 1 to 255 (decimal). You should only change this value if requested by 1E Support, and reset it back to **13** when investigation is completed.	\Debug	REG_DWORD
MODULE.WAKEUP.DELAYCYCLESMSSECS	16	Delay (in seconds) before the WakeUp Agent performs a policy refresh after receiving a policy refresh instruction from the WakeUp Server via the Primary Agent. This delay allows time for the ConfigMgr Management Point to be updated in instances where	\DelayCycleSMSSecs	REG_DWORD

1E Client installer property	Installation default	Description	Registry name	Registry type
		Advertisements are newly created. Default value is **16**.		
MODULE.WAKEUP.ENCRYPTIONLEVEL	0	The encryption level used in communications between WakeUp Agents and WakeUp Servers. This does not affect encryption used for WakeUp Reporting. • **0** – Disable WakeUp encryption (default) • **2** – Enable WakeUp encryption • **3** – Enable FIPS encryption **Note** If the MODULE.WAKEUP.USEFIPS installer property is set to **1** it will override the MODULE.WAKEUP.ENCRYPTIONLEVEL installer property and sets the **EncryptionLevel** registry value to **3**, and also uses FIPS for WakeUp Reporting by setting the **UseFipsComplianceEncryption** registry value to **1**. When configuring this option you will need to ensure that the same setting is made	\EncryptionLevel	REG_DWORD

1E Client installer property	Installation default	Description	Registry name	Registry type
		for all WakeUp Agents and WakeUp Servers. Care is required when migrating Agents from Off (**0**) to On (**2**) or the other way round, then the WakeUp Servers will need be configured to support both, by temporary use of of partial/mixed encryption (**1**). Once you are sure all Agents are configured to the same setting, then you should change the WakeUp Server to match the Agents' setting. WakeUp does not support partial/mixed use of FIPS (**3**) and EncryptionLevel (**0/2**) therefore all NightWatchman and WakeUp Servers and Agents must be configured to use FIPS from the outset, or all changed at the same time. EncryptionLevel and FIPS settings used by WakeUp do not affect other 1E Client communications.		

1E Client installer property	Installation default	Description	Registry name	Registry type
MODULE.WAKEUP.LASTMANENABLED	1	Determines if the WakeUp last man standing functionality is turned on or off. • **0** – turns last man standing functionality off • **1** – turns last man standing functionality on (default)	\LastManEnabled	REG_DWORD
MODULE.WAKEUP.LOGFILENAME **Note** The registry name is the same as the installer property name but contains a combination of LOGPATH and LOGFILENAME installer properties.	WakeUpAgt.log	The name of the WakeUp Agent log file. This combines with LOGPATH to give the LogFileName registry value.	\LogFileName	REG_SZ
MODULE.WAKEUP.LOGPATH	%ALLUSERSPROFILE%\1E\Agent	The location of the WakeUp Agent log file. This combines	**Note** See LOG	

1E Client installer property	Installation default	Description	Registry name	Registry type
Note See LOGFILENAME.		with LOGFILENAME to give the LogFileName registry value.	FILENAME	
MODULE.WAKEUP.MAGICPACKETDELAY	1	The delay (in milliseconds) between the WakeUp Agent sending subsequent Magic Packets. Default value is **1**.	\MagicPacketDelay	REG_DWORD
MODULE.WAKEUP.MAGICPACKETPORT **Note** The registry name is different to the installer property name (it has an underscore).	1776	The UDP port used to send wake up broadcasts. Default value is **1776** (decimal).	\MagicPacket_Port	REG_DWORD
MODULE.WAKEUP.MAXIMUMFILEAGESECS	1209600 (14 days)	Sets the maximum age (in seconds) for the Agent to retain reporting information locally when the **NightWatchman Management Center Web Service** cannot be contacted. By default, this is set to **1209600** seconds (14 days). Any files older than that will not be submitted to the **NightWatchman Management Center Reporting** and will be	\Reporting\MaximumFileAgeSecs	REG_DWORD

1E Client installer property	Installation default	Description	Registry name	Registry type
		deleted instead. This value need not be modified under normal circumstances.		
MODULE.WAKEUP.MAXLOGFILESIZE	1048576 (1MB)	Maximum size (in bytes) for the WakeUp Agent log file. There are 5 rollover files numbered 1 (newest) to 5 (oldest) with the rollover number included as n.log (In previous versions of WakeUp the .LOG file was renamed with a .LO_ extension and a new .LOG file is created. The .LO_ file is overwritten each time.)	\MaxLogFilesize	REG_DWORD
MODULE.WAKEUP.REFRESHHWINFOAFTERHOURS	720 (30 days)	The frequency (in hours) for hardware inventory details to be sent to the NightWatchman server if WakeUp reporting is enabled (default) and MODULE.WAKEUP.SENDHARDWAREINFO=ON. Range is from 24 to 999. The default is **720** (30 days). If the NightWatchman Agent is also installed, it will send hardware inventory more frequently.	\Hardware\RefreshHwInfoAfterHours	REG_DWORD
MODULE.WAKEUP.REFRESHONSUBNETCHANGE	ON	Triggers the local ConfigMgr client to do a Hardware Inventory Cycle when the WakeUp Agent detects a change of subnet. The client in turn, updates the ConfigMgr Site inventory, thereby enabling the	\RefreshOnSubnetChange	REG_SZ

1E Client installer property	Installation default	Description	Registry name	Registry type
		Site's WakeUp Server to have the latest subnet details. • **ON** – monitor subnet changes on both physical and wireless connections (default). • **IGNOREWIRELESS** – only monitor subnet changes on physical connections. • **OFF** – no action is taken when the subnet changes. **Tip** This is particularly useful where laptops move between offices. Typically, Wake-On-LAN is not supported over wireless, therefore **IGNOREWIRELESS** avoids the overhead of triggering a ConfigMgr hardware inventory for wireless changes. Use **OFF** only if you are sure computers will not change subnet, and you can rely on the normal ConfigMgr inventory cycle. The WakeUp system relies on having the latest subnet details in order to wake computers. The WakeUp Agent updates the NightWatchman database with		

1E Client installer property	Installation default	Description	Registry name	Registry type
		all subnet changes, because the NightWatchman server is designed to support frequent updates.		
MODULE.WAKEUP.REPEATCOUNT	0	Number of times to repeat sending Magic Packets. Default is **0**. **Note** If you suspect that your network is prone to dropping datagram packets you should try different configurations for ***RepeatCount*** and *RepeatDelay* . Otherwise, these should be left at their default values.	\RepeatCount	REG_DWORD
MODULE.WAKEUP.REPEATDELAY	0	Delay (in milliseconds) before resending a repeated Magic Packet. Default is **0**. **Note** If you suspect that your network is prone to dropping datagram packets you should try different configurations for *RepeatCount* and ***RepeatDelay*** . Otherwise, these should be left at their default values.	\RepeatDelay	REG_DWORD

1E Client installer property	Installation default	Description	Registry name	Registry type
MODULE.WAKEUP.REPORTING	ON	Enables WakeUp reporting. Sets whether the Agent sends reporting messages to the **NightWatchman Management Center Web Service**. May be set to one of the following values: • **ON** – reporting is enabled and messages are forwarded to the NightWatchman server. It is mandatory to specify one of the following: MODULE.WAKEUP.REPORTINGSERVER or MODULE.WAKEUP.SECUREREPORTINGSERVER • **OFF** – no information is reported to the server. **Tip** When installing the 1E Client on a WakeUp Server, set **MODULE.WAKEUP.REPORTING=OFF** so that the server does not appear as a client in the NightWatchman Management Center Admin Console. This will only disable Agent reporting whilst the WakeUp Server will have reporting enabled for reporting statistics.	\Reporting	REG_SZ

1E Client installer property	Installation default	Description	Registry name	Registry type
MODULE.WAKEUP.REPORTINGSERVER **Note** The registry name is different to the installer property name. The supplied value is converted into a full URL.		Set this parameter to the FQDN (recommended) or NetBIOS name of the server hosting the NightWatchman Management Center Web Service. **Warning** Mandatory when WakeUp reporting is enabled (default) and using **HTTP** for communications. **Tip** If **HTTP** is not using standard port 80 then specify the port number as part of the server name: MODULE.WAKEUP.REPORTINGSERVER="ACMESERVER.ACME.COM:8080"	\Reporting\HTTP\ServiceUrl	REG_SZ
MODULE.WAKEUP.SECUREREPORTINGSERVER **Note** The registry name is different to the installer property name. The supplied value is		Set this parameter to the FQDN (*required*) or NetBIOS name of the server where the NightWatchman Management Center Web Service component secure site has been installed. **Warning** Mandatory when WakeUp reporting is enabled (default) and using **HTTPS** for communications. **Tip**	\Reporting\HTTPS\ServiceUrl	REG_SZ

1E Client installer property	Installation default	Description	Registry name	Registry type
converted into a full URL.		If **HTTPS** is not using standard port 443 then specify the port number as part of the server name: MODULE.WAKEUP.SECUREREPORTINGSERVER="ACMESERVER.ACME.COM:7433"		
MODULE.WAKEUP.SENDHARDWAREINFO **Note** The registry name is different to the installer property name.	ON	Enables hardware information messages to be sent to the NightWatchman server, if MODULE.WAKEUP.REPORTING=ON. See also MODULE.WAKEUP.REFRESHHWINFOAFTERHOURS.	\Modules\HwInfoAgt	REG_SZ
MODULE.WAKEUP.SPOOLDIR **Note** The registry name is different to the installer property name.	%ALLUSERSPROFILE%\1E\Reporting\WakeUp\	The location of the WakeUp spooler directory, where Reporting messages are stored before being sent to the **NightWatchman Management Center Web Service**. The location should not need to be modified under normal circumstances. Default value is%ALLUSERSPROFILE%\1E\Reporting\WakeUp\	\Reporting\SpoolerDirectory	REG_SZ
MODULE.WAKEUP.STAYONFROMSTANDBYMINS	0	Set this to the number of minutes the Wakeup Agent keeps the OS awake after a	\StayOnFromStandbyMins	REG_D

1E Client installer property	Installation default	Description	Registry name	Registry type
		wakeup. This is to allow sufficient window of time for multiple jobs to run. If set to less than or equal to **0** (default) then the WakeUp Agent will keep the OS awake for 20 minutes. Set this this value to more than **20** to keep the OS awake for longer.		WORD
MODULE.WAKEUP.SUBNETOVERRIDE	**Note** The registry value is not created unless the installation property is specified.	Contains a list of all unauthenticated subnets that correspond to the authenticated subnets for which the Agent is responsible. Its use and format are described in WakeUp documentation for NightWatchman Enterprise: Configuring network access control security.	\SubnetOverride	REG_SZ
MODULE.WAKEUP.TCPPORT **Note** The registry name is different to the installer property name	1777	The listening port used by the WakeUp Agents to communicate with the WakeUp Server. Default value is **1777** (decimal). **Note** The **TCP_Port** value must be different to the **AgentTCP_Port** value, and must be the same for the	\TCP_Port	REG_DWORD

1E Client installer property	Installation default	Description	Registry name	Registry type
(it has an underscore).		WakeUp Server and all Agents.		
MODULE.WAKEUP.USEFIPS **Note** The registry name is different to the installer property name.	0	Set to **1** to force the WakeUp agent to use a FIPS-compliant algorithm for: • WakeUp Reporting to the **NightWatchman Management Center Web Service** by setting **UseFipsComplianceEncryption** registry value to 1. • Communication between WakeUp Agents and WakeUp Servers. It will override the MODULE.WAKEUP.ENCRYPTIONLEVEL installer property and set the **EncryptionLevel** registry value to 3. If enabled, then all components in the NightWatchman and WakeUp system must have FIPS enabled. EncryptionLevel and FIPS settings used by WakeUp do not affect other 1E Client communications.	\Reporting\UseFipsComplianceEncryption	REG_DWORD
MODULE.WAKEUP.WAKEDISPLAYAFTERSTANDBY	0	Set to **1** to force the display to come on (assuming it has	\WakeDisplayAfterStandBy	REG_D

1E Client installer property	Installation default	Description	Registry name	Registry type
		power) after it has been woken up. This feature works in conjunction with MODULE.WAKEUP.STAYONFROMSTANDBYMINS.		WORD
MODULE.WAKEUP.WURESULTDELAY	0	The time (in seconds) the WakeUp Primary Agent allows for responses to magic packets before it tries to pings devices that have not yet responded with a WASAWAKE or JUSTWOKE and then report NOAGENT or FAILED to the WakeUp Server for reporting purposes. This is especially useful when trying to wake devices that do not have the WakeUp client module enabled. The delay should be set to how long it normally takes for devices to start up. If set to **0** the WakeUp Server determines the time, but this can be overridden by changing the value on the WakeUp Primary Agent. In multi-agent mode, this effectively means all Agents.	\WUResultDelay	REG_DWORD

The following table is for WakeUp client module registry values that do not have Windows installer properties, and are not stored in the 1E Client configuration file.

Warning

These registry values are reserved for use by the WakeUp client module and must not be modified.

Registry name	Registry type	Description
\AgentRegInfo	REG_SZ	Used by the Primary and Alternate Agent to store information it has registered with the WakeUp Server.
\AltAgentMacAddress	REG_BINARY	Used by the Primary and Alternate Agent to store each other's MAC address details.
\InstallationDirectory	REG_SZ	Used as a record of the installation folder, for backwards compatibility.
\MiniAgentTo	REG_SZ	Used by the Primary and Alternate Agent to store the NetbiosName of the 1E Wakeup Server.
\PatchLevel	REG_SZ	Used to indicate the version of the most recent software patch installed.
\TachyonAgentVersion	REG_SZ	Used as a record of the 1E Client version that created the registry settings.

2.6.2 1E Client command-line parameters

Command-line interface (CLI) parameters available to the 1E Client executable.

Some CLI actions invoke the 1E Client itself, whereas others are used to control execution of the 1E Client. Normally a user does not have to be aware of the options, but they can be useful for testing and debugging.

If **1E.Client.exe** is run without a CLI parameter, it will output a usage message showing the options and syntax.

The syntax shown below shows all parameters starting with - but you can use **/** instead. CLI parameters are mutually exclusive unless noted otherwise.

When running these commands from a console, run as administrator (Windows) or prefix the commands with *sudo* (non-Windows).

> **Tip**
>
> A popular use of the CLI is to reconfigure settings in the 1E Client configuration file using the **-reconfigure** and**-restart**parameters.
>
> For further guidance on using the **-reconfigure** parameter, please refer to Reconfiguring 1E Client.

2.6.2.1 Command-line parameters

2.6.2.1.1 -console

Instead of running the 1E Client as a service or daemon, run it as a console application. To stop the 1E Client, press *ctrl-C*.

> **Warning**
>
> This mode is for testing and should not be used unless advised by 1E.

2.6.2.1.2 -runservice

This is the normal invocation of the 1E Client to run it as a service or daemon.

> **Warning**
>
> Do not use this mode from the command line.

2.6.2.1.3 -uninstall[=module1,module2,...]

Run the uninstall action on all (by default) or the specified modules. Case is not significant.

Most modules use the default uninstall action which does nothing, but a few such as Nomad perform important tasks.

This CLI action checks that the 1E Client service/daemon is not currently running, and aborts if it is, because it is not safe to uninstall a module that is active.

2.6.2.1.4 -getdbkey

In rare circumstances 1E Support may ask for a copy of the Tachyon persistent storage database files for diagnostic purposes. This option gives an encrypted form of the DB's key.

> **Warning**
>
> Do not use this option unless requested by 1E Support.
>
> **Note**
>
> Because the DB is generated and encrypted by the 1E Client runs using the system account, you must fetch the key in the same context. On Windows the SysInternals *psexec* command is convenient for this, as follows:

```
psexec -s 1E.Client.exe -getdbkey
```

2.6.2.1.5 -reconfigure name1=value1 ...

This is a convenient way to change settings in the 1E Client configuration file. One or more name=value pairs should be specified, and the configuration file will be updated. A value can be empty, although that is only valid for a few configuration settings. Case of the name-part is not significant, but the case of the value is preserved when it is written to the configuration file.

> **Warning**

You can change only configuration file settings using this method, you must use other methods to change registry settings. For further guidance, please refer to Reconfiguring 1E Client.

Note

Any name=value pair can be added to the configuration file, no validation is done. If a key with the name does not already exist in the configuration file, it will be added to the file and a warning output (in case the name has been misspelled).

This CLI action can be used in combination with **-start** and **-restart** (and **-stop** although that is not very useful).

Note

The 1E Client will not pick up the new configuration value(s) until it is restarted.

2.6.2.1.5.1 Examples

Set the *Switch* and *BackgroundChannelUrl* values, then restart the 1E Client (after a random stagger interval) to pick up the new values.

On Windows:

```
"C:\Program Files\1E\Client\1E.Client.exe" -reconfigure Switch=ACME-DMZ01.ACME.LOCAL:4000 BackgroundChannelUrl=https://ACME-DMZ01.ACME.LOCAL:443/Background/ -restart
```

On Linux and Solaris:

```
/usr/sbin/1E.Client -reconfigure Switch=ACME-DMZ01.ACME.LOCAL:4000 BackgroundChannelUrl=https://ACME-DMZ01.ACME.LOCAL:443/Background/ -restart
```

On macOS:

```
cd /Library/Application Support/1E/Client # Do not prefix cd with sudo
./1E.Client -reconfigure Switch=ACME-DMZ01.ACME.LOCAL:4000 BackgroundChannelUrl=https://ACME-DMZ01.ACME.LOCAL:443/Background/ -restart
```

2.6.2.1.6 -stdin

Read configuration values from standard input rather than the configuration file. This is only used with **-console** when debugging.

Warning

This mode is for testing and should not be used unless advised by 1E.

2.6.2.1.7 -stop [-immediate]

Stop the 1E Client service or daemon if it is running. If **-immediate** is given, the 1E Client will shut down immediately (or as soon as possible to preserve instruction integrity), otherwise it will happen after a random number of seconds in a range between the *ConnectionRetryTimeInSecondsMin* and *ConnectionRetryTimeInSecondsMax* configuration

values. This is to prevent flooding, for example, the Switch with offline messages, depending on which client options have been enabled.

2.6.2.1.8 -start [-immediate]

Start the 1E Client service or daemon if it is not already running. If **-immediate** is given, the 1E Client will start immediately, otherwise it will happen after a random number of seconds in a range between the *ConnectionRetryTimeInSecondsMin* and *ConnectionRetryTimeInSecondsMax* configuration values. This is to prevent flooding, for example, the Switch with online messages, or Nomad content registration messages, depending on which client options have been enabled.

2.6.2.1.9 -restart [-immediate]

Stop the 1E Client service or daemon if it is running, then start it. If **-immediate** is given, this will happen immediately, otherwise it will happen after a random number of seconds in a range between the *ConnectionRetryTimeInSecondsMin* and *ConnectionRetryTimeInSecondsMax* configuration values. This is to prevent flooding, for example, the Switch with offline and online messages, or Nomad content registration messages, depending on which client options have been enabled.

2.6.3 Log files

Details of 1E Client log files.

> **Tip**
>
> This page is a reference of log file names and location. If you are here to troubleshoot then please refer to Troubleshooting instead.

2.6.3.1 1E Client logs

> **Note**
>
> Upgrades retain the location and configuration of log files.

2.6.3.1.1 Log file locations

1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

1E Client logs on macOS

/Library/Logs/1E.Client.Daemon.log (shows any service start errors)

/Library/Logs/1E.Client.log (shows the current operation of the 1E Client)

1E Client logs on other non-Windows platforms

/var/log/1E/Client/1E.Client.log

Nomad client log

%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles\NomadBranch.log

PXE Everywhere Agent log

%ALLUSERSPROFILE%\1E\PXEEverywhere\PXEEverywhere.log

Shopping WSA client log

%ALLUSERSPROFILE%\1E\Client\WSA.log

WakeUp client log

%ALLUSERSPROFILE%\1E\Agent\WakeUpAgt.log

> **Note**
>
> By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

2.6.3.1.2 Configuration

1E Client log

The **LogPath** setting is stored in the **1E.Client.Conf** file and determines the full path and filename of the 1E Client log file.

The 1E Client log is shared by:

- 1E Client
- Tachyon client features
- Shopping client module (only available on Windows OS)

To change the logging level, please refer to LoggingLevel in the 1E.Client.CONF file.

The following are not configurable in this version:

- Maximum size of 5MB
- 5 rollover files numbered 1 (newest) to 5 (oldest) with the rollover number included as n.log

Nomad client log

LogFileName registry is configurable using MODULE.NOMAD.LOGPATH and MODULE.NOMAD.LOGNAME installer properties.

- MaxLogFileSize is configurable using MODULE.NOMAD.MAXLOGSIZE. Default is 5242880 (5MB).
- When the log file reaches its maximum size, it is renamed with a .LO_ extension and a new .LOG file is created. The .LO_ file is overwritten each time.

PXE Everywhere Agent log

LogFileName registry is configurable using MODULE.PXEEVERYWHERE.LOGPATH installer property, with the default filename PXEEverywhere.log.

- MaxLogfileSize is configurable using MODULE.PXEEVERYWHERE.MAXLOGFILESIZE. Default is 1048576 (1MB).
- When the log file reaches its maximum size, it is renamed with a .LO_ extension and a new .LOG file is created. The .LO_ file is overwritten each time.
- The logfile format is configurable using MODULE.PXEEVERYWHERE.LOGFORMAT default (1) is Configuration Manager-compatible format.

Shopping WSA client log

Not configurable using installer properties. Configurable by modifying the Log4Net settings in the WSA.exe.config file, located in %ProgramFiles%\1E\Client\Extensibility\WSA folder.

WakeUp client log

LogFileName registry is configurable using MODULE.WAKEUP.LOGPATH and MODULE.WAKEUP.LOGFILENAME installer properties.

- MaxLogFileSize is configurable using MODULE.WAKEUP.MAXLOGFILESIZE. Default is 1048576 (1MB).
- 5 rollover files numbered 1 (newest) to 5 (oldest) with the rollover number included as n.log
- In previous versions of WakeUp the .LOG file was renamed with a .LO_ extension and a new .LOG file is created. The .LO_ file is overwritten each time.

2.6.4 1E Client release information

2.6.4.1 1E Client 8.1 Release Notes – last updated 02-August-2022

These notes contain late-breaking information about 1E Client that you need to have to successfully install and use the product. For the most up-to-date information please see the online readme. You should read these release notes and the online documentation for 1E Client thoroughly before installing the software.

2.6.4.1.1 New features in 1E Client 8.1

2.6.4.1.1.1 Tachyon client for Tachyon v8.1

- The status of all Guaranteed State rules is reported after a configurable number of days, even if the rule status has not changed
- New module called Policy to give better visibility into what the current status of Guaranteed State rules:
  - /document/preview/739118#UUID-1de33ffb-d4e6-aab8-88c6-4bbfbd5b7034_id_PolicyForceStatusReport-ForceStatusReport - trigger the 1E Client to force-send all policy status messages on restart
  - /document/preview/739119#UUID-dbc9eec3-1781-f814-2efa-8af6b0fc1a2b_id_PolicyGetEventSubscriptions-GetEventSubscriptions - get event subscriptions in current policy
  - /document/preview/739120#UUID-f0f824b7-163a-72e0-2c9c-6cd39f7a0f05_id_PolicyGetRuleEvaluationHistory-GetRuleEvaluationHistory ([ruleId]) - get the evaluation history for one rule or all rules
  - /document/preview/739121#UUID-b55da451-c425-a143-6e01-37f100c0b543_id_PolicyGetRules-GetRules - get rules in current policy (with current status)
  - /document/preview/739122#UUID-daf92ecb-8959-48fc-1b3e-fd6e9a7abd3b_id_PolicyGetStatistics-GetStatistics - get policy-related statistics/perf counters
  - /document/preview/739123#UUID-d5b70c1f-8194-d25e-337b-f1ce3cbc8a3e_id_PolicyGetSummary-GetSummary - get a summary of the current policy
  - Policy.Invalidate () - reset the 1E Client's policy to null/empty, which will force a renegotiation of the policy (immediately if connected to Switch, or when it does eventually connect)
- New methods:
  - /document/preview/739176#UUID-65c8a3bf-3714-442a-4c5c-19b77d5e93af_id_StorageList-Delete
- New SQL functions:
  - /document/preview/739230#UUID-4fd278df-907a-b131-c131-e2449af777af_id_HASHSTRING-HASHSTRING, /document/preview/739234#UUID-3d29f21e-8d41-cc2a-e2cd-efc8f7639fe8_id_NEWID-NEWID

- Deprecated methods: FileContent.GetTorrentAnnounceUris, FileContent.GetTorrentDescribedFiles, FileContent.GetTorrentInfo
- Support for Solaris operating systems has been deprecated
- Will not install on Windows XP and Server 2003
- Now uses C++ 14, OpenSSL 3.0.0 7 Sep 2021, SQLite 3.36.0

Note

Only Tachyon client features are supported by the 1E Client on non-Windows devices.

2.6.4.1.1.2 Shopping client for Shopping v6.1

- Shopping 6.1 client is the Shopping module in 1E Client 8.1
- No changes - only hotfixes.

2.6.4.1.1.3 WakeUp client for NightWatchman Enterprise v7.3

- WakeUp 7.3 client is the WakeUp module in 1E Client 8.1
- No changes - only hotfixes.

2.6.4.1.1.4 Content Distribution client for Content Distribution v8.1

- NomadBranch 8.1 client is the Content Distribution module in 1E Client 8.1
- Set Nomad as Download Program - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.
- Enhancements:
  - Improvements to the Client authentication criteria to authenticate with a DP (or any download source)
  - Download reporting now includes Top status bar, for Bandwdith Protection Reporting.

2.6.4.1.1.5 PXE client for PXE Everywhere v8.1

- PXE Everywhere Agent is a client module of 1E Client 8.1, available for x64 and x86 platforms
- There are no other changes in this version other than hotfixes.

2.6.4.1.2 Online help

Tachyon comes with online help that shows you how to install, configure and use the product. Click the following link to view the help:

- Introducing 1E Client

For support queries, please:

- Use https://support.1e.com/ where you can search the KB or submit a support case.
- Contact support@1e.com.

2.6.4.1.3 Known issues

Current known issues related to installation of the 1E Client can be found on the Known issues page of the 1E Client documentation.

2.6.4.2 1E Client Release History

2.6.4.2.1 Web Release-8.1 (19-Apr-2022)

2.6.4.2.1.1 1E Client 8.1.2.62 - 1E Client Non-Windows 8.1.2.62 - TIMS 8.1.2.62

2.6.4.2.1.1.1 Features and enhancements

For new features in this release please refer to the top of the page.

2.6.4.2.1.1.2 Contained fixes - 1E Client

- Q22096 - Shopping - High CPU utilization caused by Shopping client UI (TFS 245631)
- Q22068 - Content download from Cloud DP does not work when Enhanced HTTP is enabled in CM 2107 (TFS 248101)
- Q22062 - High priority announcements are treated exactly the same as standard priority (TFS 247010)
- Q22056 - Superfluous informational message in NomadBranch log (TFS 249059)
- Q22054 - Failing to decrypt content while downloading from Cloud Distribution Points (TFS 247202)
- Q22040 - Incorrect OS reported by 1E Client when installed on Windows 11 device (TFS 247897)
- Q21994 - 1E Client - Force policy status reporting after X days (TFS 246032)
- Q21992 - Guaranteed State dashboards and detail reports may show a discrepancy for the current compliance state of a rule. (TFS 246358)
- Q21990 - 1E Client Fast File Find returning incomplete results (TFS 246923)
- Q21988 - 1E Client fails to capture output from masqueraded process (TFS 246874)
- Q21942 - 1E Client reporting Windows 10 2009 H2 differently due to OS changes (TFS 246371)
- Q21930 - Nomad precache content status is not in sync with Content Download DB (TFS 244875)
- Q21928 - Nomad download over enhanced HTTP fails with CM 2107 (TFS 245217)
- Q21874 - SoftwarePerformance data for Office executables is not captured (TFS 245425)
- Q21872 - 1E Client unable to connect to Tachyon due to Cross-Signing Certificates (TFS 237025)
- Q21870 - Allow Real-Time Control Center to display info surveys (TFS 245204)
- Q21868 - Device.GetDisks is reporting DiskStatus = Not Available on real physical devices (TFS 245612)
- Q21866 - 1E Client can log potentially sensitive data in plain-text at TRACE level (TFS 246162)
- Q21806 - Shopping notifications do not appear after upgrade to 1E Client 8.0 . (TFS 245391)

2.6.4.2.1.1.3 Contained fixes - TIMS

- None

2.6.4.2.2 Web Release-8.0 (29-Oct-2021)

2.6.4.2.2.1 1E Client 8.0.4.261 - 1E Client Non-Windows 8.0.4.261 - TIMS 8.0.4.261

2.6.4.2.2.1.1 Tachyon client for Tachyon v8.0

Real-Time Control Center - updated Client UI in notification area to support Experience Engagements (Announcements and Surveys), and ITSM Support Tickets

New methods:

Device.GetDisks, FileSystem.PathExists, Interaction.ShowAnnouncement, Storage.GetRemote

Updated methods:

Agent.GetDiagnostics, Network.GetIpAddresses, OperatingSystem.ControlService, OperatingSystem.GetProcesses, NativeServices.RunWmiInstanceMethod, NativeServices.RunWmiQuery, NativeServices.RunWmiStaticMethod, Security.UnquarantineDevice, Storage.Set

New capture sources for Tachyon Activity Record:

BootPerformance, SoftwarePerformance.DiskUsage, SoftwarePerformance.ProcessNetworkUsage

Support for the SQLite JSON extension (), allowing JSON data to be queried through SCALE

TAGS installer property for Windows devices - see Tachyon client settings

Support added for the following Operating Systems:

Windows 10 21H1

Fedora 34

openSUSE Leap 15.2

Red Hat Enterprise Linux 7.9

Red Hat Enterprise Linux 8.3

SUSE Linux Enterprise 15.2

> **Note**
>
> Only Tachyon client features are supported by the 1E Client on non-Windows devices.

2.6.4.2.2.1.2 Shopping client for Shopping v6.1

Shopping 6.1 client is the Shopping module in 1E Client 8.0

Client-side Order Tracking feature - configurable on the Shopping server - to provide toast notifications and 1E Shopping UI popup in the notification area.

2.6.4.2.2.1.3 WakeUp client for NightWatchman Enterprise v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 8.0

No changes - only hotfixes.

2.6.4.2.2.1.4 Nomad client for Nomad v8.0

NomadBranch 8.0 client is the Nomad module in 1E Client 8.0

New registry setting SiteSSDMinPackageSizeKB to set the minimum size of content before making SSD request

Installer changes:

Integrating Nomad with WakeUp

Enable Nomad FanOut as a default - default value of SpecialNetShare has changed to 0x2060 (8288)

Platform features enabled by using the BackgroundChannelUrl instead of PlatformURL

Enhancements to CacheCleaner functionality to better support remote users as part of the Working From Anywhere initiative.

2.6.4.2.2.1.5 PXE client for PXE Everywhere v8.0

PXE Everywhere Agent is a client module of 1E Client 8.0, available for x64 and x86 platforms

Bootshim.efi folder renamed from **BootPrograms** to **NetworkBootPrograms** (1E\Client\Extensibility\PXEEverywhere\NetworkBootPrograms)

There are no other changes in this version other than hotfixes.

2.6.4.2.2.1.6 Contained fixes - 1E Client

Q21786 - Nomad - Automatic CacheClean updates (TFS 244966)

Q21784 - Nomad is not doing any DP load balancing (TFS 234960)

Q21782 - Nomad failing download content requested by VMware Workspace One (TFS 244963)

Q21724 - Nomad - Get Migration Settings step is not using correct MAC address to query CM computer association (TFS 241912)

Q21706 - WSA- Nomad download jobs coming from WSA fail to download from Cloud DP (TFS 231049)

Q21704 - Shopping Order Tracking feature is always enabled (TFS 240467)

Q21694 - Nomad - CDSSync doesn't report complete download data (TFS 236909)

Q21692 - Nomad isn't honouring Job timeout (TFS 237633)

Q21690 - Nomad crashing on multiple devices (TFS 235899)

Q21670 - Notifications are not issued when the machine and Shopping are logged in with another same user. (TFS 236754)

Q21632 - Shopping Order Tracking (TFS 165266)

Q21630 - Guaranteed State Check Rule for FileSystem.GetFileDetails stopping 1E Client service (TFS 234123)

Q21628 - Nomad fails during byte-range download if ContentRegistration is disabled (TFS 235180)

Q21602 - Standardize Nomad date logging (TFS 231355)

Q21600 - Nomad hash errors on 3rd party software update downloads via WUMU (TFS 230142)

Q21470 - Agent - Client is released from Quarantine after device is hard powered off without a graceful shutdown (TFS 228018)

2.6.4.2.2.1.7 Contained fixes - TIMS

None

2.6.4.2.3 Web Release-5.2 (26-Mar-2021)

2.6.4.2.3.1 1E Client 5.2.5.479 - 1E Client Non-Windows 5.2.5.478 - TIMS 5.2.5.479

2.6.4.2.3.1.1 Features and enhancements

2.6.4.2.3.1.2 Tachyon client for Tachyon v5.2

New methods: Inventory.GetTables, Network.GetWiFiNetworks

Updated methods: Network.GetConnections, OperatingSystem.GetSummary

New TimeoutSecs parameter in: FileSystem.FindFileByName, FileSystem.FindFileBySizeAndHash, FileSystem.FindDirectoryByName

New policy trigger: DirectoryChange

New installer property for Windows devices: DataRoot

Support for TPM (Trusted Platform Module) based client certificates on Windows

OsLocale and OSInstallUtc included in online messages to Switch to support the Location tile in the Details panel of Tachyon Platform 5.2 - Device View: Overview

Support for Nomad client changes, including use of event policy system, and sharing certificate details

Improved Downloading Tachyon client content and Nomad integration

Description removed from Experience Surveys in Client UI (Interaction module)

Additional installation script for deploying client on macOS when using tachyon.pfx certificate file as an alternative to using the macOS key store

Support added for following Operating Systems:

Windows 10-20H2

macOS on Apple M1 architecture.

> **Note**
>
> Only Tachyon client features are supported by the 1E Client on non-Windows devices.

2.6.4.2.3.1.3 Shopping client for Shopping v6.0

Shopping 6.0 client is the Shopping module in 1E Client 5.2

Adding support for Single sign-on (SSO) environment and Workgroup devices to respond with machine details on Shopping website.

2.6.4.2.3.1.4 WakeUp client for NightWatchman Enterprise v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 5.2

No changes - only hotfixes.

2.6.4.2.3.1.5 Nomad client for Nomad v7.1

NomadBranch 7.1 client is the Nomad module in 1E Client 5.2

ActiveEfficiency features are now provided by Content Distribution on Tachyon Platform 5.2

Client status messages are sent via Tachyon event policy system - Content Distribution uses these instead of StatusMsgEvents using Configuration Manager

New client settings:

DeliveryOptimizationReportingEnabled - monitoring of Delivery Optimization downloads and reporting them to Content Distribution - disabled by default

SupportWPAD - provides support for Web Proxy Auto-Discovery Protocol (WPAD) - disabled by default.

2.6.4.2.3.1.6 PXE client for PXE Everywhere v4.0.100

PXE Everywhere Agent 4.0.100 is the PXE Everywhere module in 1E Client 5.2

No changes - only hotfixes.

2.6.4.2.3.1.7 Tachyon Instruction Management Studio (TIMS) v5.2

For more information about TIMS, please refer to Tachyon SDK - Getting started with TIMS.

Multiple tabs

Default instruction type for a new instruction is now Action rather than Question

Validation error when %global% or %environment% variables are used in fragments (InstructionType fix, check, and precondition).

2.6.4.2.3.1.8 Contained fixes - 1E Client

Q21416 - WSA - VPN username goes missing if the WSA wizard is relaunched without cancelling (TFS 227164)

Q21408 - Agent - Client - User service instances remain after the associated user session is logged off (TFS 222272)

Q21406 - Agent - HTTP download - File 4GB+ causes unhandled exception and failure if Nomad is used (TFS 226892)

Q21386 - Nomad does not work as ACP after CM Client upgrade to 5 00 9040 1015 (CB 2010) (TFS 221969)

Q21374 - Nomad - Fails to retrieve content locations from the MP if there are no boundary groups except the default (TFS 220818)

Q21370 - WSA – Validate WiFi VPN Credentials step fails on non-English machines in WSA task sequence (TFS 221362)

Q21368 - Agent - Methods - FileSystem Find methods can consume significant machine memory (TFS 220092)

Q21366 - Agent - Methods - Correctly handle logging of error messages when Http.Post method contains the '%' symbol within the Body parameter (TFS 220574)

Q21364 - Agent - Interaction - Interaction module establishes TCP listener even if module is disabled (TFS 220906)

Q21358 - PXE boot may fail if multiple network cards are present in the system (TFS 215056)

Q21346 - WSA compatibility scan fails for non-english machines (TFS 220588)

Q21330 - Nomad - Failing to get patches from WUMU (TFS 212827)

Q21328 - Enabling the PXE Module in the 1E Client 5.1 creates an additional 1E.Client.log in C:/Temp folder (TFS 218205)

Q21324 - Fix shopping module dll signing with correct signature (TFS 219781)

Q21280 - Agent - Experience shows processes with unrealistically high Processor Time % (TFS 216267)

Q21278 - 1E Client Shopping module will not initialize when Shopping is configured for SSO (TFS 201787)

Q21222 - Agent - Client with specific locale settings not reporting in experience (TFS 215037)

Q21220 - Agent – 1E Client UI notification icon shows Poke with DEBUG or TRACE level logging (TFS 213480)

Q21218 - Agent - Methods - NativeServices.RunCommand no longer strips trailing whitespace in Output (TFS 216457)

Q21141 - PXE boot fails when the windows firewall is enabled (TFS 212739)

2.6.4.2.3.1.9 Contained fixes - TIMS

Q21230 - Agent - Client with specific locale settings not reporting in experience

Q21226 - Agent – 1E Client UI notification icon shows Poke with DEBUG or TRACE level logging

Q21224 - Agent - Methods - NativeServices.RunCommand no longer strips trailing whitespace in Output

2.6.4.2.4 Web Release-5.1 (18-Aug-2020)

2.6.4.2.4.1 1E Client 5.1.0.922 - 1E Client Non-Windows 5.1.0.922 - TIMS 5.1.0.922

2.6.4.2.4.1.1 Tachyon client for Tachyon v5.1

User surveys and notifications, and notification area icon called 1E Client UI. This is used by Tachyon Experience, please refer to:

Tachyon Experience 1.3 - Getting feedback via User Sentiment Surveys: What the end-user sees

Tachyon Experience 1.3 - Getting feedback via General Purpose Surveys: What the end-user sees

Tachyon Experience 1.3 - Getting feedback via General Purpose Surveys: Do not disturb...

Support for user-centric features (user session reporting). This is used by Tachyon Experience, please refer to Tachyon Experience - Users page

Support for Telemetry. Please refer to Tachyon 5.2 - Telemetry data, and Tachyon 5.2 - Tachyon Setup: Telemetry for more details.

A TemporaryDirectory configuration setting has been added that can override the default location for 1E Client temporary file storage

Device information has been extended to include:

physical MAC address

inbound IP address (for NAT scenarios)

primary user (also displayed in Devices information popup from the Devices table in Explorer)

Support for VDI features (device resource demand reporting) - this is a preview feature that is not enabled by default.

New modules: Interaction

New methods: Security.QuarantineDevice, Security.ModifyQuarantineWhitelist, Users.GetPrimaryUser

Support added for following Operating Systems:

macOS – Catalina v10.15

CentOS 8.1

Debian 10.4

Fedora 32

openSUSE Leap 15.1

RHEL 8.1

SLES 15.1

Ubuntu 18.04

Only Tachyon client features are supported by the 1E Client on non-Windows devices.

2.6.4.2.4.1.2 Shopping client for Shopping v6.0

Shopping 6.0 client is the Shopping module in 1E Client 5.1

WSA - Support for nested Task Sequences

WSA - Autofill WiFi passcode on Connection page if available

WSA - Option to disable the Location page

2.6.4.2.4.1.3 WakeUp client for NightWatchman Enterprise v7.2.500 and v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 5.1

Creates a firewall exception for WakeUp with the name **1E Client (WakeUp)** that is port specific.

2.6.4.2.4.1.4 Nomad client for Nomad v7.0.200

NomadBranch 7.0.200 client is the Nomad module in 1E Client 5.1

Certificate-based client authentication for Nomad P2P communication

Configuration Manager Enhanced HTTP support

Support for multiple Certificate Authorities

Improved PKI client certificate selection logic

VMWare Workspace One support

Handling download content for "expired" offer

Improved handling of updated Software Update content

Option to reduce election notifications in Nomad logs

2.6.4.2.4.1.5 PXE client for PXE Everywhere v4.0

PXE Everywhere Agent 4.0 is a client module of 1E Client 5.1

PXE Everywhere Static Responder (to support DHCP Snooping) now has its own installer.

2.6.4.2.4.1.6 Contained fixes:

Q20741 - PXE Boot fails on Microsoft Surface Pro systems (TFS 195659)

Q21094 - Agent - Handle leak in ConvertNonStandardExecutableName (TFS 209269)

Q21092 - Agent - Infrastructure - Additional TachyonGUID/device generated if WMI is not available (TFS 207251)

Q21088 - Unable to download Pre-cache Content from Cloud DP on VPN clients (TFS 207646)

Q21070 - Add Shopping v6 Support to 1EClient (TFS 200984)

Q21060 - 1E Client (WakeUp) rule created multiple times in Windows Defender Firewall (TFS 201823)

Q21048 - CertIssuer - specifying issuer name sub string does not work for selecting Server Auth PKI cert for Nomad P2P / PBA over HTTPS (TFS 204608)

Q21020 - Support pre-caching on internet clients using AE on internet and content distributed on CDP or IBCM based DP. (TFS 203685)

Q21018 - Nomad failing to download the content in first attempt (from CMG) and succeeding in second attempt after 10 min (TFS 200803)

Q21004 - Agent - Experience - Operating System service failure - report the extra fields (TFS 200866)

Q21002 - Agent - Infrastructure - Reading output from child processes may fail (TFS 200539)

Q21000 - Agent - Experience - Better INFO logging and log ERROR if PdhOpenQuery() fails (TFS 200100)

Q20998 - Agent - Experience - .tmp files are being reported under Software->Product and Executable column (TFS 200571)

Q20996 - Agent - Experience - Client should report Processor queue length averaged across number of cores (TFS 200097)

Q20972 - Nomad fails a download when similar expired deployment is present (TFS 172581)

Q20970 - Nomad Task Sequence steps fail if Nomad module is not initialized (TFS 197292)

Q20968 - If using SMB to download content from DP in WinPE, the login to the DP share failed and Nomad failed to download the content. (TFS 200073)

Q20966 - The Pre-stage Content Using Nomad step failed to download content over SMB if the SMB path had a backslash at the end (TFS 199950)

Q20964 - If enhanced http was enabled, the Pre-stage Content Using Nomad step failed to download the content. (TFS 200380)

2.6.4.2.5 Web Release-5.0 (19-Mar-2020)

2.6.4.2.5.1 1E Client 5.0.0.745 - 1E Client Non-Windows 5.0.0.745 - 1E Client Android 5.0.0.745 - TIMS 5.0.0.745

2.6.4.2.5.1.1 Tachyon client for Tachyon v5.0

Uses OpenSSL 1.1.1c for secure communication with the Switch and Background Channel

Tachyon.Performance.Metrics.exe is now included in the 1E Client, previously included in the Windows Endpoint Performance Integrated Product pack

Tachyon activity record and storage features enhanced to include:

Software Performance

Operating System Performance

Performance data

New modules: Http.post, Device.GetLocation, Device.SetLocation

Now uses SQLite 1.29.0

Windows support confirmed for Windows 10 1909

Non-Windows now supports Red Hat v8.0 and v6.0

MacOS now supports Catalina 10.15.1

2.6.4.2.5.1.2 Shopping client for Shopping v5.6

Shopping 5.6 client is the Shopping module in 1E Client 5.0

No changes - only hotfixes

2.6.4.2.5.1.3 WakeUp client for NightWatchman Enterprise v7.2.500 and v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 5.0

Now creates WakeUp firewall exception with name '1E Client (WakeUp)' and it's now port specific.

2.6.4.2.5.1.4 Nomad client for Nomad v7.0.100

NomadBranch 7.0.100 client is the Nomad module in 1E Client 5.0

No changes - only hotfixes.

2.6.4.2.5.1.5 Contained fixes:

Q20775 - Agent - GetInboundMappedDriveHistory default columns does not contain 'Port' (TFS 198528)

Q20773 - Agent - Some patches pending reboot have a GUID but no KB ID or Title. (TFS 198284)

Q20739 - WakeUp - Improved logging for WakeUpAgt.exe at debug level (TFS 195904)

Q20737 - Tachyon - Agent - Network.GetArpEntries() shows incorrect CIDR mask (TFS 195491)

Q20733 - Nomad local SSD is not working (TFS 192409)

Q20705 - WSA IPU doesn't fire Task Sequence after upgrade to SCCM 1906 (TFS 186332)

Q20694 - Nomad - when an LST is created for a cloud DP a zero byte file causes download failure (TFS 187014)

Q20682 - Nomad - LSZGEN fails on long file path with Nomad SECure enabled (TFS 187318)

Q20680 - Nomad - LSZGEN issues on DP when CACHEPATH installer property has no trailing backslash (TFS 187334)

Q20678 - Nomad - Physical path in the LSZFILES virtual directory in IIS is not updated when LocalCachePath is changes after installation (TFS 188203)

Q20676 - Nomad downloads previous version of content (TFS 145160)

Q20674 - Nomad - Captive Portal Web page (eg Logon Page from Public Wifi) may cause issues with Nomad Downloads (TFS 156478)

Q20672 - Nomad fails to download updated task sequence references with ConfigMgr Pre-download option (TFS 182309)

Q20670 - Nomad service failure on PBA host with hidden share enabled during PBA backup (TFS 169339)

Q20666 - Nomad - PBA Size estimation doesn't update TS progress bar (TFS 184347)

Q20664 - Nomad not failing package on CRC failure (TFS 136381)

Q20662 - Nomad Status Message Improvements (TFS 107195)

Q20660 - Nomad service may fail whilst running cachecleaner manually (TFS 164341)

Q20658 - Nomad - Unable to download 0365 updates with Nomad (TFS 159484)

Q20624 - WSA doesn't fire Task Sequence after upgrade to SCCM 1906 (TFS 186332)

Q20612 - WSA wireless check (Readiness check) fails if the device connects to both wired and wireless networks (TFS 185832)

Q20592 - Nomad - 1EClient Nomad Module's install fails if Windows Firewall service is disabled or in stopped state (TFS 185011)

Q20590 - Tachyon - Agent- Methods - FileSystem.GetVersionInfo should return data even if OriginalFileName is missing, and should return SuccessNoContent instead of an error if it fails (TFS 184879)

Q20588 - Tachyon - Agent - 1E Client service terminates unexpectedly after a Patch.Deploy failure response using SCCM (TFS 185003)

Q20586 - Tachyon - Agent - Patch.Deploy returns 2 rows on success and none on failure if the PatchSpec is a GUID (TFS 184668)

Q20558 - WSA support in a multi domain environment (TFS 182470)

Q20556 - Tachyon - Agent - exception in Patch.List() while awaiting a reboot to install patches (TFS 183650)

Q20506 - WSA support for FireFox in WSA-ServiceNow (TFS 176154)

Q20504 - WSA support for ServiceNow integration with WSA in Shopping (TFS 176084)

Q20502 - Tachyon - Agent - Initial policy evaluation should be asynchronous (TFS 180719)

Q20500 - Tachyon - Agent - Exclusivity control for Scripting.Run* and NativeServices.RunCommand methods (TFS 180718)

Q20498 - Tachyon - Agent - Reduce noisiness of logging when Nomad is used (TFS 180717)

Q20496 - Tachyon - Agent - Nomad download should check Tachyon Agent cache first (TFS 180714)

2.6.4.2.6 Web Release-4.1 (21-JUN-2019)

2.6.4.2.6.1 1E Client 4.1.0.267 - 1E Client Non-Windows 4.1.0.267 - 1E Client Android 4.1.0.267 - TIMS 4.1.0.267

Tachyon Agent renamed as 1E Client

Enhancements:

Optimize ProcessUsage Minutes storage

Improvements to 1E Client on macOS

Reading certificates from the macOS keystore

DMG file installations

Agent Historic Data Capture feature renamed as Tachyon Activity Record

WSA enhancements:

Applications page includes all installed, normalized applications

Allow conditional download of Windows 10 upgrade packages

Check Windows 10 version readiness checks before upgrading

Perform In-place Upgrade compatibility check in WSA readiness checks

Allow Windows Servicing Assistant to exclude user state migration

Required for environments where TLS 1.0 is disabled.

1E module library renamed as Nomad, replacing NomadBranch client, and extended to support Nomad 7.0

Nomad provides an efficient file transfer mechanism that integrates with Microsoft Systems Center Configuration Manager, providing a host of features that maximize download efficiency and minimize WAN link bandwidth usage, and reduction in the number of servers.

2.6.4.2.6.1.1 Contained fixes:

Q20428 - Tachyon - Device.GetOutboundPrinters() crashes when handling empty registry values (TFS 173720)

Q20390 - Nomad - Allow WSA to exclude data backup (TFS 129030)

Q20384 - Nomad - Cache cleaner unable to remove content when cache already exceeded configured size (TFS 164413)

Q20382 - Nomad O365 download from untrusted forest not using Network Access Account (NAA) (TFS 169177)

Q20368 - Nomad - Active Efficiency Web service logs exception if FQDN is missing from client data (TFS 165641)

Q20350 - Nomad - Same "disqualified" master keeps winning elections. (TFS 163708)

Q20322 - Nomad - Don't download content to USB if it's already in the Nomad cache (TFS 129581)

Q20314 - Nomad - HTTP Proxy causes failures while downloading from Windows Update (TFS 165017)

Q20310 - Nomad Service Failure while logging disqualification details (TFS 163707)

Q20266 - Nomad - SMSTSNomad fails if the Nomad service is slow to start (TFS 154961)

Q20262 - Nomad - NMDS ExtraReplyDelayMS setting capped at 5000 (TFS 154089)

Q20260 - Nomad download logs CopyLoopWait CopyError: Missing File(s) (TFS 127424)

Q20256 - Nomad failing to download SU from Cloud Distribution Points (TFS 154773)

Q20254 - Nomad - TLS 1.2 compliance testing and fixes for Nomad (TFS 151453)

Q20252 - Nomad - CTM DP order with neighboring boundary group DPs (TFS 153928)

Q20250 - Nomad O365 downloads fail when requested range does not exist. (TFS 151169)

Q20248 - Nomad - Active Efficiency Nomad sync is failing with a "Arithmetic overflow error converting expression to data type bigint." error (TFS 71746)

Q20246 - Nomad - Cannot download software updates from Windows Update (TFS 120735)

Q20198 - Nomad - LSZ downloads fail when package contains files with Unicode names. (TFS 154033)

Q20196 - Nomad - Ignore Local SSD if machine is in a NomadInhibitedSubnet (TFS 127086)

Q20194 - Nomad - SSD queries may connect on inhibited subnets if the master moves (TFS 131988)

Q20192 - Nomad - Active Efficiency experiencing database deadlocks at high utilization (TFS 135419)

Q20144 - Nomad - Express Update support for Nomad (from on premises DP) (TFS 146643)

Q20142 - Nomad - RDC doesn't work in some cases (TFS 145476)

Q20138 - Nomad - SMSTSNomad does not set cache priority correctly (TFS 131034)

Q20136 - Nomad - Issues working Nomad HTTP with WINHTTP Proxy (TFS 125541)

Q20134 - Nomad - Disqualifications sent when too many connections reached over HTTP(S) (TFS 129719)

Q20132 - Nomad - Slow Nomad downloads from DP when BranchCache is enabled (TFS 109497)

Q20130 - NomadBranch Range Overlap Exception (TFS 116165)

Q20128 - Nomad Not Sending Error Status Messages (TFS 102476)

Q20056 - NomadBranch fails on NMDS_FIND HTTPPull when trying to restore a PBA user state backup; (TFS 143320)

2.6.4.3 1E Client features by release

A list of features organized by the release they were implemented in. Links through to the features have been provided for convenience.

Each release includes new or enhanced functions and methods in the Agent language (SCALE). Please refer to Tachyon SDK - Functions and Methods Reference for more details.

2.6.4.3.1 New features in 1E Client 8.1

2.6.4.3.1.1 Tachyon client for Tachyon v8.1

The status of all Guaranteed State rules is reported after a configurable number of days, even if the rule status has not changed

New module called Policy to give better visibility into what the current status of Guaranteed State rules:

/document/preview/739118#UUID-1de33ffb-d4e6-aab8-88c6-4bbfbd5b7034_id_PolicyForceStatusReport-ForceStatusReport - trigger the 1E Client to force-send all policy status messages on restart

/document/preview/739119#UUID-dbc9eec3-1781-f814-2efa-8af6b0fc1a2b_id_PolicyGetEventSubscriptions-GetEventSubscriptions - get event subscriptions in current policy

/document/preview/739120#UUID-f0f824b7-163a-72e0-2c9c-6cd39f7a0f05_id_PolicyGetRuleEvaluationHistory-GetRuleEvaluationHistory ([ruleId]) - get the evaluation history for one rule or all rules

/document/preview/739121#UUID-b55da451-c425-a143-6e01-37f100c0b543_id_PolicyGetRules-GetRules - get rules in current policy (with current status)

/document/preview/739122#UUID-daf92ecb-8959-48fc-1b3e-fd6e9a7abd3b_id_PolicyGetStatistics-GetStatistics - get policy-related statistics/perf counters

/document/preview/739123#UUID-d5b70c1f-8194-d25e-337b-f1ce3cbc8a3e_id_PolicyGetSummary-GetSummary - get a summary of the current policy

Policy.Invalidate () - reset the 1E Client's policy to null/empty, which will force a renegotiation of the policy (immediately if connected to Switch, or when it does eventually connect)

New methods:

/document/preview/739176#UUID-65c8a3bf-3714-442a-4c5c-19b77d5e93af_id_StorageList-Delete

New SQL functions:

/document/preview/739230#UUID-4fd278df-907a-b131-c131-e2449af777af_id_HASHSTRING-HASHSTRING, /document/preview/739234#UUID-3d29f21e-8d41-cc2a-e2cd-efc8f7639fe8_id_NEWID-NEWID

Deprecated methods: FileContent.GetTorrentAnnounceUris, FileContent.GetTorrentDescribedFiles, FileContent.GetTorrentInfo

Support for Solaris operating systems has been deprecated

Will not install on Windows XP and Server 2003

Now uses C++ 14, OpenSSL 3.0.0 7 Sep 2021, SQLite 3.36.0

Note

Only Tachyon client features are supported by the 1E Client on non-Windows devices.

2.6.4.3.1.2 Shopping client for Shopping v6.1

Shopping 6.1 client is the Shopping module in 1E Client 8.1

No changes - only hotfixes.

2.6.4.3.1.3 WakeUp client for NightWatchman Enterprise v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 8.1

No changes - only hotfixes.

2.6.4.3.1.4 Content Distribution client for Content Distribution v8.1

NomadBranch 8.1 client is the Content Distribution module in 1E Client 8.1

Set Nomad as Download Program - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Enhancements:

Improvements to the Client authentication criteria to authenticate with a DP (or any download source)

Download reporting now includes Top status bar, for Bandwdith Protection Reporting.

2.6.4.3.1.5 PXE client for PXE Everywhere v8.1

PXE Everywhere Agent is a client module of 1E Client 8.1, available for x64 and x86 platforms

There are no other changes in this version other than hotfixes.

2.6.4.3.1.6 Tachyon Instruction Management Studio (TIMS) v8.1

For more information about TIMS, please refer to Tachyon SDK - Getting started with TIMS.

No changes - only hotfixes.

2.6.4.3.2 1E Client 8.0

2.6.4.3.2.1 Tachyon client for Tachyon v8.0

Real-Time Control Center - updated Client UI in notification area to support Experience Engagements (Announcements and Surveys), and ITSM Support Tickets

New methods:

Device.GetDisks, FileSystem.PathExists, Interaction.ShowAnnouncement, Storage.GetRemote

Updated methods:

Agent.GetDiagnostics, Network.GetIpAddresses, OperatingSystem.ControlService, OperatingSystem.GetProcesses, NativeServices.RunWmiInstanceMethod, NativeServices.RunWmiQuery, NativeServices.RunWmiStaticMethod, Security.UnquarantineDevice, Storage.Set

New capture sources for Tachyon Activity Record:

BootPerformance, SoftwarePerformance.DiskUsage, SoftwarePerformance.ProcessNetworkUsage

Support for the SQLite JSON extension (), allowing JSON data to be queried through SCALE

TAGS installer property for Windows devices - see Tachyon client settings

Support added for the following Operating Systems:

Windows 10 21H1

Fedora 34

openSUSE Leap 15.2

Red Hat Enterprise Linux 7.9

Red Hat Enterprise Linux 8.3

SUSE Linux Enterprise 15.2

> **Note**
>
> Only Tachyon client features are supported by the 1E Client on non-Windows devices.

2.6.4.3.2.2 Shopping client for Shopping v6.1

Shopping 6.1 client is the Shopping module in 1E Client 8.0

Client-side Order Tracking feature - configurable on the Shopping server - to provide toast notifications and 1E Shopping UI popup in the notification area.

2.6.4.3.2.3 WakeUp client for NightWatchman Enterprise v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 8.0

No changes - only hotfixes.

2.6.4.3.2.4 Nomad client for Nomad v8.0

NomadBranch 8.0 client is the Nomad module in 1E Client 8.0

New registry setting SiteSSDMinPackageSizeKB to set the minimum size of content before making SSD request

Installer changes:

Integrating Nomad with WakeUp

Enable Nomad FanOut as a default - default value of SpecialNetShare has changed to 0x2060 (8288)

Platform features enabled by using the BackgroundChannelUrl instead of PlatformURL

Enhancements to CacheCleaner functionality to better support remote users as part of the Working From Anywhere initiative.

2.6.4.3.2.5 PXE client for PXE Everywhere v8.0

PXE Everywhere Agent is a client module of 1E Client 8.0, available for x64 and x86 platforms

Bootshim.efi folder renamed from **BootPrograms** to **NetworkBootPrograms** (1E\Client\Extensibility\PXEEverywhere\NetworkBootPrograms)

There are no other changes in this version other than hotfixes.

2.6.4.3.3 1E Client 5.2

2.6.4.3.3.1 Tachyon client for Tachyon v5.2

New methods: Inventory.GetTables, Network.GetWiFiNetworks

Updated methods: Network.GetConnections, OperatingSystem.GetSummary

New TimeoutSecs parameter in: FileSystem.FindFileByName, FileSystem.FindFileBySizeAndHash, FileSystem.FindDirectoryByName

New policy trigger: DirectoryChange

New installer property for Windows devices: DataRoot

Support for TPM (Trusted Platform Module) based client certificates on Windows

OsLocale and OSInstallUtc included in online messages to Switch to support the Location tile in the Details panel of Tachyon Platform 5.2 - Device View: Overview

Support for Nomad client changes, including use of event policy system, and sharing certificate details

Improved Downloading Tachyon client content and Nomad integration

Description removed from Experience Surveys in Client UI (Interaction module)

Additional installation script for deploying client on macOS when using tachyon.pfx certificate file as an alternative to using the macOS key store

Support added for following Operating Systems:

Windows 10-20H2

macOS on Apple M1 architecture.

> **Note**
>
> Only Tachyon client features are supported by the 1E Client on non-Windows devices.

2.6.4.3.3.2 Shopping client for Shopping v6.0

Shopping 6.0 client is the Shopping module in 1E Client 5.2

Adding support for Single sign-on (SSO) environment and Workgroup devices to respond with machine details on Shopping website.

2.6.4.3.3.3 WakeUp client for NightWatchman Enterprise v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 5.2

No changes - only hotfixes.

2.6.4.3.3.4 Nomad client for Nomad v7.1

NomadBranch 7.1 client is the Nomad module in 1E Client 5.2

ActiveEfficiency features are now provided by Content Distribution on Tachyon Platform 5.2

Client status messages are sent via Tachyon event policy system - Content Distribution uses these instead of StatusMsgEvents using Configuration Manager

New client settings:

DeliveryOptimizationReportingEnabled - monitoring of Delivery Optimization downloads and reporting them to Content Distribution - disabled by default

SupportWPAD - provides support for Web Proxy Auto-Discovery Protocol (WPAD) - disabled by default.

2.6.4.3.3.5 PXE client for PXE Everywhere v4.0.100

PXE Everywhere Agent 4.0.100 is the PXE Everywhere module in 1E Client 5.2

No changes - only hotfixes.

2.6.4.3.3.6 Tachyon Instruction Management Studio (TIMS) v5.2

For more information about TIMS, please refer to Tachyon SDK - Getting started with TIMS.

Multiple tabs

Default instruction type for a new instruction is now Action rather than Question

Validation error when %global% or %environment% variables are used in fragments (InstructionType fix, check, and precondition).

2.6.4.3.4 1E Client 5.1

2.6.4.3.4.1 Tachyon client for Tachyon v5.1

User surveys and notifications, and notification area icon called 1E Client UI. This is used by Tachyon Experience, please refer to:

Tachyon Experience 1.3 - Getting feedback via User Sentiment Surveys: What the end-user sees

Tachyon Experience 1.3 - Getting feedback via General Purpose Surveys: What the end-user sees

Tachyon Experience 1.3 - Getting feedback via General Purpose Surveys: Do not disturb...

Support for user-centric features (user session reporting). This is used by Tachyon Experience, please refer to Tachyon Experience.

Support for Telemetry. Please refer to Tachyon 5.2 - Telemetry data and Tachyon 5.2 - Tachyon Setup: Telemetry for more details.

A TemporaryDirectory configuration setting has been added that can override the default location for 1E Client temporary file storage

Device information has been extended to include:

physical MAC address

inbound IP address (for NAT scenarios)

primary user (also displayed in Devices information popup from the Devices table in Explorer).

Support for VDI features (device resource demand reporting) - this is a preview feature that is not enabled by default.

New modules: Interaction

New methods: Security.QuarantineDevice, Security.ModifyQuarantineWhitelist, Users.GetPrimaryUser

Support added for following Operating Systems:

macOS – Catalina v10.15

CentOS 8.1

Debian 10.4

Fedora 32

openSUSE Leap 15.1

RHEL 8.1

SLES 15.1

Ubuntu 18.04

Note

Only Tachyon client features are supported by the 1E Client on non-Windows devices.

2.6.4.3.4.2 Shopping client for Shopping v6.0

Shopping 6.0 client is the Shopping module in 1E Client 5.1

WSA - Support for nested Task Sequences

WSA - Autofill WiFi passcode on Connection page if available

WSA - Option to disable the Location page

2.6.4.3.4.3 WakeUp client for NightWatchman Enterprise v7.2.500 and v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 5.1

Creates a firewall exception for WakeUp with the name **1E Client (WakeUp)** that is port specific.

2.6.4.3.4.4 Nomad client for Nomad v7.0.200

NomadBranch 7.0.200 client is the Nomad module in 1E Client 5.1

Certificate-based client authentication for Nomad P2P communication

Configuration Manager Enhanced HTTP support

Support for multiple Certificate Authorities

Improved PKI client certificate selection logic

VMWare Workspace One support

Handling download content for "expired" offer

Improved handling of updated Software Update content

Option to reduce election notifications in Nomad logs

2.6.4.3.4.5 PXE client for PXE Everywhere v4.0

PXE Everywhere Agent 4.0 is a client module of 1E Client 5.1

PXE Everywhere Static Responder (to support DHCP Snooping) now has its own installer.

2.6.4.3.5 1E Client 5.0

2.6.4.3.5.1 Tachyon client for Tachyon v5.0

Uses OpenSSL 1.1.1c for secure communication with the Switch and Background Channel

Tachyon.Performance.Metrics.exe is now included in the 1E Client, previously included in the Windows Endpoint Performance Integrated Product pack

Tachyon activity record and storage features enhanced to include:

Software Performance

Operating System Performance

Performance data

New modules: Http.post, Device.GetLocation, Device.SetLocation

Now uses SQLite 1.29.0

Windows support confirmed for Windows 10 1909

Non-Windows now supports Red Hat v8.0 and v6.0

MacOS now supports Catalina 10.15.1

2.6.4.3.5.2 Shopping client for Shopping v5.6

Shopping 5.6 client is the Shopping module in 1E Client 5.0

No changes - only hotfixes

2.6.4.3.5.3 WakeUp client for NightWatchman Enterprise v7.2.500 and v7.3

WakeUp 7.3 client is the WakeUp module in 1E Client 5.0

Now creates WakeUp firewall exception with name '1E Client (WakeUp)' and it's now port specific.

2.6.4.3.5.4 Nomad client for Nomad v7.0.100

NomadBranch 7.0.100 client is the Nomad module in 1E Client 5.0

No changes - only hotfixes.

2.6.4.3.6 1E Client 4.1

Tachyon Agent renamed as 1E Client

Enhancements:

Optimize ProcessUsage Minutes storage

Improvements to 1E Client on macOS

Reading certificates from the macOS keystore

DMG file installations

Agent Historic Data Capture feature renamed as Tachyon Activity Record

WSA enhancements:

Applications page includes all installed, normalized applications

Allow conditional download of Windows 10 upgrade packages

Check Windows 10 version readiness checks before upgrading

Perform In-place Upgrade compatibility check in WSA readiness checks

Allow Windows Servicing Assistant to exclude user state migration

Required for environments where TLS 1.0 is disabled.

1E module library renamed as Nomad, replacing NomadBranch client, and extended to support Nomad 7.0

Nomad provides an efficient file transfer mechanism that integrates with Microsoft Systems Center Configuration Manager, providing a host of features that maximize download efficiency and minimize WAN link bandwidth usage, and reduction in the number of servers.

3 1E Client Deployment Assistant

1E Client Deployment Assistant (CDA) is a wizard that assists with deployment of 1E Client, guiding you through common settings for clients and deployments.

3.1 Introducing 1E Client Deployment Assistant

1E Client Deployment Assistant (CDA) is a wizard that assists with deployment of 1E clients, guiding you through common settings for clients and deployments.

CDA is available as a zip file which you can download from support.1e.com/ .

You use the wizard to do the following:

Create a MST transform file for each MSI containing your chosen settings

Create a text file that contains the command-line for deploying each MSI

Optionally allow deployment of an MSP patch file for each MSI

Optionally connect to Microsoft Endpoint Configuration Manager to:

Create applications and packages

Create deployments and collections for the applications

Distribute source files to Distribution Points.

The wizard creates an answer file which records the chosen settings (the wizard uses a template answer file which controls the default settings seen in the wizard).

You can download the latest Accumulated Hotfix MSP for each client, from the 1E Support Portal. The zip that you download may already contain an MSP file for each client. You should remove this if you have alternate methods of deploying patches.

If you are using Configuration Manager, you must run the wizard on a computer that has the Configuration Manager console installed. Windows ADK (with WinPE add-on) is also required locally if CDA is used to configure a deployment of PXE Everywhere .

To start the wizard, run **1EClientDeploymentAssistant.exe** (using Run as Administrator) which prompts for the following:

Connection to a local or remote Configuration Manager site server

The URLs of Configuration Manager application and package content shares where source files must be copied to.

1E Client Deployment Assistant 8.1 contains the following product versions:

1E Client 8.1.2.62 (includes modules for Nomad , PXE Everywhere , Shopping/WSA , WakeUp)

1E NightWatchman Agent 7.3.0.774

3.2 Implementing

Everything you need to know and things to consider when you deploy the 1E Client using the CDA.

3.2.1 Preparation

A list of requirements and preparation steps before Running the wizard.

3.2.1.1 Download the 1E Client Deployment Assistant

Download the **1EClientDeploymentAssistant.v9.0.x.x.zip** from the https://support.1e.com/ .

When you unzip the file, the contents of the folder are:

1E Client Deployment Assistant Release Information.html

1E_License_Agreement.rtf - the text for the 1E license agreement displayed in the CDA wizard

1EClientDeploymentAssistant.exe - executable that runs the CDA wizard

1EClientDeploymentAssistant.exe.config - configuration file for the executable, mainly used for debugging

1EClientDeploymentAssistantWizard.dll - library supporting the executable

AppImport.xml - the answer file that provides default settings for clients and deployments

GenerateMST.exe - creates MST transform files for the installers

GenerateMST.exe.config - controls the behavior of the GenerateMST.exe application

licenses.txt - edit this file if you want to provide default values for the clients that require licensing (required only for 1E NightWatchman Agent)

Microsoft.Deployment.Compression.Cab.dll - WiX tool used to create the .cab files

Microsoft.Deployment.Compression.dll - WiX tool used to create the .cab files

SACommon.dll - common utilities used in the solution accelerators

Wix Toolset source.zip - files related to the Wix toolkit

The zip file also contains the following folders:

Agent Installation Files - contains the client **.msi** installer files, **.msp** accumulated hotfix files, and base **.mst** transform files

Images - contains Client Deployment Assistant.png

> **Note**
>
> In this documentation, Configuration Manager (CM) means either Microsoft Endpoint Configuration Manager (MECM), or its predecessor Microsoft System Center Configuration Manager (SCCM).

3.2.1.2 To run CDA

3.2.1.2.1 Host computer

The host computer used to run the CDA wizard can be the Configuration Manager site server or another computer that has the following installed:

Configuration Manager console

Microsoft ADK with WinPE addon - only if the CDA wizard is used to create PXE Everywhere applications

It will need to have .Net Framework v4.8 Runtime installed, a check when the wizard runs checks for this being installed, and will if not already installed, provide a link to https://dotnet.microsoft.com/en-us/download/dotnet-framework/net48?cid=getdotnetframework where you will need to download and run the .Net Framework v4.8 Runtime. The link is provided should you wish to install this prior to running the wizard. The installation does require a reboot to complete.

If you are installing PXE Everywhere you must install the **Deployment Tools** feature from the Microsoft Assessment and Deployment Kit (ADK), and the **WinPE addon**. The user running the CDA wizard must have local administrator privileges because the CDA wizard uses *dism.exe* to mount a PXE *.wim* file in order to extract boot image files. Start the wizard using Run as Administrator.

> **Note**
>
> To download and install the Windows ADK go to https://docs.microsoft.com/en-us/windows-hardware/get-started/adk-install. Starting with Windows 10, version 1809, WinPE is an add-

on to the ADK, previously it was included in the ADK. First install the ADK, and then install the WinPE addon. Approximately 7GB disk space is required.

3.2.1.2.2 Domain Accounts

Installer account - used to run the CDA wizard on the host computer, must have local administrator rights on the host computer. If you run the CDA wizard on the Configuration Manager site server, the installer account must also have at least the Application Administrator role in Configuration Manager. Start the wizard using Run as Administrator.

Configuration Manager user - If you run the CDA wizard on a remote computer (other than the Configuration Manager site server), you must specify the user account that will create objects in Configuration Manager. This can be the same as the Installer account or any other domain user account that has at least an Application Administrator role in Configuration Manager

If the **Installer account** and **Configuration Manager user** are different accounts then you must specify the **Configuration Manager user** in the Configuration Manager connection screen.

3.2.1.2.3 Configuration Manager site

Connection to a Configuration Manager site is required even if you only want to use the CDA wizard to create the MST transform files. The site must have software distribution features enabled.

> **Tip**
>
> CDA helps create everything you need to deploy clients and agents in your Configuration Manager environment. If you prefer, you can use CDA in a lab or other environment to create the Configuration Manager application and/or package content (including MST transform files). Then you can copy the content to your production environment and manually create your deployments.
>
> If you don't want CDA to create objects in Configuration Manager then you can use Microsoft's Orca to edit the base MST transform files supplied with CDA, and manually create your deployments.
>
> Orca is a Microsoft tool for creating and editing Windows Installer packages (MSI) and merging modules (MST transforms). It is available from the Windows Installer Development Tools - https://docs.microsoft.com/en-us/windows/desktop/msi/orca-exe.

3.2.1.2.4 Application and Package content source shares

The CDA wizard requires you to specify share names that Configuration Manager uses as application and package content source shares. The CDA wizard creates folders in each share and copies files to them, and Configuration Manager will copy the files and distribute them to Distribution Points. Typically, you will already have these shares, or you can create new ones.

Each content source share must have at least the following share permissions and NTFS security:

Read access by the Configuration Manager site server computer$ account

Write access by the installer account used to run the CDA wizard.

The UNC of each content source share must be provided in the General settings screen. For example, your applications UNC may be: *\\acme-server\dsl$\Applications* and your packages UNC may be: *\\acme-server\dsl$\Packages*.

3.2.1.2.5 Configuration Manager Distribution Point Group

You must have at least one **Distribution Point Group** defined in Configuration Manager if you want to enable the **Distribute Content** option in the General settings screen. This option causes Configuration Manager to distribute application and package source to the Distribution Points after the wizard has been run.

3.2.1.3 Licenses.txt file

A license file is required to run CDA, even if it has incorrect license keys. A default file is supplied in the release root folder which can be modified to include your own license key(s), which is useful if you don't want to type them manually each time you run CDA.

At this time a license key is only required for **1E NightWatchman Agent**, therefore if you are not using the Agent then please use the default file.

The file format is a simple name=value pair with one license per line where the name is the name of the application as it appears in the answer file. For example, the contents of the file will look like this:

```
1E NightWatchman Agent=ACMEXX-5555-6666-JKLM-NOPQ
```

You must update this file if you intend to use the CDA wizard in unattended mode.

If the license file does not exist or if you have not updated it with the license for a particular client agent, you will need to manually type the license key into the **Agent selection** screen in the CDA wizard.

> **Note**
>
> 1E license keys have the format: <name>-<4Chars>-<4Chars>-<4Chars>-<4Chars>
>
> A license key may be reported as invalid if hyphens or other characters have been converted into symbols or Unicode, which can happen if copy+pasted.

> **Note**
>
> 1E Client does not have a license key. Even so, you must adhere to the terms of your license agreement.

3.2.1.4 Infrastructure requirements

When using the CDA wizard you will be required to enter details of your server infrastructure. The following table describes the server infrastructure required if you intend to deploy the corresponding clients or agents.

Server	Used by	Requirements
Tachyon Platform	Tachyon and other client settings Nomad client settings	If you intend to use Tachyon, the Tachyon client screen in the CDA wizard requires details of the Tachyon **Switch** and **Background Channel**. These are normally installed on a single Tachyon server and therefore use the same **DNS Name**. Large environments (over 50,000) may have a Tachyon **Master Stack** server and one or more separate **Response Stack** servers. These may share the same **DNS Name** or have different **DNS Names**. The names required by the Tachyon client screen will depend on the design of your Tachyon system. The Tachyon Master Stack server requires a license obtained from 1E, but details of this are not required by the CDA wizard. For 1E Client 5.2 onwards, Nomad client uses the Content Distribution feature of Tachyon platform, which replaces ActiveEfficiency Server used by earlier versions of Nomad client. You must enable the client if you want Nomad to use any of the following Nomad features. Although not a requirement for generally using Nomad, Tachyon platform must be installed and available before you can use certain Nomad features. The following Nomad features use Content Distribution and require Tachyon platform and Tachyon features of 1E Client to be enabled: Nomad app provides visibility of content distribution activity Single Site Download (SSD) (SSD) Single Site PBA (SSPBA) High Availability PBA (HAPBA) (HAPBA) Get Migration Settings task sequence action used to manage computer associations Nomad Pre-caching Nomad Download Pause.

Server	Used by	Requirements
		The following features were provided in versions of Nomad older than 7.1: 1E Client Health - now provided by the Guaranteed State feature of the Tachyon platform Nomad Dashboard - now provided by Nomad app feature of the Tachyon platform. Nomad can also be used to provide content distribution features for clients, as well as Configuration Manager.
PXE Everywhere Central	PXE Everywhere settings	The CDA wizard requires the URL of the PXE Everywhere Central web service when deploying PXE Everywhere Local client. PXE Everywhere Central is installed on a Configuration Manager Site server, or other Windows server.
NightWatchman Management Center	Tachyon and other client settings 1E NightWatchman Agent settings	NightWatchman Management Center server is required if implementing NightWatchman or WakeUp solutions. The CDA wizard requires the name of the NightWatchman web server (specifically the web server hosting the AFWebService).
WakeUp Server	Tachyon and other client settings	If implementing WakeUp, or Nomad integration with WakeUp, then you require a WakeUp Server. If you have Configuration Manager, you require a WakeUp Server on each Site server that has clients reporting into it. If you do not have Configuration Manager, you require one or more independent WakeUp Servers. Ideally, you would install the WakeUp Server before deploying the 1E Client with the WakeUp client module enabled, but that is not a prerequisite for using the CDA wizard.
Shopping Central	Tachyon and other client settings	The CDA wizard requires the URL of the Shopping Central self-service portal when configuring the Shopping client module of the 1E Client. A Shopping solution requires a Shopping Central server on a web server, and a Shopping Receiver installed on each Configuration Manager Site

Server	Used by	Requirements
		server that has a client reporting to it, and on a CAS if using Shopping for OS Deployment. You can deploy the 1E Client without Tachyon servers or Tachyon license. If users are using Edge or Metro browsers, then you must enable the loopback feature option in the CDA wizard. This feature implements a mechanism for passing information between the Shopping client, the browser's secure sandboxed environment and the local machine. This mechanism affects these browsers as a whole and is not just restricted for use by Shopping. **Note** Before enabling the **Edge/Windows App browser support** option, check your security policy on enabling loopback and be aware of the implications of allowing access between browsers and the local machine.

3.2.1.5 Configuration Manager objects

For each 1E Client, the CDA wizard allows you to choose whether to create the following objects in Configuration Manager:

Application and Deployment Type

Package and Program

Device Collection and Deployment for the Application(these are not created for packages, because packages are generally used only in Task Sequences).

Please refer to Configuration Manager objects for more detail on these objects.

Each 1E Client agent has **Specify application and/or package information** screen with the following options:

Installation Files Directory	Mandatory	Tells the CDA wizard where to locate the 1E Client source files that you extracted when you unzipped the 1E Client Deployment Assistant (CDA) files. These are used to create Configuration Manager applications and packages.
Create Application	Optional	Determines if an application for the client is created in Configuration Manager.

		You must check **Create Application** and/or **Create Package** option to enable and click on the **Next** button. If this option is not checked, then the CDA Wizard will not copy files and create an MST transform in the **Application Content Source** specified in the General settings screen.
Create Application Deployment	Optional	Only enabled if you choose **Create Application** and determine whether a required deployment type for the application is created in Configuration Manager.
Create/Select Device Collection	Mandatory if **Create Application Deployment** is enabled	The device collection is used to deploy the application. If specified, then the CDA wizard will also create a deployment for the application's deployment types and the specified collection. A default name is suggested, which you can change. If the name you entered for **Create/Select Device Collection** does not exist, one is created. You must manually populate the created device collection after running the CDA wizard. You can click **Browse** to choose from a list of existing collections that you have access to using Configuration Manager RBAC. If you do this, you will not have the option to associate the device collection with a **Limiting Collection**.
Limiting Collection	Mandatory if **Create Application Deployment** is enabled	If you are creating a new device collection, you must also choose an associated **Limiting Collection**. This limits administrators to populating the new device collection with devices only from the selected **Limiting Collection**. By default, this is **All Systems**, but you can click **Browse** to choose from a list of existing collections that you have access to using Configuration Manager RBAC.
Create Package	Optional	Determines if a legacy package and associated install and uninstall programs for the client are created in Configuration Manager.

You must check **Create Application** and/or **Create Package** options to enable and click on the **Next** button.

If this option is not checked, then the CDA wizard will not copy files and create an MST transform in the **Package Content Source** specified in the General settings screen.

> **Note**
>
> Packages are created primarily for use in Task Sequences, therefore the CDA wizard sets the **Allow this program to be installed from the Ins tall Package task sequence without being depl oyed** property, and does not create collections or deployments.
>
> Do not use this option unless you require a package to be created. You can re-run CDA wizard later to create one if required.

3.2.2 Running the wizard

Steps for running the CDA wizard interactively, with details of common deployment and configuration options for each client agent.

1E Client Deployment Assistant 8.1 creates objects for the following 1E products:

1E Client 8.1.2.62 (includes modules for Nomad , PXE Everywhere, Shopping/WSA, WakeUp)

1E NightWatchman Agent 7.3.0.774

Before you run the CDA wizard, ensure you have reviewed the requirements and completed the preparation steps listed on the Preparation page.

3.2.2.1 Running the wizard in interactive mode

3.2.2.1.1 Start

Start the wizard using **Run as administrator**.

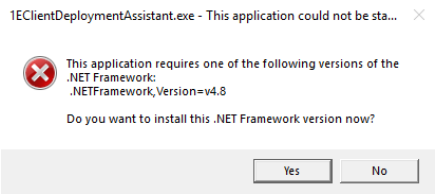
In the folder where you unzipped the 1E Client Deployment Assistant, right-click **1EClientDeploymentAssistant.exe** and from the context menu, choose **Run as administrator**.

If you do not already have .NET Framework v4.8 Runtime installed on the device before the Welcome screen is displayed, a popup is displayed prompting you to install the .NET Framework. This takes you to the https://dotnet.microsoft.com/en-us/download/dotnet-framework/net48?cid=getdotnetframework page where you should download and run the .Net Framework v4.8 Runtime. You must reboot after after installation, after which you can restart the 1E Client Deployment Assistant.

.NET Framework v4.8 is required by:

1E Client Deployment Assistant

1E Client.

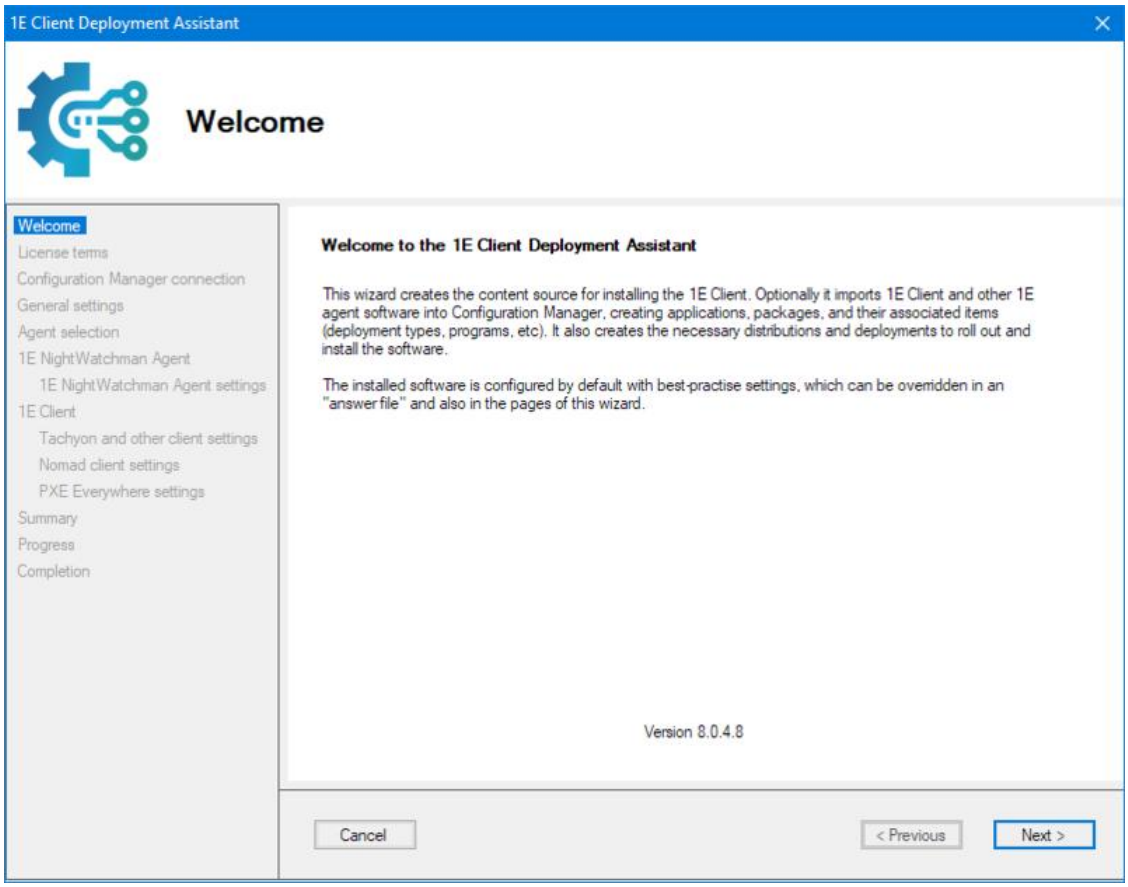


Note

The pictures on this page may not show the latest versions of 1E products.

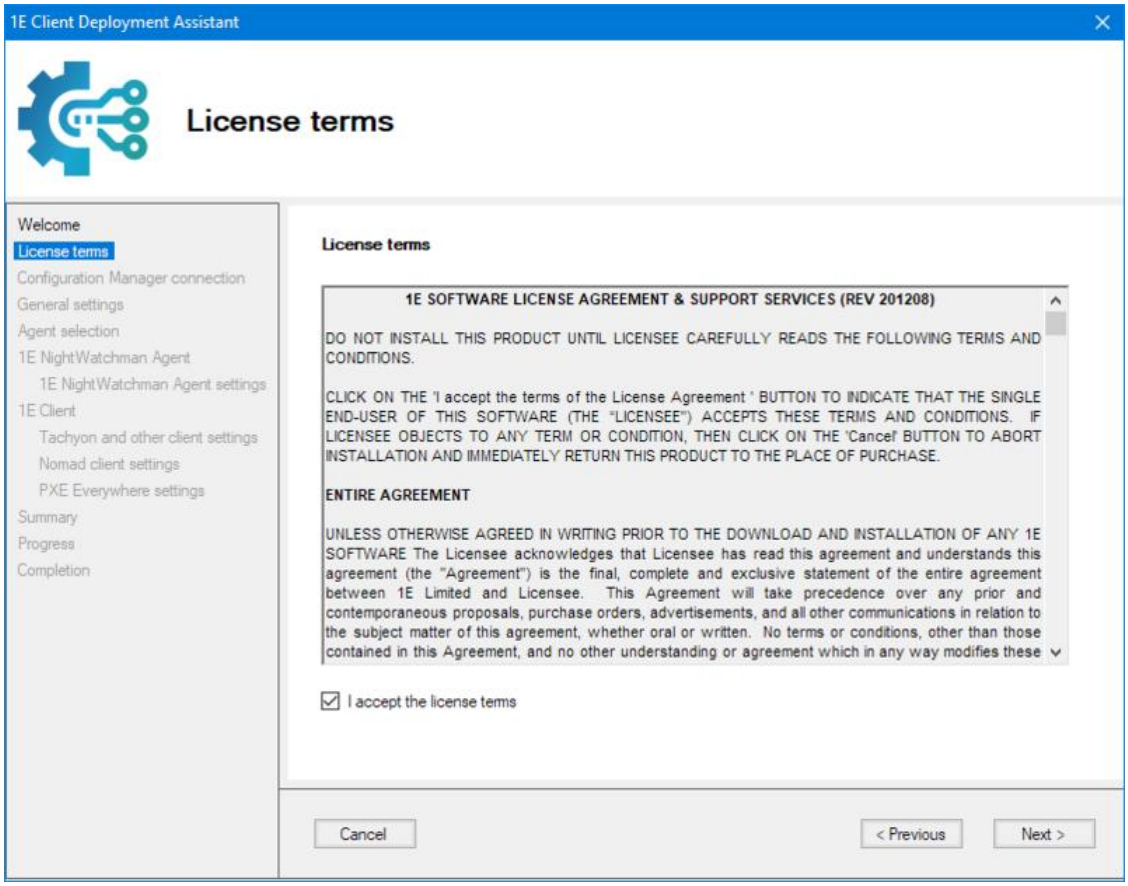
3.2.2.1.2 Welcome

On the **Welcome** screen click **Next**.



3.2.2.1.3 License terms

Check **I accept the license terms** and click **Next**.



3.2.2.1.4 Configuration Manager connection

Choose the Configuration Manager site server to connect to:

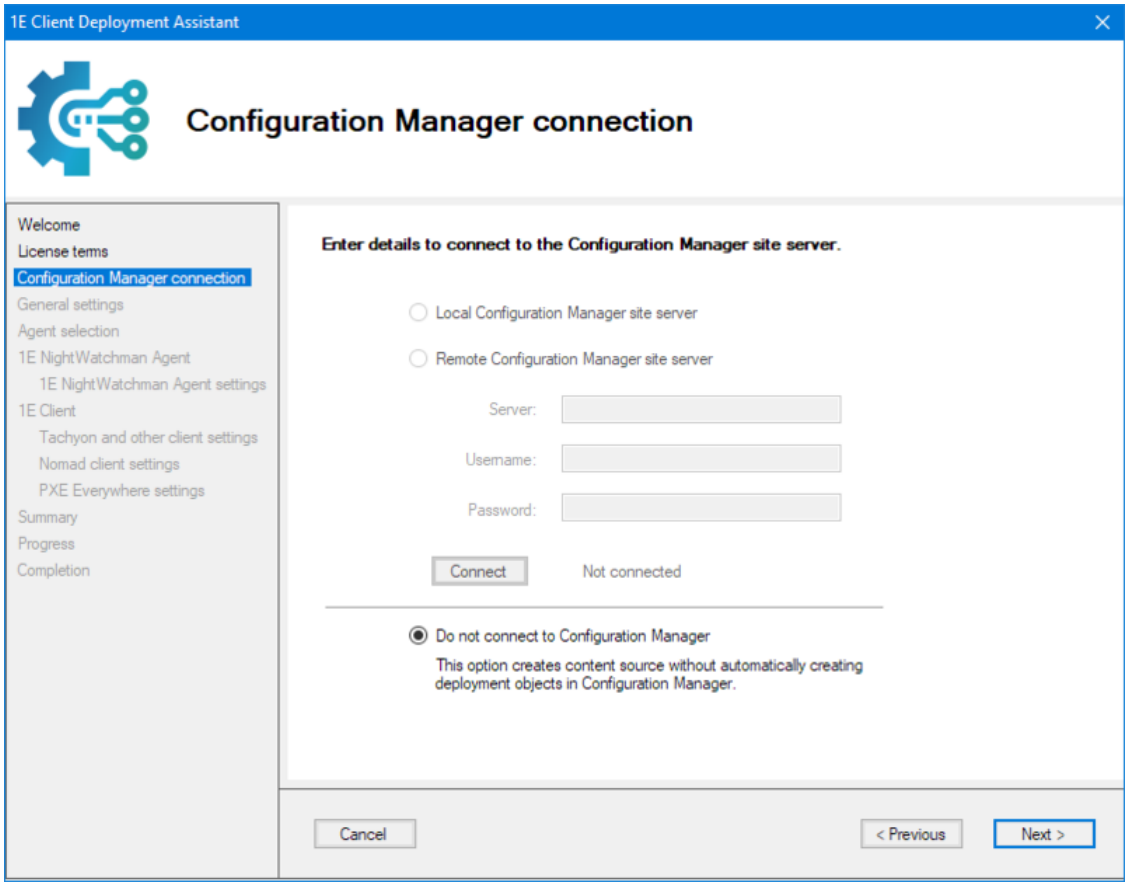
Local Configuration Manager Site Server – use this if the CDA wizard is being run on a Configuration Manager site server

Remote Configuration Manager Site Server – use this option to specify the location of a remote site server and the account used to authenticate the user

> **Note**
>
> If you have selected either of the above Configuration Manager options, click **Connect** and confirm **Connected**.
>
> To automatically create applications or packages in Configuration Manager, you must run CDA on site server or another computer that has the Configuration Manager console installed.

Do not connect to Configuration Manager- this option allows you to create content source without automatically creating deployment objects in Configuration Manager.

Click **Next**.



3.2.2.1.5 General settings

Review the following and click **Next** when completed.

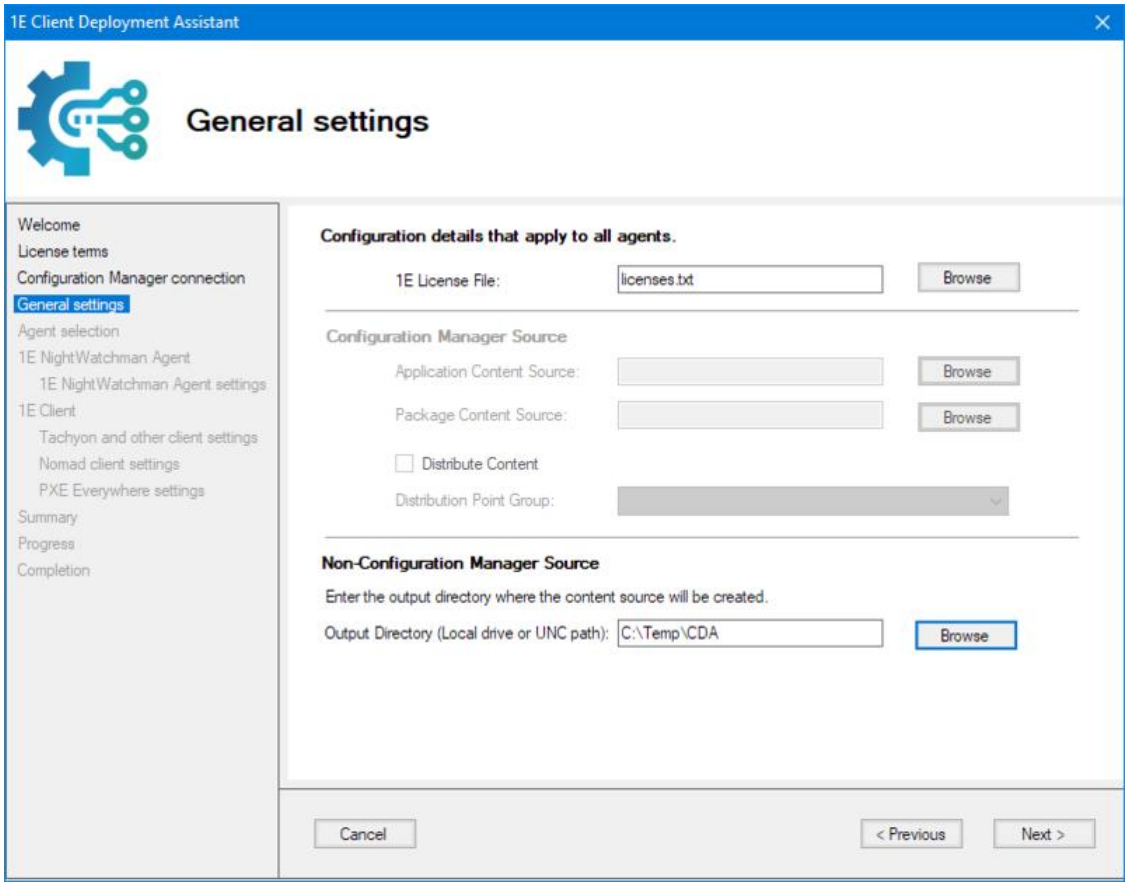
1E License File	Mandatory	If you wish to use a license file other than the default *license.txt* file, then select your own file by using the **Browse** button. A license file is required to run CDA, even if it has incorrect license keys. A default file is supplied in the release root folder which can be modified to include your own license key(s), which is useful if you don't want to type them manually each time you run CDA. At this time a license key is only required for **1E NightWatchman Agent**, therefore if you are not using the Agent then please use the default file.

		For guidance on how to add a license to the file, please see Licenses.txt file. **Warning** After you have moved to the Agent selection screen and the license keys have been validated, you cannot return to this screen and choose a different license file. You can either restart the CDA wizard and select the correct file, or manually enter new keys. The license file is ignored if the AppImport.xml answer file is pre-populated with license keys.
Application Content Source	Mandatory if using Configuration Manager	Enter the UNC of the Configuration Manager **Application Content Source** share where the wizard saves content source for use by Configuration Manager applications. The wizard will create 1E folders below it. For example, your applications UNC may be: `\\acme-server\dsl$\Applications`.
Package Content Source	Mandatory if using Configuration Manager	Enter the UNC of the Configuration Manager **Package Content Source** share where the wizard saves content source for use by Configuration Manager packages. The wizard will create 1E folders below it. For example, your packages UNC may be: `\\acme-server\dsl$\Packages`.
Distribute Content	Optional	Check this option if you want Configuration Manager to distribute application and package source to the distribution points after the wizard has been run. **Warning** Do not use this option if you need to add additional files to the application and/or package content, for example MST

		transform files based on the files created by the wizard as described in Advanced configuration. You will need to update the content and then manually instruct Configuration Manager to distribute. When enabled, a warning is displayed indicating **Distribution is enabled**, which can be helpful if this option had been enabled in the AppImport.xml answer file.
Distribution Point Group	Mandatory if **Distribute Content** is enabled.	Select a **Distribution Point Group**.
Output directory	Mandatory if not using Configuration Manager.	You can enter a local drive, or a UNC path of a network share, where the wizard will save the content source that will be created by the Wizard.

Note

In the previous version of CDA, this screen included a URL for the ActiveEfficiency Server, which was only used by Nomad. In this release instead, it uses Content Distribution, a component of the Tachyon platform. Therefore, ActiveEfficiency Server is no longer required, except as an optional component of a 1E Shopping solution, and there is no requirement to provide a URL.



3.2.2.1.6 Agent selection

Check each of the clients and agents you want to deploy and then click Next.

If you have not already added your NightWatchman Agent license key to the Licenses.txt file, or AppImport.xml file, then you can type a license key. You can override the license key displayed. Only the format of the license key is validated.

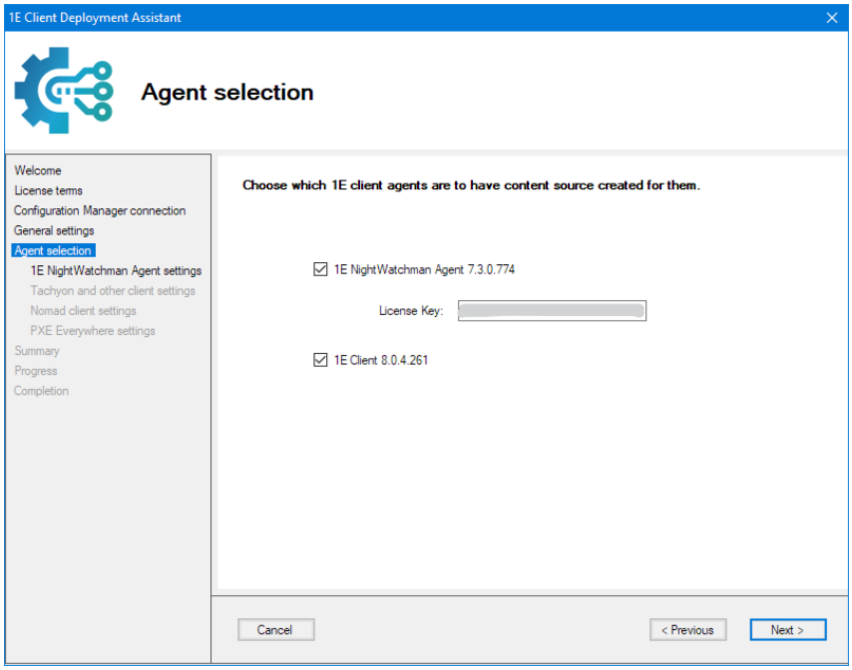
Note

1E license keys have the format: <name>-<4Chars>-<4Chars>-<4Chars>-<4Chars>

A license key may be reported as invalid if hyphens or other characters have been converted into symbols or Unicode, which can happen if copy+pasted.

Note

1E Client (1E Client, Shopping, WakeUp, Nomad, and PXE Everywhere) does not require a license key.



3.2.2.1.7 1E NightWatchman Agent application and package information

Review the following and click **Next** when completed.

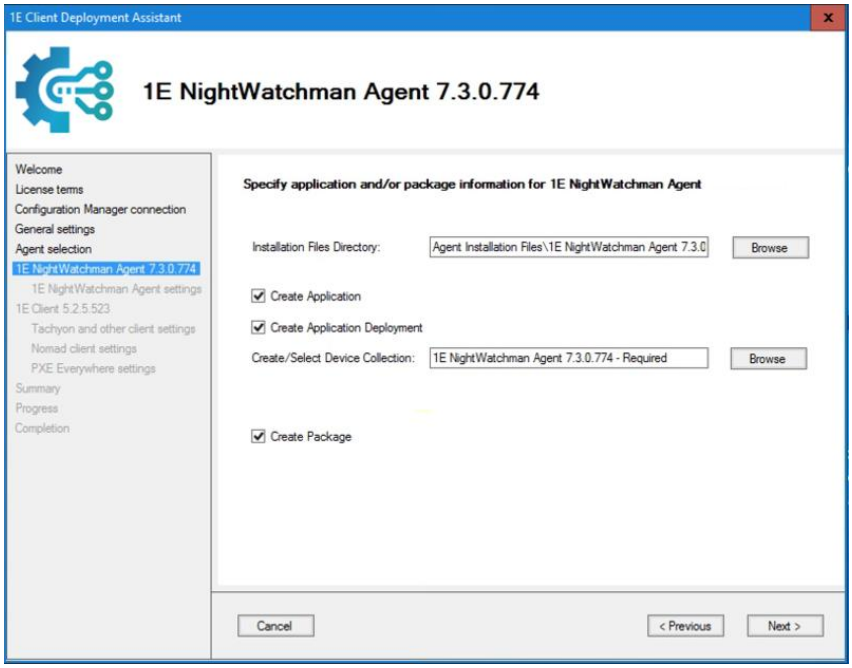
Installation Files Directory	Mandatory	Tells the CDA wizard where to locate the 1E Client source files that you extracted when you unzipped the 1E Client Deployment Assistant (CDA) files. These are used to create Configuration Manager applications and packages.
Create Application	Optional	Determines if an application for the client is created in Configuration Manager. You must check **Create Application** and/or **Create Package** option to enable and click on the **Next** button. If this option is not checked, then the CDA Wizard will not copy files and create an MST transform in the **Application Content Source** specified in the General settings screen.
Create Application Deployment	Optional	Only enabled if you choose **Create Application** and determines whether a required deployment type for the application is created in Configuration Manager.
Create/Select Device Collection	Mandatory if **Create Applicati**	The device collection used to deploy the application. If specified, then the CDA wizard will also create a

	on Deployment is enabled	deployment for the application's deployment types and the specified collection. A default name is suggested, which you can change. If the name you entered for **Create/Select Device Collection** does not exist, one is created. You must manually populate the created device collection after running the CDA wizard. You can click **Browse** to choose from a list of existing collections which you have access to using Configuration Manager RBAC. If you do this, you will not have the option to associate the device collection with a **Limiting Collection**.
Limiting Collection	Mandatory if **Create Application Deployment** is enabled	If you are creating a new device collection, you must also choose an associated **Limiting Collection**. This limits administrators to populating the new device collection with devices only from the selected **Limiting Collection**. By default, this is **All Systems**, but you can click **Browse** to choose from a list of existing collections which you have access to using Configuration Manager RBAC.
Create Package	Optional	Determines if a legacy package and associated install and uninstall programs for the client are created in Configuration Manager. You must check **Create Application** and/or **Create Package** options to enable and click on the **Next** button. If this option is not checked, then the CDA wizard will not copy files and create an MST transform in the **Package Content Source** specified in the General settings screen. **Note** Packages are created primarily for use in Task Sequences, therefore the CDA wizard sets the **Allow this program to be installed from the Install Package task sequence without being deployed** property, and does not create collections or deployments.

Do not use this option unless you require a package to be created. You can re-run CDA wizard later to create one if required.

Note

In previous versions the 1E Agent included WakeUp and NightWatchman. WakeUp is now included in the 1E Client, and NightWatchman is a separate client agent.



3.2.2.1.8 1E NightWatchman Agent settings

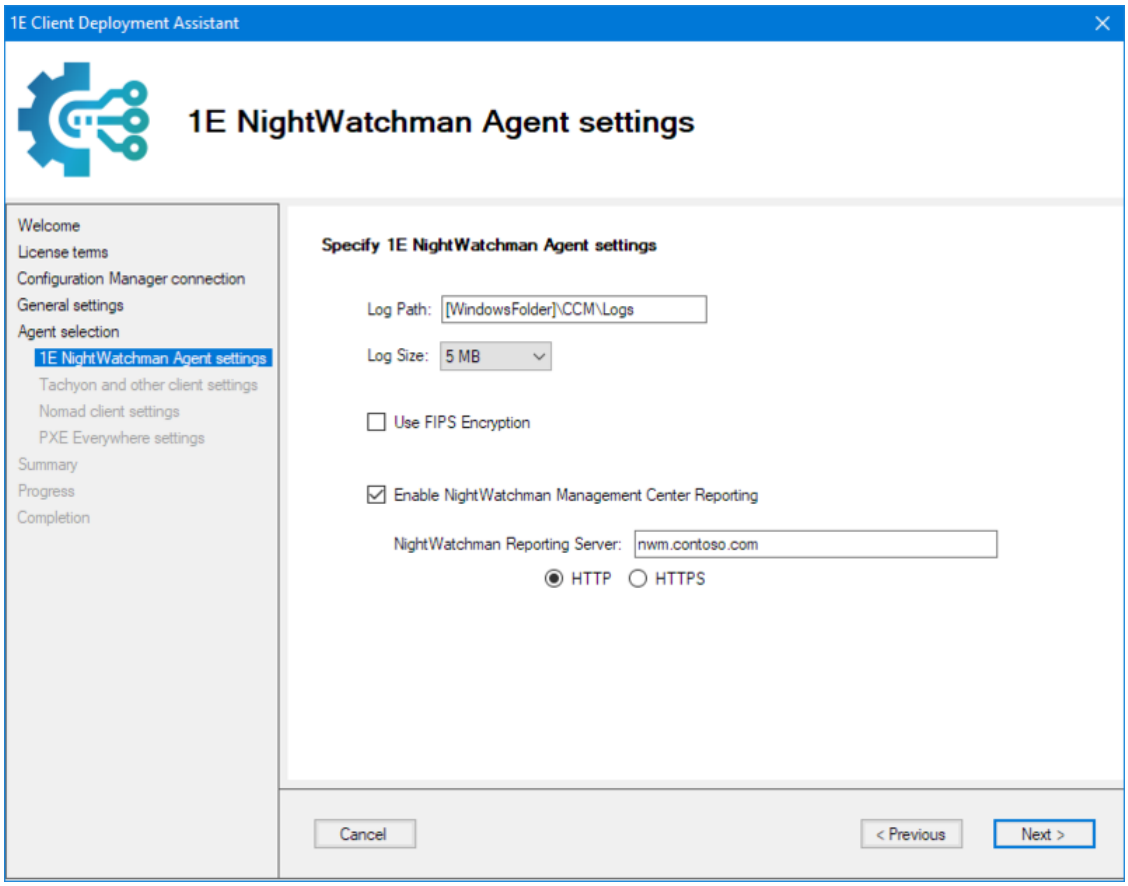
Review the following and click **Next** when completed.

Log Path	Mandatory	The path to the 1E NightWatchman Agent logs. The default path keeps the log files together with the Configuration Manager client logs. It uses *[WindowsFolder]* which is a Windows installer property name that refers to the Windows folder.

Log Size	Mandatory	The size of for the NightWatchman Agent log files. We recommend 5 MB.
Use FIPS Encryption	Optional	Check this option to enable the FIPS Encryption for NightWatchman and WakeUp. **Warning** You must use the same FIPS setting on all WakeUp clients, all WakeUp Servers, and on the NightWatchman Management Center server(s). Please ensure you use the same setting if you have previously deployed NightWatchman or 1E Agent, unless you are sure you want to change it.

Enable NightWatchman Management Center Reporting	Optional	Check this option if you have a NightWatchman Management Center server installed, and want NightWatchman to report power state changes and retrieve policy settings.
NightWatchman Reporting Server	Mandatory if **NightWatchman reporting** is enabled	Enter the name of the NightWatchman Management Center server in the format: *<serverFQDN>* Where **serverFQDN** is normally a DNS alias. The installer uses this name in the ServiceURL registry value for the WakeUp client, and references the AFWebService. **Warning** Please ensure you use the same setting if you have previously deployed NightWatchman or 1E Agent, unless you are sure you want to change it.

Select either the **HTTP** or **HTTPS** protocol.



3.2.2.1.9 1E Client application and package information

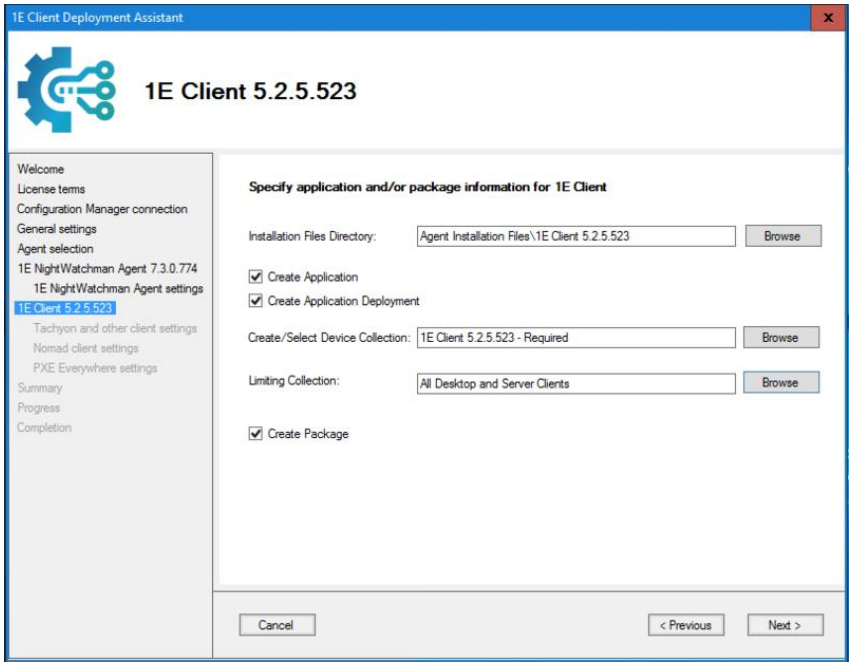
Review the following and click **Next** when completed.

Installation Files Directory	Mandatory	Tells the CDA wizard where to locate the 1E Client source files that you extracted when you unzipped the CDA files. These are used to create Configuration Manager applications and packages.
Create Application	Optional	Determines if an application for the client is created in Configuration Manager. You must check **Create Application** and/or **Create Package** option to enable and click on the **Next** button. If this option is not checked, then the CDA Wizard will not copy files and create an MST transform in the

		Application Content Source specified in the General settings screen.
Create Application Deployment	Optional	Only enabled if you choose **Create Application** and determines whether a required deployment type for the application is created in Configuration Manager.
Create/Select Device Collection	Mandatory if **Create Application Deployment** is enabled	The device collection used to deploy the application. If specified, then the CDA wizard will also create a deployment for the application's deployment types and the specified collection. A default name is suggested, which you can change. If the name you entered for **Create/Select Device Collection** does not exist, one is created. You must manually populate the created device collection after running the CDA wizard. You can click **Browse** to choose from a list of existing collections which you have access to using Configuration Manager RBAC. If you do this, you will not have the option to associate the device collection with a **Limiting Collection**.
Limiting Collection	Mandatory if **Create Application Deployment** is enabled	If you are creating a new device collection, you must also choose an associated **Limiting Collection**. This limits administrators to populating the new device collection with devices only from the selected **Limiting Collection**. By default, this is **All Systems**, but you can click **Browse** to choose from a list of existing collections which you have access to using Configuration Manager RBAC.
Create Package	Optional	Determines if a legacy package and associated install and uninstall programs for the client are created in Configuration Manager. You must check **Create Application** and/or **Create Package** options to enable and click on the **Next** button. If this option is not checked, then the CDA wizard will not copy files and create an MST transform in the

Package Content Source specified in the General settings screen.

> **Note**
>
> Packages are created primarily for use in Task Sequences, therefore the CDA wizard sets the **Allow this program to be installed from the Install Package task sequence without being deployed** property, and does not create collections or deployments.
>
> Do not use this option unless you require a package to be created. You can re-run CDA wizard later to create one if required.



3.2.2.1.10 Tachyon and other client settings

Review the following and click **Next** when completed.

Enable 1E	Optional	Check this option to enable Tachyon real-time client features of 1E Client to be used.
Switch	Mandatory if Tachyon is	Enter the connection details for the Tachyon Switch in the format: *<DNSnameFQDN>:<port>*

	enabled	Where **DNSnameFQDN** is normally a DNS alias, as used in the Tachyon Switch certificate, which is normally the same as the Tachyon Web Server certificate. **Port** is normally 4000. **Warning** Please ensure you use the same setting if you have previously deployed 1E Client with Tachyon platform client features enabled.
Background Channel URL	Mandatory if Tachyon is enabled	Enter the URL list containing one or more 1E Client Deployment Assistant Background Channel URL in the format: *https://<DNSnameFQDN1:443/Background/;https://<DNSnameFQDN2:443/Background/* Where **DNSnameFQDN** is normally a DNS alias, as used in the Tachyon Web Server certificate. **Warning** Please ensure you use the same setting if you have previously deployed 1E Client with Tachyon platform client features enabled.
Default Stagger Range Seconds	Mandatory if Tachyon is enabled	Enter the **Default Stagger Range Seconds**. The default is 300 (5 minutes).
Enable Inventory Insights	Optional	Uncheck this option to disable the Inventory module of 1E Client. Inventory supports the **Tachyon Activity Record** feature (also known as Inventory, and Historical Data Capture) which is required when using the Tachyon Connector for AppClarity or Application Migration. You can enable this separately from Tachyon, but the captured data cannot be used unless it is enabled.
Enable Interaction	Optional	Uncheck this option to disable the Interaction module of 1E Client. This feature was introduced in Tachyon 5.1.

		The Interaction module supports the **User Surveys and Notifications** feature (also known as 1E Client UI) which is required when using the Survey feature of Experience, and user-centric sampling features. You can enable this separately from Tachyon, but the captured data cannot be used unless the **Tachyon** is enabled.
Do not disturb	Optional	Uncheck this option to disable **Do not disturb** mode and allow the Client UI to show notifications from startup. Check this option to enable **Do not disturb** mode and stop the Client UI showing notifications, causing any surveys sent to this device to time out. If **Notification icon** is enabled, users will be able to enable or disable notifications by using the **Do not disturb** option. However, each time the user signs in, the **Do not disturb** mode will be reset.
Notification icon	Optional	Uncheck this option to disable the 1E Client UI notification icon. If enabled, the icon appears shortly after the user signs in.
Sample user interaction	Optional	Uncheck this option to disable Experience sampling the performance of user interactions with application windows in user sessions.
Local port	Mandatory if **Interaction** is enabled	The port number used for local communication between the 1E Client service and the 1E Client UI. Port is configurable between 100 and 65535. The default is 7766.

Enable Shopping	Optional	Check this option to enable the Shopping client module of 1E Client, which includes Windows Servicing Assistant (WSA).
Shopping Web URL	Mandatory if	Enter the **Shopping Web URL** in the format:

	Shopping is enabled	*http://<serverFQDN>/Shopping* where **serverFQDN** is normally a DNS alias. This option is available only if **Shopping** is enabled. **Warning** Please ensure you use the same setting if you have previously deployed 1E Client with Shopping client module enabled, unless you are sure you want to change it.
Enable Edge / Windows App browser support	Optional	Check this option to enable support for Microsoft Edge/Windows App browsers. This option is available only if **Shopping** is enabled.
Enable WakeUp	Optional	Check this option to enable the WakeUp client module of 1E Client.
Use FIPS Encryption	Optional	Check this option to enable the FIPS Encryption for WakeUp. This option is available only if **WakeUp** is enabled. **Warning** You must use the same Encryption setting on all WakeUp clients, all WakeUp Servers, and on the

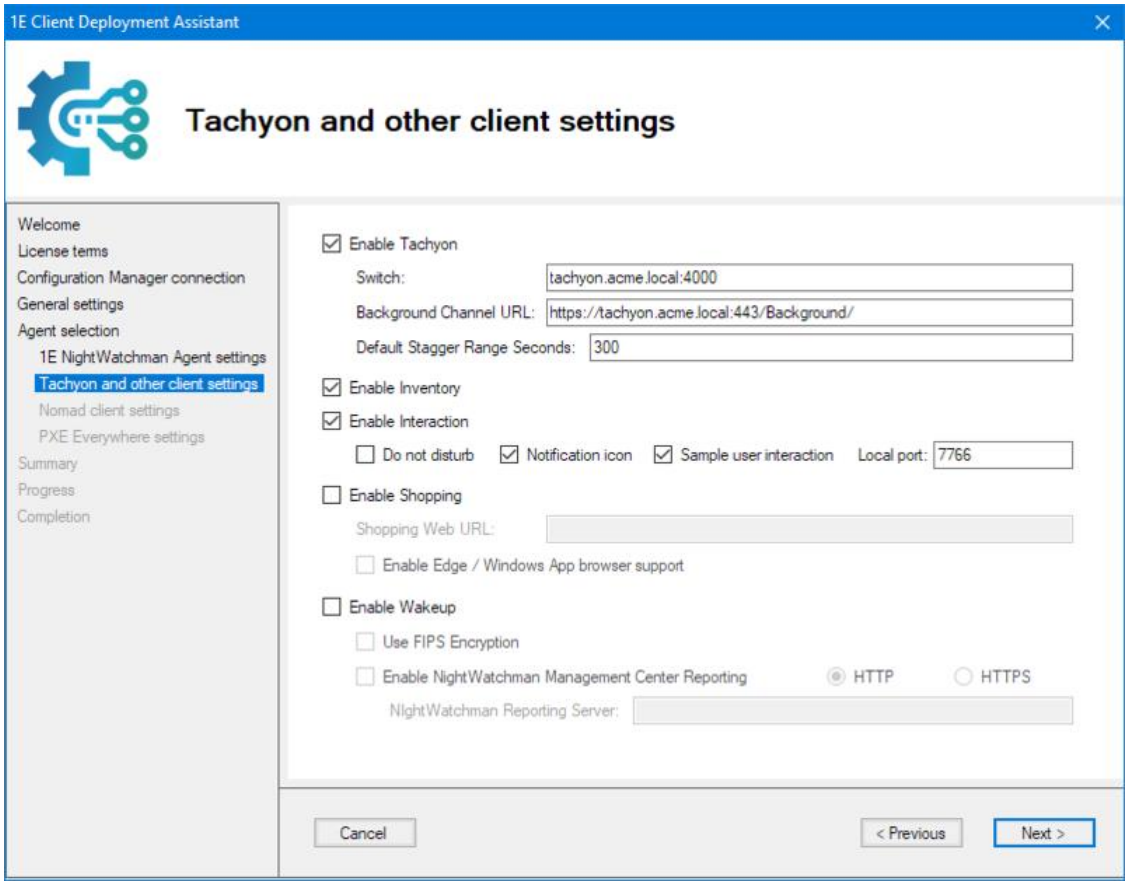
		NightWatchman Management Center server(s). Please ensure you use the same setting if you have previously deployed 1E Client or 1E Agent, unless you are sure you want to change it. **Note** Enabling FIPS Encryption will override the EncryptionLevel used by WakeUp, which is disabled by default. If you want to have FIPS Encryption disabled and WakeUp Encryption enabled then you must manually edit the EncryptionLevel setting in the MST. Please refer to Advanced configuration for how to edit an MST.
Enable NightWatchman Management Center Reporting	Optional	Check this option if you have a **NightWatchman Management Center** server installed, and want WakeUp to report subnet changes.

		Select either the **HTTP** or **HTTPS** protocol. These options are available only if **WakeUp** is enabled. This option is especially useful for computer which change location frequently. WakeUp reports subnet changes immediately, whereas NightWatchman reports changes according to its inventory reporting schedule. WakeUp only supports Wake-on-LAN for wired connections and not for wireless, therefore a laptop reporting a subnet change from wired (docked) to wireless helps the WakeUp Server avoid wakeup attempts on the wired connection, and a wakeup failure will be attributed to the wireless subnet.
NightWatchman Reporting Server	Mandatory if **NightWatchman Reporting** is enabled	Enter the name of the NightWatchman Management Center server in the format: *<serverFQDN>* Where **serverFQDN** is normally a DNS alias. This option is available only if **WakeUp** is enabled. The installer uses this name in the ServiceURL registry value for the WakeUp client,

and references the AFWebService.

Warning

Please ensure you use the same setting if you have previously deployed 1E Agent or 1E Client with WakeUp client module enabled, unless you are sure you want to change it.



3.2.2.1.11 Nomad client settings

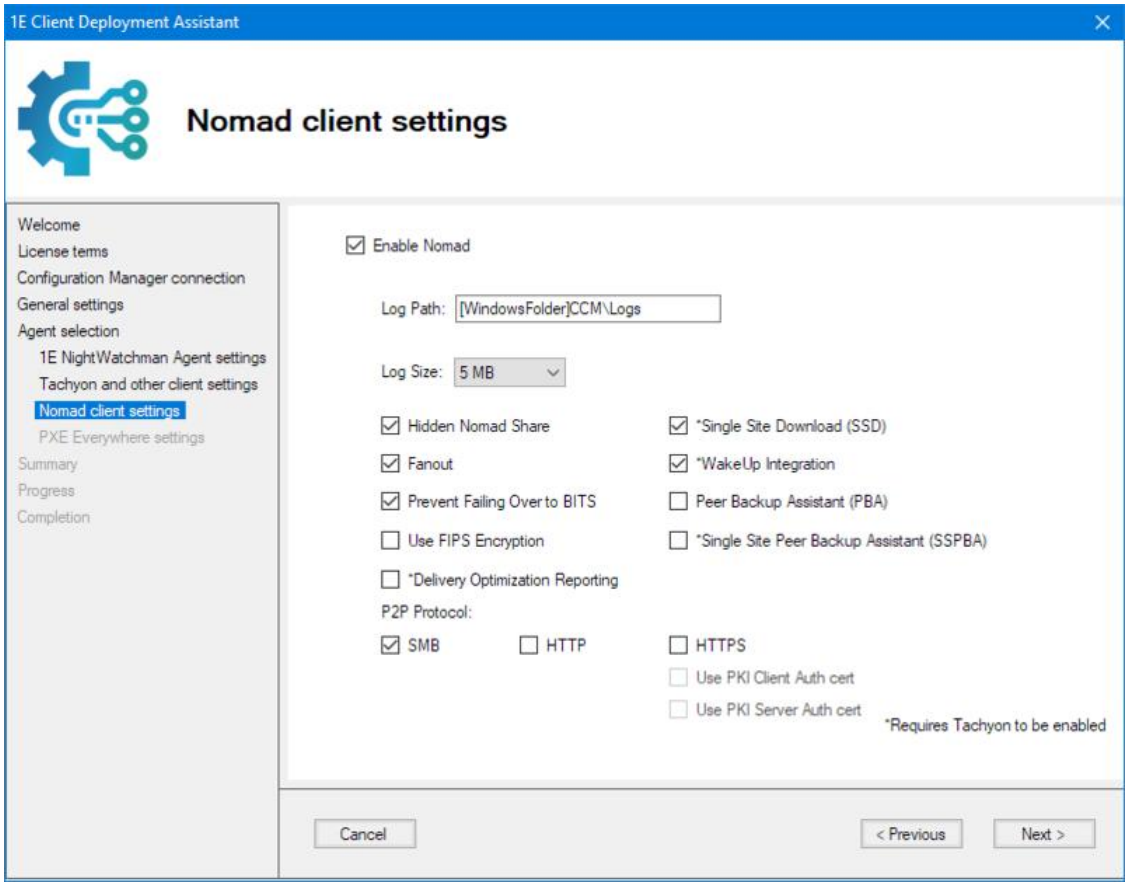
Review the following and click **Next** when completed.

Enable Nomad	Optional	Check this option to enable the Nomad client module of 1E Client.
Log Path	Mandatory if Nomad is enabled.	Enter the path to the logs. The default path keeps the log files together with the Configuration Manager client logs. It uses *[WindowsFolder]* which is a Windows installer property name that refers to the Windows OS folder. This default is useful for client OS. For location may be different for CM servers. For example CM logs on a Management Point server may be located in C:\Program Files\SMS_CCM\Logs if the MP roles was installed prior to the CM client.
Log Size	Mandatory if Nomad is enabled.	Select the size of for the log files. We recommend 5 MB.
Hidden Content Distribution Share	Optional	Check this to enable the hidden share feature and to prevents end-users from accidentally accessing the share. **Warning** If you tick this box, you must ensure that all Nomad installations are configured to use this feature. Please ensure you use the same setting if you have previously deployed Nomad Branch or 1E Client with Nomad client module enabled, unless you are sure you want to change it. **Note** Best practice is to use a **Hidden Nomad Share**. The default for this setting in the NomadMSI is disabled

		to be consistent with previous versions of installers and avoid issues for customers who deploy Nomad by other means.
Fanout	Optional	Check this to enable the **Fanout** feature. This feature is especially useful in large organizations with many networks.
Prevent Failing Over to BITS	Optional	Check this to prevent downloads from reverting to using BITS if an error occurs. It ensures that any download errors are reported back effectively with minimum impact on remote sites.
Use FIPS Encryption (v6 onwards)	Optional	Check this to ensure that Nomad is FIPS compliant in its communications. **Warning** You must use the same FIPS setting on all Nomad clients. Please ensure you use the same setting if you have previously deployed Nomad Branch or 1E Client with Nomad client module enabled, unless you are sure you want to change it.
Delivery Optimization Reporting	Optional	Check this to enable Nomad to monitor and report on Delivery Optimization (DO) downloads. Delivery Optimization monitoring and reporting is only supported in full versions (OS with UI) of Windows Server 2016 and Windows 10 Version 1909 onwards.

		You must have **Tachyon enabled** and **Tachyon Platform** installed for this feature to work.
Single Site Download (SSD)	Optional	Check this to enable Nomad single-site download feature where Nomad master caches can service an entire local site not just the local subnet. You must have **Tachyon enabled** and **Tachyon Platform** installed for this feature to work. See also **SSPBA** below.
WakeUp Integration	Optional	Check this to enable WakeUp integration so that machines where the Nomad cache contains a particular package can be used by the Nomad master even if the machine with the cache is currently switched off. You must have **Tachyon enabled** and **Tachyon Platform** installed for this feature to work. You will also need **NightWatchman and WakeUp** system.
Peer Backup Assistant (PBA)	Optional	Check this to enable Nomad PBA feature. See also **SSPBA** below, and **SDD** above. This OS deployment feature enables Nomad to be used as a data store for USMT data to migrate user settings from the old OS to the new one. It removes the necessity for specifically provisioning state migration points or servers to hold the backup data.

Single Site Peer Backup Assistant (SSPBA)	Optional	Check this to enable Nomad **SSPBA** feature (only enabled if **Peer Backup Assistant** is checked). You must have **Tachyon enabled** and **Tachyon Platform** installed for this feature to work. See also **SSD** above.
P2P Protocol	Optional	Check one or more of the following: SMB HTTP HTTPS When selecting HTTPS you can also check one or both of the following: Use PKI Client Auth cert Use PKI Server Auth cert



3.2.2.1.12 PXE Everywhere settings

Review the following and click **Next** when completed.

Enable PXE Everywhere	Optional	Check this option to enable the PXE Everywhere client module of 1E Client.
Log Path	Mandatory	The path to the PXE Everywhere logs. The default path keeps the PXE Everywhere log files together with the Configuration Manager client logs. It uses *[WindowsFolder]* which is a Windows installer property name that refers to the Windows folder.
Log Size	Mandatory	The size of for the PXE Everywhere log files. We recommend 5 MB.
Use FIPS Encryption	Optional	Check this to ensure that PXE Everywhere is FIPS compliant in its communications. This is only available from PXE Everywhere 3.0 and later.

Warning

		You must use the same FIPS setting on all PXE Everywhere Agents and PXE Everywhere Static Responders. Please ensure you use the same setting if you have previously deployed PXE Everywhere, unless you are sure you want to change it.
Windows ADK location	Mandatory	The location of the Windows ADK. If this has been installed on a Configuration Manager site server, the location should be: *C:\Program Files (x86)\Windows Kits\10\Assessment and Deployment Kit* PXE Everywhere requires that certain files are in its TftpRoot folder in order to be able to service PXE requests. These files mostly come from the winpe.wim file in the WinPE addon for the Assessment and Deployment Kit (ADK). 1E cannot bundle these files with PXE Everywhere because Microsoft does not allow their redistribution. The wizard automates this process by creating a CAB file and MST data so that the boot files are put in place as PXE Everywhere is installed. So you must locate the Windows ADK that will be used as the source.
PXE Everywhere Central web service	Mandatory	The full URL of the PXE Everywhere Central web service which the agent uses: *http://<serverFQDN>/PXELite/PXELiteConfiguration.asmx* You must have PXE Everywhere Central installed for this feature to work. **Warning** Please ensure you use the same setting if you have previously deployed PXE Everywhere, unless you are sure you want to change it.
Enable support for DHCP Snooping	Optional	Check this to enable support for DHCP Snooping. This feature requires you have at least one PXE Everywhere Responder installed, and configured

your network to forward PXE requests to the Responder(s) on the specified **DHCP port**, and authorize them to receive and respond to requests.

When you enable this option, you can also specify the **DHCP port** that the PXE Everywhere Agents listen for responses from the Responder. If you change this then you must configure Responders to use the same port. By default, this is port 2067.

If you do not check the DHCP Snooping option, then you do not need Responders and PXE Everywhere Agents listen for responses on port 67.

Note

In order to service PXE requests, certain files from the winpe.wim file in the ADK must be present in PXE Everywhere's TftpRoot folder on each client. Without using CDA, this process must be carried out after PXE Everywhere is installed, for example using a Task Sequence. However the CDA wizard automates this process during installation of PXE Everywhere. CDA uses DISM to extract files from the ADK's winpe.wim file and creates a **PXELiteLocal-xxxx.cab**, and adds custom actions to the MST transform file to do the following during installation of PXE Everywhere:

Place the boot file in the right location as PXE Everywhere is installed

Run *CreateBCD.exe* to copy an advertised PXE boot image to the PXE Everywhere cache thereby creating a boot configuration database that is useful when using task sequences.

The host computer used to run the CDA wizard can be the Configuration Manager site server or another computer that has the following installed:

Configuration Manager console

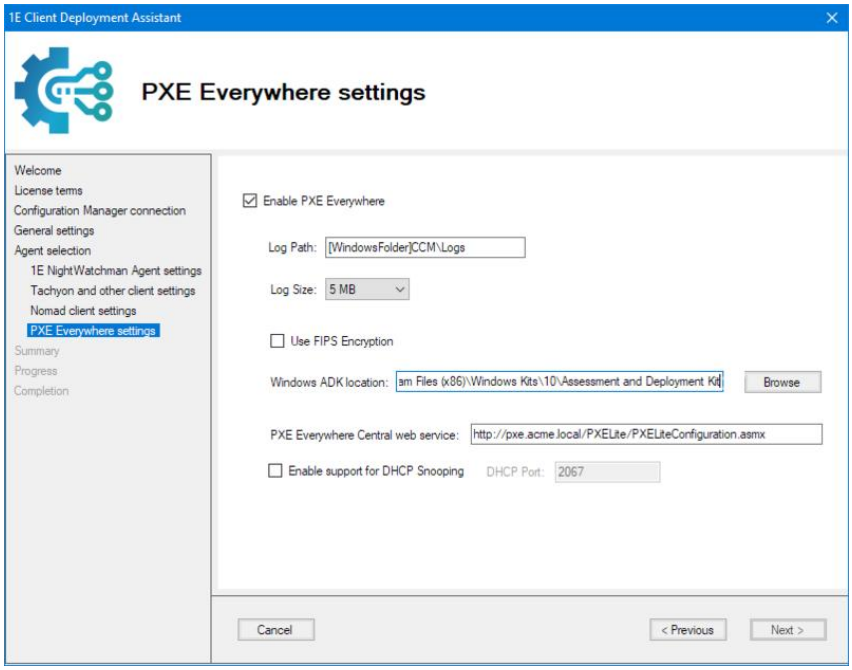
Microsoft ADK with WinPE addon - only if the CDA wizard is used to create PXE Everywhere applications

It will need to have .Net Framework v4.8 Runtime installed, a check when the wizard runs checks for this being installed, and will if not already installed, provide a link to https://dotnet.microsoft.com/en-us/download/dotnet-framework/net48?cid=getdotnetframework where you will need to download and run the .Net Framework v4.8 Runtime. The link is provided should you wish to install this prior to running the wizard. The install does require a reboot to complete.

If you are installing PXE Everywhere you must install the **Deployment Tools** feature from the Microsoft Assessment and Deployment Kit (ADK), and the **WinPE addon**. The user running the CDA wizard must have local administrator privileges because the CDA wizard uses *dism.exe* to mount a PXE *.wim* file in order to extract boot image files. Start the wizard using Run as Administrator.

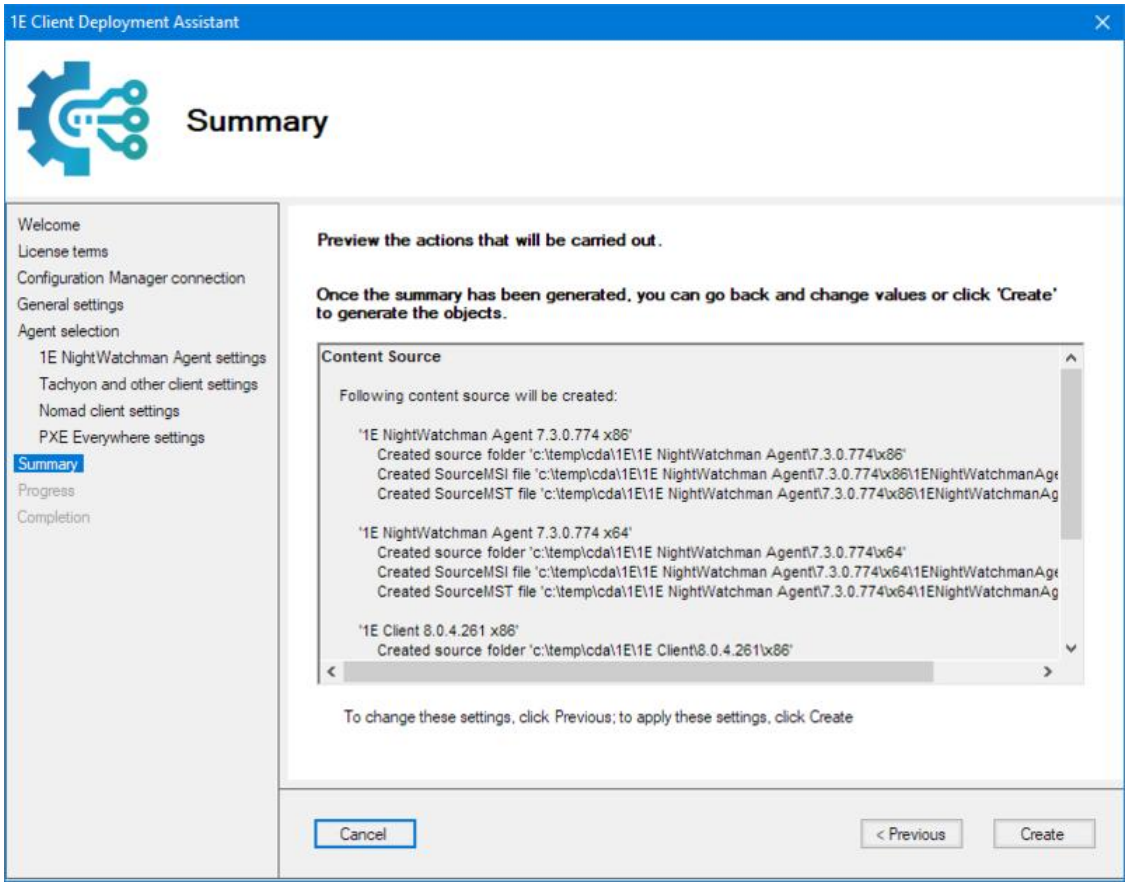
Note

To download and install the Windows ADK go to https://docs.microsoft.com/en-us/windows-hardware/get-started/adk-install. Starting with Windows 10, version 1809, WinPE is an add-on to the ADK, previously it was included in the ADK. First install the ADK, and then install the WinPE addon. Approximately 7GB disk space is required.



3.2.2.1.13 Summary

When you have defined the attributes for all the agents you intend to use, a summary screen is displayed. If you are happy with the settings for the agents, click **Create**, otherwise click **Previous** to return to review the issues and correct them.

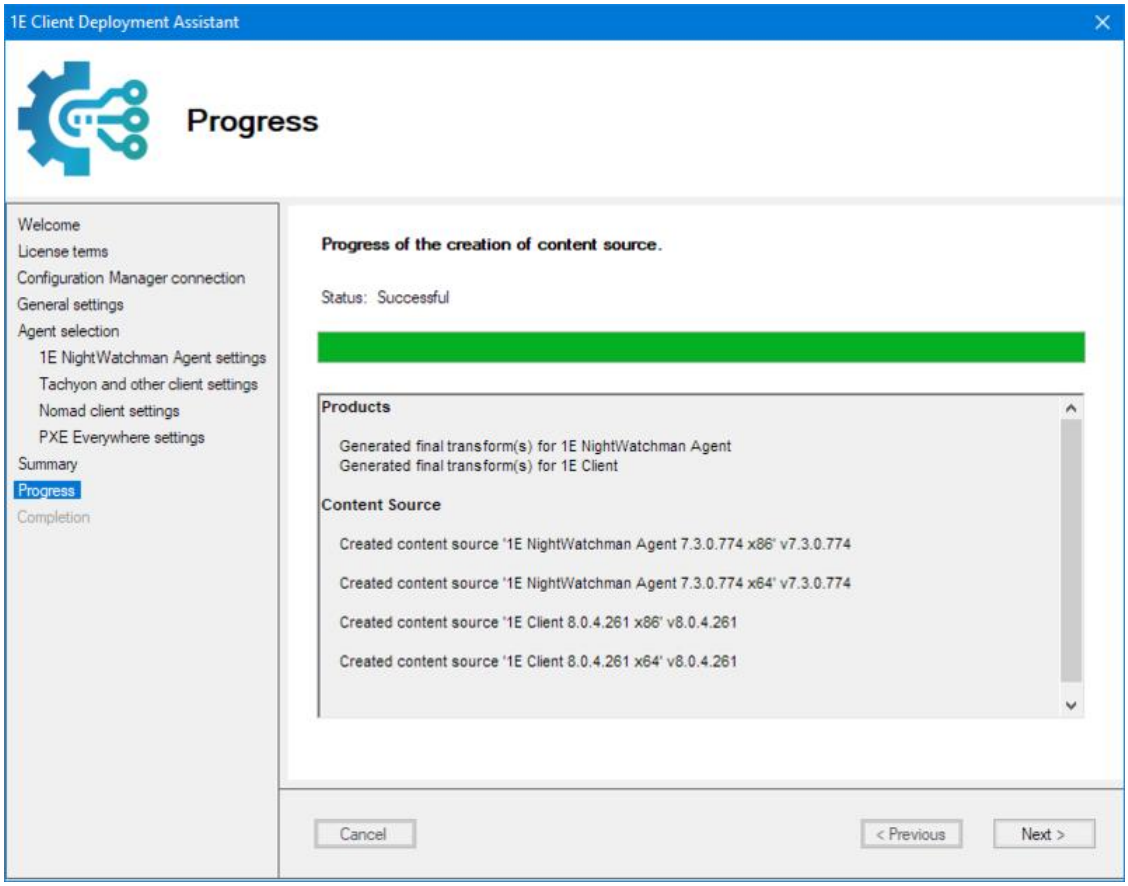


3.2.2.1.14 Progress

A screen is displayed to show the progress – there may be a slight delay before the progress bar starts as there's some background processing taking place.

Click **Next** when all the actions have been done.

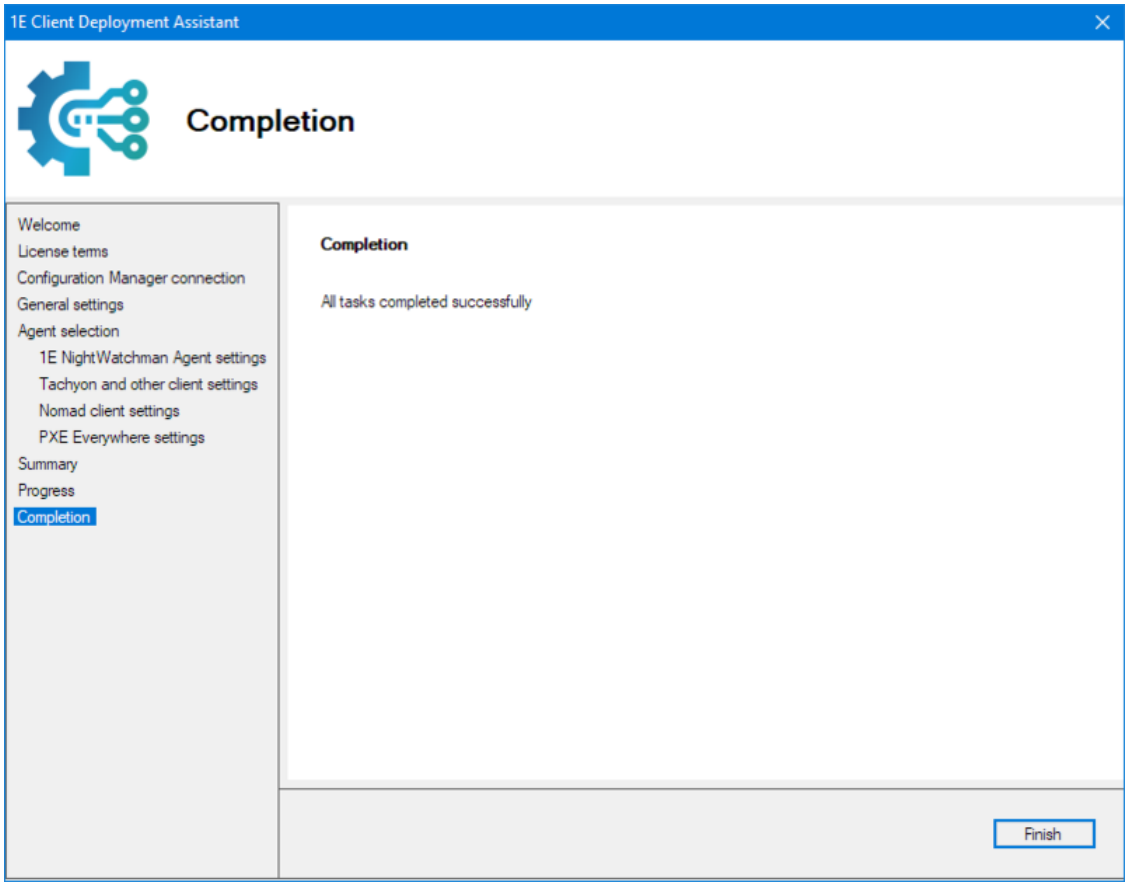
> **Note**
>
> If PXE Everywhere has been selected the CDA wizard can take a several minutes to load and extract files from the ADK winpe.wim file. You can use Task Manager to observe DISM in progress.



3.2.2.1.15 Completion

The screen will show details of any errors that were detected.

Click **Finish**.



3.2.3 Configuration Manager objects

Objects created in Configuration Manager when the CDA wizard is run using default settings.

The pictures on this page may not show the latest versions of 1E products. 1E Client Deployment Assistant 8.1 creates objects for the following 1E products:

1E Client 8.1.2.62 (includes clients for Nomad, PXE Everywhere, Shopping/WSA, WakeUp, and Tachyon) (new)

1E NightWatchman Agent 7.3.0.774

Note

The pictures on this page may not show the latest versions of 1E products.

3.2.3.1 Applications

A Configuration Manager application is created for each 1E Agent that was selected in the CDA wizard.

Applications are viewed in Configuration Manager console, Software Library as shown in the picture.

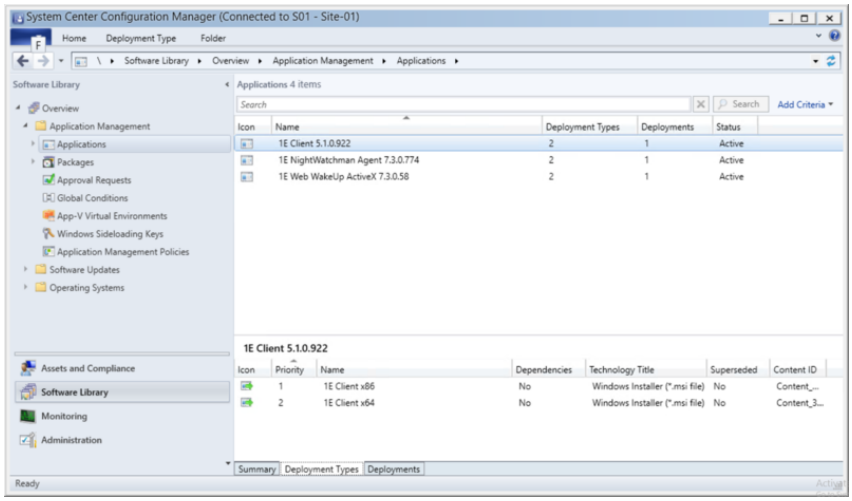
Click on an application to view its Summary, Deployment Types and Deployments tabs.

Tip

You can move the applications into folders in Configuration Manager, which will help you to organize and make it easier to find them later. For example, you can create a folder called **1E Applications** to store these applications and keep them separate from any other applications in your system.

3.2.3.2 Deployment Types

Each application has two deployments types – one for each architecture **x86** and **x64**.



3.2.3.3 Deployment Type properties

View the properties of a Deployment Type and view the settings in each tab. The Programs tab has an Installation program that installs an Agent using its MSI and the MST transform file that has been modified by the wizard, and creates a log file. You can modify the command-line as required.

Without patch:

```
msiexec /i 1E.Client-x64.msi REBOOT=ReallySuppress /l*v %TEMP%\1E.Client-x64-In
stall-5.1.0.922.log /qn TRANSFORMS="1E.Client-x64-5.1.0.922.mst"
```

With patch:

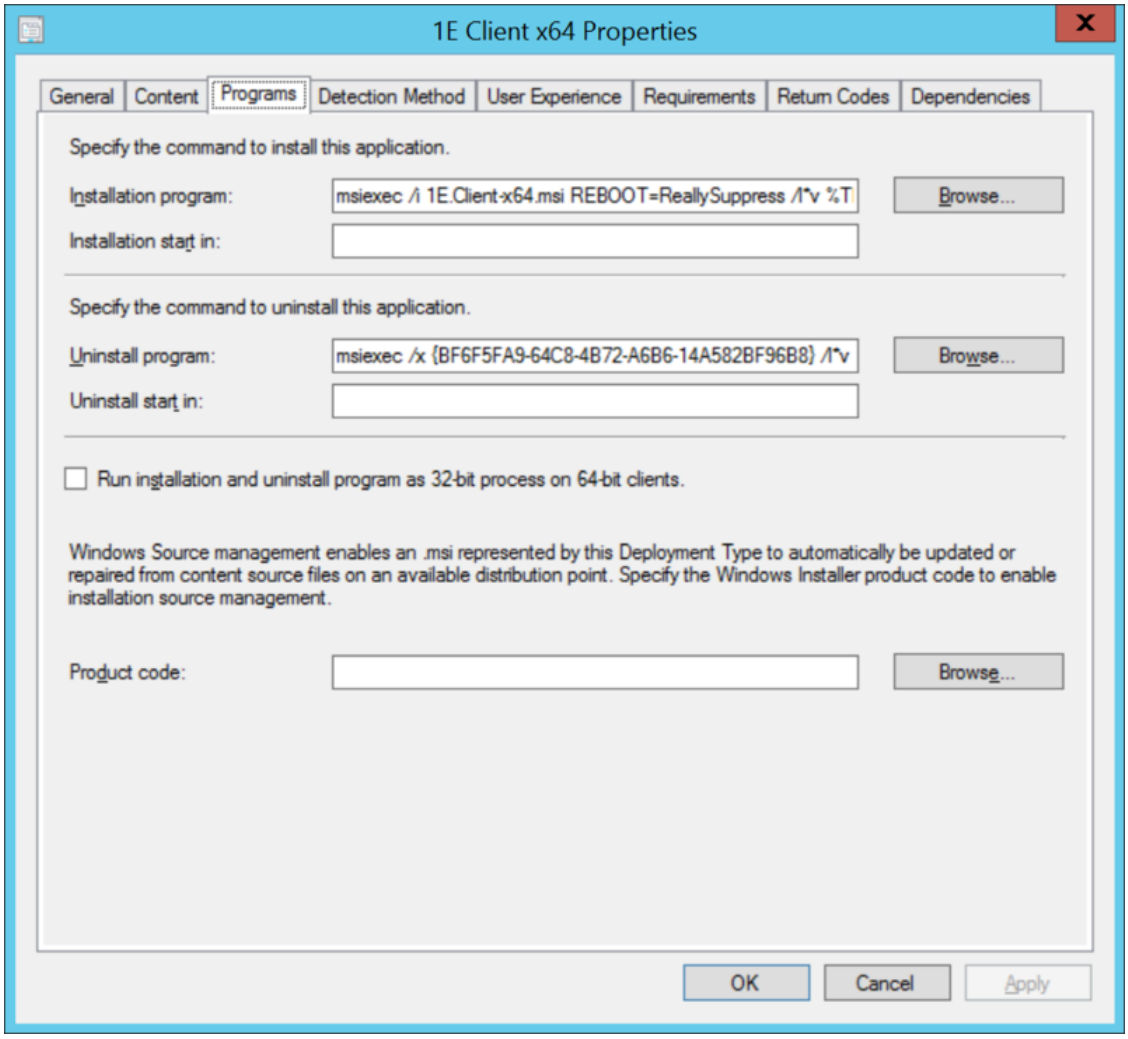
```
cmd /c "msiexec /i "%cd%\1E.Client-x64.msi" REBOOT=ReallySuppress /l*v %TEMP%\1
E.Client-x64-Install-5.1.0.922.log /qn TRANSFORMS="%cd%\1E.Client-x64-5.1.0.922
.mst" PATCH="%cd%\q21005-1e.client-x64.v5.1.0.922.msp"
```

Tip

You can make copies of Deployment Types for other purposes. For example the 1E Client x64 deployment can be copied to create one used to deploy the 1E Client (with Nomad module enabled) to Distribution Points, which would use an alternative MST transform file manually updated with relevent settings for DPs.

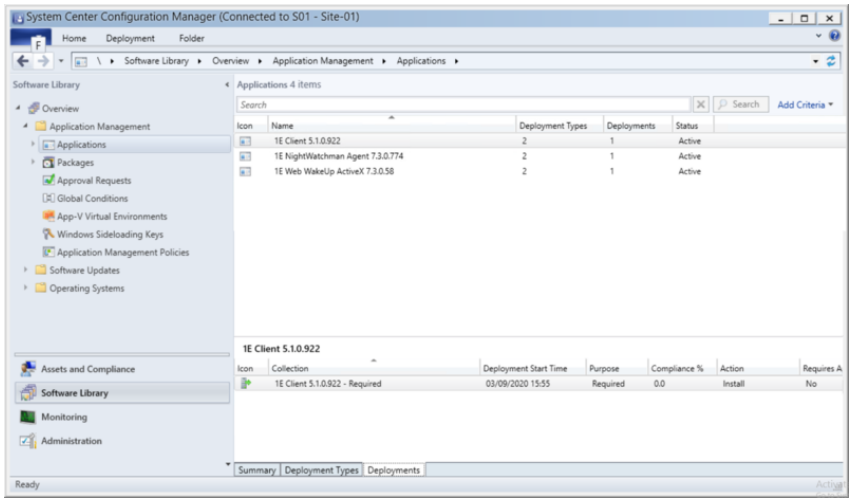
Note

The command-lines and picture shown here are an example for deploying the 1E Client with or without a patch.



3.2.3.4 Deployments

A deployment is created for each application for its corresponding device collection.



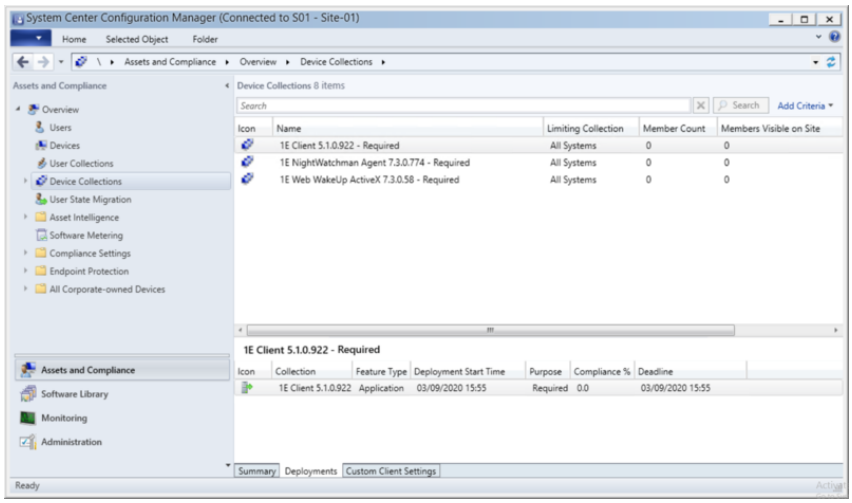
3.2.3.5 Device Collections

If you chose to create new device collections, they are found under **Device Collections** of **Assets and Compliance**.

Device collections are only associated with applications, via application deployments, and not with packages. If you have chosen to create legacy packages these require more manual work in order to deploy them.

You can move these collections into a folder.

> **Note**
>
> To deploy applications to intended targets, all you need to do is populate the appropriate device collections using membership rules according to your organization's practices.



3.2.3.6 Speeding up deployments

To speed up and monitor the progress of a deployment:

In the Configuration Manager console, select the **Assets and Compliance** workspace.

Select the **Device Collections** node, right-click on the relevant Collection created by CDA and choose **Client Notification** -> **Download Computer Policy**.

A dialog is displayed showing the number of resources in this collection. Click **OK**.

> **Note**
>
> This process causes each of the Configuration Manager clients to download the new deployment policy you just created rather than waiting for them to do it on their regular schedule, which should speed up the uptake of the new deployment.

Select the **Monitoring** workspace and choose the **Deployments** node.

Right-click the relevant client deployment and choose **View Status** from the context menu. You can view the next task when the current one finishes.

Repeat for other collections and deployments as required.

3.2.3.7 Packages

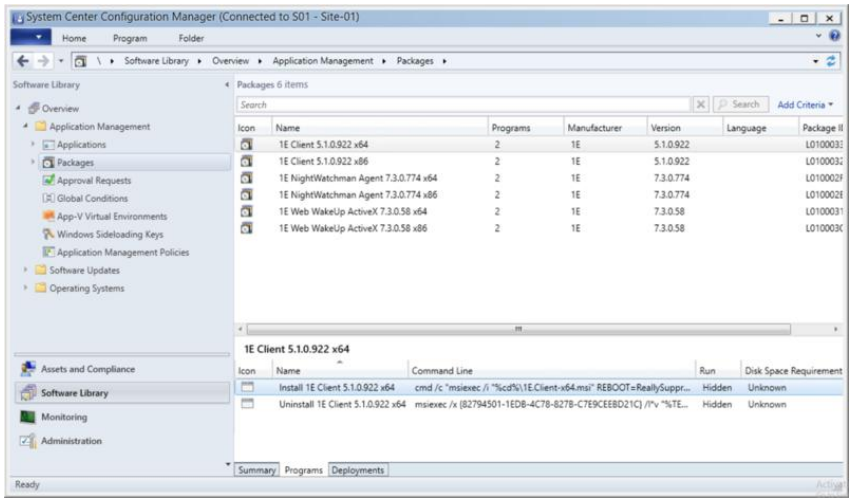
If you chose to create legacy packages one package is created for each combination of agent and architecture (**x86** and **x64)**.

Click on each package to view its **Summary**, **Programs** and **Deployments** tabs.

You can move these packages into a folder.

Packages are created primarily for use in Task Sequences, therefore the CDA wizard sets the **Allow this program to be installed from the Install Package task sequence without being deployed** property, and does not create collections or deployments.

You would not normally create packages for PXE Everywhere.



3.2.4 Advanced configuration

Advanced editing of a MST transform file to support configuration options not supported by the CDA wizard UI.

1E Client Deployment Assistant 8.1 supports the following 1E products, you should review documentation for their installer properties to know what options are possible.

1E Client 8.1 (includes clients for Nomad, PXE Everywhere, Shopping/WSA, WakeUp, and Tachyon) (new)

1E NightWatchman Agent 7.3.0.774

The guidance here is for adding an installer property by editing the base MST transform file provided out-of-box for 1E Client, but the process also works for other MST. Editing a base MST before running the CDA wizard helps you if know you will use the modified MST more than once, for example if you are working in a lab, and want to re-use it in a production environment. This approach only works if you are adding or editing installer properties that are not affected by running the CDA wizard.

An alternative approach is to edit the updated MST transform produced by CDA after running the wizard. This is only useful if the edited MST will be used in the same environment, although you can also edit the environment-specific settings you set when running the wizard. This approach is most frequently used if you

need fine-tune properties provided in the base MST and the CDA wizard is not able to configure them exactly the way you need.

In both cases, you will probably need to edit both x64 and x86 files.

Please review Installer properties page for a full list of installer properties included in each base MST.

> **Note**
>
> You must use UPPERCASE when specifying the *name* of any installer property in a **mst** transform file, and preferably when including them in a msiexec command-line.

> **Note**
>
> The pictures on this page may not show the latest versions of 1E products.

3.2.4.1 Adding installer properties to the base MST transform file

To extend installer properties or change default settings for Nomad clients, you can edit their associated MST transform files by using a tool such as Orca a database table editor for creating and editing Windows Installer packages.

> **Note**
>
> Orca is a Microsoft tool for creating and editing Windows Installer packages (MSI) and merge modules (MST transforms). It is available from the Windows Installer Development Tools - https://docs.microsoft.com/en-us/windows/desktop/msi/orca-exe.

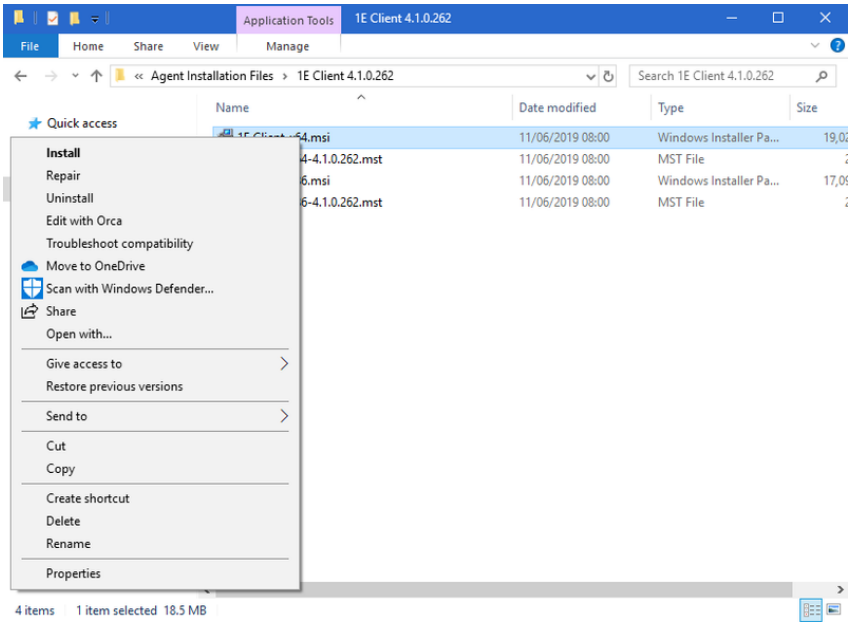
The following example configures StatusMsgEvents by modifying the x86 and x64 `.mst` files. When the wizard is run, the new transform is applied to the deployment and package, and the new value is set when Nomad is installed.

> **Warning**
>
> Status message events should be used with caution as they could impact your Configuration Manager environment when scaled up to tens of thousands of machines.

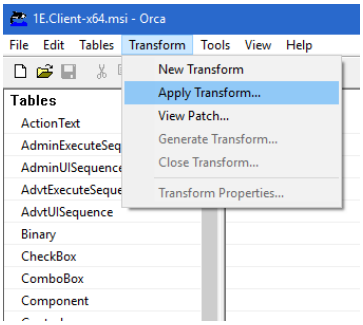
> **Note**
>
> The steps are recommended only for values unaffected by running the CDA wizard, because updated base settings may be changed when the wizard runs. Please review Installer properties page to see which installer properties are used by CDA.

To edit the installer with Orca:

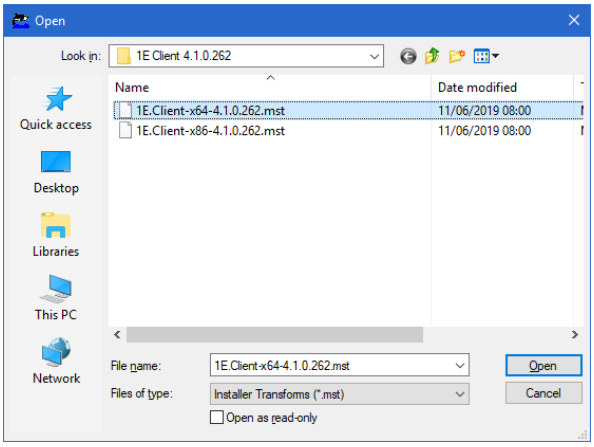
Right-click the 1E.Client-x64.msi choosing **Edit with Orca** from the context menu.



From the Transform menu in the Orca application, select **Apply Transform...**

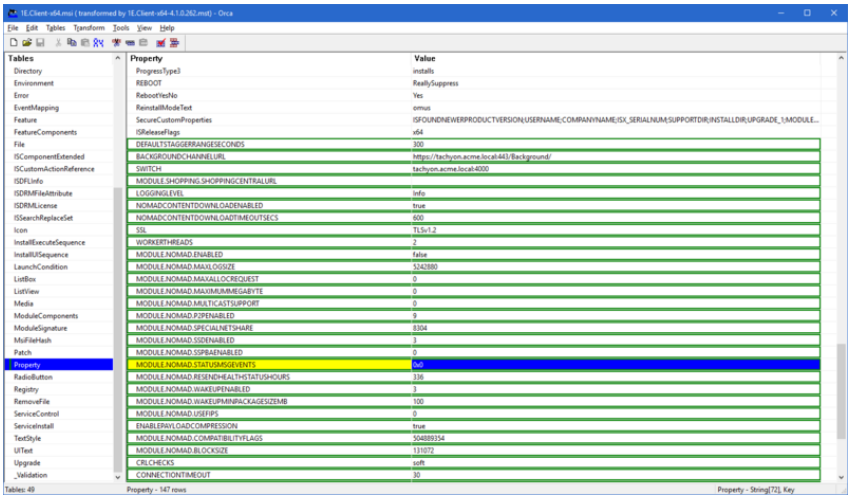


In the **Open** dialog, select the 1E.Client-x64-5.1.x.mst file.



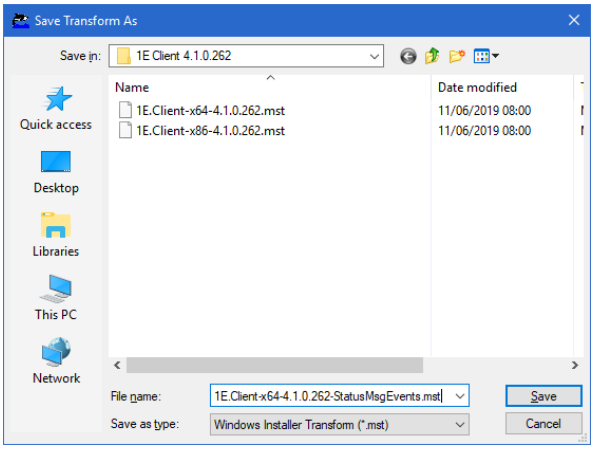
In the Table list on the left, scroll down and locate *Property*.

On the right pane, scroll down to StatusMsgEvents and update its value to 0x1000000064 (*0x0* by default).



From the Transform menu, choose Generate Transform and save the file with a new name.

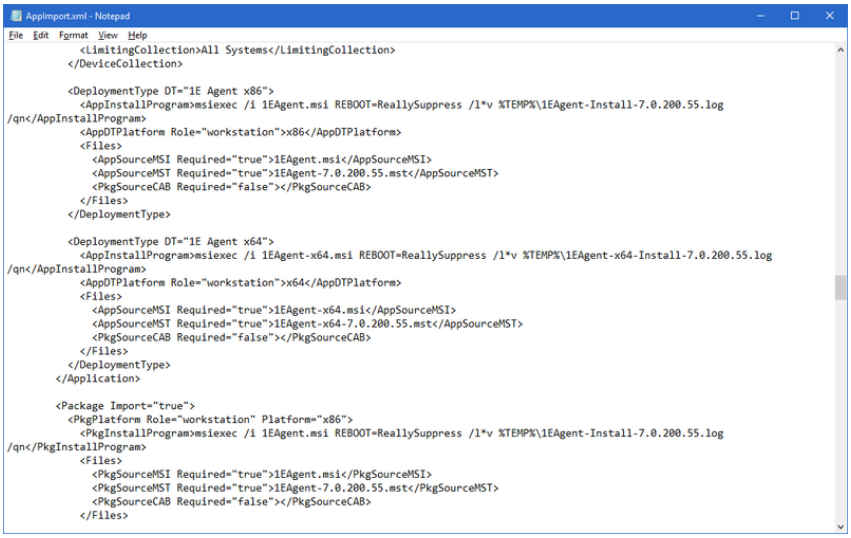
For example: 1E.Client-x64-x.x.x-StatusMsgEvents.mst



Repeat steps 1-6 for the x86 version of the installer and `.mst` file.

Edit the *`AppImport.xml`* file and update *`<AppSourceMST>`* and *`<PkgSourceMST>`* to point to the new transform files for both x86 and x64 versions.

The picture shows the original file.



3.2.5 Using client patch files with CDA

CDA supports the application of patch files during installation of the clients.

3.2.5.1 Using client patch files with CDA

The latest released patch for each client is now packaged along with the **.msi** in each new CDA release. Patches can only be installed alongside the **.msi**. That is the patching can't be done using CDA after the client has been installed.

CDA only supports single patch installation, that is you can only have one .msp file per client. In practice this shouldn't be an issue as cumulative patches are created across all the 1E products, so only one patch should be needed anyway.

Please check the 1E Support Portal https://support.1e.com/ to see if there is a later Accumulated Hotfix (Patch):

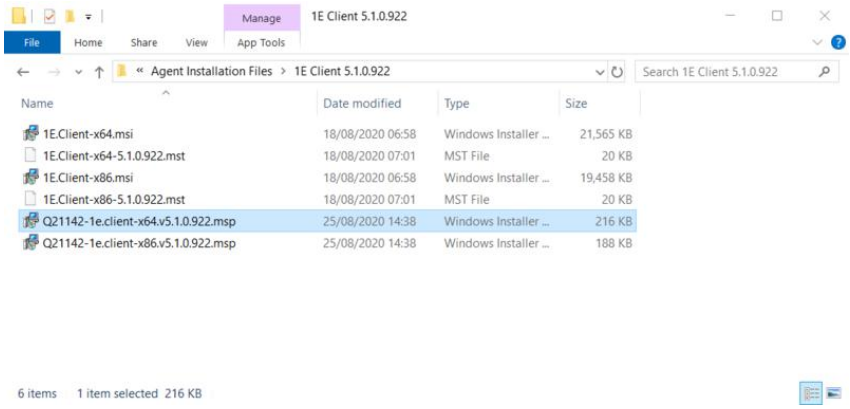
1E Client vx.x.x.x

1E NightWatchman Agent v7.3.0.774

If you want to apply patch to a client that is different to the packaged one, the existing **.msp** file must be replaced by your new one, this is located in the client's installation folder under the **Agent Installation Files** folder in the CDA artifact. This must be done prior to launching the CDA installer.

The picture opposite shows the CDA folder for the 1E Client. Here you can see the installer files for 1E Client, alongside the **.mst** files and **.msp** patches for 1E Client, which will be applied during the installation process.

Please refer to Configuration Manager objects for information about the command-lines created by CDA.



3.3 Troubleshooting

A general methodology for investigating issues with the 1E Client Deployment Assistant, as well as identifying key issues and their resolutions.

> **Note**
>
> If you are experiencing problems with client agents that have been deployed to devices already then please refer to documentation for the relevant product version.

For known issues relating to specific components, please refer to the respective troubleshooting pages:

Clients	Platform	Applications	Integration
1E Client	1E	Endpoint Automation	1E Core for ServiceNow
1E Client Deployment Assistant		Experience Analytics	1E ITSM Connect for ServiceNow
PXE Everywhere		Endpoint Troubleshooting	1E Service Catalog Connect for ServiceNow
		Writing 1E Instructions (1E SDK)	1E Virtual Assistant

3.3.1 1E Support contact details

3.3.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

3.3.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

US/Canada:	1-866-349-4032 (Toll-Free)
	1-917-339-2360 (Standard)
UK/Europe:	+44 (0)208 326 3499
India:	+91 120 402 4002
Australia:	+61 739 111 118

3.3.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation.

support@1e.com

3.3.2 The technical support process

Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

3.3.2.1 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

3.3.2.1.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

3.3.2.1.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

3.3.2.1.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

3.3.2.2 Log files

1E needs details of the recorded time when the issue took place. To ensure logs contain relevant details, please try to rerun the steps to replicate the issue.

Copies of the **AppImport.xml** files found in the folder where you ran 1E Client Deployment Assistant 8.1.

Copies of log files from: C:\ProgramData\1E\Client Deployment Assistant\LogFiles

1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

1E Client logs on macOS

/Library/Logs/1E.Client.Daemon.log (shows any service start errors)

/Library/Logs/1E.Client.log (shows the current operation of the 1E Client)

1E Client logs on other non-Windows platforms

/var/log/1E/Client/1E.Client.log

Nomad client log

%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles\NomadBranch.log

PXE Everywhere Agent log

%ALLUSERSPROFILE%\1E\PXEEverywhere\PXEEverywhere.log

Shopping WSA client log

%ALLUSERSPROFILE%\1E\Client\WSA.log

WakeUp client log

%ALLUSERSPROFILE%\1E\Agent\WakeUpAgt.log

> **Note**
>
> By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

3.3.3 Known issues

Issue	Description	Workaround
When Creating a Device Collection on the Agent screens the Limiting Collection may be missing	On an Agent screen an existing collection may be selected using the Browse button, but if a name is then typed into the Create/Select Device Collection field, the Limiting Collection will initially be missing.	Clicking or tabbing to another field will resolve the issue.
The CDA wizard may terminate with a program exception under certain circumstances.	If the connection to Configuration Manager is dropped after the initial connection test in the wizard has succeeded a program exception may occur if the connection is re-established.	You will need to check the status of Configuration Manager and confirm that it is up and running before re-trying to run the CDA wizard.
1E Clients are not being installed on Windows 11 devices.	Applcations > Deployment Types and Packages > Programs do not have the Windows 11 Operating System	The Windows 11 (64-bit) needs to be manually enabled in order to allow 1E

Issue	Description	Workaround
	enabled by default in Configuration Manager.	Clients to be installed on these devices.

3.4 Reference

This section contains all the reference material for 1E Client Deployment Assistant.

3.4.1 Supported Platforms

A list of prerequisites and dependencies you need to meet in order to run the 1E Client Deployment Assistant, and eventually install each of the 1E Client/agents.

3.4.1.1 1E Client Deployment Assistant 8.1

The following are required in order to run the 1E Client Deployment Assistant.

Category	Product	Notes
OS	Windows Server 2022 Windows Server 2019 Windows Server 2016 Windows 10 CB 21H2 Windows 11 CB 21H2 Windows 10 CB 21H1 Windows 10 CB 20H2	CDA can be run on these OS.
Runtime libraries	.NET Framework 4.8	CDA requires one of these versions of .NET Framework.
Configuration Manager	SCCM CB 2203	CDA optionally supports these versions of Microsoft Systems Center Configuration Manager.

Category	Product	Notes
	SCCM CB 2111	
	SCCM CB 2107	
	SCCM CB 2103	
	SCCM CB 2010	
Other		Please see: Below for individual client/agent requirements on client computers Infrastructure requirements for each client/agent.

3.4.1.2 1E Client 8.1

The following are required in order to install 1E Client on client computers. Some are only required for particular client modules and features. Some real-time client features of 1E Client are also supported on non-Windows platforms, however, the **1E Client Deployment Assistant** does not support using Configuration Manager to deploy 1E Client to non-Windows computers. Instead, please refer to Installation account for Windows.

3.4.1.2.1 Windows client

Category	Product	Notes
Operating System	Windows Server 2022	The zip for 1E Client for Windows is available for download from the support.1e.com/.
	Windows Server 2019	Professional and Enterprise editions are supported for Windows 10 and Windows 11.
	Windows Server 2016	All versions are provided with 32-bit & 64-installers, and can be installed on physical and virtual computers.
	Windows 11 CB 22H2	**Note** This list shows only those OS versions in mainstream support by Microsoft, and therefore supported by Tachyon, and by 1E Client 8.1. Please refer to Constraints of Legacy OS regarding the end of mainstream support.
	Windows 11 CB 21H2	
	Windows 10 CB 22H2	

Category	Product	Notes
	Windows 10 CB 21H2	For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Refer to Support for Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions. For installation guidance on Windows, please refer to Deploying 1E Client on Windows. The following 1E Client features and modules are supported on Windows OS: Real-time features (for example instructions, experience, interaction) Nomad client PXE Everywhere Agent client Shopping client Windows Servicing Assistant (WSA) client (workstation OS only, not server OS) WakeUp client
Runtime libraries	.NET Framework 4.8	.NET Framework is required only for the following features of 1E Client:
	Visual C++ 2015-2019 Redistributable	The Real-Time Control Center feature of the 1E Client (also known as 1E Client UI and Interaction module) supports Experience Engagements (Announcements and Surveys), and ITSM Support Tickets Windows Servicing Assistant (WSA) is a feature of the Shopping/WSA client module, which supports OS deployment, upgrades and migrations. **Note** This list shows only those .NET Framework versions in mainstream support by Microsoft,

Category	Product	Notes
		and therefore supported by 1E, and by 1E Client 8.1. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. 1E Client installer includes the Visual C++ 2015-2019 Redistributable package.
Other Windows Software	Nomad 8.0 (or later) PowerShell 3.0 (or later)	1E Client provides real-time client features. It also includes the Nomad client module. Real-time client features can optionally use Nomad to download content (feature enabled by default) if the Nomad client module in 1E Client is enabled (module disabled by default) or Nomad 7.0 or later is running. For more details please refer to Nomad client requirements. PowerShell is not a prerequisite for installation of the 1E Client. PowerShell is used by some Tachyon instructions (that have PowerShell commands embedded or scripts that are downloaded) and some of these require PowerShell 3.0 or later.
Microsoft Endpoint Configuration Manager Client	MECM CB 2211 MECM CB 2207 MECM CB 2203 MECM CB 2111 MECM CB 2107	The following client features work with these versions of Configuration Manager on Windows computers: Real-time client - instructions used by Tachyon Configuration Manager Console extensions Nomad client PXE Everywhere Agent Shopping/WSA client WakeUp client - including Policy Refresh and REFRESHONSUBNETCHANGE features Configuration Manager is not a prerequisite for installation of the 1E Client, and except for above features, the 1E Client, its features and modules, have no dependency on Configuration Manager.

Category	Product	Notes
		Tachyon, Nomad, WakeUp, and Application Migration have Configuration Manager Console extensions which are available separately. **Note** This list shows only those Configuration Manager versions in mainstream support by Microsoft, and therefore supported by 1E, and by 1E Client 8.1. For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search. Please refer to the Support for the Microsoft Rapid-Release Cycle on https://support.1e.com/ for details of which Current Branch versions are supported by 1E products, and known issues regarding specific versions. (Microsoft Endpoint Configuration Manager - MECM - is also known as Configuration Manager, ConfigMgr, Config Man, CM, and SCCM among other names. Version names include 2012 and Current Branch or CB.)

3.4.1.3 1E NightWatchman Agent 7.3

The following are required in order to install 1E NightWatchman Agent on client computers. NightWatchman is also supported on macOS, however the **1E Client Deployment Assistant** does not support using Configuration Manager to deploy NightWatchman Agent to non-Windows computers.

Category	Product	Notes
OS	Windows 10 CB 21H2 Windows 11 CB 21H2 Windows 10 CB 21H1	Installs on these OS. 1E NightWatchman Agent does not install on server OS. CDA only creates deployment types for workstations which can be fine-tuned. Does not require .NET Framework.

Category	Product	Notes
	Windows 10 CB 20H2	
	Windows 10 CB 2004	
	Windows 10 CB 1909	
	Windows 10 CB 1903	
	Windows 10 CB 1809	
	Windows 10 CB 1803	
Configuration Manager	SCCM CB 2111	1E NightWatchman Agent feature MonitorJobs works with these versions of Configuration Manager.
	SCCM CB 2107	
	SCCM CB 2103	
	SCCM CB 2010	
	SCCM CB 2006	
	SCCM CB 2002	
	SCCM CB 1910	
	SCCM CB 1906	
	SCCM CB 1902	

Category	Product	Notes
	SCCM CB 1810	

3.4.1.4 Constraints of Legacy OS

1E does not provide support for 1E products on the following OS unless the OS is explicitly listed as being supported for a specific 1E product or product feature. This is because Microsoft has ended mainstream support for these OS or they are not significantly used by business organizations.

Windows XP *	**Windows Server 2003 ***
Windows Vista	**Windows Server 2008**
Windows 7	**Windows Server 2008 R2**
Windows 8.0	**Windows Server 2012**
Windows 8.1	**Windows Server 2012 R2**

Note

1E Client 8.1 and later will not install on Windows XP and Windows Server 2003. Please contact 1E if you intend to continue using any of the other legacy OS. If you experience an issue, then please try replicating the issue on a supported OS.

For Microsoft product lifecycle details, please refer to https://support.microsoft.com/en-us/lifecycle/search.

3.4.2 Installer properties

A list of installer properties included in the base MST files included with 1E Client Deployment Assistant – for the 1E Client (which includes clients for Tachyon, Shopping, WakeUp and Nomad), and NightWatchman Agent.

Where the list indicates an installer property is in the AppImport.xml file, it means the CDA wizard will include add it to the MST transform file if it is not already there.

For details of additional installer properties available for each client, please refer to their respective product documentation, however any additional properties are not supported by the CDA Wizard, but can be manually added to a MST transform file as described in Advanced configuration.

1E Client installer zips

/document/preview/712367#UUID-6a06ae62-a7cb-32ae-9448-414ef934fa33

3.4.2.1 1E Client installer properties - general

Note

These settings affect 1E Client and also affect Tachyon features of 1E Client.

Note

Settings shown in 1E Client mixed-case are stored in the configuration file. Settings in UPPERCASE are stored in the Windows registry.

Property	Default value	Notes
INSTALLDIR	%PROGRAMFILES%\1E\Client	Where to install the 1E Client. The registry name is InstallationDirectory which must not be changed after installation.
LogPath	%ALLUSERSPROFILE%\1E\Client\1E.Client.log	Log file path Can be updated in *AppImport.xml* This log is used by 1E Client, Tachyonfeatures, and Shopping client. Please refer to Log files
LoggingLevel	Info	Log level Can be updated in *AppImport.xml*
REBOOT	ReallySuppress	Suppress the host from rebooting after installation. Cannot be updated in *AppImport.xml* – Advanced configuration The REBOOT property is not in the base MST but is in the install command-line for Nomad in the answer file.

3.4.2.2 1E Client installer properties - platform client

Property	Default value	Notes
Switch	tachyon.acme.local:4000	Switch

Property	Default value	Notes
		Can be updated in *AppImport.xml* **Note** Must have a value in order to enable platform client features. Must be set to **none** if Tachyon feature are not required.
BackgroundChannelUrl	https://tachyon.acme.local:443/Background/	Background channel URL Can be updated in *AppImport.xml* **Note** Must have a value in order to enable platform client features. Must be set to **none** if Tachyon feature are not required.

Property	Default value	Notes
DefaultStaggerRangeSeconds	300	Default stagger range in seconds Can be updated in *AppImport.xml*
Module.Inventory.Enabled	true	Enable Inventory module Can be updated in *AppImport.xml*
Module.Interaction.Enabled	true	Enable Interaction module (Client UI used for Surveys feature) Can be updated in *AppImport.xml*
Module.Interaction.Port	7766	Port used by the Interaction module (Client UI) Can be updated in *AppImport.xml*
Module.Interaction.DoNotDisturb	false	Enable the Interaction Do Not Disturb feature Can be updated in *AppImport.xml*
Module.Interaction.NotificationIcon	true	Enable the Interaction Notification icon Can be updated in *AppImport.xml*

Property	Default value	Notes
Module.Interaction.SampleUserInteraction	true	Enable the Interaction sampling feature Can be updated in *AppImport.xml*
AuthenticationPolicy	optional	Authentication policy Can be updated in *AppImport.xml*
ConnectionKeepaliveTimeInSecondsMax	600	Maximum time for sending a keep-alive message to the Switch Can be updated in *AppImport.xml*
ConnectionKeepaliveTimeInSecondsMin	120	Minimum time for sending a keep-alive message to the Switch Can be updated in *AppImport.xml*
ConnectionRetryTimeInSecondsMax	900	Maximum time the Agent waits before trying to reconnect to a Switch after a connection failure Can be updated in *AppImport.xml*
ConnectionRetryTimeInSecondsMin	30	Minimum time the Agent waits before trying to reconnect to a Switch after a connection failure

Property	Default value	Notes
		Can be updated in *AppImport.xml*
ConnectionTimeout	30	The maximum time in seconds that can elapse between initialising the connection and having a fully established websocket Can be updated in *AppImport.xml*
CRLChecks	soft	Carry out CRL (certificate revolcation list) checks Can be updated in *AppImport.xml*
CrlTimeoutInSeconds	3	**Note** This setting is not supported as an installer property. It is in the AppImport .xml and in the base MST file for 1E Client, but is not used.
EnablePayloadCompression	true	Whether the Agent should attempt to

Property	Default value	Notes
		compress payloads when responding to instructions Can be updated in *AppImport.xml*
NomadContentDownloadEnabled	true	Whether to integrate with Nomad for content download Can be updated in *AppImport.xml*
NomadContentDownloadTimeoutSecs	600	Time limit to wait for Nomad to download content before switching to Tachyon own download mechanism Can be updated in *AppImport.xml*
SSL	TLSv1.2	Switch connection security Can be updated in *AppImport.xml*
WorkerThreads	2	Number of instructions that will execute concurrently Can be updated in *AppImport.xml*

3.4.2.3 1E Client installer properties - 1E Client client

Property	Default value	Notes
Module.Nomad.Enabled	false	Enable Nomad client module Can be updated in *AppImport.xml*
MODULE.NOMAD.BLOCKSIZE	131072	Minimum size of each block of data Nomad copies from the package source folder. Can be updated in *AppImport.xml* Registry value: *BlockSize*
MODULE.NOMAD.DOREPORTINGENABLED	false	Delivery Optimization (DO) Reporting (disabled by default). Can be updated in *AppImport.xml* Registry value: *DeliveryOptimizationReportingEnabled*
MODULE.NOMAD.LOGPATH	[WindowsFolder]\CCM\Logs	Folder containing Nomad log file. Can be updated in *AppImport.xml* Registry value: *LogFileName* (registry folder plus file name) Please refer to Log files.
MODULE.NOMAD.MAXLOGSIZE	5242880 (5 MB)	Maximum log size. Can be updated in *AppImport.xml* (1MB, 5MB,10MB) Registry value: *MaxLogFileSize*
MODULE.NOMAD.P2PENABLED	9	Peer-to-peer support (enabled with smb with net literal names by default). Cannot be updated in *AppImport.xml* – #UUID01a4b01f25464b0c7dcbc2ce1d6ce3a3_id_AdvancedconfigurationAdditionalinstallerconfiguration Registry value: *P2PEnabled*

<table>
<tr><th>Property</th><th>Default value</th><th>Notes</th></tr>
<tr><td>MODULE.NOMAD.P2PHTTPPORT</td><td>5080</td><td>Default HTTP port to use for peer copy.

Can be updated in AppImport.xml

Registry value: P2PHttpPort</td></tr>
<tr><td>MODULE.NOMAD.P2PHTTPSPORT</td><td>5443</td><td>Default HTTPS port to use for peer copy.

Can be updated in AppImport.xml

Registry value: P2PHttpsPort</td></tr>
<tr><td>MODULE.NOMAD.MAXALLOCREQUEST

MODULE.NOMAD.MAXIMUMMEGABYTE</td><td>Disabled</td><td>Peer backup assistant support.

Can be updated in AppImport.xml (when enabled, both MAXALLOCREQUEST and MAXIMUMMEGABYTE = 5120)

Registry value: NMDS\MaxAllocRequest * NMDS\MaximumMegabyte</td></tr>
<tr><td>MODULE.NOMAD.SPECIALNETSHARE</td><td>Default value in MSI is: 0x2060 (8286) - revised 8.1

Default value used by CDA is: 0x2070 (8304)</td><td>Can be partly updated in AppImport.xml (Nomad hidden share & FanOut)

Registry value: SpecialNetShare

<table>
<tr><th>Bit</th><th>Hex</th><th>Decimal</th><th>Notes</th></tr>
<tr><td>4</td><td>0x0010</td><td>16</td><td>Enable Nomad hidden share as NomadSHR$.</td></tr>
<tr><td>5</td><td>0x0020</td><td>32</td><td>Disable broadcast of download statistics. When enabled, Nomad broadcasts download statistics to all peers when a download is complete.</td></tr>
<tr><td>6</td><td>0x0040</td><td>64</td><td>Enable Nomad FanOut.</td></tr>
<tr><td>13</td><td>0x2000</td><td>8192</td><td>Use HTTP/S or SMB. HTTP/S is automatically used if CM client is detected. Must be set if using CM2007 or if</td></tr>
</table>
</td></tr>
</table>

Property	Default value	Notes
		Nomad integration is used by Tachyon.
		0x2070 8304
MODULE.NOMAD.SSDENABLED	3	Single-site download (enabled as both consumer and provider by default). Can be updated in *AppImport.xml* Registry value: *SSDEnabled*
MODULE.NOMAD.SSPBAENABLED	0	Single-site peer backup assistant (disabled by default). Can be updated in *AppImport.xml* Registry value: *SSPBAEnabled*
MODULE.NOMAD.STATUSMSGEVENTS	0x0	Status message events. Cannot be updated in *AppImport.xml* – #UUID01a4b01f25464b0c7dcbc2ce1d6ce3a3_id_AdvancedconfigurationAdditionalinstallerconfiguration Registry value: *StatusMsgEvents* Please refer to Advanced configuration for how to use Orca to edit the base MST file to change this setting.
MODULE.NOMAD.SUCCESSCODES	Enabled	Prevent failover to BITS (0x9999 added to default SuccessCodes). Can be updated in *AppImport.xml* Registry value: *SuccessCodes*
MODULE.NOMAD.USEFIPS	false	Use FIPS encryption. Can be updated in *AppImport.xml - FIPSEncryption* Registry value: *EncryptionType*
MODULE.NOMAD.COMPATIBILITYFLAGS	1572864	Enable compatibility checks.

Property	Default value	Notes
	Default value in MSI is: 0x2020 Default value used by CDA is: *0x2070*	Cannot be updated in *AppImport.xml* – #UUID01a4b01f25464b0c7dcbc2ce1d6ce3a3_id_AdvancedconfigurationAdditionalinstallerconfiguration Registry value: *CompatibilityFlags*
MODULE.NOMAD.PLATFORMURL MODULE.NOMAD.CONTENTREGISTRATION	User defined	ActiveEfficiency server. Can be updated in *AppImport.xml* Registry value: *ActiveEfficiency\PlatformUrl* *ActiveEfficiency\ContentRegistration*

3.4.2.4 1E Client installer properties - PXE Everywhere Agent

Property	Default value	Notes
Module.PXEEverywhere.Enabled	false	Enable PXE Everywhere Agent module Can be updated in *AppImport.xml*
MODULE.PXEEVERYWHERE.CONFIGSERVERURL	http://pxe.contoso.com/PXELite/PXELiteConfiguration.asmx	Enable PXE Everywhere Agent module Can be updated in *AppImport.xml*
MODULE.PXEEVERYWHERE.LOGPATH	[WindowsFolder]\CCM\Logs	Folder containing PXE Everywhere

Property	Default value	Notes
		Agent log file. Can be updated in *AppImport.xml*
MODULE.PXEEVERYWHERE.MAXLOGFILESIZE	10485760	Maximum size of the PXE Everywhere Agent log file. Can be updated in *AppImport.xml*
WindowsADKLocation	C:\Program Files (x86)\Windows Kits\10\Assessment and Deployment Kit	This is not an installer property Determines the location of the ADK files to allow CDA to build the PXE boot image
MODULE.PXEEVERYWHERE.USEFIPS	false	Enable FIPS encryption Can be updated in *AppImport.xml - FIPSEncryption*

3.4.2.5 1E Client installer properties - Shopping client

Property	Default value	Notes
Module.Shopping.Enabled	false	Enable Shopping client module Can be updated in *AppImport.xml*
Module.Shopping.ShoppingCentralUrl	(empty)	Shopping Web URL Can be updated in *AppImport.xml*
Module.Shopping.LoopbackExemptionEnabled	false	Enable Edge / Windows app browser support Can be updated in *AppImport.xml*
Module.Shopping.LocalhostUrl	(empty)	Cannot be updated in *AppImport.xml* – Advanced configuration

3.4.2.6 1E Client installer properties - WakeUp client

Property	Default value	Notes
Module.WakeUp.Enabled	false	Enable WakeUp client module Can be updated in *AppImport.xml*
MODULE.WAKEUP.LOGPATH	[WindowsFolder]CCM\Logs	Set the path for the WakeUp Agent logfile Can be updated in *AppImport.xml*
MODULE.WAKEUP.MAXLOGFILESIZE	5242880	Set the size of the WakeUp Agent logfile Can be updated in *AppImport.xml*
MODULE.WAKEUP.REPORTING	OFF	Enable WakeUp status message reporting to a NightWatchman server Can be updated in *AppImport.xml*

Property	Default value	Notes
		Can also be set in registry by setting HKLM\Software\1E\WakeUpAgt Reporting REG_SZ value to "ON"
MODULE.WAKEUP.REPORTINGSERVER	(empty)	Can be updated in *AppImport.xml* Can also be set in registry by setting HKLM\Software\1E\WakeUpAgt\Reporting\HTTP ServiceUrl REG_SZ value
MODULE.WAKEUP.SECUREREPORTINGSERVER	(empty)	Can be updated in *AppImport.xml* *Can also be set in registry by setting HKLM\Software\1E\WakeUpAgt\Reporting\HTTPS ServiceUrl REG_SZ value*
MODULE.WAKEUP.USEFIPS	0 (off)	Enable FIPS compliance in WakeUp module Can be updated in *AppImport.xml* Can also be set in registry by setting HKLM\Software\1E\WakeUpAgt\Reporting UseFipsComplianceEncryption REG_DWORD value to 1

3.4.2.7 1E NightWatchman Agent installer properties

Property	Default value	Notes
REBOOT	ReallySuppress	Suppress the host from rebooting after installation. Cannot be updated in *AppImport.xml* – Advanced configuration The REBOOT property is not in the base MST but is in the install command-line for PXE Everywhere in the answer file.

3.4.3 1E Client Deployment Assistant release information

3.4.3.1 1E Client Deployment Assistant 8.1 release notes – last updated 03-August-2022

These release notes contain late-breaking information about 1E Client Deployment Assistant 8.1. For the most up-to-date information, see the online release notes and Known issues.

3.4.3.2 New Features

The 1E Client Deployment Assistant 8.1 release introduces the following features:

CDA now uses .NET Framework 4.8

This release includes the following changes:

Updated products and Accumulated Hotfixes (Patches)

1E Client Deployment Assistant 8.1 includes the following product versions:

1E Client 8.1.2.62 (includes clients for Nomad, PXE Everywhere, Shopping/WSA, WakeUp, and Tachyon) (new)

1E NightWatchman Agent 7.3.0.774

Accumulated Hotfixes (Patches) included:

None

> **Note**
>
> CDA only supports single patch installation, that is you can only have one .msp file per client. In practice this shouldn't be an issue as cumulative patches are created across all the 1E products, so only one patch should be needed anyway.
>
> Please check the 1E Support Portal to see if there is a later Accumulated Hotfix (Patch):

1E Client v8.1.2.62 - https://1eportal.force.com/s/1eclienttopicdetail

1E NightWatchman Agent v7.3.0.774 - https://1eportal.force.com/s/nightwatchmantopicdetail

3.4.3.3 1E Client Deployment Assistant release history

3.4.3.3.1 8.1.2.19 - Web Release (19 Apr 2022)

Products included:

1E Client 8.1.2.62 (includes clients for Nomad, PXE Everywhere, Shopping/WSA, WakeUp, and Tachyon) **(new)**

1E NightWatchman Agent 7.3.0.774

Accumulated Hotfixes (Patches) included:

None

3.4.3.3.2 8.0.4.8 - Web Release (5 Nov 2021)

Products included:

1E Client 8.0.4.261(includes clients for Nomad, PXE Everywhere, Shopping/WSA, WakeUp, and Tachyon) **(new)**

1E NightWatchman Agent 7.3.0.774

Accumulated Hotfixes (Patches) included:

MSP-Q21807-1EClient.Accumulated.v8.0.4.261

3.4.3.3.3 1.6.0.21 - Web Release (5 May 2021)

Web WakeUp ActiveX removed

Products included:

1E Client 5.2.5.523 (includes clients for Nomad, PXE Everywhere, Shopping/WSA, WakeUp, and Tachyon) **(new)**

1E NightWatchman Agent 7.3.0.774

Accumulated Hotfixes (Patches) included:

MSP-Q21471-1EClient.Accumulated.v5.2.5.523 **(new)**

3.4.3.3.4 1.5.0.28 - Web Release (19 August 2020)

PXE Everywhere removed - PXE Everywhere is now a client module of 1E Client

Products included:

1E Client 5.1.0.922 (includes clients for Nomad, PXE Everywhere, Shopping/WSA, WakeUp, and Tachyon) **(new)**

1E NightWatchman Agent 7.3.0.774

Web WakeUp ActiveX 7.3.0.5

Accumulated Hotfixes (Patches) included:

MSP-Q21142-1EClient.Accumulated.v5.1.0.922 **(new)**

3.4.3.3.5 1.4.300.5 - Web Release (21 July 2020)

Updated products and Accumulated Hotfixes (Patches)

Products included:

1E Client 5.0.0.745 (includes clients for Nomad, Shopping/WSA, WakeUp, and Tachyon)

PXE Everywhere 3.2.0.56

1E NightWatchman Agent 7.3.0.774 **(new)**

Web WakeUp ActiveX 7.3.0.58 **(new)**

Accumulated Hotfixes (Patches) included:

MSP-Q21071-1EClient.Accumulated.v5.0.0.745 **(new)**

MSP-Q20742-PXELite.Server.Accumulated.v3.2.0.56

3.4.3.3.6 1.4.200.4 - Web Release (4 May 2020)

Support for Accumulated Hotfixes (Patches)

Minor improvements in CDA

Products included:

1E Client 5.0.0.745 (includes clients for Nomad, Shopping/WSA, WakeUp, and Tachyon)

PXE Everywhere 3.2.0.56

1E NightWatchman Agent 7.2.500.721

Web WakeUp ActiveX 7.2.500.34

Accumulated Hotfixes (Patches) included:

MSP-Q21005-1EClient.Accumulated.v5.0.0.745 **(new)**

MSP-Q20742-PXELite.Server.Accumulated.v3.2.0.56 **(new)**

MSP-Q20635-1ENightWatchmanAgent.Accumulated.v7.2.500.721 **(new)**

3.4.3.3.7 1.4.100.9 - Web Release (20 Mar 2020)

1E Client 4.1 replaced by 1E Client 5.0

Products included:

1E Client 5.0.0.745 (includes clients for Nomad, Shopping/WSA, WakeUp, and Tachyon) **(new)**

PXE Everywhere 3.2.0.56

1E NightWatchman Agent 7.2.500.721

Web WakeUp ActiveX 7.2.500.34

3.4.3.3.8 1.4.0.27 - Web Release (21 June 2019)

Renamed from Endpoint Agent Installation (EAI) Solution Accelerator to 1E Client Deployment Assistant (CDA)

1E Client added (includes clients for Nomad, Shopping/WSA, WakeUp, and Tachyon)

Tachyon Agent is replaced by 1E Client

Nomad removed - Nomad is now a client module of 1E Client

Products included:

1E Client 4.1.0.267 (includes clients for Nomad, Shopping/WSA, WakeUp, and Tachyon) **(new)**

PXE Everywhere 3.2.0.56

1E NightWatchman Agent 7.2.500.721

Web WakeUp ActiveX 7.2.500.34

3.4.3.4 Endpoint Agent Installation solution accelerator release history

3.4.3.4.1 1.3.0.13 - Support Release (11 Apr 2019)

Updated Tachyon Agent, Nomad and PXE Everywhere

Products included:

Tachyon Agent 4.0.0.580 (includes clients for Shopping/WSA, WakeUp, and Tachyon) **(new)**

Nomad 6.3.201.6 **(new)**

PXE Everywhere 3.2.0.56 **(new)**

1E NightWatchman Agent 7.2.500.72

Web WakeUp ActiveX 7.2.500.34

3.4.3.4.2 1.3.0.1 - Web Release (08 Oct 2018)

1E Agent removed

WakeUp client is now a client module of Tachyon Agent

NightWatchman client is replaced by 1E NightWatchman Agent

Products included:

Tachyon Agent 3.3.0.1033 (includes clients for Shopping/WSA, WakeUp and Tachyon) **(new)**

Nomad 6.3.201.6

PXE Everywhere 3.1.300.5

1E NightWatchman Agent 7.2.500.721 **(new)**

Web WakeUp ActiveX 7.2.500.34 **(new)**

3.4.3.4.3 1.2.1.8 - Web Release (01 Jun 2018)

Products included:

Tachyon Agent 3.2.0.638 (includes clients for Shopping/WSA and Tachyon) **(new)**

Nomad 6.3.201.6 **(new)**

PXE Everywhere 3.1.300.5

1E Agent 7.2.0.156 **(new)**

Web WakeUp ActiveX 7.2.0.33

3.4.3.4.3.1 1.2.1.6 - Support Release (27 Apr 2018)

Added Tachyon Agent

Removed Shopping Agent - Shopping Agent is now a client module of Tachyon Agent

Products included:

Tachyon Agent 3.2.0.618 (includes Shopping module to provide WSA and replace the Shopping Agent) **(new)**

Nomad 6.3.200.123 **(new)**

PXE Everywhere 3.1.300.5

1E Agent 7.2.0.156

Web WakeUp ActiveX 7.2.0.33

3.4.3.4.3.2 1.1.1.70 - Support Release (16 Jan 2018)

Updated Nomad 6.3.200.82

3.4.3.4.4 1.1.1.59 - Web Release (07 Nov 2017)

Updated Nomad 6.3.100.20

3.4.3.4.4.1 1.1.1.52 - Support Release (02 Oct 2017)

Updated Nomad 6.3.0.90

3.4.3.4.5 1.1.1.49 - Web Release (17 Aug 2017)

Updated 1E Agent 7.2.0.156

Updated Web WakeUp ActiveX 7.2.0.33

3.4.3.4.6 1.1.1.46 - Web Release (30 Mar 2017)

Updated Nomad 6.2.200.6

Updated 1E Shopping Agent 1.0.200.11

3.4.3.4.6.1 1.1.1.44 - Support Release (24 Mar 2017)

Updated Nomad 6.2.200.5

Updated PXE Everywhere 3.1.300.5

3.4.3.4.6.2 1.1.1.41 - Support Release (10 Mar 2017)

Updated Nomad 6.2.100.5

Updated PXE Everywhere 3.1.300.4

3.4.3.4.6.3 1.1.1.32 - Support Release (03 Feb 2017)

Updated Nomad 6.2.0.296

3.4.3.4.6.4 1.1.1.22 - Support Release (02 Feb 2017)

Updated Nomad 6.2.0.290

3.4.3.4.7 1.1.1.16 - Web Release (04 Nov 2016)

Updated Nomad 6.1.100.116

3.4.3.4.8 1.1.1.10 - Web Release (02 Sep 2016)

Updated Nomad 6.1.0.142

Updated PXE Everywhere 3.1.200.4

3.4.3.4.9 1.1.0.47140 - Web Release (30 May 2016)

Updated Nomad 6.0.200.25891

Updated PXE Everywhere 3.1.100.46309

Updated 1E Agent 7.1.0.263

Updated Web WakeUp ActiveX 7.1.0.12

Updated 1E Shopping Agent 1.0.100.2

3.4.3.5 CDA features by release

3.4.3.5.1 New in 1E Client Deployment Assistant 8.1

The 1E Client Deployment Assistant 8.1 release introduces the following features:

CDA now uses .NET Framework 4.8

This release includes the following changes:

Updated products and Accumulated Hotfixes (Patches)

1E Client Deployment Assistant 8.1 includes the following product versions:

1E Client 8.1.2.62 (includes clients for Nomad, PXE Everywhere, Shopping/WSA, WakeUp, and Tachyon) (new)

1E NightWatchman Agent 7.3.0.774

Accumulated Hotfixes (Patches) included:

None

> **Note**
>
> CDA only supports single patch installation, that is you can only have one .msp file per client. In practice this shouldn't be an issue as cumulative patches are created across all the 1E products, so only one patch should be needed anyway.
>
> Please check the 1E Support Portal to see if there is a later Accumulated Hotfix (Patch):

1E Client v8.1.2.62 - https://1eportal.force.com/s/1eclienttopicdetail

1E NightWatchman Agent v7.3.0.774 - https://1eportal.force.com/s/nightwatchmantopicdetail

3.4.3.5.2 Features released in version 8.1

CDA now uses .NET Framework 4.8

3.4.3.5.3 Features released in version 8.0

Version number of CDA is now inline with the version of 1E Client

CDA can run independently of Microsoft Endpoint Configuration Manager

3.4.3.5.4 Features released in version 1.6

Web WakeUp ActiveX removed

3.4.3.5.5 Features released in version 1.5

PXE Everywhere removed - PXE Everywhere Agent is now a client module of 1E Client

3.4.3.5.6 Features released in version 1.4.300

Updated products and Accumulated Hotfixes (Patches)

3.4.3.5.7 Features released in version 1.4.200

Patches are now supported for the products. This version supports the installation of patches (.msp) alongside their corresponding client installer files (.msi). The latest released patch for each client is now packaged along with the .msi in each new CDA release. Patches can only be installed alongside the .msi. That is the patching can't be done using CDA after the client has been installed. If you want to apply patch to a client that is different to the packaged one, the existing .msp file must be replaced by your new one, this is located in the client's installation folder under the **Agent Installation Files** folder in the CDA artifact. This must be done prior to launching the CDA installer. For more details, please refer to Using client patch files with CDA.

3.4.3.5.8 Features released in version 1.4.100

1E Client 4.1 replaced by 1E Client 5.0 (includes clients for Nomad, Shopping/WSA, WakeUp, and Tachyon)

3.4.3.5.9 Features released in version 1.4.0

The main 1.4.0 release included the following features:

Renamed from Endpoint Agent Installation (EAI) Solution Accelerator to 1E Client Deployment Assistant

1E Client added (includes clients for Nomad, Shopping/WSA, WakeUp, and Tachyon)

Tachyon Agent is replaced by 1E Client

Nomad removed - Nomad is now a client module of 1E Client

Other products updated

3.4.3.5.10 Features released in version 1.3.0

1E Agent removed

WakeUp is now a client module of Tachyon Agent

NightWatchman is replaced by 1E NightWatchman Agent

Other products updated

3.4.3.5.11 Features released in version 1.2.8

Tachyon Agent added

Shopping Agent removed - Shopping Agent and Windows Servicing Assistant are now client modules of Tachyon Agent

Shopping Client Identity removed

Other products updated

3.4.3.5.12 Features released in version 1.1.1

Endpoint Agent Installation (EAI) Solution Accelerator provides a single wizard interface covering the following agents:

Nomad – the wizard also adds a file to the Nomad cache to prevent it from being scanned for installed software during Configuration Manager inventory.

PXE Everywhere – the wizard also builds a PXE boot image and related files in order to service PXE requests and runs *CreateBCD.exe* to copy an advertised PXE boot image to the PXE Everywhere cache within a task sequence - thereby reducing the manual configuration required post-installation

1E Agent – NightWatchman and WakeUp

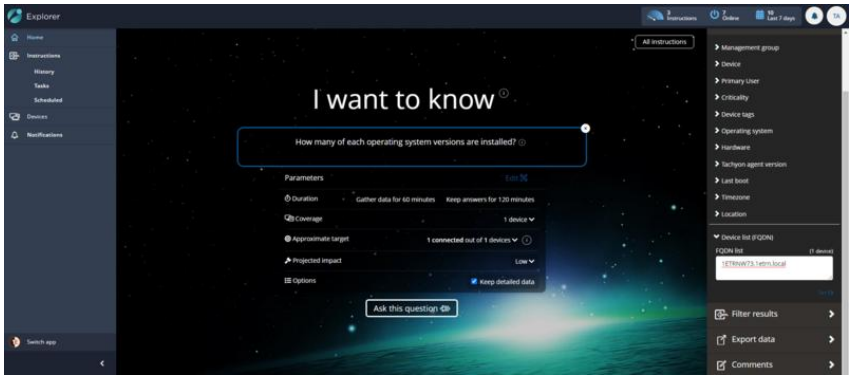
Shopping Client Identity

1E Shopping Agent

Web WakeUp ActiveX Control

4 Tachyon Explorer

Tachyon Explorer is the front-end to the real-time aspects of Tachyon. It lets you interactively ask questions, run actions and view responses. You can also use it to view the connected client devices.



4.1 Introducing Tachyon Explorer

An overview of Explorer is presented; what it does and how it can benefit your organization.

4.1.1 Tachyon Explorer features

Explorer gives you the ability to investigate, remediate issues and manage operations across all your endpoints in real time. For more information, please refer to Using Tachyon Explorer.

Here's an overview of the features available in the Explorer application.

4.1.1.1 Questions, actions and their responses

Explorer lets you directly question connected devices to retrieve responses, run actions, and get real-time information from them. The Explorer front-end capabilities ensure fast querying, investigation, and remediation.

The questions, responses and actions feature includes:

Graphical display of response information

Instruction impact assessment

Response history.

Note

For more information on Instructions and their responses, please refer to:

ExplorerHome page, questions and responses

Question parameters

Instructions

History.

4.1.1.2 Exporting data from Tachyon Explorer

Results visible in Explorer can be exported to files containing comma-separated values (CSV) or, in the case of the **Export all** option on the instruction response page, tab-separated values (TSV), and results can be marked for export at the point of asking a question to automate the process. Explorer lets you export the data on a number of pages to CSV files:

Instruction history

Responses - you can export a single page or all results once the Instruction has finished gathering responses - these can then be used for auditing purposes or to drive external programs

Drill-down responses

Device information.

Note

For more information on exporting data from Explorer, please refer to:

Exporting data from Explorer.

4.1.1.3 Coverage, question filters, view filters and follow-on instructions

Questions and responses can be tailored to focus on specific ranges of devices through the use of coverage and filters:

Coverage acts first to let you restrict the devices that will be asked a given question

Question filters act before devices have responded to narrow the responses that are sent

View filters act after the responses have been sent to focus the responses presented to the user and to determine the input into the follow-on instructions

The responses to initial questions can be further refined by asking follow-on questions or actions, allowing questioners and actioners to focus in on the results they want to see.

> **Note**
>
> For more information on coverage, question filters, view filters and follow-on instructions, please refer to:

Coverage, question filters and view filters

Limiting coverage using a Management group - tutorial

Refining responses with follow-up questions.

4.1.1.4 Approval workflow

To enhance the safety of running actions in the Tachyon system, there is an approval workflow that ensures that every Tachyon action requires the approval of designated approvers before it can be run. To make it even safer, someone with approval permissions cannot approve their own action.

When an attempt is made to run an action, the Tachyon approval workflow sends an email and a notification to all the approvers associated with the action. Any of the approvers may approve or reject the request to run the action.

> **Note**
>
> For more information on the Approval workflow, please refer to:

The action approval workflow

Performing an action - tutorial.

4.1.1.5 Authentication

Users must provide their user credentials when attempting to run an action, this prevents unauthorized access by a third party attempting to make use of an unattended computer.

Actions can also be configured to require two-factor authentication. This is where the user attempting to run an action is challenged to enter a unique, one-time authorization code that has been sent to them by an alternative method such as email or a registered mobile.

> **Note**

For more information on authentication, please refer to:

Two-factor authentication.

4.1.1.6 Task-based organization for accessing and scheduling instructions

Tachyon provides a way of accessing the questions and actions that is organized around the way that network administrators typically interact with their network. This interface also lets you run the Instruction using a schedule.

The **Explorer**→**Instructions**→**Tasks** page in Explorer provides a structured view of the instructions defined in the Product Pack. It also lets you schedule the tasks so they can be run in the future or according to a particular schedule.

4.1.1.7 Using task groups

The benefit of using **Tasks** lies in the task group structure that is defined in the Product Pack. It is this structure that enables you to focus in on specific task areas to find the particular instruction that you want.

For example you may be interested in instructions related to particular software vendor's products. Depending on the Instructions that you have uploaded to your Tachyon system you may see the following structure:

At the top-level there is a **Software Vendors** task group whose children are **1E** and **Microsoft**.

Underneath the **1E** task group there is a **Tachyon** group that contains **Configuration**, **Diagnostics** and **Verification** groups as well as a couple of Instructions.

Underneath the **Microsoft** task group is the **Configuration Manager** task group containing Instructions related to that product.

Note

For more information on using Task groups to access and schedule Instructions, please refer to:

Tasks

Scheduling instructions

Scheduling instructions - a tutorial.

4.1.1.8 Inventory and connectivity

The **Devices** page in the Explorer shows you all the devices that have connected with Tachyon and their current connection status. There are two views provided that let you research the devices: the devices table and the devices dashboard, please refer to The Devices Table and The Devices Dashboard for more details.

Note

For more information on inventory and connectivity, please refer to:

Investigating Devices

Using the Devices dashboard - Tutorial.

4.2 Planning for Tachyon platform

For information about planning your implementation, please refer to Planning for Tachyon.

4.3 Installing Tachyon Explorer

Tachyon Explorer is an application that is part of Explorer platform and is installed using Tachyon Setup. For more information on installing the platform, please refer to Installing Tachyon.

For more information on uploading Product Packs for use in Explorer, please refer to the following pages.

4.3.1 Tachyon Product Pack Deployment Tool

A description of the Tachyon Product Pack Deployment Tool (PPDT).

The PPDT can be used to upload multiple Classic and Integrated Product Packs into Tachyon.

The PPDT is found in the Product Packs folder of the Tachyon Platform zip, please refer to the Tachyon Platform zip for more details, and with appropriate permissions. Once the zip has been extracted, the tool can be used to upload any Classic and Integrated Product Packs found in its folder structure. Ensure you use the same version of the tool to match the version of Tachyon.

Classic Product Packs

Classic Product Packs contain instructions, for use in Explorer and other Tachyon applications.

Classic Product Packs can also be uploaded using the Settings app→ Instructions → Instruction Sets, described in Tachyon Platform - Instructions Menu, this method does not assign instructions to any instruction set. Settings can also be used to export instructions.

Hyphens

The tool creates an instruction set with the same name as its zip.

When creating or updating an instruction set, the tool converts hyphens to spaces. Hyphens can be included in names of Instruction sets, but they are converted by the tool. Older versions of the tool removed hyphens.

The Settings application keeps hyphens and spaces in the zip name when downloading (exporting) an instruction set. If the tool is then used to re-upload the same pack the hyphens are lost, creating a new instruction set with a different name to the original.

Individual Product Packs are not versioned, however each instruction has its version stored in the instruction definition.

Integrated Product Packs	Integrated Product Packs contain policies, rules and fragments for use by Guaranteed State, and may also include instructions. If the Product Pack contains instructions associated with the policies, the tool creates an instruction set using the name in its manifest file.

When the tool is used to upload new versions of instructions, then the updated instructions remain in their current instruction set, they are not moved to the new set created by the tool.

4.3.1.1 Getting started

To run the tool you need the following:

4.3.1.1.1 Account permissions

The account used to run the **Tachyon.ProductPackDeploymentTool.exe** must:

have local administrator rights on the computer it is running on

exist as a user with the following administrator rights:

Guaranteed State administrator

Instruction Set administrator.

4.3.1.1.2 Locating the Tachyon Product Pack Deployment Tool

This is now included in the Tachyon Platform zip file under the ProductPacks folder.

This folder holds the **Tachyon.ProductPackDeploymentTool.exe** (and its supporting files) used to upload the Classic and Integrated Product Packs into Tachyon.

It will create a log file called **Tachyon.ProductPackDeploymentTool.log** in the same folder.

4.3.1.1.3 What's in the ProductPacks folder?

The ProductPacks folder contains two directories, **Classic** and **Integrated**.

The **Classic** directory holds a number of Classic Product Packs that contain Tachyon Instructions.

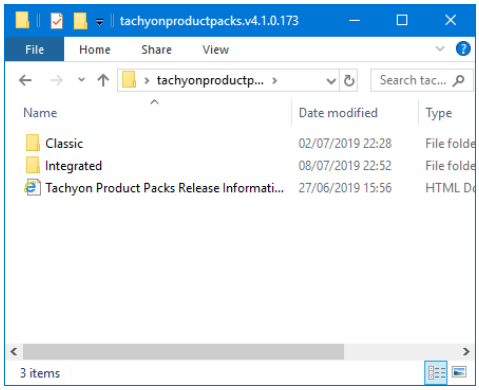
The **Integrated** directory holds a number of Integrated Product Packs that contain definitions for some Guaranteed State Policies, associated Fragments and Instructions. In addition a core utilities pack has been provided with common Fragments that you can use to build your own Policies.

4.3.1.2 Running the Tachyon Product Pack Deployment Tool

Here are the steps for running the tool:

Navigate to the directory where the **tachyonproductpacks.<version>.zip** file has been unzipped.

You will see two directories: **Classic** and **Integrated**.



Navigate to the **Integrated** directory**.**

In this directory you can see the Integrated Product Pack zip files along with the PPDT files:

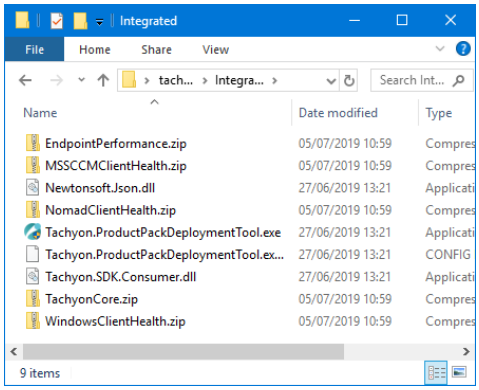
Newtonsoft.Json.dll

Tachyon.ProductPackDeploymentTool.exe

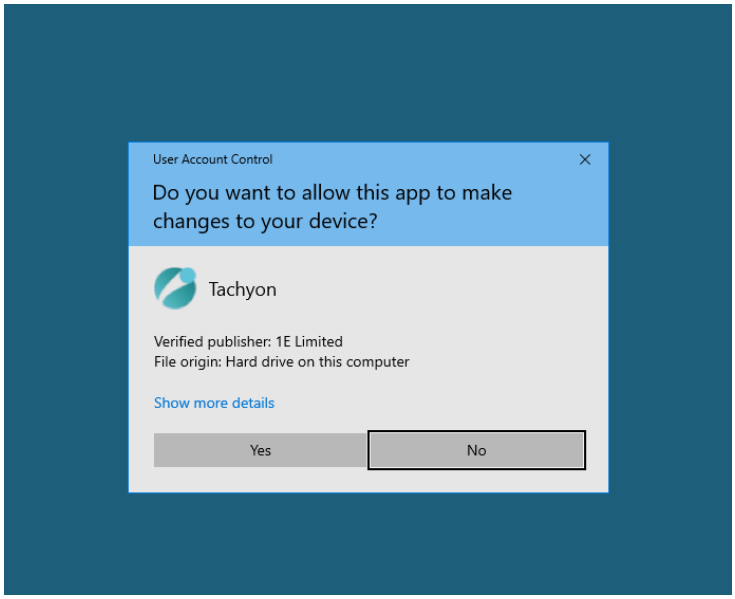
Tachyon.ProductPackDeploymentTool.exe.config

Tachyon.SDK.Consumer.dll

Double-click on **Tachyon.ProductPackDeploymentTool.exe**.



Click on **Yes** if any UAC dialog is displayed.



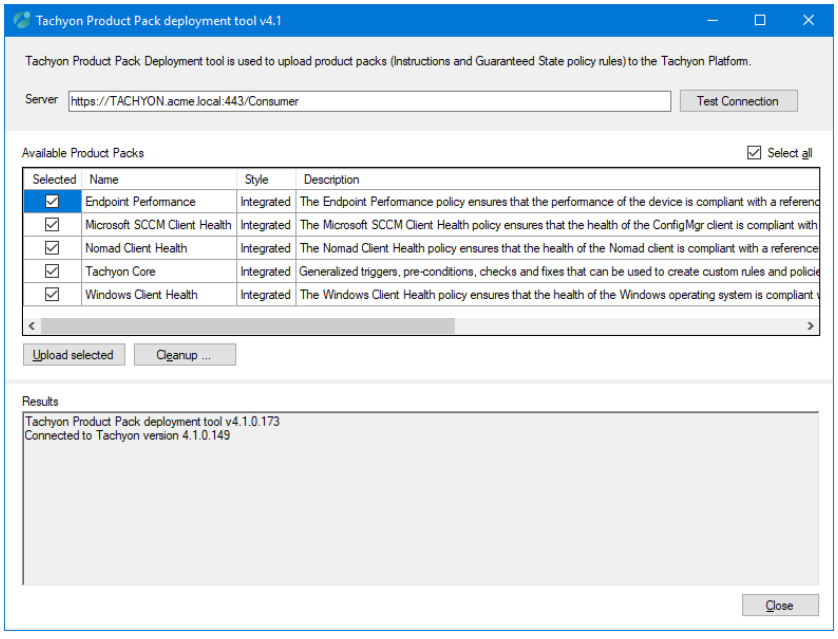
The **Tachyon Product Pack deployment tool** dialog will appear.

You must specify the URL of the Tachyon Consumer API in the **Server** field and then click on **Test Connection** to verify that you have entered the correct value.

Alternatively, you can specify the parameter *-url "<ConsumerAPI>"* on the command-line, for example: *-url "https://tachyon.acme.local/Consumer"*. If you run the tool on the Tachyon Server, the tool will automatically prefill the URL.

The **Style** column of the **Available Product Packs** table indicates whether each **Product Pack** is **Classic** or **Integrated**. The **Available Product Packs** table will be populated with all the zip files encountered in the directory the tool was launched from and all its sub-directories.

The **Select all** box can be used to select or deselect all the items in the **Available Product Packs** table.



4.3.1.2.1 Uploading Product Packs

When you have selected and checked the Tachyon Consumer API location you will then be able to upload the selected **Available Product Packs** by clicking on the **Upload selected** button. The content of the selected packs will then be uploaded to the Tachyon Server. The **Results** field displays the progress of the operation.

> **Warning**
>
> Updating Policies, Rules, Fragments, and Triggers that already exist in the Tachyon database is supported, but you need to be careful to ensure that the new artifacts uploaded are compatible with the existing ones. In particular, any new fragments and trigger templates uploaded need to have the same parameters that are used by the version of the same artifact that already exists in the database. Otherwise, any rules that are passing the previous set of parameters to the fragments will be broken when the new fragments start requiring a different set of parameters to be passed to them.

4.3.1.2.2 Cleanup option

The **Cleanup...** button on the main screen displays a **Cleanup** dialog that lets you remove items from the Tachyon server.

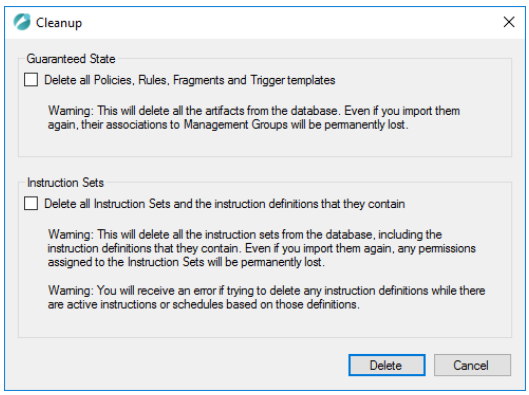
You would not normally perform a cleanup on a production server. This option is intended mainly for use in lab environments where you want to delete and re-upload the content in order to test different Product Packs.

There are two types of data that can be deleted using the Cleanup dialog and you will need to check the boxes for each type you want to delete:

Type of data	Description
Guaranteed State	Selecting this will delete **all** Policies, Rules, Fragments and Trigger templates from Tachyon and any previous associations those items had with any Management Groups will be permanently lost.
Instruction Sets	Selecting this will delete **all** the Instruction Sets and any Instruction definitions they contain. When you do this all the Instruction Sets and Instruction definitions currently loaded into Tachyon will be deleted and any permissions associated with them will be permanently lost. Errors will be generated if you try to delete any Instruction definitions that have active Instructions or schedules based on those definitions.

> **Warning**
>
> You need to read the warnings displayed on the dialog and be completely sure about wanting to delete the content before clicking on the **Delete** button. The program will display an additional confirmation dialog before proceeding to delete the selected content.

The deployment tool then calls the Consumer API and tells it to delete the selected items. If the Consumer API then decides that it cannot delete something because its current status doesn't allow it, then it returns an error to the deployment tool. The deployment tool displays the message. The tool doesn't care about whether a policy is enabled, or deployed or whatever. All validations are delegated to the Platform.



4.3.1.3 Log files

The log file is called **Tachyon.ProductPackDeploymentTool.log**. It is created in the same folder where the tool executable is located.

The logging level can be changed by adding the parameter **-log <level>** on the command line, for example, **-log DEBUG**. Supported values available:

TRACE

DEBUG

INFO (default)

WARN

ERROR

4.3.2 Verifying

The Verifying steps for Explorer can be found on the Verifying page.

4.4 Using Tachyon Explorer

How to use the Explorer application to investigate, remediate issues and manage operations across all your endpoints in real-time.

Note

Explorer can be reached directly using the following URL:

`https://<tachyon DNS Name FQDN>/Tachyon/App/#/explorer/`

where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names.

4.4.1 Introducing Explorer

An overview of Explorer is presented; what it does and how it can benefit your organization. An introduction to the features is provided.

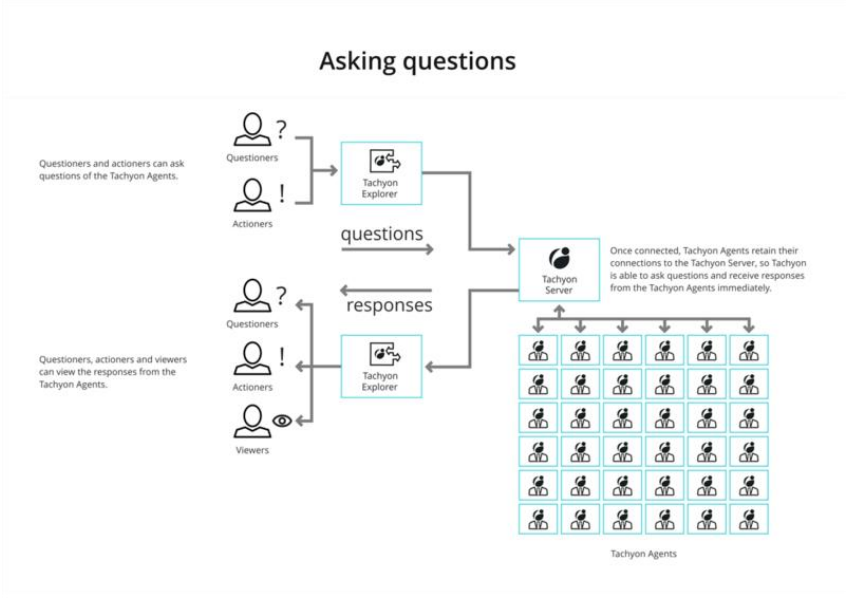
4.4.1.1 Introduction

Explorer is the front-end to the real-time aspects of Tachyon. It lets you interactively ask questions, run actions and view responses. You can also use it to view the connected client devices.

4.4.1.1.1 Asking questions

Using the Explorer, questions can be asked of the Tachyon client devices by users with the questioner or actioner roles . The responses can be viewed by viewers, questioners and actioners.

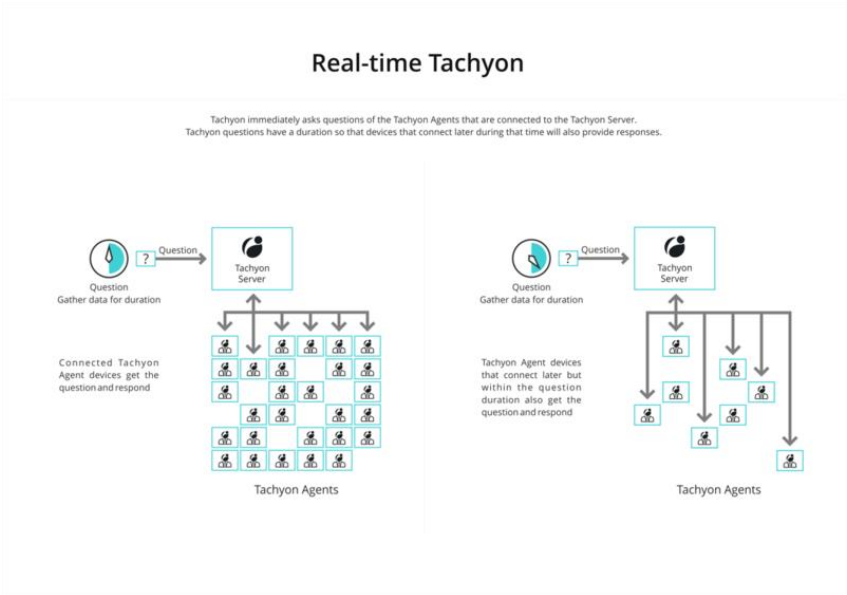
Details on asking questions can be found in ExplorerHome page, questions and responses.



4.4.1.1.2 Real-time Tachyon

Tachyon works in real-time, so not all of the devices may be connected at the time a question is asked. Questions have a configurable duration that they will gather data for - allowing devices that connect later, within the **gather data for** duration, to respond.

Questions also have a configurable **keep answers for** duration - given that the answers from a live network can potentially get stale quickly and questions are fast enough that you can simply ask the question again rather than relying on old answers.



4.4.1.1.3 Coverage and filters

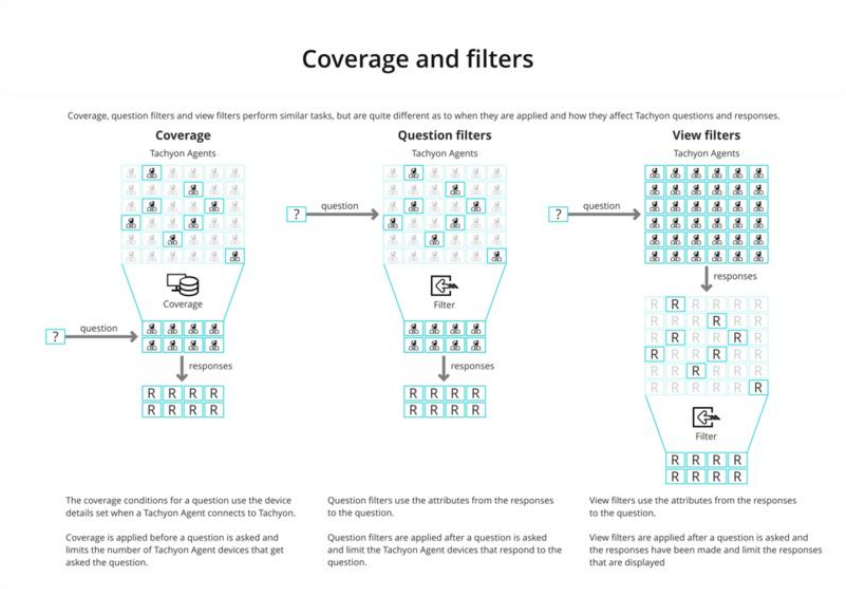
You can use coverage and filters to reduce the amount of network traffic caused by asking a question. They are also useful in reducing the amount of data that is presented to the Tachyon users. Tachyon provides coverage, question filters and view filters.

Coverage is applied before a question is asked and reduces how many Tachyon client devices get asked the question. Coverage uses the device properties that are sent by a Tachyon client when it connects to Tachyon.

Question filters are applied at the Tachyon client after the question has been asked and use the attributes from the question responses to determine whether the client should send the response.

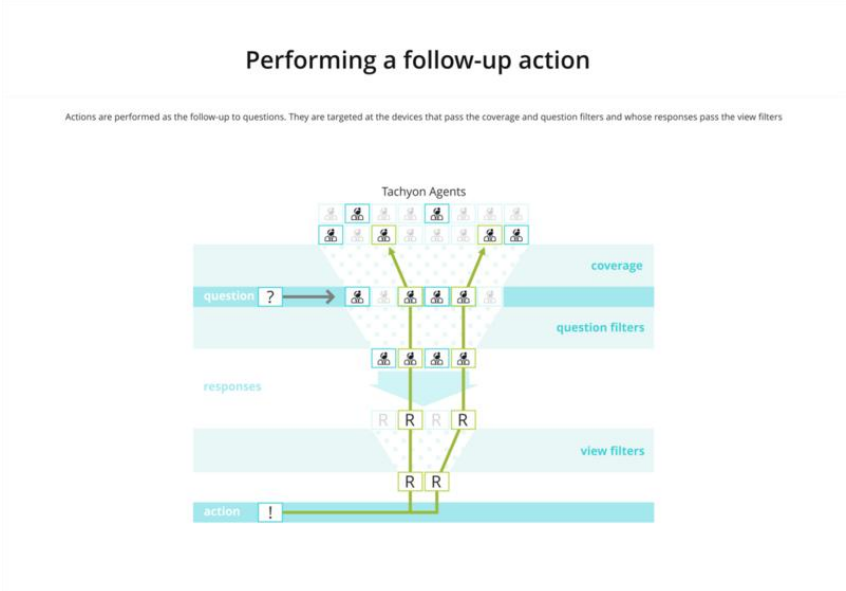
View filters are applied in the Explorer after the responses have been sent and reduce the responses that are displayed.

For more information see Coverage, question filters and view filters.



4.4.1.1.4 Performing actions

Normally, before an action is performed a question is asked. This identifies the set of devices the action will be performed on, after the coverage, question and view filters have been applied.



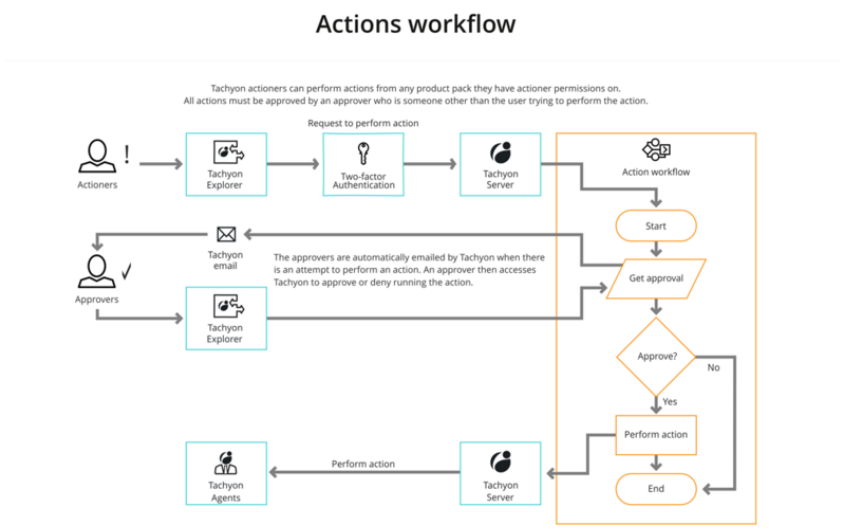
Using the Explorer, actions can be performed on the client devices by users with the actioner role on a product pack subject to the following:

they will need to enter their password

if the action has been configured to use two-factor authentication, they will need to enter the authentication code

they will need the approval of someone other than themselves with an approver role.

Details on performing actions and the approval workflow can be found in The action approval workflow.



4.4.2 Explorer Features

An overview of Explorer application features.

The Explorer application gives you the ability to investigate, remediate issues and manage operations across all your endpoints in real-time. For more information, please refer to Using Tachyon Explorer.

Here's an overview of the features available in the Explorer application.

4.4.2.1 Explorer features

4.4.2.1.1 Questions, actions and their responses

Explorer lets you directly question connected devices to retrieve responses, run actions, and get real-time information from them. The Explorer front-end capabilities ensure fast querying, investigation, and remediation.

The questions, responses and actions feature includes:

Graphical display of response information

Instruction impact assessment

Response history.

> **Note**
>
> For more information on Instructions and their responses, please refer to:

ExplorerHome page, questions and responses

Question parameters

Instructions

History.

4.4.2.1.2 Exporting data from Explorer

Results visible in Explorer can be exported to files containing comma-separated values (CSV) or, in the case of the **Export all** option on the instruction response page, tab-separated values (TSV), and results can be marked for export at the point of asking a question to automate the process. Explorer lets you export the data on a number of pages to CSV files:

Instruction history

Responses - you can export a single page or all results once the Instruction has finished gathering responses - these can then be used for auditing purposes or to drive external programs

Drill-down responses

Device information

> **Note**
>
> For more information on exporting data from Explorer, please refer to:

Exporting data from Explorer.

4.4.2.1.3 Coverage, question filters, view filters and follow-on instructions

Questions and responses can be tailored to focus on specific ranges of devices through the use of coverage and filters:

Coverage acts first to let you restrict the devices that will be asked a given question

Question filters act before devices have responded to narrow the responses that are sent

View filters act after the responses have been sent to focus the responses presented to the user and to determine the input into the follow-on instructions

The responses to initial questions can be further refined by asking follow-on questions or actions, allowing questioners and actioners to focus in on the results they want to see.

> **Note**
>
> For more information on coverage, question filters, view filters and follow-on instructions, please refer to:

Coverage, question filters and view filters

Limiting coverage using a Management group - tutorial

Refining responses with follow-up questions.

4.4.2.1.4 Approval workflow

To enhance the safety of running actions in the Tachyon system, there is an approval workflow that ensures that every action requires the approval of designated approvers before it can be run. To make it even safer, someone with approval permissions cannot approve their own action.

When an attempt is made to run an action, the approval workflow sends an email and a Tachyon notification to all the approvers associated with the action. Any of the approvers may approve or reject the request to run the action.

Note

For more information on the Approval workflow, please refer to:

The action approval workflow

Performing an action - tutorial.

4.4.2.1.5 Authentication

Users must provide their user credentials when attempting to run an action, this prevents unauthorized access by a third party attempting to make use of an unattended computer.

Actions can also be configured to require two-factor authentication, where the user attempting to run an action is challenged to enter a unique, one-time authorization code that has been sent to them via an alternative method - such as email or via a registered mobile.

Note

For more information on authentication, please refer to:

Two-factor authentication.

4.4.2.1.6 Task-based organization for accessing and scheduling instructions

Tachyon provides a way of accessing the questions and actions that is organized around the way that network administrators typically interact with their network. This interface also lets you run the Instruction using a schedule.

The **Explorer→Instructions→Tasks** page in Explorer provides a structured view of the instructions defined in the Product Pack. It also lets you schedule the tasks so they can be run in the future or according to a particular schedule.

4.4.2.1.7 Using task groups

The benefit of using **Tasks** lies in the task group structure that is defined in the product packs. It is this structure that enables you to focus in on specific task areas to find the particular instruction that you want.

For example you may be interested in instructions related to particular software vendor's products. Depending on the Instructions that you have uploaded to your Tachyon system you may see the following structure:

At the top-level there is a **Software Vendors** task group whose children are **1E** and **Microsoft**.

Underneath the **1E** task group there is a **Tachyon** group that contains **Configuration**, **Diagnostics** and **Verification** groups as well as a couple of Instructions.

Underneath the **Microsoft** task group is the **Configuration Manager** task group containing Instructions related to that product.

Note

For more information on using Task groups to access and schedule Instructions, please refer to:

Tasks

Scheduling instructions

Scheduling instructions - a tutorial.

4.4.2.1.8 Inventory and connectivity

The **Devices** page in the Explorer shows you all the devices that have connected with Tachyon and their current connection status. There are two views provided that let you research the devices: the devices table and the devices dashboard, please refer to The Devices Table and The Devices Dashboard for more details.

Note

For more information on inventory and connectivity, please refer to:

The Devices Table

Using the Devices dashboard - Tutorial.

4.4.3 ExplorerHome page, questions and responses

How to frame questions in Explorer and view the responses.

4.4.3.1 Asking a question

Explorer is where you frame the questions that let you immediately explore the information available on connected devices.

Note

Explorer can be reached directly using the following URL:

`https://<tachyon DNS Name FQDN>/Tachyon/App/#/explorer/`

where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described in DNS Names.

The animation shows the **TCNQuestioner01** user entering the URL used in our examples, **https://tachyon.acme.local/Tachyon/App/#/Explorer**

The animation shows the Explorer prompting for credentials only because the browser's security settings have been configured to prompt for username and password, which can be useful when testing.

4.4.3.1.1 Choosing your instruction

Clicking on the **All Instructions** button lets you browse through all the currently installed questions.

You can select to browse through the instructions using groups with the following options:

Group by	Description
Instruction set	This option groups instructions by the instruction set they belong to. You can click on an instruction set to expand and collapse a list of its instructions. An instruction can only belong to one instruction set.
None	This option lists all of the instructions without sets.

You can see the instruction type (question or action), name and description

The animation shows the following steps:

The user selects the **All Instructions** dialog for a Tachyon system which has had Product Packs already added.

In the **All instructions** popup the user then takes a quick look through the available **Instruction sets** as selected in the **Group by** options.

You can expand each of the Instruction sets and select the instruction that you want to run. In our example the user expands the **1E TachyonCore** set and then selects the **How many of each operating system versions are installed?** question.

Selecting the question loads it into Explorer You can see the text for the question loaded into the question box with its operational parameters laid out underneath.

The following table briefly describes the available parameters:

Parameter	Description
Duration	Determines how long the data will be gathered for and how long to keep the answers for. Instructions have defaults for the number of minutes to **gather data for** and **keep answers for**. You can override either of these defaults.
Approximate Target	An estimation of how many devices will receive the question.
Projected Impact	An estimation of how much impact the question will have on the target devices. The estimate depends on previous occasions the instruction has run.
Options	Lists any additional options that have been set for the question.

To ask a question you just click the **Ask this question** button below the parameters. When a question is asked, the view automatically switches to its **Responses** page and provides immediate feedback on how the question

responses are coming in. The **Responses from** value at the top-right of the page displays the number of devices that have responded. In our example all 12 devices respond.

The selected Instruction displays a response visualization chart and returns a list of responses. You can switch to the list by clicking the **List view** icon.

4.4.3.2 Interacting with a response visualization

Some questions provided in Product Packs are defined so that their responses can be viewed as graphs.

In our example we want to know which processes have made the most connections to the Domain Controller for our example environment in the past 10 days. The question we will ask is:
Which processes have made connection to <ipAddresss> in the last <numDays> days?. This question will return the information so that it can be reviewed as a graph. It also makes use of Tachyon Activity Record, where potentially useful information about network and device performance is gathered and held by the Tachyon client.

The animation opposite shows the following steps of the example:

On the Explorer home page the **TCNQuestioner01** user types the text **which processes** into the text box and then selects the **Which processes have made connection to <ipAddress> in the last <numDays> days?** question from the matching list.

They then set **<ipAddress>** to **100.100.100.100** (the IP address for the ACME Domain Controller) and **<numDays>** to **10**.

Once the parameters are set they then click on the **Ask this question** button and the clients respond with the list of **Process Names** that have connected to that IP address.

You can interact with the charts, toggling the display for each individual process between on and off, by clicking on the name of the process displayed beneath the chart. In our example **TCNQuestioner01** toggles the display of each process with the highest number of connections off to reveal the processes with less connections.

You can also investigate the individual data nodes of the graphs by hovering the mouse over the points. Here the user looks at each node in turn for **ccmexec.exe**.

4.4.3.3 Checking the status of responses using the summary tab

In the animation opposite we show how the **Summary** tab on the **Responses** page can be used to check the status for the responses to a question.

To check the Response page **Summary** tab we will run a Configuration Manager client health check question.

From the Tasks view navigate to **Software Vendors→Microsoft→Configuration Manager**

Select the
What is the health of my SCCM clients? Check that inventory has run and that policy has been evaluated in the last <numdays> days. question.

Set **<numdays>** to **7** and click the **Ask this Question** button.

When the responses start coming in for the question, select the **Summary** tab to see how they are progressing.

On this page you will see some statistics related to the question responses and some charts that display the information graphically.

The **Sent Count** chart shows the total number of questions that have been sent and the balance between the responses that have been received and the awaiting responses. As each response comes in the percentage of **Responses** goes up and the **Awaiting** goes down. This is also seen in the actual values for the **Responses count** and **Awaiting responses count**.

The **Responses Status** chart shows the status for each response as it comes in. For each response the status may be one of the following:

Reponses	Description
Success	Devices that have responded with a success status
Success - no content	Devices that have responded with a success status but did not provide a response to the instruction content request
Error	Devices that have responded with an error encountered when attempting to run the instruction
Not implemented	Devices that have responded where the feature contained in the instruction is not implemented on the device
Response too large	Devices that have not been able to respond to the instruction content request because their response was too large

In our example, eventually the **Responses** count in the **Percent Sent Count** chart rises to 100% indicating that all the responses have been received now (for the devices currently connected).

We can now check on the **Status** tab to investigate the reasons for the response statuses we've seen.

Expanding the **Not implemented** row, we can see that our Linux device cannot run this instruction because it uses a PowerShell script that is not supported on this platform.

Expanding the **Error** row, we can see that one of our Windows 7 devices generated a PowerShell error.

4.4.3.4 Question parameters

How to configure Question Parameters.

4.4.3.4.1 Duration

The section in the list of instruction parameters is **Duration**. When Explorer asks a question it does so immediately to all the connected devices, which can be seen in the **Approximate Target** parameter, in the picture there are 12 out of 12 devices connected so the question will get sent immediately to all of the devices.

In a large dynamic network having all the devices connected at one time is unlikely, due to the nature of laptops or mobile devices for example connectivity is liable to be a very fluid thing with devices connecting and disconnecting constantly.

For this reason questions are asked over a duration, this allows devices that connect inside of that duration to answer the question. The default time varies according to the instruction definition in the Product Pack but you can change this parameter to the time that you think will give the highest number of responses.

The other aspect of a dynamic network is that the information returned in the responses to a question may change afterwards at the source. For this reason the responses to a question are only kept for a configurable period of time. Like the **Gather data for** parameter, the default **Keep answers for** time varies according to the instruction definition in the Product Pack but you can change this parameter to a time appropriate to how volatile the information in the question response is.

Setting the duration for gathering data and keeping answers can be done by:

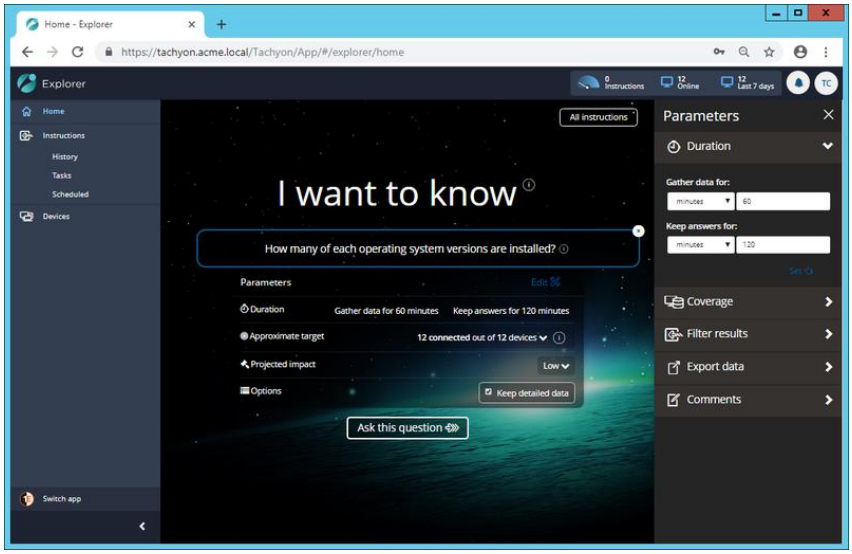
Editing the question **Parameters**

Expanding the **Duration** heading in the **Parameters** rollout

Selecting a value and unit (minutes or hours) for each of the **Gather data for:** and **Keep answers for:** fields.

Clicking the **Set** link at the bottom-right of the expanded **Duration** heading.

The picture shows a question **Duration** with the default values.



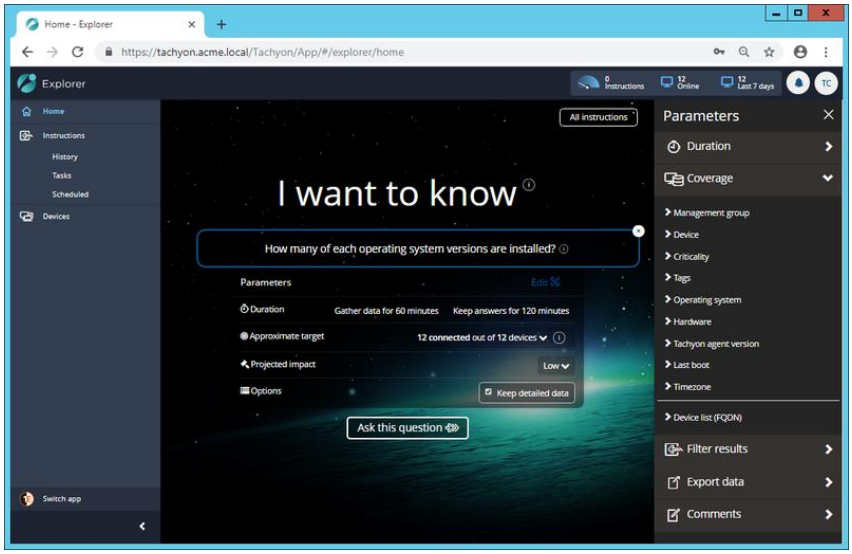
4.4.3.4.2 Coverage

The Coverage section lets you control which devices get sent the instruction you are defining. This helps to minimize network bandwidth usage as all the processing of which devices get targeted is all done within Tachyonbefore the instruction is sent. Coverage uses the data sent to Tachyon by devices when they register.

The picture shows the Coverage section for a question.

4.4.3.4.2.1 More information on Coverage

Coverage, question filters and view filters describes the similarities and differences between the three main types of filter that can be applied to an instruction, and a tutorial on Management groups and coverage can be found on Limiting coverage using a Management group - tutorial. Tables of information on the coverage parameters can be found in Coverage parameters.



4.4.3.4.3 Filter results

The **Filter results** section lets you define a question filter that determines which devices respond to an instruction. In this case the instruction is sent to the device and the filter is applied there to determine whether the device sends a response or not. Like Coverage this reduces unnecessary network bandwidth usage but unlike Coverage the data that can be used for the filter comes from the instruction and is not limited to the data sent to Explorer when devices connect.

The picture shows the **Filter results** parameter section expanded.

4.4.3.4.3.1 Selecting the attributes to filter

The **Filter results where:** field lets you build filter conditions from the attributes of the question, a comparison operator and a value. You can build multiple filter conditions, but each of them must be built and set before you can build the next.

The workflow steps for creating each condition are as follows:

Choose the attribute to filter

Choose the comparison operator

Set the value

Each step uses the **Filter results where:** field in a slightly different way. To choose the attribute you click in the field. A list of the attributes that are available to filter on from the selected question will be displayed. Each attribute has a type that changes the options that are available for the operator and value selectors, as shown in the following table.

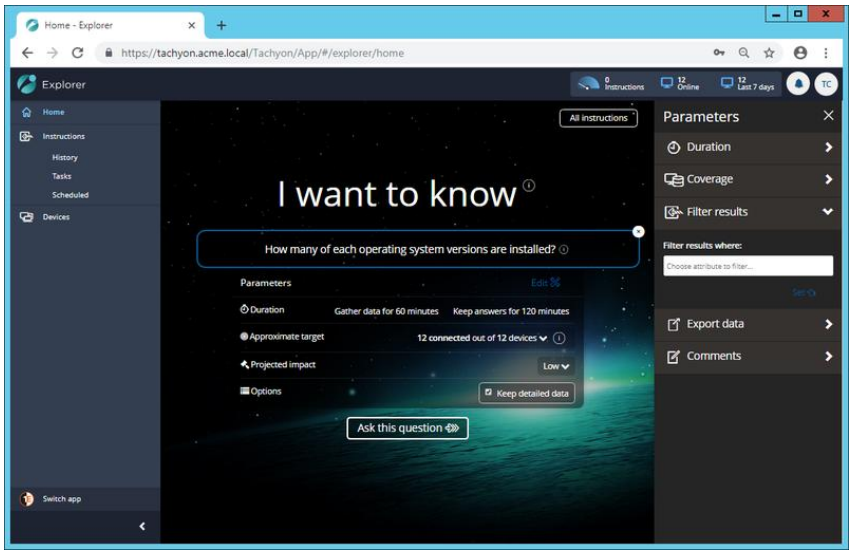
Attribute type	Operators	Value field
string	begins with	Edit field

Attribute type	Operators	Value field
	contains	
	is	
	ends with	
integer	>=	Edit field constrained to integer values
	=	
	<=	
datetime	before	date/time picker
	after	
bool	is	menu containing true/false

Once the operator has been set the value can be set. For string and integer type attributes there is an edit field. For boolean type attributes there is a menu that allows you to select true or false. For datetime type attributes there is a date picker that lets you select the date and time interactively.

4.4.3.4.3.2 More information on Filter results

Coverage, question filters and view filters describes the similarities and differences between the three main types of filter that can be applied to an instruction.



4.4.3.4.4 Export data

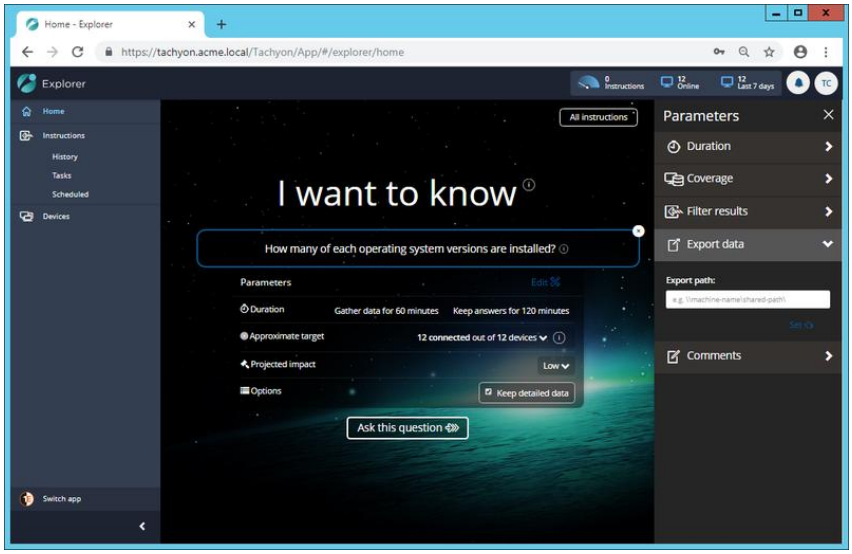
The Export data section lets you define from the outset that the responses to the instruction will be exported when all the results have been gathered.

The picture shows the Export data section expanded. There is a single edit field where you must supply the path to a Windows share with the appropriate permissions set, please refer to Configure Tachyon to support the Export all responses feature for more details.

4.4.3.4.4.1 More information on Export data

An example of running an instruction with **Export data** enabled can be found in Tasks.

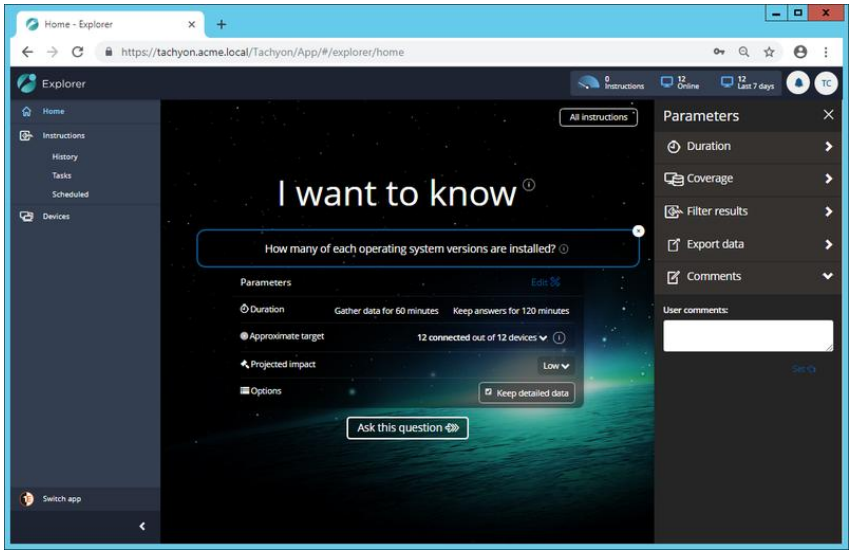
Exporting data from the outset is also similar to exporting all results from the responses page, as described in Exporting data from Explorer.



4.4.3.4.5 Comments

The **Comments** section lets you add a comment to the instruction that will appear in the emails sent to approvers.

The picture shows the **Comments** section expanded.



4.4.3.5 Coverage, question filters and view filters

How to define the coverage for a question, how to filter the responses to a question at source and how to filter them in the responses view.

4.4.3.5.1 Coverage and filters

In ExplorerHome page, questions and responses we've seen an example of asking a question and returning some responses. The question was asked of all 6 devices and the responses from all 6 devices could be seen. However, our example environment is not representative of a real network where there may be many thousands of devices and a corresponding number of responses. In the real world it would be expected that questioners would want to perform some limiting of the number of devices questioned, the number of responses returned and the number of responses displayed.

Explorer provides options for each of these:

Coverage - limits the number of devices that are questioned

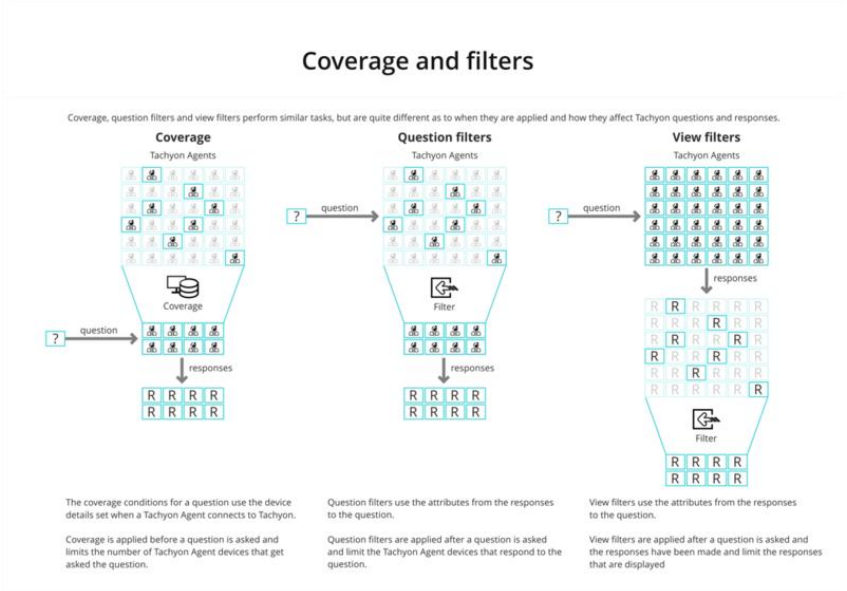
Question filters - limits the responses at the client

View filters - limits the number of responses shown in a view

All of these limit the amount of data that is displayed to the user, but it's worth while making a quick comparison of the similarities and the differences to help determine when it is best to use each.

The picture shows the basic similarities and differences between the three options. We'll look at each option in more detail in the following headings.

In the following examples **TCNQuestioner01** is logged in to Explorer, they have access to the **How many of each operating system version are installed?** question that we will use to illustrate the similarities and differences between Coverage, Question filters and View filters.



4.4.3.5.2 Coverage

Let's take a look at coverage first. To demonstrate the difference between filters and coverage we will set the coverage of the question to only target devices that have Windows 10 or later installed.

In the example we're logged on as **TCNQuestioner01**, here are the instructions for it:

After typing the text **How m** in the edit field, select the
How many of each operating system version are installed? question from the list of matching questions.

Note that the **Approximate target** field shows that there are **12 connected out of 12 devices**. This is because in our example environment there are only 12 client devices in total and all of them are connected. In a real network you are liable to have intermittently connecting devices and the connected number shown will vary accordingly.

After the question is loaded click on the **Edit** link in the parameters section beneath the question text. Doing this expands the **Parameters** rollout.

On the **Parameters** rollout click the **Coverage** heading to see the coverage parameters.

Click the **Operating system** heading to expand the controls for setting a coverage using the operating system details

The **Type** parameter lets you select the device's operating system from a list of supported OS. Select **Windows**.

The **Version** parameter lets you define a numeric comparison for the number you type in the edit field. Select the **>=** operator and then type **10** in the edit field. This will check for all Operating Systems of version 10 or later.

Click the **Set** link in the bottom-left of the expanded **Operating system** heading, which adds the **OsVer >= 10** and **OSType = Windows** coverage parameters to the question details.

Now click the **Ask this question** button. The question will only be asked of the devices whose device parameters match the coverage just set.

The **Responses** page for the question displays the selected **Coverage** parameters in the question header.

Once all the responses have been received you can see in the video that there are two rows where the **Os Version Text** is **Windows 10 Enterprise** and **Windows 10 Pro** respectively and the **Count** totals **2**.

4.4.3.5.2.1 Real-time coverage

Explorer does not just work on the basis of the client devices that are currently, or have previously, connected to Tachyon. It is also open to existing information changing and to new, previously unconnected, client devices that come online while a question is active. This means that the coverage information in the question header, where it shows the percentage of answers received out of the total number of devices included in the coverage, could change as client devices change their device properties registered with Tachyon or new client devices come on line.

In our coverage example the responses could change if a client device finishes a migration to a Windows 10 operating system or a new client device with the Windows 10 operating system connects while the question is still active. In this case the number of devices in the coverage would change but the percentage could stay at 100% if all of the new devices covered have also sent responses.

4.4.3.5.3 Question filters

The second option is to apply a filter at the point the question is being framed. This does not affect which clients get asked the question. The question filter, which is constructed from the attributes of the question response, controls which of the clients actually send their responses.

Question filters are set by editing the question parameters, once a question has been selected, you expand the **Filter results** heading in the **Parameters** rollout.

In the example we're logged on as **TCNQuestioner01**, here are the instructions for it:

After typing the text **How m** in the edit field, select the
How many of each operating system version are installed? question from the list of matching questions.

After the question is loaded, click on the **Edit** link in the parameters section beneath the question text. Doing this expands the **Parameters** rollout.

On the Parameters rollout, click the **Coverage** heading to see the coverage parameters.

Click on the **Filter results** heading to expand that section.

Clicking on the **Filter results where:** field displays the question attribute list, that is the list of attributes that are defined as part of the question.

Select **OsType** from the list and it gets added to the field and a second list is displayed containing the operators that are relevant to the attribute type, in this case a string.

Select the **contains** operator and that gets added to the field. Now the rest of the field becomes an edit field.

Type in **Windows** to complete the filter and then click the **Set** link in the bottom-right of the expanded **Filter results** heading to add the filter to the **Filter results** for the question.

Now start the process of building the second part of the filter. This time, click in the field and select **OSVersionText**.

Select the **contains** operator.

Type **10** into the edit field and finally click the **Set** link to add the second filter to the **Filter results** for the question.

Once the filters have been added, click on **Ask this question**.

The **Responses** page for the question displays the selected **Filter results** parameters in the question header.

The responses come back from the devices and the results look similar to the coverage example.

4.4.3.5.4 View filters

The last option is to apply a filter at the point of viewing the responses to the question. This does not affect which client devices get asked the question, nor does it affect which client devices return responses.

View filters are set on the **Responses** page for the individual instruction, once a question has been selected and asked, you then expand the **Filter results** panel just above the responses table.

In the example we're logged on as **TCNQuestioner01**, here are the instructions to follow it:

After typing the text **How m** in the edit field, select the
How many of each operating system version are installed? question from the list of matching questions.

This time go straight to clicking on **Ask this question**.

In moments, the **Responses** page for the question shows that all the devices have responded.

Click on the **Filter results** button to expand the filter results panel.

Type **Windows** into the **OS Type** field and **10** into the **OS Version Text** field then click the **Search** button.

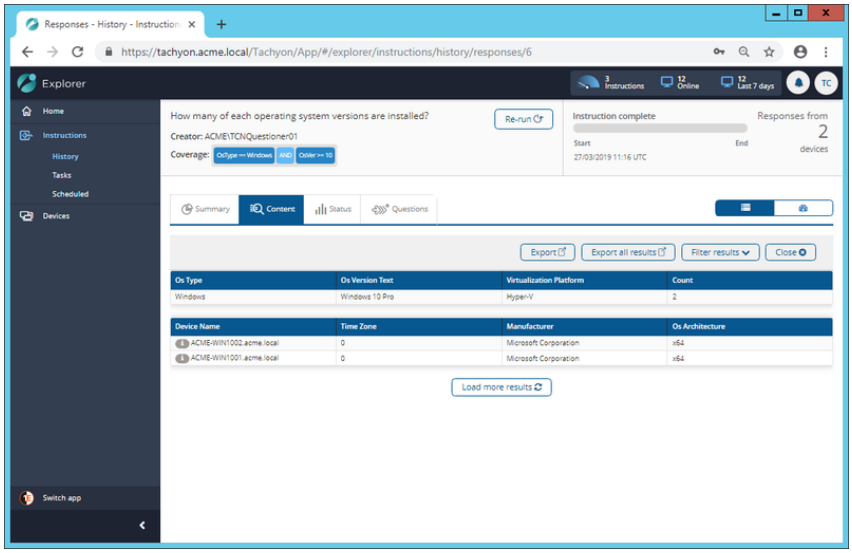
Now the responses from all the connected devices are filtered to just the Windows 10 devices.

4.4.3.5.5 Comparing coverage, question filters and view filters

Here we compare the three sets of responses to the same question, but set with different coverage, question filters and view filters.

4.4.3.5.5.1 Coverage

Here are the results of running a question with coverage set.



The following points summarize coverage:

Lets you constrain a question so that it only gets asked of particular client devices

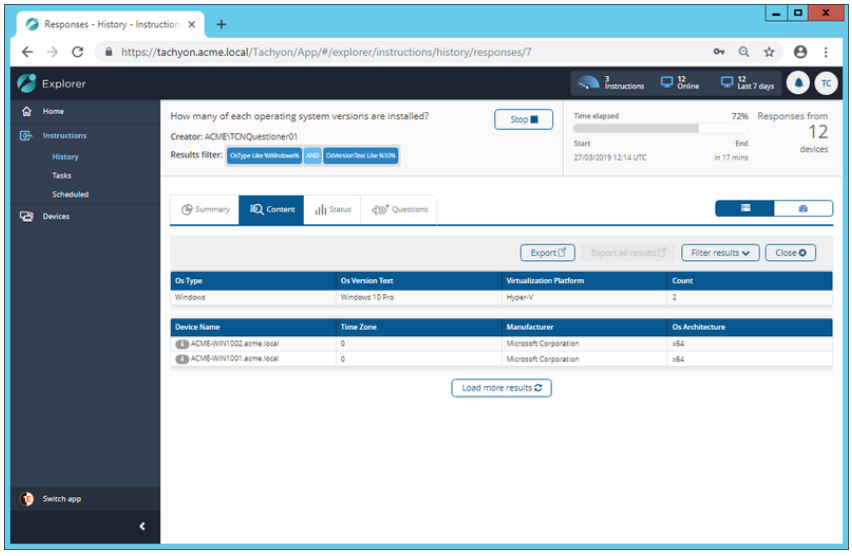
Uses the device details registered with Tachyon by each client device

Is applied at the Tachyon Server before the question is asked

Remains active for the duration of the question, so client devices that change their device details registered with Tachyon may subsequently be included in the question's coverage - that may include new client devices that haven't previously connected.

4.4.3.5.5.2 Question filter

Here are the results of running a question with a question filter set.



The following points summarize a question filter:

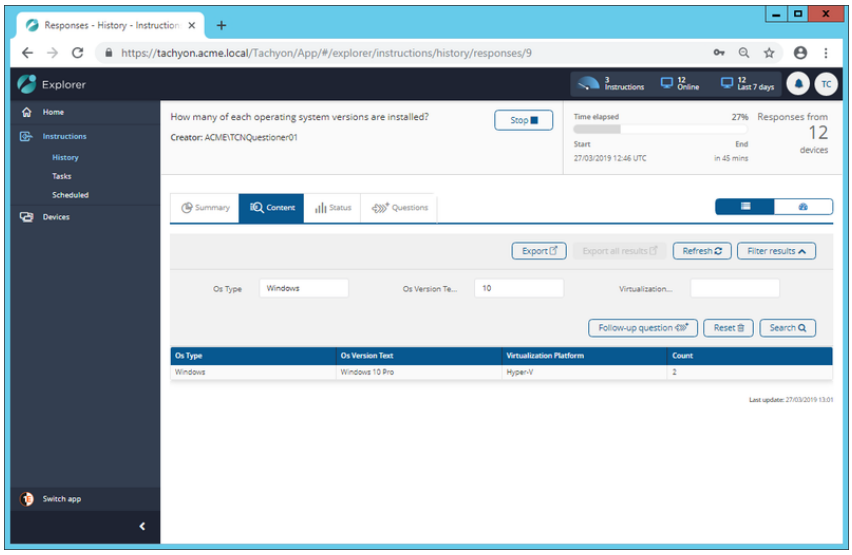
Lets you constrain a question so that responses are only made by particular client devices

Uses the question attributes. The question is run on the client and if the response satisfies the question filter it is sent to Explorer

Is applied at the client after the question is asked but before the response is sent.

4.4.3.5.5.3 View filter

Here are the results of running a question with a view filter set.



The following points summarize a view filter:

Lets you constrain the responses for a question so that only the ones that pass the filter are displayed

Uses the data in the columns for the responses to a particular question

Is applied in the Explorer in the **Responses** view after the responses have been sent to Tachyon Server and are being viewed.

4.4.3.5.6 Limiting coverage using a Management group - tutorial

How to use Management groups to set the coverage for a question to target a specific set of devices.

In this tutorial

In this tutorial, we set the coverage for a question using a Management group. The examples assume that the Management groups have already been configured by a userwho has the group administrator role, please refer to Management Groups - tutorial for more details.

As an example, we will show how to specifically target the devices in the **Executive** Management group. In our example this Management group, defined according to the OU the devices belong to, contains two devices used by members of the executive team:

ACME-WIN1001.acme.local

ACME-WIN1002.acme.local

In this tutorial, we will demonstrate:

Opening the Parameters Coverage Management group panel

Searching for the Management group and setting the coverage

Asking the question, viewing the results and drilling down to see the devices.

4.4.3.5.6.1 Setting Management group coverage

This tutorial starts at the point the **TCNQuestioner01** user has already selected the question: **How many of each operating system versions are installed?**

To set the coverage for the question they need to open the **Parameters** rollout to locate the **Coverage** section and open the **Management group** panel.

4.4.3.5.6.1.1 Opening the Parameters Coverage Management group panel

To do this:

Click the **Edit** link displayed below the question field in the **Parameters** section. Doing this opens the **Parameters** rollout on the right-hand side of the screen.

Click on the **Coverage** heading in the rollout to expand that section and display all the alternative types of coverage that can be set.

Click on the **Management group** heading to expand that panel and reveal a search combobox.

4.4.3.5.6.1.2 Searching for the Management group and setting the coverage

When the Management group field is open:

Click in the edit field, a drop-down list with all the currently defined Management groups is displayed.

Type the first few letters of the Management group you want to use. In our example **TCNQuestioner01** types **Ex** to find the **Executive** Management group.

Click on the Management group in the list of matches displayed.

When the Management group has been selected click **Set** to add it to the question parameters.

> **Note**
>
> You can only set one Management group for a given question. If you try to set another it will replace the one already set.

In our example you can see in the question parameters that the coverage has been set to the **Executive** Management group and the **Approximate target** has changed from **12** to **2**. Hovering over the information icon by the **Approximate target** field displays a notification that the target has been reduced.

4.4.3.5.6.1.3 Asking the question, viewing the results and drilling down to see the devices

We're now ready to ask the question.

Click the **Ask this question** button.

Having set the coverage, the question will only be asked of the devices contained in the selected Management group.

In our example, when the responses come back a single bar is displayed indicating that the 2 devices both have the **Windows 10 Pro** operating system installed.

When **TCNQuestioner01** clicks on the **Responses list** icon, it displays a single entry for the **Windows 10 Pro** operating system.

Clicking on that entry expands the devices that have that operating system installed.

Here the two target devices in the Executive Management group can be seen:

ACME-WIN1001.acme.local

ACME-WIN1002.acme.local

In this tutorial we've shown how to:

Open the Parameters Coverage Management group panel

Search for a Management group and apply the coverage to the question

Ask the question, view the results and verify the devices the question was targeted at.

4.4.3.6 Refining responses with follow-up questions

How to refine responses by asking follow-up questions.

4.4.3.6.1 Follow-up questions

Explorer lets you build on top of initial questions by asking follow-up questions. Those questions may themselves have follow-up questions and so on. The purpose of the follow-up questions is either to constrain the responses further, acting as a kind of super filter, or to get additional information from the devices in the initial responses.

4.4.3.6.2 The example

To illustrate the use of follow-up questions we will use a scenarios where an administrator wants to find out which users are currently logged on to just the Windows devices that have previously been tagged with an **ACMEDEPLOY Phase 3** value coverage tag.

A user with permissions to ask questions, in our example **TCNActioner01**, is logged on to Explorer.

The example contains the following steps:

On the Explorer home page, type in **coverage** to find and then select the **What are the coverage tags?** question.

Click the **Ask this question** button.

Responses are sent back from the client devices showing the coverage tags applied to each of the devices

Filter the responses to show just those with the **Phase 3** value set. This is done by clicking on the **Filter results** button, which expands the **Filter results** panel.

Enter the text **Phase 3** into the **Values** edit field and then click **Search** to apply the filter. The responses change to display just the **Phase 3** tagged devices.

Now click the **Follow-up question** button to ask a question of just these devices. Doing this displays the **Questions** tab with the original question and filter displayed above the usual question edit field.

Type **How many** to find and then select the **How many of each operating system version are installed?** question.

Click **Ask this question**, at the bottom of the page

Responses to the new question are sent back from the client devices that pass the original question and filter. In this case it provides responses from just the **Phase 3** tagged devices

From these follow-up responses the **Os Type** of the devices can be used to filter and just display the **Windows** devices. To do this Expand the **Filter results** panel, type **Windows** in the **Os Type** field and then click the **Search** button. Notice how the **Linux** device has been filtered out.

Click the **Follow-up question** button to create a second follow-up question. Again the follow-up **Questions** tab is displayed, this time with the follow-up question and filter displayed.

Type the word **logged** into the edit field to find and then select the **Who is currently logged in?** question.

Click the **Ask this question** button.

Now the responses to the second follow-up question display the logged on users for just the Windows devices that have been tagged with the **Phase 3** value for the **ACMEDEPLOY** coverage tag. Job done.

If the user wants to monitor how they got to this point they can look at the **Trail**, over on the left of the responses table

Going from top to bottom they can see they asked **What are the coverage tags?**, then **How many of each operating system version are installed?** and finally **Who is currently logged in?**

4.4.4 Instructions

Viewing the instruction history, navigating instructions using the tasks page and scheduling instructions. This page describes how the Instructions section of the Explorer interface works and how it relates to the running of instructions.

4.4.4.1 Instructions

Instructions must be loaded into Tachyon before it can be used to question or perform actions on your network. For more details please refer to Instruction sets page.

4.4.4.1.1 Questions and actions

There are two types of instruction: questions and actions. When an instruction is run it returns a table of responses, for questions the responses are the answers to the question - for actions the responses are the results of running the action. Questions do not require approval. Actions must be approved before they can be run.

4.4.4.2 The History page

When an instruction is run an entry appears in a table on the **History** page. The responses for an individual question or an action can be viewed by clicking on its entry in the **History** page table. This page also supports search and filtering of the instruction history and interacting with the instruction entries, for example to re-run a question.

For more details please refer to History.

4.4.4.3 The Tasks page

Questions may be asked from the **Home** page using the edit field which presents a list of matching questions as you type text into the field, please refer to ExplorerHome page, questions and responses for more details. This is useful if you know the name of the question you want to ask. From the **Home** page you can also view the available questions using the **All questions** button, which displays a list of the questions that have been loaded into Tachyon and can also be organized by Instruction Set.

The **Tasks** page also lets you browse instructions, this time organized into a hierarchy of Task groups, where each Task group denotes a particular functional area and may be broken down into more specific functional areas. For example the **Systems Management** Task group could contain a **Software Distribution** Task group and then any instructions related to software distribution would appear there. A single instruction can also appear in more than one Task group. The last difference is that instructions may be scheduled from the **Tasks** page but not from the **Home** page.

For more details please refer to Tasks.

4.4.4.4 The Scheduling page

Tachyon allows instructions to be scheduled from the **Tasks** page. This enables particular instructions to be run at some point in the future, or on a regular basis depending on your requirements. The Scheduling page lets you interact with the schedules that have been defined for instructions. For more details please refer to Scheduling instructions.

4.4.4.5 History

How the History and individual Instruction **Responses** pages work.

4.4.4.5.1 The History page

On this page you can see a table that shows all the instructions that have replies, are in progress, have expired, have been canceled and have been rejected.

4.4.4.5.1.1 The Instruction History header

Located just above the Instruction History table this section lets you sort, search and filter the instructions displayed in the table. From here you can also export the instruction data for the current page and change the view from a table to a grid.

The options available in the Instruction History header are shown in the following table:

Option	Description
Created	Here you can set a filter on the date and time an instruction was created. The **From** date picker lets you select a time and date that filters the view to show responses that occurred after that time and date. The **Until** date picker lets you select a time and date that filters the view to show responses that occurred before that time and date. You can combine the two to display the responses that occurred between the **From** and **Until** filters.
Filter by	Here you can select to show all or just the instruction responses that are in the following states, corresponding to the **Status** column:

State	Description
Created	A transitory state showing that the instruction has just been created but not yet processed
In approval	The action is awaiting approval

Option	Description	
	Rejected	The action has been rejected
	Approved	The action has been approved
	Sent	The instruction has been sent to the switches via the cores
	Expired	The instruction responses have expired
	Canceled	The instruction has been canceled and any existing responses have been deleted
	Failed	The instruction failed to run

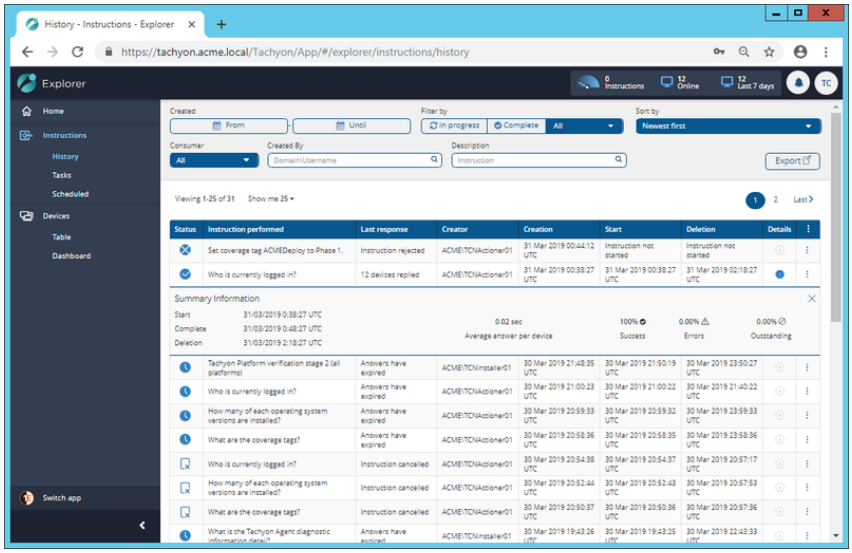
Sort by This control lets you sort the responses by the time they were created or alphabetically by their name in ascending or descending order.

Consumer This control lets you filter the Instruction history according to the consumer that created the instruction. This can be one of the consumers listed in the following table:

Consumer	Description
All	Displays the Instruction history for all the consumers.
Explorer	Investigate, remediate issues and manage operations across all you endpoints in real-time.
Platform	Formerly the SLA Platform, this consumer provides a semi-permanent storage mechanism for different types of information that can be used by other consumers.
Inventory	This is a placeholder for the Inventory consumer, which will be provided in future releases of Tachyon.
GuaranteedState	Ensure endpoint compliance to enterprise IT policiies.
PatchSuccess	Maximise enterprise-wide patch deployment success.

Created By This field filters the Instruction history according to the value in the **Creator** column.

Option	Description
Description	This field filters the Instruction history according to the value in the **Instruction performed** column.
Export	Exports the instructions listed on the current page to a .csv file. This will be saved to your browser's download directory.



4.4.4.5.1.2 The Instruction History table

The Instruction History table displays and lets you interact with the instructions that have been created. The columns are described in the following table:

Column	Description
Status	The icons displayed at the start of each row show the status of the instruction.

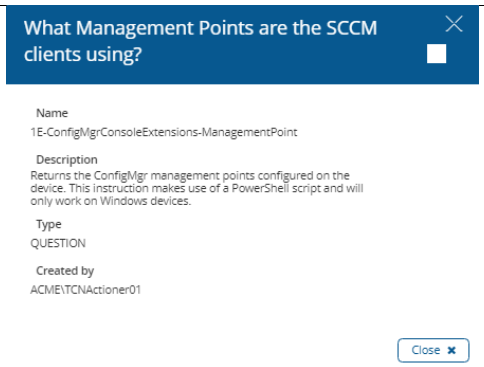
Icon	Description
	This instruction is in progress and still gathering responses
	This instruction has responses that can be viewed
	This instruction's responses have expired
	This instruction has been canceled in Explorer
	This action has been rejected by an approver

Column	Description
Instruction performed	The name of the question or action. Clicking on the **Instruction performed** name in the instruction row takes you to that instruction's Responses page where you can view all its responses.
Last response	The last response received from the instruction. Equivalent to its last known status.
Creator	The user who ran the instruction.
Creation	The time and date the instruction was requested by the creator.
Start	The time and date the instruction was started.
Deletion	The time and date the responses to the instruction will be or were deleted.
Details	Clicking on the information icon in this column expands a **Summary Information** panel below the selected row. The information displayed is described in the following table:

Information	Description
APPROVED BY	This information is only displayed for actions that have been approved and gives the user name for the approver
INSTRUCTION REJECTED BY APPROVER	This information is only displayed for actions that have been rejected and gives the user name for the user who rejected the action. When an action has been rejected this is the only information that is displayed in the **Summary Information** panel.
Start	The time and date the instruction was started
Complete	The date and time the instruction completed
Deletion	The date and time the responses for the instruction will be deleted

Column	Description	
	Average answer per device	Provides an average for the amount of time it took to process the action
	Success	Gives a percentage for the successful responses returned by the devices targeted by the instruction
	Errors	Gives a percentage for the errors returned by the devices targeted by the instruction
	Outstanding	Gives a percentage for the devices targeted by the instruction that have yet to respond.
⋮	Selecting this icon when it is present at the end of a row displays a menu that lets you interact with the instruction. It is only displayed on questions not on actions. The items on the menu are: Item / Description Stop — Displayed if the question is currently running. It stops the currently running question. Re-run — Displayed if the question has completed or the answers have expired. It runs the question again with the same parameters as before. Show advanced information — Displays a popup containing additional information about the instruction. For example the following shows the advanced information for a **What Management Points are the SCCM clients using?** Instruction.	

Column	Description



4.4.4.5.2 The instruction Responses page

On this page you can see the device responses for an individual instruction, summary information about the way the instruction is running and the status of the responses. You can also select to run follow-up questions and actions.

4.4.4.5.2.1 The instruction header

Just below the status bar at the top of the **Responses** page is the instruction header. Here you can see what instruction was run, who ran it and what parameters were set (coverage, question filter etc...). On the right-hand side you can see the percentage of elapsed time for the question's duration and the answers that have been received from the Tachyon client devices currently covered by the question.

You also have an option to stop the instruction. When you click **Stop** you will see a confirmation dialog that gives you the option to keep the responses or not. If you continue Tachyon immediately stops the instruction from running and retrieving any further responses. Any subsequent responses that may come in will be disregarded.

4.4.4.5.2.2 The instruction response tabs

The tabs just below the instruction header provide various information and ways of interacting with the responses. They are described in the following table:

Tab	Description
Summary	This tab provides summary information about the instruction. More information on this tab can be found in #UUIDde48b76b58e22788044acbfe820f803d_id_ExplorerHomepage,questionsandresponsesCheckingthestatusofresponsesusingthesummarytab.
Content	This tab displays the actual response data. Here you can define filters that can be used as the basis for follow-up actions and questions. These follow-up actions and questions will be targeted at the devices whose responses pass the filter. This should be contrasted with the follow-up actions and

Tab	Description
	questions that can be defined on the Questions and Actions tabs, which are targeted at all the same devices as the original instruction.
Status	This tab displays the status information for the responses. Here you can track down the reasons for any errors generated by devices when attempting to respond to the instruction.
Questions	This tab lets you define questions that follow-up the original instruction. Any questions defined here will be targeted at the same devices as the original instruction.
Actions	This tab lets you define actions that follow-up the original instruction. Any actions defined here will be targeted at the same devices as the original instruction.

4.4.4.6 Tasks

How to use Tachyon's Task-based user interface to select and configure instructions.

4.4.4.6.1 Tasks

The **Explorer→Instructions→Tasks** page in Explorer provides a structured view of the instructions defined in the product packs. It also lets you schedule the tasks so they can be run in the future or according to a particular schedule.

4.4.4.6.1.1 Using task groups

The benefit of using **Tasks** lies in the task group structure that is defined in the Product Packs. It is this structure that enables you to focus in on specific task areas to find the particular instruction that you want.

For example you may be interested in instructions related to particular software vendor's products. Depending on the Instructions that you have uploaded to your Tachyon system you may see the following structure:

At the top-level there is a **Software Vendors** task group whose children are **1E** and **Microsoft**.

Underneath the **1E** task group there is a **Tachyon** group that contains **Configuration**, **Diagnostics** and **Verification** groups as well as a couple of Instructions.

Underneath the **Microsoft** task group is the **Configuration Manager** task group containing Instructions related to that product.

4.4.4.6.1.2 Navigating Tasks

Navigating around and using **Tasks** is simple:

The top-level is called **Tasks**. At this level are all the top-level task groups

Clicking on a task group displays all its children in the column to the right, which also shows the name of the selected task group. A child may be a task or another task group

Clicking on a child task group in the next column displays all its children in a column to its right and so on

Clicking on a task displays a page that lets you set the parameters for the task before sending it to some Tachyon client devices

A task is a question or action that has been made part of a task group. Tasks have a grey background and are marked with a question icon

or an action icon

To illustrate the use of the Tasks page we provide two examples: in the first example a user asks a question to retrieve the currently running processes; in the second an actioner has to respond to an emergency situation by asking to perform an action to stop the Configuration Manager client service.

4.4.4.6.1.3 Asking a question from Tasks

In this example we'll track down and ask the **What are the Tachyon Agent settings?** question, as illustrated in the animation shown.

Navigate to the **Explorer**→**Instructions**→**Tasks** page.

The top-level **Tasks** is displayed, here there are three task groups: **Security**, **Software** and **Software Vendors**.

The one we want is the **Software Vendors** task group. Select this to display the child task groups **1E** and **Microsoft**in the next column.

Select the **1E** child task group to display its child task group **Tachyon** in the next column.

Select **Tachyon** and a combination of groups and Instructions are shown at the next level: the **Configuration**, **Diagnostics** and **Verification** task groups and two Instructions. To get to the question we want select the **Configuration** task group.

Scrolling to the bottom of the list of Instructions in the **Configuration** Task group we see the question that we want to run. Click on the **What are the Tachyon Agent settings?** question to display the task page for that Instruction, which provides parameters and information for running the task and two buttons: **Schedule question** and **Ask this question**.

We click the **Ask this question**button and in our example the question is then asked of all the Tachyonclient devices.

After a moment Explorer then displays the responses from all the target devices - task done.

4.4.4.6.2 The Task page

Each question and action has its own Task page which provides information related to the task or action and lets you control how the task is run.

Section	Description
Name and Description	The title of the task and a description that tells you what the task does.
Task parameters	This section displays the **Duration**, **Coverage**, **Filter results**, **Export data on expiry** and **Comments** parameter settings for the current task. To set these you can use the **Parameters** section of the page.
Approximate target	This provides information about the target devices the task will be applied to.
Ask this question Perform this action	This button, named according to whether the task is a question or an action, tells Tachyon to start processing the task.
History	This section provides information from the previous times the task was processed.

Information	Description
Last executions	Provides information on the last time the task was processed.
Projected impact	This describes the projected impact of the task on the Tachyon client devices, based on the last time the task was processed.

Beneath these are a set of statistics related to the selected task based on this instruction's previous runs:

Statistics	Description
Number of times this instruction was run	The total number of times this instruction has been run previously
Average network transfer per device	The average amount of data transferred over the network per Tachyon client device as a result of running the instruction

Section	Description	
	Database rows inserted per device	The total number of database rows inserted per Tachyon client device as a result of running the instruction
	Average execution time on device	The average time it took to run the instruction on a Tachyon client device
Parameters	This section provides controls for setting the duration and coverage for the task. It also lets you set a filter on the results, specify that you want to export the data and add comments.	

4.4.4.6.2.1 A Task page example

As an example of setting parameters on the Task page we'll use the **What processes are running?** question to filter for occurrences of running the winlogon.exe process and restrict this to a coverage of Tachyon client devices running Windows 10. To speed things up we'll set this to gather responses for 10 minutes and keep those responses for 20 minutes. We'll also select to export the data to a previously defined share with the appropriate permissions and add a suitable comment to the question.

The animation opposite shows the following steps

On the **Parameters** pane we set:

Duration to **Gather answers for** 10 minutes and **Duration** 20 minutes

Coverage to check **Operating system Type** Windows and **Version** is greater than or equal to 10

Filter results using the **Executable** attribute where the value contains **winlogon.exe**

Export data to export the responses to the previously configured share **\\ACME-CM01\Tachyon**

Comments to **Need to find currently running winlogon.exe on devices running the Windows 10 os**

We then click the **Ask this question** button to fire the question off to the devices in the coverage.

Here we can see two responses from the two Windows 10 devices in our environment.

We then speed things up in the animation to get to the end of the 10 minutes of data gathering. Complete responses can only be exported once the question has finished data gathering.

We then pick up the results from the **\\ACME-TCN01\TachyonResponses** share and see the complete output for the two responses we saw earlier.

4.4.4.7 Scheduling instructions

Scheduling instructions.

4.4.4.7.1 Creating a scheduled instruction

The following headings show how to create, configure, authenticate and approve a scheduled instruction. A tutorial showing the steps in greater detail is provided on the Scheduling instructions - a tutorial.

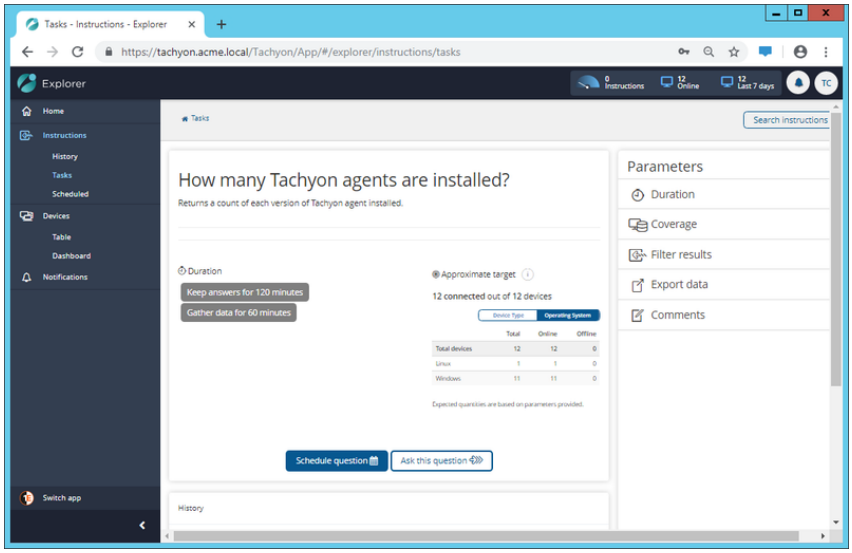
4.4.4.7.1.1 Scheduling an instruction from the Tasks page

Select the Instruction from any of the Task Groups it belongs to or search for it using the **Search instructions** button.

Complete the parameters for the instruction.

Click the **Schedule question** button, as shown in the image.

Fill out the **Instruction scheduler** popup.



The **Instruction scheduler** popup lets you:

Add **Comments** to the schedule that will help later to identify the reasons for the schedule.

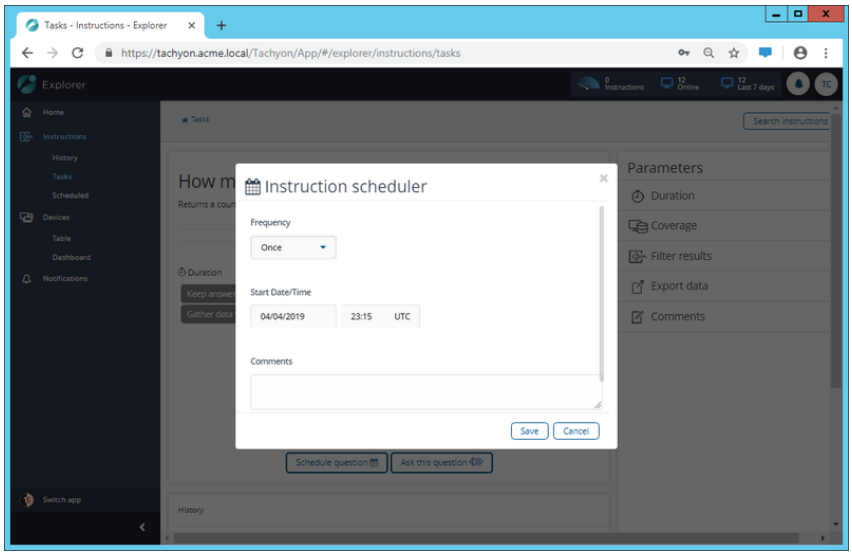
Set the**Frequency**of the schedule:

Type	Description
Once	Specifies a one-off schedule for the selected instruction. The **Once** frequency type uses the following controls: Control — Description **Start** — Set the **Start** dateandtimefor when you want the instruction to run.
Daily	Specifies a daily schedule for the selected instruction between a start and end time.

Type	Description
	The **Daily** frequency type uses the following controls: Control — Description **Start** — Set the **Start** dateandtimefor when you want the schedule to run from. **End** — Set an **End** date and time for when you want the schedule to end. **Every** — Set how many days are left between each run of the scheduled instruction **Repeat Every** — Optionally set how many hours the scheduled instruction is set to repeat on each day it is set to run
Weekly	Specifies a weekly schedule for the selected instruction between a start and end time. The **Weekly** frequency type uses the following controls: Control — Description **Start** — Set the **Start** date and time for when you want the schedule to run from. **End** — Set an **End** date and time for when you want the schedule to end. **Every** — Set how many weeks are left between each run of the scheduled instruction **On** — Check which days of the week you want the scheduled instruction on during the weeks it is set to run
Monthly	Specifies a monthly schedule for the selected instruction between a start and end time. The **Monthly** frequency type uses the following controls: Control — Description **Start** — Set the **Start** date and time for when you want the schedule to run from.

Type	Description	
	End	Set an **End** date and time for when you want the schedule to end.
	Every	Set how many months are left between each run of the scheduled instruction
	Repeat Every	Select the day of the month when you want the scheduled instruction to run on the months it is set to run

After the **Instruction scheduler** dialog has been filled out, you click **Save** to set the schedule. The new schedule will then appear in the **Scheduled instruction** page.



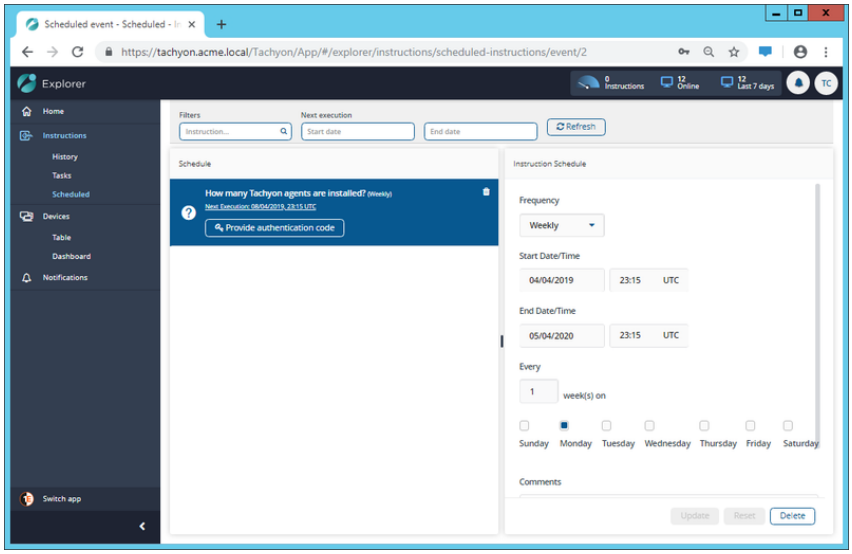
4.4.4.7.1.2 Authentication and approval

The first time the scheduled instruction appears in the **Scheduled instruction** page you will be notified of its authentication and approval state, as shown in the picture opposite.

Before the schedule starts, regardless as to whether the instruction is a question or an action, there are two further steps:

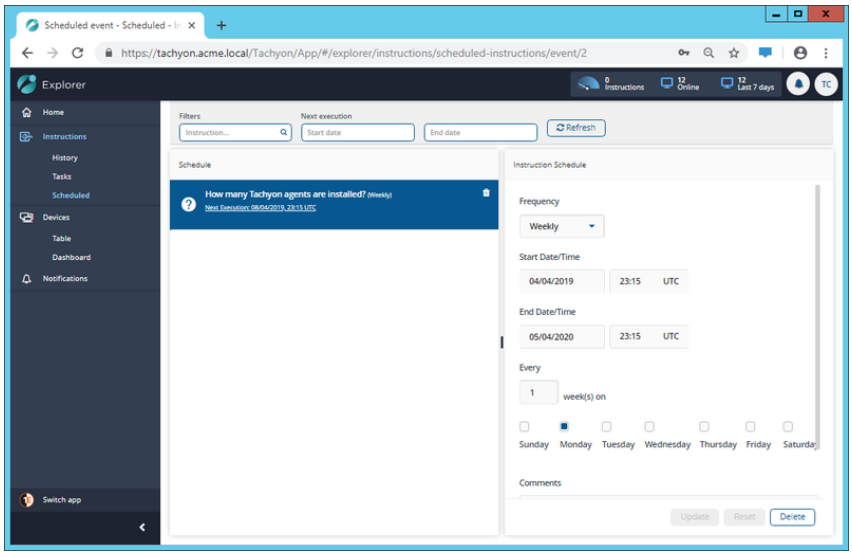
The scheduled instruction must be authenticated, only required if two-factor authentication is enabled.

The scheduled instruction must be approved.



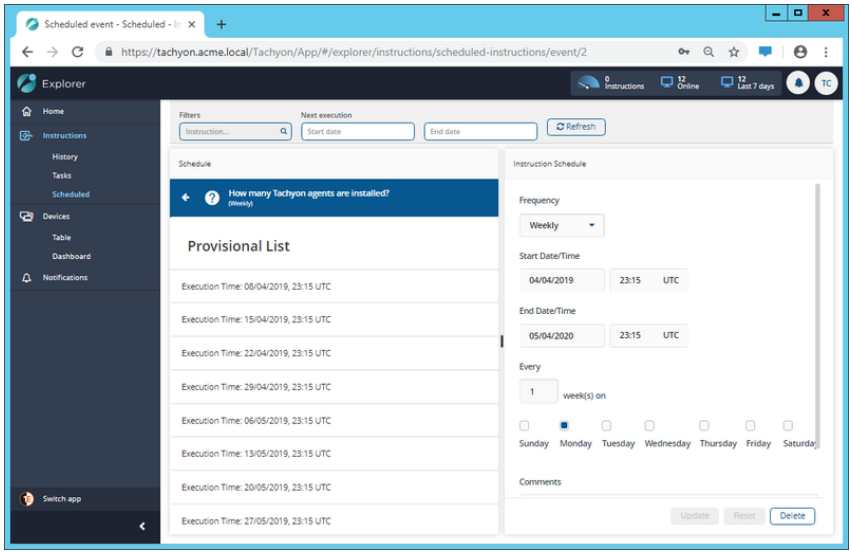
4.4.4.7.1.3 The next execution

After the scheduled instruction has been authenticated and approved its entry in the Scheduled instruction page will show its next scheduled execution date and time, as shown in the picture opposite.



4.4.4.7.1.4 Expanding the execution schedule

Clicking on the **Next Execution** link on the scheduled instruction entry expands the execution schedule, so you can see the future dates and times for the instruction execution, as shown in the picture.



4.4.4.7.2 Updating a scheduled instruction

You can update the configuration for a created scheduled instruction by:

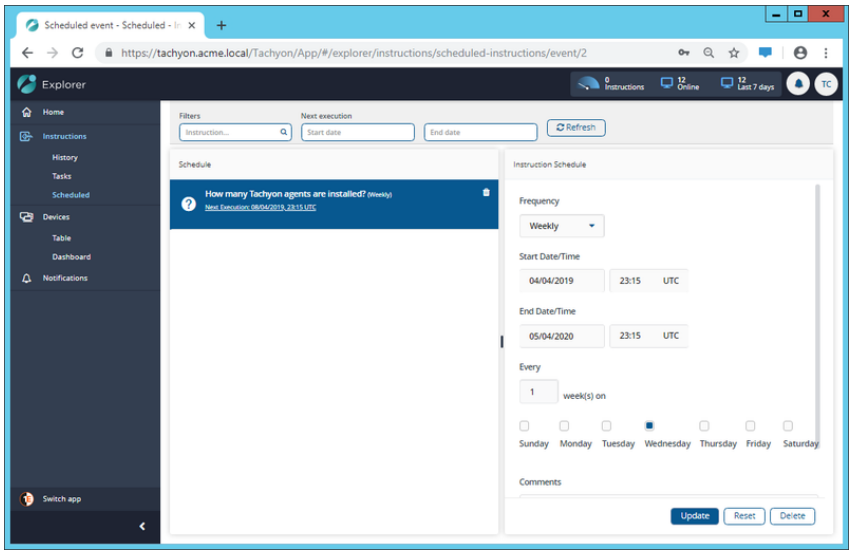
Click on the scheduled instruction entry you want to change in the **Schedule** list.

Modify the parameters on the **Instruction Schedule** panel to its right.

Click the **Update** button to commit the changes.

The picture shows a scheduled instruction where the day for a weekly schedule has been changed from **Monday** to **Wednesday**. The **Update** button is shown highlighted.

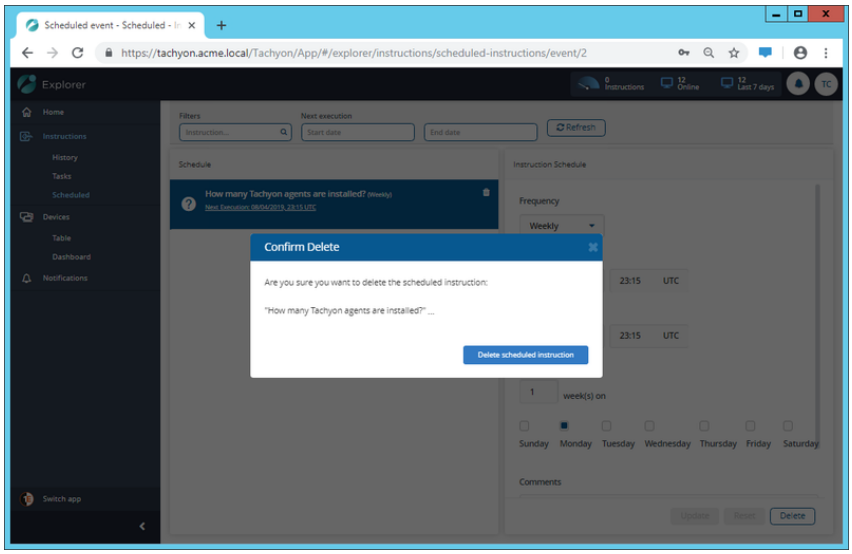
You can also click **Reset** to discard any changes you have made.



4.4.4.7.3 Deleting a scheduled instruction

You can delete a scheduled instruction by clicking on the bin icon to the right of its entry in the **Schedule** list.

Doing this will display the **Confirm Delete** popup that will ask if you want to proceed. Click the **Delete scheduled instruction** button to continue. The schedule for the instruction will then be deleted and no further attempts will be made to run the instruction. Instructions currently in-flight will not be affected by this and will continue to completion.



4.4.4.7.4 Scheduling instructions - a tutorial

A tutorial on creating a daily scheduled instruction that will check for any machines that have Windows update pending reboots.

4.4.4.7.4.1 Creating a weekly instruction schedule

To illustrate this we will use a simple example where Tachyon will check every week to see if any Windows updates are pending a reboot.

4.4.4.7.4.1.1 Selecting the question for scheduling

Use the Tasks page to locate and select the instruction you want to schedule.

Set any desired **Duration** and **Scope** parameters for the instruction.

Click the **Schedule question** button.

The animation starts with the **Which Windows updates are pending a reboot?** question already selected from the Tasks page.

4.4.4.7.4.1.2 Filling out the Instruction scheduler dialog

Set the **Frequency** to **Weekly**.

For any schedule you have to set the **Start Date/Time**. We want ours to run each **Sunday** at **23:53** AM, so we leave the **Start** date at the default current time plus one hour.

Set the **End Date/Time**. We want to review the schedule on April the 14th 2020 so we set this as the **End** date.

For a weekly schedule you must select how many weeks between running the instruction. In our case we want the schedule to run on a weekly basis, so we leave the **Every** field at the default of **1**.

For a weekly schedule you also select which day of the week you want the schedule to run. In our example we click the **Sunday** box to highlight it.

Add a suitable comment to the schedule. This will be stored with the schedule and can be used as a reminder for why the schedule was configured.

This completes the configuration of the **Instruction scheduler** dialog so we click **Save** to create the schedule.

4.4.4.7.4.1.3 Authenticating and approving the schedule

Normally questions do not require authentication and approval, however for scheduled questions this is required.

The scheduled instruction entry appears in the **Scheduled instruction** page showing that it needs an authentication code.

The user requesting the schedule is sent an email with the authentication code.

They click on the **Provide authentication code** button and enter the code in the dialog then click **Submit.**

The scheduled instruction entry now shows that it is Awaiting Approval.

The approver receives an email requesting approval for the requested scheduled instruction.

They log on to Explorer and fill out the approval request notification, by entering a suitable approval comment, checking the **I understand the impact of this scheduled instruction and approve this request** checkbox and clicking the **Approve** button.

The scheduled instruction has now been authenticated and approved.

4.4.4.7.4.1.4 The scheduled instruction

Once authenticated and approved, the scheduled instruction entry now displays a link which indicates the scheduled times that the selected instruction will be run. In our example the instruction will now run every **Sunday** at **23:53** AM until the **14th April 2020**.

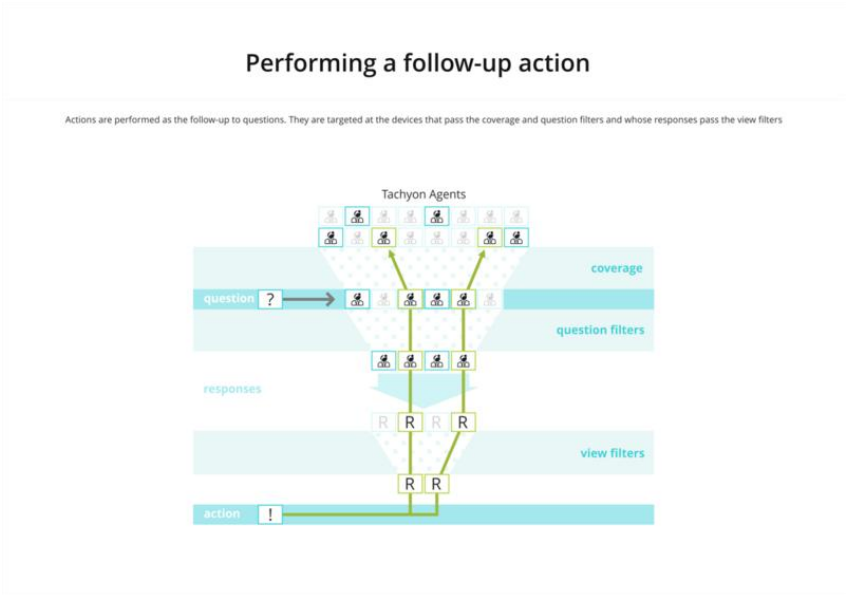
4.4.5 The action approval workflow

How to run actions with approval.

4.4.5.1 Running an action that restricts the number of devices sending

To run any action in Tachyon, you first need to ask a question. Questions may have coverage and question filters applied that restrict the number of devices that send responses.

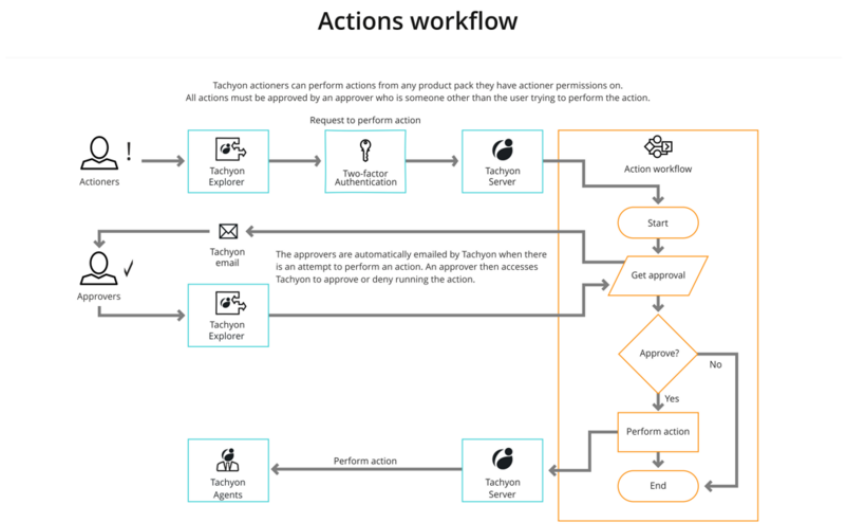
When the responses come back you can apply a view filter to reduce the responses even further. When you select a follow-up action, this will be only be performed on the final set of filtered responses.



4.4.5.2 Approving an action

Configuration of approvers is explained on the Roles page.

Enabling Tachyon users to run actions on devices in a network is always a powerful proposition. The potential for mistakes or deliberately malicious actions is always there. For this reason Tachyon has role-based access control to the features it presents and it implements an approval workflow that implements a process to prevent unauthorized changes from taking place.



4.4.5.3 Two-factor authentication

Two-factor authentication is now the default mode for running actions. When an actioner creates an action they are first required to enter their password. They are then required to enter an authentication code which is sent to them by email. Because this is now the default mode for

performing actions there are numerous examples of two-factor authentication throughout this documentation wherever an action is described. A good example of the two-factor authentication process can be found in Performing an action - tutorial. You can also find some additional details in Two-factor authentication.

4.4.5.4 Performing an action - tutorial

A quick tutorial on asking a question and then performing an action, getting approval and confirming the action has been performed successfully.

4.4.5.4.1 The example

To illustrate the process of performing an action we use an example of setting registry entry for the **ACMEFinance** application. We do not want to create the registry entry, we only want to change an existing entry.

The **ACMEFinance** application has a registry entry that determines whether the automatic backup feature is enabled. We want to run a question which will find devices where the registry entry has the feature turned off and then perform a follow-up action that will turn it on for those devices.

The registry entry for ACMEFinance is under the following key:
HKLM\SOFTWARE\ACME\ACMEFinance\AutoBackupEnabled

The value is a string and may be set to either **TRUE**, where the feature is turned on, or **FALSE**.

4.4.5.4.2 Asking a question

In this example, to perform a follow-up action we first ask a question. The responses to the question then gives Tachyon a list of devices to perform the action on.

In our example we want to check a specific value in the registry and change it if necessary. To find the registry related questions we enter the text **registry** into the Explorer and then select
What is the value of registry entry <hive> <subkey> <name>?

For our example the user is **TCNActioner01**, with the All Instructions Actioner role, who is going to set the registry entry for the **ACMEFinance** application. The animation illustrates the following steps:

Type **registry** into the I want to field and select the
What is the value of the registry entry <hive> <subkey> <name>? question.

Fill out the question variables, leaving **<hive>** as the default **HKLM**, setting **<subkey>** to **SOFTWARE\ACME\ACMEFinance** and **<name>** to **AutoBackupEnabled**

Click **Ask the question** and a number of responses are returned from devices where the **ACMEFinance** application is installed.

We are only interested in the responses where the value is **FALSE**. Double-clicking on the **FALSE** value in the responses opens up the **Filter results** panel with the **Value** set to **FALSE**. Cllck the **Search** button to filter the responses.

Now the responses show only the responses where the value for the registry key is **FALSE**. This filtered list represents the devices where we want to follow-up with an action to change the registry entry.

4.4.5.4.3 Follow-up with an action

Click the **Follow-up action** button.

Type **registry** into the edit field and then select the **Set registry entry <hive> <subkey> <name> to <valuetype> <value>** action from the list of matching actions.

Fill out the action variables, leaving **<hive>** as the default **HKLM**, setting **<subkey>** to **SOFTWARE\ACME\ACMEFinance** and **<name>** to **AutoBackupEnabled**. The **<valuetype>** variable must be set to **REG_SZ** to indicate a string type and lastly the **<value>** gets set to **TRUE**.

Having set and reviewed the parameters, scroll to the bottom of the page and click the **Perform this action** button

The action is subject to confirmation, authentication and approval. First confirm your credentials by entering the password of **TCNActioner01**.

When challenged to provide an authentication code, emails for **TCNActioner01** are checked, and the code is copy and pasted it into the challenge dialog.

Approvers for this action are sent an email. **TCNApprover01** is a global approver, receives the email, and uses the link at the bottom of the email to navigate to Explorer and approves the action.

The action runs and the responses appear to **TCNActioner01**. In our example **TCNActioner01** sees that 1 device has had a value set.

Clicking on a response shows the device that made the response. In our example it is the **ACME-WIN1001.acme.local** device that has responded. This was the device that responded to the original question with the value for the registry entry as set to **FALSE**.

4.4.5.4.4 Confirm the action was successful

To confirm that the action was successful you can re-run the original question to retrieve that registry entry value.

> **Note**
>
> Before a follow-up action is run, all devices within the coverage will be re-asked the same question, and the Tachyon client will apply the filter to the latest result on each device. In this example, if someone changed the registry entry on their device from TRUE to FALSE *after* the first question was asked, then the filter will detect this and the follow-up action will also apply to this device.
>
> This is why you see the Approximate target remain the same as when you asked the first question. The number of devices connected will change only if devices within the coverage come online or go offline.
>
> **Note**
>
> Using the Follow-up action button ensures the action is carried out on the filtered devices. If the Action tab is used instead then the Follow-up action applies to all the devices that were asked the question without using the filter, as if the filter has been reset.

4.4.5.5 Two-factor authentication

How Tachyon implements two-factor authentication for users running actions.

4.4.5.5.1 Two-factor authentication

Tachyon is a powerful tool that enables changes to be made across an organization's entire estate. It employs RBAC to ensure that only users with the required permissions can run particular actions. In addition, at the point of running an action, Tachyon uses two-factor authentication to ensure that the logged-on user is actually the user with the correct permissions.

Two-factor authentication is implemented through a unique authentication code (one-time password) that is generated at the point of running an action. This authentication code is then sent to the user by email. The authentication code is then used to proceed with the action.

4.4.6 Tagging client devices

Tachyon client devices can have a number of custom tags assigned using Tachyon and the Tachyon clients. There are two types of tag: Device tags, which can be used in the scopes for questions and actions to help target specific collections of devices; and freeform tags that can be queried and set using specific questions and actions.

4.4.6.1 Device versus freeform tags

Tachyon supports two kinds of tag that can be used to set properties on Tachyon client devices. The Tachyon client stores both types of tag in persistent storage. Values are set or deleted using actions and queried using questions. The differences are described below.

Tag type	Description
Device	Can also be used when defining the coverage for questions and actions. A Full Administrator must define the names and values for Device tags before they can be applied to devices using Device tag actions. Once set by an action, the Tachyon client reports device tags back to the System where they are stored in the TachyonMaster database for each device, which is how they can be used to define coverage for questions and actions. The Tachyon client regularly reports back its list of tags. The list consists of a separator and name=value for each tag plus a final separator at the end of the list. The entire list of name=value pairs and their separators must not exceed 511 bytes. Any tags that exceed this limit are not reported back. Only the tags reported back by each client can be used for coverage. Therefore, the length of tag names and values should be kept short if many different tags are to be used. The maximum length of a tag name is 16 characters, and the maximum length of a tag value is 32.

Tag type	Description
	More details on the Coverage tag workflow are given below, including links to associated tutorials.
Freeform	Cannot be used when defining the coverage for a question. Freeform tags can be set with arbitrary names and values that are defined only when running a Freeform tag action. There is no limit to the number of freeform tags or the length of the list, and no limit to the length of tag name or tag value.

Tag names are case-insensitive. Tag values are not case-sensitive, and case is preserved.

Note

Please refer to /document/preview/737044#UUID-c70396b5-6ef9-af19-7b28-3665ddcb7687 for how to use tagging methods when writing your own instructions.

4.4.6.2 The Device tag workflow

You create and manage Device tags using the **Custom properties** page in **Settings→Configuration**.

Tachyon enables Device tag properties to be created and set on Tachyon client devices, which can then be used when setting the coverage for a question. The basic workflow is:

A Full Administrator defines the name of a Device tag and one or more associated values. See Adding properties - tutorial for more details on this step.

Actioners with permissions to the Tachyon client tags Product Pack run actions that use the defined properties and values and assign them to particular client devices. See Actions to set tags - tutorial for more details on this step.

Questioners can then use the **Tags** parameter, when defining the coverage for a question, to constrain the coverage to particular properties and values thereby targeting particular client devices. See Using tags to set the coverage for a question - tutorial for more details on this step.

4.4.6.3 Adding properties - tutorial

A quick tutorial on adding properties and values for use when setting the coverage for questions.

Tachyon enables Device tag properties to be created and set on client devices, which can then be used when setting the coverage for a question. The basic workflow is:

A Full Administrator defines the name of a Device tag and one or more associated values. See Adding properties - tutorial for more details on this step.

Actioners with permissions to the Tachyon client tags Product Pack run actions that use the defined properties and values and assign them to particular client devices. See Actions to set tags - tutorial for more details on this step.

Questioners can then use the **Tags** parameter, when defining the coverage for a question, to constrain the coverage to particular properties and values thereby targeting particular client devices. See Using tags to set the coverage for a question - tutorial for more details on this step.

This page provides a quick tutorial on how to perform step 1.

To illustrate the configuration of device tags, we use an example where the property relates to the business function of a device. We'll create a single **Department** property with a number of values that enables us to differentiate between the departments we want Tachyon to support.

4.4.6.3.1 Adding a property and values

The first step to creating a property with values is to create the property name. Generally to do this you click on the **Add** button on the **Settings→Custom Properties→Device Tags** page.

The following steps walk through how to add a Device tag:

4.4.6.3.1.1 Add a property and values

The following steps can be used to create a property name:

Navigate to **Settings→Configuration→Custom properties→Device Tags**.

Click the **Add** button.

Type in a name for the new device Tag.

You now need to add values to the property:

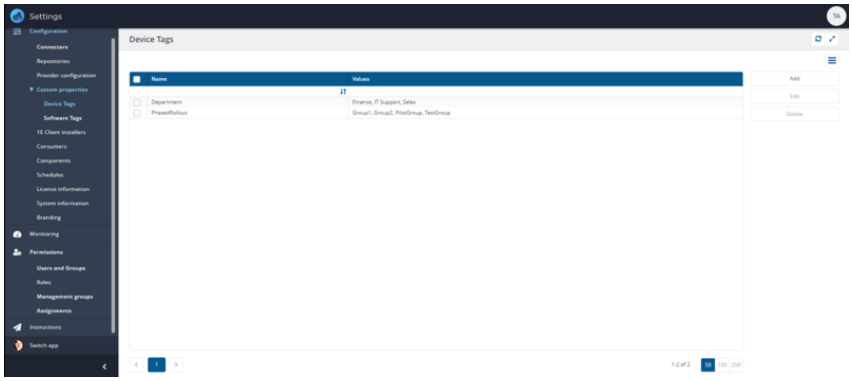
In the edit field below the **Values** heading, type in a value for the property.

If you want to add more values, click the **+** button beneath the **Values** heading.

Repeat step 4 to add as many values as you require for the selected property name.

When all the values have been added, click **Add**. (An error message is displayed if you exceed a maximum of 16 characters).

We use these steps to create Device Tags for Finance, IT Support and Sales departments.



In this brief tutorial, we've shown how to create a Device tag. The next step is to apply a tag to the appropriate devices, as described in Actions to set tags - tutorial.

4.4.6.4 Actions to set tags - tutorial

A quick tutorial on adding properties and values for use when setting the coverage for questions.

Tachyon enables Device tag properties to be created and set on client devices, which can then be used when setting the coverage for a question. The basic workflow is:

A Full Administrator defines the name of a Device tag and one or more associated values. See Adding properties - tutorial for more details on this step.

Actioners with permissions to the Tachyon client tags Product Pack run actions that use the defined properties and values and assign them to particular client devices. See Actions to set tags - tutorial for more details on this step.

Questioners can then use the **Tags** parameter, when defining the coverage for a question, to constrain the coverage to particular properties and values thereby targeting particular client devices. See Using tags to set the coverage for a question - tutorial for more details on this step.

This page provides a quick tutorial on how to perform step 2.

4.4.6.4.1 Setting tags

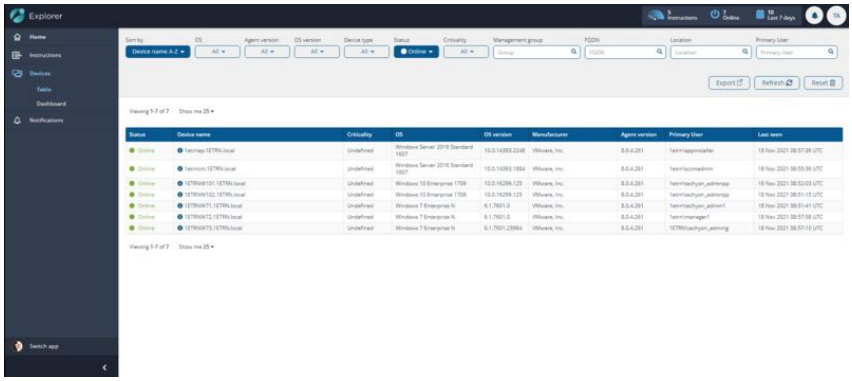
4.4.6.4.1.1 The example

On the Adding properties - tutorial page we set up a scenario with three departments whose devices we want to manage using Tachyon. The three departments are **Finance**, **IT Support** and **Sales**. We want to map these departments onto the devices in our example by setting tags. The only thing that links the devices is the departments they belong to, and this is known according to the FQDN of the devices. The best way to handle the setting of the tags is to use a question where the coverage is set to a list of FQDN for a particular department, and follow that with an action that sets the tags for that department.

The following table shows the department mapping we want to model using tags:

Department	Device FQDN
Finance	1ETRNW73.1etrn.local
IT Support	1ETRNW102.1etrn.local
Sales	1ETRNW71.1etrn.local
	1ETRNW72.1etrn.local

Our example environment, as shown in the picture, is obviously very small, but the advantages will be seen for much larger examples, where each department's set of devices may run into the hundreds or even thousands.



4.4.6.4.1.2 Choosing the right Instruction

Which Instruction should you run? You may already know what devices to target, and so can create a management group, or provide a list of FQDN to run an action against, if now then running a question to obtain the list would be a good way to begin.

Fundamentally, questions return a list of device names, with associated information. This list of device names can then be used to target the devices on which to run actions.

There are many different circumstances, questions and actions that may be used, but generally the question selected should try to meet the following guidelines:

The question should identify a superset or the set of devices that you want to run an action on. Question responses can always be refined by setting coverage, response filters or view filters.

Avoid questions that retrieve information that isn't relevant to the action. This is mainly to avoid unnecessary network traffic.

In our example, we will select the question of
How many of each operating system version are installed?.

We choose this question because:

We want a question that would get a response from every device, and we'll apply a coverage that selects the devices we want using their FQDN

The question does not return much unnecessary information.

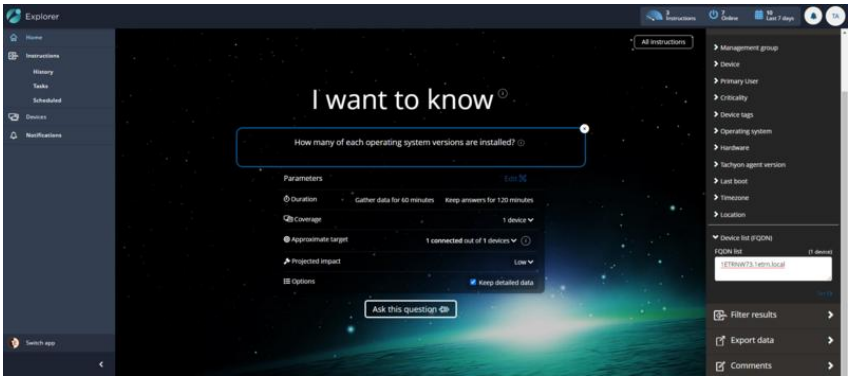
4.4.6.4.1.3 Setting coverage tags

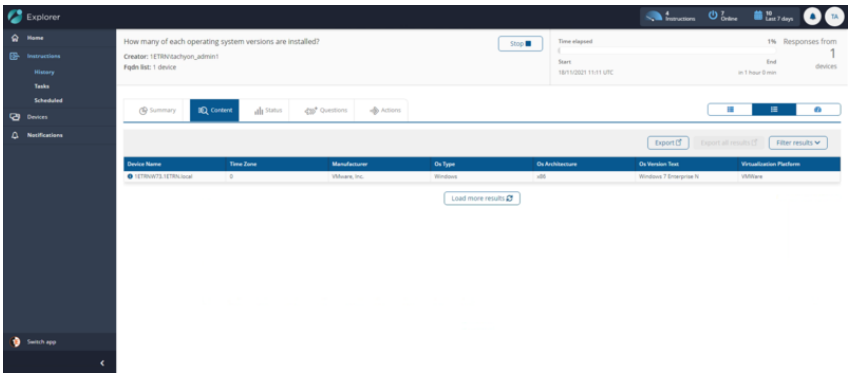
For our example, the user **Tachyon_Admin1**, with the Full Administrator role, is going to set the tags for the finance department. The following steps illustrate how to achieve this:

Tachyon_Admin1 selects the **How many of each operating system version are installed?** question.

After the question has been selected, they then edit the question parameters, expand the **Coverage** heading and enter the FQDN for the device in the finance department into the field under the **Device List (FQDN)** heading. To save the list to the question they click on **Set**.

Asking the question, by clicking on the **Ask the question** button, gets a response from the device named in the FQDN list.





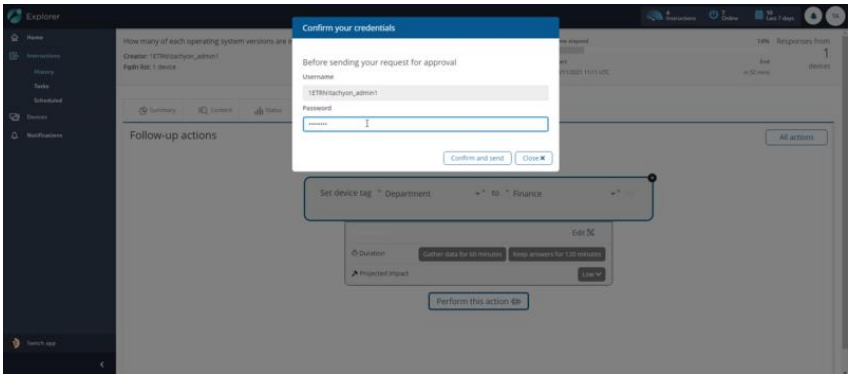
Having got back the responses they were looking for they now run the **follow-up actions** that will set the correct tag for that device. The action is selected from the **Actions** tab.

They type **set device** into the edit field and then select the **Set device tag <tagname> to <tagvalue>** action.

The parameters for the action are populated from the device tag and values that have previously been set. They set the **<tagname>** to **Department** and the **<tagvalue>** to **Finance**.

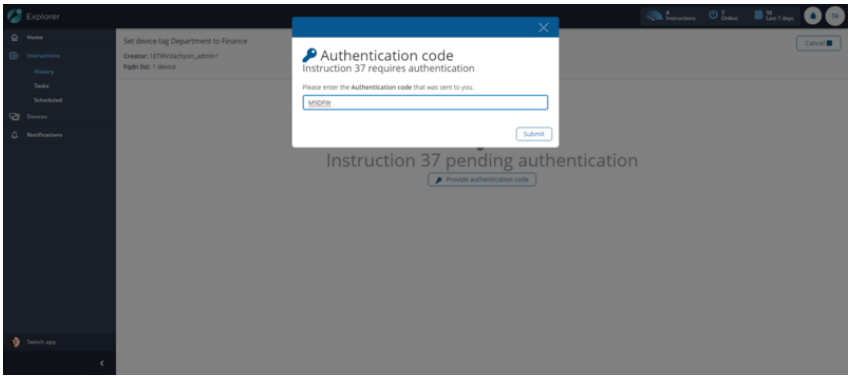
After setting the values they click the **Perform this action** button.

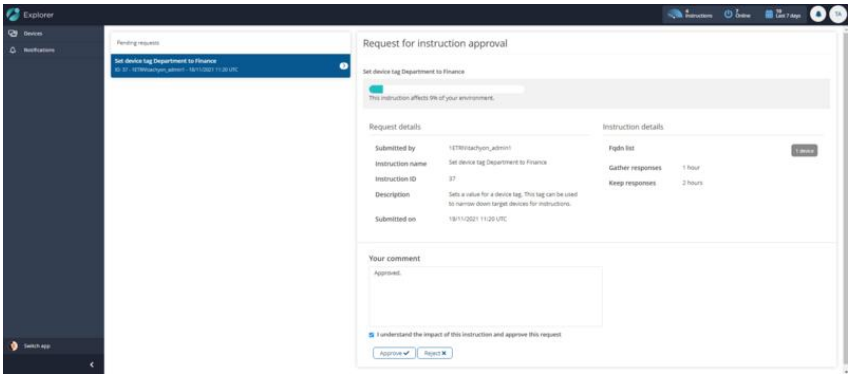
The action is subject to confirmation, authentication and approval. They first confirm their credentials by entering their password.



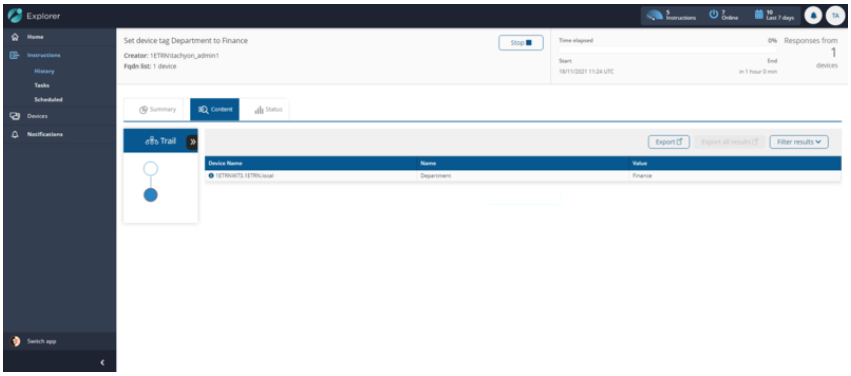
When challenged to provide an authentication code, **Tachyon_Admin1** then checks their email, copies the code and pastes it into the challenge dialog.

Now **Tachyon_adminG**, a global approver, will be sent an email, using the link at the bottom of the email they navigate to Explorerand approve the action.





The action now runs and the responses appear to **Tachyon_Admin 1**. Here you can see the device that was targeted using their FQDN has responded and the tag with the property name **Department** and a value of **Finance** has been set.



Having set the tag for the finance device, the exact same approach can be used to set the tags for the other two department's devices. Once all the tags have been set, questions can be asked with scopes that target the tags, as described in Using tags to set the coverage for a question - tutorial.

4.4.6.5 Using tags to set the coverage for a question - tutorial

A quick tutorial on using predefined tags when setting the coverage for a question.

Tachyon enables Device tag properties to be created and set on client devices, which can then be used when setting the coverage for a question. The basic workflow is:

A Full Administrator defines the name of a Device tag and one or more associated values. See Adding properties - tutorial for more details on this step.

Actioners with permissions to the Tachyon client tags Product Pack run actions that use the defined properties and values and assign them to particular client devices. See Actions to set tags - tutorial for more details on this step.

Questioners can then use the **Tags** parameter, when defining the coverage for a question, to constrain the coverage to particular properties and values thereby targeting particular client devices. See Using tags to set the coverage for a question - tutorial for more details on this step.

This page provides a quick tutorial on how to perform step 3.

4.4.6.5.1 Using tags in question coverage

4.4.6.5.1.1 The example

On the Actions to set tags - tutorial page we set the tags for the devices belonging to a number of departments in our organization. Now we're going to extend the example to deal with a particular scenario and show how the tags can be used when defining the coverage for a question.

In our environment we've just rolled out a software package for a product called **Sales Application**, this application is used by a number of departments - but we've realized that the **Finance** department use some extra features of the application that requires a special license. So we urgently want to find if the device in the **Finance** department has the software installed and apply the special license to only that device.

To find the device we want to treat we will ask the question **What versions of <appname> are installed?**

4.4.6.5.1.2 Using device tags

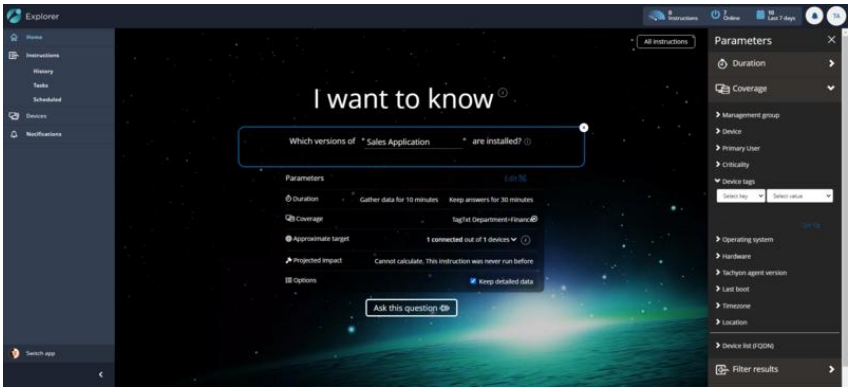
For our example the user **Tachyon_admin1**, with the Full Administrator role, is going to run the question to locate if the **Sales Application** is on the **Finance** department device.

Tachyon_admin1 types **Which versions** into the I want to know field and then selects **What versions of <appname> are installed?** from the list of matching questions.

Once the question is loaded they set the **<appname>** inline parameter to **Sales Application**, the application they want to track down.

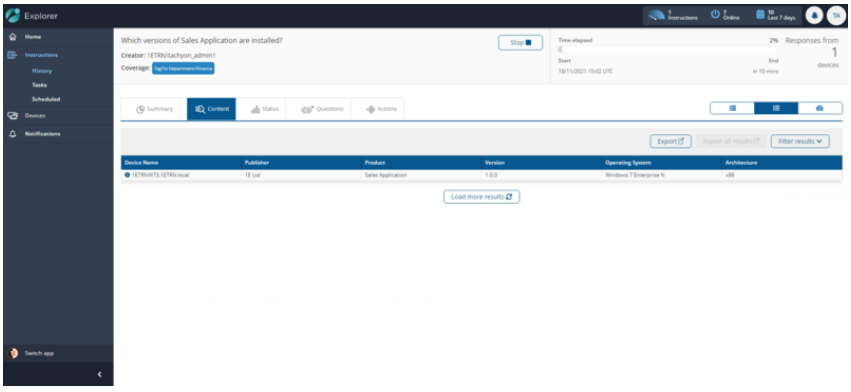
They then click on the **Edit** link to expand the **Parameters** rollout, click on **Coverage** to expand that heading and then on **Device Tags** to display the coverage tags controls.

They select **Department** from the **Select key** dropdown list, and **Finance** from the **Select value** dropdown list (populated when**Department** was selected) and click **Set** to save the coverage to the question.



Having set the coverage they then click **Ask this question**, which will ask the question of just those devices with the selected tag set.

The responses in our example shows the connected finance devices has the **Sales Application** software.



We can now target the **1ETRNW73.1etrn.local** device outside of Tachyon with the special license update.

In this tagging example we've seen how Extended Properties administrators define the properties that can be used for tagging, as described in Adding properties - tutorial. We've seen in turn how those tags can be set on Tachyon client devices by an actioner, as described in Actions to set tags - tutorial. Finally, on this page we've seen how those tags can be used to define the coverage for a question and help to target otherwise unassociated devices simply and effectively.

4.4.6.6 Creating the Tags instruction set

Steps for creating the Tags instruction set containing instructions for setting, deleting and querying Device tags and freeform tags.

4.4.6.6.1 Prerequisites

To create the Tags instruction set, you will need the following:

A Full Administrator will need the following role permissions:

Full Administrator role to upload the 1E-Explorer-TachyonCore Product Pack instructions and assign them to a new instruction set.

4.4.6.6.2 Creating the Tags instruction set

The steps below create an instruction set called **Tags**. Users who are members of the following built-in system roles will automatically then be able to use these instructions on all devices.

Full Administrator

All Instructions Questioner

All Instructions Actioner

All Instructions Approver

The **Tags** instruction set will contain 17 instructions from the **1E-Explorer-TachyonCore Product Pack** described in the table below. The product pack filename is **1E-Explorer-TachyonCore.zip** and is downloaded as part of the **Tachyon Product Packs** zip file from the 1E Support Portal. For more information about this product pack and its instructions, please refer to 1E Explorer TachyonCore product pack.

First upload the instructions:

Logon to the Tachyon Portal using a user account with the **Full Administrator** or **Group Administrator** role.

Open the **Settings** application.

Navigate to the **Settings**→**Instructions**→**Instruction sets** page.

Click on the **Upload** button.

In the Open dialog, navigate to the location of the **1E-Explorer-TachyonCore.zip** file.

Select **1E-Explorer-TachyonCore.zip** and click **Open**.

Over 100 instructions contained in the zip file will initially be added to the default **Unassigned** instruction set. Instructions in the **Unassigned** instruction set cannot be used, so you will need to select and add the tag instructions to a new instruction set:

Click on the **Unassigned** folder.

Enter **tag** into the search field to filter the tag instructions, some other instructions may also be visible.

Select the 17 tag instructions to add to the new set, by clicking the checkbox at the start of each instruction row in the list.

Click the **Add new set** button in the button panel to the right of the page.

In the **Add new instruction set** popup subsequently displayed, type **Tags** as the name.

Optionally select a **custom icon** file.

Ensure that the **Include 17 selected instructions** checkbox is checked.

Click the **Add** button to add the new instruction set, with the selected instructions.

4.4.6.6.2.1 Tag instructions in the 1E-Explorer-TachyonCore product pack zip

Instruction file name	Instruction text (ReadablePayload)	Type
1E-Explorer-TachyonCore-CreateEmptyFreeformTag	Create an empty freeform tag named <tagname>.	Action
1E-Explorer-TachyonCore-DeleteAllCoverageTags	Delete all coverage tags.	Action
1E-Explorer-TachyonCore-DeleteAllFreeformTags	Delete all freeform tags.	Action
1E-Explorer-TachyonCore-DeleteCoverageTag	Delete coverage tag named <tagname>.	Action
1E-Explorer-TachyonCore-DeleteFreeformTag	Delete freeform tag named <tagname>.	Action
1E-Explorer-TachyonCore-CheckIfCoverageTagExists	Does coverage tag <tagname> exist?	Question
1E-Explorer-TachyonCore-CheckIfFreeformTagExists	Does freeform tag <tagname> exist?	Question
1E-Explorer-TachyonCore-CountCoverageTags	How many coverage tags are there?	Question
1E-Explorer-TachyonCore-CountFreeformTags	How many freeform tags are there?	Question
1E-Explorer-TachyonCore-CheckIfCoverageTagHasGivenValue	Is coverage tag <tagname> set to <tagvalue>?	Question
1E-Explorer-TachyonCore-CheckIfFreeformTagHasGivenValue	Is freeform tag <tagname> set to <tagvalue>?	Question
1E-Explorer-TachyonCore-SetCoverageTag	Set coverage tag <tagname> to <tagvalue>.	Action
1E-Explorer-TachyonCore-SetFreeFormTag	Set freeform tag <tagname> to <tagvalue>.	Action

Instruction file name	Instruction text (ReadablePayload)	Type
1E-Explorer-TachyonCore-GetAllCoverageTags	What are the coverage tags?	Question
1E-Explorer-TachyonCore-GetAllFreeformTags	What are the freeform tags?	Question
1E-Explorer-TachyonCore-GetCoverageTag	What is the value of the coverage tag <tagname>?	Question
1E-Explorer-TachyonCore-GetFreeformTag	What is the value of the freeform tag <tagname>?	Question

4.4.7 Using Device Criticality

Assigning Criticality to devices according to their importance within your organization.

4.4.7.1 Overview

Device criticality is an attribute of a device that you define for its importance within your organization. You must first agree the criteria for importance within your organization, and ensure all Tachyon users have the same understanding of criticality and how they are expected to use it.

Criticality is set on devices using an instruction, as described below in Setting Device Criticality.

Tachyon allows you to use Criticality to define the following:

Rules to create Management Groups - see Management Groups page

Coverage for instructions, for example, you can choose to target an instruction to be sent only to devices whose criticality is set to any one of the following:

Undefined (or not set)

Non-critical

Low

Medium

High

Critical.

Criticality is displayed in a number of app pages in the Tachyon Portal, including the following:

Experience	Devices page (Device View - Identification tab)
	Experience Filters

Explorer	The Devices Table (Device View - Identification tab) Coverage parameters
Guaranteed State	Devices page (Device View - Identification tab) Guaranteed State Overview page
Content Distribution	Nomad app (Device View - Identification tab)
Patch Success	Device pages Targeted Devices tab
Settings	Management Groups page

4.4.7.2 Setting Device Criticality

Device criticality is set using the instruction **Set the criticality of my devices to <criticality>** where **<criticality>** is selected from the list above.

In Explorer, type the instruction and then choose the desired criticality from the dropdown.

Select the coverage for the instruction and submit it. After approval, devices which match the specified coverage value will have their criticality set to the specified value.

Any devices that do not have their criticality set are reported as **Undefined** or **Not set**.

There is a corresponding instruction **What is the criticality of my devices?**

> **Note**
>
> The two instructions **1E-Explorer-TachyonAgent-GetCriticality** and **1E-Explorer-TachyonAgent-SetCriticality** are available by uploading the Classic Product Pack **1E-Explorer-TachyonAgent**, which is included in the **Tachyon Platform** zip downloaded from the 1E Support Portal.

4.4.8 Using Location

Assigning Location to devices within your organization.

4.4.8.1 Overview

Explorer allows you to use Location when defining coverage for an instruction. For example, you can choose to target an instruction to be sent only to devices whose location has been set. Location is an attribute of a device. You must agree a naming convention for locations within your organization, and ensure all Tachyon users have the same understanding of location and how they are expected to use it. For example, it may simply be a city or town name, a known abbreviation used within your organization, an address, building name, that might include floor or room name.

In the case of a laptop, it might represent the office base of its owner instead of its physical location.

Location is currently displayed in the following pages in the Tachyon Portal.

Application	Page
Multiple applications	Device View
Explorer	The Devices Table The Devices Dashboard
Guaranteed State	Guaranteed State Overview page
Patch Success	Device pages Targeted Devices tab

4.4.8.2 Assigning a device to a location

You assign a device to a location by using the instruction
Set the location of my devices to <location> where <location> is entered as free-form text up to 99 characters.

In Explorer, type **location** in the search field and select the instruction. Enter the desired location name, select the coverage for the instruction, and then submit the instruction. After approval, devices which match the specified coverage value will have their location to the specified value, and responses will report the old and new location.

Devices are reported as blank if they are not assigned to a location.

There is a corresponding instruction **Get the location of my devices**.

> **Note**
>
> The instructions **1E-Explorer-TachyonAgent-SetLocation** and **1E-Explorer-TachyonAgent-GetLocation** are available by uploading the Classic Product Pack **1E-Explorer-TachyonAgent**, which is included in the **Tachyon Platform** zip downloaded from the 1E Support Portal.
>
> For more information about this Product Pack and its instructions, please refer to Tachyon Platform - 1E Explorer TachyonAgent product pack.

4.4.9 Exporting data from Explorer

Results visible in Explorer can be exported to files containing comma-separated values (CSV) or, in the case of the **Export all** option on the instruction response page, tab-separated values (TSV), and results can be marked for export at the point of asking a question to automate the process.

4.4.9.1 Exporting the responses instruction list

To export the responses instruction list, an administrator would follow these steps:

The instruction list displayed on the **Responses** page can be exported to a **.csv** file.

Clicking on the Export button exports the current page of instructions to a file called **instructionsList.csv**.

You can check the contents of the file in a text application such as **Notepad**.

4.4.9.2 Exporting instruction responses

Exporting the values enables the responses to be acted upon outside of Tachyon via a script, batch file or 3rd party application.

The information contained in the responses to a particular instruction can be exported in various ways:

On a single page basis to a **.csv** file from the Explorer. Single-page exports are output in comma-separated format. This is to enable the limited amount of data to be easily viewed in a spreadsheet application. Because of the small amount of data held in these files single-page exports are downloaded via the website to the browser's download cache.

Exporting the drill-down information held for a single item in the responses page.

Exporting all the responses to a **.tsv** file once the instruction has completed. Exporting all the responses outputs to a tab-separated format file. This is to enable the potentially large amount of data to be easily processed by a 3rd party application. Because of the potentially large amount of data these files are output to a share location that must be selected by the user. Please refer to Configure Tachyon to support the Export all responses feature for more details.

To demonstrate these types of export we'll use the responses for the question
Which Windows services are disabled?

4.4.9.2.1 Exporting one page of the top-level responses

To export one page of the top-level responses, follow these steps:

To export the current page of responses click on the **Export** button in the row just above the table heading where the responses are displayed. The **Export** button is shown highlighted in the picture opposite, and the resulting file, called **aggregatedResults.csv**, is downloaded to the browser's download folder, as seen in the bottom-left of the chrome browser shown in the picture.

For top-level responses the output file is always called **aggregatedResults.csv**. If the file already exists in the downloads folder the browser will usually rename the downloaded file by appending consecutive numbers to the end.

When you open the **.csv** file you will see the exported responses from the current page. The picture shows the **aggregatedResults.csv** file opened using notepad.

An administrator could then use these responses to identify any disabled services that should be running.

4.4.9.2.2 Exporting drill-down responses

Let's suppose that an administrator is interested in investigating and taking action on the devices where the **Internet Connection Sharing (ICS)** service is disabled.

To export drill-down responses, follow these steps:

Clicking on that top-level response for that service displays all the devices that have responded to say that it is disabled. In our example this shows a number of devices where the service has been disable, as shown in the picture opposite.

We can now select to export the drilled-down responses in order to use that information outside of Tachyon. The picture opposite shows the result of clicking the **Export** button. In the case of drilled-down responses the exported file is called **detailedResults.csv**.

Now when we open the file in notepad we can see the names of the devices and the service that is disabled. This can then be passed on to another resource to process those devices to get the service turned on.

4.4.9.2.3 Export all results from the completed instruction

To export all results from the completed instruction, follow these steps:

When an instruction has completed, that is when it has finished retrieving answers from the Tachyon client devices, the **Export all results** button will appear on the responses page.

Clicking the **Export all results** button displays the **Export all results** popup. Here you need to enter the location of an appropriately permissioned share where the results will be exported. Please refer to Configure Tachyon to support the Export all responses feature for more details. In our example we have a share called Tachyon located on the same server as our Tachyon Web Server. The path to the share is **\\ACME-TCN01\TachyonResponses** in our example the share has previously been entered so the dialog recalls the name for us.

After the share has been designated click the **Save** button to begin the export.

Once the export has finished, a file named **Response_<timestamp>.tsv** will be created in the specified share.

In our example, opening the exported **.tsv** file in Notepad shows all the results related to the **Which Windows services are disabled?** instruction.

You'll notice that exporting in this way includes far more information than the export of the single page shown earlier and the type of data displayed is different.

The single-page export shown earlier contains the processed values, as displayed when viewing the responses page, whereas the **.tsv** contains all the raw unprocessed data sent back from the Tachyon client devices.

4.4.9.3 Exporting device information

The information on the **Devices Table** page can also be exported to a **.csv** file, as described in the following steps:

From the **Devices Table** page, clicking the **Export** button exports the current page of devices to a file called **Devices.csv**.

The contents of the **Devices.csv** can be displayed using **Notepad.exe**.

4.4.10 Investigating Devices

Investigating devices that have connected to Tachyon using the 1E Client.

4.4.10.1 Overview

You can use the **Devices** section to browse a predetermined set of information for all the devices that are known to Tachyon, that is the devices that are currently connected to Tachyon or have connected in the past. This is in addition to the ability to explore devices using instructions to get back a range of information that is only limited by the instructions you have available to you.

The **Devices** section can be viewed by users assigned to any role that has permissions on any instruction set. This includes custom roles and the following system roles:

All Instructions Actioner

Full Administrator

All Instructions Approver

All Instructions Questioner

Viewer

There are two options for directly investigating the devices known to Tachyon: The Devices Table and The Devices Dashboard.

4.4.10.2 The Devices Table

Explorer lets you view details for devices on your network, including real-time visibility of which devices are currently connected (online) and can therefore be interacted with directly.

Device details are stored in the TachyonMaster database and not in the inventory repositories. They are updated each time a client connects to a Switch.

Please refer to Introducing Inventory for details of inventory repositories.

> **Tip**
>
> 1E Explorer TachyonAgent product pack contains Instructions that help with device connectivity and configuration.

4.4.10.2.1 The Devices table

The picture shows the devices that have connected to our example Tachyon system. They are all shown as currently online.

Each time you view or change the page, the table is refreshed. You can also click the **Refresh** button while viewing the table.

4.4.10.2.1.1 The Devices table

Property	Description
Status	Indicates the status of the device: **online** - the device is connected to a Switch **offline** - the device does not have a network connection to a Switch. This may be because the device is powered down, disconnected from the network, the Tachyon client is not running or is incorrectly configured.
Device name	The Fully Qualified Domain Name (FQDN) of the device, as presented by the device to the Switch. If the FQDN of a device changes then it will be updated in the TachyonMaster database, it does not create a duplicate entry. Each device is uniquely identified by a GUID which is not visible in any screens. You can view additional properties for a device by clicking on the information icon next to the device name - see The Device View Overview tab.
Criticality	The criticality of the device as determined by your organization. Please refer to Using Device Criticality.
OS	The Operating System name.
OS version	The Operating System version.
Manufacturer	The manufacturer of the device as it appears in the device BIOS. The name is not normalized.
Agent version	The version of the Tachyonagent.
Primary User	The Primary User that the Tachyon agent has determined is most clearly related to the device.
Last seen	The date and time when the device last reported a Keep Alive to the Switch, which is at least every 15 minutes by default, as defined in 1E Client - #UUID4b0c8700283e161c086960470cc47bc0_id_TachyonclientsettingsConnectionKeepaliveTimeInSecondsMax.

4.4.10.2.1.2 Sorting the table

Click on the **Sort by** button and select one of the following properties, to sort the Devices table.

Property	Description
Device name	Sorts on the device name in A-Z or Z-A order.
OS	Sorts on the OS name in A-Z or Z-A order.
Agent version	Sorts by the version number of the Tachyon client in ascending or descending order.
OS version	Sorts on the OS version number in ascending or descending order.
Criticality	Sorts on the device Criticality, ascending or descending according to the following order: Criticality Undefined Non-critical Low Medium High Critical

4.4.10.2.1.3 Filtering the table

You can filter rows of the table using the following properties. A button turns blue if it is being used. You can click on the **Reset** button to delete all the filters.

Property	Description
OS	A drop-down list let's you filter on one of the following:

Property	Description
	OS --- All Windows Linux Mac Android Solaris
Agent version	This drop-down lets you filter on the version number of the Tachyon client using a numeric condition, as described under the heading Numeric conditions.
OS version	This drop-down lets you filter on the OS version number using a numeric condition, as described under the heading Numeric conditions.
Device type	This drop-down lets you filter on one of the following device types: Device type --- All Desktop Laptops Servers Mobiles
Status	This drop-down lets you filter according to whether the device is currently Online or Offline.
Criticality	This drop-down lets you filter according to the Criticality set for the device. For more detail about this feature, please refer to Using Device Criticality.

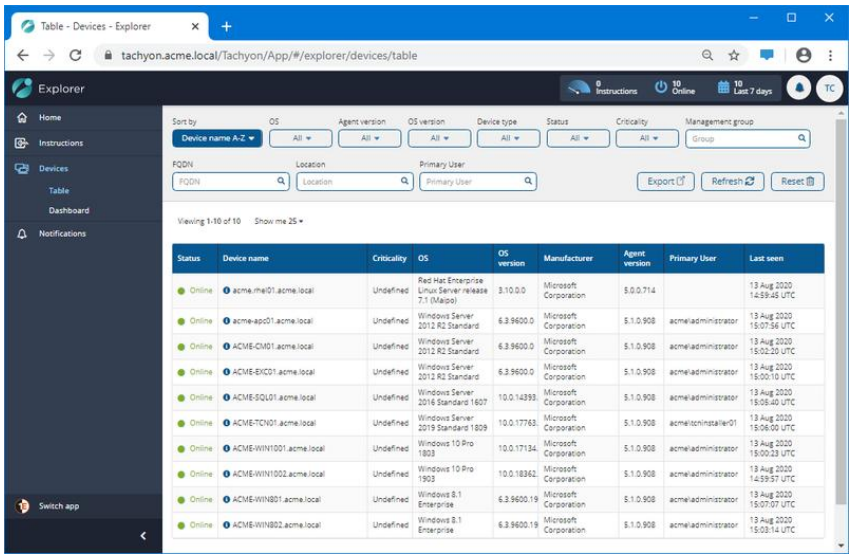
Property	Description
	Criticality Undefined Non-critical Low Medium High Critical
Management group	This entry field lets you filter according to a Management group that devices belong to. A list of Management groups is displayed when you click in the entry field, or you can type a name to filter the list as you type.
FQDN	This entry field lets you enter all or part of the Fully Qualified Domain Name for devices, and dynamically refreshes the table as you type.
Location	This entry field lets you filter on the location set for the devices, and dynamically refreshes the table as you type.
Primary User	This entry field lets you filter on the Primary User that the 1E Client has determined is most clearly related to the device, and dynamically refreshes the table as you type.

4.4.10.2.1.4 Numeric conditions

Condition	Description
Equals	Checks if the property is equal to the value you supply.
Greater	Checks if the property is greater than the value you supply.
Less	Checks if the property is less than the value you supply.
Range	Checks if the property lies between the upper and lower bounds you supply.

4.4.10.2.1.5 Exporting the table

You can export the devices data to a .csv file, as described in Exporting data from Explorer.



4.4.10.2.2 The Device View Overview tab

Clicking on the information icon next to the device name in the **Device Name** column of the **Devices Table** page displays the Device view for the selected device. The aim of the Device view is to provide a combined overview of all the information known about a device, along with the ability to retrieve information about the device in real-time. When displaying the Device view from the Explorer Devices Table page, the view defaults to the **Overview** tab. This tab contains the following panels.

4.4.10.2.2.1 The Details panel

This panel displays the basic details for the device. This is contained in a number of tiles, as described in the following table.

> **Note**
>
> If you upgrade macOS to a new major version (For example, 11 to 12) then the O/S install date will change. However, if the upgrade is a minor version, such as 12.2 to 12.3 then the install date remains the same as the original major upgrade.

Tile	Description	
Identification	Field	Description
	FQDN	The FQDN for the device.
	Name	The server name for the device.

Tile	Description
	Domain The device's domain. **Criticality** The Tachyon set criticality value for the device. **Serial Number** The device serial number. **1E Client** The version of the 1E Client installed on the device. **Tachyon GUID** The GUID used by Tachyon to uniquely identify the device.

Field	Description
Timezone	The timezone the device is operating in.
Offset	The offset from UTC for the timezone the device is operating in.
Location	The device location, if any has been set.
Locale	The language locale set for the device.

This table provides information on how the device has been tagged and grouped from a Tachyonperspective.

Field	Description
Tags	Indicates all Tachyon tags that have been set for the device.
Coverage Tags	Indicates Tachyon tags that have been set for the device that can be used to determine coverage for an instruction.
Mgmt. Groups	Indicates the Management Groups the device belongs to.

Hardware and Operating System

This table provides information on the device's hardware.

Tile	Description

Field	Description
Virtual/Physical	Indicates whether the device is virtual or physical. For virtual devices it indicates the type of virtualization. For example **Hyper-V**.
Manufacturer	Shows the hardware or virtual device manufacturer. For example **Microsoft Corporation** for Hyper-V virtual devices.
Model	The model of the hardware or virtual device. For example **Virtual Machine** for Hyper-V virtual devices.
Device Type	The type of device, whether it's a server, desktop or mobile device. For example for Windows 10 virtual devices this would be **Desktop**.
Chassis Type	The type of device, whether it's a server, desktop or mobile device. For example for Windows 10 virtual devices this would be **Desktop**.
RAM	The amount of RAM in MB.
CPU Type	The CPU Type for the device. For example, **Intel(R) Xeon(R) CPU E5620 @ 2.40GHz**.
CPU Architecture	The architecture for the CPU. For example, **x64**.
SMBIOS GUID	The GUID for the device. For example, **2e4533e6-ea92-4292-8b9c-ebae17edee75**.

This table provides information on the device's Operating System.

Field	Description
Type	Indicates the main type of the OS. For example, **Windows** or **Mac**.

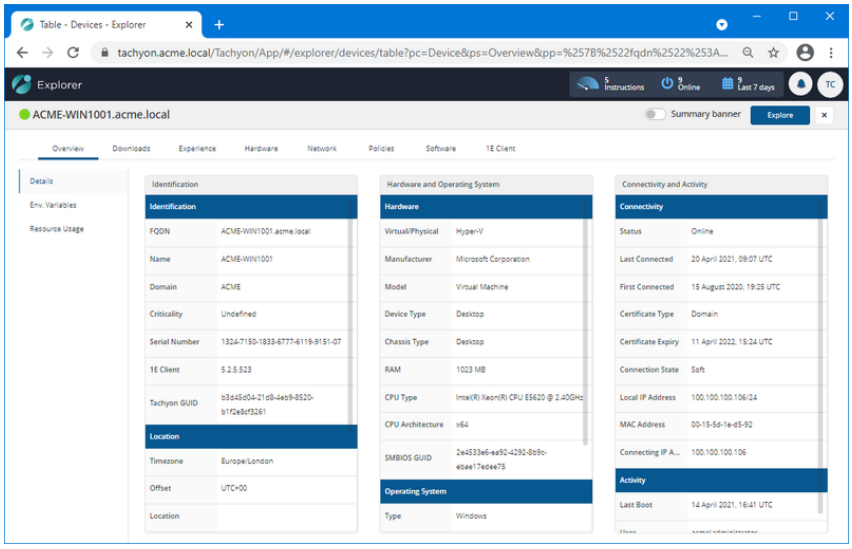
Tile	Description	
	Version	Shows the colloquial version for the OS. For example, **Windows 10 Pro 20H2**.
	Version Number	The version for the Operating System. For example: **10.0.19042.928**.
	Architecture	The architecture of the OS. For example, for 64-bit Windows systems, this would be **x64**.
	Installation	The UTC date and time the operating system was installed or updated.
Connectivity and Activity	This table provides information on the device's current connection status with Tachyon.	

Field	Description
Status	Whether the device is connected to Tachyon or not. This could be **Online** or **Offline**.
Last Connected	Shows the UTC date and time the device last connected to Tachyon.
First Connected	Shows the UTC date and time the device first connected to Tachyon.
Certificate Type	The type of certificate the device is using to connect to Tachyon.
Certificate Expiry	The UTC date and time the device certificate will expire.
Connection State	How the device connects to the Switch.
Local IP Address	The local IP address for the connecting device.
MAC Address	The MAC address for the client device interface used to connect to the Switch.

Tile	Description
	Connecting IP Address — The IP address for the connecting device.

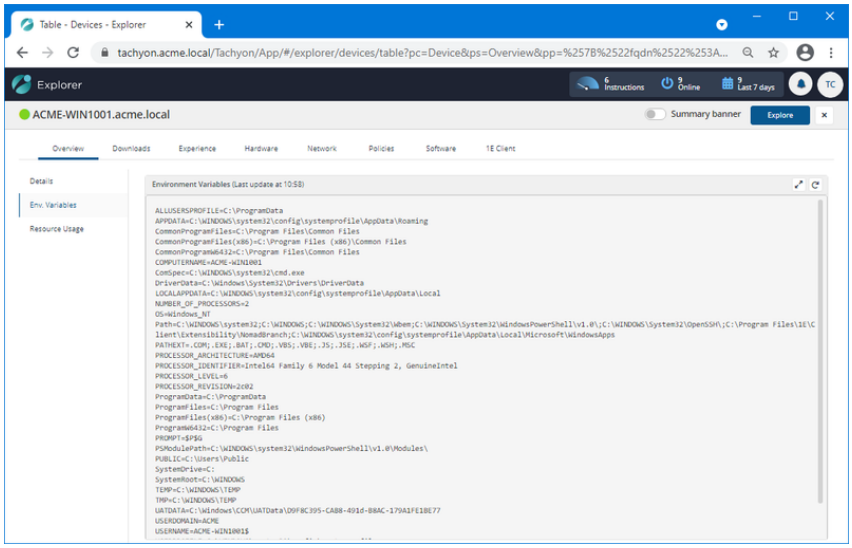
This table provides information on the device's current activity status.

Field	Description
Last Boot	The UTC time and date the device was last booted.
User	The username for the user most associated with the device.



4.4.10.2.2.2 The Env. Variables panel

Displays the list of environment variables set on the device. This information is updated each time the page is refreshed.



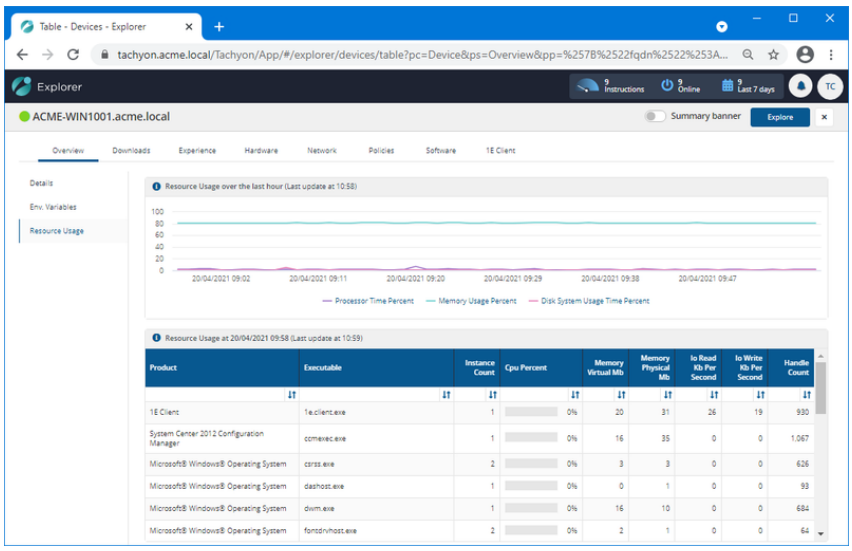
4.4.10.2.2.3 The Resource Usage panel

This panel displays the recent resource usage for the device.

Tile	Description
Resource Usage over the last hour (Last update time)	This tile displays a line graph showing the percentage of resource usage over time during the last hour. Selecting a point on the graph selects the data displayed in the **Resource Usage at date and time** tile. This can be useful if there is an outlying data point where you want to investigate the breakdown according to the products on the device. The three lines displayed show the **Processor Time Percent**, the **Memory Usage Percent** and the **Disk System Usage Time Percent**. You can toggle the display of these lines by clicking on the legend name at the bottom of the graph.
Resource Usage at date and time	This tile displays the product resource usage. Click on a point on the **Resource Usage over the last hour** tile to show the product resource usage at that particular time. The table shows the following data:

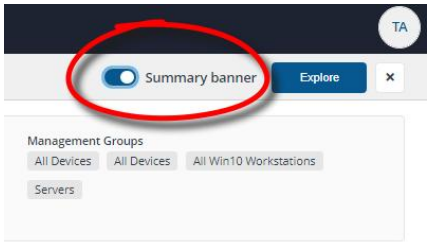
Column	Description
Product	Software product name.
Executable	Executable name.

Tile	Description	
	Instance Count	The number of instances of the product that are running.
	Cpu Percent	The percentage of CPU used by the product.
	Memory Virtual Mb	The virtual memory consumed by the product in MB.
	Memory Physical Mb	The physical memory consumed by the product in MB.
	Io Read Kb Per Second	The disk I/O read rate per second.
	Io Write Kb Per Second	The disk I/O write rate per second.
	Handle Count	The number of resource handles open for the product.



4.4.10.2.3 The Device View Summary banner

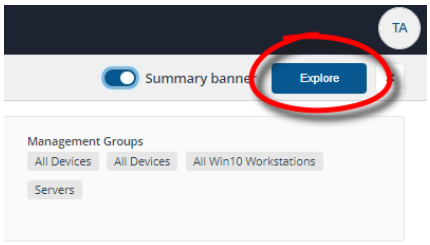
The Summary banner displays a quick summary of the information provided in the various tabs displayed in the Device View. It can be viewed by toggling the **Summary banner** switch to on.



The following image shows the Summary banner displayed for a particular device.

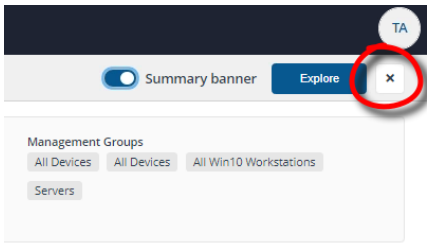
4.4.10.2.4 Launching the Explorer from the Device View

You can click on the **Explore** button in the Device View to launch Explorer with the current device set as the scope.



4.4.10.2.5 Closing the Device View

The Device View is a popup that is displayed when clicking on the name of a device on a page where devices are displayed. To return to the page you came from you need to click the x button.



4.4.10.2.6 Additional Device View tabs

In addition to the **Overview** tab, there are a number of other tabs, each corresponding to an app, feature or data set implemented in Introducing Tachyon:

The **Overview** and **1E Client** tabs are always present in the **Device View**. Other tabs are visible if an app has been installed and is licensed.

Each tab has one or more panels with tiles populated with data from various sources, some by instructions that are run instantly, with results cached for 3 minutes. An appropriate error message is displayed instead of a tile in the following circumstances:

If the device is offline, as indicated by the color of the icon in the top left

The user does not have at least Viewer permission to view use the license the tab or panel

The user does not have questioner permission to run the instruction

An instruction has not been uploaded.

The Device View tabs and panels page lists the names of tabs and their panels, and a description of each tile indicating how the tile is populated.

4.4.10.2.6.1 The Device View tabs and panels

<table>
<tr><th>Tab</th><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td>Overview</td><td>Details</td><td>Displays a number of tiles sorted into Identification, Hardware and Operating System and Connectivity and Activity columns that show information for the selected device retrieved from the online status information stored in the TachyonMaster database.

The columns and tiles are shown in the following table:

<table>
<tr><th>Column</th><th>Tile</th><th>Description</th></tr>
<tr><td>Identification</td><td>Identification</td><td>Display's the current device:

FQDN

Name

Domain

Criticality</td></tr>
</table>
</td><td>Data from TachyonMaster (the latest online status message)</td></tr>
</table>

Tab	Panel	Description		Data source
			Serial Number 1E Client Tachyon GUID.	
		Location	Displays the device's: Timezone Offset Location Locale.	
		Grouping	Displays the device: Tags - freeform tags applied to the	

Tab	Panel	Description		Data source
			device Coverage Tags - any coverage tags applied to the device Mgmt. Groups - lists the management groups the device is a member of.	
		Hardware and Operating System	Hardware	Shows hardware details for the device:

Tab	Panel	Description			Data source
				Virtual /Phyiscal	
				Manufacturer	
				Model	
				Device Type	
				Chassis Type	
				RAM	
				CPU Type	
				CPU Architecture	
				SMBIOS GUID.	
		Operating System	Shows operating system, type and version for example:		
				Type	

Tab	Panel	Description			Data source
				Version	
				Version Number	
				Architecture	
				Installation.	
		Connectivity and Activity	Connectivity	Shows current device connectivity status:	
				Status	
				Last Connected	
				First Connected	
				Certificate Type	
				Certificate Expiry	

Tab	Panel	Description			Data source
				Connection State Local IP Address MAC Address Connecting IP.	
			Activity	Shows Last Boot date and time and current user.	
Env. Variables	Shows a list of the environment variables set on the device.				
Resource Usage	Two panels: **Resource Usage over the last hour** - shows system disk, CPU and memory usage per minute for the last one hour **Resource Usage at** *day/month/year time* - shows executable resource usage for a specific minute:				1E-TachyonPlatform-Hardware-ResourceUsage 1E-TachyonPlatform-Hardware-ResourceUsageByMinute

Tab	Panel		Description	Data source
	Column	Description		
	Product	Resource name, for example 1E Client		
	Executable	Resource executable, for example 1e.client.exe		
	Instance Count	Number of currently running instances.		
	Cpu Percent	Percentage of CPU currently being consumed.		
	Memory Virtual Mb	Virtual memory consumed in Mb.		
	Memory Physical Mb	Physical memory consumed in Mb.		
	Io Read Kb Per Second	Number of associated read input/output operations per second.		
	Io Write Kb Per Second	Number of associated write input/output operations per second.		
	Handle Count	The number of object handles.		
Downloads	**Summary**		Download activity and status for the device. Whenever you click on an FQDN on any of the Nomad pages then the **Device View** will be displayed with the **Downloads** tab selected.	Data from Nomad.

Tab	Panel	Description	Data source
Content	Content Titles on the selected device, the default view is from **All Sources**, **All Types** and **All Status**. **Note** You may see a difference in the number of items in a device's Nomad cache versus that displayed in the Nomad app Device View. This is because if downloaded content has been deleted from Configuration Manager, the content titles cannot be resolved in the Nomad app and are not displayed. This is under consideration for re-design and may be revised in future versions of Nomad.	Data from Nomad.	
Nomad Configuration	**1E Nomad Branch Settings .**	1E-Nomad-NomadBranchSettings	
Experience	**Metrics**	Metrics are the data points that are collected by the 1E Client and sent to the Tachyon server. They are collected at different intervals depending on the type of data that is being collected.	Data from Experience metrics
Trends	The Trends tab shows the changes in the scores over time. Hovering over any of the bars shows the details for that time and event. If the user viewing the device details also has the ability to at least ask a question in Explorer the Explore button will be visible.	Data from Experience metrics	

<table>
<tr><th>Tab</th><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td>Logs</td><td>The Event Logs tab gives you a listing of the Windows Event log entries for that device. This brings that data to this view and is very useful when determining the root cause of an issue that has been reported on the device.</td><td>Data from Experience metrics</td><td></td></tr>
<tr><td>Application Interactions</td><td>Shows user interaction times and ratios across applications measured over the last 30 days</td><td>1E-Experience-ApplicationInteraction</td><td></td></tr>
<tr><td>User interactions</td><td>Shows user interactive sessions with activity over last 30 days.</td><td>1E-Experience-UserInteractionHistory</td><td></td></tr>
<tr><td>Hardware</td><td>Disk drives</td><td>Shows disk drives, including hardware and usage information.<table><tr><th>Column</th><th>Description</th></tr><tr><td>Drive</td><td>Drive letter.</td></tr><tr><td>Volume Name</td><td>Volume name, if set.</td></tr><tr><td>Drive Type</td><td>Drive type, for example:
Removable Disk
Local Disk</td></tr></table></td><td>1E-Tachyon Platform-Hardware-DiskDrives</td></tr>
</table>

Tab	Panel	Description		Data source
			Compact Disk.	
		Size Gb	Total disk size in Gb.	
		Free Space Gb	Current free space in Gb.	
		Usage Percent	Percentage used of total drive space.	
		File System	File system, for example NTFS.	
		Manufacturer	Standard or SSD drive.	
		Model	Drive manufacturer.	
		Serial Number	Unique disk serial number.	
		Partition	Drive and partition of the specific drive.	

<table>
<tr><th>Tab</th><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td></td><td></td><td>Firmware Revision</td><td>Drive firmware version.</td><td></td></tr>
<tr><td></td><td></td><td>Device ID</td><td>Device ID of the specified disk.</td><td></td></tr>
<tr><td>Peripherals</td><td>Shows the list of plug and play hardware devices (Windows only).

Column | Description

Device Type | Hardware device, including for example things like:
Battery
Monitor
Keyboard
Mouse
Ports
SoftwareDevice.

Name | Device name.

Instance Count | Number of instances of a peripheral device.

Service | Associated Windows service, for example atapi, serial, PCI, ACPI.</td><td colspan="2">1E-TachyonPlatform-Hardware-Devices</td></tr>
<tr><td>Network</td><td>Throughput</td><td colspan="2">Shows network throughput on all adapters for the last</td><td>1E-Tachyon Platform - Network -</td></tr>
</table>

Tab	Panel	Description	Data source
		hour, represented by the following tiles: **Average throughput** - including Timestamp, Bytes Received per Second, Bytes Sent Per Second **Bytes received per second** **Bytes sent per second**.	Average Throughput
Interface configuration	Returns the output from the native network interface configuration command (e.g. ipconfig or ifconfig).	1E-TachyonPlatform-Network-InterfaceConfiguration	
DNS	Shows the **Cache** and **Host file** tiles: **DNS Cache Contents** - with the entries from local DNS cache, **Host Name** and **Address**. **HOSTS file** - shows the content of the drivers/etc/hosts file.	1E-TachyonPlatform-Network-DnsCache 1E-TachyonPlatform-Network-HostFileContent	
TCP connections	Returns a list of established TCP connections.	1E-TachyonPlatform-Network-TcpConnections	

Column	Description
Process Name	Local process name.
Process Id	Uniquely identifies an active process.
Class	Class of Internet networking protocol.

Tab	Panel		Description	Data source
	Local Address	Local network address.		
	Local Port	Network port used by a specific process.		
	Remote Address	Source IP address from which the traffic came from.		
	Remote Port	Remote port used by a specific process.		
	Latency Ms	The time taken in milliseconds for data or a request to go from a source to a destination.		
Listening ports	Returns a list of processes which are listening for network connections.			1E-TachyonPlatform-Network-ListeningPorts
	Column	Description		
	Process Name	Local process name.		
	Process Id	Uniquely identifies an active process.		
	Class	Class of Internet networking protocol.		
	Local Address	Local network address.		
	Local Port	Network port used by a specific process.		
	Product	Related product, for example host process for Windows Services,		

Tab	Panel	Description	Data source
	Local Security Authority Process, SCNotification.		
ARP Cache	Returns a list of processes which are listening for network connections and also shows routing tables.	1E-TachyonPlatform-Network-ArpCache 1E-TachyonPlatform-Network-RoutingTable	
WIFI	Shows a list of visible wifi networks, including basic network properties.	1E-TachyonPlatform-Network-WiFiNetworks	

Column	Description
SSID	WiFi network name.
Is Connected	Shows as either true or false, dependent on whether the corresponding adapter is connected to the network.
Is Hidden	Shows as true if the WiFi network is not broadcasting a public SSID.
Is Secure	Shows as either true or false: true - if the WiFi network is secure false - if the network is open.
Signal	Shows WiFi signal quality; from 0 (worst) to 100 (best).
Authentication	The default authentication mechanism supported by the network.
BSSI IDs	The Service Set Identifier (SSID) of the network, it will

Tab	Panel		Description		Data source
		be empty if the network is hidden.			
	Encryption	Shows the default encryption mechanism supported by the network.			
	Adapter	Shows the WiFi network adapter name to which this network is visible.			
Policies	**Rules Compliance**		Column	Description	Data from Guaranteed State
			Rule Name	Name of rules applied to the current device. The viewable list relates to the selected Tachyon policy from the policy dropdown on the page.	
			State	If the device state is Compliant, Noncompliant or Not Applicable.	
			Type	Rule type:	

Tab	Panel	Description		Data source
			Check - allows you to verify that a device has a particular state, such as a registry key having a specific value Fix - allows you to define a desired state for the device and then enforce that state.	
		Effectiveness	Policy rule effectiveness is the usefulness of policy rules and is represented as either: Disabled - the rule has not yet been enabled from the Guaranteed State Rule	

Tab	Panel	Description	Data source
		Administration page, so it is not currently active Unassigned - the rule is enabled, but has not been deployed to any devices Ineffective - the rule has been deployed, but no devices have changed their compliance position for this rule in the last thirty days Effective - the rule has been deployed and at least one device has changed its compliance position	

Tab	Panel	Description		Data source
			for this rule in the last thirty days.	
			History Rule history.	
Software	**Installations**	Shows (per-device) installed software.		1E-Tachyon Platform - Software-Installations
		Column	Description	
		Product	Software product name.	
		Publisher	Software publisher.	
		Version	Product version number.	
		Architecture	Instruction set architecture (ISA) version.	
		Install Date	Software installation date.	
Windows services	Shows list of installed Windows services and their current state.	1E-TachyonPlatform-Software-Services		

Tab	Panel	Description	Data source

Column	Description
Name	Windows service name.
State	Windows service state, Running or Stopped.
Startup Type	Windows service startup type, for example Automatic, Automatic (Delayed Start), Manual, Disabled.
Process Id	Uniquely identifies an active process.
Description	Windows service description.
Logon Account	Windows service logon account context.
Type	Windows services type, for example file system driver, kernel driver, shared process.

Tab	Panel	Description	Data source
Env. Variables	Shows operating system environment variables.		1E-TachyonPlatform-Software-EnvironmentVariables
Processes	Shows detailed information about all running processes.		1E-TachyonPlatform-Software-Processes

Column	Description
Product	Software product name.
Executable	Executable name.

Tab	Panel	Description	Data source
	Version	Product version number.	
	Devices count	How many devices are reporting.	
	Crashes	Number of times this software crashed during the last 24-hour reporting period.	
	Hangs	Number of times this software crashed during the last 24-hour reporting period. **Note** Software crash and hang information is obtained from Windows event data. For background information on Windows events and the event viewer refer to https://support.microsoft.com/en-gb/help/302542/how-to-diagnose-system-problems-with-event-viewer-in-microsoft-windows	
	Performance anomalies	Number of performance anomalies detected in this software during the last 24-hour reporting period.	
	I/O write KB/s	Average disk I/O read rate per second during the last 24-hour reporting period.	

Tab	Panel	Description	Data source
	I/O write KB/s	Average disk I/O write rate per second during the last 24-hour reporting period. **Note** For background information on analyzing disk storage performance refer to https://docs.microsoft.com/en-gb/archive/blogs/cotw/analyzing-storage-performance	
	Virtual Memory Usage KB	Average Virtual Memory Usage KB during the last 24-hour reporting period. **Note** For an explanation of Windows Virtual Memory organization refer to https://answers.microsoft.com/en-us/windows/forum/windows_10-performance/physical-and-virtual-memory-in-windows-10/e36fb5bc-9ac8-49af-951c-e7d39b979938 and https://support.microsoft.com/en-us/help/2160852/ram-virtual-memory-pagefile-and-memory-management-in-windows	
	Processor Time Seconds	Each instance of the executable will burn processor time. This column gives the average of the total time consumed by each process instance per second. Each instance uses the sum of all time used by each core in parallel.	

Tab	Panel	Description	Data source
		Therefore, it is possible to see more seconds here than in a day (usually 60 x 60 x 24 = 86400) for the whole column, if your system is working extremely hard 24x7. The theoretical maximum would be somewhere near ***number of cores*** x ***seconds per day*** . Hence, 'Processor Time' rather than 'Human Time'	
	Processor Time %	This is an easier notion than Processor Time Seconds. This is the average of the processor consumption of each instance. Each instance of this process will have caused different percentages of compute resource in all the processors and cores to be used over time (unless they have specifically requested certain core affinity). For each minute each process is running, a profile of the usage is built for the whole day. This value is the average of all of those samples. There is no way to work out, for any one of the process instances involved, how long any particular instance was running for. This could indicate a process that is going wild with resources, but it would take more investigation on the device to discover for how long this is happening. It is perfectly possible to see all the values in this column adding up to more than 100% as the processes were not necessarily running at the same time. **Note**	

Tab	Panel	Description	Data source
		For further information on Processor time refer to https://social.technet.microsoft.com/wiki/contents/articles/12984.understanding-processor-processor-time-and-process-processor-time.aspx	
	Responsiveness Impact %	An indicator of how reactive a process is to activity by other processes on the device. Typically, anti-virus products watch and respond to potentially suspicious activity such as increased network traffic. Anti-virus products will differ in their impact on the overall performance of a device. **Note** Responsiveness Impact % is used to indicate how sensitive a process appears to be to the use of system resources by other processes on a device. For example, Security Protection software present on a device may reveal a spike in its activity whenever a new process is started on that device. This would typically be because the Security Protection software may wish to ensure that the new process starting on the device is present in a security white list. Other software may also react to activity by other processes and by reacting they impact system resource uses,	

Tab	Panel	Description	Data source
		thereby adversely affecting the user's experience. So it is useful to be able to identify software with the highest Responsiveness Impact on a device and potentially investigate further. **Note** Responsiveness Impact % represents the proportion of the increased CPU activity detected by the 1E Client as a result of performing a set of operating system-level operations that can be attributed to a given running process. Examples of these would be Windows registry and resource creation operations. It is reported as a percentage to normalize results across devices that offer a range of computing power. For example, if *software.exe* on a device is attributed a Responsiveness Impact of 53% this means that more than half of the spike in CPU usage caused by software monitoring activity on that device can be attributed to *software.*	

Tab	Panel	Description	Data source
	Handle Count	Average number of Windows handles used by this software during the last 24-hour reporting period. **Note** For further information on Windows handles refer to https://docs.microsoft.com/en-us/windows/win32/sysinfo/handles-and-objects For tips on examining open handles for any Windows process refer to https://docs.microsoft.com/en-us/sysinternals/downloads/handle and https://techcommunity.microsoft.com/t5/windows-blog-archive/pushing-the-limits-of-windows-handles/ba-p/723848	
	Physical Memory Usage KB	Average Physical Memory Usage KB during the last 24-hour reporting period. **Note** Please refer to https://docs.microsoft.com/en-us/sysinternals/downloads/rammap for a useful tool to examine physical memory allocation on a device.	
1E Client	**Binaries**	Shows a list of the binary files in the executable folder of the 1E Client.	1E-Tachyon Platform-Client-Binaries

Tab	Panel	Description		Data source
		Column	Description	
		File Name	Associated 1E Client file name.	
		File Version	Software version.	
		File Size	File size in bytes.	
		Description	File description	
		Date Created	The date the file was written to disk.	
		Date Modified	The date the file was last saved.	
Configuration file	Shows the full content of the 1E Client configuration file, including: Logging settings Communication settings Agent settings Module settings.			1E-TachyonPlatform-Client-ConfigFileContent

Tab	Panel	Description	Data source
Extensibility	Shows extensibility objects (modules and providers) loaded by the 1E Client. Column: Description **Type**: Module or Provider component. **Binary Name**: Associated 1E Client binary name, for example 1E.Client.Module.Interaction.dll **Name**: Name, for example Interaction. **Version**: 1E Client version, for example 5.2.5.251	1E-TachyonPlatform-Client-Extensibility	
Local Storage	Shows **Data Files** and **Client Inventory Database Use** tiles that display the list of: Data files (logs, databases, etc) created by the 1E Client Tables in the1E Client Inventory database, along with a row count per table.	1E-TachyonPlatform-Client-DataFiles 1E-TachyonPlatform-Client-InventoryDatabaseUse	

4.4.10.3 The Devices Dashboard

Explorer lets you view details for devices on your network including real-time visibility of which devices are currently connected (online) and can therefore be interacted with directly.

Device details are stored in the TachyonMaster database and not in the inventory repositories. They are updated each time a client connects to a Switch.

Please refer to Introducing Inventory for details of inventory repositories.

> **Tip**
>
> 1E Explorer TachyonAgent product pack contains Instructions that help with device connectivity and configuration.

4.4.10.3.1 The Devices dashboard

The devices dashboard provides a view of the devices that have contacted Tachyon.

There are two panes in the dashboard:

The left-hand pane displays a list of filters that appear as charts

The right-hand pane displays a list of devices that correspond to the currently selected filter, you can click on a row in the table to see the Device View for the device.

For more information on using the Devices dashboard please see Using the Devices dashboard - Tutorial.

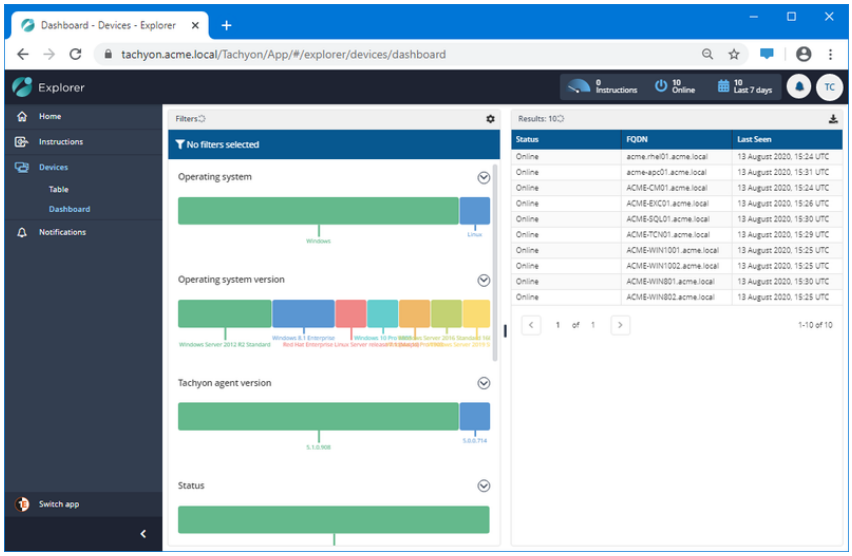
The available filters are:

Filter	Description
Operating system	Partitions the 1E Client devices according to the OS running on the devices.
Operating system version	Partitions the 1E Client devices according to the OS version running on the devices.
Tachyon agent version	Partitions the 1E Client devices according to the version of the 1E Client running on the devices.
Status	Partitions the 1E Client devices according to the current connection status of the devices.
Device type	Partitions the 1E Client devices according to the type of the devices.
Timezone	Partitions the 1E Client devices according to the time zone the devices are configured with.
Location	Partitions the 1E Client devices according to their location.

The available charts are:

Chart	Description
SmartBar	Displays a single horizontal bar where the distinct values in the data are represented by different colors. The individual colored blocks can be clicked on to select the corresponding devices that have that value.
Pie	Displays a pie chart where the distinct values in the data are represented by different colors. The wedges can be clicked on to select the corresponding devices that have that value.

Chart	Description
Column	Displays a column for each distinct value in the data. Each column can be clicked on to select the corresponding devices that have that value.
Bar	Displays a horizontal bar for each distinct value in the data. Each bar can be clicked on to select the corresponding devices that have that value.



4.4.10.3.2 Using the Devices dashboard - Tutorial

A quick tutorial on using the Devices dashboard to filter and highlight specific devices.

4.4.10.3.2.1 The example

To illustrate the process of selecting a specific device in Tachyon we use an example of locating Windows servers.

4.4.10.3.2.1.1 Setting filters

Our example shows the following steps:

In our example the **Devices Dashboard** page is already selected showing all **12** of our connected devices.

Click on the **Operating system type** bar with the **Windows** label. A new **OsType=Windows** filter appears in the top row and the **Results** then show only the **11** Windows server type devices.

Click on the **Device type** bar with the **Server** label. A new **DeviceType=Server** filter is added. This filters the **Results** table to show only the **5** Windows server type devices.

4.4.10.3.2.1.2 Removing filters

You can remove any of the filters that have been set by clicking on **x** button at the right-hand end of the filter displayed just beneath the **Filters** header. You can identify the set filters by their thicker border.

The animation at the top of the page shows the following steps:

Click on the **x** at the right-hand end of the **OsType=Windows** filter. This filters the **Results** table to now show **6** Server devices.

To remove the next filter, click on the **x** at the right-hand end of the **DeviceType=Server** filter. The **Devices Dashboard** now shows the default unfiltered **12** devices.

4.4.11 Tachyon Activity Record

A description of the benefits of Tachyon Activity Record feature and how the data can be retrieved.

Also known as Tachyon Inventory.

4.4.11.1 What is Tachyon Activity Record?

Tachyon clients capture certain types of event data in a local database (Persistent Storage) so that instructions can query later. Data is compressed and encrypted in a way that ensures a very low impact on device performance and security.

Tachyon Activity Record is similar to Windows Task Manager and Perfmon. On Windows client devices Tachyon continuously captures events, which enables all significant events to be captured as they happen. Other OS use polling, which requires the polling frequency to be regular enough to ensure brief events to be captured.

The type of data captured and is described below and the configuration options for each capture source are described in 1E Client - Tachyon client settings: Inventory module settings. There are Product Pack instructions for getting and setting these configuration options.

4.4.11.1.1 What are the capture sources?

The table below lists the capture sources supported by the Tachyon Activity Record feature, and on which OS they are supported.

Source Name	Description	Windows	macOS	Linux	Solaris
ARP	ARP cache entries - the Inventory module captures the results of cached IP address to physical address resolutions	3.2	n/a	n/a	n/a
BootPerformance	Windows boot performance metrics.	8.0	n/a	n/a	n/a
DeviceInteraction	User session input metrics (keyboard and mouse activity).	5.1	n/a	n/a	n/a
DevicePerformance	Device performance metrics for device performance by interrogating Windows Performance Counters.	5.0	n/a	n/a	n/a

Source Name	Description	Windows	macOS	Linux	Solaris
	These metrics cover disk, memory, network and processor performance. This capture source is required by the **Experience** application.				
DeviceResourceDemand	Disk, network, memory, and processor performance metrics.	5.1	n/a	n/a	n/a
DNS	DNS resolution queries - the Inventory module captures whenever a DNS address is resolved	2.1	2.1	n/a	n/a
OperatingSystemPerformance	Performance metrics for OS - the metrics executable runs every 4 hours by default This capture source is required by the **Experience** application.	5.0	n/a	n/a	n/a
PerformanceEvent	Distinct events which may be of relevance when diagnosing performance or end-user experience issues.	5.0	n/a	n/a	n/a
Process	Process execution - the Inventory module captures whenever a process starts on the device	2.1	2.1	2.1	2.1
ProcessStabilization	The time taken for a process execution to be considered stable whenever a monitored process starts on the device	3.2	n/a	n/a	n/a
ProcessUsage	A daily summary of the launches and terminations of processes. The Process Usage capture source is required by the	3.2	n/a	n/a	n/a

Source Name	Description	Windows	macOS	Linux	Solaris
	Tachyon Powered Inventory feature (Tachyon connector). **Note** Process Usage capture can generate high disk I/O while capturing process usage on virtual machine hosts with guests starting at the same time.				
SensitiveProcess	Performance metrics for sensitive processes - the metrics executable runs every 4 hours by default This capture source is required by the **Experience** application.	5.0	n/a	n/a	n/a
Software	Software installs/uninstalls/presence - the Inventory module captures whenever software is installed/uninstalled, and also captures which software is present on a device	2.1	2.1	2.1	2.1
SoftwareInteraction	Software process responsiveness and duration of active interaction.	5.1	n/a	n/a	n/a
SoftwarePerformance	Performance metrics for software - Software performance polling is every 10 seconds by default This capture source is required by the **Experience** application. Aggregated with SoftwarePerformance data: SoftwarePerformance.DiskUsage - Disk related metrics for each running process	5.0	n/a	n/a	n/a

Source Name	Description	Windows	macOS	Linux	Solaris
	SoftwarePerformance.ProcessNetworkUsage - Network related metrics for each running process.				
TCP	Outbound TCP connections - the Inventory module captures whenever an outbound TCP connection is made	2.1	2.1	2.1	n/a
UserUsage	A daily summary of all the logons and logoffs of users. This capture source is required by the **Tachyon Powered Inventory** feature (Tachyon connector).	3.2	n/a	n/a	n/a

4.4.11.1.2 How is the data managed?

The data is captured and stored to a local, encrypted persistent store and then periodically aggregated according to an ongoing daily, weekly, monthly window. This means that the data is held securely and the amount of data is minimized while still maintaining its usefulness.

4.4.11.1.3 How do I retrieve the data from the 1E Client devices?

Tachyon provides a number of Product Pack instructions that will let you interrogate your 1E Client devices for the data they hold.

4.4.12 Tachyon Quarantine

A description of the quarantine feature provided in the client and implemented in the quarantine instructions present in the 1E-Explorer-TachyonCore.zip file.

4.4.12.1 What is Quarantine?

On Windows, the Tachyon client is able to prevent communications to or from a target device. This is intended to be reserved for security breaches and other rare circumstances.

4.4.12.1.1 What will it do?

Quarantine will prevent all communications except those to the Tachyon server(s). This allows a Tachyon administrator to investigate and remove possible malicious software on the device.

Warning

Devices that have been quarantined will only be able to contact Tachyon. CRL checks must be set to soft. Certificate expiry can cause the client to fail to connect to the switch. If a client is no longer connected to Tachyon after quarantine, it will remain in quarantine. Please use with care, and please read this documentation carefully before use.

If the Tachyon Server has 1E Client installed (with Tachyon client features enabled) then it is possible to quarantine Tachyon Server like any other device. Therefore, please exercise caution before using this feature, and avoid targeting the server.

4.4.12.1.2 How do I quarantine a device?

Before you can use the Quarantine feature, you must upload the **1E-Explorer-TachyonCore.zip** Product Pack. This pack contains many instructions, amongst which are the Quarantine instructions described in the table below.

Instruction	Description
Are my devices quarantined? Warning: Please read the description before use.	This question returns a list of devices.
Quarantine selected devices. Warning: Please read the description before use.	This action quarantines all the devices in the scope of the action. Do not run this action without restricting the coverage to the devices you want to quarantine.
Release selected devices from quarantine. Warning: Please read the description before use.	This action releases all the devices in the scope of the action from quarantine.

Note

As you can see, there is a warning attached to the name of each instruction. Quarantine is a powerful solution for use in extreme circumstances and should be used with care. We therefore recommend these instructions have Actioner permissions assigned only to specific users, who are told the instructions must be used carefully.

Tip

If you used the Tachyon Product Pack Deployment Tool to upload the product pack, it will have created or updated an instruction set called **1E Explorer TachyonCore** , containing the above instructions. You can move the Quarantine instructions into their own instruction set, for example called **High Security**, and assign Actioner permissions to individual users or to a custom role.

4.4.12.1.3 What do I need to know before I quarantine a device?

Quarantine is available only on Windows, but not available on Windows XP.

Quarantine requires that at least one switch URI and one background channel URI each resolve to IPv4 addresses.

Quarantine will only work if a device's connection to the switch is over IPv4. This is because IPv6 is disabled by the quarantine mechanism.

The **CRLChecks** setting in the 1E Client configuration file should be set to soft.

As the device will be unable to contact anything but the tachyon server(s), the Tachyon client will be unable to retrieve CRLs for certificates requiring validation.

CRLChecks can be set to hard, but this can cause the Tachyon client to lose connection to the switch when the CRL validity period is exceeded.

Quarantine will persist until the **Release selected devices from quarantine** instruction is received.

If a Tachyon client cannot be connect to the Tachyon Server, it will not be possible to issue this command.

Any changes to the routing tables, IPv6 bindings or the hosts file made during quarantine will be reverted when the **Release selected devices from quarantine** instruction is received.

If the persistent storage of the client is deleted or modified by anything other than Tachyon whilst in quarantine, the client will not be able to release the device from quarantine properly.

Upgrading, uninstalling, installing or modifying the client installation during quarantine is not supported. Do not upgrade, uninstall or install Tachyon, or issue an extensibility update whilst the client is under quarantine.

After a release from quarantine the IPv4 loopback address will not be resolvable. A restart is required to fix this.

Quarantining a device will also stop it from being able to see Domain Controllers, so this may cause problems with logging on to the workstation. Cached logons should still work though.

4.5 Troubleshooting

A general methodology for investigating issues as well as identifying key issues and their resolutions.

4.5.1 Troubleshooting table

For known issues relating to specific components, please refer to the respective troubleshooting pages:

Clients	Platform	Applications	Integration
1E Client	1E	Endpoint Automation	1E Core for ServiceNow
1E Client Deployment Assistant		Experience Analytics	1E ITSM Connect for ServiceNow
PXE Everywhere		Endpoint Troubleshooting	1E Service Catalog Connect for ServiceNow
		Writing 1E Instructions (1E SDK)	

4.5.2 1E Support contact details

4.5.2.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

4.5.2.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

US/Canada:	1-866-349-4032 (Toll-Free)
	1-917-339-2360 (Standard)
UK/Europe:	+44 (0)208 326 3499
India:	+91 120 402 4002
Australia:	+61 739 111 118

4.5.2.3 Email support

Maintenance customers can use the following email for additional support:

support@1e.com

In this section:

4.5.2.3.1 Known issues

4.5.2.3.2 Server installation issues

4.5.2.3.3 Client issues

4.5.2.3.4 _Inventory issues

4.5.3 The technical support process

Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

4.5.3.1 Maintenance

You are recommended to review and apply hotfixes on a monthly basis. Hotfixes are provided in **Hotfix Bundles** and in **Monthly Updates**, which are installed using Tachyon Setup. Please refer to Maintenance.

4.5.3.2 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

4.5.3.2.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

4.5.3.2.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

4.5.3.2.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

4.5.3.3 Log files

Below is a summary, please refer to the Log files page for more details.

4.5.3.3.1 Tachyon Setup log files

Tachyon Setup creates a Setup log file for itself and an Install log for each of the components (if used) in the same folder as itself:

BIInstall.log

CatalogInstall.log

ContentDistribution.log

SLAInstall.log

Tachyon.Setup.log

TachyonInstall.log

4.5.3.3.2 Tachyon Server log files

For any issue, please provide a zip containing log files from the following locations:

%ALLUSERSPROFILE%\1E\Catalog*.log

%ALLUSERSPROFILE%\1E\ContentDistribution*.log

%ALLUSERSPROFILE%\1E\Platform Consumers*.log

%ALLUSERSPROFILE%\1E\SLA Platform*.log

%ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

%ALLUSERSPROFILE%\1E\Licensing*

Please refer to the Log files page for more details.

4.5.3.3.3 1E Client log files

1E Client logs on Windows

1E Client logs on macOS

1E Client logs on other non-Windows platforms

Nomad client log

PXE Everywhere Agent log

Shopping WSA client log

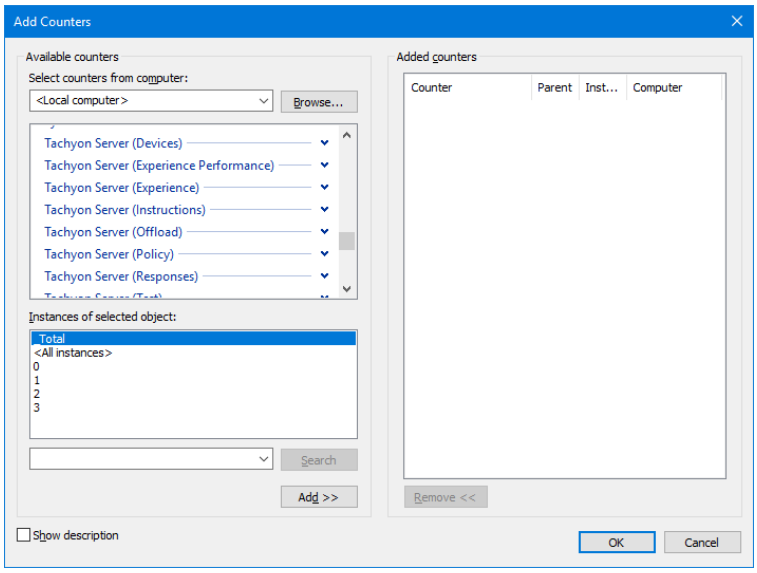
WakeUp client log

> **Note**
>
> By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

4.5.3.4 Tachyon Windows Perfomance Counters

Tachyon now creates Windows Performance Counters that can be accessed using Performance Monitor. These are primarily for internal use and troubleshooting and need not be monitored, unless requested by 1E Support.

The counters are all under headings that start with **Tachyon**. The image shows the Performance Monitor **Add Counters** dialog with some Tachyon counters visible.



4.5.4 Known issues

Lists of the current known issues with implementing, configuring, and using Tachyon Explorer.

If you cannot find an issue and its workaround on this page, please:

Refer to Known issues for the Platform and other applications.

Try searching the 1E Support Portal https://support.1e.com/ for issues which have hotfixes.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

4.6 Reference

All the list type information, such as installer properties, in alphabetical lists etc.

4.6.1 Log files

Names and locations of log files created by Tachyon Server, 1E Client, and Tachyon tools.

4.6.1.1 Tachyon Setup logs

Tachyon Setup creates a Setup log file for itself and an Install log for each of the components (if used) in the same folder as itself:

AEInstall.log

BIInstall.log

CatalogInstall.log

SLAInstall.log

Tachyon.Setup.log

TachyonInstall.log

4.6.1.2 Tachyon Server logs

The default location for all Tachyon logs is the folder *%ALLUSERSPROFILE%\1E*

Subsystem	Component		
Tachyon Master	Tachyon Portal UI and applications (Tachyon)	1E\Tachyon\	`Tachyon.Portal.log`
Consumer API	1E\Tachyon\	`Tachyon.ConsumerAPI.log`	

Subsystem	Component		
Coordinator service	1E\Tachyon\	`Tachyon.Coordinator.log` `Tachyon.Instrumentation.log`	
Experience application	1E\Tachyon\	`Tachyon.Experience.log`	
Catalog	Catalog UI (CatalogWeb - Admin sync)	1E\Catalog\	*`Catalog.Integration.UI.log`*
Catalog API			
Catalog Update Service	1E\Catalog\	*`Catalog.UpdateService.log`*	
SLA	SLA/Platform APIs (Admin, Core External)	1E\Tachyon\	`Tachyon.AdminAPI.log`
SLA Platform UI (Platform)	1E\SLA Platform\	*`Web.log`*	
SLA Engine	1E\SLA Platform\	*`Engine.log`*	
SLA Integrate Services (Connector Manager)	1E\SLA Platform\	*`1E.SLAPlatformIntegrateAgent.log`* *`1E.SLAPlatformIntegrateManager.log`* *`1E.SLAConnector.<type>_sync.log`*	
SLA Inventory	n/a	n/a	

Subsystem	Component		
SLA Operations Provider (not currently used)	1E\Platform Consumer\	n/a	
SLA databases (Data, Integrate, Shared)	n/a	n/a	
BI	MDX API	SQL database	[SLA-BI].[BI].[Event Log]
Tachyon Response	Core	1E\Tachyon\	`Tachyon.CoreAPI.log`
Background Channel (Background)	1E\Tachyon\	*`Tachyon.BackgroundAPI.log`*	
Switch(es) (also includes a single Switch Host service)	1E\Tachyon\	`Tachyon.Switch.4000.SW1.log` `Tachyon.Switch.Host.log`	

Please refer to Services and NTFS Security if changing the location of log files.

In this version of Tachyon Server, some installers do not support the LOGPATH property and the logs folder is not configurable during installation.

Each component has a configuration file in the Tachyon Server installation folder structure, which contains log configuration details. Defaults are:

Filepath *%ALLUSERSPROFILE%\1E\<product>* where product is Tachyon, SLA Platform, and Catalog

Filename as shown in the table above.

Maximum size 10MB (2MB for Switch logs).

2 rollover files numbered 1 to 2 with the rollover number included as n.log (5 rollover files for Switch logs).

Date and timestamps are UTC to help troubleshooters synchronize logs on systems in different timezones.

Switch logs have the following names:

The first Switch installed will typically have a log filename **Tachyon.Switch.4000.SW1.log** (where 4000 is the port it is listening on and SW1 is the **config name** in the SwitchConfiguration table in the TachyonMaster database).

Other Switches on the same server will have different config names appended.

The log filename will be unique on a server, but there may be the same named log on a different server.

A Switch will continue to use the same log, unless the SwitchConfiguration table is modified so that a different ID is used.

If you see a Tachyon.Switch.log without a config name appended, this is a special case where a Switch cannot find its correct configuration, and has fallen back to using the template * row which has ID=1. In which case you will need to troubleshoot how that happened.

Rollover logs have numbers appended, for example Tachyon.Switch_A.1.log, up to a default maximum of 5.

Tachyon server components use the **log4net RollingFileAppender** class. Details can be found in http://logging.apache.org/log4net.

4.6.1.2.1 Summary of server log file locations

For any issue, please provide a zip containing log files from the following locations:

%ALLUSERSPROFILE%\1E\Catalog*.log

%ALLUSERSPROFILE%\1E\Platform Consumers*.log

%ALLUSERSPROFILE%\1E\SLA Platform*.log

%ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

%ALLUSERSPROFILE%\1E\Licensing*

Please refer to the Log files page for more details.

4.6.1.2.2 Logging Levels

The table below describes the logging levels which are configurable for server components.

Value	Description
Error	Only outputs errors. An error is a serious problem, typically requiring operator intervention of some sort to restore full functionality.
Warn	Outputs errors and warnings. A warning indicates a potential problem, where the system can nonetheless function without intervention.
Info	Outputs general information in addition to errors and warnings. This is the default.

Value	Description
Debug	Outputs debugging information in addition to all the previous levels.

Warning

Logging levels should only be changed from **info** only if requested by 1E Support and reset to **info** after investigation is complete.

Tip

The method of configuring logging levels uses the above text values, where -log=0 is the default to mean the same as *-log=info*.

4.6.1.3 1E Client logs

1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

1E Client logs on macOS

/Library/Logs/1E.Client.Daemon.log (shows any service start errors)

/Library/Logs/1E.Client.log (shows the current operation of the 1E Client)

1E Client logs on other non-Windows platforms

/var/log/1E/Client/1E.Client.log

Nomad client log

%ALLUSERSPROFILE%\1E\NomadBranch\LogFiles\NomadBranch.log

PXE Everywhere Agent log

%ALLUSERSPROFILE%\1E\PXEEverywhere\PXEEverywhere.log

Shopping WSA client log

%ALLUSERSPROFILE%\1E\Client\WSA.log

WakeUp client log

%ALLUSERSPROFILE%\1E\Agent\WakeUpAgt.log

Note

By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

4.6.1.4 Software Reclaimer logs

Every time the Reclaimer runs it will create a local log file of the process it is doing. The location and name of the log file depends on what task the reclaimer is doing.

Task	Logpath	Notes
Optout	**C:\Users\{USER}\AppData\Local\Temp\ AppClarity.SoftwareReclaimer.log**	Optout mode is normally run under user context so that the user can interact with the dialog. This means the log file will be in the users Temp folder within the user profile.
Mandatory	**C:\windows\Temp\AppClarity.SoftwareReclaimer.log**	Mandatory mode is normally set to run under system context, in order to process reclaim uninstall command

Task	Logpath	Notes
		s. Therefore, the log file will be under the system temp directory.
Reclaim	**C:\windows\Temp\AppClarity.SoftwareReclaimer.MSI.log**	For a mandatory reclaim, if a reclaim occurs using an MSI then an MSI log file is also created.

4.6.1.5 Configuration Manager Console Extensions log

%ALLUSERSPROFILE%\1E\Tachyon\Tachyon.CmConsole.log

%ALLUSERSPROFILE%\1E\Tachyon\Tachyon.RunInstructionUI.log

4.6.1.6 The Instruction Management Studio (TIMS) log

%ALLUSERSPROFILE%\1E\Tachyon\Tachyon.InstructionManagementStudio.log

4.6.1.7 Tachyon Product Pack Deployment Tool log

Tachyon.ProductPackDeploymentTool.log

In the same location as the tool.

4.6.2 Explorer reference

Reference information specific to Explorer.

4.6.2.1 Coverage parameters

Details of the parameters available when setting the coverage for a question or action.

4.6.2.1.1 Coverage parameters

When the Tachyon clients start and connect to Tachyon they provide some basic information about the devices they are running on that enables Tachyon to determine the coverage of a question and be selective about which devices get asked.

The information returned enables the coverage to be limited according to the following attributes:

Attribute	Description
Management group	Limits coverage to the devices specified by the selected Management group.
Device	Limits coverage according to complete or partial matches for the provided text found in the device's FQDN.
Primary User	Limits coverage to the devices where Tachyon has determined the selected user to be the primary user of each device.
Criticality	Limits coverage to the devices where the 1E Client has the selected Criticality set, or not set.
Device Tags	Limits coverage to devices where the 1E Client has the selected Device tag name and value set.
Operating System	Limits coverage according to the Type, Name and Version number of the device's Operating System.
Hardware	Limits coverage according to the device type, model, virtual platform or installed RAM.
Tachyon Agent Version	Limits coverage according to the device's installed Tachyon Agent or client version.
Last boot	Limits coverage according to whether the last time the device was rebooted was before or after a given date and time.
Timezone	Limits coverage to devices with the selected timezone set.
Location	Limits coverage to the devices where the 1E Client has a Location set, that matches with a specified search string.
Device list (FQDN)	Limits coverage to the devices specified in a comma-separated list of device FQDN.

Please read Limiting coverage using a Management group - tutorial for more information on other ways to set coverage to a group of devices.

4.6.2.1.2 Management group

You can search for and select a Management Group. If you do not select a group, then the default All Devices group is used.

For more information, please refer to the Tachyon Platform Management Groups page.

4.6.2.1.3 Device

Control	Description
Operator	This drop down list contains the following operators:
Edit field	Set this to any part of the FQDN for the devices you are trying to match

Operator	Description
=	Will match if the source string is equal to the contents of the edit field
Begins with	Will match if the source string begins with the contents of the edit field
Ends with	Will match if the source string ends with the contents of the edit field
Contains	Will match if the contents of the edit field can be found anywhere in the source string

4.6.2.1.4 Criticality

Control	Description
Operator	This drop down list contains the following operators:
Edit field	Set this to one of the following types:

Operator	Description
=	Equals
!=	Does not equal

Control	Description
	Criticality Undefined Non-critical Low Medium High Critical

For more information, please refer to the Using Device Criticality.

4.6.2.1.5 Tags

Chart	Description
Key drop-down list	Select from the list of currently defined coverage tag keys to match against any coverage tags set on the target devices
Value drop-down list	Select from the list of values for the selected coverage tag key to match against the value set for the selected coverage tag on the target devices

For more information, please refer to Tagging client devices.

4.6.2.1.6 Operating System

Chart	Description
Type	This drop down list lets you select from one of the following Operating System types: Operating System Windows Linux MacOS

Chart	Description
	Android Solaris
Name	This parameter lets you match string values in the name of the Operating System.

Control	Description
Operator	Operator: = — Will match if the source string is equal to the contents of the edit field Begins with — Will match if the source string begins with the contents of the edit field Ends with — Will match if the source string ends with the contents of the edit field Contains — Will match if the contents of the edit field can be found anywhere in the source string
Edit field	Set this to any part of the Operating System name you want to match

Version — This field lets you set a numeric comparison on the version number of the Operating System on the device. The drop-down list contains the following operators:

Control	Description
Operator	Operator: = — Will match if the source value is equal to the contents of the edit field >= — Will match if the source value is greater than or equal to the contents of the edit field <= — Will match if the source value is less than or equal to the contents of the edit field

Chart	Description
Edit field	Set this to the OS version you want to compare against

4.6.2.1.7 Hardware

Chart	Description
Device Type	Select from: Device Type Desktop Laptop Mobile Server
Model	Control: Edit field Description: Set this to any part of the Model name you want to match Operator: = Operator Description: Will match if the source string is equal to the contents of the edit field Operator: Begins with Operator Description: Will match if the source string begins with the contents of the edit field Operator: Ends with Operator Description: Will match if the source string ends with the contents of the edit field Operator: Contains Operator Description: Will match if the contents of the edit field can be found anywhere in the source string
Virtual Platform	If you want to constrain the coverage to a particular type of virtual platform, select one of the following from the drop-down list:

Chart	Description
	Virtual Platform
	Virtual Server
	Hyper-V
	VMWare
	VirtualBox
	Red Hat KVM
RAM (MB)	Set a comparison value for the amount of RAM in MB on the target devices.

Control	Description
Operator	Operator Description
	= Will match if the source value is equal to the contents of the edit field
	>= Will match if the source value is greater than or equal to the contents of the edit field
	<= Will match if the source value is less than or equal to the contents of the edit field
Edit field	Set this field to the value in MB you want to compare the target device's RAM against.

4.6.2.1.8 Tachyon agent version

Controls	Description
Operator	This drop down list contains the following operators:

Operator	Description
=	Will match if the source value is equal to the contents of the edit field

Controls	Description	
	>=	Will match if the source value is greater than or equal to the contents of the edit field
	<=	Will match if the source value is less than or equal to the contents of the edit field
Edit field	Set this to the Agent or client version you want to compare against.	

This coverage parameter allows you to set a version range by adding a less than or equal to and a greater than or equal to comparison using the **Add** option.

4.6.2.1.9 Last boot

Control	Description	
Operator	Operator	Description
	Before	Will match if the source date is on or before the date set in the date picker field
	After	Will match if the source date is on or after the date set in the date picker field
Date picker	Use the date picker control to select the date you want to compare the last boot date of the device against	

4.6.2.1.10 Timezone

Control	Description
Timezone drop-down list	Select from this drop-down list of timezones with their UTC values and locations to match against the timezones set for the target devices

4.6.2.2 Devices dashboard filters and charts

Details of the filters and charts available on the Devices dashboard.

4.6.2.2.1 Devices dashboard filters

Filter	Description
Operating system	Partitions the Tachyon client devices according to the OS running on the devices.

Filter	Description
Operating system version	Partitions the Tachyon client devices according to the OS version running on the devices.
Tachyon agent version	Partitions the Tachyon client devices according to the version of the Tachyon client running on the devices.
Status	Partitions the Tachyon client devices according to the current connection status of the devices.
Device type	Partitions the Tachyon client devices according to the type of the devices.
Timezone	Partitions the Tachyon client devices according to the time zone the devices are configured with.
Location	Partitions the Tachyon client devices according to their location.

4.6.2.2.2 Devices dashboard charts

Chart	Description
SmartBar	Displays a single horizontal bar where the distinct values in the data are represented by different colors. The individual colored blocks can be clicked on to select the corresponding devices that have that value.
Pie	Displays a pie chart where the distinct values in the data are represented by different colors. The wedges can be clicked on to select the corresponding devices that have that value.
Column	Displays a column for each distinct value in the data. Each column can be clicked on to select the corresponding devices that have that value.
Bar	Displays a horizontal bar for each distinct value in the data. Each bar can be clicked on to select the corresponding devices that have that value.

4.6.2.3 Responses Summary tab information

Details of the information displayed on the **Responses** page **Summary** tab.

4.6.2.3.1 The Statistics table

The following information for the running instruction is shown in the **Responses** page **Summary** tab statistics table:

Statistic	Description
Dispatch sequence	Displays the number for the instruction used in the workflow. This may be referenced against the Tachyon logs to track down issues related to running the instruction
Running time	The total time the instruction has been running for
Approximate target	The approximate number of devices the instruction has been sent to. This is an approximate value because a new device might register with Tachyon while the instruction is still running and be included in the instruction's target
Sent count	This displays the number of devices the instruction has been sent to
Responses count	Displays the number of devices that have responded to the instruction. This is displayed in the PERCENT SENT COUNT chart.
Awaiting responses count	Displays the number of devices that have been sent the instruction where Tachyon is still awaiting a response. This is displayed in the PERCENT SENT COUNT chart.

4.6.2.3.2 The Responses table

The following information for the running instruction is shown in the **Responses** page **Summary** tab responses table:

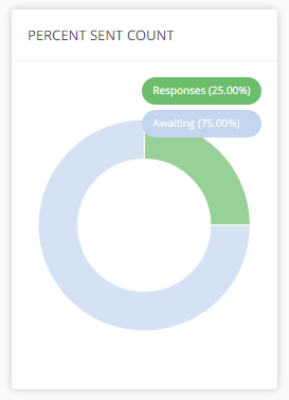
Reponses	Description
Success	Devices that have responded with a success status
Success - no content	Devices that have responded with a success status but did not provide a response to the instruction content request
Error	Devices that have responded with an error encountered when attempting to run the instruction
Not implemented	Devices that have responded where the feature contained in the instruction is not implemented on the device
Response too large	Devices that have not been able to respond to the instruction content request because their response was too large

4.6.2.3.3 The Performance table

Performance	Description
Average execution time	The average instruction execution time for the devices
Average bytes received	The average number of bytes received from each device in response to the instruction
Total bytes received	The total number of bytes received by all devices responding to the instruction
Total bytes sent	The total number of bytes sent by Tachyon when performing the instruction
Total number of rows inserted	The total number of rows inserted into the TachyonResponses databases (response, error and aggregated) as a result of performing the instruction
Total number of rows processed	The total number of rows processed by the core as a result of performing the instruction. **Note** This value may be higher than the Total number of rows inserted depending on whether the instruction results are aggregated or not.

4.6.2.3.4 The PERCENT SENT COUNT chart

This chart displays the percentage of the sent instructions divided into received **Responses** and **Awaiting** responses.

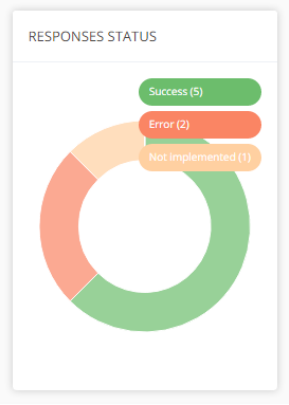


4.6.2.3.5 The RESPONSES STATUS chart

This chart displays the received response statuses. These may be one of the following:

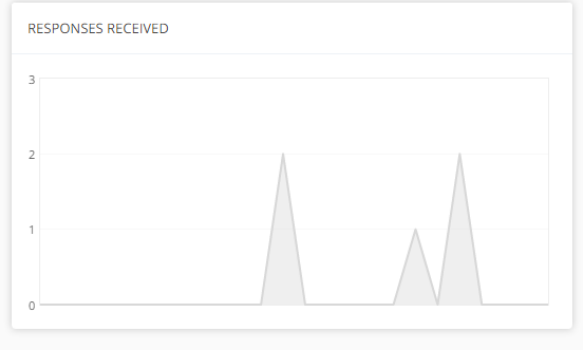
Reponses	Description
Success	Devices that have responded with a success status
Success - no content	Devices that have responded with a success status but did not provide a response to the instruction content request
Error	Devices that have responded with an error encountered when attempting to run the instruction
Not implemented	Devices that have responded where the feature contained in the instruction is not implemented on the device
Response too large	Devices that have not been able to respond to the instruction content request because their response was too large

This picture shows the RESPONSE STATUS chart with three types of response status displayed:



4.6.2.3.6 The RESPONSES RECEIVED chart

This chart displays in real-time the number of responses received while the instruction is active.



4.6.2.4 Explorer comparison operators

Details of the operators available when configuring comparisons for different data types, for example question coverage parameters.

4.6.2.4.1 String comparison operators

When configuring comparisons for string values, the following operators are available:

Operator	Description
=	Will match if the source string is equal to the contents of the edit field
Begins with	Will match if the source string begins with the contents of the edit field
Ends with	Will match if the source string ends with the contents of the edit field
Contains	Will match if the contents of the edit field can be found anywhere in the source string

4.6.2.4.2 Numeric comparison operators

When configuring comparisons for numeric values, the following operators are available:

Operator	Description
=	Will match if the source value is equal to the contents of the edit field
>=	Will match if the source value is greater than or equal to the contents of the edit field
<=	Will match if the source value is less than or equal to the contents of the edit field

4.6.2.4.3 Date comparison operators

When configuring comparisons for date values, the following operators are available:

Operator	Description
Before	Will match if the source date is on or before the date set in the date picker field
After	Will match if the source date is on or after the date set in the date picker field

4.6.3 Glossary

A glossary of Tachyon terminology.

4.6.3.1 Tachyon alphabetical glossary

Term	Definition
1E Client	1E Client provides client features and modules for 1E products including Tachyon. It replaces the Tachyon Agent.
Action	An Action is a specific type of instruction that is sent to client devices which can be used to modify the state of the target device. For example, setting a registry key, killing a process, deleting a file. Whereas a Question is an instruction that requests information from the target device, but does not change its state. Generally an Action needs to undergo an approval process before it is sent.
Agent	Agent is the old name for the client. The Agent has been replaced by the 1E Client which provides client features and modules for 1E products including Tachyon.
All Instructions Approver	This is a Tachyon system role which allows assigned users to approve actions for all Instruction Sets . Users can approve unless the action was requested by themselves.
All Instructions Questioner	This is a Tachyon system role which allows assigned users to ask questions and view responses for all Instruction Sets; use custom properties.
All Instructions Viewer	This is a Tachyon system role which allows assigned users to view instructions and responses for all Instruction Sets.
Audit information log	The Audit information log page displays audit information related to installation, permissions, instruction set and consumer related operations carried out using the Explorer and Settings applications. See Audit information log page
Historic Data Capture	The old name for Tachyon Activity Record.

Term	Definition
Agent Language	The Agent language is an interpretive programming language that is executed by the client in the form of an **instruction payload**. Instructions, and their payload, are based on instruction definitions which are stored in the TachyonMaster database. Definitions are uploaded into the database from the Administrator console by dragging and dropping one or more Instruction Definition files, a Product Pack or ZIP file containing Instruction Definition files. The language, called SCALE, uses Agent modules and methods and is documented in the SDK.
Agent Provider	A plug-in component for the 1E Client which communicates with an external component, such as an operating system facility (for example Windows registry) or a service-provider application (for example Content Distribution). 1E Client modules use Providers to get their work done. Examples: WMI provider Registry provider Nomad provider BASH provider
Auto-curation	Auto-curation is a Catalog function and refers to the automated process of creating match rules in 1E Catalog. These match rules are neither created by the customer not by the 1E curation team. The rules are created in the customer's local 1E Catalog copy using automated logic built by 1E.
Background Channel	The Background Channel is a mechanism by which the Tachyon client can download resources via HTTPS without loading the Switch. Since this traffic does not go through the Switch, the client is still able to receive and process instructions instructions while performing these downloads. From v2.0 onwards, the client is able to download resources via Content Distribution. The Background Channel is a web application on the Tachyon Server Website and provides the following:

Term	Definition
	Stores Tachyon content from the Consumer API in the Background Channel for clients to retrieve Responds to clients retrieving Tachyon content from the Background Channel See Tachyon Architecture and Communication Ports.
Client module	A plug-in component for the 1E Client which encapsulates business logic. Modules contain Methods, which can be invoked by SCALE. Modules (and their methods) effectively provide a platform independent API. To that end, Modules and their Methods do not (generally) talk about anything platform specific (Windows, Linux, Android etc). Examples: FileSystem OperatingSystem Network Software
Column filters	Some tables contain a column filter that lets you easily filter the information displayed in the table.**Using column filters**The picture opposite shows an example taken from AppClarity. In our example we want to filter the table to show only those items where the **Edition** contains the text **Prof**.To filter the table on the **Edition** column:Click on the filter iconjust beneath the header row in the **Edition** column.The filter popup is displayed.Now select the operator. In our example this will be **contains**.Then type the text **Prof** into the text field.Click **Apply** and a new filter will be added to the table.The table will be filtered to just those items whose **Edition** contains the text **Prof**.**Adding another filter**You can add another filter by clicking on the filter icon for any of the columns. The picture opposite shows another filter added selecting table rows where the **Type** also contains the text **License**. The table will also be filtered accordingly.**Removing filters**You can remove filters by clicking on the filter close icon at the end of the filter.
Column Picker	**Using column picker**Where the column picker control is shown you can choose which columns are displayed. In the following example on

Term	Definition
	the **Microsoft Core License Demand** page we hide the **Unknown Installs** column and move the **License Demand** column to the left of the page.To pick the displayed columns:Click on the Choose columns iconto the right of the header row to view the visible columns.To exclude **Unknown Installs**, select the Unknown Installs row and click **Exclude columns** button.The **Unknown Installs** column is now hidden.To move the **License Demand** column to the top of the list, hover your mouse over **License Demand** and using the direction control drag it to the top of the list.The Microsoft Core License Demand page has now been automatically updated with our changes.
Column sorts	Some tables contain column sorts that let you easily re-order the information displayed in the table.**Using column sorts**The picture opposite shows an example taken from AppClarity. In our example we want to sort the table on the **Cost** column from the highest cost at the top to the lowest at the bottom. To sort the table on the **Cost** column:Click on the sort iconjust beneath the header row in the **Cost** column.The sort popup is displayed.Now select the sort direction. In our example this will be **Sort descending**.After selecting this the data in the table is now sorted on the **Cost** column from highest to lowest and the sort icon has changed to a sort descending icon**Clearing the sort**You can clear the sort by clicking on the sort icon again and selecting the **Clear sorting** menu item from the sorting popup.
Configuration Manager Extensions	The Configuration Manager Extensions currently include. Configuration Manager Agent emergency stop and resume actions Configuration Manager Agent actions Client Health Check Tachyon Run Instruction utility (used by the each of the above right-click actions to request Tachyon to run an instruction) Tachyon Instruction Runner (a mini UI version of the Tachyon Explorer) This feature is included in the Tachyon Toolkit. Documentation for installing and using the Configuration Manager Extensions will be available soon.
Consumer	A Consumer is any application that connects to and uses the Consumer API. An example is the Explorer application.

Term	Definition
Consumer API	The Consumer API is a documented set of API endpoints provided by a web application on the Tachyon Web Server called Consumer. It is referred to as the Consumer API in order to avoid confusion with Tachyon Consumers, which are 'consumers' of the API. The Consumer API is a web application on the Tachyon Server Website, actually named Consumer, and provides the following: Processes the consumer requests from the Explorer and other Consumers Publishes Tachyon content to the Background Channel Forwards requests for instrumentation data from the Explorer to the Tachyon Instrumentation component Forwards workflow commands from the Explorer to the Tachyon Workflow component See Tachyon Architecture and Communication Ports.
Consumer requests	A Consumer sends requests to the Consumer API.
Coordinator Service	The Coordinator Service has two modules: Instrumentation module Workflow module See Tachyon Architecture and Communication Ports.
Coordinator Instrumentation module	The Coordinator Instrumentation module is part of the Coordinator Service on the Tachyon Server which processes instrumentation data from the following components: Core Coordinator Workflow module Switch And responds to requests for instrumentation data from the Consumer API. See Tachyon Architecture and Communication Ports.

Term	Definition
Coordinator Workflow module	The Coordinator Workflow module is part of the Coordinator Service on the Tachyon Server that provides the following: Forwards workflow commands from the Consumer API to the Core Stores workflow in SQL Connects to remote SMTP to send emails used in the approval process for actions See Tachyon Architecture and Communication Ports.
Core	The Core is a Tachyon Server web component that does the following: Forwards workflow commands from the Coordinator workflow module to the Switch Forwards responses from the Switch to the Responses database (this task requires high throughput) Generates and sends instrumentation data to the Instrumentation service See Tachyon Architecture and Communication Ports.
Core Internal	Core Internal is the part of the Core which allows fast internal communication with the Switch using HTTP instead of HTTPS, restricted to the Switch server's local IP Address only. See Tachyon Architecture and Communication Ports.
Custom Role	Tachyon roles that define which Users have access to which Instruction Set. These roles can be modified in the Administration pages by users assigned to the Full Administrator role.
Custom Properties	Full Administrator can manage the custom properties using the Properties page in Explorer. The only custom property type available after installing the Tachyon server is Coverage tags, further types may be added during installation of other Consumers.

Term	Definition
Device tags	Device tags can be used when setting the coverage for a particular question so that only client devices with a particular tag name and value get the question. The names and values of Device tags must be pre-configured by a Full Administrator before setting them on a client device using Device tag actions. Device tags can also be queried directly by Device tag questions. Device tags were previously known as Coverage tags. In 1E Client log files, Device tags are also referenced as scopable tags. Please also see Freeform tags.

DNS Name	DNS Name FQDN is the term used in this documentation to represent the name of a Tachyon Server. Typically a Tachyon Server will have only one DNS Name, which will be the CNAME or an (A) Host record that uniquely represents a server's IP Address. 1E normally recommends using an CNAME record.
	
	In a Tachyon system, each Tachyon Server will have a DNS Name FQDN.
	
	In a single-Switch installation the Switch is on the same server and uses the same DNS Name. When a Response Stack has more than one Switch, each Switch has its own IP Address, so you can choose if the will share the same DNS Name, or if each will have its own DNS Name. The Tachyon Server certificate must have all
	
	`NAME TYPE VALUE`
	`----------`
	`tachyon.acme.com. CNAME tachyon.acme.local.`
	`tachyon.acme.local. CNAME foo.example.com.`
	`foo.example.com. A 192.0.2.23`
	
	`tachyon.acme.com is an Alias record`
	
	`tachyon.acme.local is a CNAME record`
	
	`foo.example.com is a (A) Host record`

Event Subscription	A type of instruction that can be sent to the client. An Event Subscription tells the client to monitor an arbitrary event source for a period of time (defined by the Instruction's TTL), to capture events as they occur and to report them back via the Switch.

Term	Definition
Guaranteed State application	The Explorer application is the web portal used by users and administrators. It is an example of a Consumer application. **Note** Explorer can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/explorer/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names. It is a web application on the Tachyon Server Website and provides the following: Browser connection providing the Explorer and Administration pages Sends consumer requests to the Consumer API See Tachyon Architecture and Communication Ports.
Filters	There are two kinds of filter: Question filters are used to reduce the responses from the clients; View filters reduce the information displayed in Explorer on the Responses page.
Freeform tags	Freeform tags may be used to set properties on client devices that can subsequently be used in Freeform tag questions. They cannot be used when defining the coverage for a question. Freeform tags can be set with arbitrary names and values that are defined only when running a Freeform tag action. In Tachyon log files, Freeform tags are also known a non-scopable tags. Please also see Device tags.
FQDN	Fully Qualified Domain Name. This is the complete domain name for a specific IP-connected device, and is unique within the network and unambiguous. The FQDN consists of two parts: the hostname and the domain name. For example tachyon.acme.com.
Full Administrator	This is a Tachyon system role which has the combined rights of all the other system roles.

Term	Definition
Group Administrator	This is a Tachyon system role which allows assigned users to create, modify and delete Management groups and modify their membership.
Guaranteed State application	Guaranteed State application is used to ensure endpoint compliance to enterprise IT policies. It is an example of a Consumer application. **Note** Guaranteed State can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/guaranteedstate/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described in DNS Names.
Instruction	Instruction is the generic term used to describe: Questions Actions An Instruction is sent to one or more clients, and will yield one or more responses.
Instruction Definitions	Instruction Definitions are retrieved from the Core by the Switch. They define the type and functionality of the instructions and are used to control the clients to respond in the appropriate way.
Instruction Definition Files	Instruction Definition files are XML format files that contain definitions for Instructions and any associated resources.
Instruction Sets	Instruction Sets provide a way of organizing instructions and setting permissions on those instructions. They can be created, modified and deleted from the Tachyon Administration console.
Instrumentation data	Each of the Tachyon components creates instrumentation data that can be used to display how the Tachyon system is performing.
JSON Provider	This is an internal provider within the Tachyon agent library, used to deserialize and return a JSON string as a data table. Analogous to the Windows specific PowerShell Provider.

Term	Definition
Legacy OS	In this documentation, Windows XP, Vista and Windows Server 2003 are referred to as legacy OS. Microsoft has withdrawn support for Windows XP and Windows Server 2003, but 1E includes Vista in this list because it is not significantly used by business organizations. For details of limitations and additional considerations for these OS, please see Supported Platforms.
License file	1E will provide you with a **Tachyon.lic** license file that defines the applications, tools, and features your Tachyon System is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license. The license must be activated. Once activated, it may be used only by the Tachyon System that activated it. Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable. For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk. For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server. Ensure the following URL is whitelisted: https://license-v1.1e.com This URL must be accessible from the Tachyon Server during setup and running of Tachyon. The Tachyon license must be validated on a regular basis via internet contact with the 1E license service. The regular validation period is set when the license is requested. For whitelisting purposes, the Tachyon Server (specifically the Coordinator Workflow module in the Master Stack) requires an Internet connection to the 1E license service, as defined in the license file itself. If activation fails, then the system will install but not be usable until activation is completed. **Upgrading**

Term	Definition
	When upgrading, you are recommended to get a new license file and update your whitelist with the new URL. The old URL (https://license.1e.com) is suitable only for 8.0 and earlier. However, if you are upgrading and your license file has the old URL then you should also whitelist the old URL.
License Service	The License Service is hosted in the cloud by 1E, and accessible via an internet connection.
Method	Methods are documented in the SDK.
Normalization	Normalization is a Platform function that refers to the process of finding (or not finding) a match rule in 1E Catalog, then deduplicating and rationalizing the information using Platform logic, and publishing the information on the 1E Catalog UI. Partial Matching for example does not have a match rule in 1E Catalog but it's still normalized and published on the UI using Platform logic.
Patch Success application	Patch Success application is used to report on and ensure successful patching of your enterprise. **Note** Patch Success can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/patchsuccess/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names
Permissions	How the Role-Based Access Control feature assigns Users to Roles, providing access to Instruction Sets and Administration pages.
Persistent Storage	The client stores information in Persistent Storage which it needs each time it starts. For example the last processed instruction. A hash value of each item of information is stored in the registry, which the client uses to ensure it trusts each item. Persistent storage includes a local database that is compressed and encrypted in a way that ensures a very low impact on device performance and security. This database is used to store data for the Tachyon Activity Record feature.

Term	Definition
PowerShell Provider	This is a Windows specific internal provider within the Tachyon agent library. It provides functionality to execute powershell.exe from a fixed location (System32\WindowsPowerShell\v1.0) on a PowerShell (.sp1) script and return the result. Some earlier versions of Windows (such as Windows XP) do not support PowerShell.
Product Pack	Product Packs contain instructions or other things which extend the capabilities of Tachyon. Product Packs which are required to support Tachyon features out-of-the-box are provided in the Tachyon Platform zip downloaded from the 1E Support Portal. Other Product Packs are available for download from the 1E Exchange. There are two types of Product Packs described in the following table. **Classic Product Packs**: Classic Product Packs contain instructions (actually Instruction Definition files) for use in Explorer and other Tachyon applications. Classic Product Packs can be uploaded into Tachyon using either of the following methods: Tachyon Product Pack Deployment Tool - which will upload the instructions in the pack and create an Instruction Set for them based on the name of the zip (with hyphens converted into spaces) the Tachyon Portal Settings app→ Instructions → Instruction Sets, described in Instructions Menu. This method requires instructions to be organized into Instruction Sets by an Instruction Set Administrator. Settings can also be used to export instructions.

Term	Definition	
		Either method requires an Instruction Set Administrator to configure permissions for accessing the instructions.
	Integrated Product Packs	Integrated Product Packs contain policies, rules and fragments for use by Guaranteed State, and may also include instructions. If the Integrated Product Pack contains instructions associated with the policies, the tool creates an Instruction Set using the name in its manifest file. Integrated Product Packs are uploaded using the PPDT.
Tachyon Product Pack Deployment Tool	A tool for uploading Classic and Integrated Product Packs. Please see Tachyon Product Pack Deployment Tool.	
Providers	Providers can be used by applications to leverage external tools to perform specific operations. For example the reclaim provider enables software to be uninstalled, thereby extending the functionality of the platform to include uninstallation.	
Question	In Tachyon a Question is a specific type of instruction that requests information from client devices. The information is returned to Tachyon as responses.	
Report Refresh	You can refresh reports from individual AppClarity screens as well as using the Settings App. Where this is available you can do this by using the refresh icon next to the **Last Refreshed** box: 	
Response	The data resulting from a client executing an instruction.	
Role-Based Access Control	Also known as RBAC. This is a general term for assigning users to roles which allow them access specific features of Tachyon.	

Term	Definition
	Roles can be assigned to AD users and groups added in the Administration Security page. A role can be either of the following: System role Custom role
SCALE	The Agent Language.
SDK	The Tachyon SDK describes the following and is available here: /document/preview/736743#UUID-33c212b3-863e-21bc-bc5d-52e41a0492b3 Agent Language (SCALE) Agent modules and methods
Securable	Refers to an item that may be secured by Tachyon using RBAC.
Server installation account	This is the account used to run Tachyon Setup (and the MSI installer) when installing or upgrading a Tachyon Server. The account is automatically defined as a Tachyon admin user with limited rights which cannot be edited (called a system principal). The installation account only has sufficient rights to add other users, assign them to roles, and install Tachyon applications. The users and roles created by the installation account are then used for ongoing use and management of Tachyon. If you need the installation account to have additional roles or be a Full Administrator, then the recommended approach is: First create a role-based AD Security group, and add the installation and other accounts to this group Then, the installation account: Logs into Tachyon and navigates to Settings → Permissions → Users and Groups Creates a new user for the role-based AD Security Group Assigns the relevant system role(s) to the new user - this can be Full Administrator.

Term	Definition
	When installing a Tachyon Server, the account must be an Active Directory domain account with various rights on the Tachyon Server and the SQL Server instance. For more detail see Tachyon Server Installation Account. For a new installation, only the Server installation account is able to use the Explorer and assign user rights to other users and groups. Once these other users or groups have been assigned, then the Server installation account can be optionally disabled in AD pending future updates and upgrades. The Server installation account is a system principal and cannot be deleted or granted additional rights; it is able to manage additional users and groups, create and edit custom roles, which are then used for ongoing use and management of the system. However, the account may be included in any AD security group assigned to a Tachyon system or custom role.
Server instructions	A special type of instruction, which cannot be run in Explorer. They are for internal use only, run on the server, and used to carry out on-demand or scheduled processing of data across various datasources, such as SQL databases. For example, the Dashboards app uses them to populate tiles and charts with data from the TachyonMaster and Experience databases. They are also called server-side instructions, to differentiate them from client-side instructions which run on client devices.
Settings application	Settings application is used to configure Tachyon system and application settings. It is an example of a Tachyon Consumer application. **Note** Settings can be reached directly using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon/App/#/platform/` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names.
Single-Switch installation	A **single-Switch installation** is a type of single-server installation which has only one Switch. This is the simplest Tachyon Server configuration.

Term	Definition
Single-server installation	A **single-server installation** is where all Tachyon Server components are installed on the same Web Server, with one to five Switches, and SQL Server either local or remote. A single-Switch installation is the simplest configuration. More than one Switch requires additional hardware resources. If SQL Server is remote then it is also referred to as a **split-server configuration**. Best performance is achieved using a local SQL Server installation. See Tachyon Architecture and Communication Ports.
SMTP gateway	Systems such as the Tachyon Server connect to the gateway in order to send emails. Also known as SMTP relay.
Switch	The Switch component on the Tachyon Server provides the following: Sends instructions to and retrieves responses from the clients Forwards responses to the Core component Receives workflow commands from the Core component Retrieves instruction definitions from the Core component Sends instrumentation data to the Instrumentation component On the Tachyon Server, the Switch Host service is responsible for managing all the local Switches The Switch configuration is stored in the SwitchConfiguration table of the TachyonMaster database. This includes the number of slots and workers used by the Switch which controls the maximum number of devices that can be managed by each Switch. A Switch restart will fail if the Switch failed to de-register itself, therefore the registration entry in the TachyonMaster database will need to be manually removed after troubleshooting. See Tachyon Architecture and Communication Ports.
Switch Host	The Switch Host service is a Windows service that manages local Switches

Term	Definition
	automatically starts each Switch and if a Switch stops, the Switch Host analyses the reason and attempt to restart it has a configuration file contains entries for one or more Switches has its own log file See Tachyon Architecture and Communication Ports.
System Principal	A system principal is a Tachyon user which cannot be modified in the Administration pages, and is assigned to a system role. The Server installation account is a system principal which is assigned to the Consumer Administrator, Security Administrator and Instruction Set Administrator system roles.
System Role	Tachyon roles which cannot be modified in the Administration pages. Tachyon users can be assigned to these roles. For more information about System and Custom roles, please refer to Roles and Securables. The following are built-in system roles. All Instructions Actioner All Instructions Approver All Instructions Questioner All Instructions Viewer Full Administrator Group Administrator Guaranteed State Administrator Guaranteed State Policy Assigner Guaranteed State User Installer Inventory Administrator Inventory User Tachyon System

Term	Definition
Tachyon Activity Record	This is a client feature, also known as inventory, previously known as Historic Data Capture. This feature captures data from a number of sources on the client device, encrypts and stores in compressed form on the client device. Raw and summarized (aggregated) data is stored and can be queried using instructions. See Tachyon client settings.
Tachyon client	Client features are provided by the 1E Client. The 1E Client includes client features and modules for other 1E products including Tachyon. Tachyon enables rapid response to instructions using the client, which supports the retrieval of information, running actions and device tagging. The client can also be extended to support additional features. The client connects to the Switch and the Background Channel. See Tachyon Architecture and Communication Ports.
Tachyon content	Tachyon content is: files (such as scripts) associated with a particular instruction via their which the client will download when it performs that instruction. extensibles (normally in the form of DLLs on Windows), which the client will download when it self-updates. This allows additional client functionality to be deployed. Tachyon content is downloaded on demand via the Background Channel.
1E Exchange	The 1E Exchange is a community platform and library of automation modules (Product Packs) for systems management created by 1E. Our goal for this community is to democratize the development and optimization of automation processes to simplify work. Leveraging SCALE, Tachyon's native language, and the Tachyon Platform we wish to grow into a community that builds powerful modules to serve each other's needs. https://tachyonexchange.1e.com/ You can browse the 1E Exchange but you will need a 1E Support login to download.

Term	Definition
Tachyon Instruction Management Studio (TIMS)	This feature is included in the Tachyon Toolkit. TIMS provides a user interface for developing and testing instructions using SCALE. It includes an isolated copy of the 1E Client so that you can develop instructions for that client version, independent of the 1E Client version that may be installed on your computer. By default TIMS and its Tachyon client run under the security context of the user that started it. To use the context of **Local System**, as used by a normal Tachyon client, you can start TIMS using PSexec. More information about TIMS is available in the Tachyon Community on the 1E Support Portal. TIMS should be used to edit and save Instruction Definition files.
Tachyon Instruction Runner	This feature is the graphical user interface part of the Configuration Manager Extensions which is included in the Tachyon Toolkit. It is a mini UI version of Explorer. It is an example of a Tachyon Consumer. It should not to be confused with the Tachyon Run Instruction utility available in the Tachyon Toolkit.
TachyonMaster database	The SQL Server database which contains: Configuration details of the Tachyon System instruction definitions and Instruction Sets Users (Principals) Permissions Roles Devices Audit log The configuration files for the following components contain SQL Connection strings for the TachyonMaster database. Core

Term	Definition
	Coordinator Workflow module Consumer API
Tachyon Master Stack	A Tachyon Master Stack is part of a Tachyon System. There is one Tachyon Master Stack that all the Tachyon Response Stacks communicate with. A Tachyon Master Stack contains the following components: SQL Server instance with TachyonMaster Database (local or remote/split) Consumer API Coordinator Explorer Authentication Registration
Tachyon Portal	The Tachyon Portal is the home page for Tachyon applications, which can be reached using the following URL: `https://<tachyon DNS Name FQDN>/Tachyon` where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names. The following buttons appear on all application pages of the Tachyon Portal. The refresh button is used to refresh the contents of the page. The expand button toggles the size of the page inside the browser by hiding or showing the menu and main title bar.

Term	Definition
TachyonResponses database	The SQL Server database which contains: Responses
Tachyon Response Stacks	A Response Stack is part of a Tachyon System. This is where one or more Response Stacks talk back to a single Tachyon Master Stack. Multiple Response Stacks are necessary when additional Switches are required for scale, security or for geographic or other network reasons. Each Switch can handle 50000 devices, so each Response Stack can handle a maximum of 250000 devices. Each Response Stack has the following components: Switch Host Switches (up to 5, local or remote/split) Core SQL Server instance with Tachyon Responses database (local or remote/split) Background Channel A Response Stack will typically host Switches and Background Channel using the same DNS Alias.
Tachyon Role	Tachyon roles are used to implement Role-base access control (RBAC) and assign permissions to users and restrict access to areas of Explorer and ability to use instructions in Instruction Sets .The roles may be system roles or custom roles related to specific Instruction Sets .
Tachyon Run Instruction utility	This command-line utility is included in the Tachyon Toolkit and is targeted at 3rd party integration, and can be used by scripts. It is an example of a Tachyon Consumer. It is used by the Configuration Manager Extensions which is also available in the Tachyon Toolkit. More information about the Tachyon Run Instruction utility is available in the Tachyon Community on the 1E Support Portal.

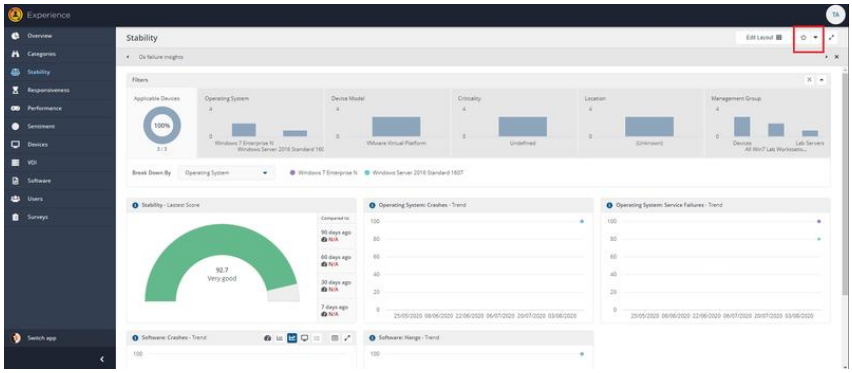
Term	Definition
Tachyon Server	A Tachyon Server is any server on which a Tachyon Server component is installed. The following are Tachyon Server components. Coordinator service (Instrumentation and Workflow modules) Switch Host Switches Website (including Explorer and Core) A Tachyon Server can have one or more Switches. See also single-server installation and single-Switch installation. See Tachyon Architecture and Communication Ports.
Tachyon Stack	There are two types of Stack: Master Stack and Response Stack. Every Tachyon system has a single **Master Stack**, which provides web services for Tachyon applications. Master Stack components are typically all installed on a single **Master Server**. Tachyon real-time features require **Response Stacks**, which are made up of one or more **Response Servers**. A **DMZ Server** is an example of a Response Server. Each Response Stack has at least one **Background Channel** for sharing resources, and a single **Core** component that supports an associated set of up to five **Switches**. Switches are the primary mechanism for rapidly requesting and retrieving responses from the **clients**. As each Switch can handle up to 50,000 devices there is a limit of 250,000 devices per Response Stack. Higher numbers can be achieved if you contact 1E for guidance. Switches may be local or remote to the other components in the Response Stack. **Databases** for Tachyon, Catalog, Content Distribution, Experience, SLA and BI, are installed on SQL Server database instance(s) that may also be local or remote to their respective Master and Response servers. It is also possible for multiple Response Stacks to share the same Responses database. The **Cube** used by Patch Success (SLA-BI) is installed on a local or remote SQL Server Analysis Services (SSAS) instance. For more details about architecture and components, please see Tachyon Architecture. Also see Architectural requirements.

Term	Definition
Tachyon System	At the top-most level, a Tachyon System consists of Tachyon Server components, grouped into Tachyon Stacks, and a set of clients that are deployed onto the devices that you want to manage. In addition, a system can have one or more Consumers (the built-in Consumer is Explorer). See Tachyon Architecture and Communication Ports. Tachyon System is also a system role, used by Tachyon for service an equivalent account to perform Tachyon system operations.
Tachyon Toolkit	The Tachyon Toolkit is a collection of the following tools, which can be installed on a Windows computer for use by a User who has appropriate permissions. Configuration Manager Extensions - this can be installed only on a computer that has already installed a Supported Platforms Tachyon Instruction Management Studio. .Tachyon Run Instruction utility The toolkit is available for download from the Tachyon Community in the 1E Support Portal. Documentation for installing and using the Toolkit will be available soon.
Tachyon User	A domain account that is authorized to access Explorer portal and/or the Tachyon Administration pages. Authorization is achieved by adding the AD account or group and assigning it to a role.
Tags	There are two types of tag: coverage tags and freeform tags. In Tachyon log files, these tags are also known a scopable and non-scopable tags.
Two-factor authentication	Also known as 2FA. See Two-factor authentication.
Website	The Tachyon Website hosts the following web applications:

Term	Definition
	Master: Admin Consumer - Consumer API CoreExternal Platform Tachyon Response and DMZ: Background - Background Channel Core Optional applications on Master: ContentDistrbution Experience The Website has an HTTP binding and HTTPS binding. The HTTP binding uses the server's hostname FQDN as a host header, and is used only by SLA components - please refer to Removing the HTTP binding from the Tachyon website One or more HTTPS bindings - these use the Tachyon Web Server certificate, the server's DNS Alias as the host name, and has SNI enabled. See Tachyon Architecture and Communication Ports.
Workflow commands	Workflow commands determine how the Coordinator Workflow module processes an instruction, particularly in terms of the permissions required to run the instruction.

5 Tachyon Experience

Tachyon Experience helps you visualize your end-users' experience of IT service delivery across your enterprise.



5.1 Introducing Tachyon Experience

Tachyon Experience helps you visualize your end-users' experience of IT service delivery across your enterprise. It is centered around the experience score, which is based on metrics covering four categories:

Stability - derived from the frequency of operating system and software crashes, hangs and service failures.

Responsiveness - based on the speed of operating system startup, system resource creation and availability.

Performance - a weighted indication of load and throughput for device processor, memory and disk resources.

Sentiment - an aggregated measurement of users feelings or opinions of their device's performance, stability and responsiveness based on user surveys.

5.1.1 Tachyon Experience Features

5.1.1.1 The Tachyon Experience Overview page

This page shows a dashboard of the Experience score.

> **Note**
>
> For more information on the **Overview** page please refer to:

Overview page.

5.1.1.2 Categories page

The Categories page shows a dashboard of the Stability, Responsiveness, Performance and Sentiment scores.

> **Note**
>
> For more information on the **Categories page** please refer to:

Categories page

5.1.1.3 Stability page

The Stability page shows a dashboard of the Stability score.

Note

For more information on the **Stability page** please refer to:

Stability page.

5.1.1.4 Responsiveness page

The Responsiveness page shows a dashboard of the Responsiveness score.

Note

For more information on the **Responsiveness page** please refer to:

Responsiveness page.

5.1.1.5 Performance page

The Performance page shows a dashboard of the Performance score.

Note

For more information on the **Performance page** please refer to:

Performance page.

5.1.1.6 Sentiment page

The Sentiment page shows a dashboard of the Sentiment score.

Note

For more information on the **Sentiment page** please refer to:

Sentiment page

5.1.1.7 Devices page

The Devices page lists all the devices that are reporting into Experience.

Note

For more information on the **Devices page** please refer to:

Devices page.

5.1.1.8 Software page

The Software page shows all the software titles that are installed in the entire environment.

Note

For more information on the **Software page** please refer to:

Software page.

5.1.1.9 Users page

The Users page shows metric data for the users in the entire environment.

Note

For more information on the **Users page** please refer to:

Users page

5.1.1.10 Surveys page

The Surveys page shows all the surveys created in the entire environment, and allows for surveys to be created, cloned, deleted, enabled, disabled, and assigned to management groups.

Note

For more information on the **Surveys page** please refer to:

User Engagement page.

5.1.1.11 Filters bar

The Filters bar is at the top of each page and is used to change the view of the tiles on that page.

Note

For more information on the **Filters bar** please refer to:

Filters.

5.1.1.12 Tile buttons

There are a set of Tile Buttons on the Stability, Responsiveness, and Performance pages, they can be used to show different views on the tiles or open other windows for details.

Note

For more information on the **Tile Buttons** please refer to:

Tile Buttons.

5.2 Implementing Tachyon Experience

Everything you need to know about getting Experience installed and running in your network. This section is structured in a way that leads you through the three phases of a typical implementation project.

Design, including requirements

Install

Verify.

5.2.1 Requirements

What you will need to prepare in advance of implementing a Tachyon Server in your network. Typically, these are tasks that may take some time to organize, depending on how your organization works.

You will already have installed Experience using Tachyon Setup. To do this, you required the following:

A full installation of Tachyon including deployments of clients

Experience must be a licensed and enabled consumer

Guaranteed State must be a licensed and enabled consumer

The Inventory module of the 1E Client must be enabled on the devices.

> **Note**
>
> Experience and Guaranteed State do not need to be licensed to install Experience, but they must be licensed to use Experience. See Tachyon License file details.
>
> Guaranteed State does not need to be configured to install or enable Experience, nor do any **Guaranteed State policies** need to be created. For customers that are not using Guaranteed State in their environment, the **Deploy** button in Guaranteed State must be clicked one time to allow **Experience policies** to be deployed and enabled on the devices.
>
> **Note**
>
> Experience does not require SQL Server Analysis Server (SSAS) because it no longer uses a Cube. It continues to require SQL Server for its database.

5.2.1.1 Supported Platforms

Please refer to:

Planning for Tachyon

Planning for 1E Client.

5.2.1.2 Active Directory and Tachyon users

A **domain account** or **security group** that is a **Tachyon user** is required with the following Tachyon roles applied, depending on what you want to do with Experience.

To use Experience, you must assign the role:

Experience Viewers

To view Experience Surveys and Survey responses you must additionally assign the role:

Survey Viewer

To create Surveys, you must additionally assign the following roles:

Event Subscription Administrators

Event Subscription Viewers

Survey Administrators (also includes the Survey Viewer role).

To initially deploy a policy to clients so that they report information back to Experience you must assign the role:

Guaranteed State Administrators.

These roles do not have to be assigned to the same Tachyon user. Enabling (deploying) Experience policies in Guaranteed State is a one-time task that should be performed before using Experience, please refer to Installing Experience for more information.

5.2.1.3 Tachyon License details for Experience

Ensure your Tachyon License file has the Experience consumer enabled. Please contact 1E in order to obtain a license for Tachyon Experience.

You can view your Tachyon license details using either of the following methods:

in the Tachyon Portal, navigate to **Settings→Configuration→License information**, look in the **Products** section and expand **Features** and instructions items

in the license file **Tachyon.lic** found in **C:\ProgramData\1E\Licensing**

If this section does not exist, then the Experience application will not be installed during the Tachyon installation. You may have an old version of Tachyon, or your license needs to be updated.

```
</Feature>
     <Feature name="Experience">
       <Consumer name="Experience" enable="on"> </Consumer>
```

5.2.2 Installing Experience

Warning

You should select to install Experience at the same time as installing Tachyon, even if your license file does not include Experience. As the only way to install it post-Tachyon installation is to uninstall and then re-install your Tachyon system.

Without a license present, after installation, the Experience application will be installed but not visible in the Tachyon Portal. When you get and activate a new Tachyon License file with Experience included, Experience will then become visible in the Tachyon Portal.

Note

Tachyon Experience is only for Windows Devices.

Tachyon Setup automatically configures Experience, as long as your Tachyon license file enables Experience.

After the installation of Tachyon is complete you will need to add at least one user in Tachyon to the **Experience Viewers** role.

5.2.2.1 Installing Tachyon Experience

Tachyon Experience is an application installed using Tachyon Setup. Please refer to Tachyon Setup for more details.

5.2.2.2 Post-Installation

Experience deploys the following types of policies:

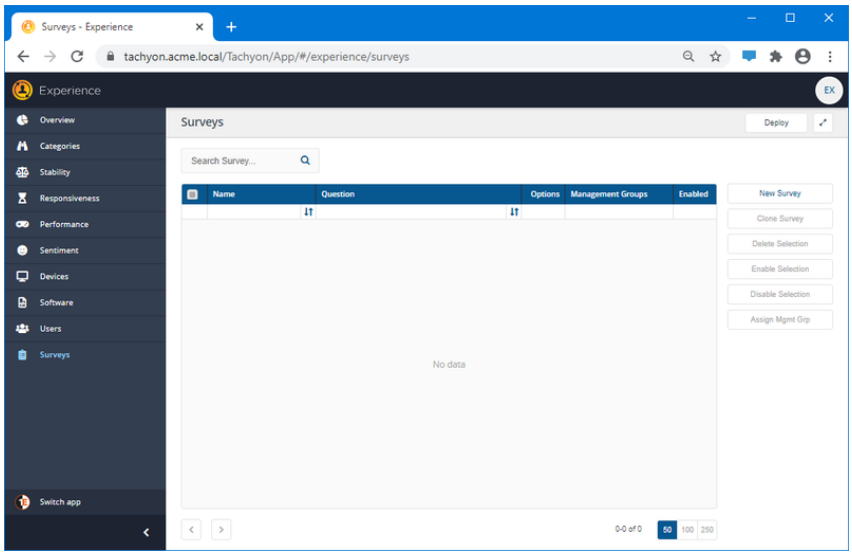
Metrics - these are built-in, and cover Stability, Responsiveness, Performance and Sentiment categories

Surveys - these are optional User Sentiment and General Purpose surveys

To kick start gathering metrics, you must deploy Experience policies.

Open Experience as a user with the **Survey Administrators** role, navigate to the **Surveys** page, and click the **Deploy** button, even if you are not intending to implement any Surveys in your environment, or you have not deployed 1E Client.

This step only needs to be done once. This will use the default **All Devices** Management Group and send the Experience policies to all devices that are reporting into Tachyon. In this release of Experience there is no ability to exclude any devices and may deploy the policies to mission critical devices, including servers.



5.2.3 Verifying

Basic verification tests that cover a single-server installation of Tachyon Server. These tests only cover Tachyon and do not verify the configuration of 1E client modules with other 1E products.

Note

> Please ensure you complete all verification tests. They not only confirm your system is operational, but they also introduce you to concepts and tasks that you will use later when using Tachyon.

These tests should be run in series. They start with basic server checks, then testing 1E Clients, and finally, use the verification instructions from the **1E-TachyonPlatform** product pack to do end-to-end tests that confirm all components are working. Depending on the decisions you have made during the design phase of your implementation, you may need additional tests to verify your Tachyon implementation.

To run these tests, you need:

Tachyon Server installed with Tachyon Experience configured.

At least one test device on which the 1E Client has been installed.

The Tachyon platform has already been verified following the Verifying page which requires a Tachyon User with various administration rights.

Access to the SQL Server database instance and SQL Server Analysis Services instance to check the Experience database.

To complete the test below requires a Tachyon User assigned to **Experience Administrators** role.

5.2.3.1 Verify Tachyon and Experience installation

Ref	Test	Expected	Remediation
TCNE01	Check the configuration of the Experience Consumer	In **Settings - Configuration - Consumers** **Experience** should be licensed and Enabled	Check your **Tachyon** License file for the Experience consumer **Enable = on**. If this is not present or not enabled, contact SalesOps@1E.com for a new license file.
TCNE02	Check the TachyonExperience Database	Open **SQL Management Studio**. Connect to the *Database Engine* and expand Databases - TachyonExperience should be listed.	

5.3 Using Tachyon Experience

Tachyon Experience helps you visualize your end-users' experience of IT service delivery across your enterprise.

It is centered around the experience score, which is based on metrics that cover four categories:

Stability - derived from the frequency of operating system and software crashes, hangs and service failures.

Responsiveness - based on the speed of operating system startup, system resource creation and availability.

Performance - a weighted indication of load and throughput for device processor, memory and disk resources.

Sentiment - an aggregated measurement of users feelings or opinions of their device's performance, stability and responsiveness based on user surveys.

> **Note**
>
> Experience can be reached directly using the following URL:
>
> `https://<Tachyon DNS Name FQDN>/Tachyon/App/#/Experience`
>
> where <Tachyon DNS Name FQDN> is the one set up during the preparation phase, as described in DNS Names.

5.3.1 Personas

Tachyon Experience was built with the following three personas in mind, these personas are an example of typical users:

End User Computing Manager (EUC Manager)

Level 1/Level 2 Service Desk Analysts

Level 3 Service Desk Analysts.

The pages in the Using Experience section show the different ways that each of these personas use Experience to achieve specific goals related to their role.

5.3.2 Monitoring and investigating enterprise-wide experience

This scenario outlines a typical day for an **end-user computing (EUC) manager**. It shows how they use Tachyon Experience to monitor their overall Experience score, drill-down to view details and finally pinpoint the devices with the worst scores - so they can take action to improve their end-users' experience.

5.3.2.1 A typical day for the EUC Manager

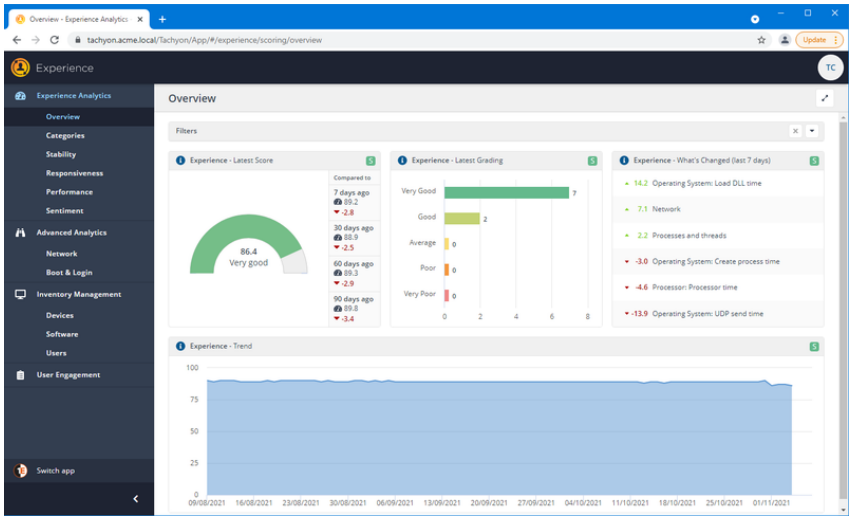
The EUC Manager is concerned with how the network performs for their end-users. They are constantly looking to improve stability, responsiveness and performance so that their end users are happier with the IT Service they receive.

5.3.2.1.1 Looking at the Experience Overview page

To start their day, the EUC manager loads up their Experience application and looks at the **Overview** page. Here they check the latest Experience score to see how their network is doing overall right now. The score of **86.4** is looking good, but is there anything more they can do to improve service? Checking the **Compared to** section of the **Experience Latest Score** tile, they can

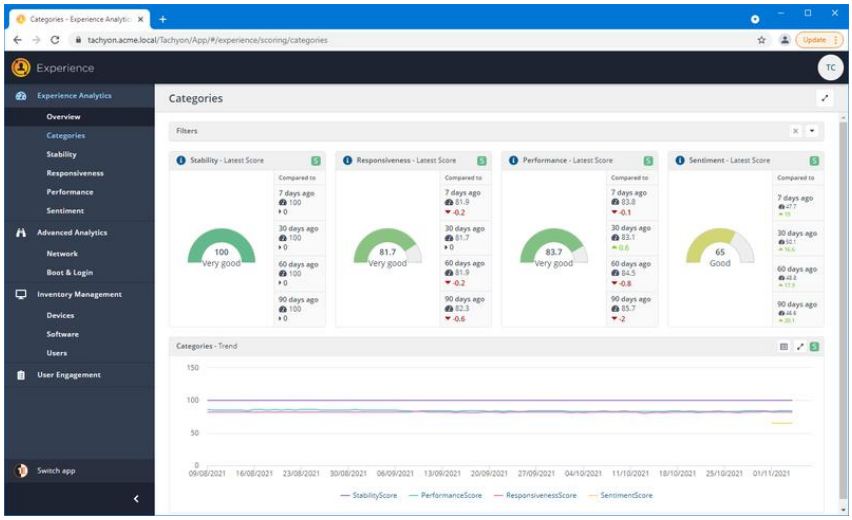
see that in general the Latest Score is moderately down against the results from 7, 30, 60 and 90 days ago. The EUC manager is interested in how the scores changed, particularly if the scores are decreasing - since this may be indicative of a problem that needs action.

So is there anything in the makeup of the latest Experience score that merits investigation?



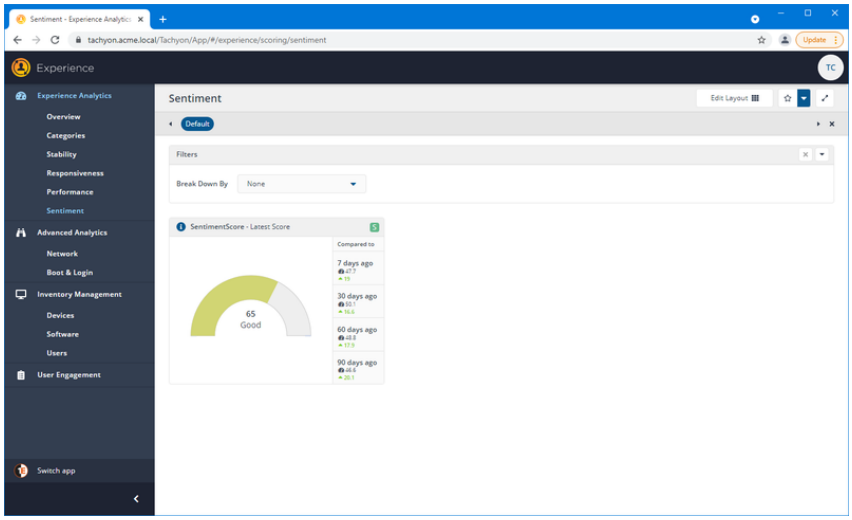
5.3.2.1.2 Looking at the constituent scores

Clicking on the **Experience - Latest Score** tile drills down to display the constituent scores on the **Categories** page. Here the EUC manager checks the **Stability**, **Responsiveness**, **Performance** and **Sentiment** scores. Scanning across, the **Sentiment - Latest Score** of **65** is good, but lower than the others. The comparisons with 7, 30, 60 and 90 days ago shows there has been an overall improvement - but the fact that the score is the lowest, is there still an issue that may be affecting end-user sentiment?



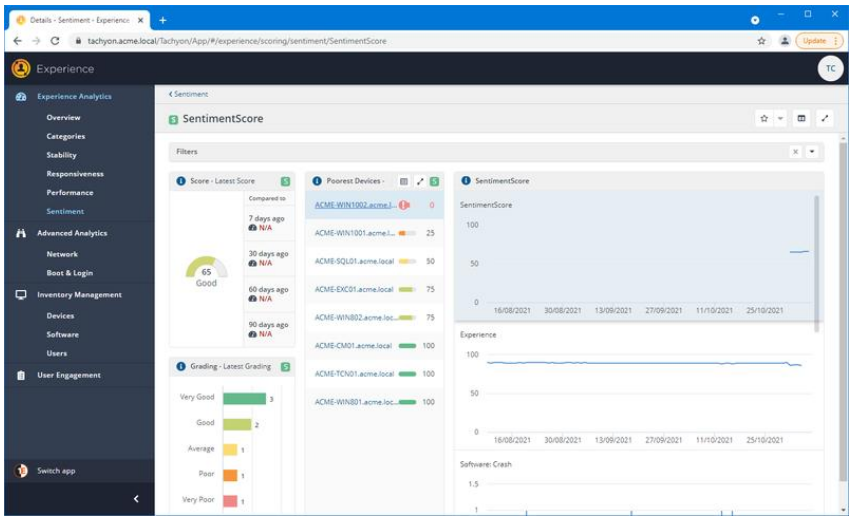
5.3.2.1.3 Investigating Sentiment

Clicking on the **Sentiment - Latest Score** tile drills down to the **Sentiment** page, here the EUC manager can drill down again by clicking on the same tile.



5.3.2.1.4 Reviewing the Poorest Devices

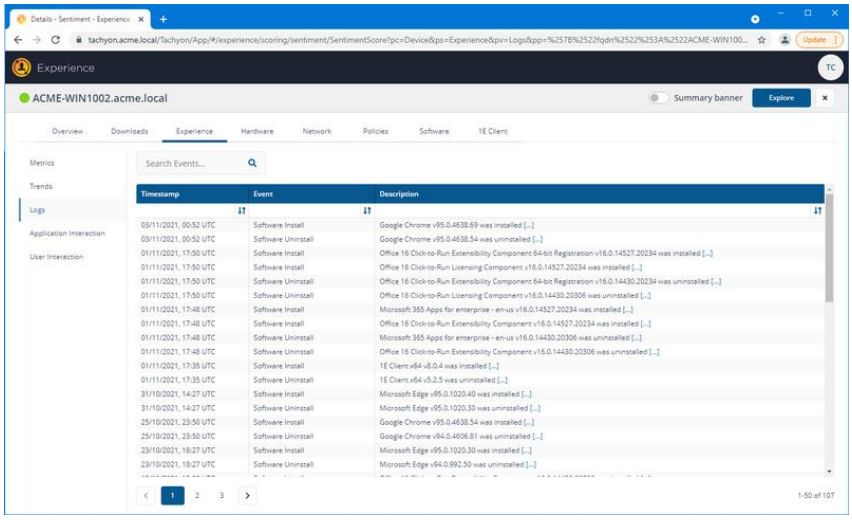
On the **Sentiment** page, the EUC manager scans the **Poorest Devices** tile. The items in the **Poorest Devices** tile are ordered from the poorest to the best performance. They see that the topmost item seems to have a much lower score than the others, so they decide to take a closer look.



5.3.2.1.5 Zooming in on the lowest score

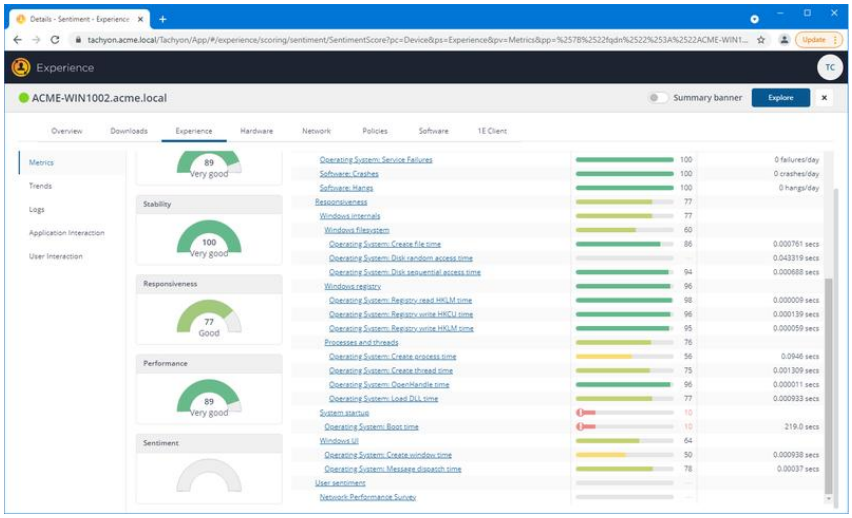
Clicking on the name link for the device in the **Poorest Devices** tile, displays the **Device Details** for the selected device. This view displays information for the device that is derived from all the Tachyon applications you are licensed for, as well as displaying real-time information that is gathered immediately from the device. This information is gathered by instructions that are automatically triggered when displaying a tab or chart and show you the current status for the device.

When navigating from the **Poorest Devices** tile, **Device Details** initially opens on the **Logs** panel, as seen in the picture. Here, the EUC manager can view information about the device that is retrieved from the device logs.



5.3.2.1.6 Investigating the Metrics for a particular device

Clicking on the **Metrics** table the EUC manager scrolls down and sees that there are issues reported for the device related to the **System** startup, specifically the **Operating System Boot time** - where the score is only **10**. They can also see that this is affecting the **User sentiment** for the device. At this point they could click the **Explore** button and investigate the issue further using Tachyon's real-time system, or assign the task to one of their IT team. Whichever they choose, they are now ready to take action.



5.3.3 Focusing on specific device experience

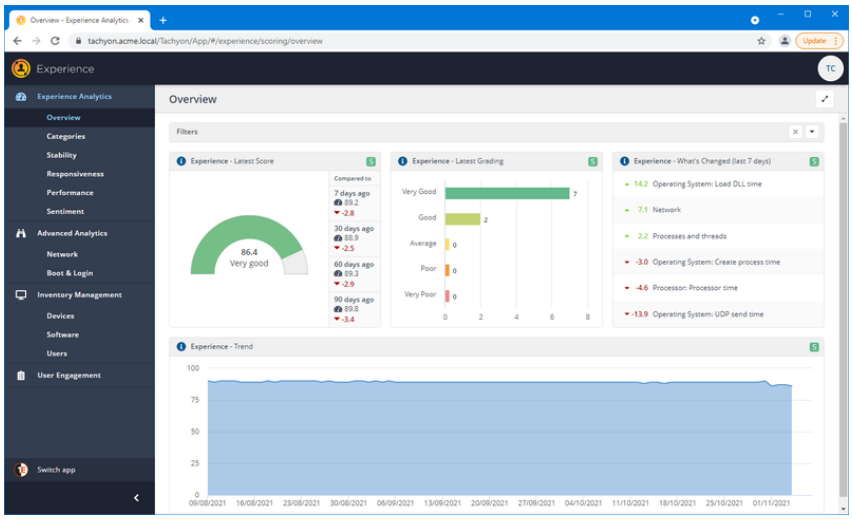
In this scenario we show how a **level 1 helpdesk analyst** would use Experience and Explorer together as part of their daily routine. A level 1 helpdesk analyst usually focuses on a specific device at any particular time. Here the user of a device is on the phone with the analyst describing the symptoms. Experience will enable the analyst to troubleshoot primary causes, and Explorer will let them interact directly with the device to further investigate and resolve the issue.

5.3.3.1 A case for the level 1 helpdesk analyst

An end-user, **Gary Hayes**, calls the IT helpline, gets put through to the level 1 helpdesk analyst, and reports that their device is running slowly.

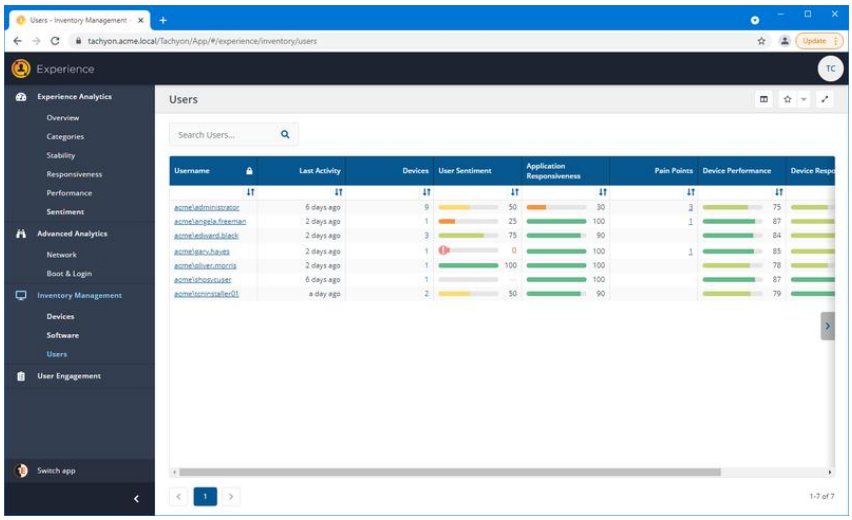
5.3.3.1.1 Tracking down the issues in real-time

While the user is on the phone, the Level 1 helpdesk analyst checks the **Experience** tab they have open in their browser.



5.3.3.1.2 Getting information via the Users page

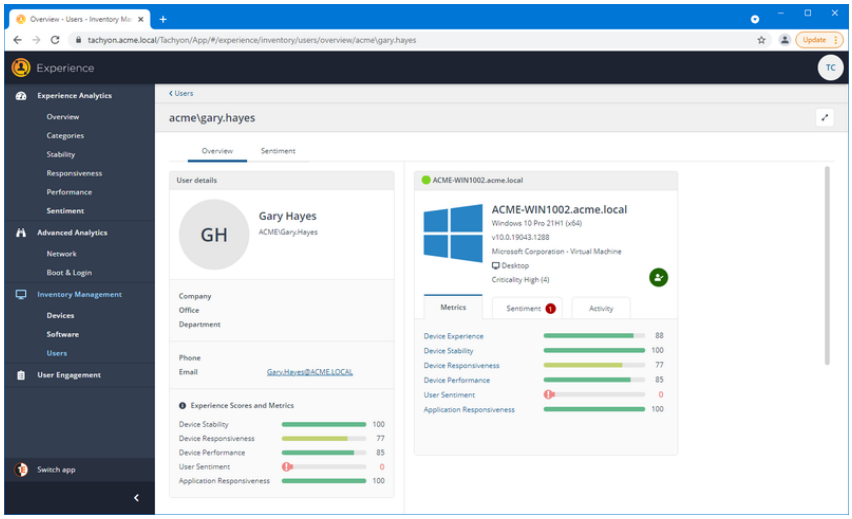
They navigate to the **Experience→Inventory Management→Users** page, which provides an overview of all the users currently known to Tachyon. To check the device the user is working on, they click on their link in the **Username** column.



5.3.3.1.3 Information on the devices associated with the user

The user's page shows all the devices known to be associated with the user by Tachyon. In this example it shows that **Gary Hayes** is associated with the device **ACME-WIN1002.acme.local**. The

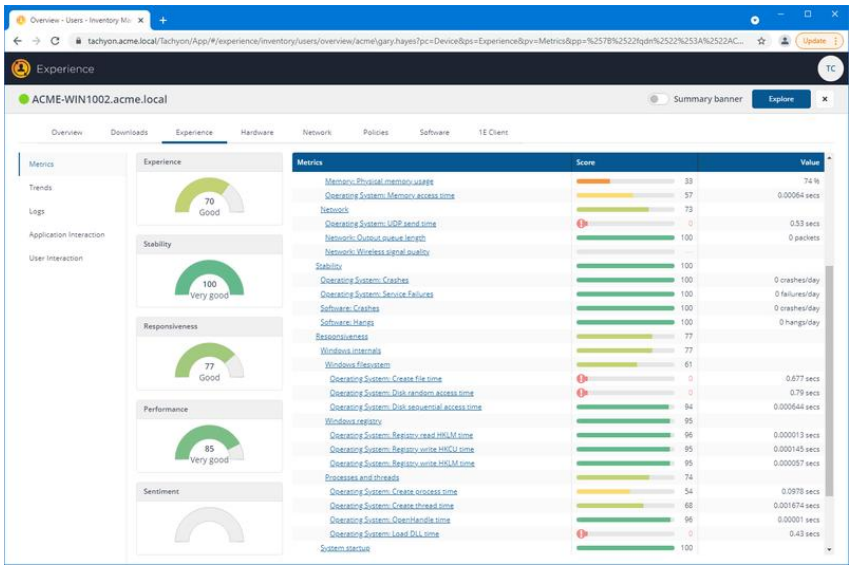
analyst can also see that this user has given some negative **User Sentiment** feedback on this device.



5.3.3.1.4 Investigating the device

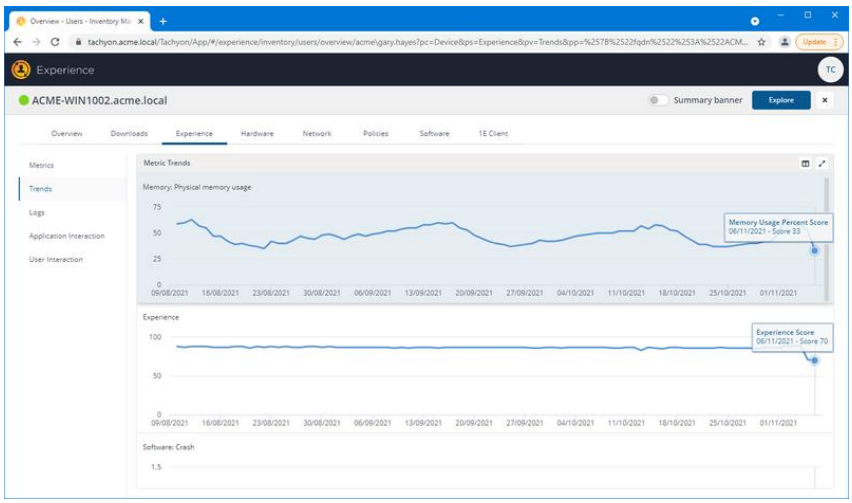
Clicking on the panel for the device shows its **Device View**. Here on the left of the pane you can see the summaries for the device's overall **Experience**, **Stability**, **Responsiveness**, **Performance** and **Sentiment** scores. On the right, you can see the **Metrics** that have been captured for the device.

Scrolling down through the metrics the analyst can see critical values for the **Operating System: UDP send time**, **Operating System: Create file time**, **Operating System: Disk random access time**, and **Operating System: Load DLL time** metrics. The **Memory: Physical memory usage** metric also has a low score, perhaps there's a memory related issue that is causing the other issues and slowing the device down.



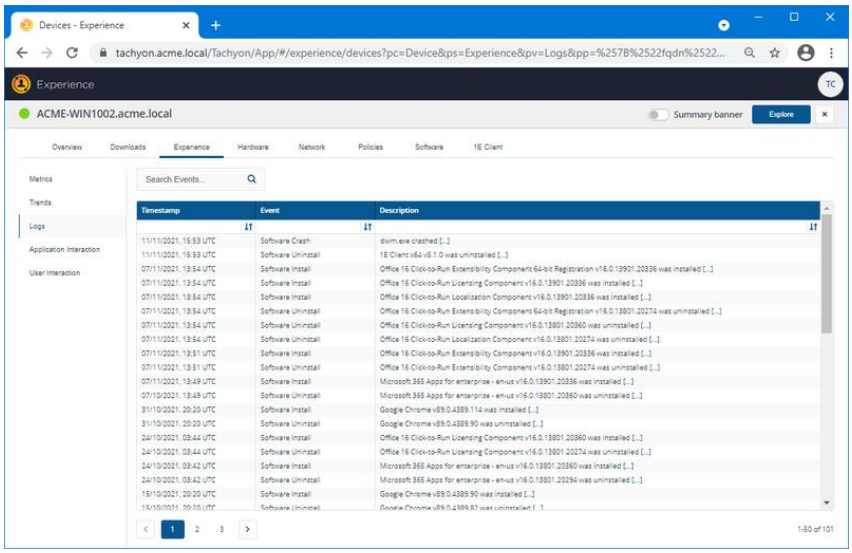
5.3.3.1.5 Memory usage trends, a possible cause?

Clicking on the link for the metric drills down show to show the **Trends** for that parameter. Here, the analyst can see that the general trend (even though the measurement has only been taken for just a few days) is headed downwards. So could be worth investigating more, the analyst makes a note and continues investigating.



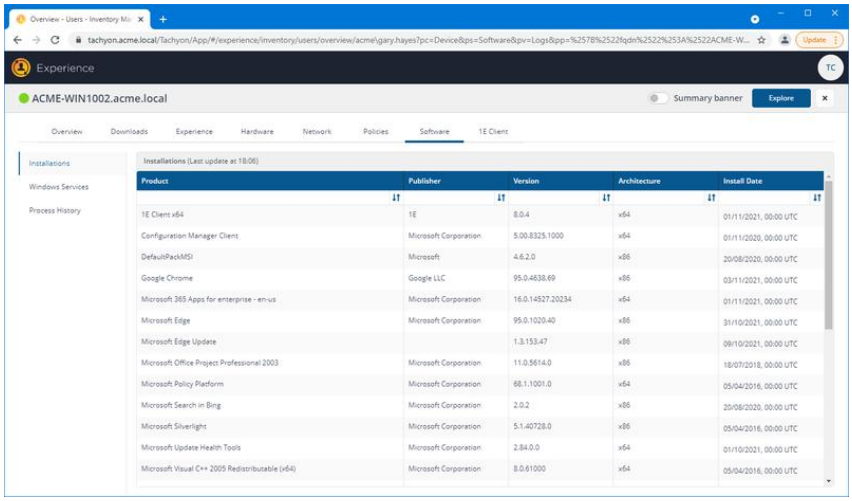
5.3.3.1.6 Checking the Event log

Clicking on the **Logs** tab displays any significant events that have been stored in the Event log on the device. In this example, the analyst can see that there's been one crash - which might or might not be significant, but worth noticing at least.



5.3.3.1.7 Checking the Software installed on the device

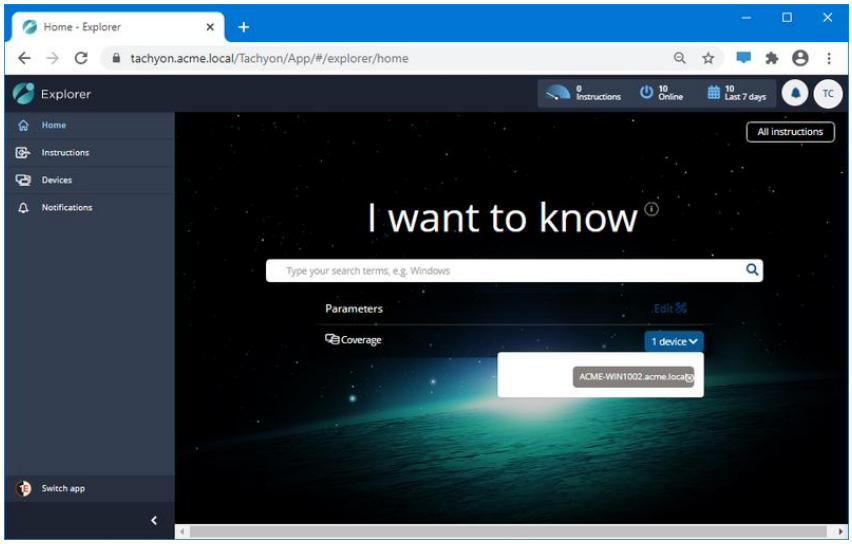
Clicking on the **Software** tab displays all the software reported as being installed on the device. This may be useful information in general, but doesn't show anything out of the ordinary as far as the analyst can tell.



5.3.3.1.8 Further investigating the device using Explorer

Having reviewed all the information retrieved for the device by the 1E Client, a reasonable next step for the analyst is to query the device directly to get some extra info that's not captured by default. They have an idea that memory issues might be causing the slowdown and something they would like to check is what processes are running on the device.

Clicking on the **Explore** button in the **Device View** navigates to the Explorer application, assuming that the analyst has the required Questioner and Actioner permissions. In the Explorer application the analyst can confirm that the Coverage for the question is constrained to the **ACME-WIN1002** device. This means that the instruction they select will be run on that target device.

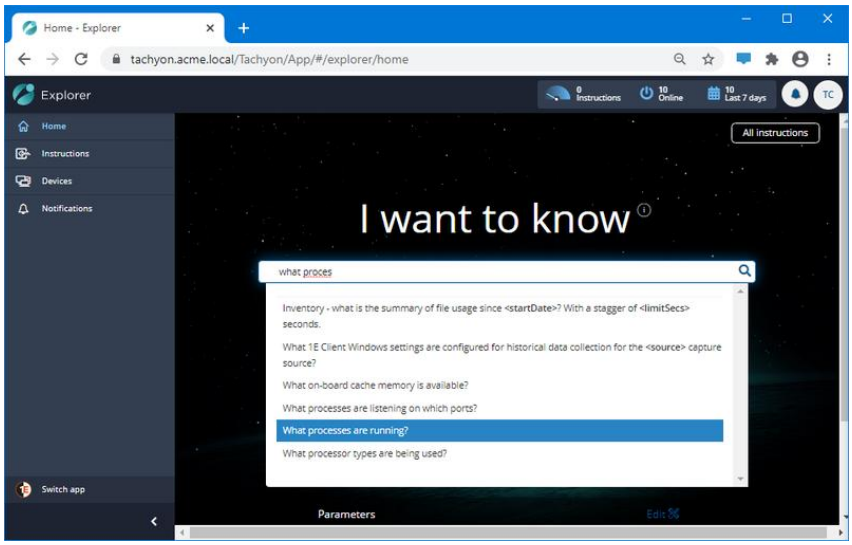


5.3.3.1.9 Finding out what processes are running on the device

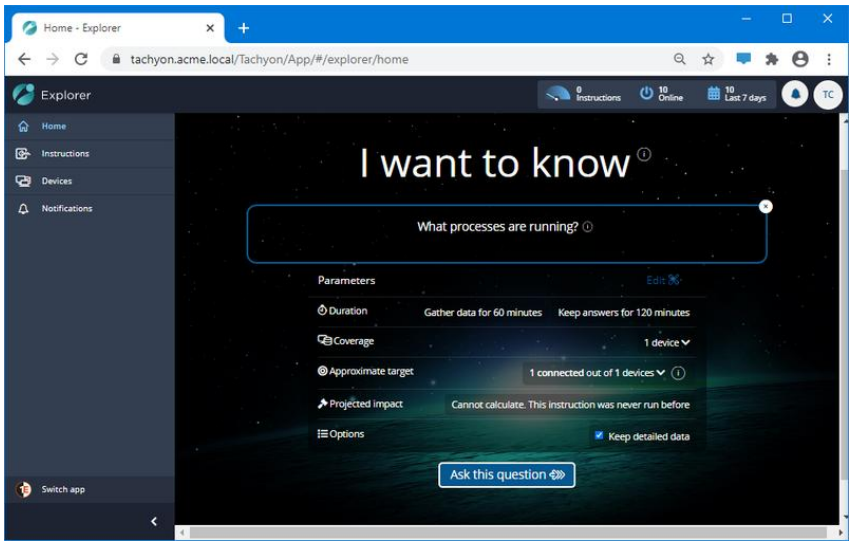
The analyst starts typing **What proces** into the search field, as they know that's involved in the instruction text. They could have typed **process** or **processes** if they were less sure and just wanted to find all the instructions related to processes.

When the list of suggested matches comes back the analyst selects: **What processes are running?**

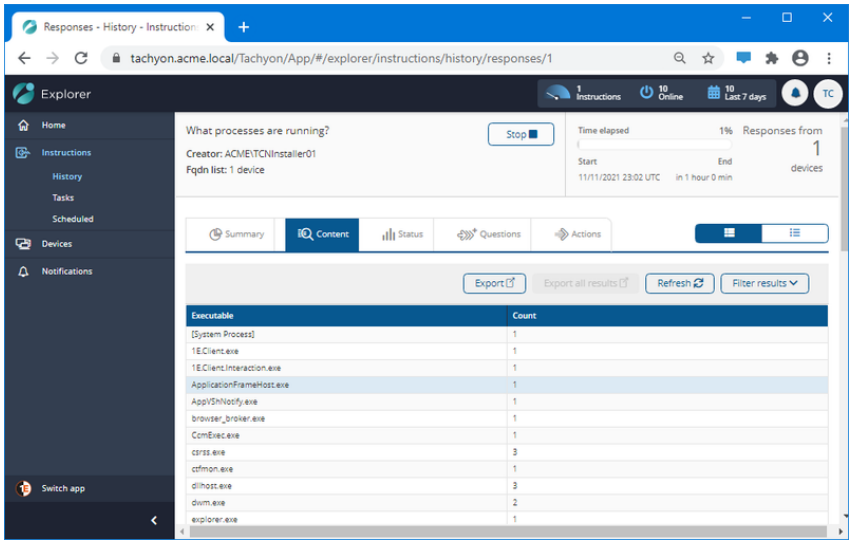
There is also a useful product pack on the Tachyon Exchange called: Windows Process Management which includes instructions to give a verbose listing of all running processes (List running process details) and another is List resource consumption details to identify what is impacting the end-user experience.



The instruction is loaded into the Explorer home. All the analyst needs to do is click **Ask this question** to fire it off to the selected device.

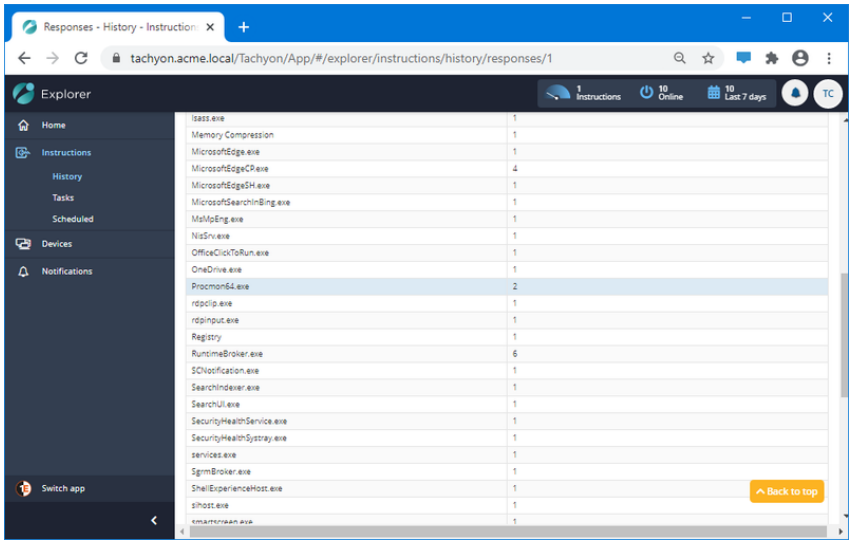


The list of running processes comes back almost immediately.



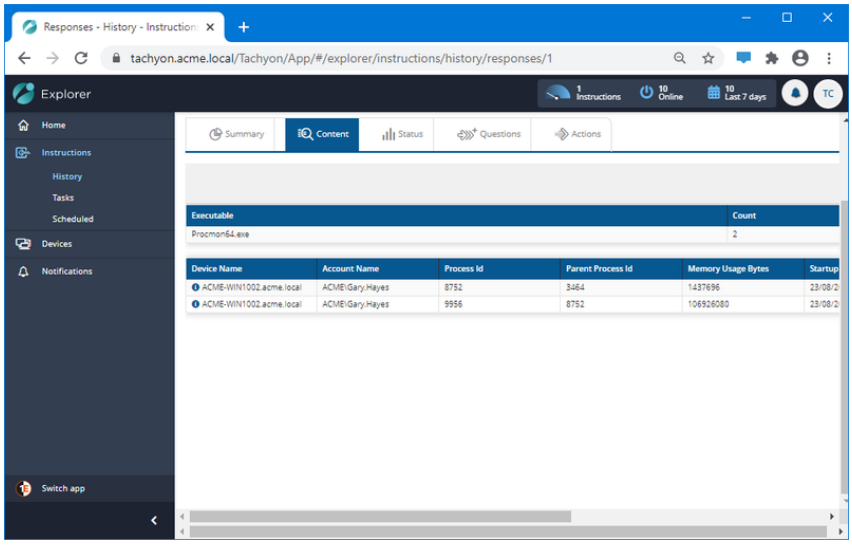
5.3.3.1.10 A possible culprit process?

The analyst scrolls down through the list until they find one that might be a cause of the issue. **Procmon64.exe** is a good candidate as it can use up large amounts of memory and may still be running even if the front-end is not being displayed. In this instance the effect could be exaggerated by the fact that there are two copies of this process running.



5.3.3.1.11 Details reveal that the process is using large amounts of memory

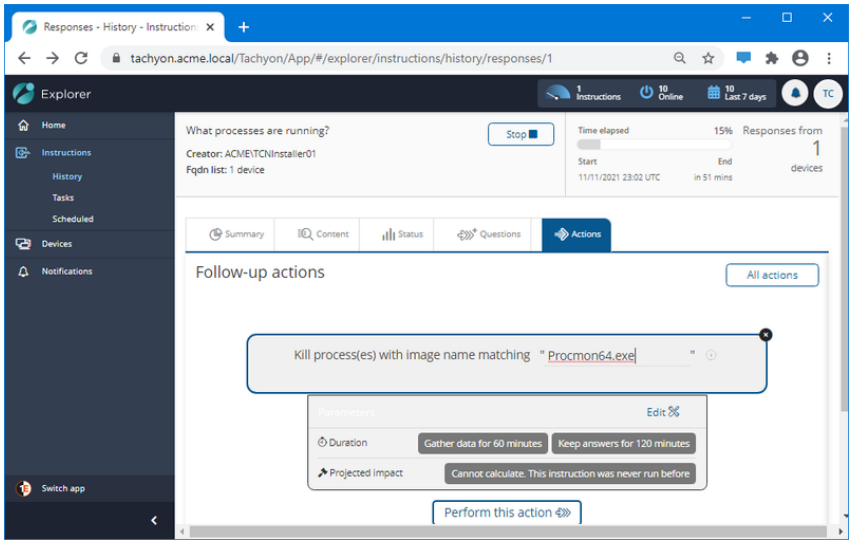
Clicking on the number link in the **Procmon64.exe** row in the results table, displays details for those results. Here the analyst can see that the pair of processes running are consuming a lot of memory. If the user is sufficiently skilled we can check over the phone whether the Procmon interface is visible and therefore these are just background processes that are consuming resources. Now it's time to kill the processes and hopefully return the device to its proper state.



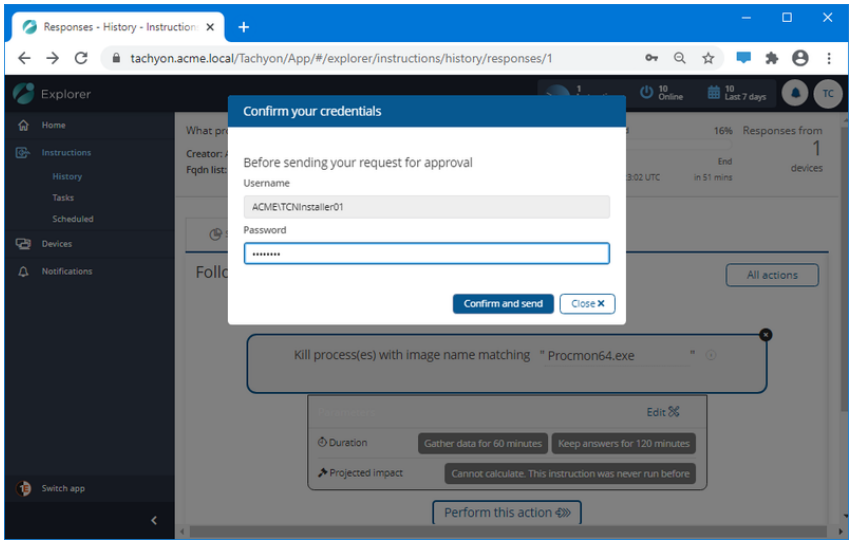
5.3.3.1.12 Resolving the issue

You can kill a running process from Tachyon using the **Kill process(es) with image name matching...** action. The analyst selects to run a **Follow-up action**, by clicking on the **Actions** tab on the results page, searching for the kill action and then filling out the image name parameter with the text **Procmon64.exe**.

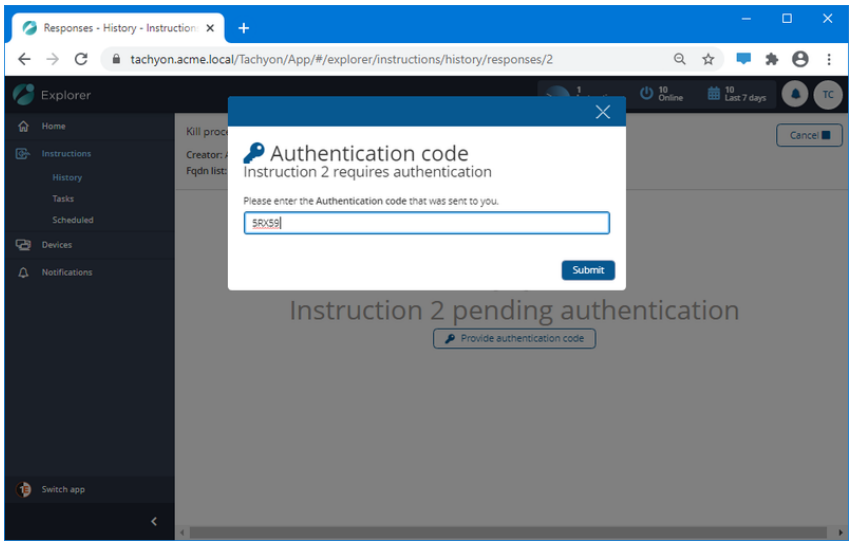
They run the action this way because the scope has already been set to the right device.



After clicking **Perform this action** Tachyon puts them through the authentication and approval process. First they have to confirm their credentials.



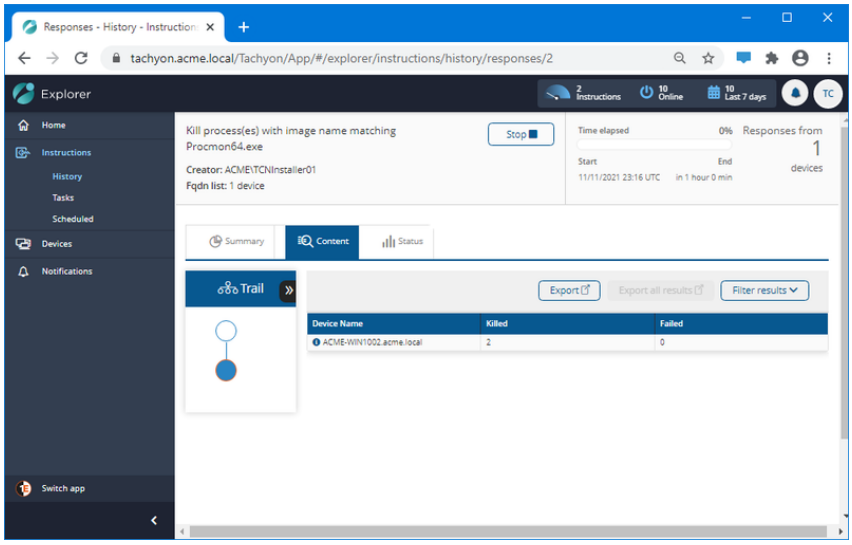
Then they have to supply the **Authentication code** that has been emailed to them.



The action must then be approved by another user with Approver permissions. When all this is done, the action runs and the **Procmon64.exe** processes are killed on that device. Hopefully that was the cause of the problem, the analyst goes back to the user on the phone and gets them to confirm that things have improved.

5.3.3.1.13 In conclusion

This is a simple scenario that shows how Experience can be used to detect a problem and Explorer can be used to investigate and resolve the problem. It shows how the two applications working together can be used as part of the analyst's process for solving end-user device issues reported to the IT helpline.



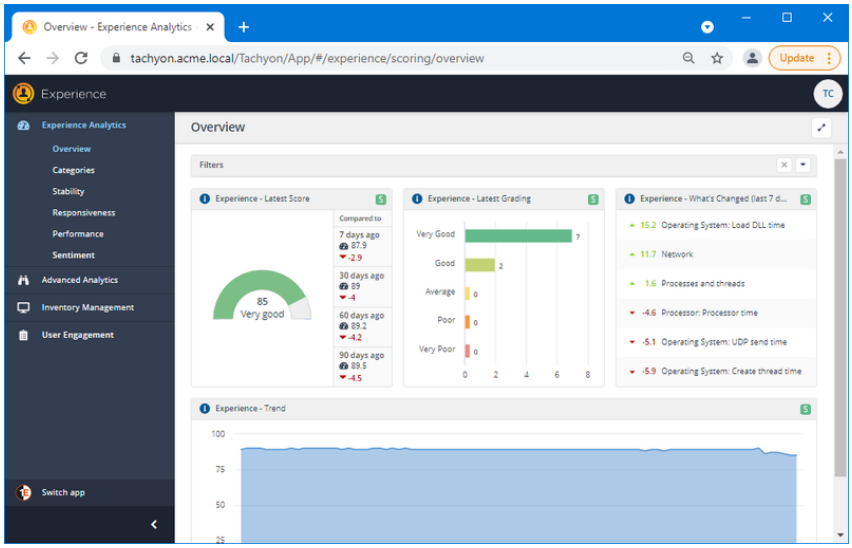
5.3.4 Investigating enterprise-wide software experience

The scenario described here covers a typical Experience journey for a **level 3 support engineer**. Typically, the Level 3 support engineer focuses on resolving global or wide-spread issues. We show how they would look for the applications in the environment that are crashing most often, and then how they would investigate the impacted devices to find a resolution.

5.3.4.1 How a level 3 support engineer uses Experience to investigate enterprise-wide software issues

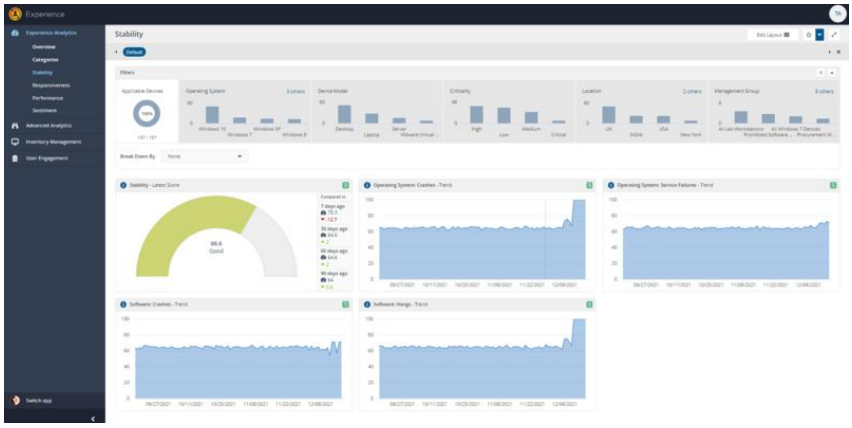
In this scenario the level 3 support engineer is performing a routine check to see if there are any devices where software crashes have been experienced. To do this they make use of Tachyon Experience to view the software installed across all the 1E Client enabled devices in their network and then focus on the ones that have the most crashes. Having found some problems they then use Explorer to run further questions on any affected devices to help pinpoint the exact issue and find a possible solution.

To start their journey, the engineer opens Experience in a browser. It has been reported that users are experiencing software crashes, and so from the Overview page the engineer navigates to the Stability page.



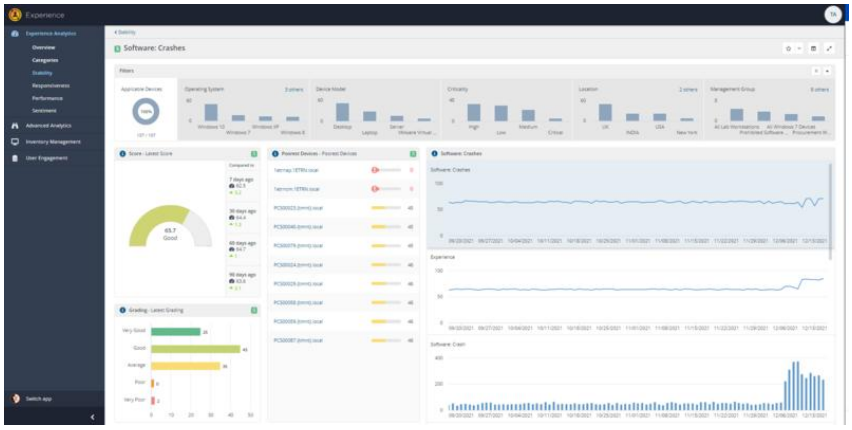
5.3.4.1.1 Navigating to the Stability page

They then navigate to the **Experience → Stability** page. Here they can see tiles that show how the environment is behaving with respect to Operating System Crashes, and Service Failures trends, and also the Software Crashes and Hang trends. They could use the filters along the top of the page to filter the results being shown.



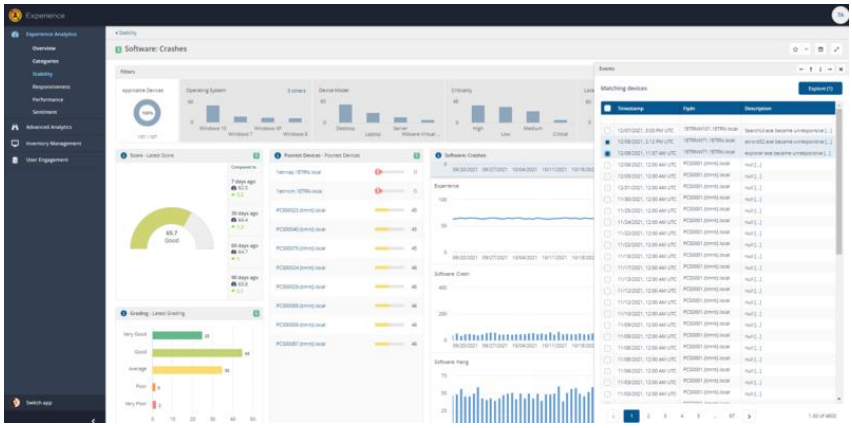
5.3.4.1.2 Viewing the Software Crashes page

To carry out the investigation they then click on the **Software Crashes: Trend** tile and are taken to the Software: Crashes page, they now need to locate any event that is causing the score to decrease, and so click on the bar graph showing the Software Crash information which is the third tile on the right, and the events pane is displayed.



From the events pane they are able to view what software has crashed and which devices have been affected, selecting the offending software enables the Explore button, and clicking this will open Tachyon Explorer, which if the user has either All Instructions Actioner, or All Instructions Questioner, they are then able to run instructions against the device to validate whether the offending software or process is still installed. A useful instruction for this is List Software Installations, which can be pre filtered with the product name if you have it, or if not clear then use the Get the count of a process "processname" that has been started in the last "x" days which is available from the Tachyon Exchange, which is available here:

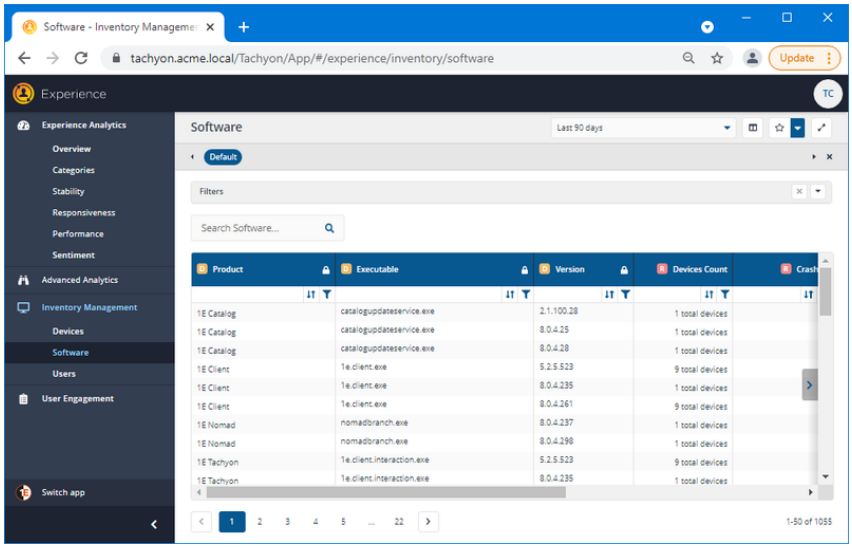
https://tachyonexchange.1e.com/product-packs/windows-process-management/



Alternatively the engineer could follow the path below

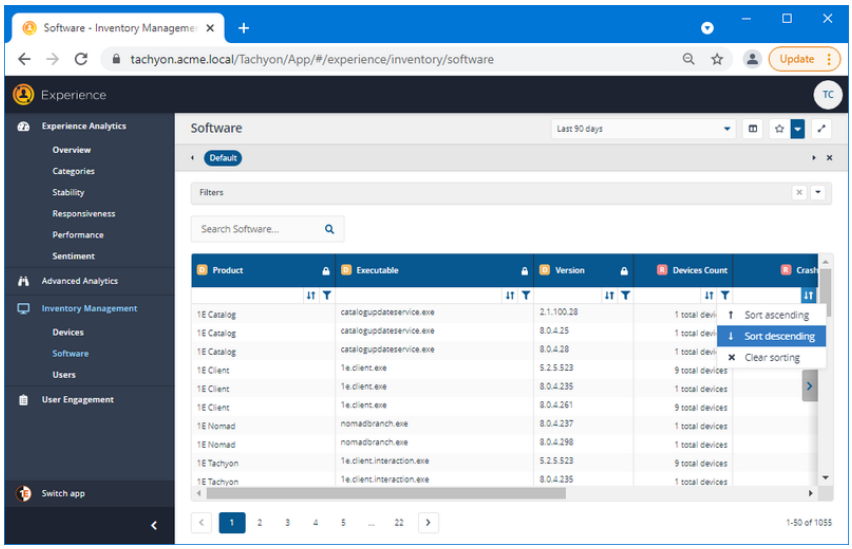
5.3.4.1.3 Navigating to the Software page

They navigate to the **Experience→Software** page. Here they can see all the software that is installed in the environment and a count of the devices that have each title.

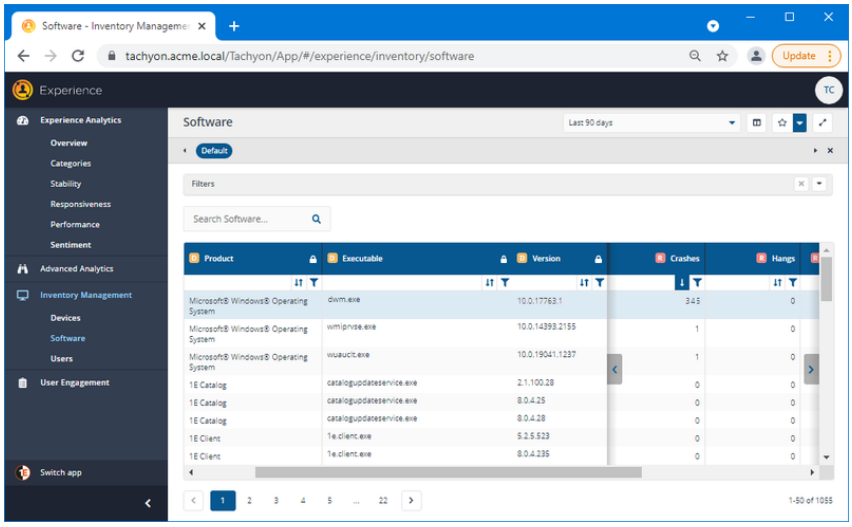


5.3.4.1.4 Sorting the Software table to show the software with the most crashes

To investigate software crashes the engineer clicks on the sort icon on the **Crashes** column and selects to **Sort descending**, which will bring the software with the most crashes to the top of the table.

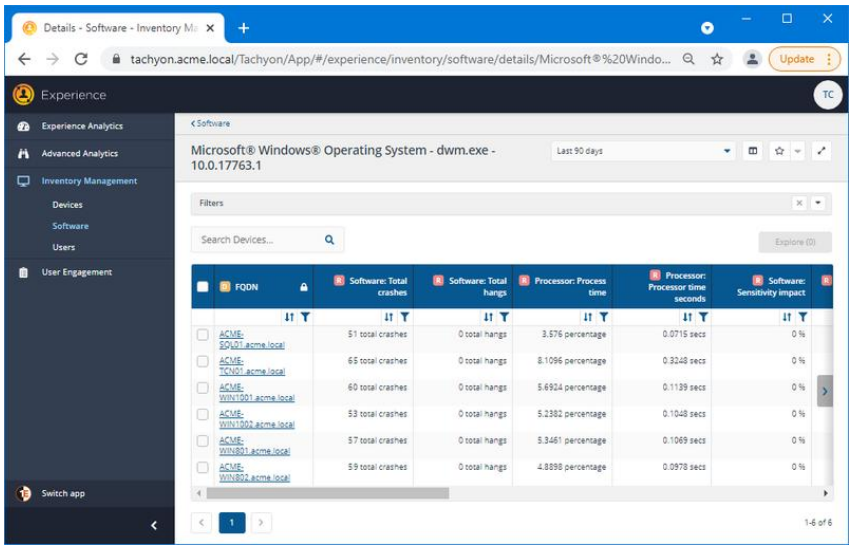


Here they can identify the top offending software for crashes. In this case it is the Desktop Window Manager process **dwm.exe**. The large number of crashes, **345**, indicates that a likely suspect would be the driver software for the graphics card. They can also see that these crashes have occurred within the **Last 90 days**, as shown in the time range selector in the header for the page. The **Devices Count** column shows that these crashes are happening for, at most, **6** devices in the environment.



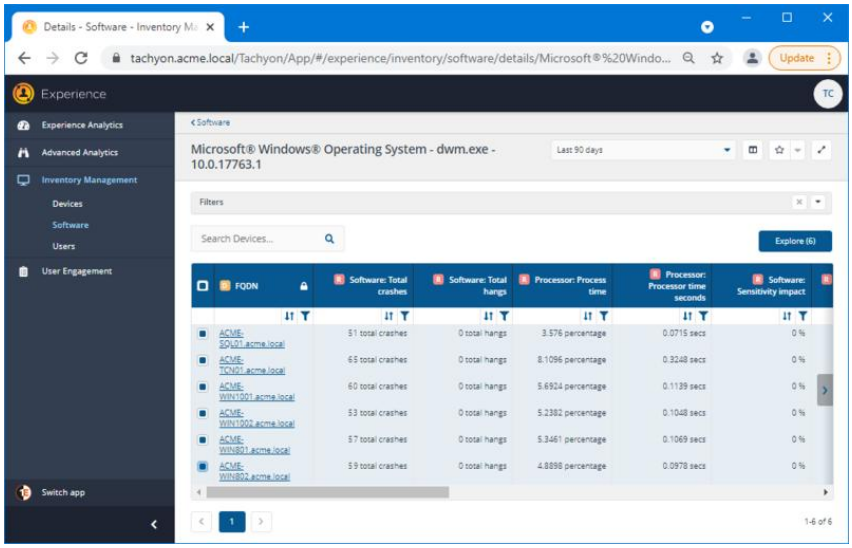
5.3.4.1.5 Viewing the devices where the software is installed

Clicking on the software row displays the list of devices with that software installed. Here they can see that the **345** crashes are distributed fairly evenly across the devices with that version of the software.

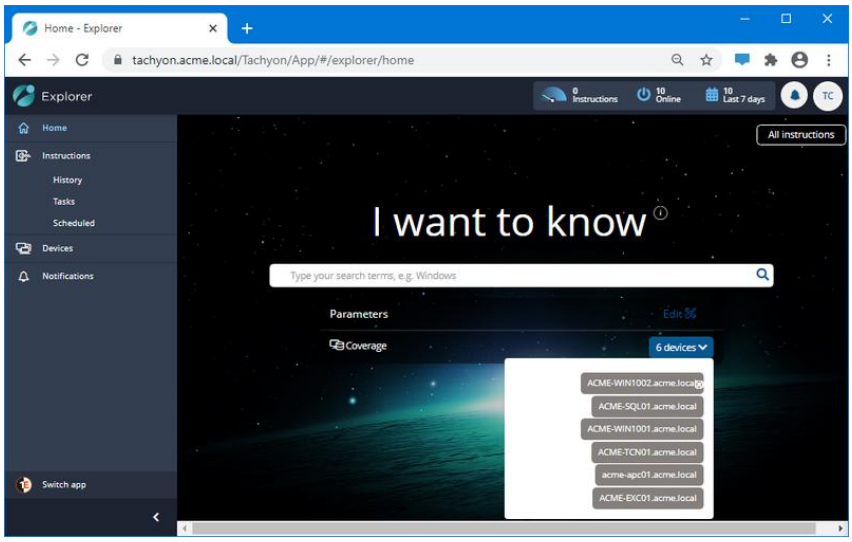


5.3.4.1.6 Exploring the devices in real-time

Having seen the devices that are affected by the issue the engineer can then investigate further. They do this by clicking the checkbox in the header row for the table to select all the devices and then the **Explore** button just above the table - notice how the text of the button has changed to indicate the number of devices that have been selected.

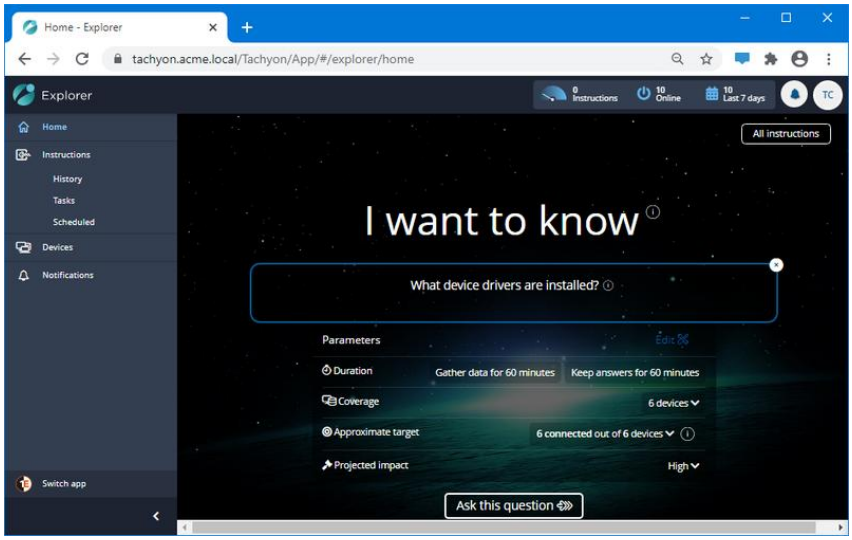


The **Explorer** application is displayed with the **Coverage** set to the selected devices. Now the engineer can question all the devices at the same time to find out what drivers are installed. Typing drivers into the search field lets them select the **What device drivers are installed?** question.

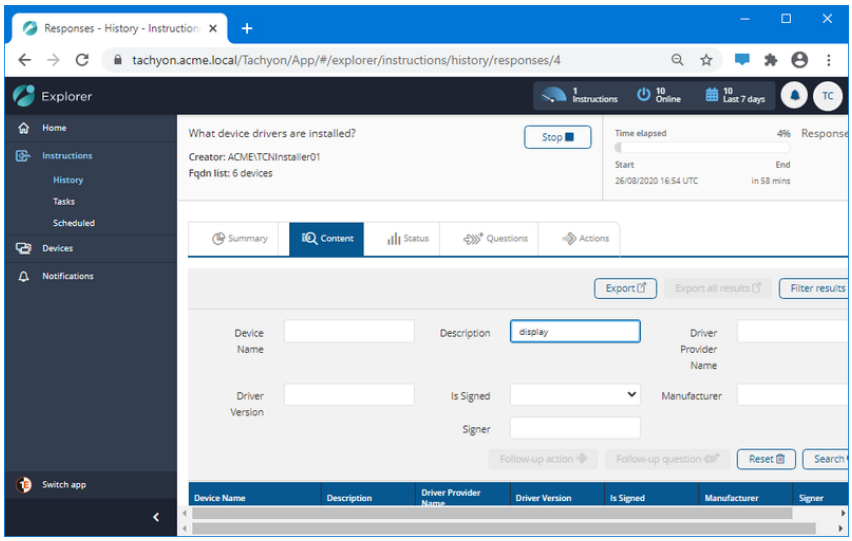


5.3.4.1.7 Checking what device drivers are installed

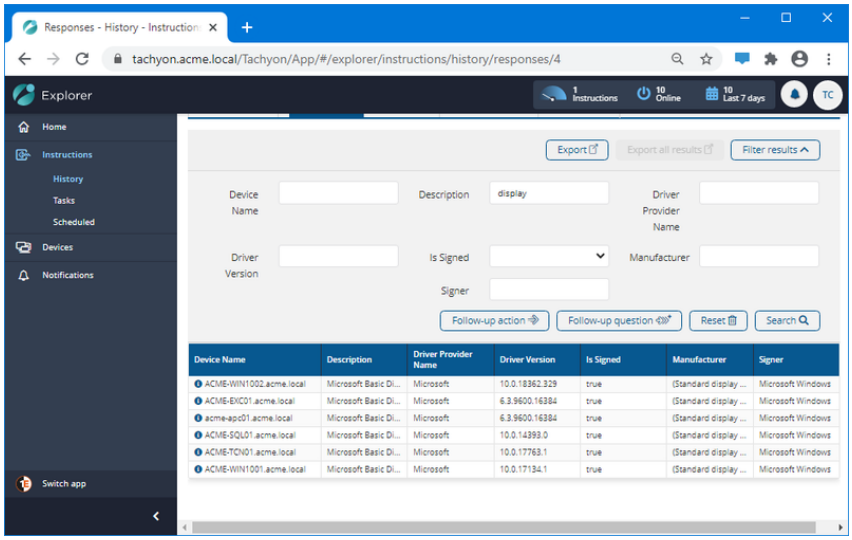
After the question has been selected they click on the **Ask this question** button at the bottom of the page.



As you can imagine the query returns many results from the 6 devices, to help pinpoint the type of drivers they are looking for the engineer uses the filter to show only the results that have the text **display** in the driver **Description** field.

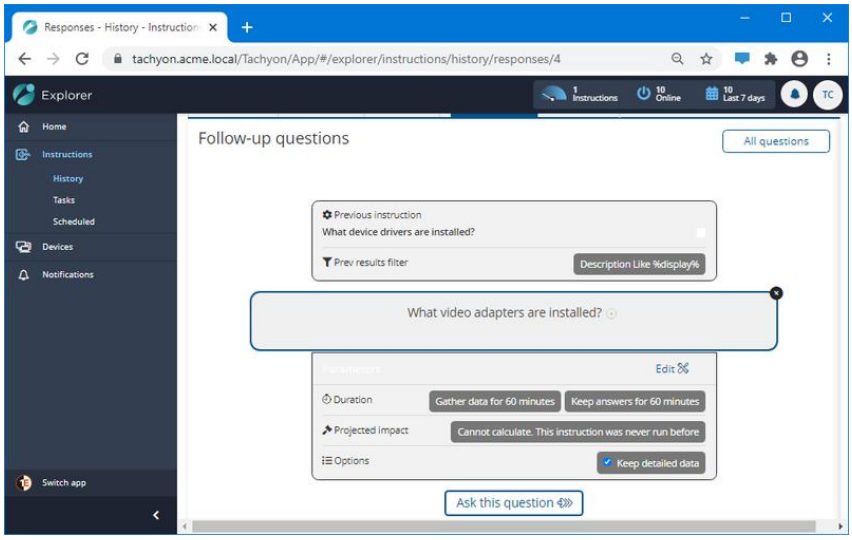


Clicking the **Search** button filters the rows displayed. Here they can see that the driver for all the devices is **Microsoft Basic Driver**, perhaps there is a compatibility issue that needs to be resolved.



5.3.4.1.8 Following up to find what video adapters are installed

The engineer decides to run a follow-up question to find out what video adapters are installed on the devices by clicking the **Follow-up question** button just above the results table. They then type video and select the matching **What video adapters are installed?** question.

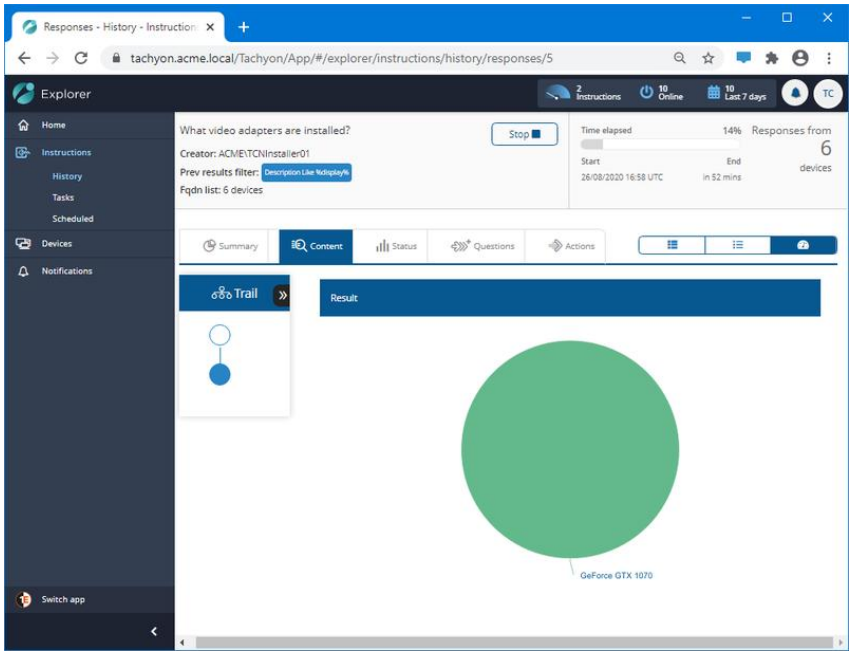


After asking the question they see that all the devices where the Desktop Windows Manager was crashing have the same graphics card installed. This is likely incompatible with the **Microsoft Basic Driver** that is also being used on all those devices so the best course of action would be to find the latest drivers for that graphics card and apply them to all the devices where the crashes are occurring.

5.3.4.1.9 Conclusion

In this scenario the level 3 engineer used the **Experience** pages to check the software installed in their environment. They sorted the table to see the software with the most crashes. Clicking on the worst one, enabled them to view the devices that had been most affected by the software crashes. Selecting all of those devices they were then able to launch Explorer and question the devices to find out what device drivers they had installed and follow that up with a question that

showed the devices' video adapters. Matching those bits of information they concluded that the software driver for the video adapter needed to be updated to the latest for all the devices.



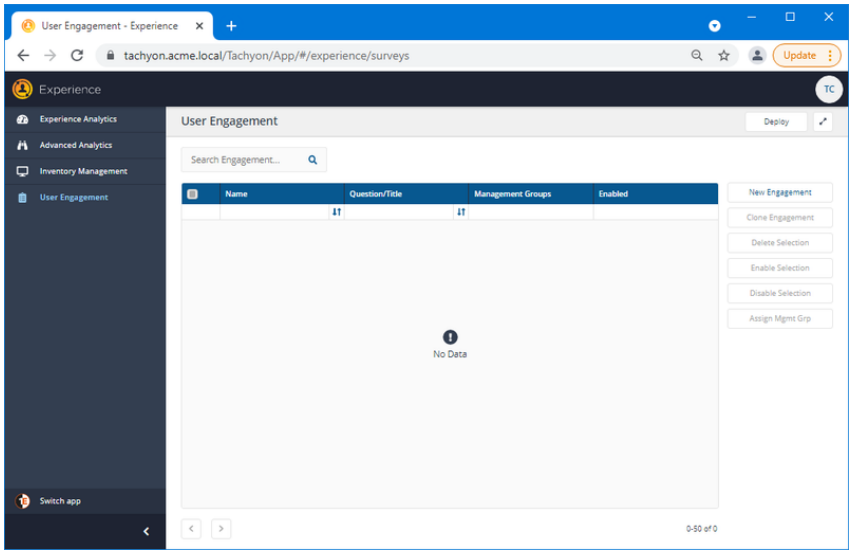
5.3.5 Getting feedback via Sentiment Surveys

In this scenario the IT team have just completed some improvements to their network. The **end-user computing (EUC) manager** uses Experience to gather some continuous feedback to see if the improvements have made a difference to the end-user's experience of their service. This is done using a daily survey that gathers responses that contribute towards the Sentiment score, enabling progress and improvements to be monitored over time.

5.3.5.1 Creating a new Sentiment Survey

The **Experience→User Engagements** page is where you manage all the Sentiment, Info Surveys and Announcements that have been created in Experience. You can easily see for each Survey the **Question** and **Options** that it has been configured with, what **Management Groups** it has been assigned to and whether it's **Enabled** or not. In the picture, you can see the initial state where no Surveys are currently defined, as would be the case for a newly implemented Tachyon system.

Click the **New Engagement** button to begin.

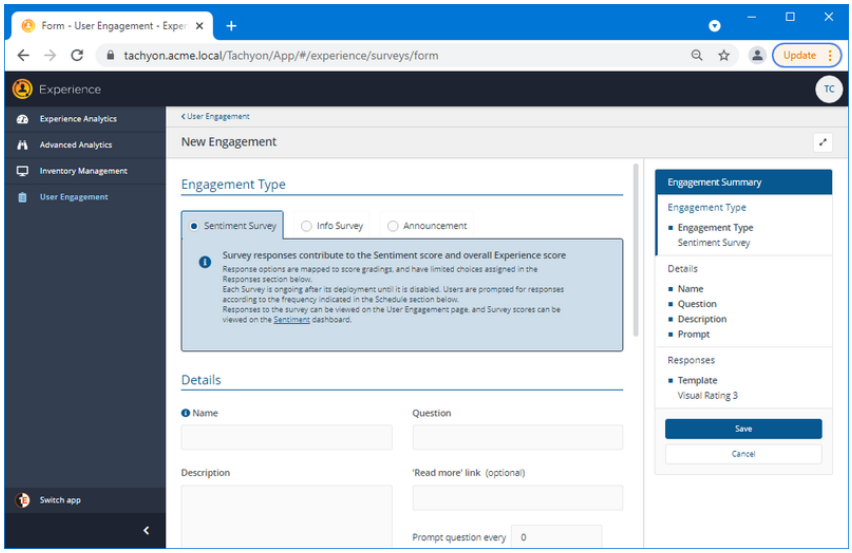


5.3.5.1.1 Sentiment or Info Surveys?

The first choice you face is whether to create a **Sentiment Survey**, an **Info Survey** or an **Announcement**. Announcements expect no response from users.

If the EUC manager wanted to create a one-off survey to gather some user feedback due to a particular event without wanting to monitor the results as part of an ongoing assessment of user experience, they would likely choose an Info Survey. The responses for Info Surveys can be modified to a larger extent than Sentiment Surveys, making them great for doing an arbitrary quick poll, but they don't contribute to the Sentiment Score and therefore cannot be monitored over time. For more information on Info Surveys please refer to Getting feedback via Info Surveys.

Sentiment Surveys are more limited than Info Surveys in the range of possible responses you can select from, but this also means they can be consistently measured and reported on. In our scenario, the EUC manager wants to create a survey that contributes towards the Sentiment score they'll be able to monitor from the Experience Overview page, this means they need to create a **Sentiment Survey**.



5.3.5.1.2 Names, Questions, Descriptions and Frequency

Having selected the **Sentiment Survey** type the next steps are to set a **Name** for the survey, the **Question** and **Description** that will frame the purpose of the survey and the range of **Responses** that will be allowed.

The **Name** for the survey will be stored as a metric that Experience can then report on. This **Name** must be unique amongst all the metrics that are used by, or have been defined for Experience. In this scenario this is set to **Network Performance Survey**. But, be aware that **Network** on its own could not have been used as the **Name**, as this is already a metric that Experience reports on.

The **Question** frames the meaning and purpose of the survey, if the question you choose has not been thought through carefully you will likely confuse your end-users and skew the results. You should also consider the responses you are setting for the survey as they should relate directly to the question. For example, if, like in our scenario, you choose **Visual Rating 5** - which gives you five options ranging from **Very Good** to **Very Poor** - you would have problems if your question was: **Is your network performing badly?** How would you map that question onto the range of chosen responses? Here the question text has been defined as:
How would you rate your network connection? You can see how each of the possible responses could be a suitable answer, so this seems an appropriate question.

The **Description** lets you provide some additional context for the question, and can be used to engage the end-user and provide some guidance as to how the question should be considered. Here the **Description** is defined as:
We've recently made some improvements to the ACME network and wanted to get your feedback on how it's performing for you. This sets the scene for why the question is being asked and gives a small indication on how it could benefit the end-user. The survey is part of a process for improving the performance of the network, and the user's response could help in that process and encourages them to work with the IT department. This aspect of the survey is subtler than determining the question but can still be important in terms of encouraging the maximum number of responses possible.

The **Description** is limited to 512 characters, if you have a site where you can provide additional information with more context for the survey question you can add a link in the **'Read more' link (optional)** field.

Prompt question every x days lets you select how often the survey will be presented to the end-users. We've mentioned that Sentiment Surveys are a way of assessing progress or change from the perspective of the end-users. They are part of a continuous process, and the frequency determines how often data points are taken in order to measure the process. By repeating the question, end-users get the chance to change their responses according to the ongoing performance. But timing is critical, set a schedule that is too often and the end-users may get tired and not respond as often as you would like. Set a schedule that is too seldom, and you may miss out on some changes that occur between polls.

In our scenario, the IT department has just made the improvements to the network, and they are keen to get immediate feedback on how those changes are working and how the systems are adjusting to the changes. So the EUC manager sets the most frequent **Schedule** of prompting the question every day with the view that as the changes mature the **Schedule** for the question can be adjusted to a larger interval.

5.3.5.1.3 Responses

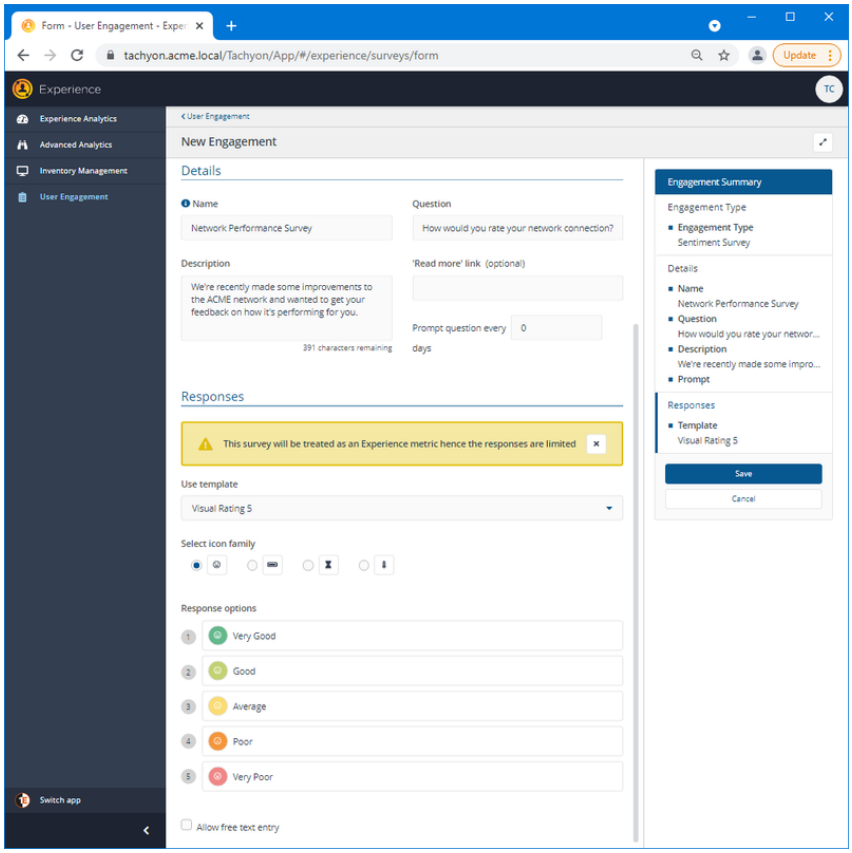
As mentioned earlier, the **Responses** must be closely linked with the **Question** text, and you will likely need to adjust both before you get a suitable fit that is obvious, simple and effective.

For Sentiment Surveys, you can choose a range of 3 or 5 responses, and they can be displayed with several sets of icons or just numbers. You can't change the text of the Responses or the order. Limiting the **Responses** in this

way enables the survey to be measured consistently and contribute to the Sentiment score and ultimately forms a part of the overall Experience score.

Info Surveys let you choose a greater range, edit the response text and select from a wider palette of colors and icons. But, because of that flexibility, they cannot be measured consistently and therefore cannot contribute towards the Sentiment score and have no bearing on the overall Experience score.

The **Allow free text entry** checkbox gives the end-users the opportunity to qualify their responses by typing in any text they feel would help clarify their choice. This does not contribute towards the score but can be invaluable in helping you to interpret the results of the survey. In our scenario, the EUC manager chooses to let the responses speak for themselves and leaves the box unchecked.



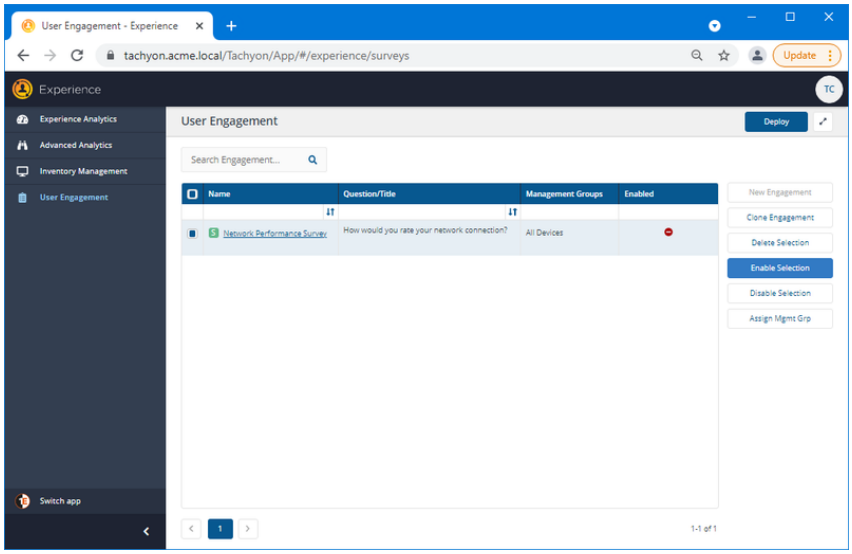
5.3.5.1.4 Saving the new survey

When you're happy with the settings you've made in the survey editor, you can click **Save** to commit the changes and continue to the next step.

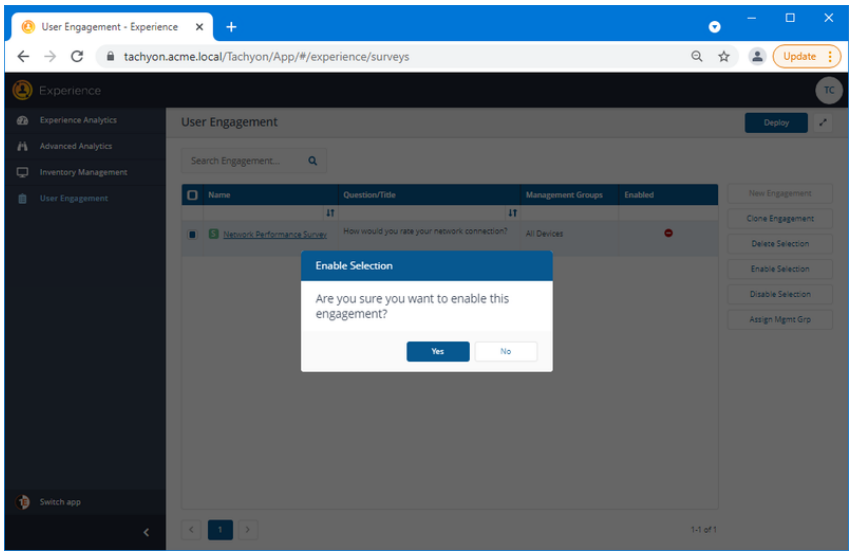
5.3.5.1.5 Enabling surveys

Before a new survey can be deployed, it must first be enabled - this is an extra gateway that prevents the survey being sent out too soon before it's ready.

To enable one or more engagements, select the checkbox at the left-hand end of each engagement's entry in the Engagements table and then click the **Enable Selection** button.



Doing this displays an **Enable Selection** confirmation popup that you must acknowledge before the selected survey(s) are actually enabled. Click **Yes** to confirm the operation and **No** to cancel it.



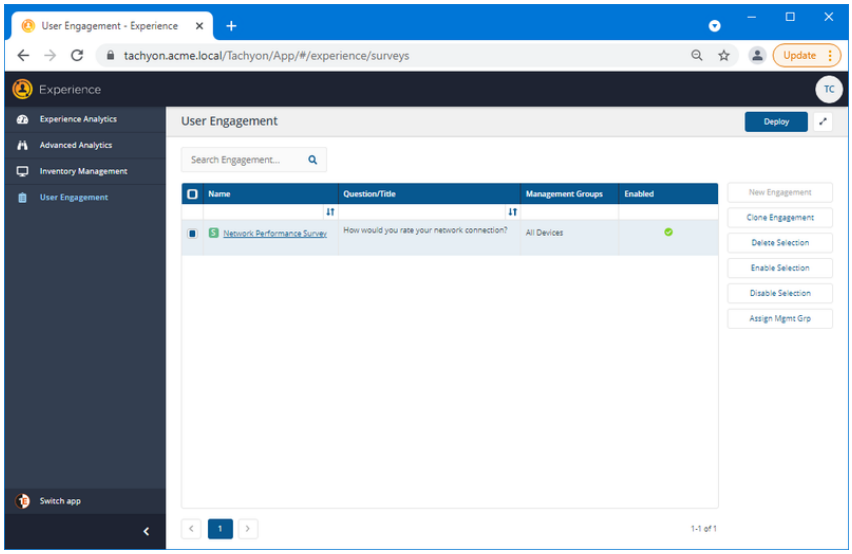
5.3.5.1.6 Deploying surveys

The new survey has been enabled, it can now be sent to the end-users' devices by clicking the **Deploy** button. When a survey is created, the **Management Groups** parameter defaults to **All Devices**. This means that clicking **Deploy** targets all the devices currently and subsequently connected to Tachyon.

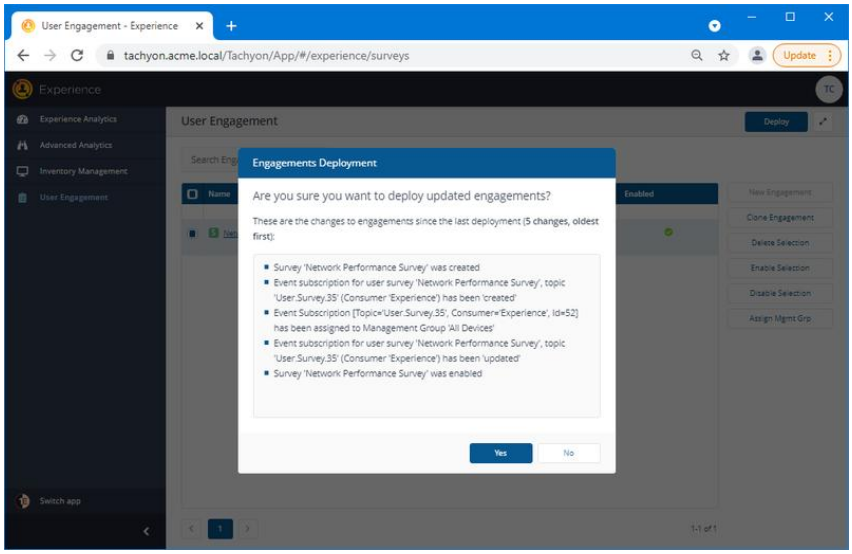
> **Note**
>
> The **Deploy** button sends out any changes to the states of the surveys - meaning you can also use it to set previously deployed surveys to not **Enabled**, thereby preventing further responses without completely deleting the survey, or you can delete surveys when they are no longer needed. You should be aware that the **Deploy** button will also send any other User Engagement administrator's changes.

It's good practice to test the survey on a few machines first before deploying to **All Devices**. This lets you see how the survey will appear to your end-users and gives you the opportunity to debug the text and selections before deploying to a wider audience. Doing this involves assigning a different Management Group to the survey that targets the selected devices. The **Assign Mgmt Grp** button can be used to limit the survey's targeted devices to a specific Management Group.

In our example, which only involves a few devices anyway, to keep things simple we can get away with deploying the survey without testing, so the EUC manager clicks the **Deploy** button.

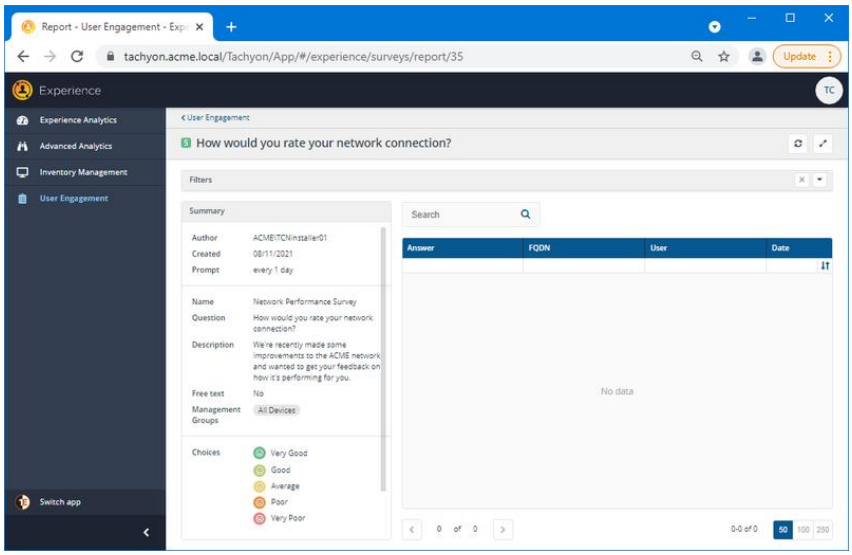


A **Policies Deployment** popup appears that shows the changes that will be deployed when the **Yes** button is clicked. The EUC manager reads the list carefully, sees that the only changes are the ones related to creating and enabling the **Network Performance Survey** and clicks **Yes**.



5.3.5.1.7 Monitoring surveys

Now the survey has been deployed, you will likely want to monitor its responses as they occur. In our scenario, the EUC manager clicks on the **Network Performance Survey** link in the **Name** column for the survey in the Engagements table, to display the responses page for that survey.



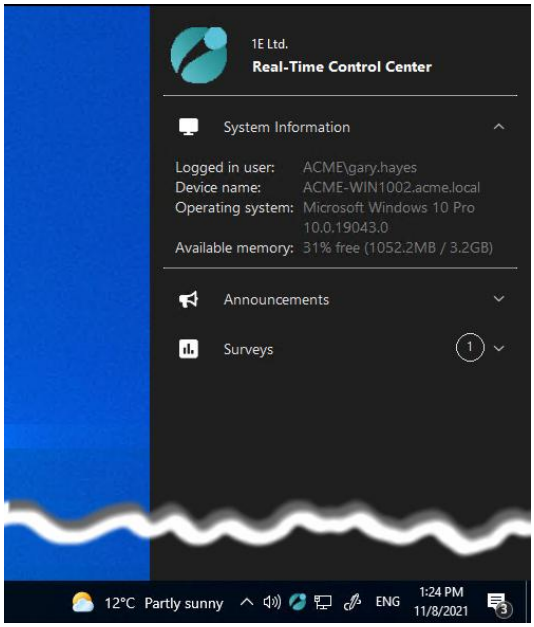
5.3.5.2 What the end-user sees

When the 1E Client is installed on a network device, by default it also adds an icon to the notification area that displays the Real-Time Control Center (RTCC). Initially this may be hidden, but can be dragged onto the taskbar to make it always visible. When an end-user clicks on the icon they will see an information bar with various section, as in the picture, that shows them:

Section	Description
Icon and title	Displays an icon, a company name and title for the Real-Time Control Center.
System Information	A collapsible section that provides information about the device and session where the RTCC is being displayed:

Information	Description
Logged-in user	The domain username for the session.
Device name	The FQDN for the device.
Operating system	The Operating System name and version number.

Section	Description
	Available memory The % free and the free and total values.
Announcements	A collapsible section that lists any current announcements targeted at the device.
Surveys	A collapsible section that lists any current surveys targeted at the device.



In our scenario the end-user **Gary Hayes** clicks on the notification icon to open the RTCC. They then expand the **Surveys** section to see survey question text for the newly deployed survey waiting to be answered, as shown in the picture.

Note

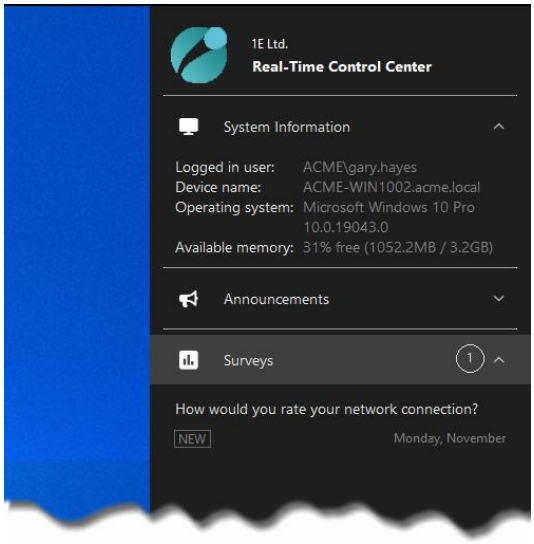
Surveys will also automatically popup to prompt the user without them having to manually select the item from the RTCC. This happens at what the 1E Client assesses to be the best moment according to the user's interaction with the device and whether they have chosen to allow the 1E Client to disturb them or not.

Note

The following 1E Client settings are used to configure the behavior of the Real-Time Control Center. If you click on a link, it will take you to the 1E Client documentation space.

Module.Interaction.Enabled | Module.Interaction.ActiveSessionThresholdSeconds | Module.Interaction.CompanyName | Module.Interaction.DoNotDisturb | Module.Interaction.IdleSessionThresholdMinutes | Module.Interaction.ITSM.ServiceNow.CreateIncidents | Module.Interaction.ITSM.ServiceNow.Enabled | Module.Interaction.ITSM.ServiceNow.GoBackDays |

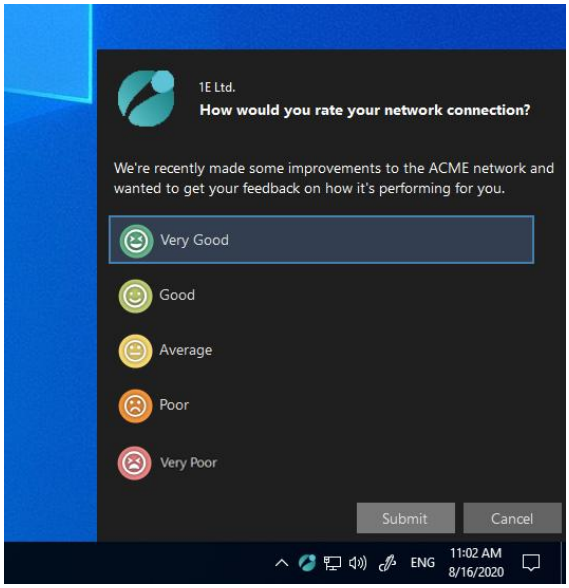
Module.Interaction.ITSM.ServiceNow.Url | Module.Interaction.LogSessionNotificationReadiness | Module.Interaction.MinimumMinutesAfterLogonBeforePrompt | Module.Interaction.MinimumMinutesAfterSessionActivationBeforePrompt | Module.Interaction.MinimumMinutesBetweenPrompts | Module.Interaction.NotificationIcon | Module.Interaction.PeriodsBeforeUiLaunch | Module.Interaction.PeriodsBeforeUiLaunchTimeout | Module.Interaction.Port | Module.Interaction.ResponseAuditsBeforeTidy | Module.Interaction.ResponseRetentionRows | Module.Interaction.SampleExclusionList | Module.Interaction.SampleUserInteraction | Module.Interaction.SnoozeTimeMinutes | Module.Interaction.Theme



5.3.5.2.1 Submitting a response to the survey

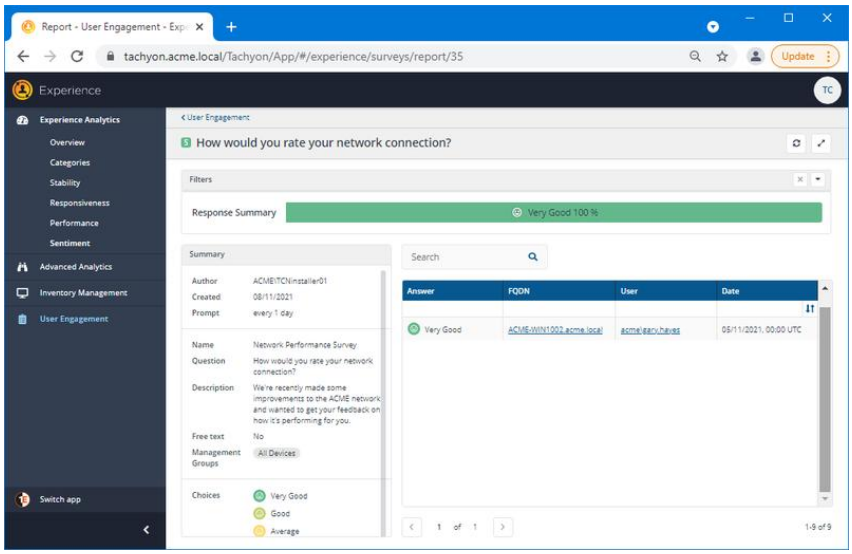
Clicking on the text of the survey question in the **Surveys** section displays the survey, showing the range of responses that can be made, as seen in the picture opposite.

Gary Hayes is happy with the way that the network is currently performing, so he clicks on the **Very Good** response and then clicks **Submit**.

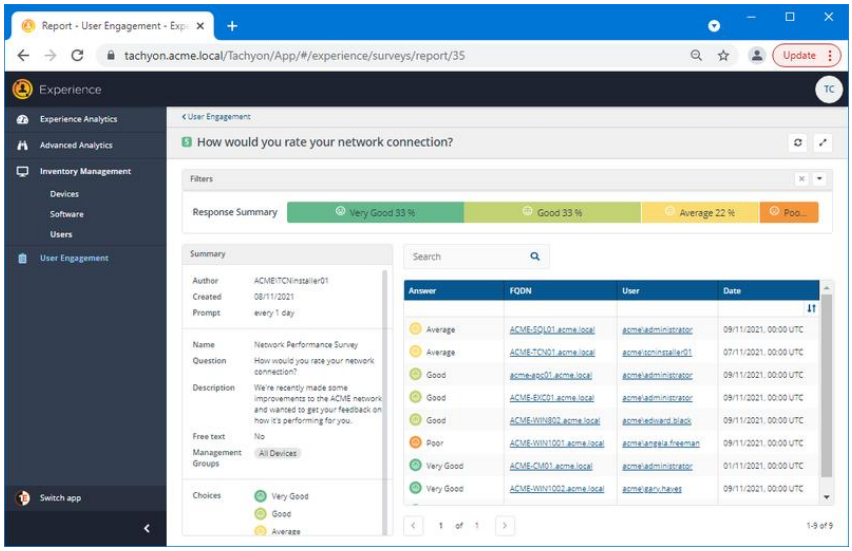


5.3.5.3 Viewing survey responses

Pretty soon after **Gary Hayes** has submitted his response, the EUC manager sees it appear in the Experience interface.

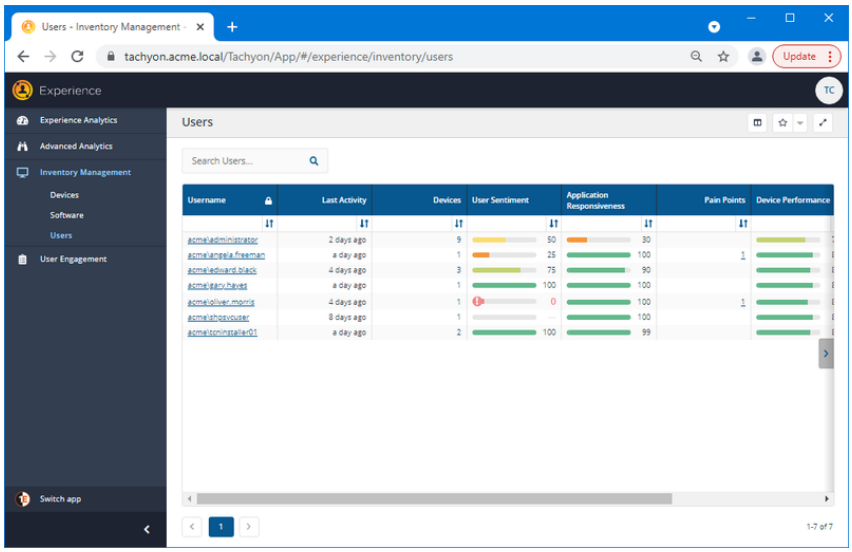


After a number of responses have been made, a clearer picture of the current user sentiment emerges. Here the EUC manager can see that overall the responses have been positive, with 33% being **Very Good** and another 33% being **Good**. There are a couple of outlying responses though that might merit some additional investigation.

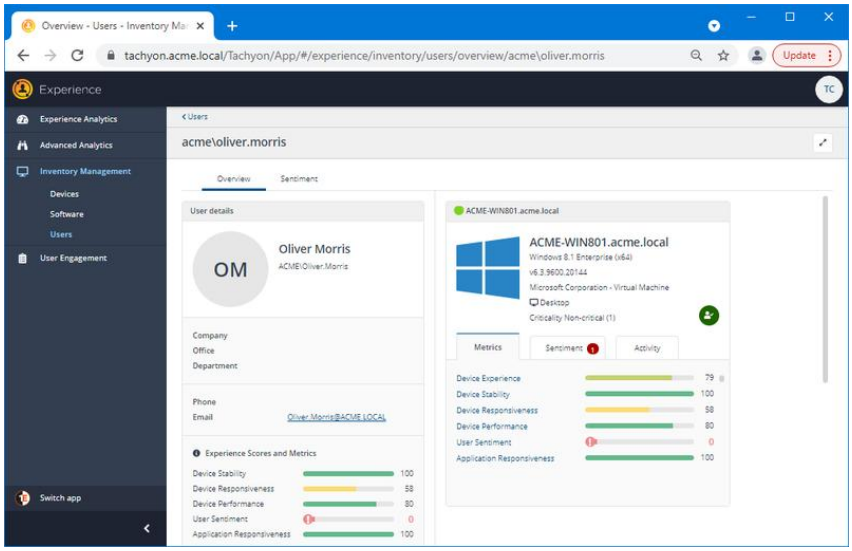


5.3.5.4 Viewing the Users page

Now the current set of responses are in, the EUC manager clicks on the **Experience→Users** page to view how Experience has rated their scores across a range of measurements. Here they notice that one of the users, **Oliver Morris**, has an exclamation mark showing in the **User Sentiment** column.



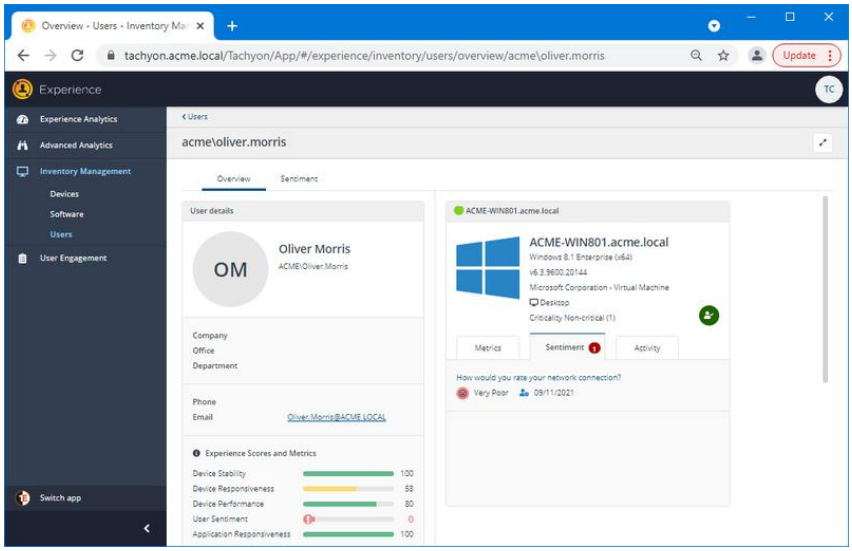
Clicking on the **Username** link for a user navigates to a page that displays information related solely to that user. Here the EUC manager has clicked on the link to view the page for **oliver.morris**. A number of details related to the user are displayed, the **Metrics** tab and the **User Sentiment** score are of interest here - particularly the exclamation mark displayed.



5.3.5.4.1 Viewing the user's Sentiment Survey responses

Clicking on the **Sentiment** tab displays the history of survey responses made by the user. For **Oliver.Morris** their response to the **How would you rate your network connection?** survey was to rate it as **Very Poor**. This is an interesting outlier for the survey responses and warrants further investigation, especially given that the other Experience scores for this user are coming back as good.

The EUC manager could click on the user's email and request some clarification directly. Perhaps there was some other cause for the **Very Poor** rating, such as an accidental response - or perhaps there were other environmental issues that haven't yet come to light. Nonetheless, the manager has been able to investigate the response and is empowered to do something to resolve the user's issue.



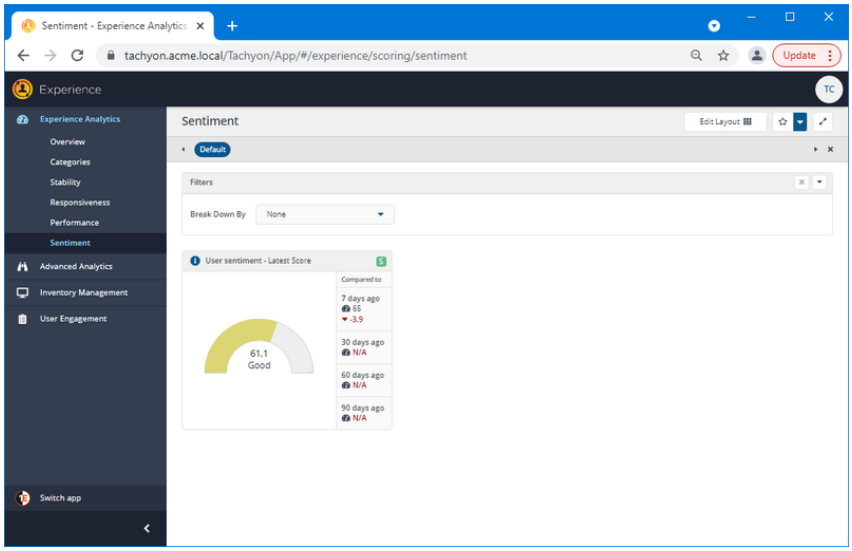
5.3.5.5 Adding the new survey to the Sentiment page

Now that the EUC manager has seen that the survey is returning the type of information that helps assess how the ACME network changes are affecting users, they would like to have those results

figure more prominently and be easier to access. To do this they can add a tile for the survey to the **Sentiment** page. By default, the Sentiment page just shows the **User sentiment - Latest Score** tile, so there's plenty of space available for you to add your own Sentiment Survey tiles.

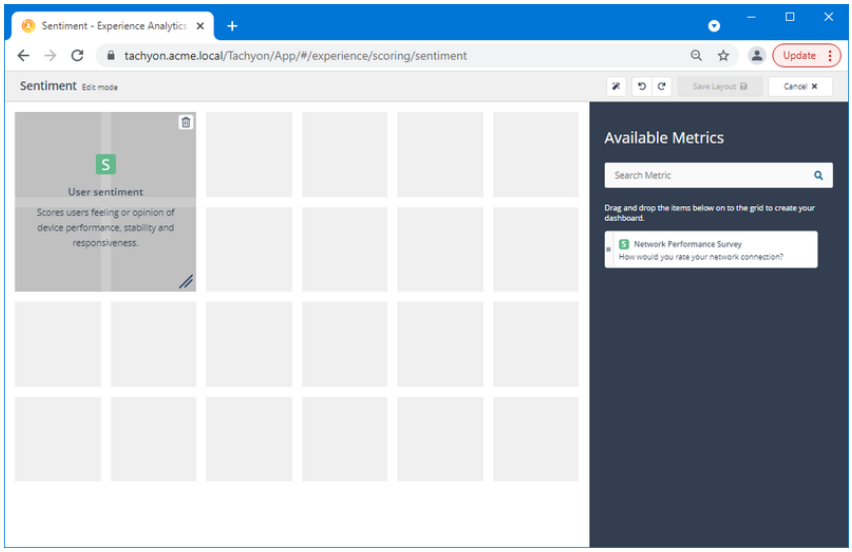
5.3.5.5.1 Editing the page layout to add the new Sentiment Survey

You can change the tiles that are displayed on the page by clicking on the **Edit Layout** button in the page header.



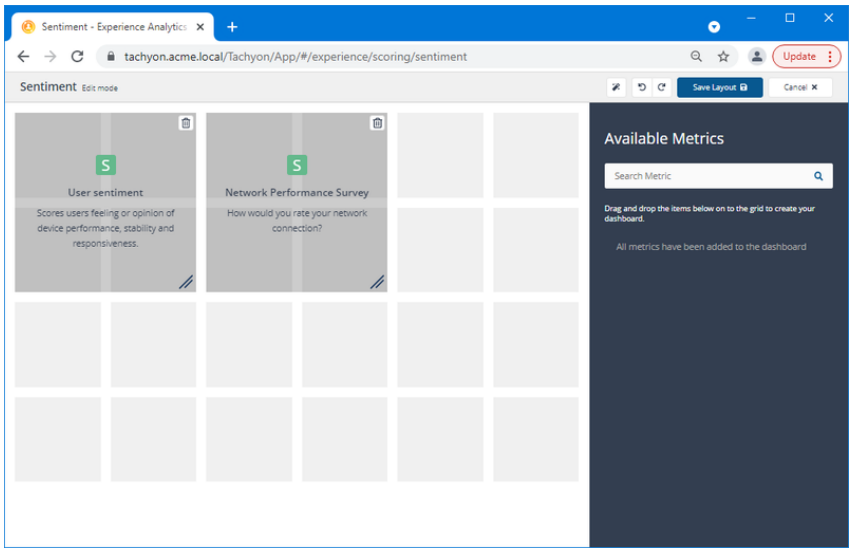
Clicking on **Edit Layout** opens up the **Sentiment Edit mode**. Here they can see the tiles that are already displayed on the page as well as the **Available Metrics**, that is the metrics that can be added to the page. As mentioned earlier the metric that gets added to the system for Sentiment Surveys is the same as the name set for the survey when it was created.

The EUC manager can see the **Sentiment** tile on the left-hand page layout pane, which is the default tile for the Sentiment page, and also the **Network Performance Survey** entry in the **Available Metrics** section. To add the new tile they click and drag it from the **Available Metrics** over on to the layout pane.



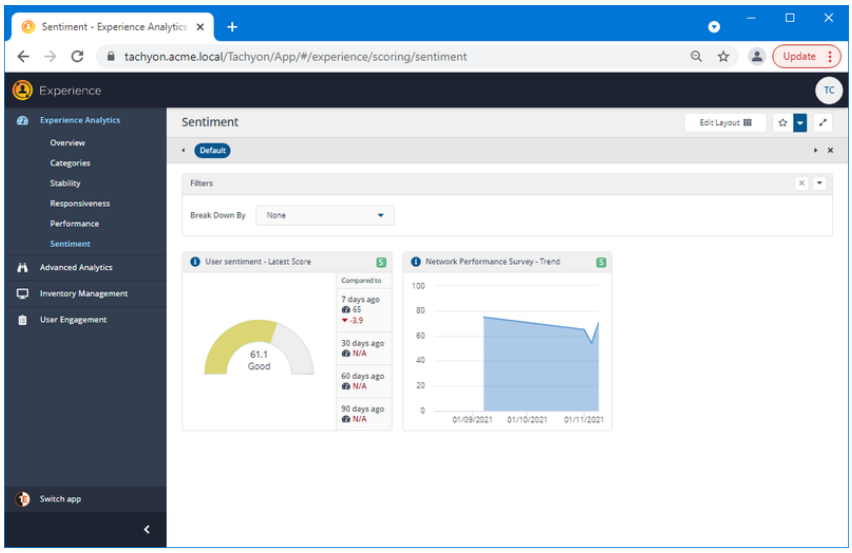
There are different options for the location of the tile and its dimensions, as described in Adding metrics to a dashboard, here the EUC manager just places the new tile next to the existing one and keeps it at the default size of four squares.

Clicking **Save Layout** applies the layout to the **Sentiment** page.

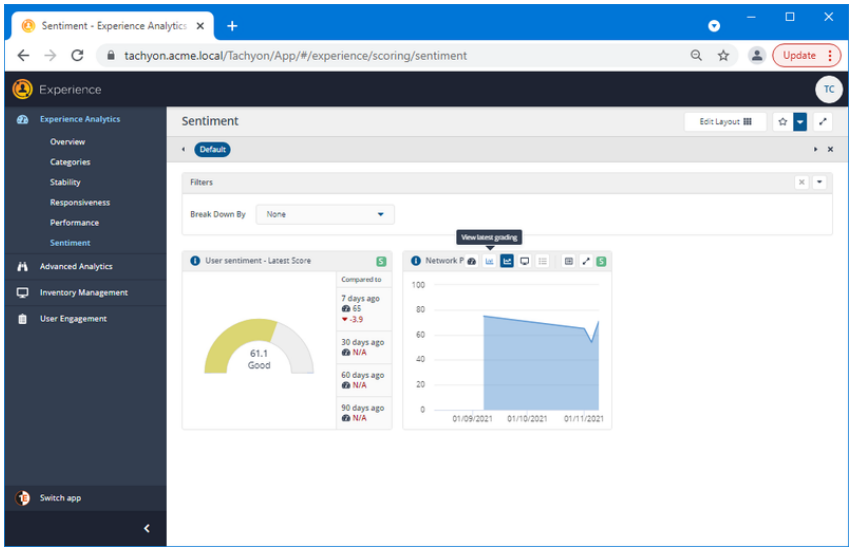


5.3.5.5.2 Changing the tile display

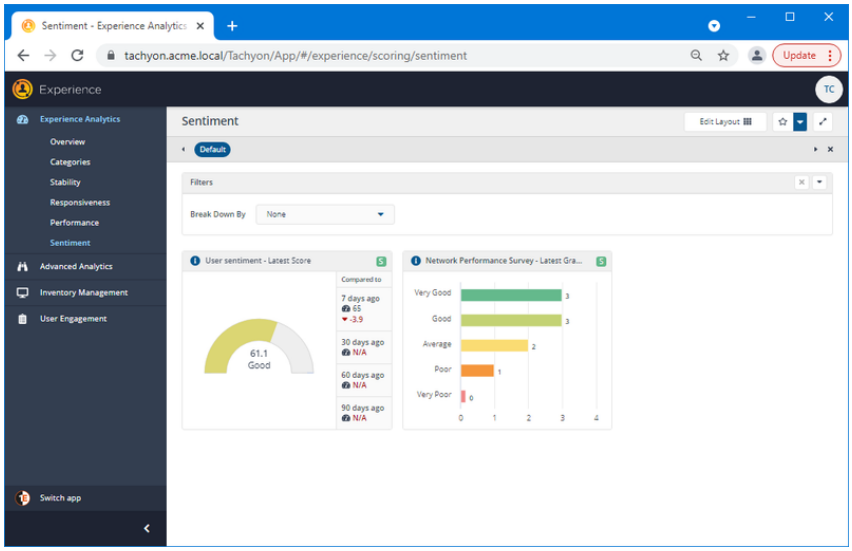
The EUC manager has added the **Network Performance Survey** tile to the **Sentiment** page, but it's still not quite displaying the information the way they want to see it. Instead of a line graph, they want to see the latest score for all the 5 possible responses.



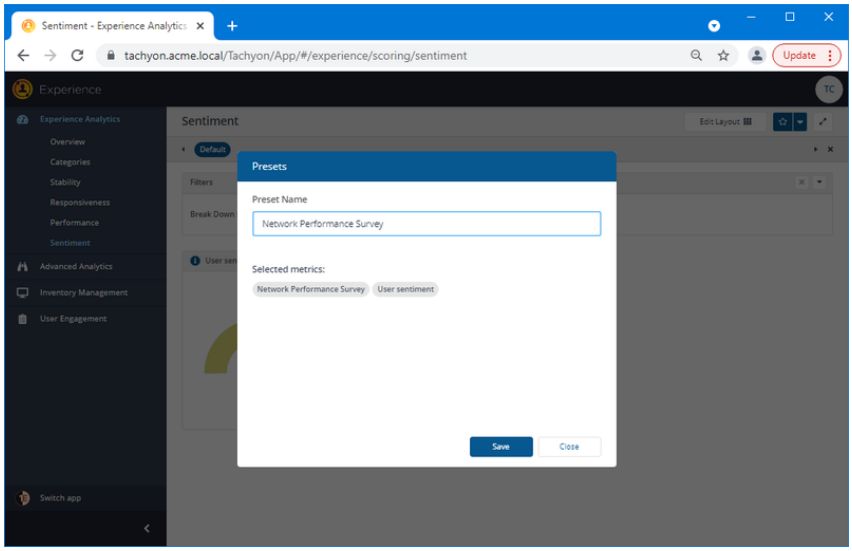
Clicking on the **View latest grading** button in the tile heading will provide the graphic needed.



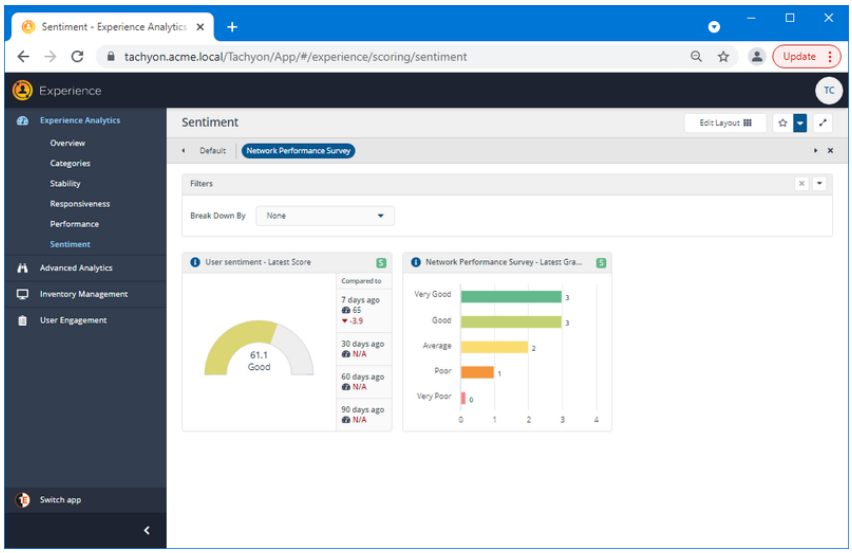
So this is the view the EUC manager wanted. Now they need to make it easily accessible after a page refresh or revisiting the site at a later date. To do that they need to save the layout as a Preset, which is done by clicking on the star button in the page header.



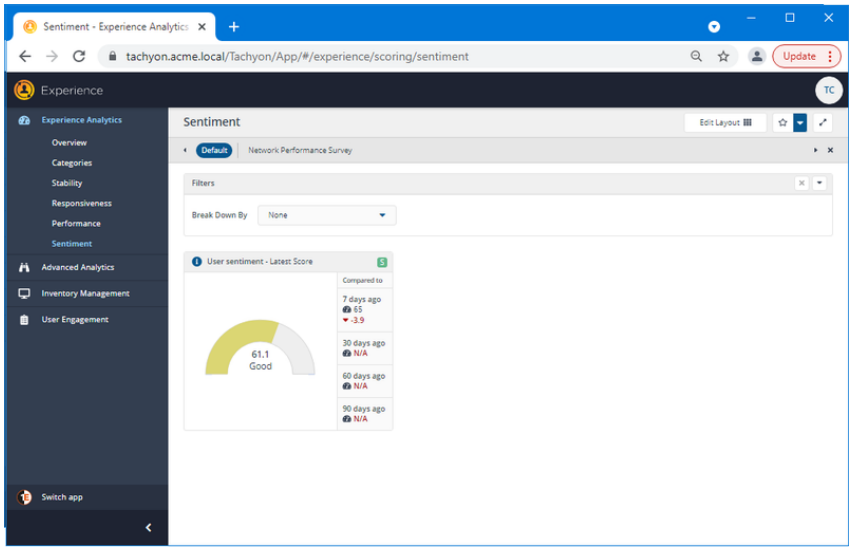
In the **Presets** popup they add a suitable name for the Preset and click **Save**.



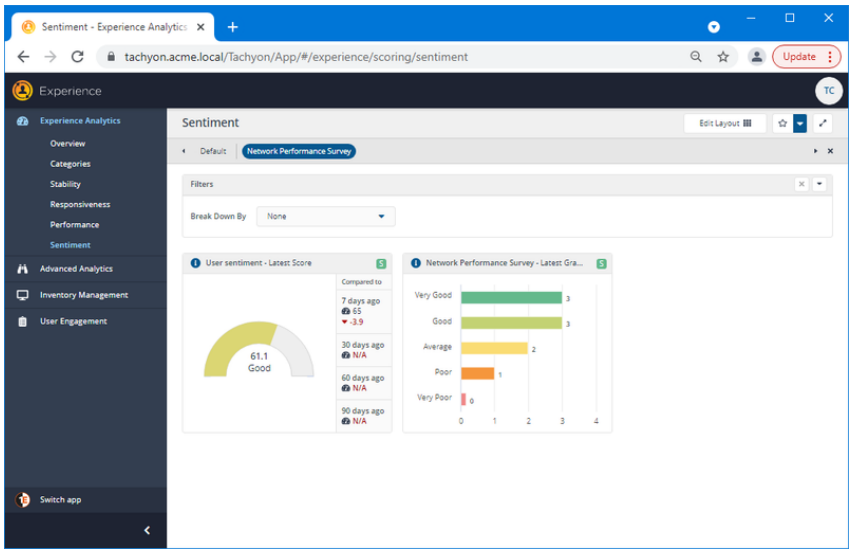
The new **Network Performance Survey** Preset is added to the page.



Now when they refresh the page it will revert to the default as normal, but they can easily get back to their tailored view by clicking on the **Network Performance Survey** Preset.



As they create new Sentiment Surveys, further tiles can be added to this view and stored in the same way, so the EUC manager can keep track of how their users are responding.



5.3.5.6 Next steps

Now that you've seen a possible way of using Sentiment Surveys for capturing ongoing feedback from end-users, you might want to take a look at Getting feedback via Info Surveys to see how one-off Surveys can be created, deployed and monitored in the Experience application.

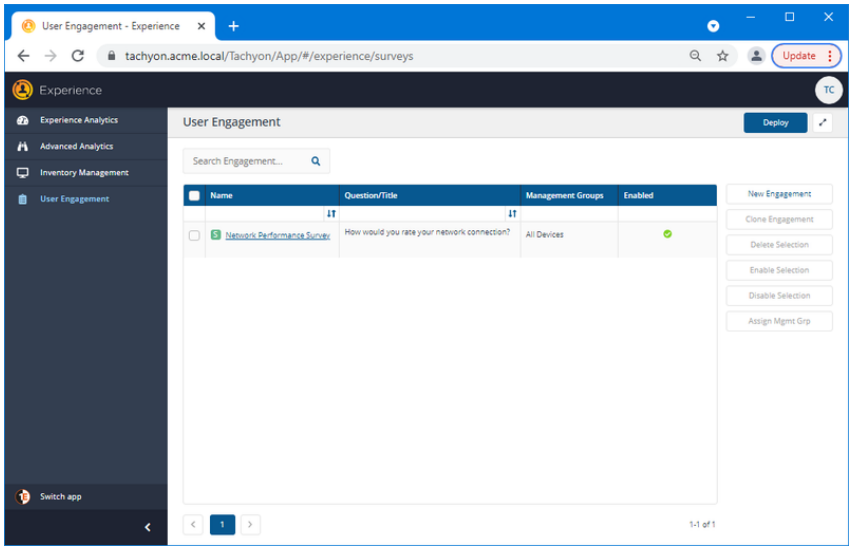
5.3.6 Getting feedback via Info Surveys

In this scenario the IT team want to make improvements to the way they provide their IT services, and they want to get some feedback from their users to see how they are currently resolving issues. The **end-user computing (EUC) manager** uses Experience to create and send a one-off survey to the users asking about how they currently resolve issues with IT. The users will have a week to choose to respond.

5.3.6.1 Creating a new Info Survey

The **Experience→User Engagement** page is where you manage all the Sentiment, Info Surveys and Announcements that have been created in Experience. You can easily see for each engagement the **Options** that it has been configured with, what **Management Groups** it has been assigned to and whether it's **Enabled** or not. In the picture, you can see the state following on from the Getting feedback via Sentiment Surveys scenario.

Click the **New Engagement** button to begin.

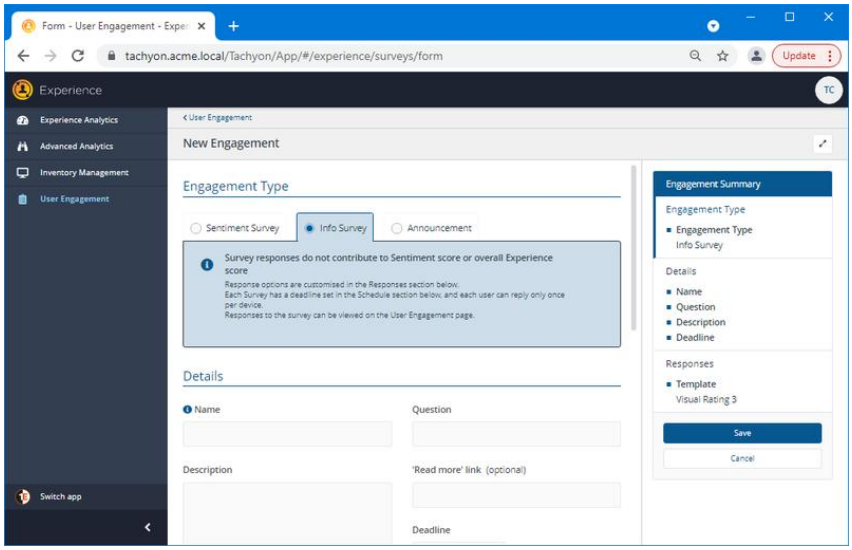


5.3.6.1.1 Info Surveys?

The first choice you face is what type of engagement you want to create.

Sentiment Surveys are more limited than Info Surveys in the range of possible responses you can select from, but this also means they can be consistently measured and reported on. However, in this scenario, the EUC manager doesn't want to create a survey that contributes towards the Sentiment score. Instead, they want to create a one-off survey to gather some user feedback on how end-users currently resolve their IT issues, they won't want to monitor the results as part of an ongoing assessment of user experience and so would choose an Info Survey.

The responses for Info Surveys can be modified to a larger extent than Sentiment Surveys, making them great for doing this type of arbitrary quick poll, but remember that they don't contribute to the Sentiment Score and therefore cannot be monitored over time.



5.3.6.1.2 Names, Questions, Descriptions and Deadlines

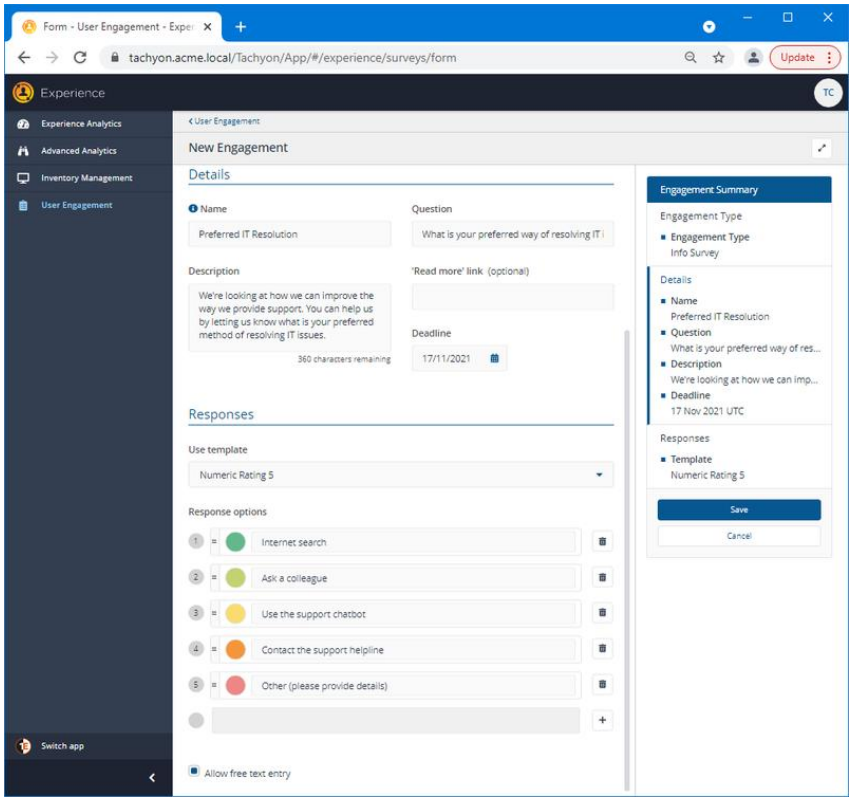
Having selected the **Info Survey** type the next steps are to set a **Name** for the survey, the **Question** and **Description** that will frame the purpose of the survey and the range of **Responses** that will be allowed.

The **Name** for an Info Survey is not stored as a metric that Experience can then report on. The **Name** must be unique amongst all the survey names that have been defined for Experience, but does not have to avoid other Metric names. For example, unlike Sentiment Surveys, **Network** on its own could be used as the **Name** for an Info Survey, even though this is already a metric that Experience reports on. It is best to choose a good name for the survey that reflects the type of question being asked, in this scenario the EUC manager names the survey: **Preferred IT Resolution**.

Just as in Sentiment Surveys, the **Question** frames the survey's meaning and purpose, if the question you choose has not been thought through carefully you will likely confuse your end-users and skew the results. For Info Surveys, the responses you set for the survey can be customized, so a wider variety of questions can be asked. In our scenario, the EUC manager sets the question to:
What is your preferred way of resolving IT issues?

Like Sentiment Surveys, the **Description** for Info Surveys is displayed to the end-user alongside the question and should provide additional context. Use it to capture their attention and provide some guidance as to how the question should be considered. Here, the EUC manager sets the **Description** to:
We're looking at how we can improve the way we provide support. You can help by letting us know what your preferred method of resolving IT issues is. This sets the scene for why the question is being asked and gives a small indication on how it could benefit the end-user and engages them in the process of improving IT. This aspect of the survey is subtler than determining the question but can still be important in terms of encouraging the maximum number of responses possible.

Unlike Sentiment Surveys, Info Surveys are only sent out once and end-users can only make a response once. You can, however, set a **Deadline** for receiving responses, this gives end-users a time range to interact with the survey and send their feedback. Before the deadline occurs, users that haven't yet responded will be prompted repeatedly at appropriate times to make a response. In this scenario, the EUC manager sets the **Deadline** to **17/11/2021**, giving their end-users 7 days to complete. After that time, the survey is closed and the prompts will no longer appear to users who haven't yet responded.



5.3.6.1.3 Defining the responses to the survey

The **Responses** must be closely linked with the **Question** text, and you will likely need to adjust both before you get a suitable fit that is obvious, simple and effective. Info Surveys let you choose a greater range, edit the responses text and select from a wider palette of colors and icons. But, because of that flexibility, they cannot be measured consistently and therefore cannot contribute towards the Sentiment score and have no bearing on the overall Experience score. Initially, the EUC manager selects Numeric Rating 5 for the response options. This gives them five options they can modify, choosing to add more responses (up to a maximum of 10) or remove some. The text of each response can also be edited. For this scenario, the EUC manager edits the text to allow the end-user to choose from the following options:

Internet search

Ask a colleague

Use the support chatbot

Contact the support helpline

Other (please provide details)

To support the last option the EUC manager also checks the **Allow free text entry** checkbox to give the end-users the opportunity to qualify the **Other** response by entering text that describes their other method of resolving IT issues.

5.3.6.1.4 Saving the new survey

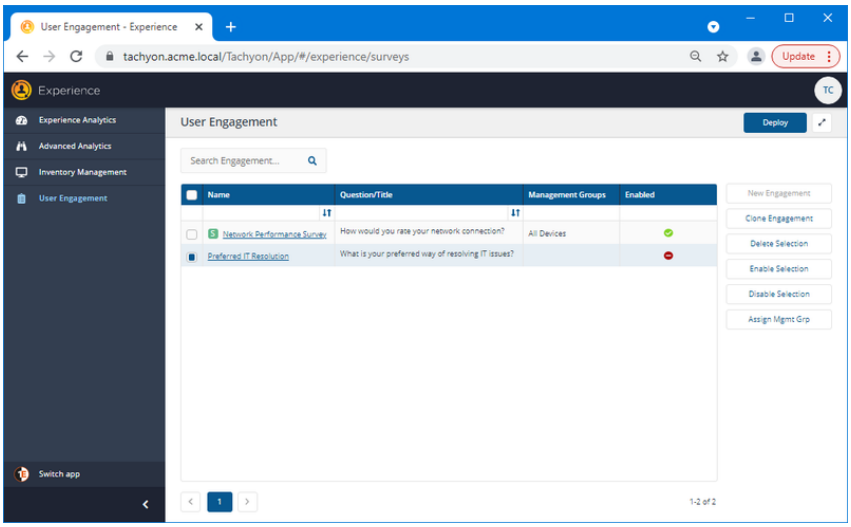
When you're happy with the settings you've made in the survey editor you can click **Save** to commit the changes and continue to the next step.

5.3.6.1.5 Setting the Management Groups for the new survey

Sentiment Surveys default to the **All Devices** Management Group, so they always have a target. Info Surveys don't have a default Management Group, so one must be assigned before the survey can be enabled and then deployed. For this survey the EUC manager wants to poll all of their end-users, so they will assign the **All Devices** Management Group.

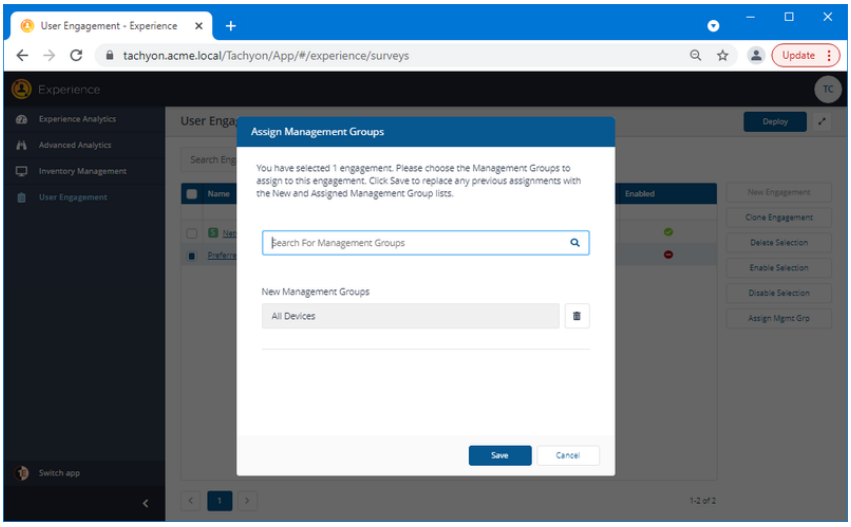
To do this:

They select the survey and then click the **Assign Mgmt Grp** button.



In the **Assign Management Groups** popup subsequently displayed, they type **All** into the search field and then select **All Devices** from the list of matching Management Groups. This gets added to the **New Management Groups** field.

They click **Save** to assign the Management Group.

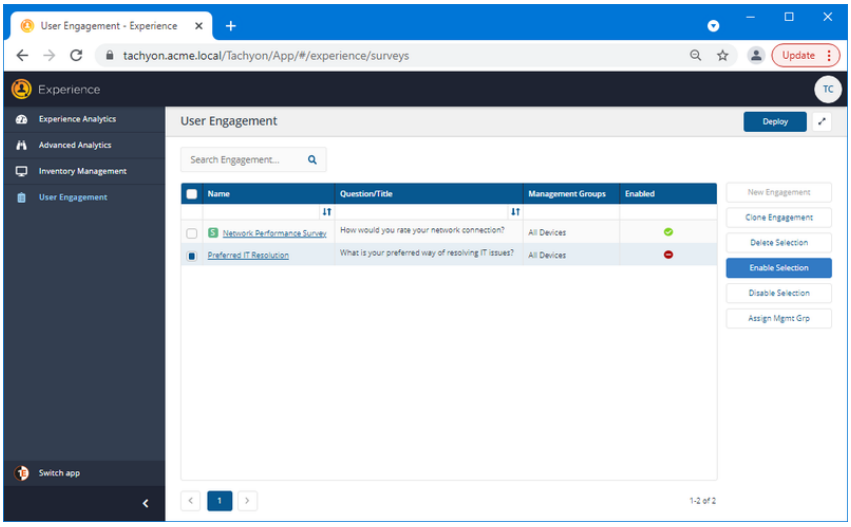


5.3.6.1.6 Enabling the new survey

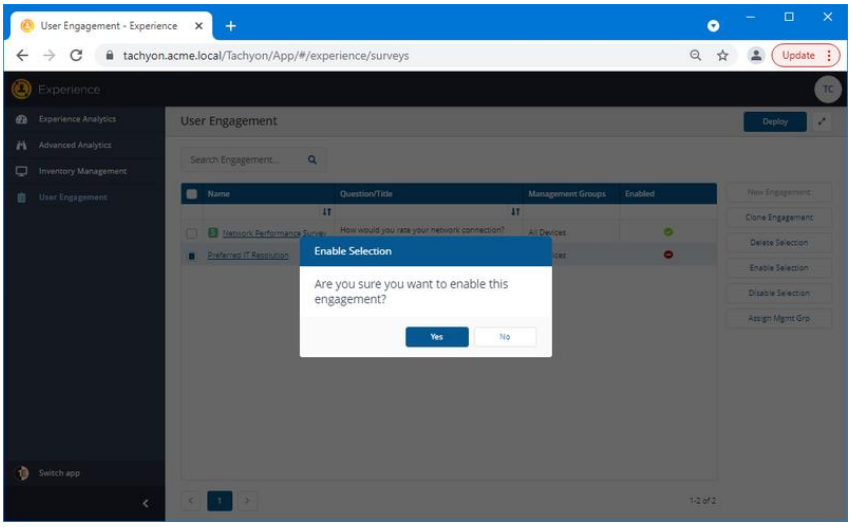
New surveys are not enabled by default. Before they can be deployed, they must be explicitly enabled, providing an additional gateway that prevents the survey being sent out too soon before it's ready.

To enable the new Info Survey the EUC manager:

Selects the checkbox at the left-hand end of each survey's entry in the Engagements table and then click the **Enable Selection** button.



Doing this displays an **Enable Selection** confirmation popup that you must acknowledge before the selected engagements are actually enabled. Click **Yes** to confirm the operation and **No** to cancel it.



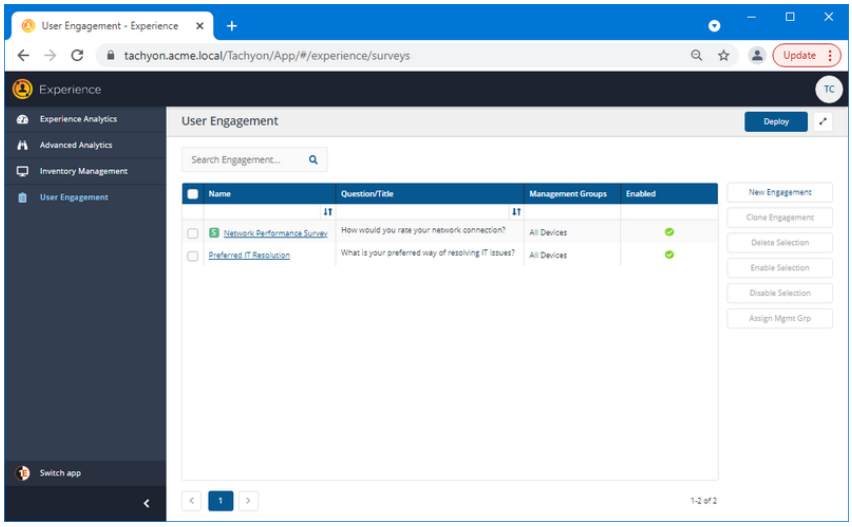
5.3.6.1.7 Deploying the new survey

So the new Info Survey has the **All Devices** Management Group assigned and has been enabled, it can now be sent to the end-users' devices by clicking the **Deploy** button, which will send the survey to all the devices currently and subsequently connected to Tachyon.

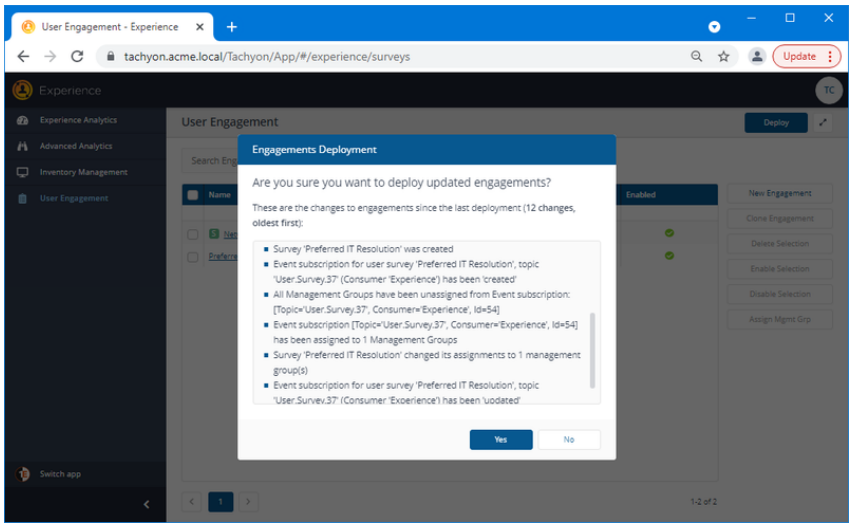
> **Note**
>
> The **Deploy** button will send out any changes to the states of the surveys - meaning you can also use it to set previously deployed surveys to not **Enabled**, thereby preventing further responses without completely deleting the survey, or you can delete surveys when they are no longer needed. You should be aware that the **Deploy** button will also send any other User Engagement administrator's changes.

It is good practice to test the survey on a few machines first before deploying to **All Devices**. This lets you see how the survey will appear to your end-users and gives you the opportunity to debug the text and selections before deploying to a wider audience. Doing this involves assigning a different Management Group to the survey that targets the selected devices.

In our example, which only involves a few devices anyway, to keep things simple we can get away with sending the Info Survey out without testing, so the EUC manager clicks the **Deploy** button.



An **Engagements Deployment** popup appears that shows the changes that will be deployed when the **Yes** button is clicked. The EUC manager reads the list carefully, sees that the only changes are the ones related to creating, assigning Management Groups and enabling the **Preferred IT Resolution** survey and clicks **Yes**. Subsequently, a notification will appear showing that the policy changes are being applied to the Tachyon Agents.



5.3.6.2 What the end-user sees

When the 1E Client is installed on a network device, by default it also adds an icon to the notification area that displays the Real-Time Control Center (RTCC). Initially the icon may be hidden, but may be dragged onto the taskbar to make it always visible. When an end-user clicks on the notification icon they will see the **Surveys** and **Announcements** that have been deployed to the device.

> **Note**
>
> Although Info Surveys are displayed in the list of available surveys, you cannot display them by clicking. Instead, for Info Surveys, the end-user must wait until they appear.

5.3.6.2.1 When does the survey appear?

To minimize the disruption to the end-user of having a survey popup when they're busy using the computer for other things, the 1E Client has a few heuristics that govern when the notifications appear. These measure and compare things like: whether the user is currently interacting with the device, how long it has been since they stopped interacting with the device, how long the notifications should wait before re-displaying if the user didn't respond to the last time it was displayed. These various options interact to essentially display the notification in the sweet spot between the user not actively doing something and the user having left their device.

Info Surveys also provide an option to **Dismiss**, which means that they don't want to answer the survey at all, or click **Later**, which means that they don't want to be bothered just at this moment but may respond when the notification is next displayed.

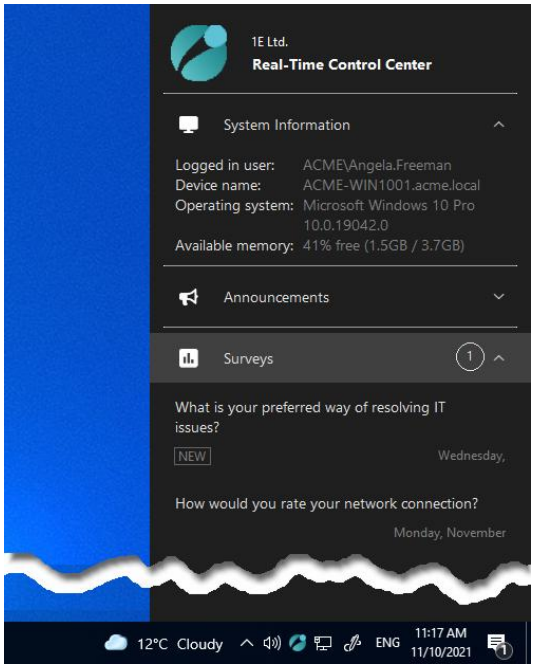
> **Note**
>
> Your end-users can also set the **Do not disturb** option, which prevents notifications from appearing for a configurable time period. Please refer to Do not disturb... for more details.

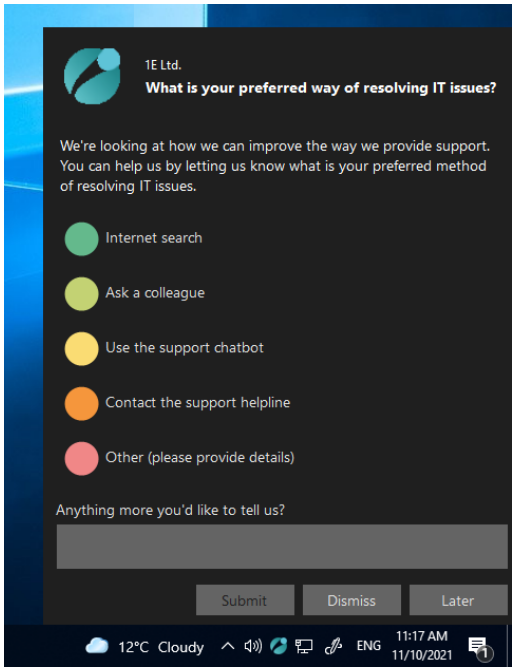
5.3.6.2.2 Responding to the survey

In our scenario, the deployed Info Survey pops up on an end-user's device. They can see both the question and the description text that was defined as part of the survey, along with the range of five customized options for responding and a free text edit box labelled **Anything more you'd like to tell us?**. Although the intention of the EUC manager is for this free text to be associated with the **Other (please provide details)** option, there's nothing to stop the end-user from adding extra information to help clarify any of their choices. There's also nothing to stop the end-user from selecting the **Other** option and not filling out the text box. This is why it is critical for the EUC manager to label the option correctly and at least provide a hint that more details should be added if that option is selected.

> **Note**
>
> The following 1E Client settings are used to configure the behavior of the Real-Time Control Center. If you click on a link, it will take you to the 1E Client documentation space.
>
> Module.Interaction.Enabled | Module.Interaction.ActiveSessionThresholdSeconds | Module.Interaction.CompanyName | Module.Interaction.DoNotDisturb | Module.Interaction.IdleSessionThresholdMinutes | Module.Interaction.ITSM.ServiceNow.CreateIncidents | Module.Interaction.ITSM.ServiceNow.Enabled | Module.Interaction.ITSM.ServiceNow.GoBackDays | Module.Interaction.ITSM.ServiceNow.Url | Module.Interaction.LogSessionNotificationReadiness | Module.Interaction.MinimumMinutesAfterLogonBeforePrompt | Module.Interaction.MinimumMinutesAfterSessionActivationBeforePrompt | Module.Interaction.MinimumMinutesBetweenPrompts | Module.Interaction.NotificationIcon | Module.Interaction.PeriodsBeforeUiLaunch | Module.Interaction.PeriodsBeforeUiLaunchTimeout | Module.Interaction.Port | Module.Interaction.ResponseAuditsBeforeTidy | Module.Interaction.ResponseRetentionRows | Module.Interaction.SampleExclusionList |

Module.Interaction.SampleUserInteraction | Module.Interaction.SnoozeTimeMinutes | Module.Interaction.Theme

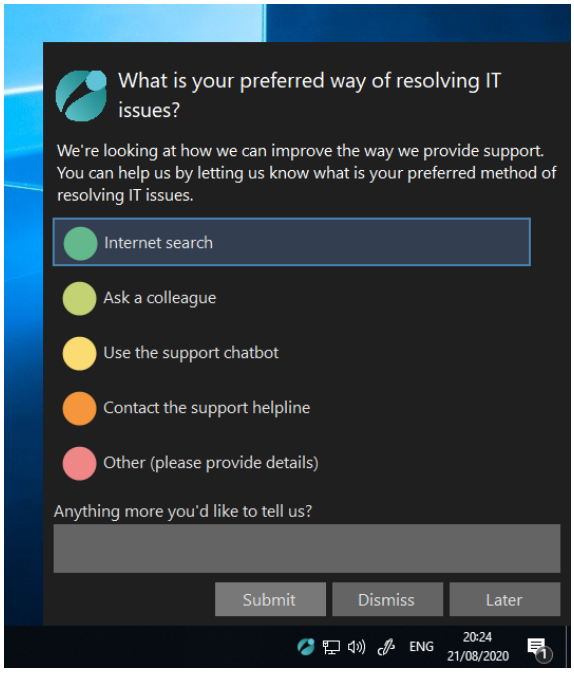




5.3.6.2.3 Submitting a response to the survey

The end-user will need to click on the response they want to make before the **Submit** button becomes enabled.

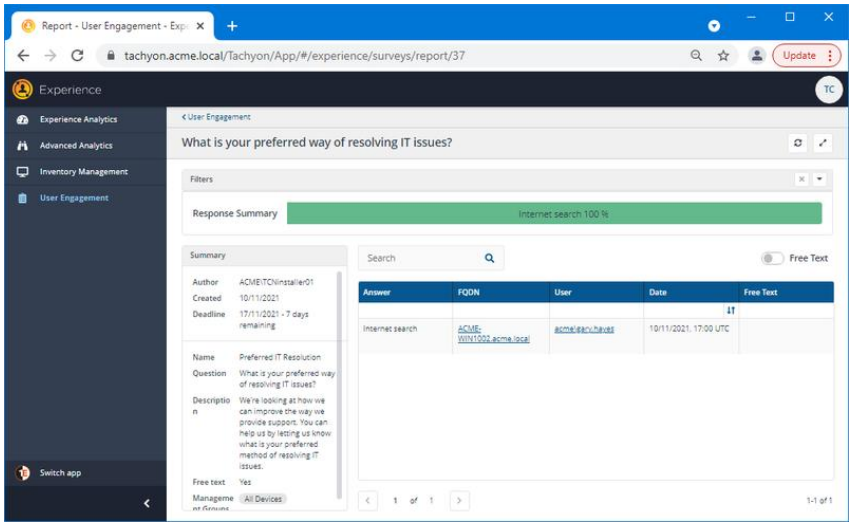
Our end-user is fairly tech-savvy and likes to sort their own problems as far as possible, so they click on the **Internet search** response and then on **Submit**.



5.3.6.3 Viewing survey responses

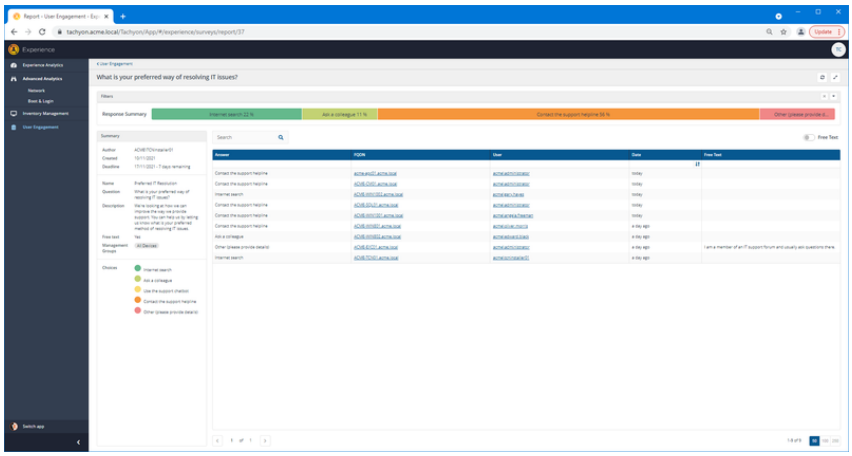
The **Preferred IT Resolution** survey has been deployed and end-users have begun to respond, the EUC manager wants to monitor those responses. For an Info Survey the only place the responses can be viewed is from its details page, you get to this by clicking on the link for the survey in the **Name** column of the Engagements table on the **User Engagement** page.

In the picture, the EUC manager has clicked on the **Preferred IT Resolution** link to display its details page. Here, they can see that a user has submitted a response.



After a number of responses have been made a clearer picture of the current user behavior appears. The majority of users **Contact the support helpline**. The next most popular option is to use **Internet search** and try to resolve their own issues. **Ask a colleague** is the next used option along with **Other**, the text that went with that response indicates that the user is a member of an IT support forum. A surprising aspect of the survey is that no one prefers the support chatbot, Perhaps that is because it is difficult to find, or that the users have had

a poor experience with it. Perhaps the EUC manager would want to follow up with another survey specifically aimed at getting feedback on the support chatbot. Clearly, the survey has performed its task and provided the EUC manager with information that will be useful to the IT department in terms of improving their IT service for end-users.

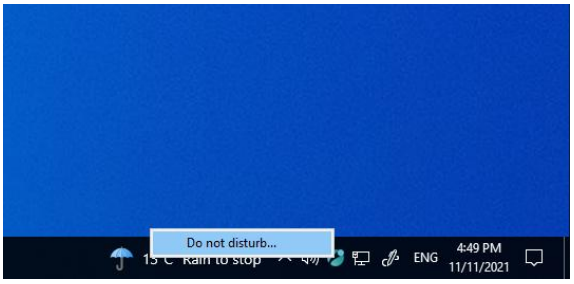


5.3.6.4 Do not disturb...

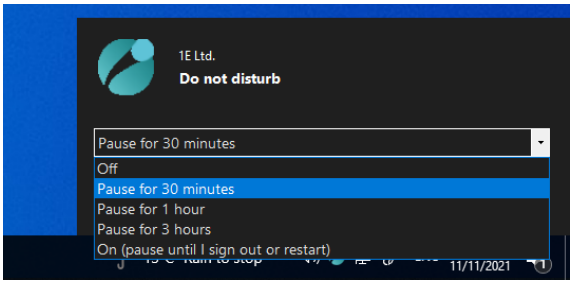
Sometimes your end-users want to be left undisturbed by survey notifications. They may be concentrating on a tricky piece of work or using their device to present to an audience and the last thing they want is a survey notification to popup unexpectedly. In these cases, the end-user can interact with the 1E Client notification icon to temporarily suspend notifications from appearing.

To do this, the end-user would:

Right-click on the 1E Client notification icon to display the **Do not disturb...** option.



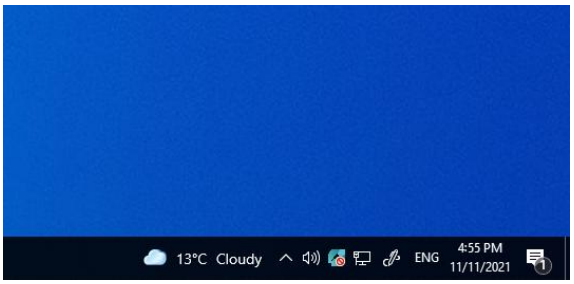
In the **Do not disturb** popup they would select the behavior they want to set.



The options are:

Option	Description
Off	Sets the **Do not disturb** feature to off. Notifications will appear as normal.
Pause for 30 minutes, 1 hour, 3 hours	Set the **Do not disturb** feature to on for the selected time period. Notifications will not appear during the selected period, 30 minutes, 1 hour or 3 hours. After that time notifications will appear as normal.
On (pause until I sign out or restart)	Set the **Do not disturb** feature to on until the end-user signs out or restarts their device.

After selecting one of the options that turns the **Do not disturb** feature to on, the notification icon will change to indicate that notifications will not appear.

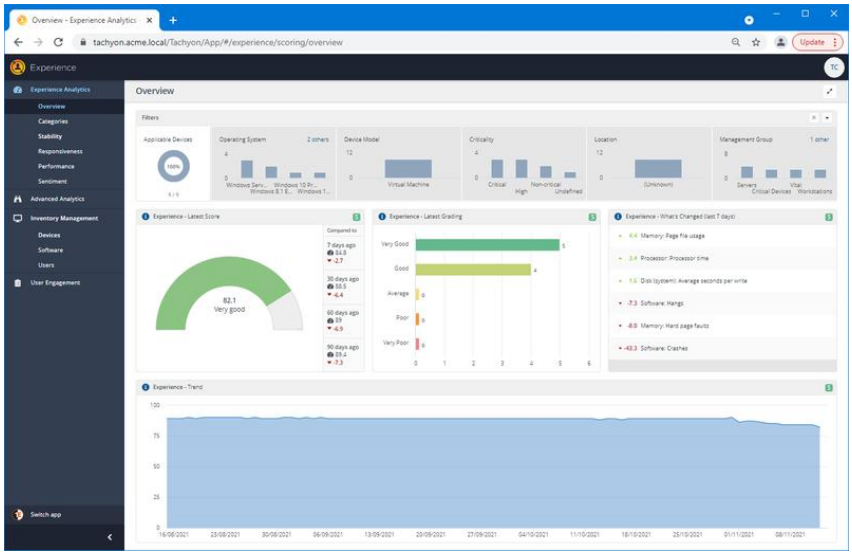


5.3.7 Investigating software crashes

In this scenario, the EUC manager uses Experience to track down the causes for a recent spate of software crashes. After finding some information, they then check whether the crashes have affected key devices currently involved in some urgent work for the company. Finally, they compare two devices, good and bad, to pinpoint the issue cause.

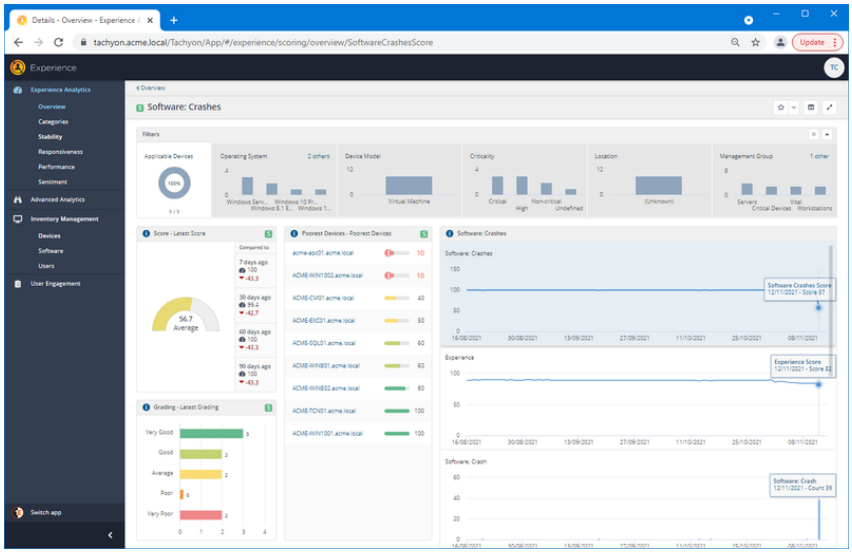
5.3.7.1 Checking the recent trends on the Overview page

The EUC manager checks the **Experience Analytics→Overview** page and notices on the **Experience - What's Changed (last 7 days)** tile that there has been a **-43.3** drop in **Software Crashes**. They click on the **Software Crashes** link in the tile to investigate this disturbing issue.



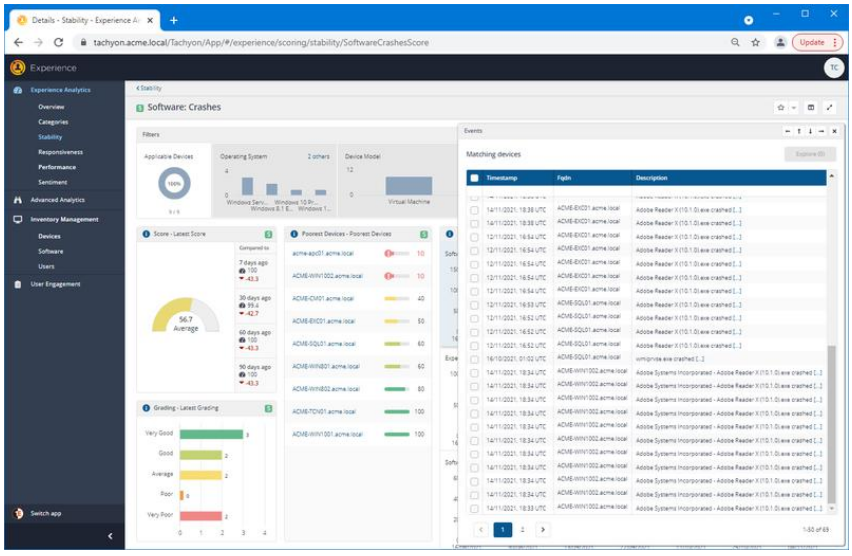
5.3.7.1.1 Checking the Software Crashes

On the Software Crashes page that there has been stability degradation across a number of devices, particularly for two devices, whose software crash score is now just 10 out of 100. Scanning through the graphs, they see that there is a sharp dip in the **Software Crashes Score** and that there have been **39** crashes counted for a single day.



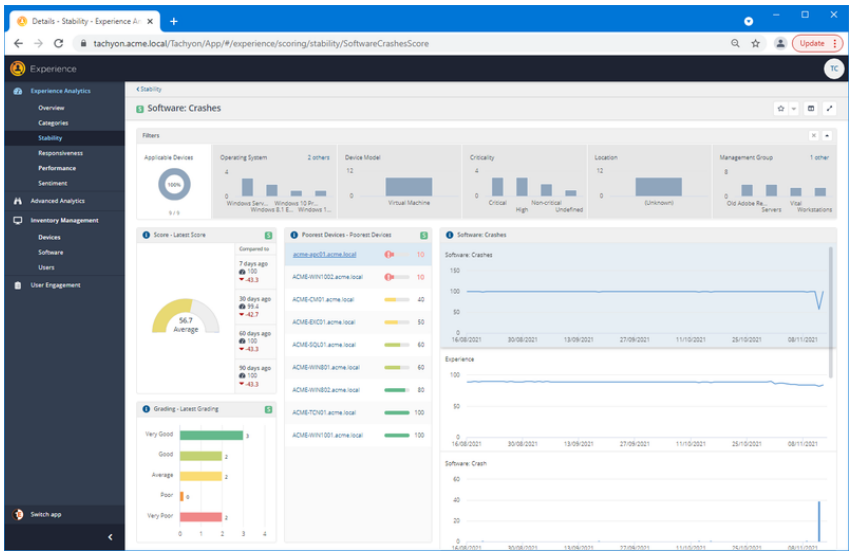
5.3.7.1.2 Viewing the recent crash events

Clicking on the bar for the Software Crash count displays a panel showing the related events. Here they can see that there have been numerous crashes for a particular version of Adobe Reader X (10.0.1).



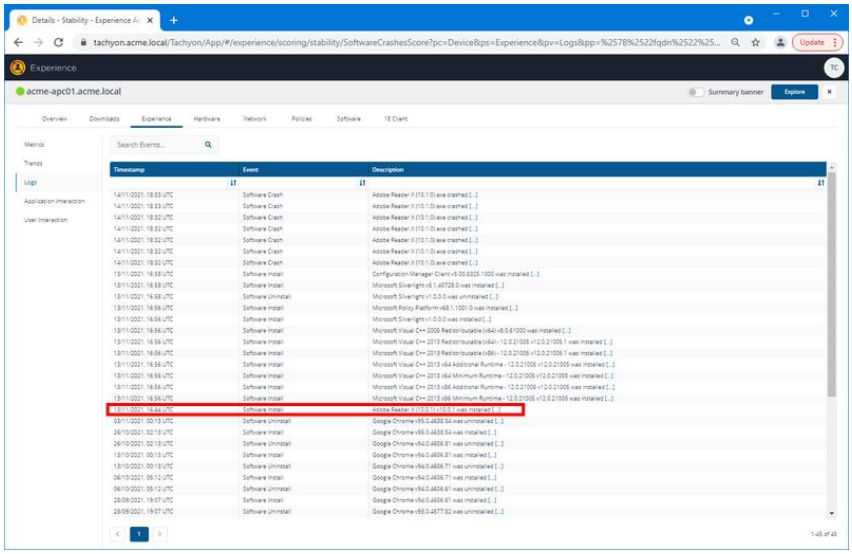
5.3.7.1.3 Investigating the most affected device

Closing the events panel, the EUC manager then clicks on the link for the topmost device in the Poorest Devices tile to open the Device Details panel for that device.



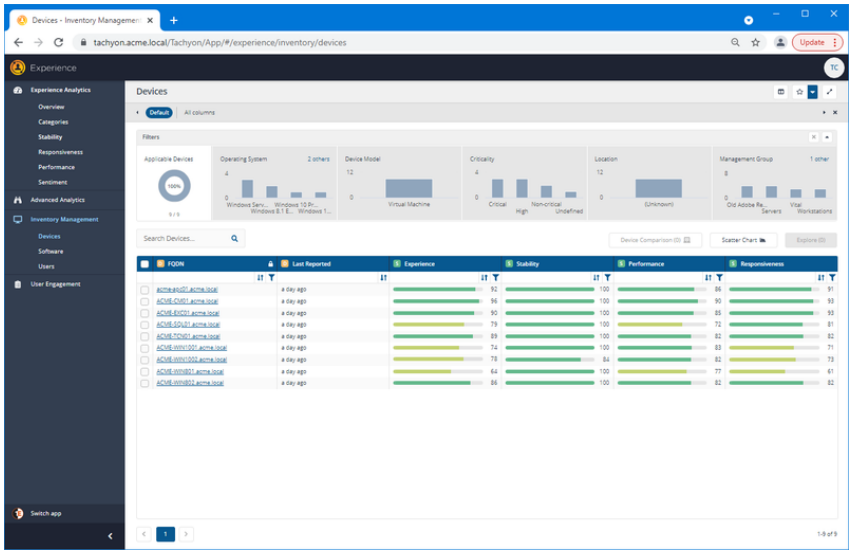
5.3.7.1.4 Checking the Logs for the device

From the Software Crashes page, the device links display the Device Details with the Logs panel open. Scanning down the log entries, they spot a significant entry that shows that Adobe Reader X (10.0.1) has recently been installed on the device.



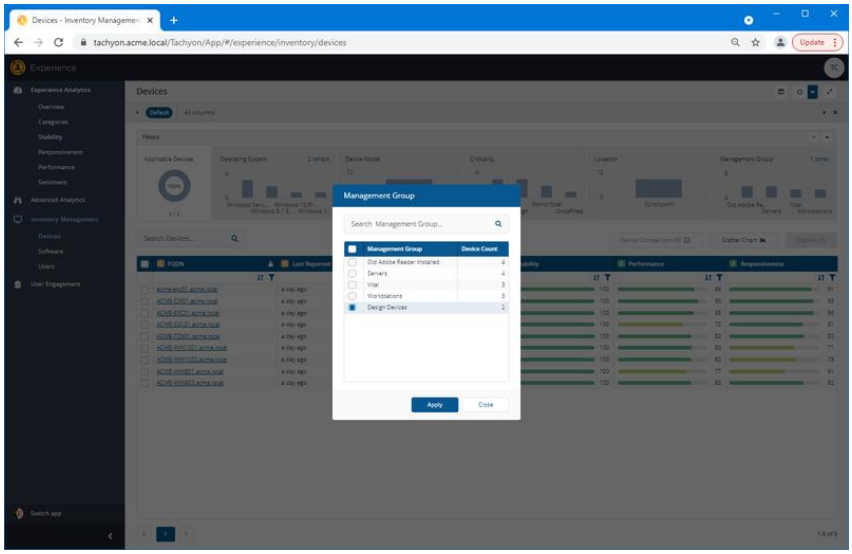
5.3.7.2 Focusing on specific devices using a Management Group filter

The EUC manager now wants to compare two devices, one affected by the crashes and the other not. They also want to check how a particular set of devices has been affected by the crashes. In our example, the EUC manager has an existing Management Group for the devices. They navigate to the **Inventory Management→Devices** page in order to use the Management Group filter to focus the view on the devices they are interested in.



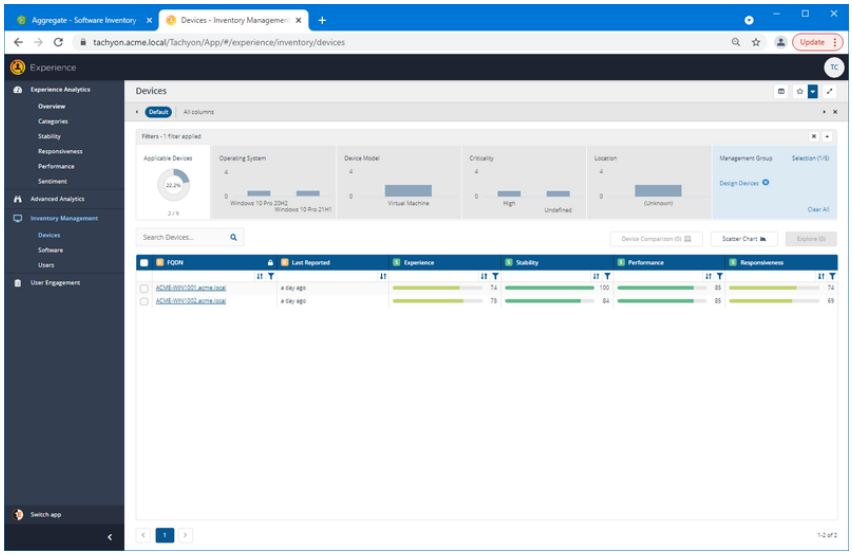
5.3.7.2.1 Selecting the Management Group filter

Clicking on the **1 other** link in the Management Group tile of the Filters bar displays the **Management Group** popup. Here they select the **Design Devices** Management Group that holds the devices they are interested in, and then click the **Apply** button.



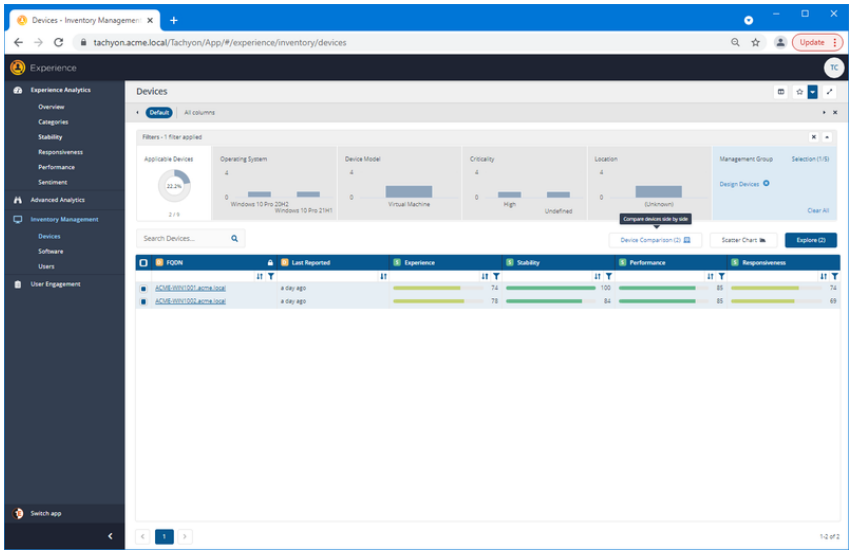
5.3.7.3 Comparing two devices

The Devices list is then filtered to contain just those devices. They can see from the Stability score that only one device has been affected by the crashes.



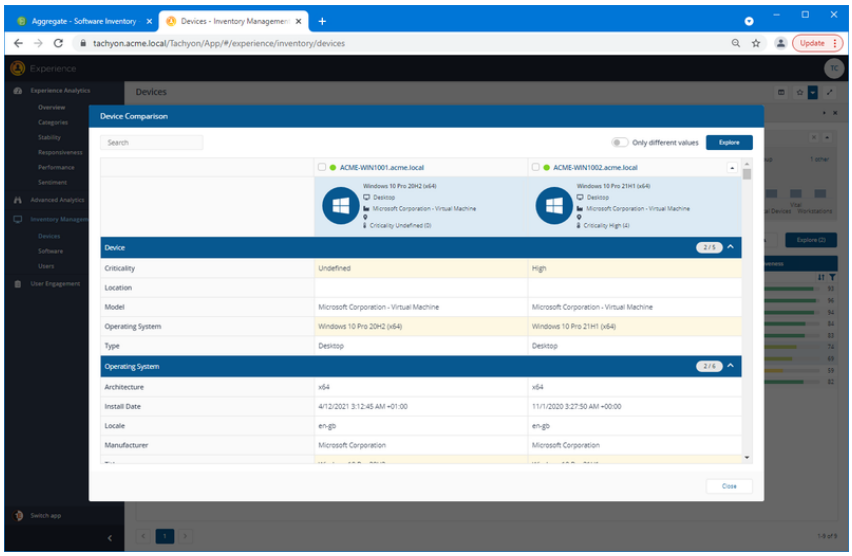
5.3.7.3.1 Using the Device Comparison tool

Selecting the two devices by clicking on the checkbox at the left-hand end of the header row enables the **Device Comparison** button. This button becomes enabled only when there are two items selected in the Devices list. Clicking on the Device Comparison button displays the **Device Comparison** popup and gathers the data from the two selected devices in real-time.



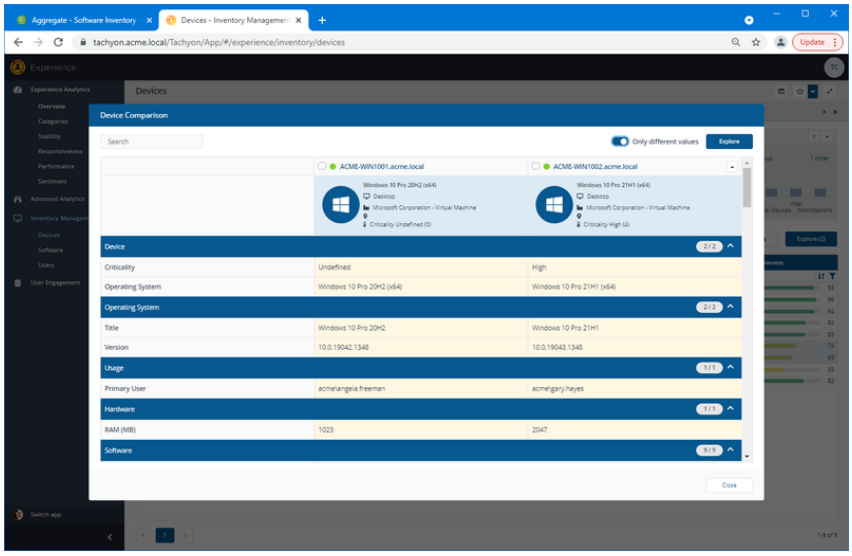
5.3.7.3.2 Comparing the settings for the devices

Initially, the **Device Comparison** popup shows all the parameters gathered from the devices, whether they are different or not. The differences are highlighted in yellow.



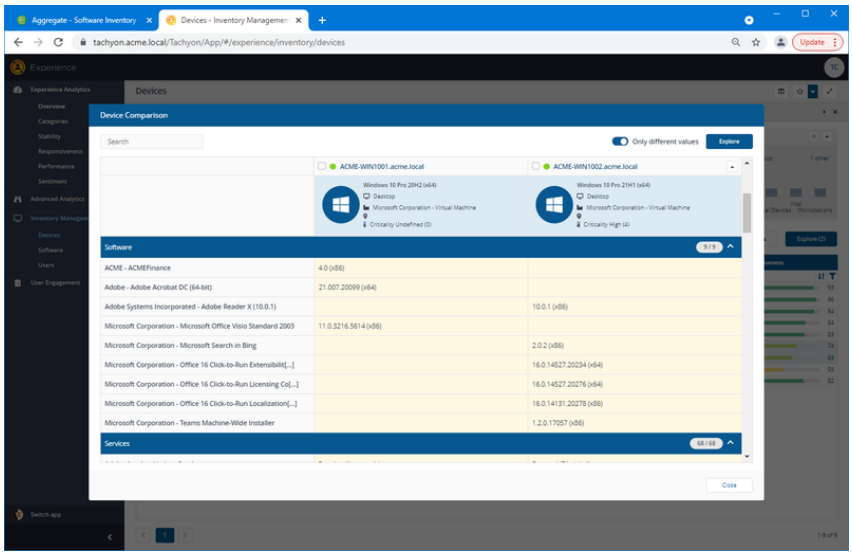
5.3.7.3.3 Focusing on the differences

You can focus on just the different value by flipping the **Only different values** toggle to on. The EUC manager notices some differences between the devices that may require some action - for example, the Operating System for the two devices is different and ideally for these devices they should be the same. However, they make a note of that for a future action and concentrate on tracking down the differences that may be significant to the Adobe Reader crashes.



5.3.7.3.4 Checking the differences in the installed software

Scrolling down the list of differences, they see in the **Software** section that two different versions of Adobe Acrobat\Reader are installed. The one on the device affected by the crashes is version **10.0.1 (x86)**, a very old version around 10 years out of date and with known vulnerabilities.

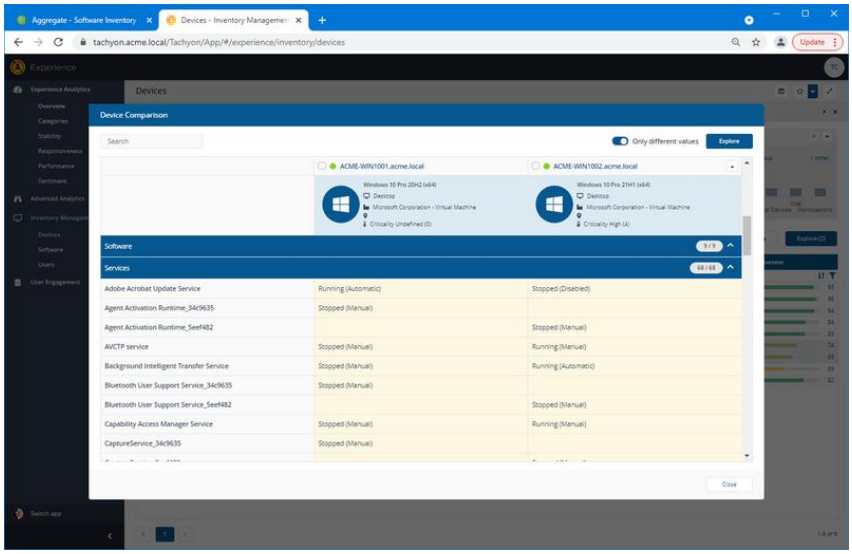


5.3.7.3.5 Checking the differences in the Services configuration

Checking the Services, they then see that the **Adobe Acrobat Update Service** is **Stopped (Disabled)** on the device affected by the crashes. So the device has an old version of the Adobe Reader installed, and the update service has been disabled. This strongly indicates the cause for the issue and suggests a possible resolution.

The EUC manager now needs to assign his team use Explorer to have the Adobe Acrobat Update Service to Started so that Adobe Reader will be updated on all devices where the old version is installed. Before doing this, there may be a need to send an announcement to all the affected devices to provide information about this

necessary change to the end-users on the devices, please refer to Broadcasting information via Announcements for more details.



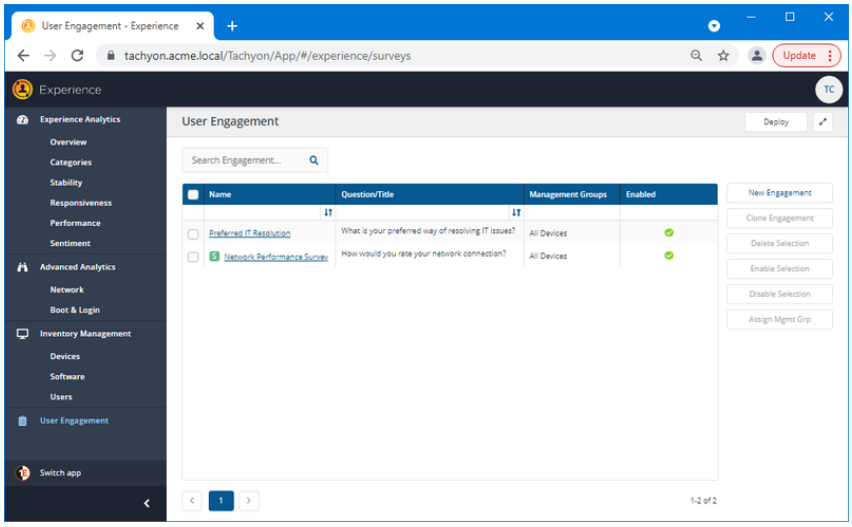
5.3.8 Broadcasting information via Announcements

In this scenario, the IT team want to notify users with certain older versions of Adobe Acrobat Reader that they are going to be upgraded to the latest version. The **end-user computing (EUC) manager** uses Experience to create and send an announcement that will be seen by the users on the devices in a specific Management Group.

5.3.8.1 Creating a new Announcement

The **Experience→User Engagement** page is where you manage all the Sentiment, Info Surveys and Announcements that have been created in Experience. You can easily see for each engagement the **Options** that it has been configured with, what **Management Groups** it has been assigned to and whether it's **Enabled** or not. In the picture, you can see the state following on from the Getting feedback via Info Surveys scenario.

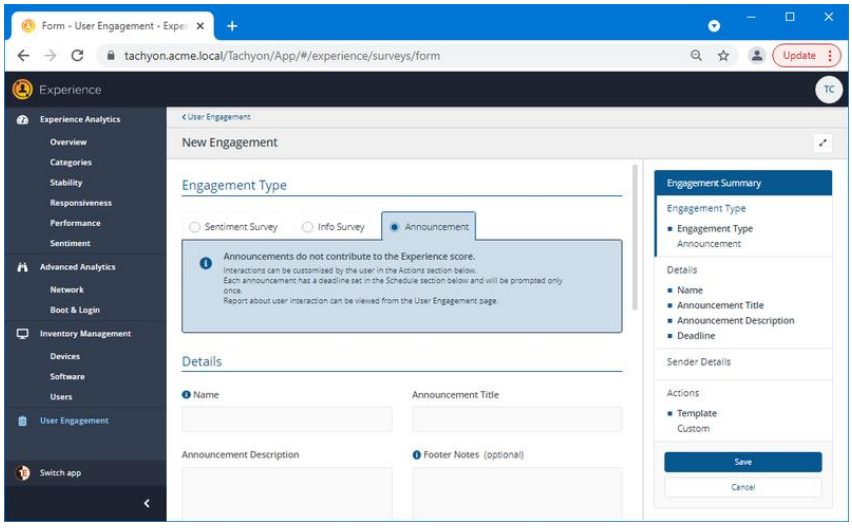
Click the **New Engagement** button to begin.



5.3.8.1.1 Announcements

In contrast to the survey types, Sentiment Survey and Info Survey, Announcement type engagements are used solely to broadcast information to end-users. You can still gather the results of sending the announcement, but this is only done to check that the information has been received. Announcements don't contribute to the Sentiment Score.

The picture shows the **Announcement** type selected.



5.3.8.1.2 Names, Announcement Titles and Descriptions, Footer Notes, Read more links, Deadlines and Priorities

Having selected the **Announcement** type, the next steps are to set a **Name** for the announcement, the **Announcement Title** and **Announcement Description** that will frame the purpose of the announcement. You can also optionally add **Footer Notes**, which can provide additional information in the announcement itself, and a **'Read more' link**, which can provide additional information for the announcement in the form of an externally available web page.

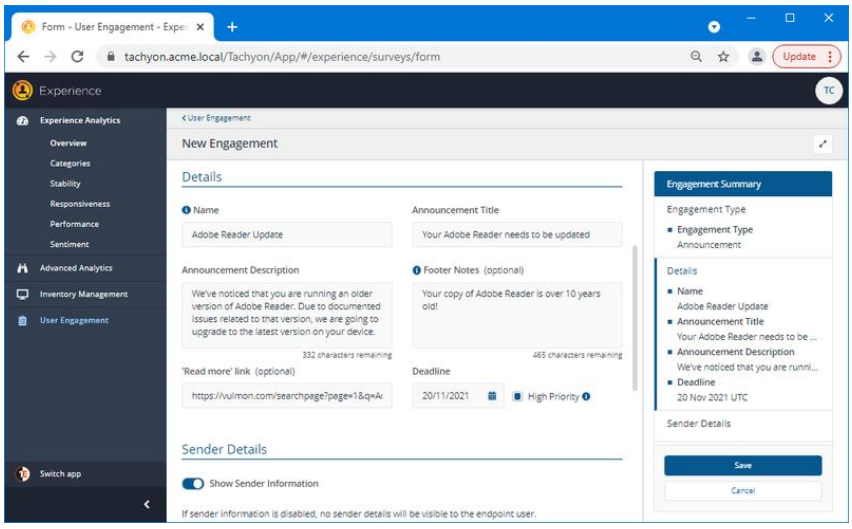
The **Name** for an Announcement is not stored as a metric that Experience can then report on. The **Name** must be unique amongst all the Engagement names that have been defined for Experience, but does not have to avoid other Metric names. For example, unlike Sentiment Surveys, **Network** on its own could be used as the **Name** for an announcement, even though this is already a metric that Experience reports on. It is best to choose a good name for the announcement that reflects the type of information being broadcast, so that it reminds you of its purpose if you encounter it on the **User Engagement** page at a later date, in this scenario the EUC manager names the survey: **Adobe Reader Update**.

The **Announcement Title** provides the headline for the information you are trying to get across to the end-user, if the headline has not been thought through carefully you will likely confuse your end-users and fail in your objective. In our scenario, the EUC manager sets the question to: **Your Adobe Reader needs to be updated**

The **Announcement Description** is displayed to the end-user just below the **Announcement Title** and should provide additional context. Use it to answer the likely questions that will arise from the announcement and provide some guidance as to what the user should expect. Here, the EUC manager sets the **Announcement Description** to:
We've noticed that you are running an older version of Adobe Reader. Due to documented issues related to th at version, we are going to upgrade to the latest version on your device. This sets the scene for why the action is being taken and gives a small indication on how it will increase the security on the end-user's device.

Footer Notes let you optionally provide additional bullet-points that emphasize your message. These are displayed in the announcement beneath the **Announcement Description**. In our example, the EUC manager adds **Your copy of Adobe Reader is over 10 years old!** as a footer note. This highlights just how out-of-date the installed version is and brings the message home that it needs to be replaced.

Optionally, the **'Read more' link** field can be set, which adds the text **Click here to find out more** to the announcement. The user can click on this link to find out related supplementary information. In our scenario, the EUC manager has found a page on a vulnerabilities listing site that deals with the particular version of Adobe Reader. That way the end-user can click on the **Click here to find out more** link in the announcement and check for themselves the vulnerabilities that are present on their device - because that version of the software is installed - again reinforcing the idea that an upgrade is required.



Announcements are only sent out once, and end-users can only make a response once. You can, however, set a deadline for receiving responses, this gives end-users a time range to acknowledge that they have seen and processed the information. Before the deadline occurs, users that haven't yet responded will be prompted repeatedly at appropriate times to respond. In this scenario, the EUC manager sets the **Deadline** to **20/11/2021**, giving their end-users a seven-day window to view the information. After that time, the announcement is closed and the prompts will no longer appear to targeted users who haven't yet responded.

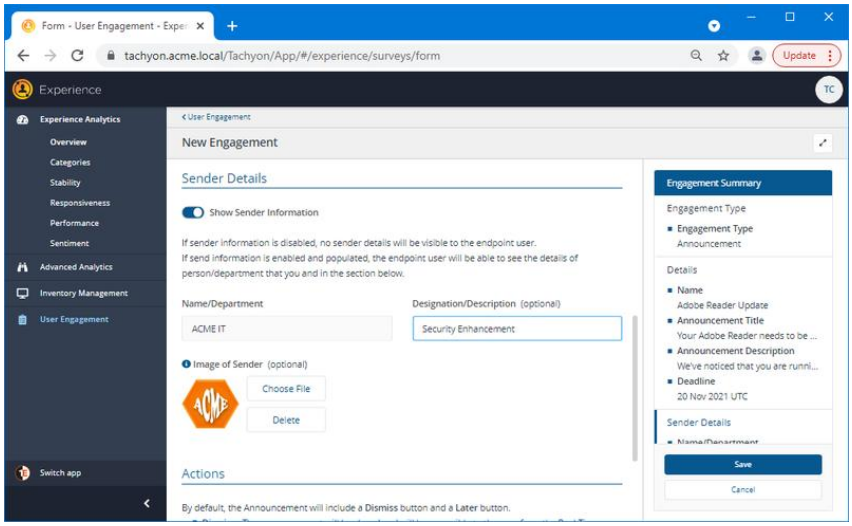
The final parameter in the **Details** section lets you determine how insistent the announcement will be. Setting the **High Priority** option ensures that the announcement will be delivered, even if the end-user has chosen to restrict notifications. You should use this option with care, as you don't want to be disturbing your end-users for every notification you want to send. If every notification is set to high priority, then none of them are.

In our scenario, the EUC manager is justified in setting this announcement to **High Priority**, as the action they intend to take will have an impact on the targeted end-users and will enhance the security and reliability of their device.

5.3.8.1.3 Setting the Sender Details

Announcements are a direct communication to your end-users, you will likely want that communication to be as well-received as possible. Part of that process is to provide information about exactly who wants the communication to be made. In this example it will be the ACME IT department who will take the action, but in another scenario, the announcement could just as well have been sent on behalf of the CEO for the company. You can imagine how this would affect the processing of the information by the end-user when they receive the announcement.

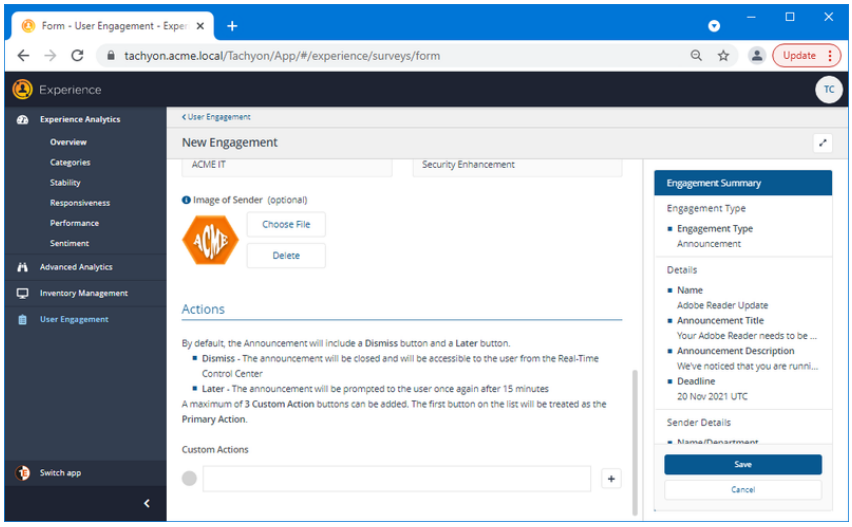
The EUC manager enables the **Show Sender Information** toggle, sets the **Name/Department** field to **ACME IT** and the optional **Designation/Description** to **Security Enhancement**, because that's the name of the project they are taking this action under. They also badge the announcement with the ACME logo to make it official and give it the company seal of approval.



The **Actions** section comes last in the Announcement Engagement editor. Here you can provide additional URLs tied to buttons, that can be triggered by clicking on each button - or in the case of the **Primary Action** button (the first one on the list), by hitting the <enter> key. For example, you may have set up a registration page on your company intranet that can be triggered by a URL. In this case you could create a **Please register** announcement, add a **Custom Actions** button called **Register** and set that to the URL. When an end-user subsequently receives the announcement asking them to register, they click on the **Register** button and it takes them to the registration page via the provided URL.

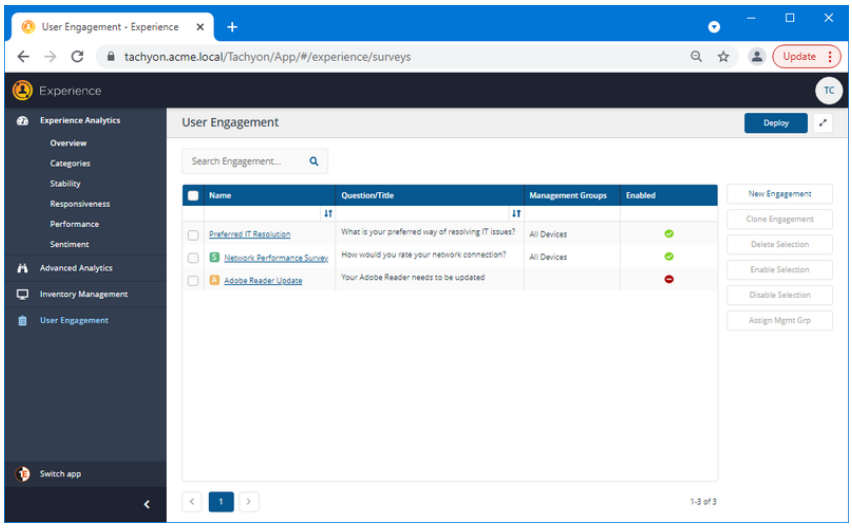
A second option, if your organisation allows is to provide a link to an App Store or Service Catalog, to allow users to update the software themselves.

In our scenario, the EUC manager doesn't have any **Custom Actions** they want to add to the announcement so they leave this section blank.



5.3.8.1.4 Saving the new announcement

When you're happy with the settings you've made in the survey editor you can click **Save** to commit the changes and continue to the next step. The picture shows the new announcement added with no Management Groups set and not yet enabled.

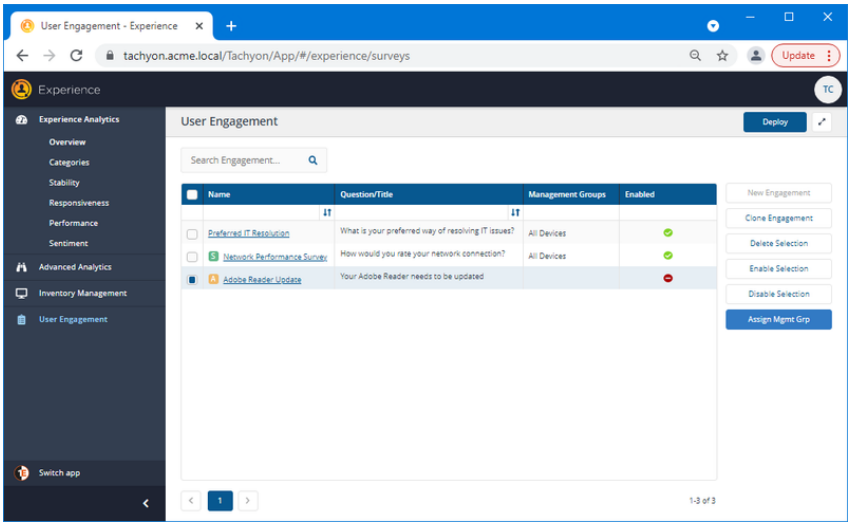


5.3.8.1.5 Setting the Management Groups for the new announcement

Announcements don't have a default Management Group, so one must be assigned before the survey can be enabled and then deployed. For this announcement, the EUC manager already has an **Old Adobe Reader Installed** Management Group defined that targets the devices they have identified where the old version is installed. They now need to set that as the Management Group for the announcement.

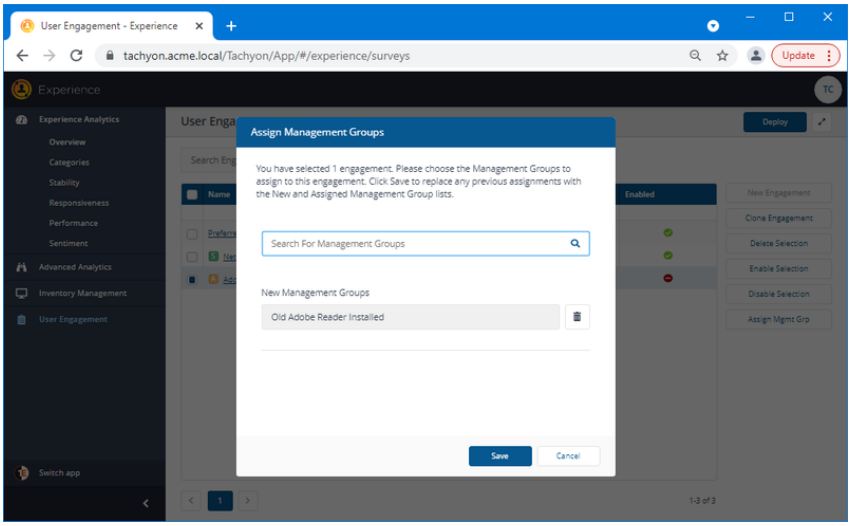
To do this:

They select the survey and then click the **Assign Mgmt Grp** button.



In the **Assign Management Groups** popup subsequently displayed, they type **Adobe** into the search field and then select **Old Adobe Reader Installed** from the list of matching Management Groups. This gets added to the **New Management Groups** field.

They click **Save** to assign the Management Group.

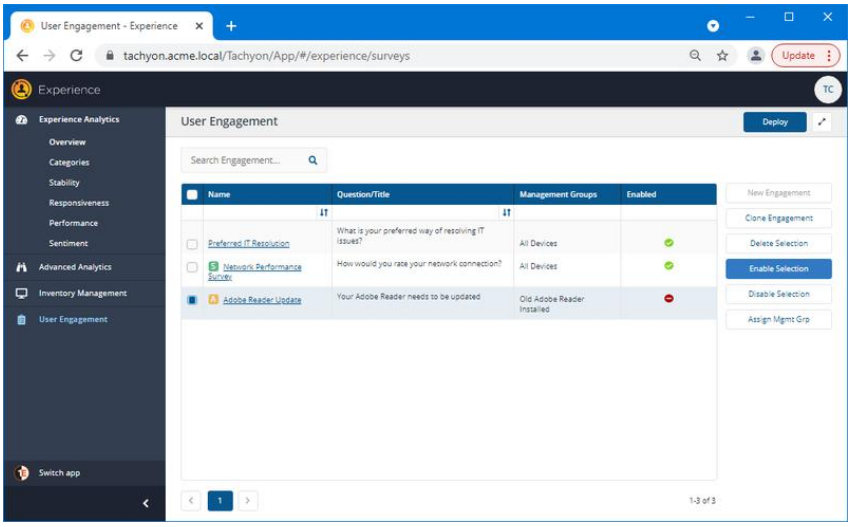


5.3.8.1.6 Enabling the new announcement

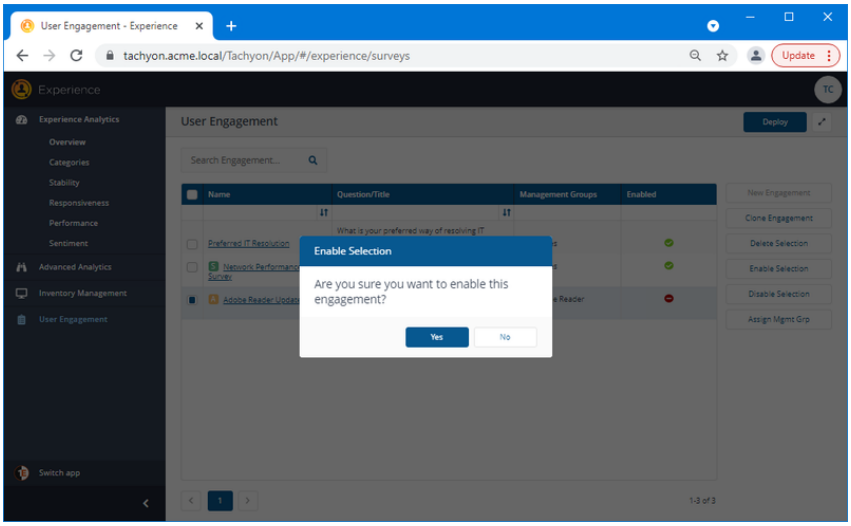
New engagements are not enabled by default. Before they can be deployed, they must be explicitly enabled, providing an additional gateway that prevents the engagement being sent out too soon before it's ready.

To enable the new announcement the EUC manager:

Selects the checkbox at the left-hand end of the announcement's entry in the Engagements table and then clicks the **Enable Selection** button.



Doing this displays an **Enable Selection** confirmation popup that you must acknowledge before the selected engagements are actually enabled. Click **Yes** to confirm the operation and **No** to cancel it.



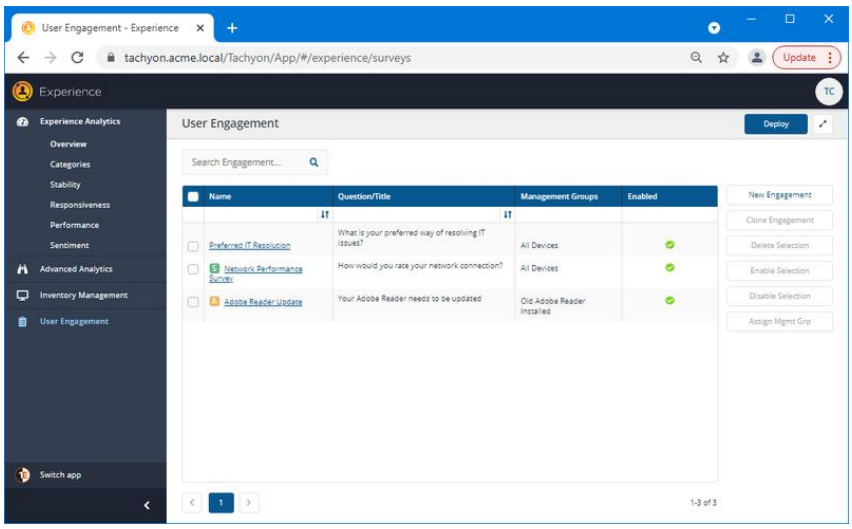
5.3.8.1.7 Deploying the new announcement

So the new announcement has the **Old Adobe Reader Installed** Management Group assigned and has also been enabled, it can now be sent to the end-users' devices by clicking the **Deploy** button, which will send the announcement to all the devices in the selected Management Group, that are currently or subsequently connected to Tachyon.

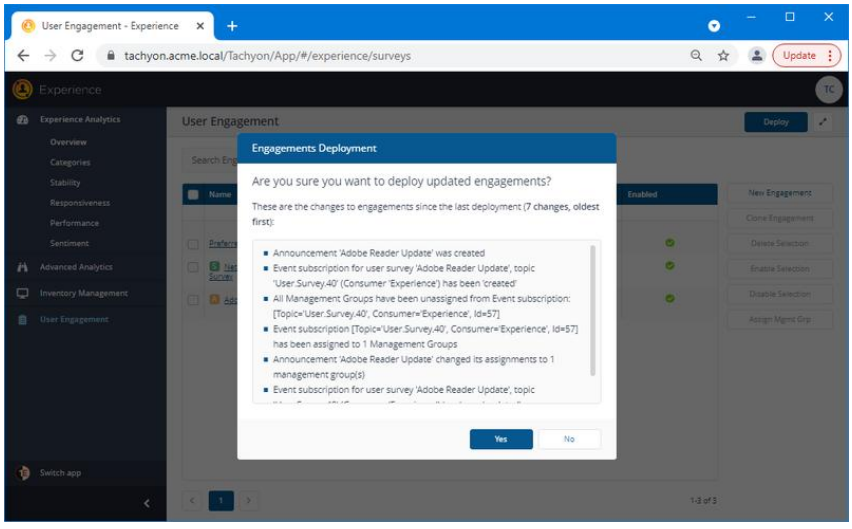
> **Note**
>
> The **Deploy** button will send out any changes to the states of the engagements - meaning you can also use it to set previously deployed engagements to not **Enabled**, thereby preventing further responses without completely deleting the engagement, or you can delete engagements when they are no longer needed. You should be aware that the **Deploy** button will also send any other User Engagement administrator's changes.

It is usually good practice to test the engagement on a few machines first before deploying to **All Devices**. This lets you see how the engagement will appear to your end-users and gives you the opportunity to debug the text and options before deploying to a wider audience. Doing this involves assigning a different Management Group to the survey that targets the selected test devices.

In our example, which only involves a few devices anyway, to keep things simple we can get away with sending the announcement out without testing, so the EUC manager clicks the **Deploy** button.



An **Engagements Deployment** popup appears that shows the changes that will be deployed when the **Yes** button is clicked. The EUC manager reads the list carefully, sees that the only changes are the ones related to creating, assigning Management Groups and enabling the **Adobe Reader Update** announcement and clicks **Yes**. Subsequently, a notification will appear showing that the policy changes are being applied to the Tachyon Agents.



5.3.8.2 What the end-user sees

When the 1E Client is installed on a network device, by default it also adds an icon to the notification area that displays the Real-Time Control Center (RTCC). Initially the icon may be

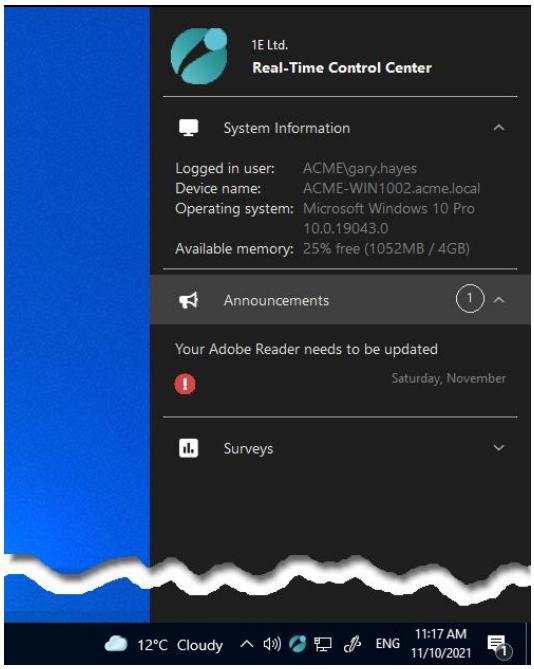
hidden, but may be dragged onto the taskbar to make it always visible. When an end-user clicks on the notification icon they will see the **Announcements** and **Surveys** that have been deployed to the device.

5.3.8.2.1 When does the announcement appear?

To minimize the disruption to the end-user of having an announcement pop up when they're busy using the computer for other things, the 1E Client has a few heuristics that govern when the notifications appear. These measure and compare things like: whether the user is currently interacting with the device, how long it has been since they stopped interacting with the device, how long the notifications should wait before re-displaying if the user didn't respond to the last time it was displayed. These various options interact to essentially display the notification in the sweet spot between the user not actively doing something and the user having left their device.

> **Note**
>
> Your end-users can also set the **Do not disturb** option, which usually prevents notifications from appearing for a configurable time period. However, the Experience Engagement Administrator can also override this option by setting an announcement to High Priority, so that the announcement will appear regardless of the user's selection in the **Do not disturb** option - as is the case in our scenario.

Announcements are also accessible from the **Real-Time Control Center**, which allows the end-user to access them directly at any time.

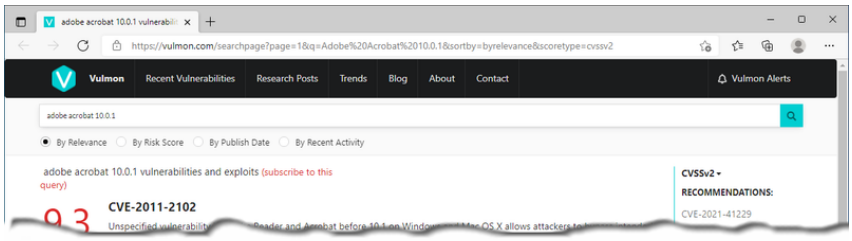


5.3.8.2.2 Interacting with the announcement

In our scenario, the deployed announcement pops up on an end-user's device. They can see from the announcement title that their Adobe Reader needs to be updated, and from the description

text, why this is necessary and what is going to happen. A footnote on the announcement highlights the fact that the installed version is over 10 years old.

The announcement has been configured with a URL that links to a page with more information. Clicking on the**Click here to find out more**link opens the linked page in their default browser. Here, they can read more about the vulnerabilities associated with the installed version of adobe reader and along with the description and footnote in the announcement feel re-assured that upgrading is the right choice.

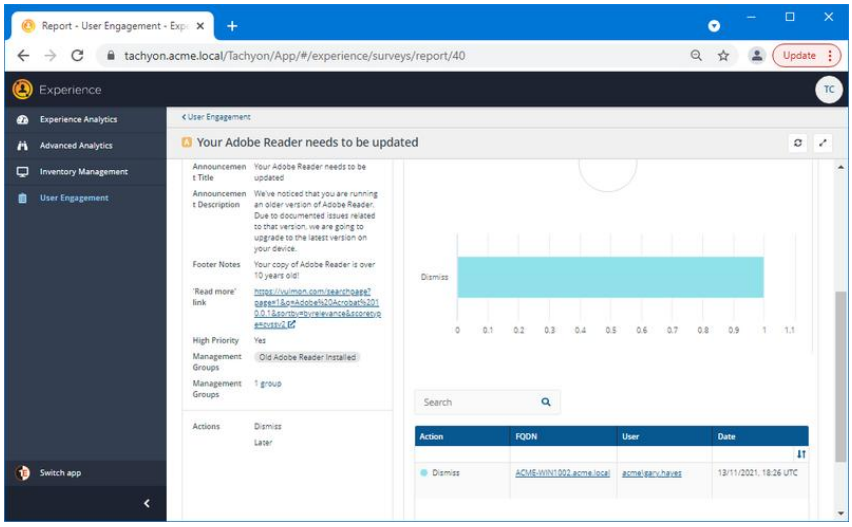


Announcements provide two default buttons, **Dismiss** and **Later**, Clicking **Dismiss** indicates that the end-user has read and processed the announcement. Clicking **Later**, means that they don't want to be bothered just at this moment but may respond when the notification is next displayed.

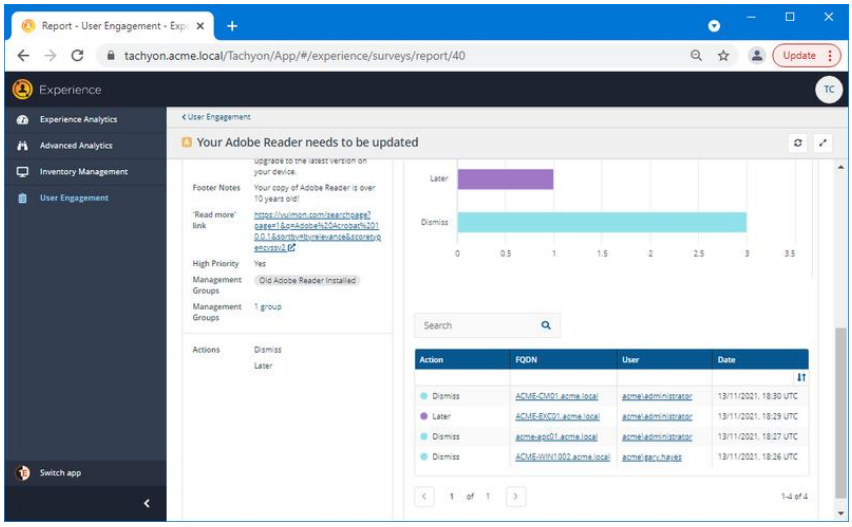
5.3.8.3 Viewing the announcement responses

The **Adobe Reader Update** announcement has been deployed and end-users have begun to respond, the EUC manager wants to monitor those to see who has read the announcement. For an announcement the only place the responses can be viewed is from its details page, you get to this by clicking on the link for the announcement in the **Name** column of the Engagements table on the **User Engagement** page.

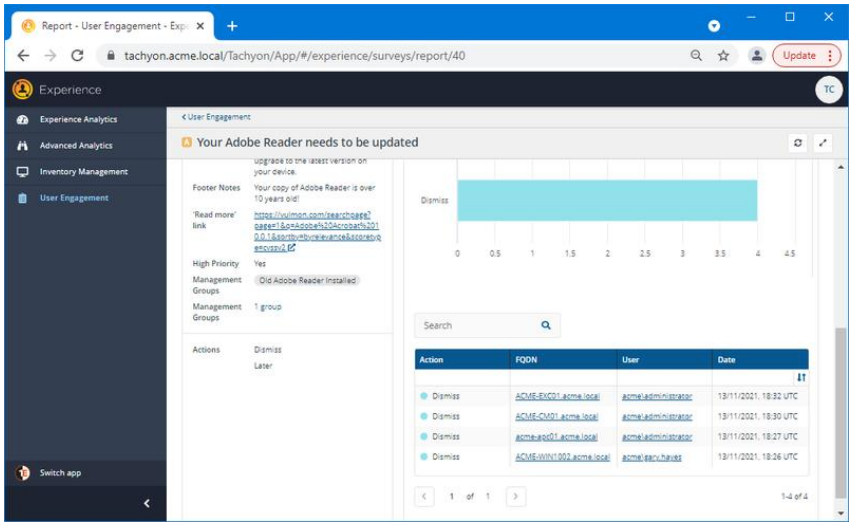
In the picture, the EUC manager has clicked on the **Adobe Reader Update** link to display its details page. Here, they can see that a user has submitted a response. **Dismiss** in this case is likely a good response to the announcement, indicating that the end-user has at least looked at the announcement and clicked the **Dismiss** button.



After a number of responses have been made, a clearer picture of the current user behavior appears. Most of them have clicked the **Dismiss** button, and just one has clicked **Later** to receive the announcement at a later time.



Finally, the EUC manager checks the results again and sees that all the targeted end-users have responded. They can now go ahead and remediate the Adobe Reader issue knowing that the affected users have been notified.



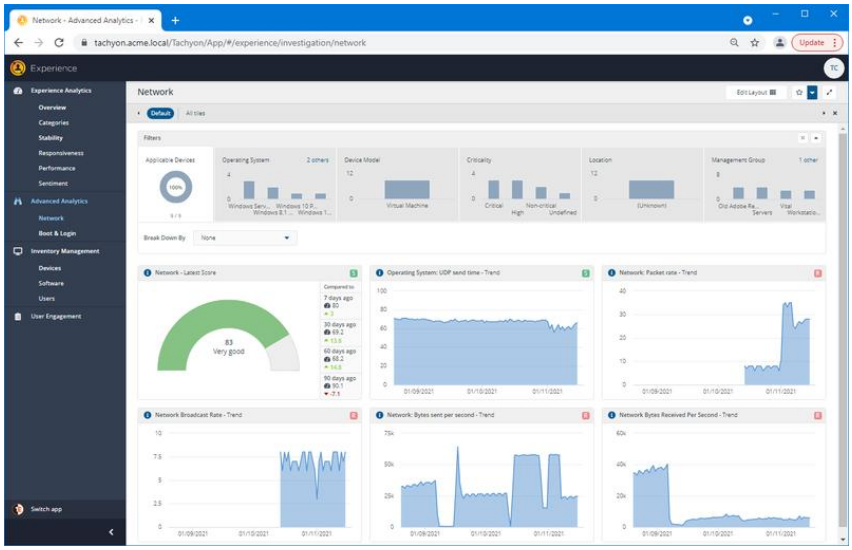
5.3.9 Investigating Network Performance

In this scenario, the EUC manager uses the **Advanced Analytics→Network** page of Experience to monitor and examine experience related to the network performance for devices.

5.3.9.1 Taking a look at the Network page

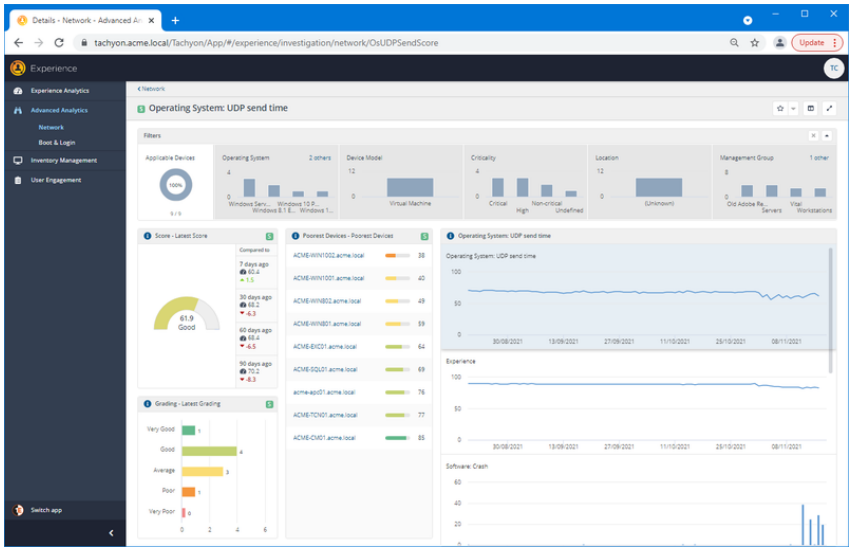
The **Advanced Analytics→Network** page provides a dashboard where network performance data can be examined. By default, there are two score related tiles: **Network - Latest Score** and **Operating System: UDP send time - Trend**. The rest of the tiles show averages of the raw, unprocessed data being measured across all the devices.

The EUC manager navigates to the **Advanced Analytics→Network** page, sees that the general overall score is **83 Very good**, but also sees that there's been a bit of fluctuation for the measurements on the other tiles showing the averaged raw data.



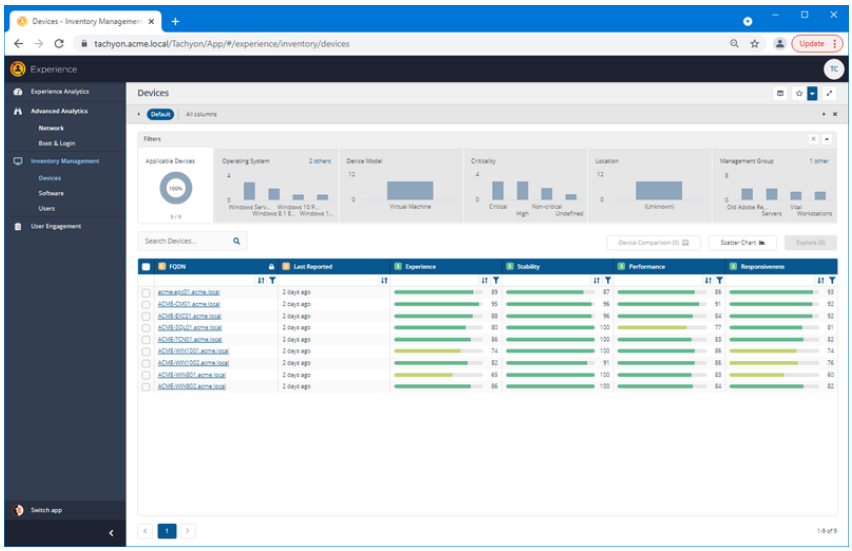
5.3.9.1.1 Focusing on the UDP send time

Looking at the trend on the **Operating System: UDP send time - Trend** tile, they notice that there has recently been a dip in the score. Clicking on one of the data points in the chart navigates to the **Operating System: UDP send time** page. Here they can see in the **Poorest Devices** tile that a few devices aren't performing particularly well in that area. There is also a recent downward trend for the Experience score that matches the fluctuations in the UDP send time.



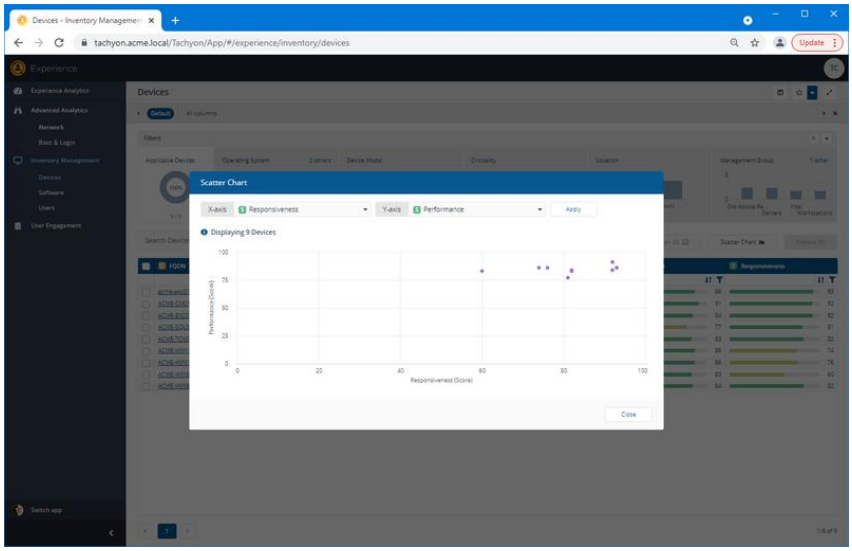
5.3.9.2 The Devices page

Navigating to the **Inventory Management→Devices** page enables the EUC manager to investigate the devices using the Scatter Chart popup. To display this, click on the **Scatter Chart** button just above the devices table.



5.3.9.2.1 The Scatter Chart

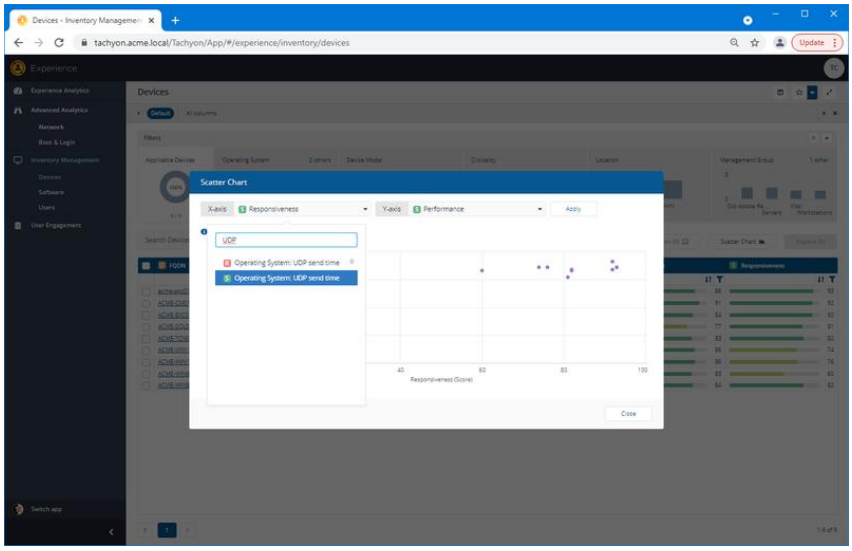
The Scatter Chart plots the devices in the current view on a chart with two selectable axes. Initially, this shows the **Responsiveness** score on the **X-axis** and the **Performance** score on the **Y-axis**. In our example, the devices are all situated in the ideal top-right quadrant for these two scores.



5.3.9.2.2 Selecting the UDP sent time score for the X-axis

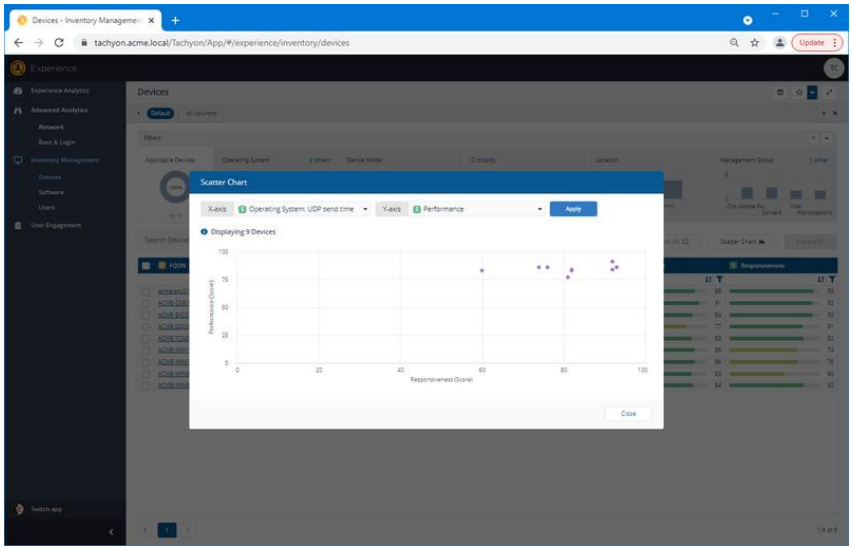
The EUC manager wants to plot the devices according to the UDP send time, in order to determine both the poorest and best scoring devices. Clicking on the drop-down menu next to the X-axis field, displays the list of available parameters. You can choose from a selection of score or raw values. Typing into the search field filters the available parameters to those that match.

In our example, the EUC manager types **UDP** into the search field and then selects the **Operating System: UDP send time** score from the list of matching parameters.



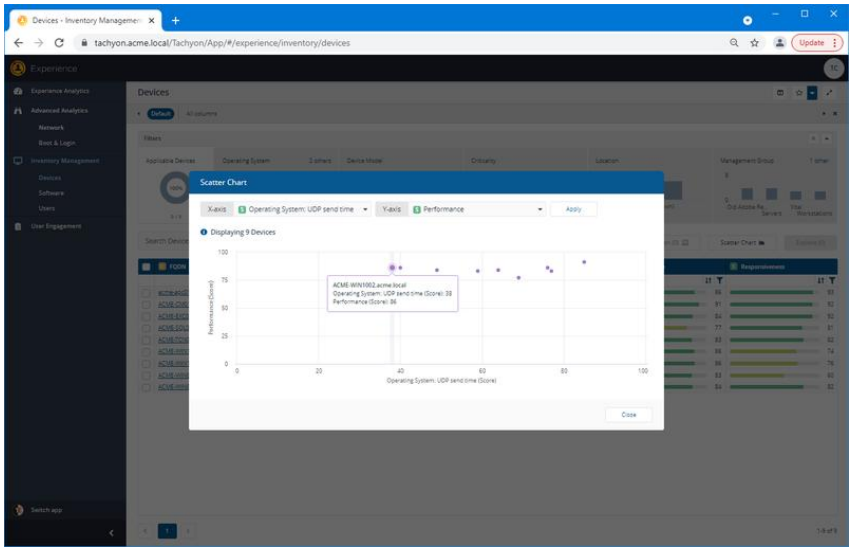
5.3.9.2.3 Applying the selected change to the X-axis

When you make a change to either axis parameter, you then need to click **Apply** to change the plot of the Scatter Chart. The picture shows the **Apply** button highlighted.



5.3.9.2.4 The device with the lowest UDP send time score

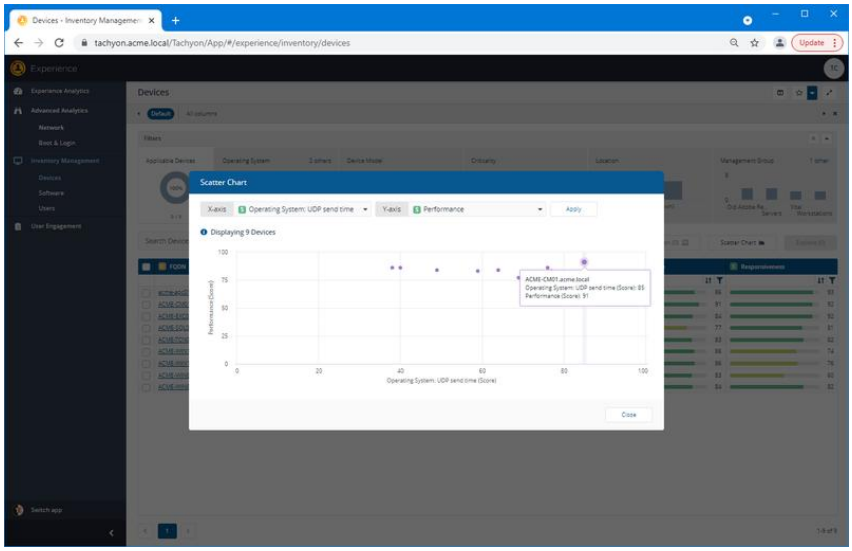
When the devices are plotted using the **Operating System: UDP send time** along the X-axis, the poorest score is displayed on the left. Hovering over a point, shows the FQDN and X and Y values for that device. Here, the EUC manager can see that the device with the poorest UDP send time score is **ACME-WIN1002.acme.local**.



5.3.9.2.5 The device with the highest UDP send time score

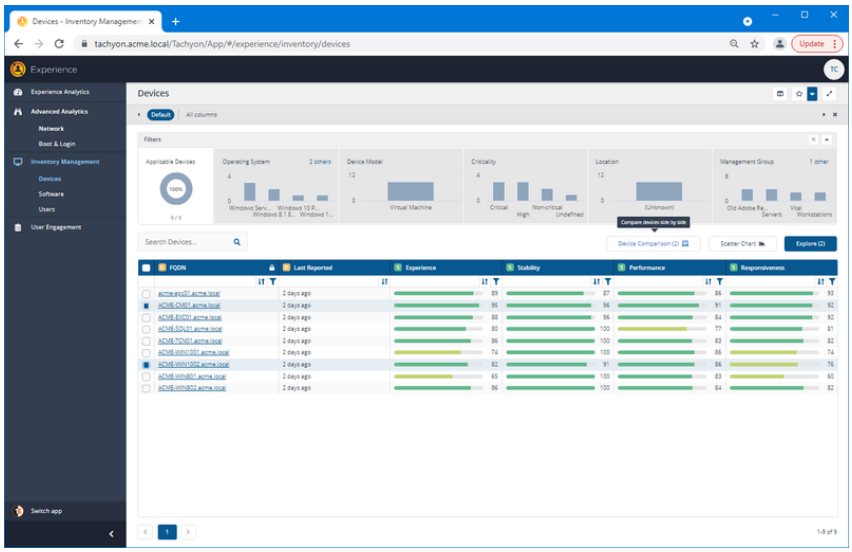
Correspondingly, hovering over the point furthest to the right displays the details for the device with the highest UDP send time score. In our example, this is **ACME-CM01.acme.local**. Having

made a note of the devices with the lowest and highest UDP send time scores, the EUC manager clicks the Close button on the **Scatter Chart** popup.



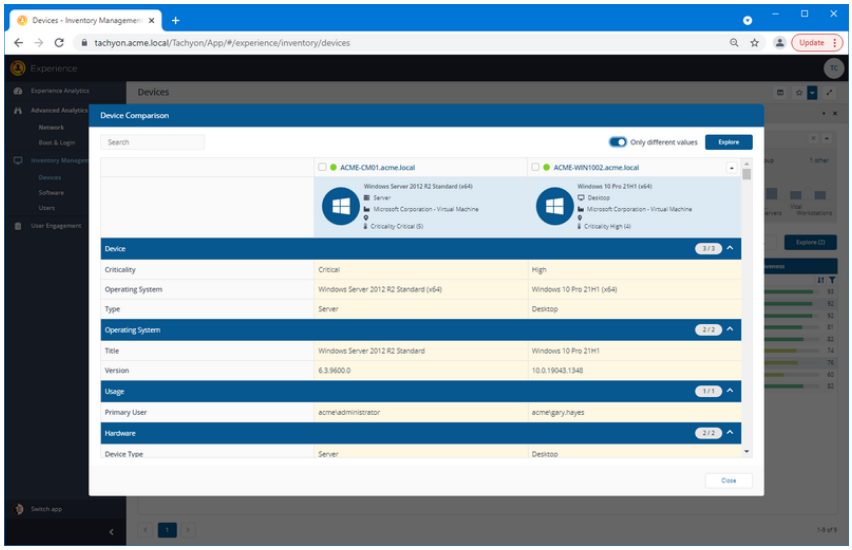
5.3.9.2.6 Selecting the devices with the lowest and highest UDP send times

On the **Devices** page, the EUC Manager selects the two devices they made a note of earlier, and then clicks the **Device Comparison** button.



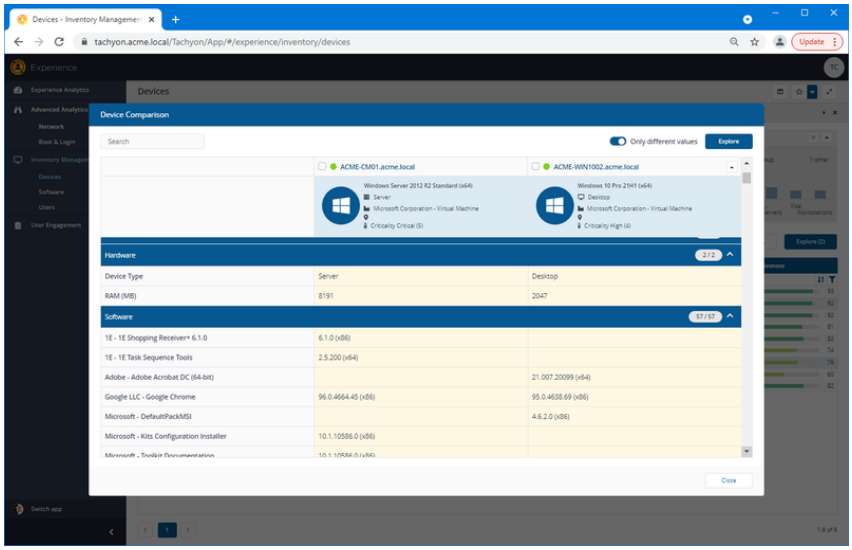
5.3.9.2.7 The Device Comparison popup set to display only different values

When the **Device Comparison** popup is displayed, the EUC manager first turns on the **Only different values** toggle - to concentrate on the differences. They can see that the two devices have different Operating Systems, which may or may not be significant.



5.3.9.2.8 A possibly significant difference

Further down in the **Hardware** section, another, more significant difference is shown. Here, the EUC manager can see that the device with the best performing UDP send time score has 4 times as much **RAM (MB)** as the poorest one. As they know that these are both virtual devices, they conclude that this may be a contributing factor to the differences in throughput performances. The next step would be to test assigning more RAM to the device with the poorest UDP send time and see if this resolves the issue.



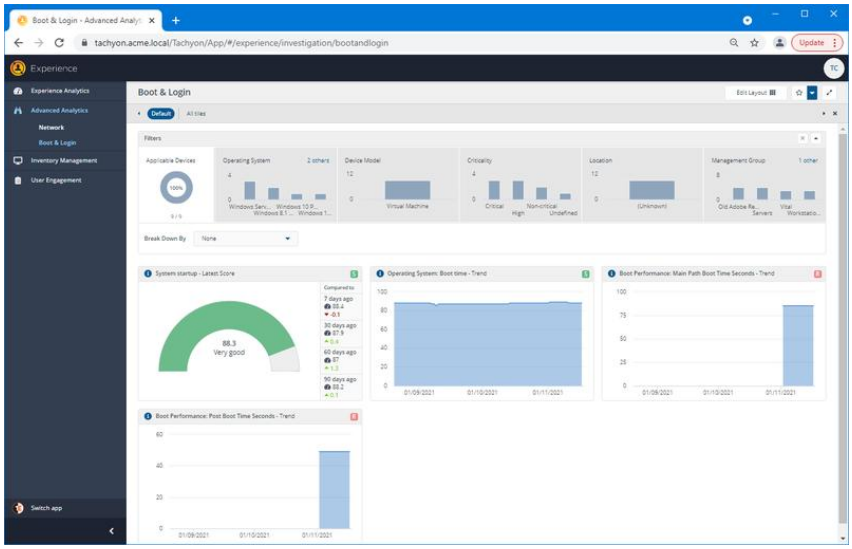
5.3.10 Investigating Boot and Login Performance

In this scenario, the EUC manager uses the **Advanced Analytics→Boot & Login** page of Experience to monitor and examine experience related to the boot and login performance for devices.

5.3.10.1 Taking a look at the Boot & Login page

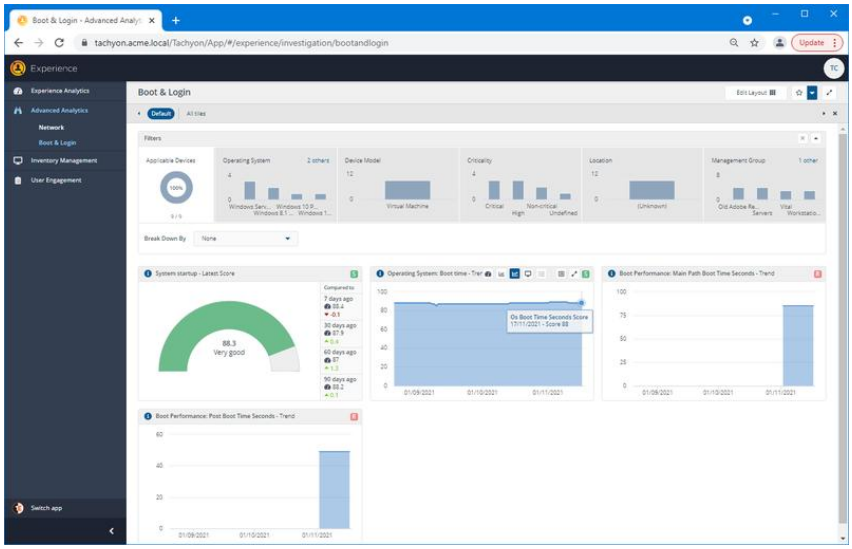
The **Advanced Analytics→Boot & Login** page provides a dashboard where boot and login performance data can be examined. By default, there are two score related tiles: **System startup - Latest Score** and **Operating System: Boot time - Trend**. The rest of the tiles show averages of the raw, unprocessed data being measured across all the devices.

The EUC manager navigates to the **Advanced Analytics→Boot & Login** page, sees that the **System startup - Latest Score** is **88.3 Very good**, but also sees that there's been a very slight downward trend for both the System startup score over the past 7 days and for the **Operating System: Boot time**.



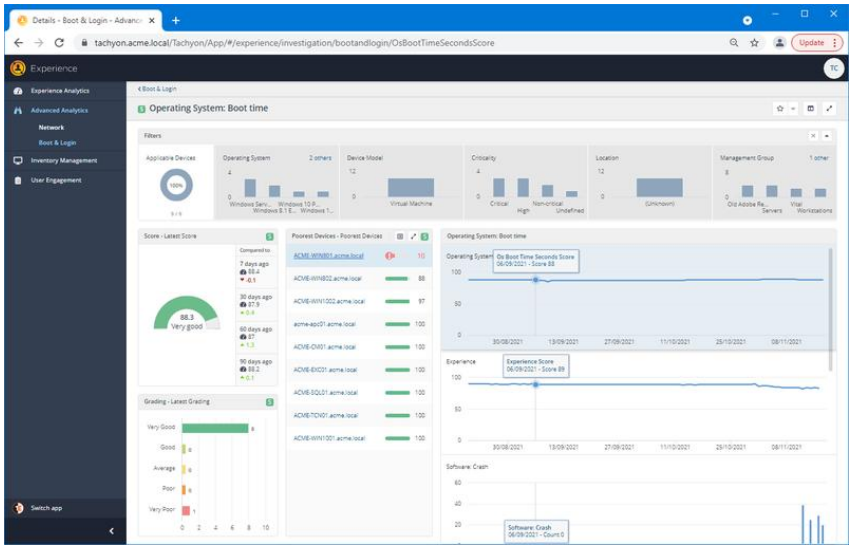
5.3.10.1.1 Focusing on the Boot time

Looking at the trend on the **Operating System: Boot time - Trend** tile, they click on one of the data points in the chart, which navigates to the **Operating System: Boot time** page.



5.3.10.2 The Operating System: Boot time page

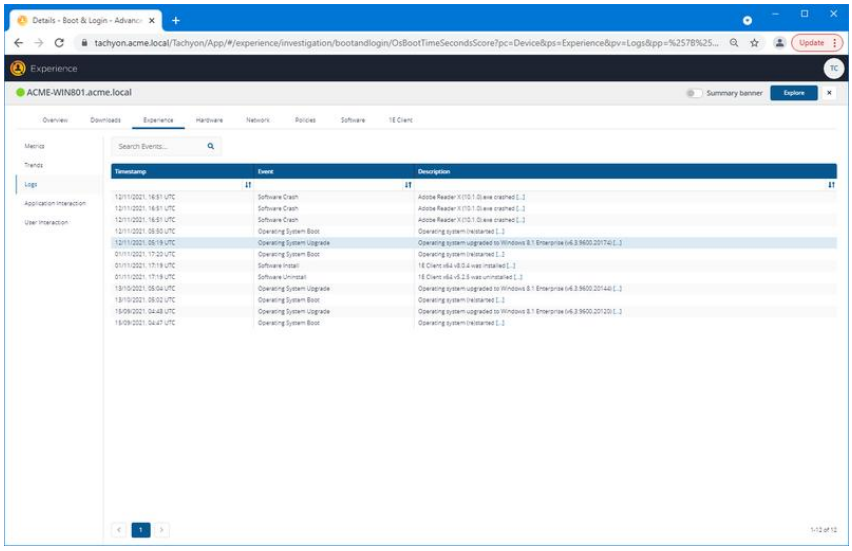
Here, the EUC manager can see in the **Poorest Devices** tile that one device isn't performing particularly well on its boot time score. Selecting the device FQDN link displays its device details.



5.3.10.2.1 A possibly significant sequence of events

From this link, the device details opens on the **Experience** tab with the **Logs** panel displayed, which shows the system events for the device. Here, the EUC manager sees that the most recent **Operating System Boot** event for this device has occured just after an **Operating System Upgrade**.

They conclude that this may be a contributing factor to the poor startup time and that they can safely overlook the issue for the time being. However, they make a note of the device name just in case there is actually an ongoing issue that stems from another cause.



5.3.11 Creating your own dashboard

Experience allows you to customize and save your own dashboards for viewing later, the saved dashboards are called Presets. This tutorial shows you how to create and use them.

The ability to customize dashboard views is common to the following Experience pages.

Experience page	Pages with customizable dashboard views
Experience Analytics	Stability
	Responsiveness
	Performance
	Sentiment
Advanced Analytics	Network
	Boot & Login
Inventory Management	Devices
	Software
	Users.

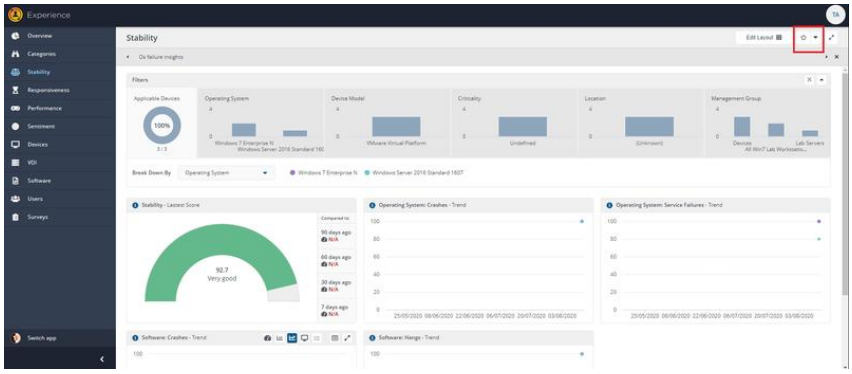
At the top of pages where you can customize the dashboard you'll see the controls highlighted in the picture.

> **Note**
>
> Before saving the dashboard you may want to choose which metrics to show in your custom Preset view. The way you choose metrics differs depending on the page you're customizing:

Stability, Responsiveness, Performance, Sentiment, Network and Boot & Login pages use **Edit Layout**

Devices, Software, and Users pages use **Select Metrics**.

> For a detailed walkthrough of how to choose and save the metrics for your new Preset, please refer to Adding metrics to a dashboard.

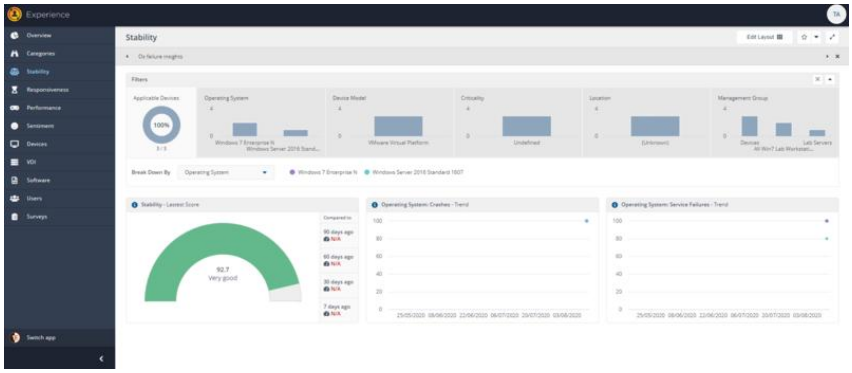


Our example shows the**Stability**page where the tiles displayed have been edited to focus on the following metrics:

Stability - Latest Score

Operating System: Crashes - Trend

Operating System: Service Failures - Trend.



To save the preset we click the star button on the top right of the page, called **Save the configuration as preset**. This opens the **Presets** popup where we can set the **Preset Name** and save the Preset view for our selected metrics:

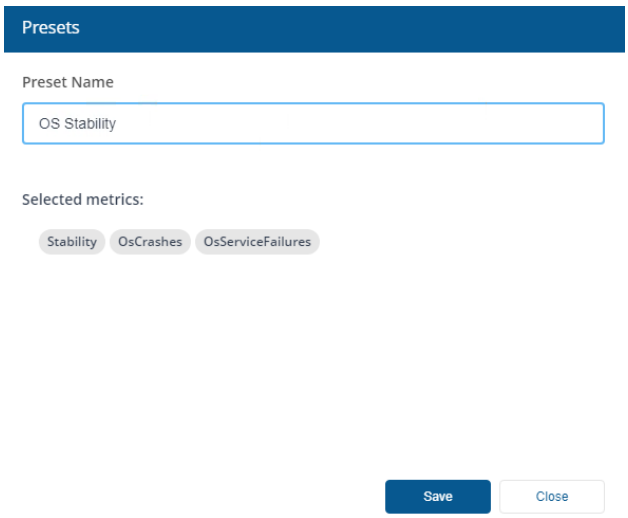
Stability

OsCrashes

OsServiceFailures.

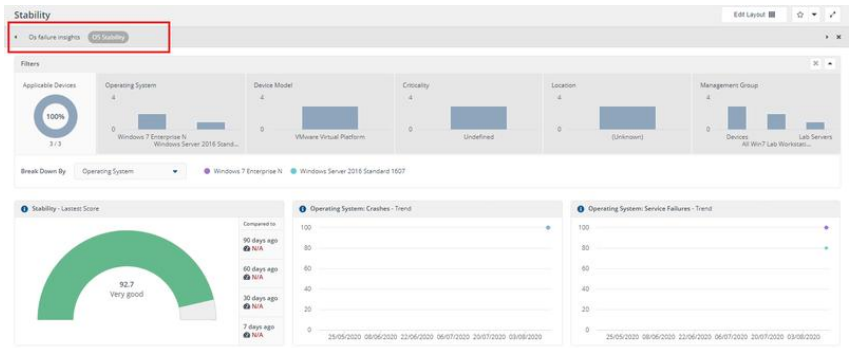
Your selected metrics and filters will show on this screen.

We'll set the **Preset Name** as **OS Stability** and click **Save** to return to the Stability dashboard page.

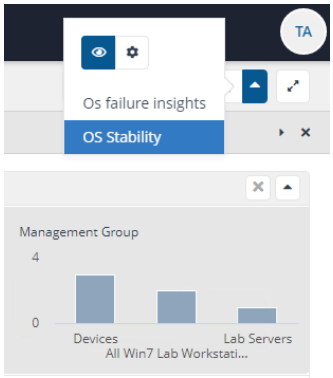


Now, on the **Stability** page our Presets are shown at the top of the page on the preset view bar. When you have multiple Presets on the presets bar, you can view that preset dashboard by selecting one of them.

> **Note**
>
> The preset bar can be closed using the **X** icon on the right side of the bar. You can reopen the preset bar by using the down arrow next to the star icon and selecting the eye icon.
>
> The preset bar is also reopened when current page is manually reloaded, or when you navigate to another page the preset bar will be open when you return.



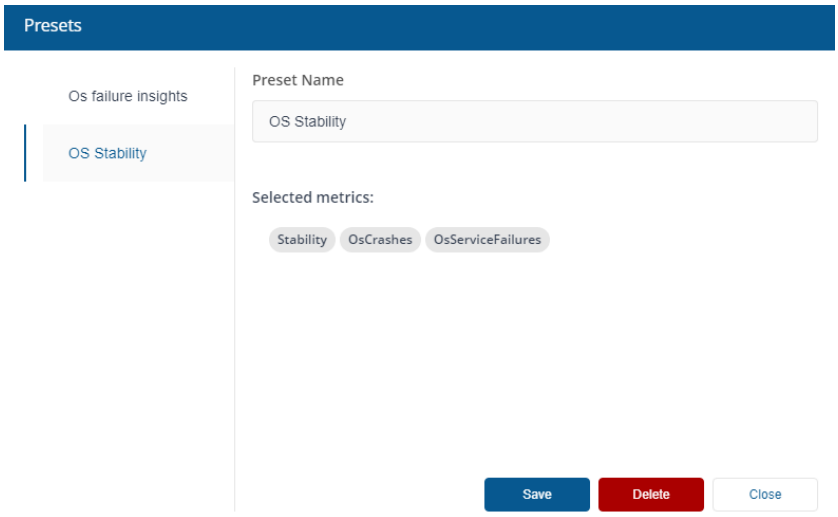
To view (eye icon) or manage (gear icon) a Preset, click the down arrow next to the star button.



When you click the gear icon you can do either of the following:

Changethe name used for the selected Preset by editing the **Preset Name** field then clicking **Save**.

Delete the selected Preset by clicking the **Delete** button.



5.3.12 Adding metrics to a dashboard

It is possible to change the displayed metrics for a dashboard in order to view different data in Experience.

Experience allows you to create custom dashboards and choose which metrics are displayed on them. The saved dashboards are called Presets. This tutorial shows you how to choose the metrics for these custom preset dashboards.

The ability to customize dashboard views and choose which metrics are shown on them is common to the following Experience pages:

Stability

Responsiveness

Performance

Sentiment

Devices

Software

Users.

At the top of each page where you can customize the dashboard, depending on the page you're viewing you'll see either an **Edit Layout** or a **Select Metrics** control:

Edit Layout- used on the Stability, Responsiveness, Performance and Sentiment pages

Select Metrics- used on the Devices, Software, and Users pages.

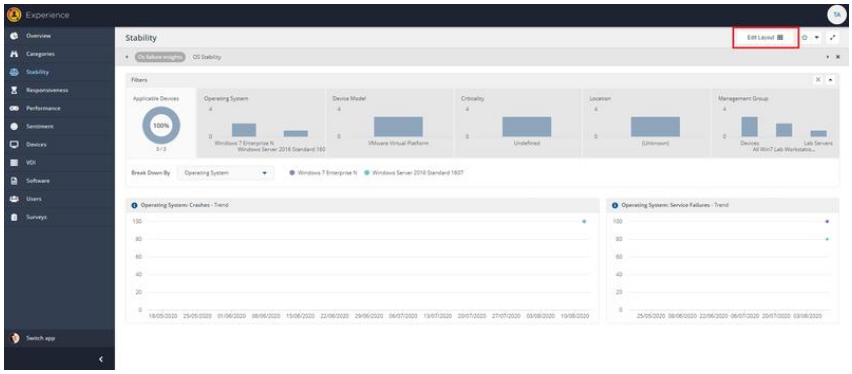
Note

For a detailed walkthrough of how to create custom dashboards for your chosen metrics, please refer to Creating your own dashboard.

5.3.12.1 Edit Layout

The **Edit Layout** control only applies to the Stability, Responsiveness, Performance and Sentiment pages.

To choose the metrics to display on your dashboard, click the **Edit Layout** control as highlighted in the picture.



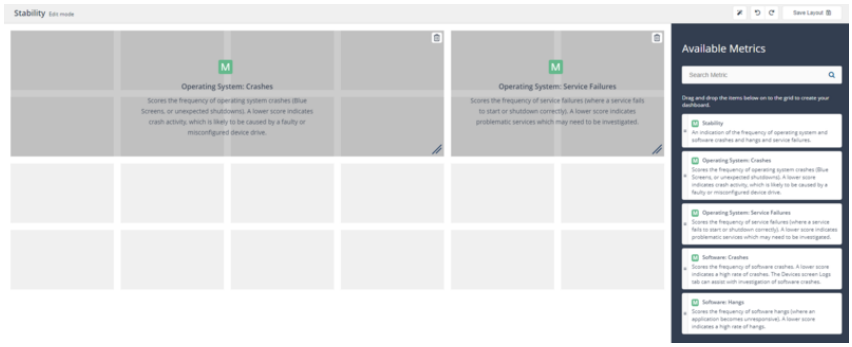
When you're in **Edit mode** you can choose which metrics are displayed on your dashboard. You can:

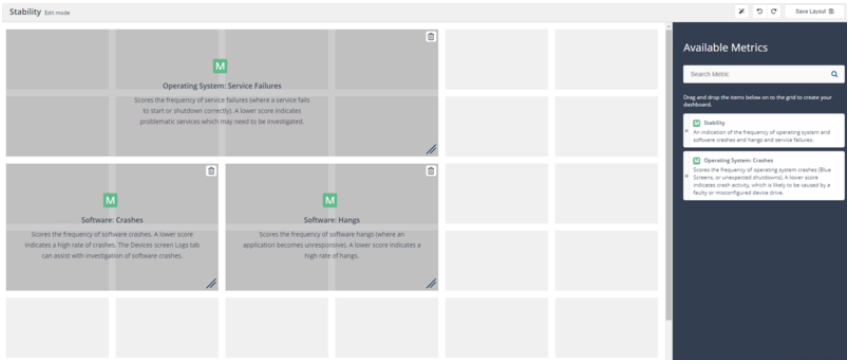
Add metrics from **Available Metrics** by using drag and drop on to the grid to create your dashboard

Remove metrics from your dashboard by clicking the trash can icon on metric panels in the left-hand pane

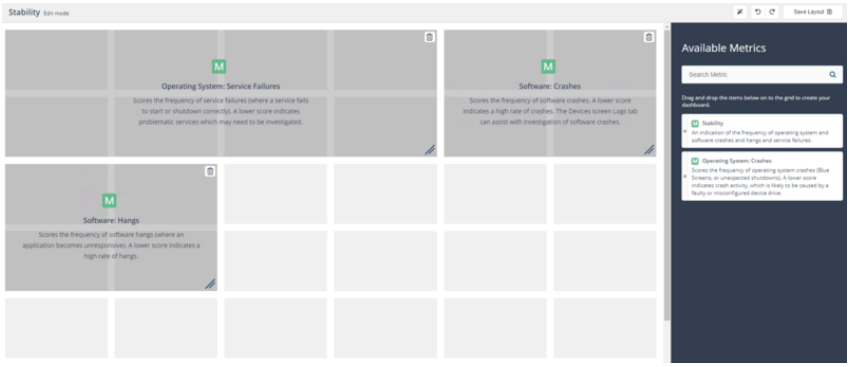
Resize how much of the dashboard an individual metric uses by dragging the bottom right-hand corner of a panel using the squared background as a guide.

In our example we chose to add **Software: Crashes** and **Software: Hangs** and remove **Operating System: Service Failures**. We also want the**Operating System: Service Failures**to have more visibility on the dashboard, so we have expanded this view.





You can also use the **optimise space** icon (magic wand) on the top right-hand corner of the page, which automatically adjusts the view to remove any potential gaps on the dashboard. In our example clicking the **optimise space** icon gives us the result in the picture.



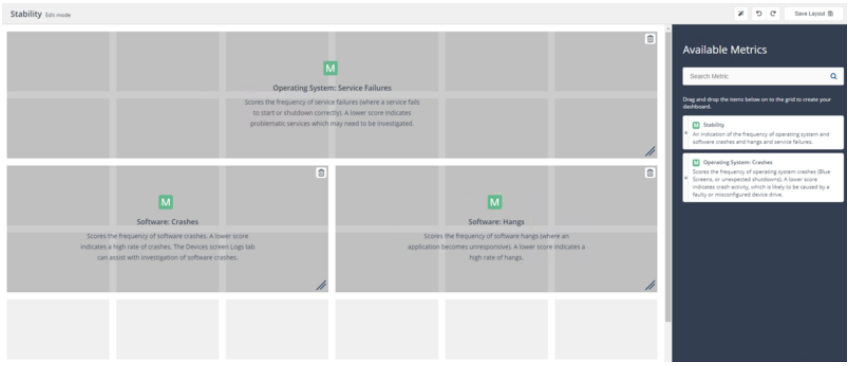
In our example we preferred to manually adjust the view so that **Operating System: Service Failures** covers the top of the dashboard with **Software: Crashes** and **Software: Hangs** underneath.

Using the **undo** icon on the top right-hand corner of the screen we undid the **optimise space** action and then manually expanded **Operating System: Service Failures**, **Software: Crashes** and **Software: Hangs** to fill the space.

We then clicked **Save Layout** on top right-hand corner of the screen, to save this layout and return to the dashboard view.

Note

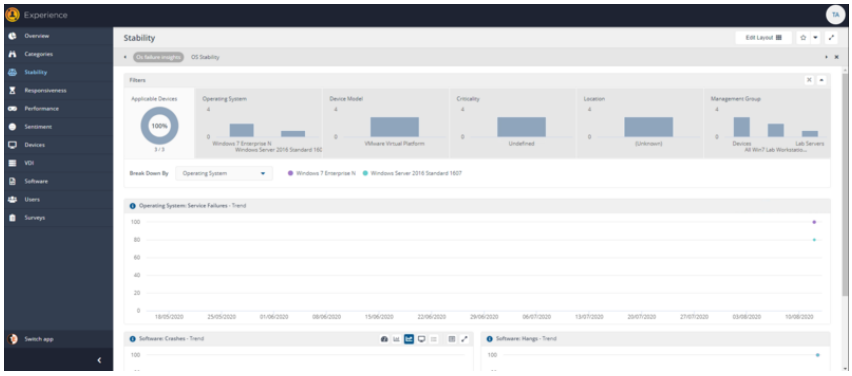
To reverse your changes in edit mode, either use the undo button on the top right-hand corner of the screen. You can also reload the page to return to the selected dashboard without saving your changes or use the back button on your browser.



Now we have chosen the metrics to display on our dashboard we can add it to the list of Preset dashboards.

Clicking the star icon in the top right-hand corner of the screen will give you the option to save this view as a Preset dashboard you can return to a later date.

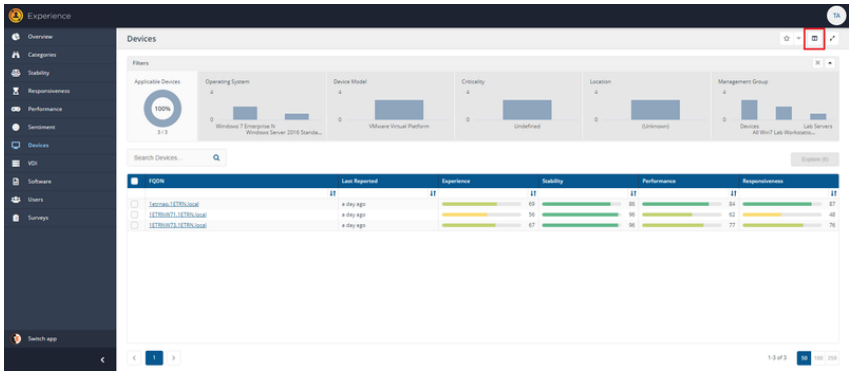
> **Note**
>
> For a detailed walkthrough of how to save Preset dashboards for your chosen metrics, please refer to Creating your own dashboard.



5.3.12.2 Select Metrics

The **Select Metrics** control only applies to the Devices, Software, and Users pages.

To choose the metrics to display on your dashboard, click the **Select Metrics** control as highlighted in the picture.



The **Select Metrics** control allows you to add different metrics or remove metrics that are visible on the currently displayed dashboard.

In our example, we'll remove the **Experience** metric to focus on **Stability**, **Performance** and **Responsiveness**. We can do this by selecting the **Experience** metric and clicking the double arrow icon to remove it from the list of **Visible Metrics** and add it to the list of **Available Metrics**.

In addition, you can:

Drag and drop columns to change the order they are displayed.

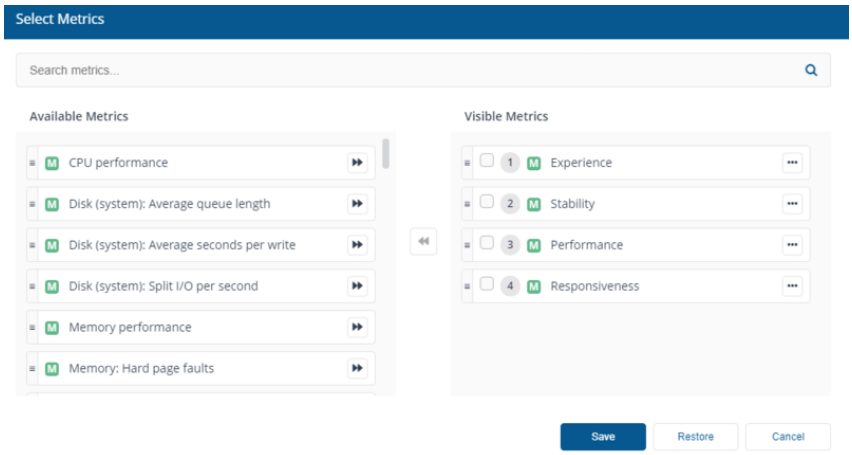
Also use the arrow controls to move up or move down, exclude or include any column - clicking on the ellipsis displays on each metric displays these additional controls.

To apply the view to the current dashboard and return to the dashboard view, click**Save**.

Note

If you've made a number of changes and you want to revert to the original metrics settings you can click on the **Restore** button in the **Select Metrics** popup to revert to the original settings.

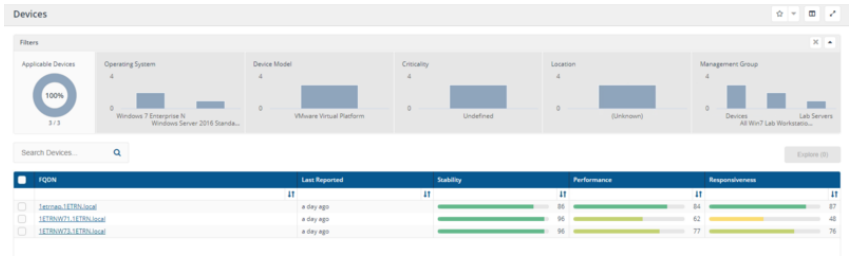
Clicking **Cancel** will also cancel your changes and exit the **Select Metrics** control.



When you have saved your changes and returned to the dashboard view, clicking the star icon in the top right-hand corner of the screen will allow you to save this view as a Preset dashboard you can return to a later date.

Note

For a detailed walkthrough of how to save Presets for your chosen metrics, please refer toCreating your own dashboard.



5.4 Troubleshooting

A general methodology for investigating issues with ExperienceExperience, as well as identifying key issues and their resolutions.

For known issues relating to specific components, please refer to the respective troubleshooting pages:

Clients	Platform	Applications	Integration
1E Client	1E	Endpoint Automation	1E Core for ServiceNow
1E Client Deployment Assistant		Experience Analytics	1E ITSM Connect for ServiceNow

PXE Everywhere	Endpoint Troubleshooting Writing 1E Instructions (1E SDK)	1E Service Catalog Connect for ServiceNow 1E Virtual Assistant

5.4.1 1E Support contact details

5.4.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

5.4.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

US/Canada:	1-866-349-4032 (Toll-Free) 1-917-339-2360 (Standard)
UK/Europe:	+44 (0)208 326 3499
India:	+91 120 402 4002
Australia:	+61 739 111 118

5.4.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation.

support@1e.com

5.4.2 The technical support process

Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

5.4.2.1 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

5.4.2.1.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

5.4.2.1.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

5.4.2.1.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

5.4.2.2 Log files

5.4.2.2.1 Tachyon Server log files

For any issue, please provide a zip containing log files from the following locations:

%ALLUSERSPROFILE%\1E\Catalog*.log

%ALLUSERSPROFILE%\1E\ContentDistribution*.log

%ALLUSERSPROFILE%\1E\Platform Consumers*.log

%ALLUSERSPROFILE%\1E\SLA Platform*.log

%ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

%ALLUSERSPROFILE%\1E\Licensing*

Please refer to the Tachyon Platform 8.1 - Log files page for more details.

5.4.2.2.2 1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

5.4.3 Configuration issues

Configuration issues that may prevent data getting into Tachyon Experience.

5.4.3.1 No data in Tachyon Experience

Component	Things to Check	Notes

Tachyon Coordinator	Log file (%programdata%\1E\Tachyon\Tachyon.Coordinator.log)	Check for log entries like the following to ensure that the Coordinator is successfully initiating data processing:
		`INFO AggregateSoftwarePerformance - Starting full aggregation of software performance (or Starting incremental aggregation of software performance)`
		`INFO AggregateSoftwarePerformance - Software performance aggregation results`
		Ensure no errors are reported in the Coordinator log.
		Additional logging of the data processing can be found in the SQL table TachyonExperience.dbo.ProcessLog, such as tasks performed, time taken and row counts. The same data is logged into the coordinator log file.
		Note

Component	Things to Check	Notes
		The following value in %programfiles%\1E\Tachyon\Coordinator\Tachyon.Server.Coordinator.exe.config controls the frequency with which the Coordinator initiates cube processing. `<add key="ExperienceSync" value="0 2 * * * ExperienceSynchronization" /> (2am is the default)` It is not recommended that this value be changed.

1E Licensing	License file (%programdata%\1E\Licensing\Tachyon.lic	Ensure the Tachyon Server is licensed for Tachyon Experience:
		`<Feature name="TachyonPlatform">`
		`<Consumer name="Platform" enable="on"> </Consumer>`
		`<Consumer name="Experience" enable="on"> </Consumer>`

Aggregated Software Data	Ensure software aggregated data has been populated	Check the **LastProcessed** setting in the **TachyonExperience.dbo.GlobalSettings** table for the last processed time. To check the sizes of aggregation tables, run a DB report **Disk usage by table** and verify that **dbo.SoftwarePerformance_xx tables** have non zero records.

Component	Things to Check	Notes

5.4.4 Known issues

Lists of the current known issues with implementing, configuring, and using Tachyon Experience.

If you cannot find an issue and its workaround on this page, please

Refer to 1E platform - Known issues for the Platform and other applications.

Try searching the 1E Support Portal https://support.1e.com/ for issues that have hotfixes.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

Issue	Description	Workaround
Experience - Software > Duplicate row for a product is displayed on Software screen when architecture column is added from column picker following an upgrade from 8.0.	The architecture column did not exist in pre-v8.0 SoftwarePerformance table. When upgraded to v8.0 or later, architecture column has been introduced as nullable column to accommodate pre-upgrade data. It will be set as null for all existing data from before the upgrade. Gradually as new experience performance data comes in post upgrade architecture will now be included. This means that for 90 days after the upgrade aggregations within the Software screen of experience can have two entries, one with an unknown architecture and one with a valid architecture.	The existing data will correct itself 90 days after the upgrade. If you need to fix this issue in the meantime, a maintenance Stored Procedure for the Experience database can be obtained from 1E. The SP will update the null architecture for pre-upgrade software performance rows by using post-upgrade rows to identify and correct old software architectures.
Experience Analytics - Tiles have an additional text "score" added to them when view between saved preset is changed.	When user changes the view between Default and user saved presets; an additional text "Score" gets added to the tile title, e.g: StabilityScore, ResponsivenessScore.	Refreshing the browser removes the additional text "Score".
A survey that has been dismissed by the user will reappear if it is disabled then re-enabled.	If a user engagement (survey or announcement) is disabled then re-enabled then it appears to the 1E Client as a completely new	Do not disable an engagement then re-enable it! In effect this creates a new instance, at least in terms of data sent to the 1E Client.

Issue	Description	Workaround
	engagement and the previous state (dismissed, in this case) is lost.	
Application Interaction table can contain processes reported as *.tmp files where the Product and Version columns are blank.	The Application Interaction view is reached by launching the Experience > Devices and viewing the Device hyperlink. When viewing the Experience > Application Interaction tab, the *.tmp records are also displayed which do not have associated Product or Version details. These should be filtered out.	None
The Survey response page displays responses from a device that do not match the score seen when viewing the Device details due to duplicate survey names	When a survey is deleted, the old responses do not get removed and current behavior causes issues when a new survey is created with the same name. The calculations for sentiment score includes responses from the old survey where the names match.	Where this occurs, recreate the survey using a unique name that has not been previously used. If you are affected by this, please contact 1E Support for additional help.
When doing a search on Survey page, the page size resets back to the default (50)	On the Experience > Survey page, the page size can be increased to to display 100 or 250 rows. However, when a search is performed on the page, the page size jumps back to the default 50.	None
Survey reports always shows Applicable devices as 100%	Even when a general purpose survey has been assigned to a Management Group, the filter for survey reports always shows 100% for Applicable devices and not consistent with the devices assigned to the selected Management Group	None

5.5 Reference

This section includes references for the tiles included in Experience as well as how the scores are calculated.

5.5.1 Page reference

A reference for the fields and tables on the pages in the Tachyon Experience application.

5.5.1.1 Experience Analytics menu

The Experience Analytics menu contains a number of pages. We recommend the Overview page as the starting place for any Tachyon Experience journey where you can get immediate answers to how your enterprise is performing from an end-user perspective, and you can drill down to get details on specific problem areas and find routes to immediate resolutions.

5.5.1.1.1 Overview page

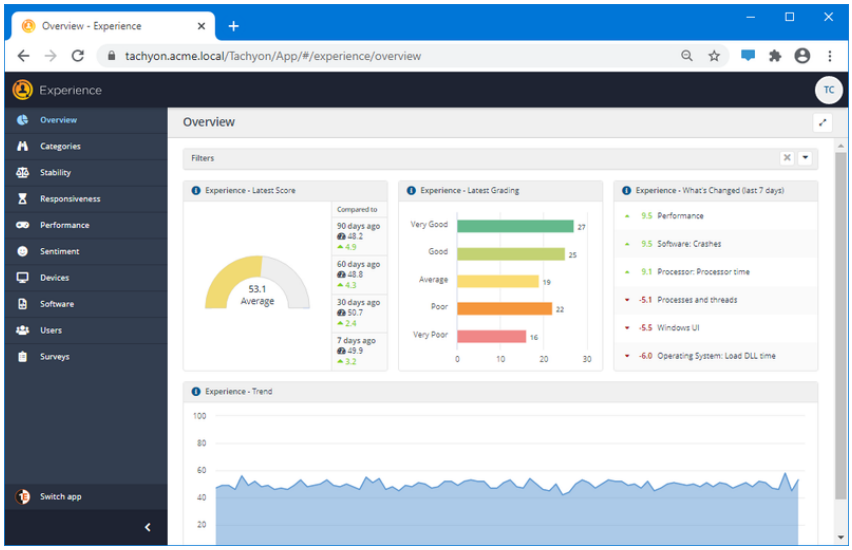
The **Overview** page is the starting place for any Tachyon Experience journey. Here you can get immediate answers to how your enterprise is performing from an end-user perspective and you can drill-down to get details on specific problem areas and find routes to immediate resolutions.

Your key indicator is the **Experience - Latest Score** chart, which gives your enterprise a score out of 100 based on a combination of measured events and user surveys. The closer you are to 100 the better the IT experience your end-users are having.

The **Experience - Latest Grading** chart provides a breakdown of the experience score showing how many devices and users fall into each of the five experience grades - ranging from **Very Good** to **Very Poor**. This helps interpret the experience score and see how it maps onto end-user experiences.

The **Experience - What's Changed (last 7 days)** chart provides an overview of the significant changes, good or bad, that have occurred during the past week.

Finally you can use the **Experience - Trend** chart to check how well your enterprise is performing over time in terms of how your end-users see it. You could use this chart to help gauge progress on any improvement programs you might have put in place or act as an advanced warning that there are underlying issues that are affecting your end-users and need resolving.



Without filters, the dashboard shows the status of all devices in the environment and all of their subsequent scores. When filters are added, the dashboard is recalculated according to the applied filter. For an explanation of filters, please refer to Filters and Breakdown bar.

Hovering over the icon in the upper left corner of any tile shows the name of that tile or the metric that tile is displaying.

5.5.1.1.1.1 Dashboard charts

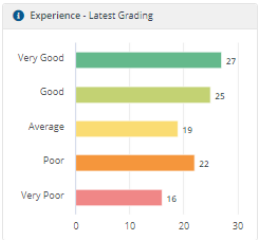
5.5.1.1.1.1.1 Experience - Latest Score

This tile shows the overall score with a sidebar showing the score over the last week, month, 60 day, and 90 day periods. It will show the difference in the score over that time period. Clicking into the colored portion of the chart will take you to additional details.

For details on the calculation of the Experience Score please refer to The Scores: Experience Score.

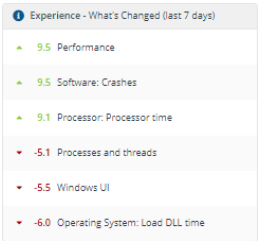
5.5.1.1.1.2 Experience - Latest Grading

The Grading tile allows you to see the numbers of devices for each score. You can drill into each of the ratings - Very Good, Good, Average, and Poor to see the devices that have that score. This allows identification of the poorly performing devices very quickly.



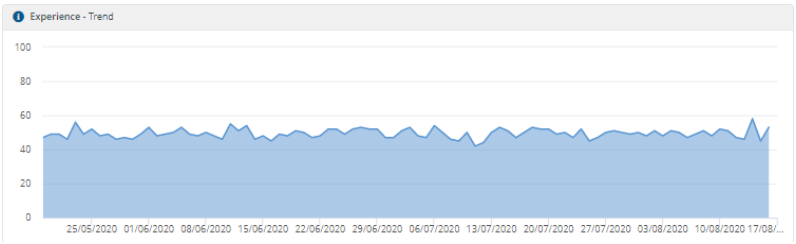
5.5.1.1.1.1.3 Experience - What's Changed (last 7 days)

This tile shows you the score over a period of days and the amount of change in the score. A negative number is reflected in Red and shows the performance has worsened. A positive number is reflected in Green and shows that the performance has improved.

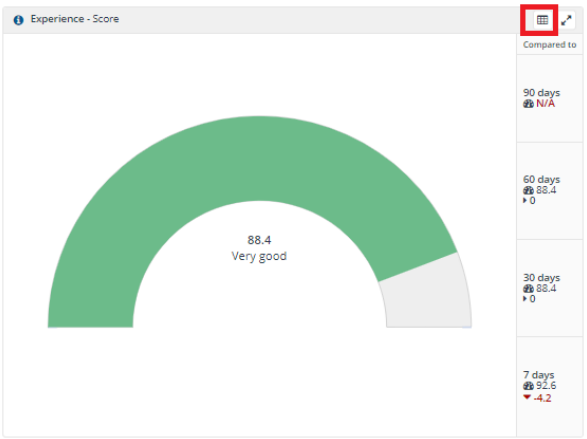


5.5.1.1.1.1.4 Experience - Trend

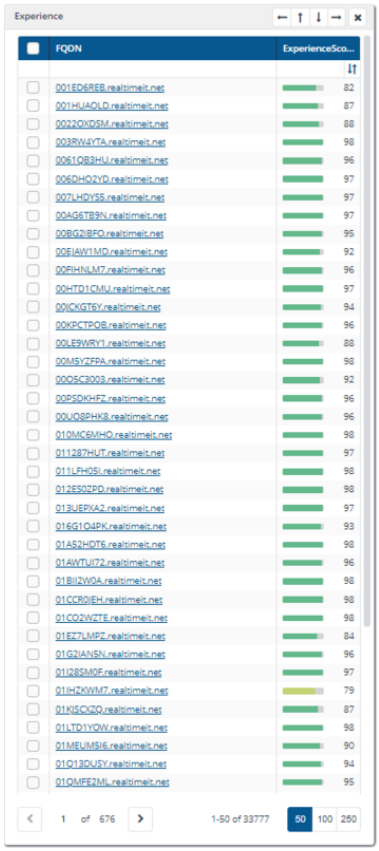
The trend tile shows the score over a succession of days. Any area on the line can be highlighted and the date and the score for that day viewed.



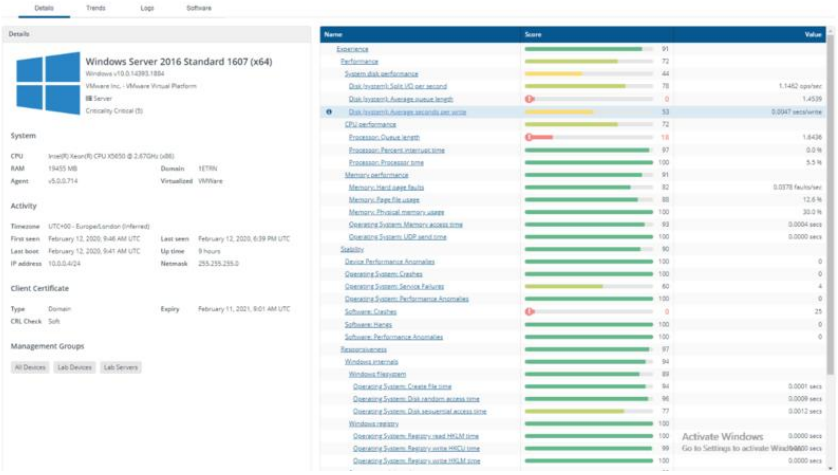
Clicking on the View Detailed data button at the top of any tile brings up the Raw data



This presents a box of the raw data for the selection. Clicking on any of the devices opens the details page for the device.



The details page shows all the metrics that are being collected. The colored bars represent the grading numbers. Any that are very poor will be red with an exclamation point.



5.5.1.1.2 Categories page

The Categories page shows a dashboard of the scores from each of the four categories:

Stability

Responsiveness

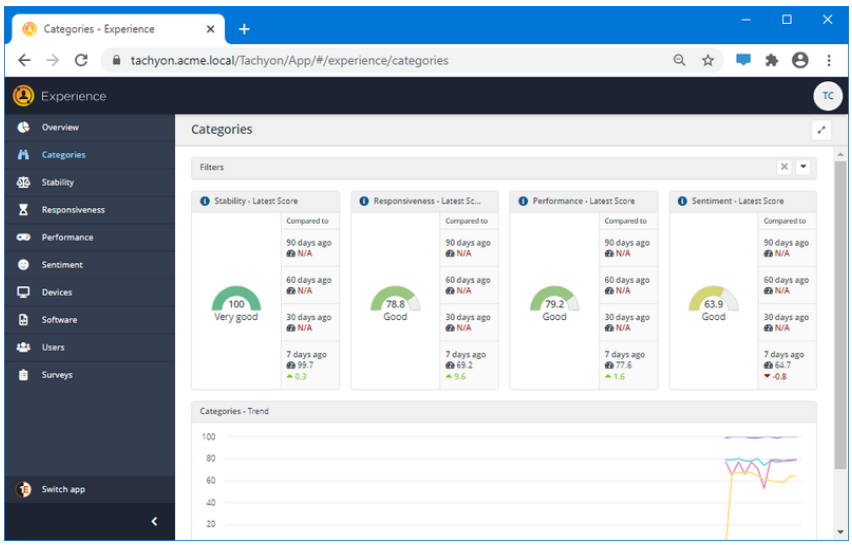
Performance

Sentiment

The first row of tiles shows the Latest Score view from each of the categories. Clicking on one of these tiles opens the related page in Experience.

The tiles either display information on the entire estate, if no filtering has been selected, or just the devices that are covered by the filtering query. For example, if the selected filter is **High Criticality** - the tiles will only contain devices that were configured as **High** for **Criticality**.

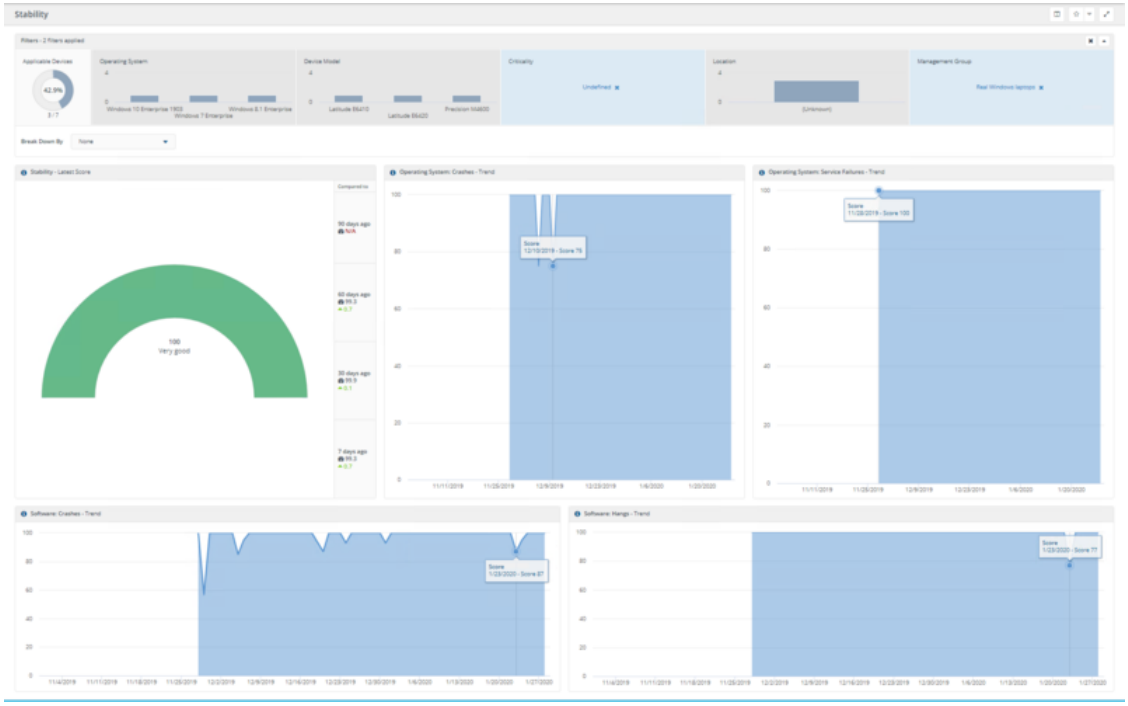
The tile on the bottom row shows the trend for all the categories over time.



5.5.1.1.3 Stability page

The stability score is derived by measuring the "crashiness" of applications and the operating system of a device. The different types of crashes have a differing impact on the score, based on the amount of impact on the end-user.

An application crash is annoying but the crash of the entire operating system could cause data loss so has more weight on the score. The page allows you to drill into the tiles to see the different metrics that are collected. For information on the makeup of the score see Stability Score



5.5.1.1.3.1 Stability - Latest Score Tile

The Latest Score tile can be selected for additional details. This is the view when selecting the Latest Score Tile with the Filters bar collapsed.

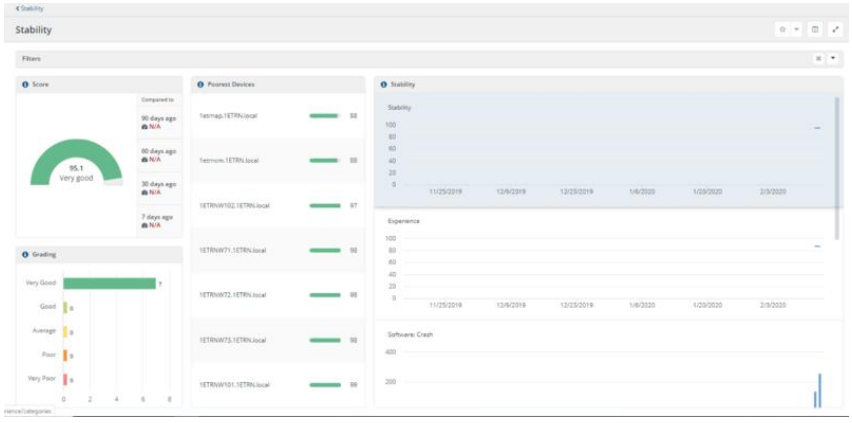
This view has the following tiles:

Score - with comparison history on the side

Poorest Devices in the Environment

Timeline of the Scores for Stability and Experience

Environment Stability Grading Bar Chart

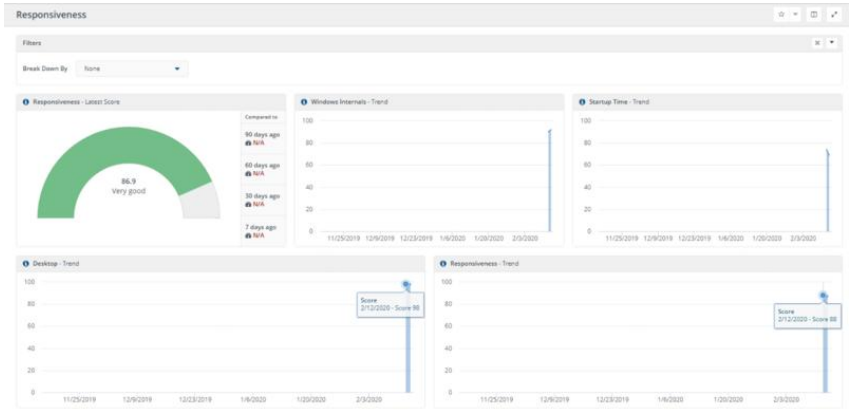


5.5.1.1.4 Responsiveness page

The responsiveness score is derived by measuring how well Windows application perform during our "Synthetic micro-transactions". The successful and timely operation of Windows and Windows applications is key to a positive user experience on that device.

The page allows you to drill into the Latest Score tile to see the different metrics that are collected. For information on the makeup of the score see Responsiveness Score

5.5.1.1.4.1 The Responsiveness Page



5.5.1.1.4.2 Responsiveness - Latest Score Tile

The Latest Score tile can be selected for additional details. This is the view when selecting the Latest Score Tile with the Filters bar collapsed.

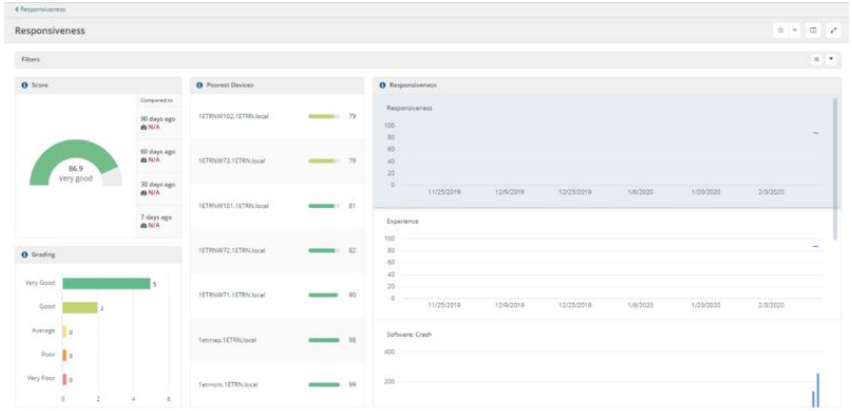
This view has the following tiles:

Score - with comparison history on the side

Poorest Devices in the Environment

Timeline of the Scores for Responsiveness and Experience

Environment Stability Grading Bar Chart



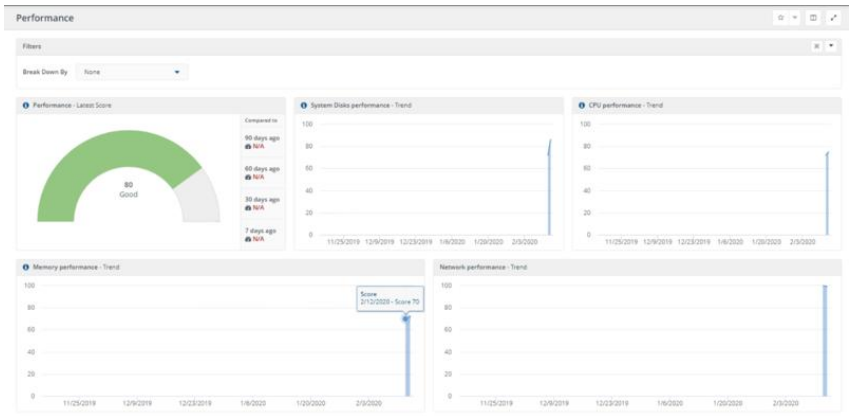
5.5.1.1.5 Performance page

The performance score is derived by measuring the performance of the device using the Windows Performance Counters. These counters measure many data points on the device including CPU usage, disk usage, memory usage, and processes.

The page allows you to drill into the Latest Score tile to see the different metrics that are collected. For information on the makeup of the score see Performance Score

More information on the Windows Performance Counters can be found here: https://docs.microsoft.com/en-us/windows/win32/perfctrs/performance-counters-portal.

5.5.1.1.5.1 The Performance Page



5.5.1.1.5.2 Performance - Latest Score Tile

The Latest Score tile can be selected for additional details. This is the view when selecting the Latest Score Tile with the Filters bar collapsed.

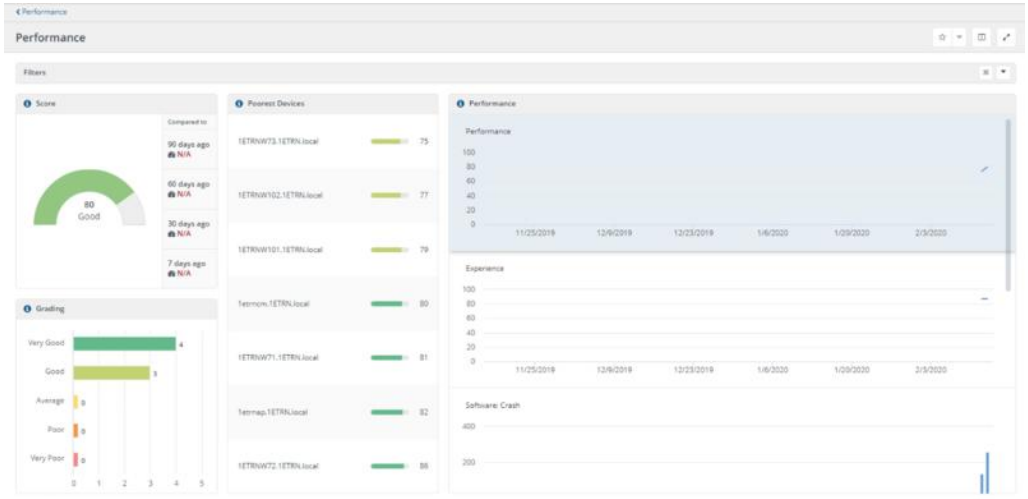
This view has the following tiles:

Score - with comparison history on the side

Poorest Devices in the Environment

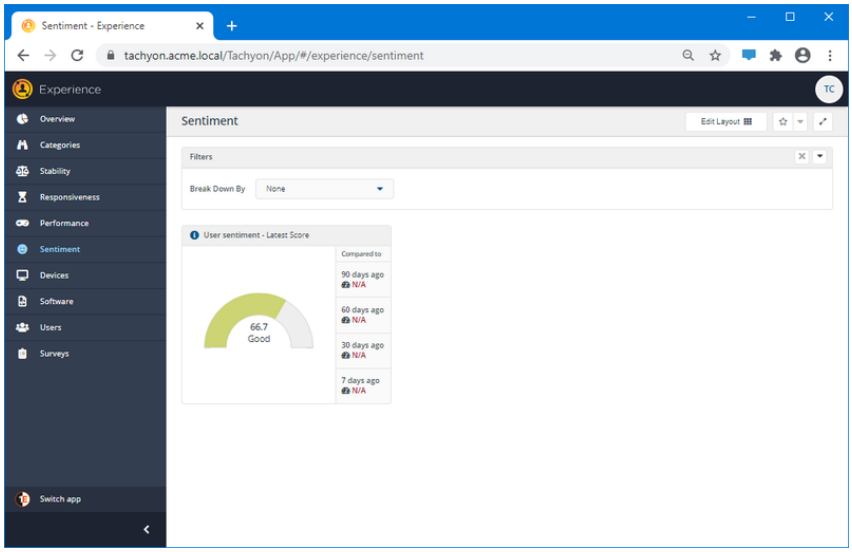
Timeline of the Scores for Performance and Experience

Environment Stability Grading Bar Chart



5.5.1.1.6 Sentiment page

The **Sentiment** page provides charts that focus on the Sentiment scores in Experience. You can also change the layout to add tiles for any User Sentiment Surveys you have created.



5.5.1.1.6.1 The Sentiment page

This page is the dashboard for monitoring your network's User Sentiment score and any User Sentiment Surveys you have created.

5.5.1.1.6.2 Editing and storing the Sentiment page layout

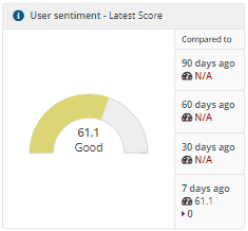
To display your own User Sentiment Surveys on the Sentiment page you click on the **Edit Layout** button to add the new metrics that are related to the Surveys. Once you have configured

5.5.1.1.6.3 Filters

You can apply filters and different breakdowns for the data displayed on the Sentiment page.

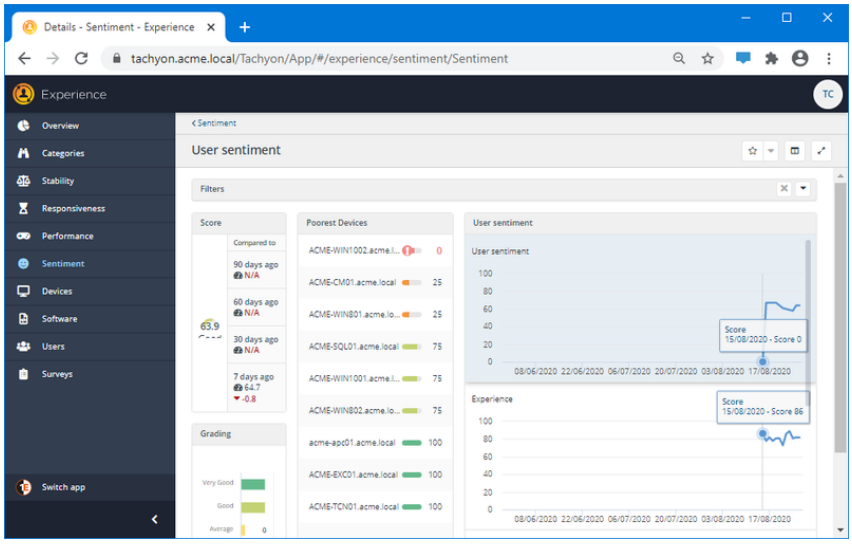
5.5.1.1.6.4 User sentiment - Latest Score tile

The default tile displayed on the **Sentiment** page is the **User sentiment - Latest Score** tile. This shows the latest User Sentiment score along with comparisons between the current date and those of 7, 30, 60 and 90 days ago. If you don't have enough data yet the relevant section of the **Compared to** column shows the text N/A to indicated that it's not applicable.



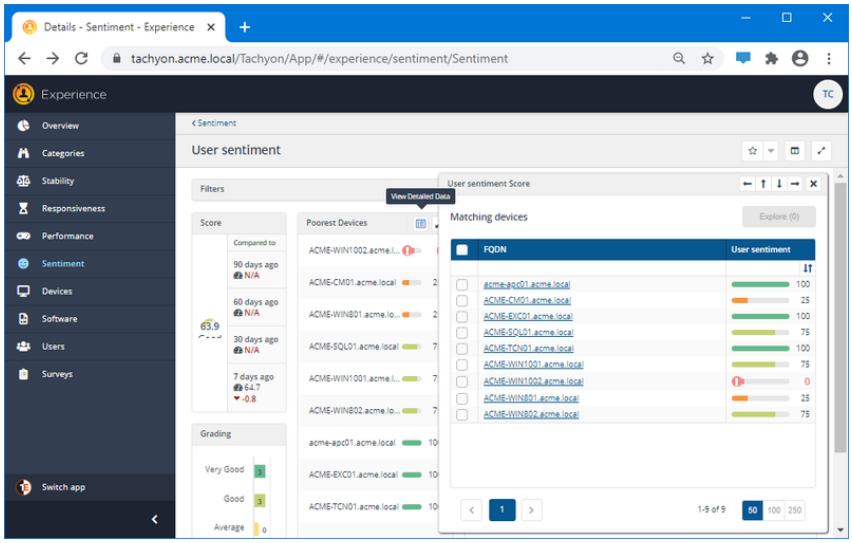
5.5.1.1.6.5 User sentiment page

Clicking on the **User sentiment - Latest Score** tile displays the **User sentiment** page. Here there are tiles for the **Score**, **Poorest Devices**, **User sentiment**, **Experience** and **Grading**.



5.5.1.1.6.5.1 User sentiment Score panel

Clicking on the **View Detailed Data** button on any of the tiles displays the **User sentiment Score** details, as shown in the picture opposite, which is a list of the devices and their current **User sentiment** scores. From here you can navigate to a device page by clicking on the device's FQDN, or make a selection and click on the **Explore** button to open the **Explorer** Application with the selected devices set as the scope.



5.5.1.2 Advanced Analytics menu

The Advanced Analytics menu contains two pages providing information to IT Support team members:

Networkpage, where they can monitor and manage network performance throughout their enterprise

Boot & Login page, where they can monitor and manage end-user boot and login experience throughout their enterprise.

5.5.1.2.1 Network page

The **Network** page provides information to IT Support team members, so they can monitor and manage network performance throughout their enterprise. By default, this page displays the following tiles:

Network - Latest Score

Operating System: UDP send time - Trend

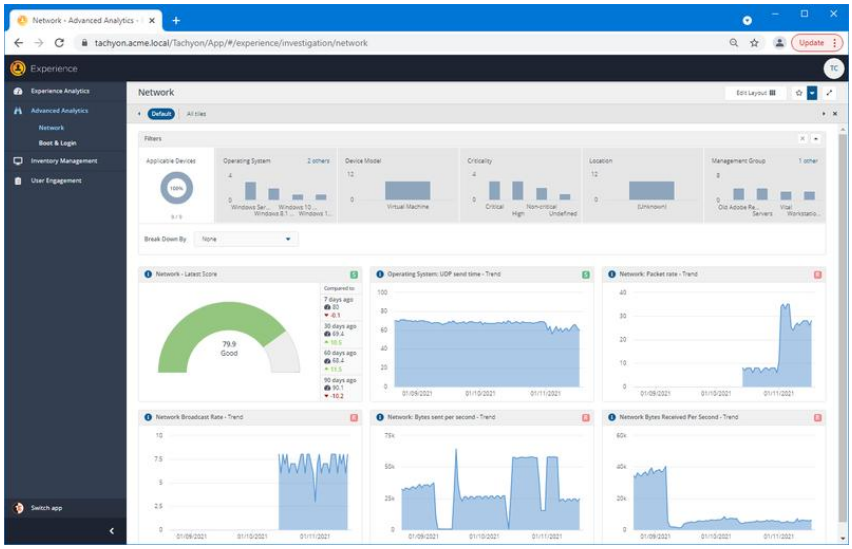
Network: Packet rate - Trend

Network Broadcast Rate - Trend

Network: Bytes sent per second - Trend

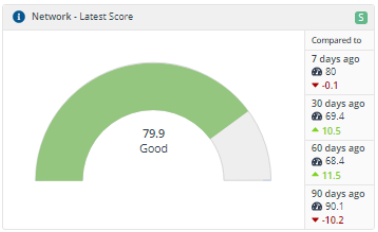
Network Bytes Received per second - Trend

Please refer to Investigating Network Performance for more information on how to use this feature.



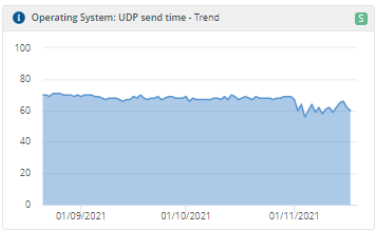
5.5.1.2.1.1 Network - Latest Score

This chart displays a score for device network stack performance based on: the Wireless signal quality, the UDP send time and the output queue length (does not include physical network considerations, such as latency).



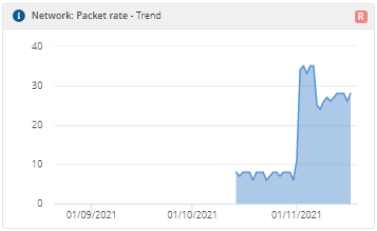
5.5.1.2.1.2 Operating System: UDP send time - Trend

This chart provides a score for the time taken to perform a basic loopback UDP send. A lower score may indicate problems with the operating system network stack.



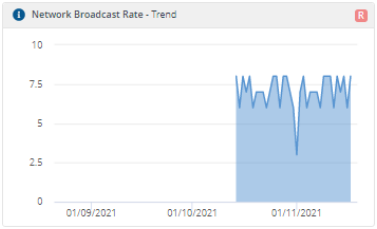
5.5.1.2.1.3 Network: Packet rate - Trend

This chart provides an overview of the sum of all TCP packets that have been sent and received per second; represents a measure of network resource utilization on the device.



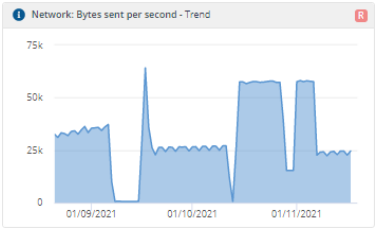
5.5.1.2.1.4 Network Broadcast Rate - Trend

This chart provides an overview of the sum of all multicast packets that have been sent and received per second (across all physical network interfaces on the device).



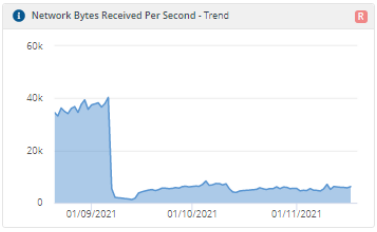
5.5.1.2.1.5 Network: Bytes sent per second - Trend

This chart provides an overview of the average number of bytes sent per second across all network adapters.



5.5.1.2.1.6 Network Bytes Received per second - Trend

This chart provides an overview of the average number of bytes received per second across all network adapters.



5.5.1.2.2 Boot and Login page

The **Boot & Login** page provides information to IT Support team members, so they can monitor and manage end-user boot and login experience throughout their enterprise. By default, this page displays the following tiles:

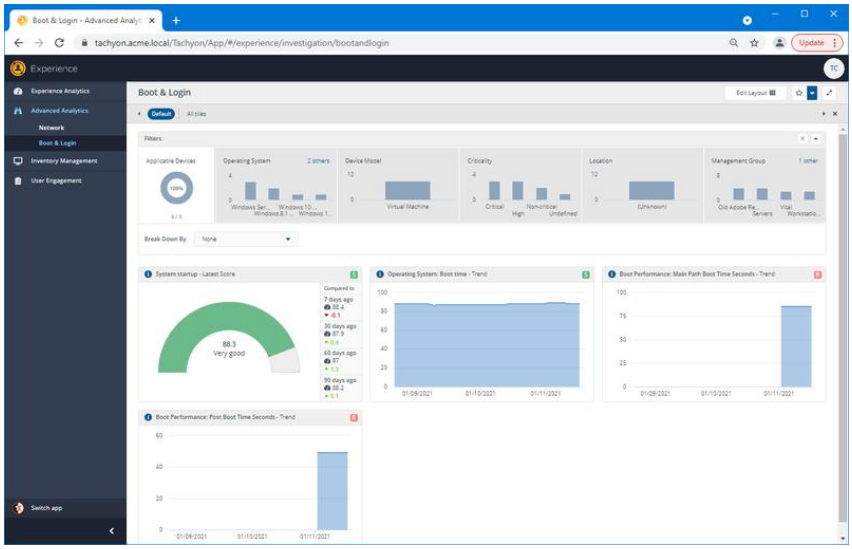
System startup - Latest Score

Operating System: Boot time - Trend

Boot Performance: Main Path Boot Time Seconds - Trend

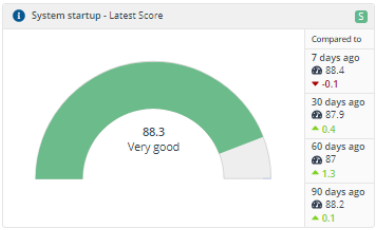
Boot Performance: Post Boot Time Seconds - Trend

Please refer to Investigating Boot and Login Performance for more information on how to use this feature.



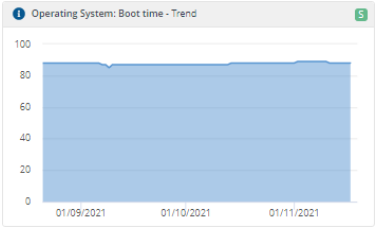
5.5.1.2.2.1 System startup - Latest Score

This chart provides a score derived from operating system startup times for devices.



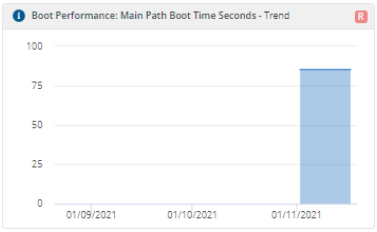
5.5.1.2.2.2 Operating System: Boot time - Trend

This chart provides a score derived from the times taken for devices to boot to the logon prompt. A lower score indicates a long boot up duration, which may affect user satisfaction.



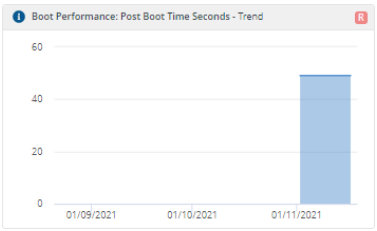
5.5.1.2.2.3 Boot Performance: Main Path Boot Time Seconds - Trend

This chart provides an overview across all devices, of the time taken (in seconds) to perform the Main Path step of the boot sequence, which starts when the Windows splash screen appears and ends when the desktop becomes available.



5.5.1.2.2.4 Boot Performance: Post Boot Time Seconds - Trend

This chart provides an overview across all devices, of the the time taken (in seconds) to perform the Post-boot step of the boot sequence, which starts when the desktop appears and ends when the system reaches a certain idle state having initialized services and applications.



5.5.1.3 Inventory Management menu

The Inventory Management menu contains three pages:

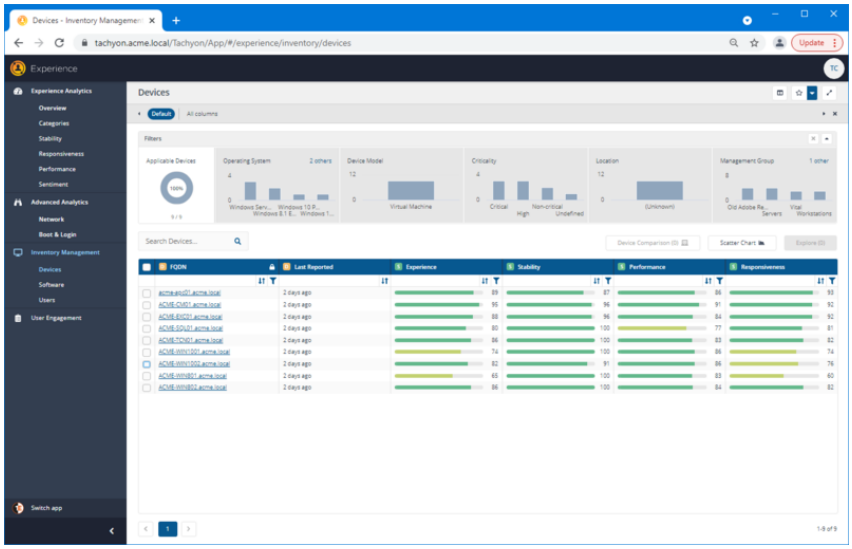
Devices page provides a list of all devices visible to Tachyon Experience

Software page provides a tabular listing of all the Software products that are installed in the environment (including executable, version, architecture).

Users page displays user experience information.

5.5.1.3.1 Devices page

The **Devices** page provides a list of all devices visible to Tachyon Experience. You can see all of their **Experience**, **Stability**, **Performance**, and **Responsiveness** statistics and sort them accordingly.



5.5.1.3.1.1 The Devices page

The Devices page allows you to view detailed information for each device in your environment by drilling into a device. From here, you can:

Select two devices and use Device Comparison to compare their settings

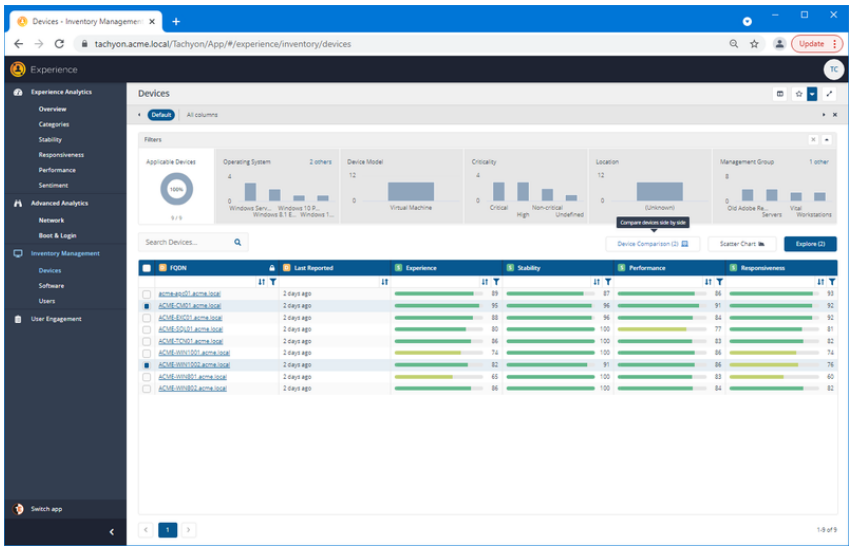
Use the Scatter Chart to plot the displayed devices on a two-dimensional graph with configurable axes

Select one or more devices and use Explore to set them as the scope for an explorer instruction

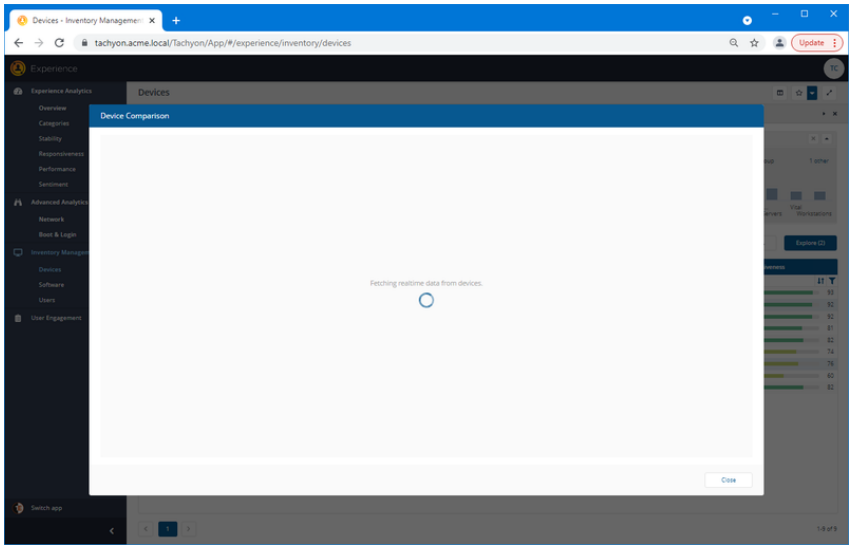
You can display the Device View for a selected device by clicking on its link in the **FQDN** column.

5.5.1.3.1.1.1 Device Comparison

Selecting two devices from the **Devices** table enables the **Device Comparison** button. Clicking on the button displays the **Device Comparison** popup.



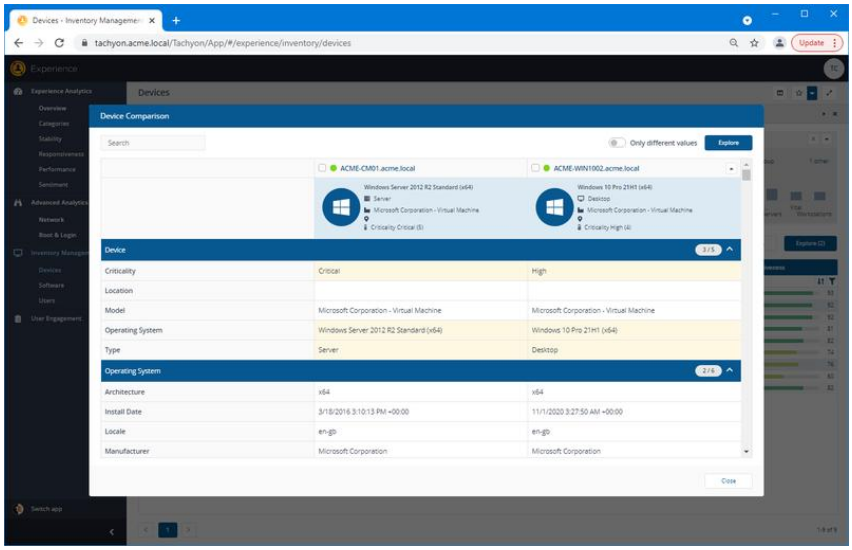
The data for the comparison is fetched in real-time from both the selected devices.



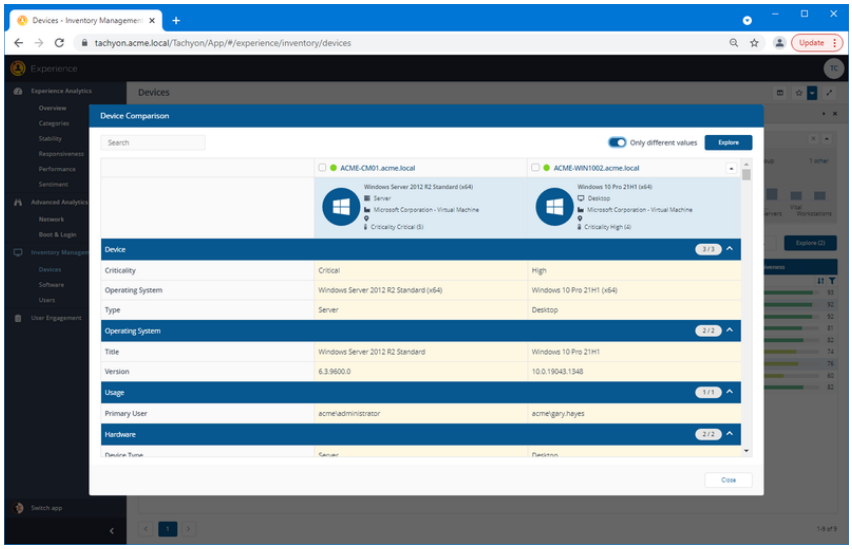
The details for the comparison are displayed in a table, with the parameter headings on the left-hand column and then one column per-device showing the values corresponding to the parameters.

Each column heading for the devices contains a checkbox, that can be used to select the device as the scope for an Explorer session by clicking on the **Explore** button. The FQDN name for each device is a link that can be used to display the Device View for that device.

The information in the table is grouped into 7 collapsible category headings: **Device**, **Operating System**, **Usage**, **Hardware**, **Software**, **Services** and **Processes**.

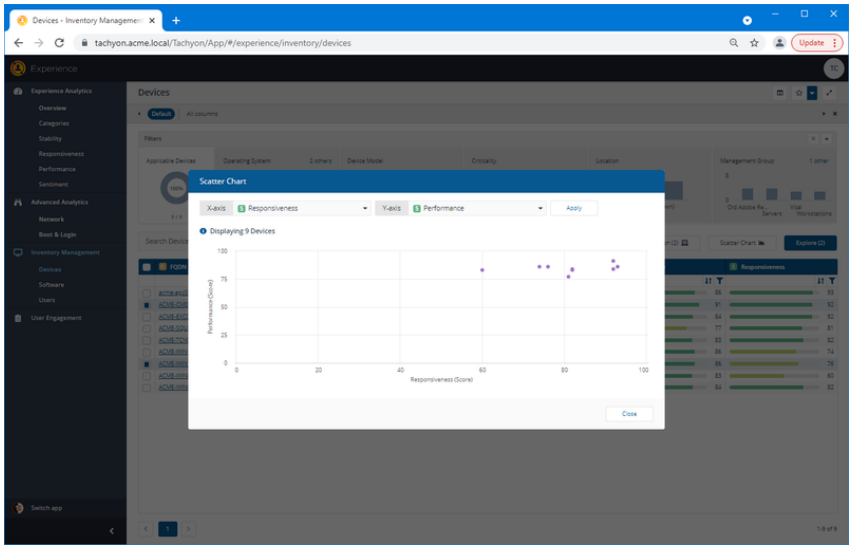


Each row where there is a difference is highlighted in yellow and where the information is the same in white. You can select to focus on only the differences by switching the **Only different values** toggle to on.

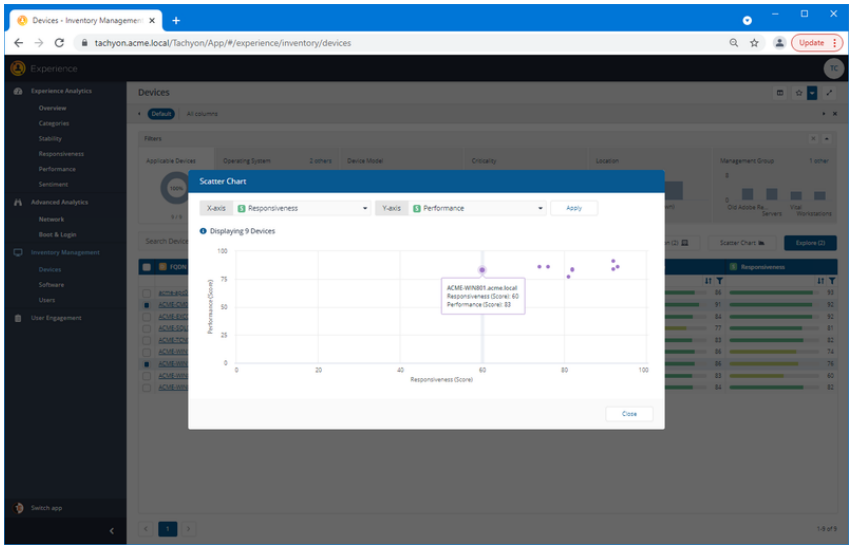


5.5.1.3.1.1.2 Scatter Chart

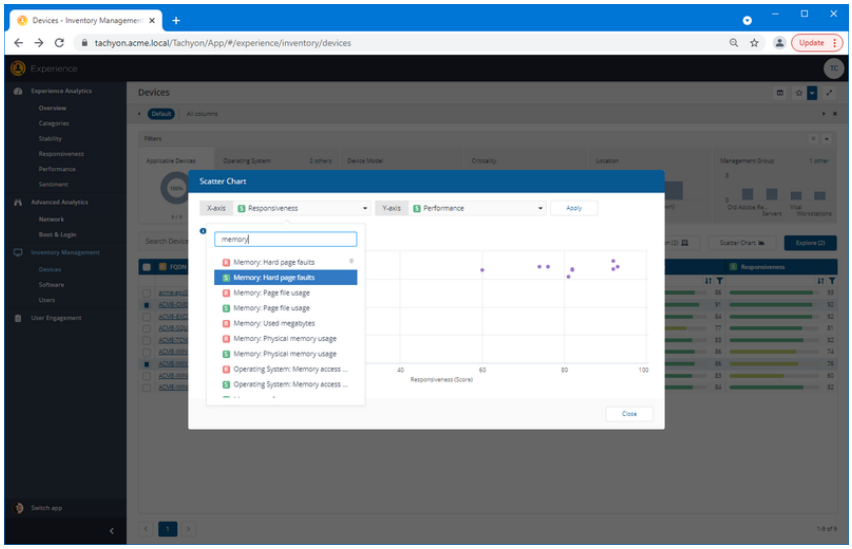
Clicking on the **Scatter Chart** button in the **Devices** page displays the **Scatter Chart** popup. The devices from the current view are plotted as points on a graph according to their **Responsiveness** scores on the X-axis and **Performance** scores on the Y-axis.



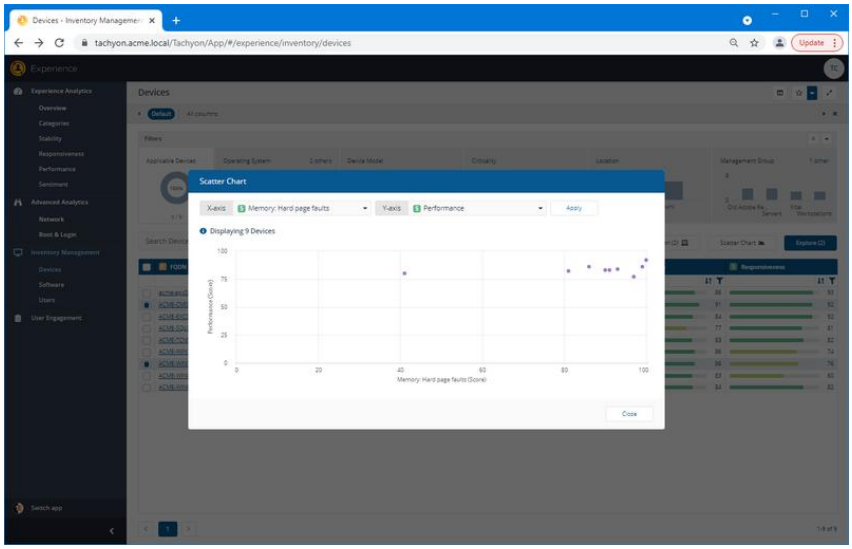
You can hover over a point on the graph to view its details.



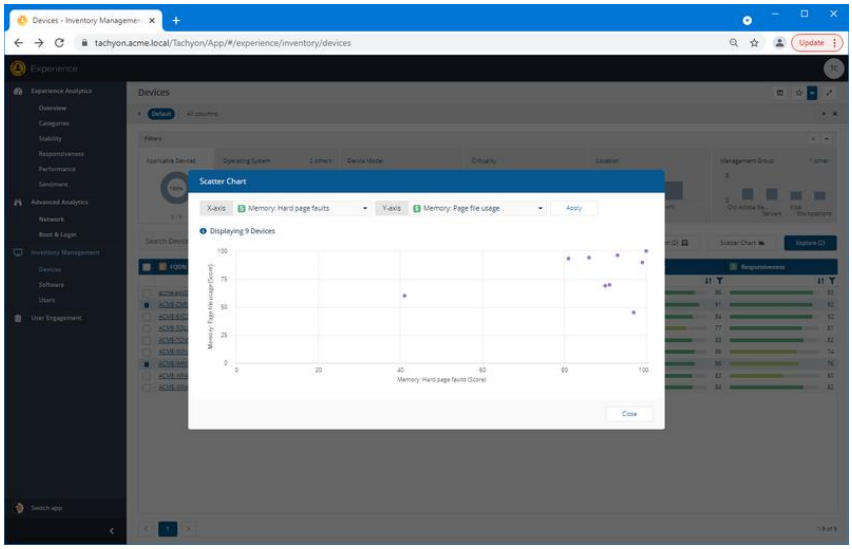
The parameters plotted on the axis can be changed using the axis dropdowns. The parameter you want to plot is selected from a list that can be filtered by typing text into the search field. The picture opposite shows the **Memory: Hard page faults** parameter selected.



You must click the **Apply** button to re-plot the graph according to the new selection.

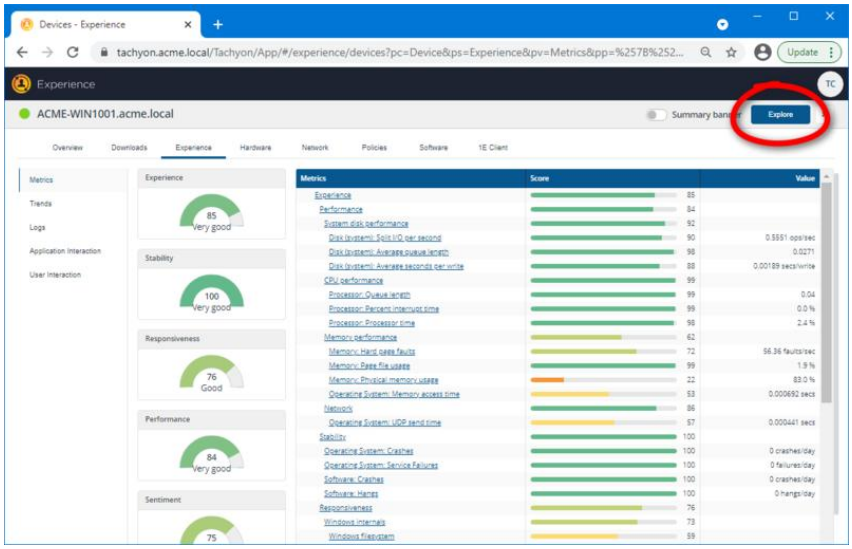


Both axes can be changed. The picture opposite shows the device **Memory: Hard page faults** plotted against the **Memory: Page file usage** scores.

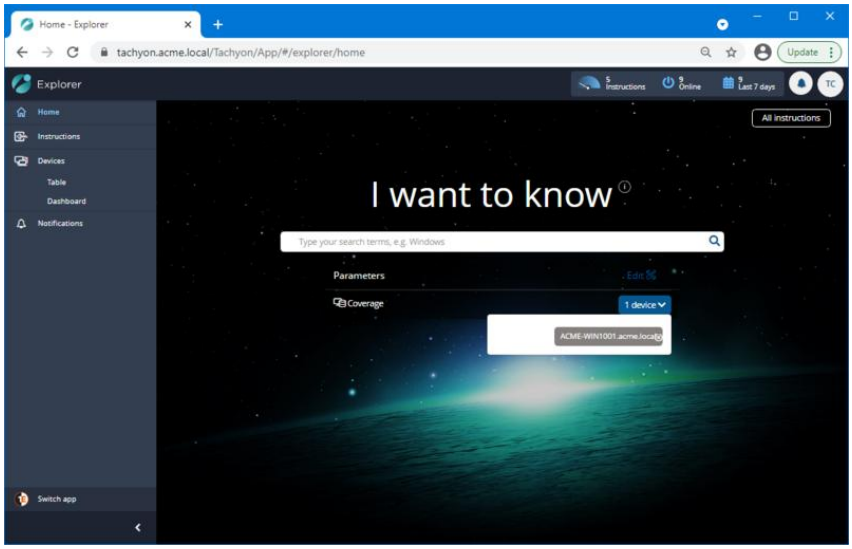


5.5.1.3.1.1.3 Explore Button

If the account you are viewing Tachyon Experience with has at least the Global Questioner role, you will also see an **Explore** button. Clicking this button will launch Tachyon Explorer.



The coverage will be set to the device you were viewing in Experience.



5.5.1.3.1.2 The Device View

Clicking on one of the links in the **FQDN** column of the **Devices** page displays the Device View for the selected device. The aim of the Device View is to provide a combined overview of all the information known about a device, along with the ability to retrieve information about the device in real-time. There are a number of tabs available in the Device View, but the **Experience** tab is specific to the Experience application.

5.5.1.3.1.3 The Device View Experience tab

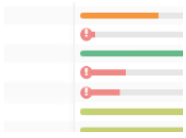
When displaying the Device view from an Experience page the view defaults to the **Experience** tab. The **Experience** tab contains information derived from and useful for Tachyon Experience. It contains the following panels:

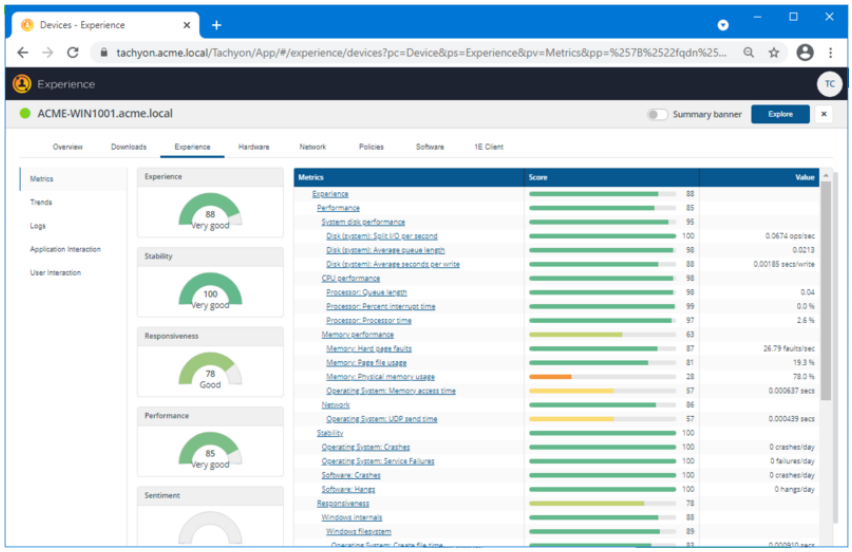
5.5.1.3.1.3.1 Metrics panel

This panel shows the current gradings for all the Metrics that are measured by Tachyon Experience.

> **Note**
>
> Only the current gradings can be seen here, there is no ability to look at the history information in this panel.

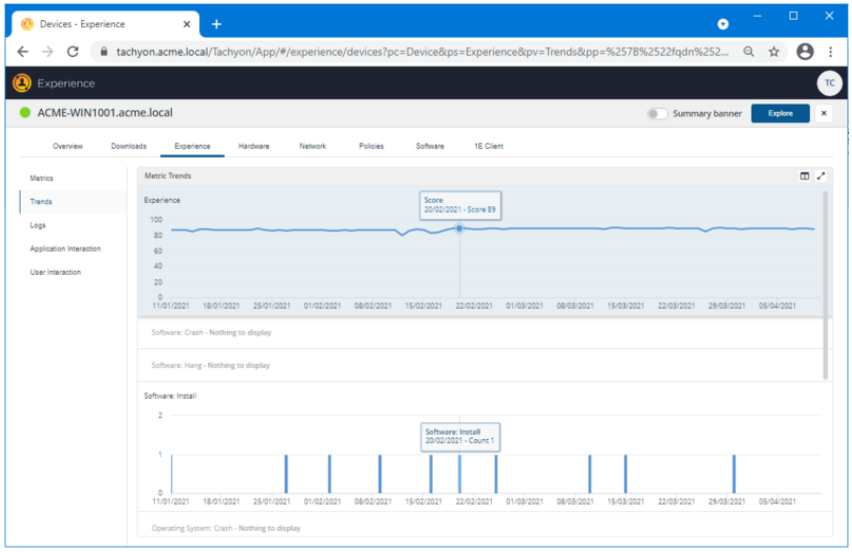
Metrics with a **Very Poor** grading are marked by lines in red with an exclamation mark.





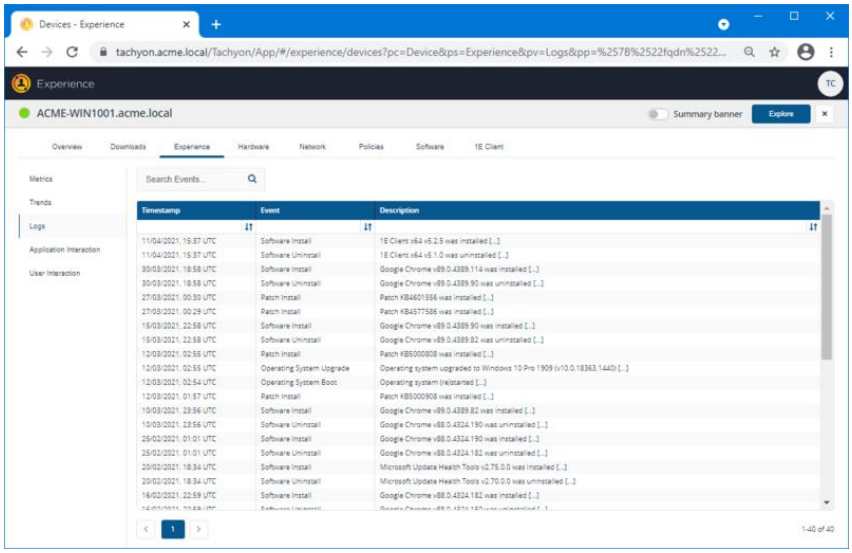
5.5.1.3.1.3.2 Trends panel

The **Trends** panel shows the Metric measurements over time, making it easy to determine trends and see what else was happening on the device as an issue progressed.



5.5.1.3.1.3.3 Logs panel

The **Logs** panel shows the Windows Event Log entries for significant events. These events are captured as they happen, the device does not wait for the daily digest to send the information to the switch.



5.5.1.3.1.3.4 Application Interaction panel

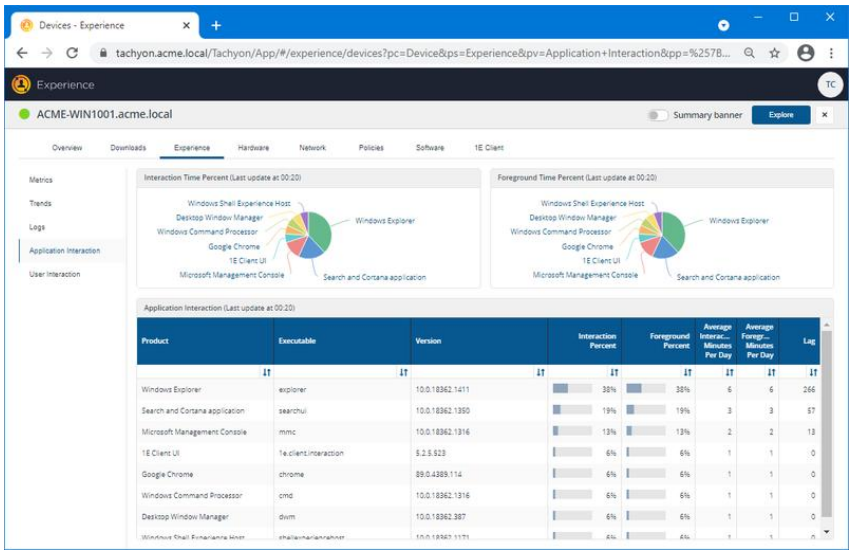
This panel provides a couple of charts and lists the applications that have most recently been interacted with on the device.

The **Interaction Time Percent** chart shows the amount of time each application on the device was interacted with as a percentage of the time for all the applications.

The **Foreground Time Percent** chart shows the amount of time each application spent in the foreground as a percentage of the time for all the applications.

The table lists the applications most recently interacted with on the device. The table can be sorted on each column.

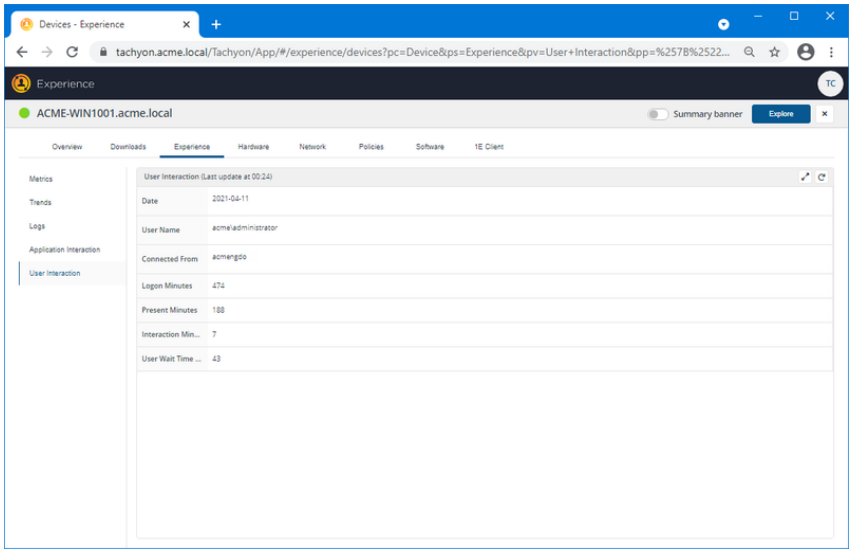
Column	Description
Product	The common name for the product.
Executable	The executable name associated with the product.
Version	The version number for the product entry.
Interaction Percent	The percentage of time the product was interacted with out of the total time all the applications were interacted with.
Foreground Percent	The percentage of time the product spent in the foreground out of the total time all the applications spent in the foreground.
Average Interaction Minutes Per Day	The daily average number of minutes the product was interacted with.
Average Foreground Minutes Per Day	The daily average number of minutes the product spent in the foreground.
Lag	The maximum lag time between interacting with the application and getting a response.



5.5.1.3.1.3.5 User Interaction panel

This panel provides information about the last known user for the device.

Row	Description
Date	The date the interaction took place.
User Name	The domain user name who performed the interaction.
Connected From	The device the user connected to the device from.
Logon Minutes	The number of minutes the specified user has been logged on for.
Present Minutes	The number of minutes the specified user was counted as present on the device while they were logged on.
Interaction Minutes	The number of minutes the specified user interacted with the device.
User Wait Time	The amount of wait time in seconds the user spent waiting for a response from an application.



5.5.1.3.1.4 Additional Device View tabs

In addition to the **Experience** tab, there are a number of other tabs, each corresponding to an app, feature or data set implemented in Introducing Tachyon:

The **Overview** and **1E Client** tabs are always present in the **Device View**. Other tabs are visible if an app has been installed and is licensed.

Each tab has one or more panels with tiles populated with data from various sources, some by instructions that are run instantly, with results cached for 3 minutes. An appropriate error message is displayed instead of a tile in the following circumstances:

If the device is offline, as indicated by the color of the icon in the top left

The user does not have at least Viewer permission to view use the license the tab or panel

The user does not have questioner permission to run the instruction

An instruction has not been uploaded.

The Device View tabs and panels page lists the names of tabs and their panels, and a description of each tile indicating how the tile is populated.

<table>
<tr><th>Tab</th><th>Panel</th><th>Description</th><th>Data source</th></tr>
<tr><td>Overview</td><td>Details</td><td>Displays a number of tiles sorted into Identification, Hardware and Operating System and Connectivity and Activity columns that show information for the selected device retrieved from the online status information stored in the Tachyon Master database.

The columns and tiles are shown in the following table:

Tab	Panel	Description	Data source
	Version	Product version number.	
	Devices count	How many devices are reporting.	
	Crashes	Number of times this software crashed during the last 24-hour reporting period.	
	Hangs	Number of times this software crashed during the last 24-hour reporting period. **Note** Software crash and hang information is obtained from Windows event data. For background information on Windows events and the event viewer refer to https://support.microsoft.com/en-gb/help/302542/how-to-diagnose-system-problems-with-event-viewer-in-microsoft-windows	
	Performance anomalies	Number of performance anomalies detected in this software during the last 24-hour reporting period.	
	I/O write KB/s	Average disk I/O read rate per second during the last 24-hour reporting period.	

Tab	Panel	Description	Data source
	I/O write KB/s	Average disk I/O write rate per second during the last 24-hour reporting period. **Note** For background information on analyzing disk storage performance refer to https://docs.microsoft.com/en-gb/archive/blogs/cotw/analyzing-storage-performance	
	Virtual Memory Usage KB	Average Virtual Memory Usage KB during the last 24-hour reporting period. **Note** For an explanation of Windows Virtual Memory organization refer to https://answers.microsoft.com/en-us/windows/forum/windows_10-performance/physical-and-virtual-memory-in-windows-10/e36fb5bc-9ac8-49af-951c-e7d39b979938 and https://support.microsoft.com/en-us/help/2160852/ram-virtual-memory-pagefile-and-memory-management-in-windows	
	Processor Time Seconds	Each instance of the executable will burn processor time. This column gives the average of the total time consumed by each process instance per second. Each instance uses the sum of all time used by each core in parallel. Therefore, it is possible to see more seconds here than in a day	

Tab	Panel	Description	Data source
		(usually 60 x 60 x 24 = 86400) for the whole column, if your system is working extremely hard 24x7. The theoretical maximum would be somewhere near ***number of cores*** x ***seconds per day*** . Hence, 'Processor Time' rather than 'Human Time'	
	Processor Time %	This is an easier notion than Processor Time Seconds. This is the average of the processor consumption of each instance. Each instance of this process will have caused different percentages of compute resource in all the processors and cores to be used over time (unless they have specifically requested certain core affinity). For each minute each process is running, a profile of the usage is built for the whole day. This value is the average of all of those samples. There is no way to work out, for any one of the process instances involved, how long any particular instance was running for. This could indicate a process that is going wild with resources, but it would take more investigation on the device to discover for how long this is happening. It is perfectly possible to see all the values in this column adding up to more than 100% as the processes were not necessarily running at the same time. **Note** For further information on Processor time refer to https://social.technet.microsoft.com/wiki/contents/articles/12984.understanding-processor-processor-time-	

Tab	Panel	Description	Data source

and-process-processor-time.aspx

Responsiveness Impact %

An indicator of how reactive a process is to activity by other processes on the device. Typically, anti-virus products watch and respond to potentially suspicious activity such as increased network traffic. Anti-virus products will differ in their impact on the overall performance of a device.

Note

Responsiveness Impact % is used to indicate how sensitive a process appears to be to the use of system resources by other processes on a device. For example, Security Protection software present on a device may reveal a spike in its activity whenever a new process is started on that device.

This would typically be because the Security Protection software may wish to ensure that the new process starting on the device is present in a security white list. Other software may also react to activity by other processes and by reacting they impact system resource uses, thereby adversely affecting the user's experience. So it is useful to be able to identify

Tab	Panel	Description	Data source
		software with the highest Responsiveness Impact on a device and potentially investigate further. **Note** Responsiveness Impact % represents the proportion of the increased CPU activity detected by the 1E Client as a result of performing a set of operating system-level operations that can be attributed to a given running process. Examples of these would be Windows registry and resource creation operations. It is reported as a percentage to normalize results across devices that offer a range of computing power. For example, if *software.exe* on a device is attributed a Responsiveness Impact of 53% this means that more than half of the spike in CPU usage caused by software monitoring activity on that device can be attributed to *software.*	
	Handle Count	Average number of Windows handles used by this software during the last 24-hour reporting period. **Note**	

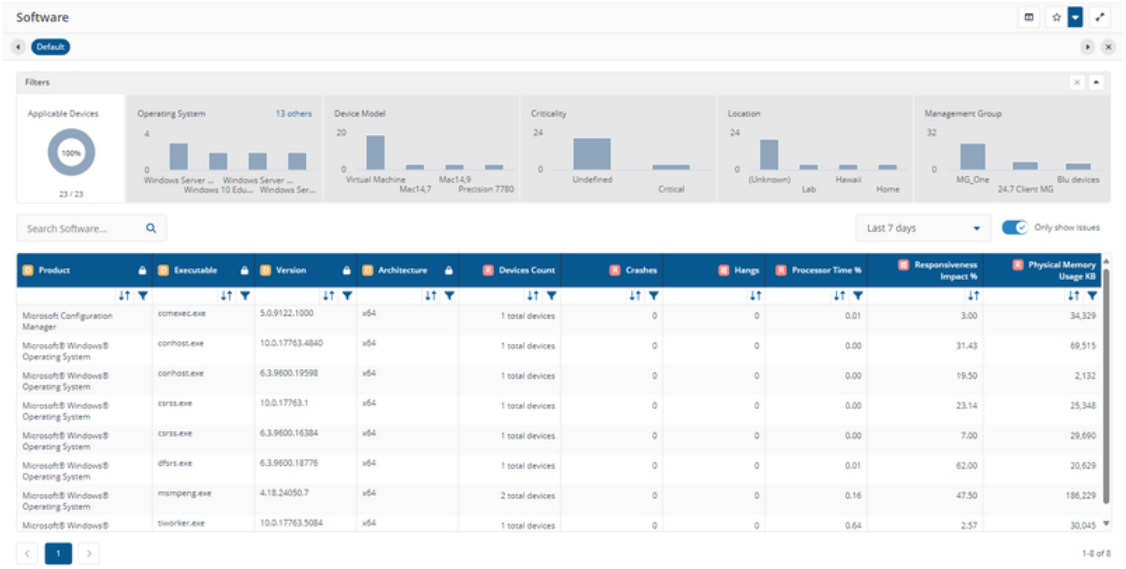
Tab	Panel		Description	Data source
		For further information on Windows handles refer to https://docs.microsoft.com/en-us/windows/win32/sysinfo/handles-and-objects For tips on examining open handles for any Windows process refer to https://docs.microsoft.com/en-us/sysinternals/downloads/handle and https://techcommunity.microsoft.com/t5/windows-blog-archive/pushing-the-limits-of-windows-handles/ba-p/723848		
	Physical Memory Usage KB	Average Physical Memory Usage KB during the last 24-hour reporting period. **Note** Please refer to https://docs.microsoft.com/en-us/sysinternals/downloads/rammap for a useful tool to examine physical memory allocation on a device.		
1E Client	**Binaries**		Shows a list of the binary files in the executable folder of the 1E Client. Column: **File Name** Description: Associated 1E	1E-Tachyon Platform-Client-Binaries

Tab	Panel	Description		Data source
			Client file name.	
		File Version	Software version.	
		File Size	File size in bytes.	
		Description	File description	
		Date Created	The date the file was written to disk.	
		Date Modified	The date the file was last saved.	
Configuration file	Shows the full content of the 1E Client configuration file, including: Logging settings Communication settings Agent settings Module settings.			1E-TachyonPlatform-Client-ConfigFileContent
Extensibility	Shows extensibility objects (modules and providers) loaded by the 1E Client. Column: **Type** — Description: Module or Provider component.			1E-TachyonPlatform-Client-Extensibility

Tab	Panel		Description	Data source
	Binary Name	Associated 1E Client binary name, for example 1E.Client.Module.Interaction.dll		
	Name	Name, for example Interaction.		
	Version	1E Client version, for example 5.2.5.251		
Local Storage	Shows **Data Files** and **Client Inventory Database Use** tiles that display the list of: Data files (logs, databases, etc) created by the 1E client Tables in the 1E Client Inventory database, along with a row count per table.		1E-TachyonPlatform-Client-DataFiles 1E-TachyonPlatform-Client-InventoryDatabaseUse	

5.5.1.3.2 Software page

The Software page provides a tabular listing of all the Software products that are installed in the environment (including executable, version, architecture). The second set of columns in the list provide additional metrics or event details associated with the Software products.



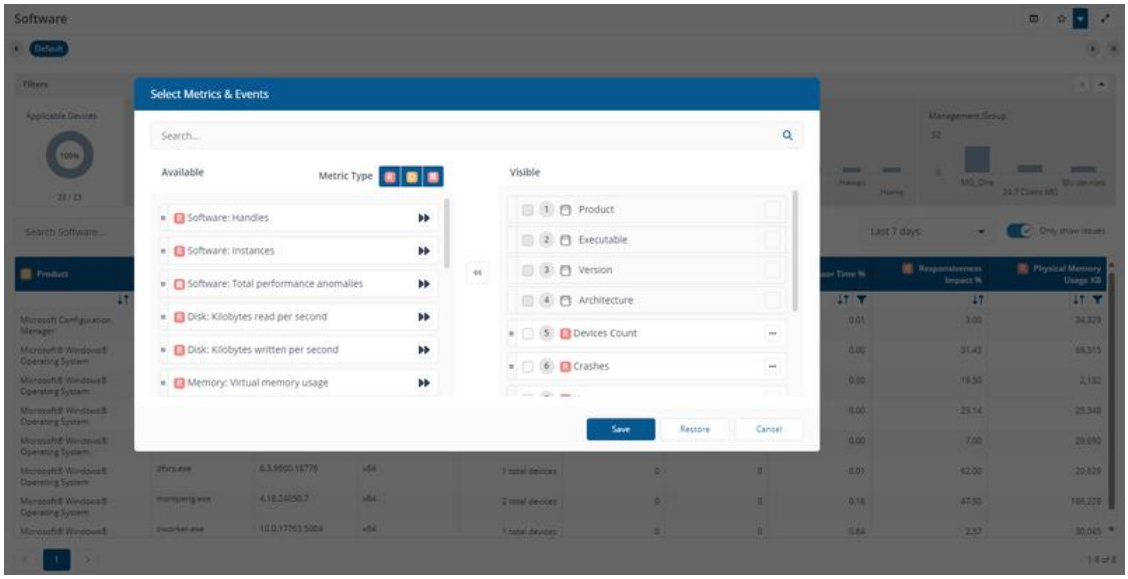
5.5.1.3.2.1 Filtering and navigation

The drop-down selection at the top right of the page allows you to select to display data for the last 90, 60, 30 or 7 days.

The **Filters** at the top of the page, also lets you focus the data, allowing you to center your insights on specific areas of the environment. For example, specific Operating Systems and/or Locations.

The table can be sorted by each column (ascending or descending), as well as filtered based on the available columns values.

You also have the ability to add or remove columns from the tabular listing, which is present at the bottom of the page, based on the level of detail that your investigation requires. You can also set the new structure of the page as a persistent preset.



Clicking on a row filters the table to only display entries that match the **Product**, **Executable**, **Version** and **Architecture** values for that row. The table displayed subsequently omits the **Product**, **Executable**, **Version** and **Architecture** columns, as these will all be the same, so you can focus your attention on the rest of the data.

5.5.1.3.2.2 Software page metrics

The other metrics or events that can be added and removed from the list are:

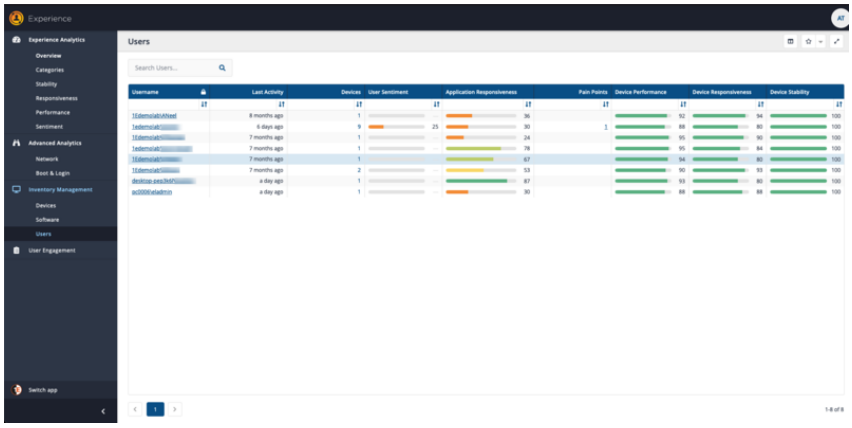
Metric	Description
Devices Count	Number of devices on which the Software product and its associated process is installed.
Crashes	Number of crashes that have occurred for the Software product's process during the reporting period.
Hangs	Number of hangs that have occurred for the Software product's process during the reporting period.

Metric	Description
Processor Time %	Average processor time for the Software product's process during the reporting period.
Sensitivity/Responsiveness Impact %	How sensitive this software product's process appears to be in relation to operating system activity used to indicate how reactive a process is to activity by other processes on the device.
Physical Memory Usage KB	Average memory usage in KB for the Software product's process during the reporting period.
Virtual Memory Usage KB	Average Virtual Memory Usage KB for Software product's process during the reporting period.
Handles	Average number of Windows handles used by this Software product's process during the reporting period.
Processor Time Seconds	Average total process time consumed by the Software product's process instance per second during the reporting period.
Kilobytes read per second	Average KB read from disk per second by the Software product's process during the reporting period.
Kilobytes write per second	Average KB written to disk per second by the Software product's process during the reporting period.
Disk Read IOPS	Average disk I/O read rate per second of the Software product's process during the reporting period.
Disk Write IOPS	Average disk I/O wire rate per second of the Software product's process during the reporting period.
Bytes Received per Second	Average network bytes received per second for the Software product's process during the reporting period.
Bytes Sent per Second	Average network bytes sent per second for the Software product's process during the reporting period.
Bytes Exchange per Second	Average sum of network bytes received and sent per second for the Software product's process during the reporting period.

Metric	Description
Total Megabytes Sent	Total network megabytes sent for the Software product's process during the reporting period.
Total Megabytes Received	Total network megabytes received for the Software product's process during the reporting period.

5.5.1.3.3 Users page

The **Users** page displays user experience information, with measurements of how well their devices are providing them with a good experience combined with their user survey responses.



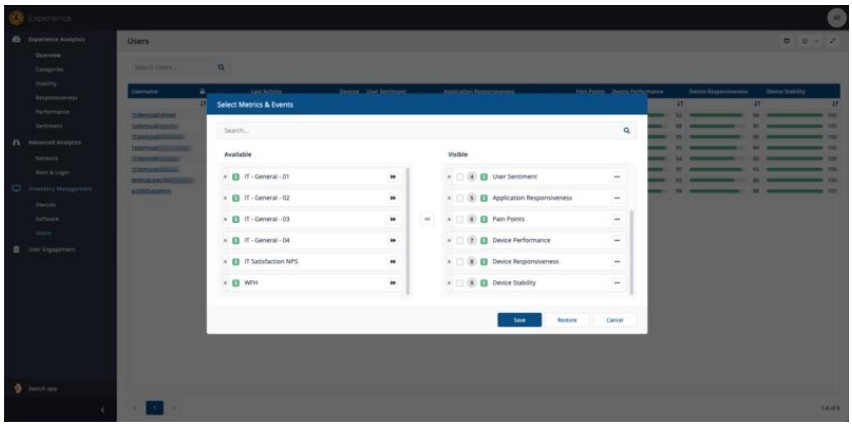
5.5.1.3.3.1 The Users page

Here you can find all of the user-related information in Experience. The main part of the page is the Users table, which displays the following information:

Column	Description
Username	The name of the user. This is a link to a page that provides data specific to that user, as gathered by Experience.
Last Activity	The last time data was gathered for the user.
Devices	The number of devices the user is associated with.
User Sentiment	The user's latest User Sentiment score.
Application Responsiveness	The latest score for how reactive the user's sessions have been.

Column	Description
Pain Points	The number of entries where the latest User Sentiment score is marked as Poor (orange) or Very Poor (red with an exclamation mark). The number is a link, which displays the particular user's Sentiment Survey responses, filtered to show the latest and just Poor or Very Poor ratings.
Device Performance	The average device performance for the user and their devices.
Device Responsiveness	The lowest score for device responsiveness for the user across all their devices.
Device Stability	The score for device stability for the user across all their devices.
Additional Metrics	Any Metric that has been created by an Experience Survey Administrator as part of defining a new User Sentiment Survey. These aren't shown by default but can be added from the **Select Metrics** popup.

You can also control the information that is displayed in the table using the **Select Metrics** button in the page header, which displays the Select Metrics popup, allowing you to determine which columns get displayed and in which order.

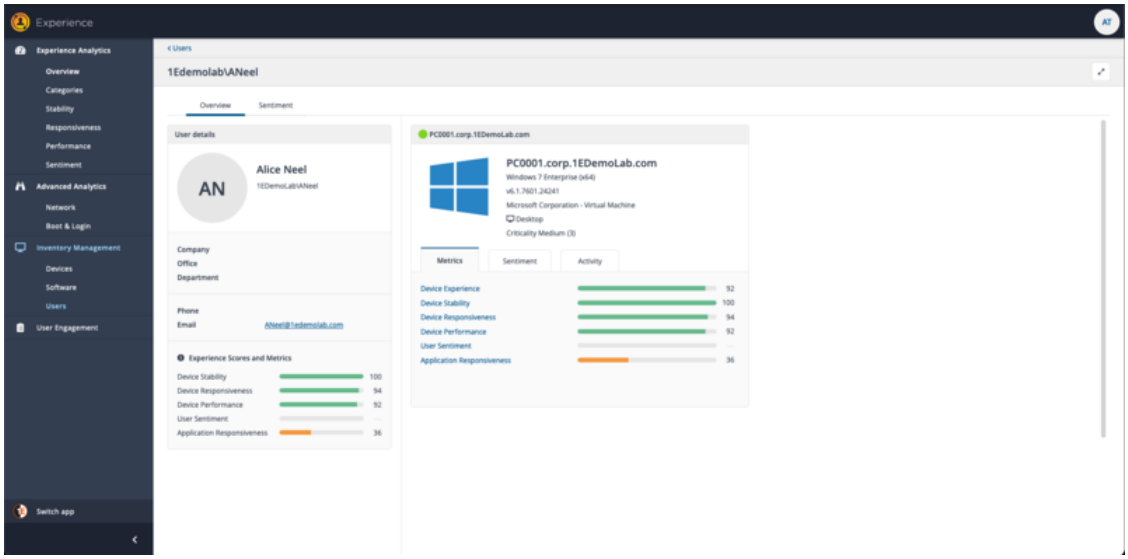


5.5.1.3.3.2 The Users page - Overview tab

This page is displayed when you click on a username on the **Users** page and shows all of the details that have been gathered or derived for that user. There are two main tabs on the page: **Overview**, as shown in the picture opposite, and **Sentiment**, which displays a list of the user's survey responses.

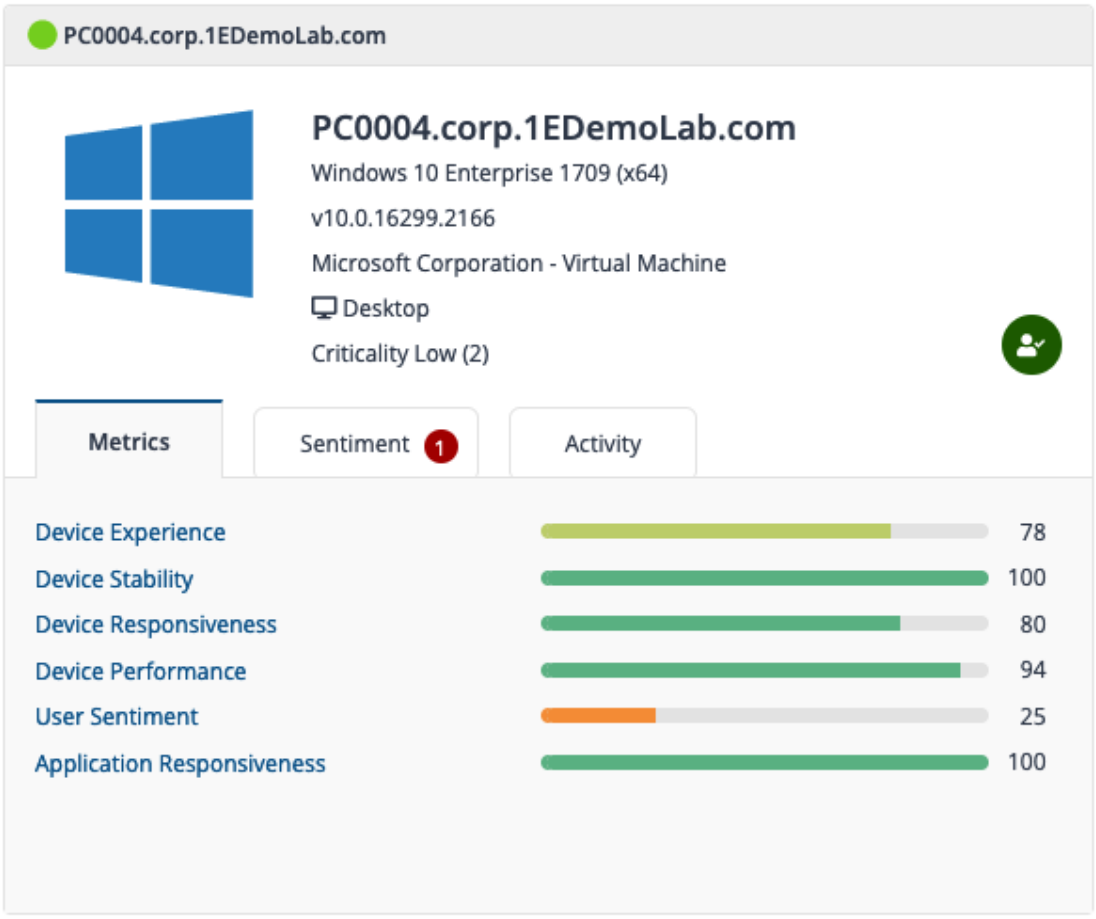
The **Overview** tab displays the following information:

User details - a panel that displays information for the user that is held in AD and the aggregated scores for that user, as derived by the Experience application from all of the devices the user is associated with and their User Sentiment Survey responses.



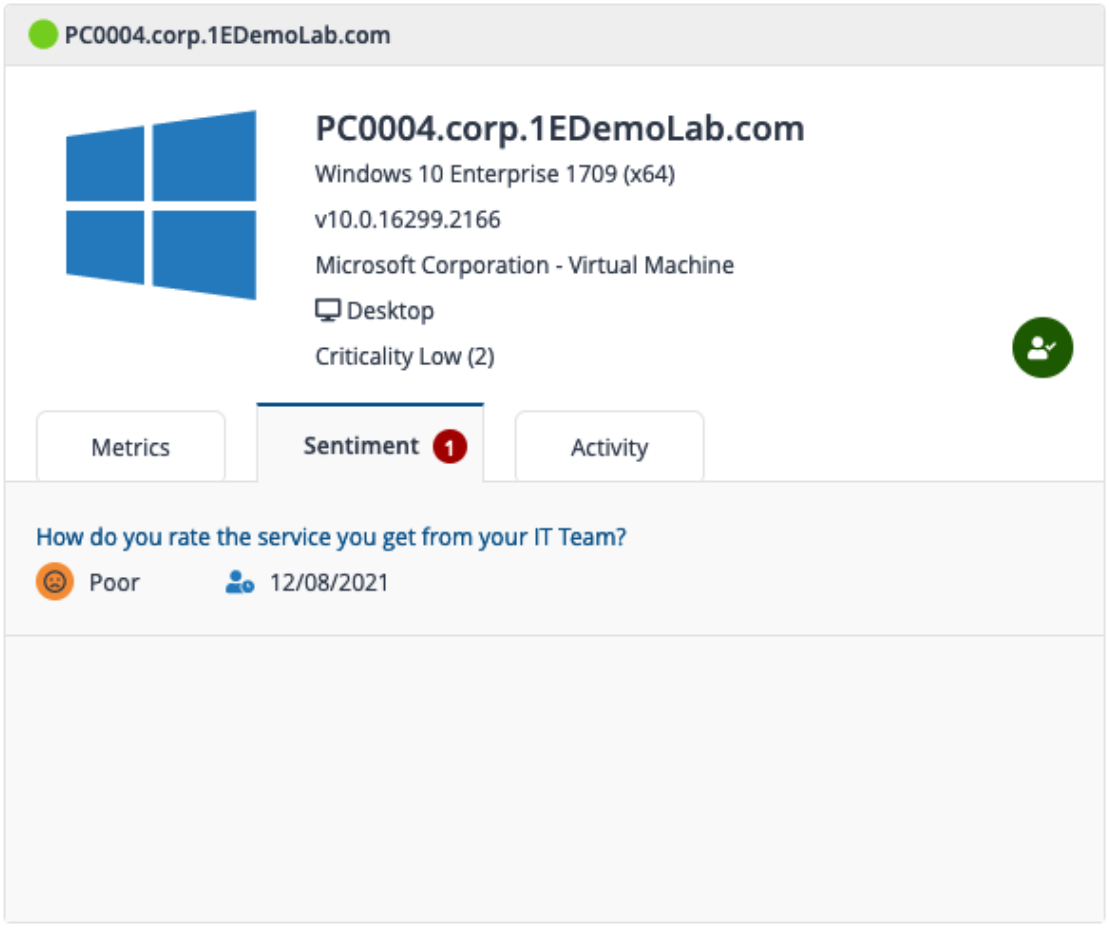
5.5.1.3.3.2.1 The Device Panel Metrics tab

To the right of the **User details** panel are device panels for all of the devices the user is associated with. The device panel displays some basic information about the device, as gathered by Tachyon, and three tabs: **Metrics**, **Sentiment** and **Activity**.



5.5.1.3.3.2.2 The Device Panel Sentiment tab

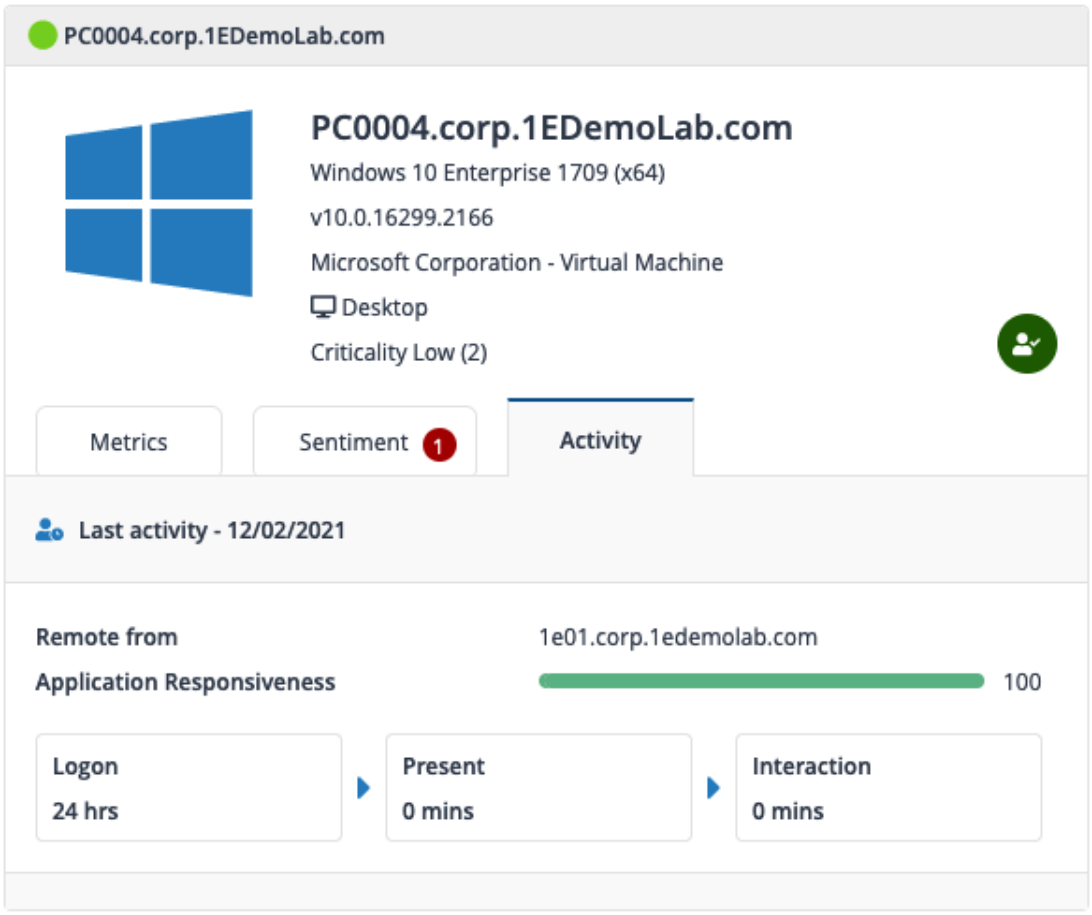
The picture opposite shows the Device Panel **Sentiment** tab for **ACME-WIN1002.acme.local**. This displays the last responses to User Sentiment Surveys made by the user on that device, clicking on the question link displays the user page **Sentiment** tab filtered to show just the responses to that question on that device.



5.5.1.3.3.2.3 The Device Panel Activity tab

The **Activity** tab shows when the user was last logged on to the device, where they accessed it from, how well their session is performing in terms of how reactive it is.

There is also an indication of how long they have been logged on, how long they've been present at the device and how long their current interaction with the device has been.



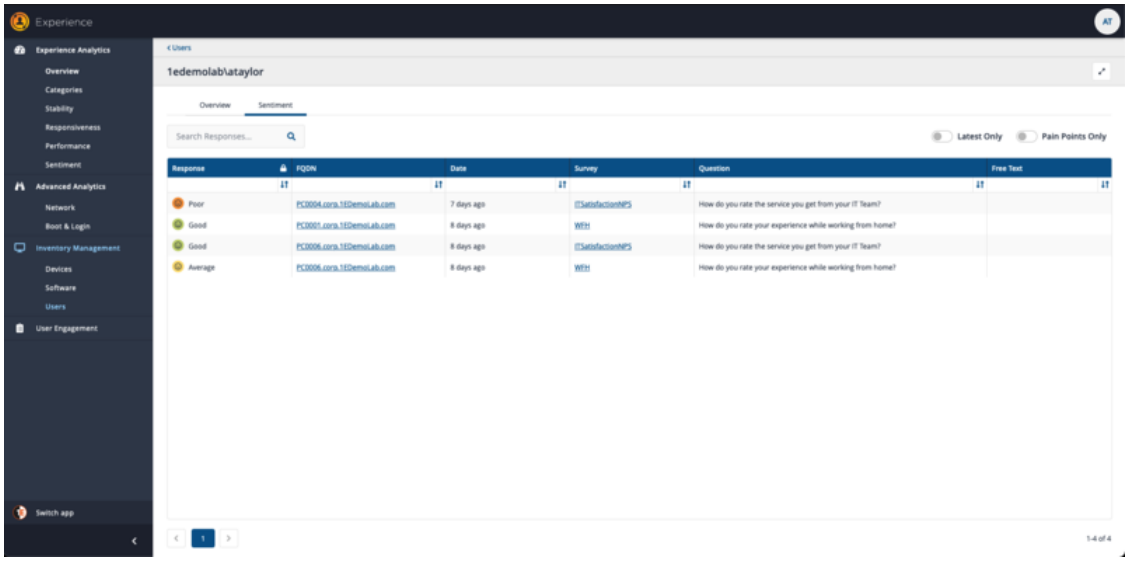
5.5.1.3.3.3 *The User page - Sentiment tab*

Here you can see all of the responses made by a user to any User Sentiment Surveys they have received. The main part of this page is a searchable Responses table:

Column	Description
Response	The response they made to a User Sentiment Survey.
FQDN	The FQDN for the device where they made the response. This is a link to the Devices page for the device, where you can view all of the device metrics.
Date	How long ago they made the response.
Survey	The User Sentiment Survey name. This is a link to the Survey page for the survey, where you can view all the Survey responses.
Question	The question for the User Sentiment Survey.

Column	Description
Free text	Any free text they entered when responding.

You also have the option for viewing the latest responses to the survey by switching the **Latest Only** toggle to on. You can also select to display only the responses that are rated **Poor** or **Very Poor** by switching the **Pain Points Only** toggle to on.



5.5.1.4 User Engagement page

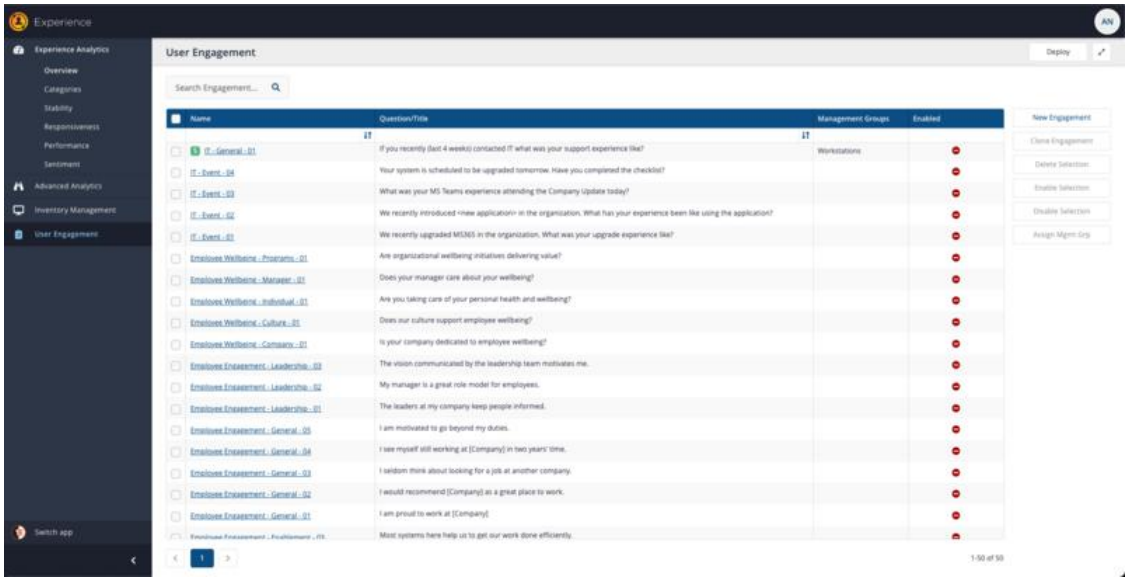
The **User Engagement** page lets you create and manage Sentiment and informational surveys, to gain direct feedback related to end-user experience, as well as create and manage Announcements to communicate with your end-users.

There are three types of **User Engagement**:

Sentiment Surveys - have well-defined responses that contribute to the overall Sentiment score, and the returned results can be visualized under the format of charts on the Sentiment page.

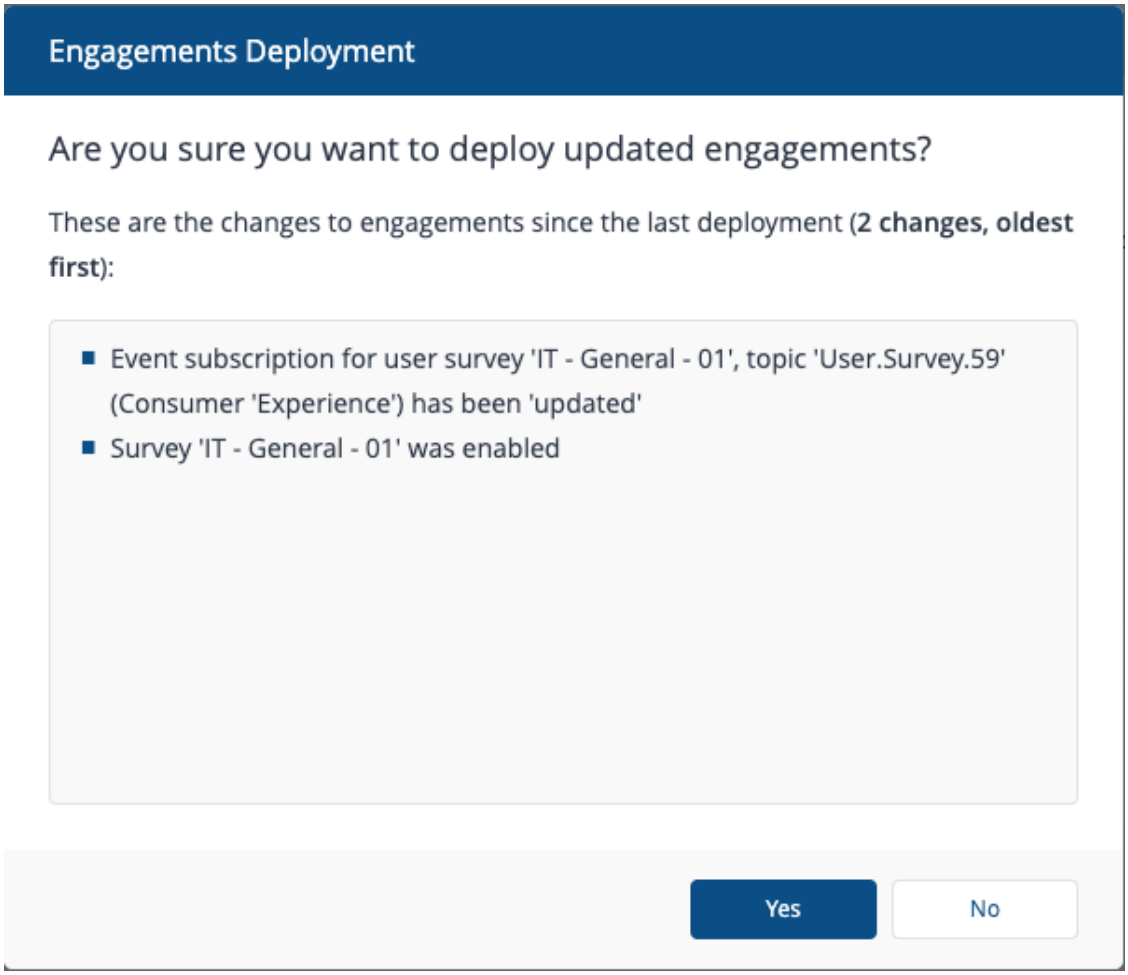
Info Surveys - can be customized to a greater extent than the Sentiment surveys, but they do not contribute to the overall Sentiment score.

Announcements – these are one-way communications which can be used for a variety of use cases, such as broadcasting to end-users information about organizational changes, IT news and updates and more.



5.5.1.4.1 The User Engagement page

At the top of the page, in the header, is a **Deploy** button. This must be used whenever you want to apply any of the changes you make to the devices targeted by either Surveys or Announcements. When you click the **Deploy** button, an **Engagements Deployment** popup appears, as shown in the picture opposite, with a list of changes that have been made.



The main part of the **User Announcements** page is represented by a searchable table:

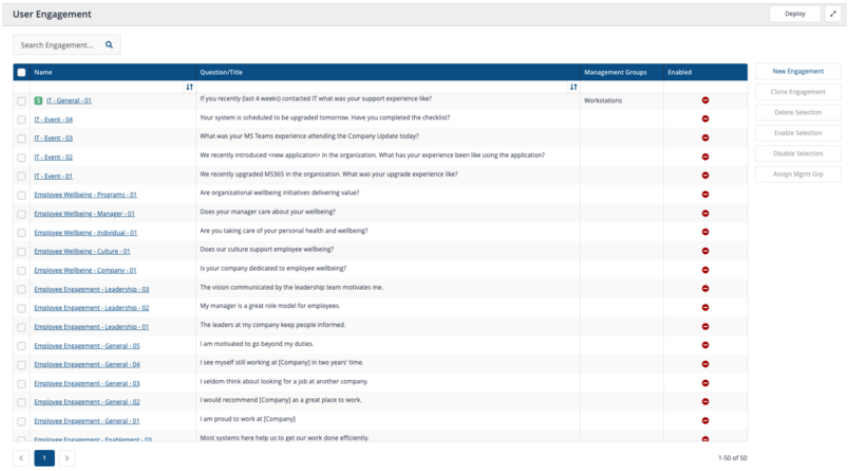
Column	Description
Name	The name of the **Engagement**. This also is a link to the User Engagement details page that provides all the information you need to monitor related to either the Survey's responses or User Engagement results. For Sentiment Surveys, the name is also a Metric that contributes towards the Sentiment score. You can monitor it using a chart on the **Sentiment** page, and appears under the **Sentiment** heading of the Device Metrics - displayed when viewing device details from the Devices page. Sentiment Surveys are marked by a Survey icon - S Announcements are marked by an Announcement Icon - A

Column	Description
Question/Title	Shows the question set for the Survey or, for Announcements, the Title.
Management Groups	The Management Groups set for a User Engagement determine which devices the Survey or Announcement is sent to.
Enabled	This indicates whether the User Engagement is enabled or not. Only enabled Engagements that are deployed become visible to end-users.

There are also a number of action buttons, related to the selections in the table.

Button	Description
New Engagement	Displays the **New Engagement** page where you can create a new Sentiment Survey, Info Survey or Announcement. This button is only enabled if there are no selections in the User Engagement table.
Clone Engagement	Displays the **New Engagement** page pre-filled with the details from the Survey or Announcement currently selected in the User Engagement table. This button is only enabled if there is a single selection in the**User Engagement**table.
Delete Selection	Deletes the selected Survey(s) and/or Announcement(s) in the User Engagement table. Clicking this button displays the **Engagement Deletion** popup. This button is only enabled if there is one or more selections in the**User Engagement**table.
Enable Selection	Enables all the selected Survey(s) and/or Announcement(s) in the User Engagement table regardless of their current enabled state. Clicking this button displays the **Enable Engagement** popup. This button is only enabled if there is one or more selections in the**User Engagemen**t table.
Disable Selection	Disables all the selected Survey(s) and/or Announcements in the User Engagement table, regardless of their current enabled state. Clicking this button displays the **Disable Engagement** popup.

Button	Description
	This button is only enabled if there is one or more selections in the **User Engagement** table.
Assign Mgmt Grp	Assigns Management Groups to the selected Survey(s) and/or Announcements in the User Engagement table. Clicking this button displays the **Assign Management Groups** popup. This button is only enabled if there is one or more selections in the**User Engagement**table.



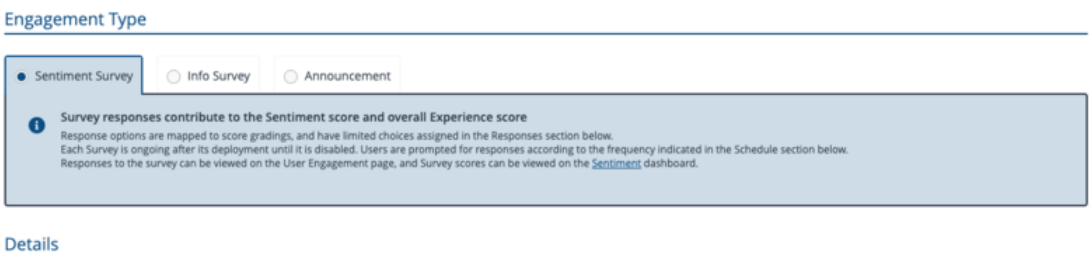
5.5.1.4.2 The New Engagement page

Clicking on the **New Engagement** button in the User Engagement table displays the **New Engagement** page, where you can define all the parts to your new Engagement.

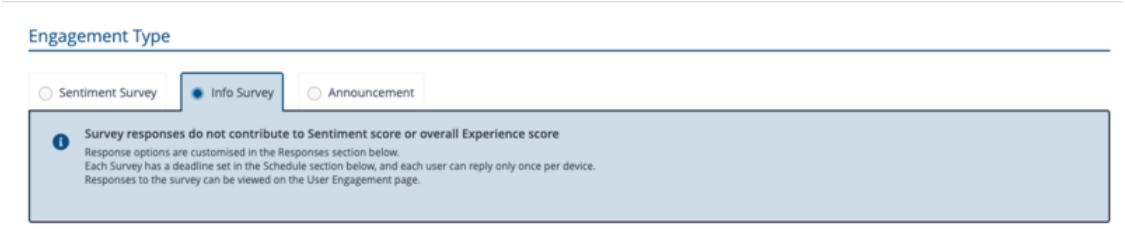
5.5.1.4.2.1 Engagement Type

The first choice is the **Engagement Type** here you can choose between Sentiment Survey, Info Survey or Announcement types. The controls displayed for each type are different.

The default **Engagement Type** selected on the **New Engagement** page is **Sentiment Survey**, as shown in the picture opposite.



If you want to define an **Info Survey** or an **Announcement** you must select that option under the **Engagement Type** heading.

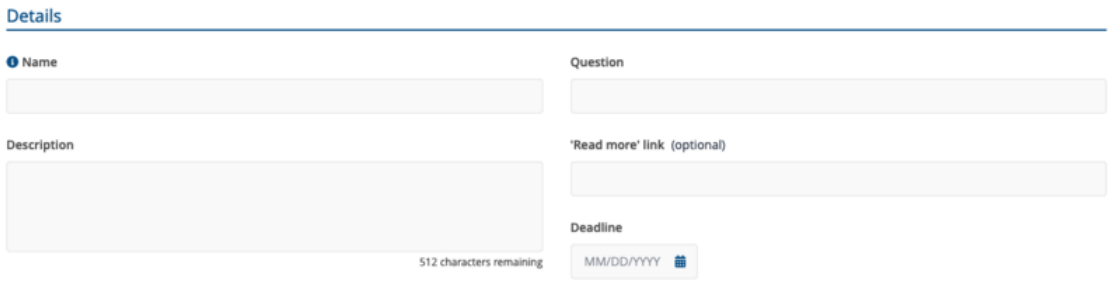


5.5.1.4.2.2 Survey Details

For Sentiment and Info Surveys here you define the **Name**, **Question**, **Description** and an optional **Link** to further information. The Details section is **almost the same** for Sentiment Surveys and Info Surveys, with one difference detailed in the last row of the following table.

Field	Description
Name	Defines how the Survey is referred to in the Experience UI. For Sentiment Surveys, the Name also defines the name of the Metric the responses will be scored on.
Question	Sets the question you will be asking your end-users. You should design your questions carefully, as they will be sent to end-users, and you will want to maximize your responses. Some guidance and thoughts can be found on Getting feedback via User Sentiment Surveys: Names, Questions, Descriptions and Responses. The **Question** can be a maximum of **128** characters, including the question mark.
Description	Used to support and provide context for the **Question**, the **Description** is also displayed to end-users. The **Description** can be a maximum of **512** characters.
Link (optional)	Lets you specify the URL to any additional information you want to add to help support and provide context for the question. The text for the link is displayed to end-users as **Click here to find out more**. This field is optional.
Prompt Question Cadence or Deadline	This section is different for **Sentiment Surveys** and **Info Surveys** and reflects the nature of the two types of Survey. For **Sentiment Surveys** you are trying to get information on a Metric that you want to measure progress on over time. This means that you want to prompt your end-users to respond on a regular basis. For this reason this section for

Field	Description
	Sentiment Surveys provides an option where you can set to **Prompt question every x days**. For **Info Surveys** you are trying to get feedback on a particular topic on a one-off basis. Your end-users aren't likely to all respond immediately, so you want to send a cut-off date that prevents the Survey from going stale, but still allows your end-users to send responses when they can. For this reason, this section for Info Surveys provides a **Deadline** field with a date picker that lets you choose when to stop prompting users that haven't yet responded.



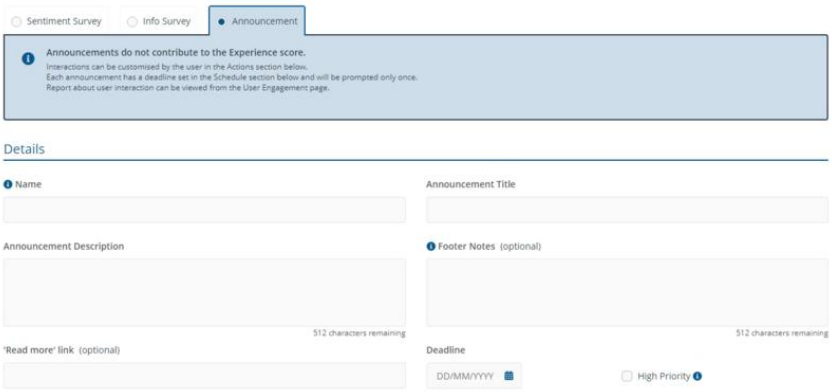
5.5.1.4.2.3 Announcement Details

For **Announcements** here you define the **Name**, **Announcement Title**, **Announcement Description, Footer Notes**, an optional **Link** to further information, the **Deadline**, as well whether the Announcement should be **High Priority**.

Each section described in the following table:

Field	Description
Name	Defines how the **Announcement** is referred to in Experience.
Announcement Title	Sets the title that end-users will see when the **Announcement** will display on their device. The **Title** can be a maximum of **128** characters.
Announcement Description	Used to for the actual content of the **Announcement,** and is displayed to end-users. The **Description** can be a maximum of **512** characters.
Footer Notes (optional)	This section can be used to add disclaimers or contact information relevant for the **Announcement**.

Field	Description
	The **Footer Notes** can be a maximum of **512** characters.
Deadline	For **Announcements** you are trying to broadcast information on a particular topic on a one-off basis. Your end-users aren't likely to all review the Announcement immediately, and the Announcement may cease to be relevant after a certain period of time, so you want to send a cut-off date that prevents the Announcement from going stale. For this reason, this section for Announcements provides a**Deadline**field with a date picker that lets you choose when to stop prompting users that haven't yet seen the announcement.
High Priority	For Announcements considered urgent, and need to be immediately displayed on the end-user devices, select this option. If **High Priority**is selected, the 1E Client, which manages the timing for any engagement displayed to the end-user, will show the announcement immediately after the announcement has been deployed, and the 1E Client receives it.



5.5.1.4.2.4 Survey Responses

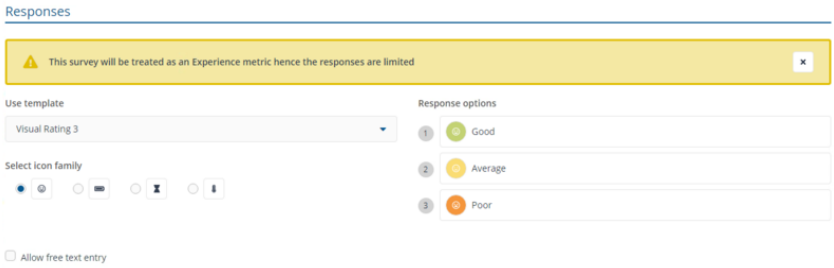
The Responses section of a Survey differs slightly depending on whether you are creating a Sentiment Survey or Info Survey. The main headings are the same, though. The picture opposite shows the Responses section for a Sentiment Survey.

Field	Description
Use template	Provides a template to base the responses on. For Sentiment Responses the selected templates are fixed and cannot be edited. For Info Surveys you can edit

Field	Description
	the text for the responses added by selecting a template and then add or delete more responses, up to a maximum of 10.

Template	Description
Visual Rating 3	Provides 3 options: **Good**, **Average** and **Poor** with icons that help to visually describe the rating.
Visual Rating 5	Provides 5 options: **Very Good**, **Good**, **Average**, **Poor** and **Very Poor** with icons that help to visually describe the rating.
Numeric Rating 3	Provides 3 options: **Good**, **Average** and **Poor** with numbers that rank the rating.
Numeric Rating 5	Provides 5 options: **Very Good**, **Good**, **Average**, **Poor** and **Very Poor** with numbers that rank the rating.
Custom	This option is only available to Info Surveys and starts off with no items that are preset. When using this option, you will also be prompted to add at least two options to the Info Survey.

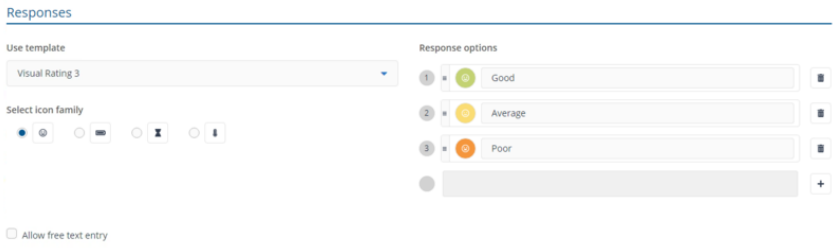
Select icon family	This heading is only displayed if you have selected either of the Visual Rating templates. It is available to both types of Survey and lets you select the family of icons that will be used to represent the visually rated options. There are four family options available: Smileys, Bars, Hourglasses and Thermometers. The icons chosen are for display purposes only and have no effect whatsoever on the responses or their score.
Response options	This field shows the options that correspond to the currently selected template and icon family (if appropriate). For Info Surveys the names, icons used and number of options can be edited.
Allow free text entry	This checkbox sets whether the end-user gets the option to enter free text to support or qualify their selection. When checked, the end-user will see a text edit field with the label **Anything more you'd like to tell us?** The free text responses can be viewed along with the response entry in the Survey Responses page.



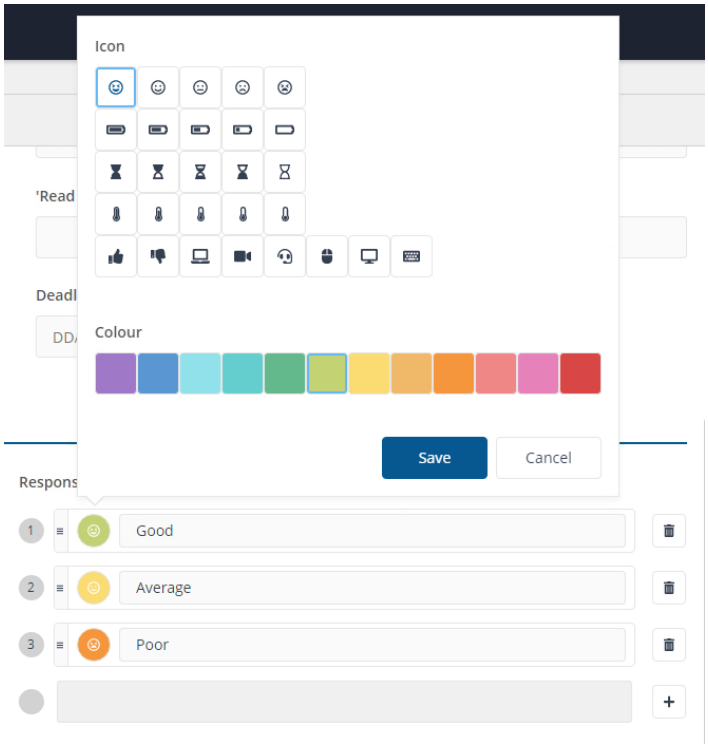
The picture opposite shows the Responses section for Info Surveys.

Here you can see that there is a delete option at the end of each response option and there is a + button for adding more options. You can add up to 10 options in total.

Clicking in the text field for an option lets you edit the text.



Clicking the colored circle for an option displays a popup where you can change the color and icon used to display the option, as shown in the picture opposite. Click **Save** when you've finished making changes.

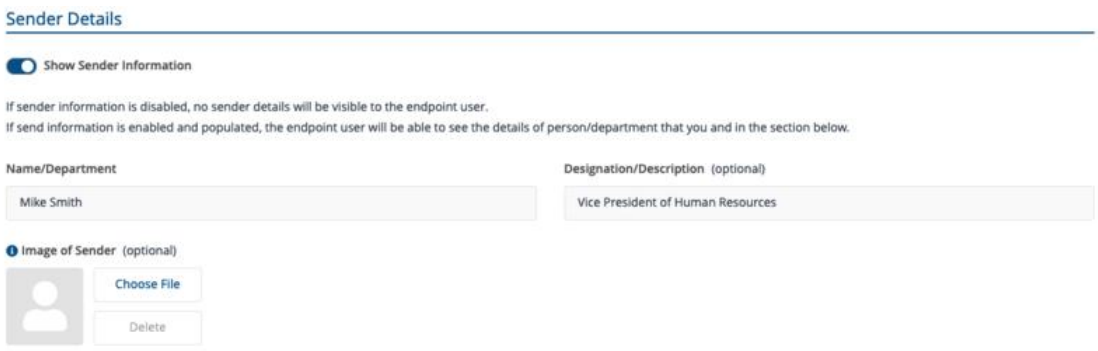


5.5.1.4.2.5 Announcement Sender Details

The **Sender Details** section of **Announcements** allows personalization of this type of user engagement, by adding additional fields to the Announcement. This section can be disabled from an Announcement by switching the **Show Sender Information** Toggle to **Off**.

Each section of **Sender Details** is described in the following table:

Field	Description
Name/Department	Sets a Name or a Department on behalf of whom the Announcement is sent and which the end-users will see when the announcement is displayed on their device. The Name/Department can be a maximum of**64**characters.
Designation/ Description (optional)	Sets the Designation or the Description associated with either the Name or Department, which the end-users see when the announcement is displayed on their device. **Designation** can be used to add a **Role** or **Function** if the Sender is an **Individual**. The Description can be used to add the Department Description, when the Sender is a Department. The**Designation/Description**can be a maximum of**128**characters.
Image of Sender (optional)	Sets an **Image** associated with either the Sender Name or Department, which the end-users will see when the announcement is displayed on their device. If no image is selected, the default user interaction image/logo, as configured for the 1E Client will be used for the announcement. **Note** The supported file types are .png and .jpg and the maximum size is 200 KB.



5.5.1.4.2.6 Announcement Actions

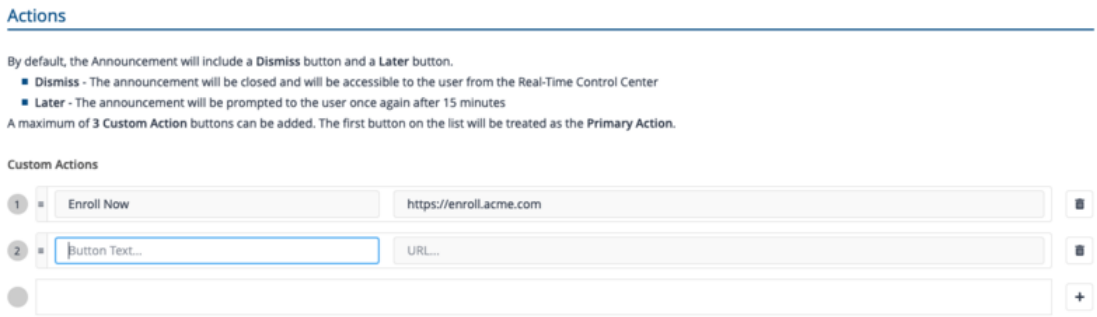
By default, any created Announcement includes a **Dismiss** button and a **Later** button.

Dismiss - The announcement is closed and will be accessible to the user from the Real-Time Control Center (1E Client User Interface)

Later - The announcement will be prompted to the user again after 15 minutes.

If additional actions under the format of buttons, a maximum of **3 Custom Action** buttons can be added. The first button on the list will be treated as the **Primary Action**.

For the Tachyon Platform 8.0 release, the only supported actions are under the format of URLs, which are displayed as buttons to end-users.

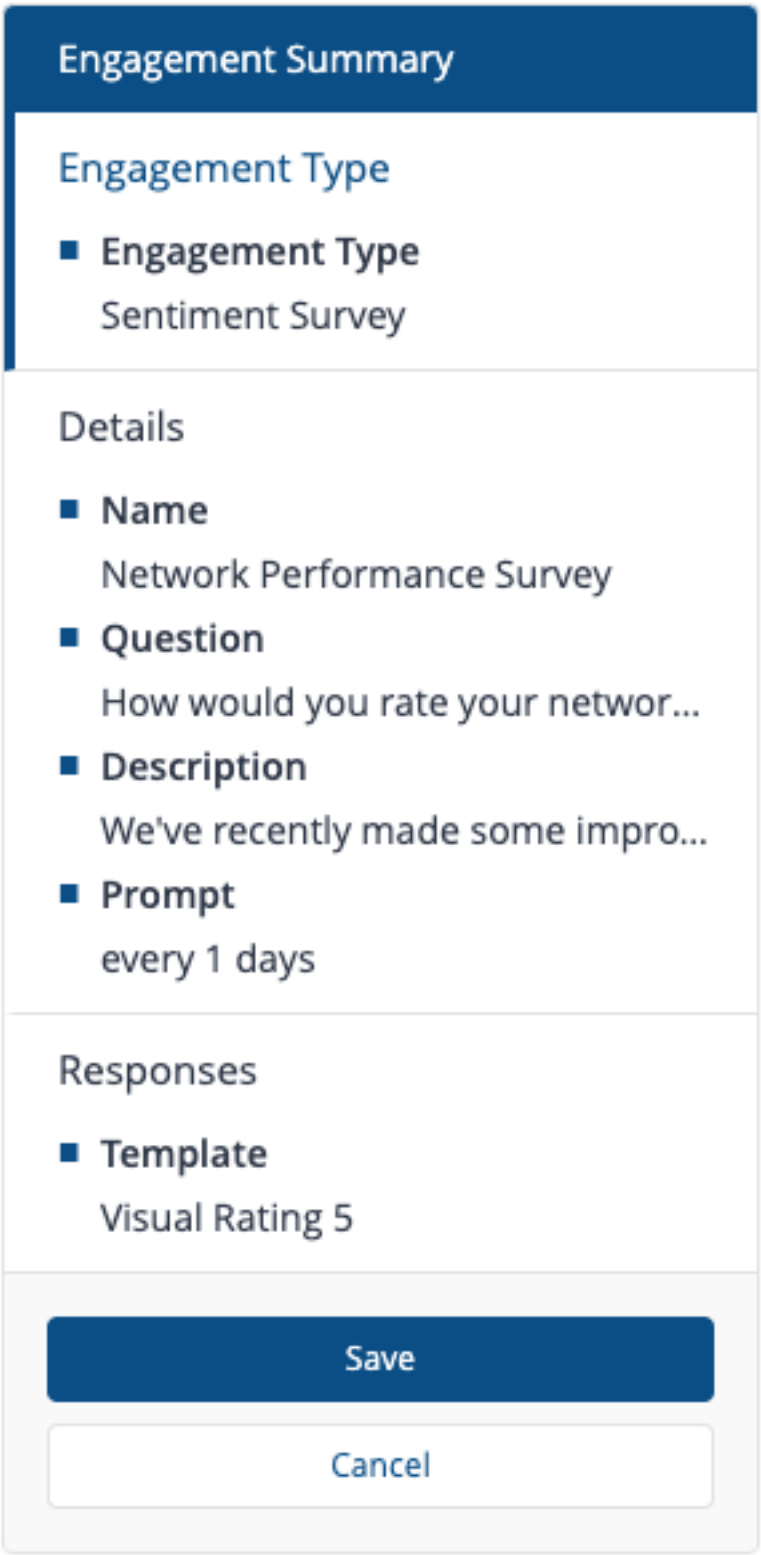


5.5.1.4.2.7 User Engagement Summary

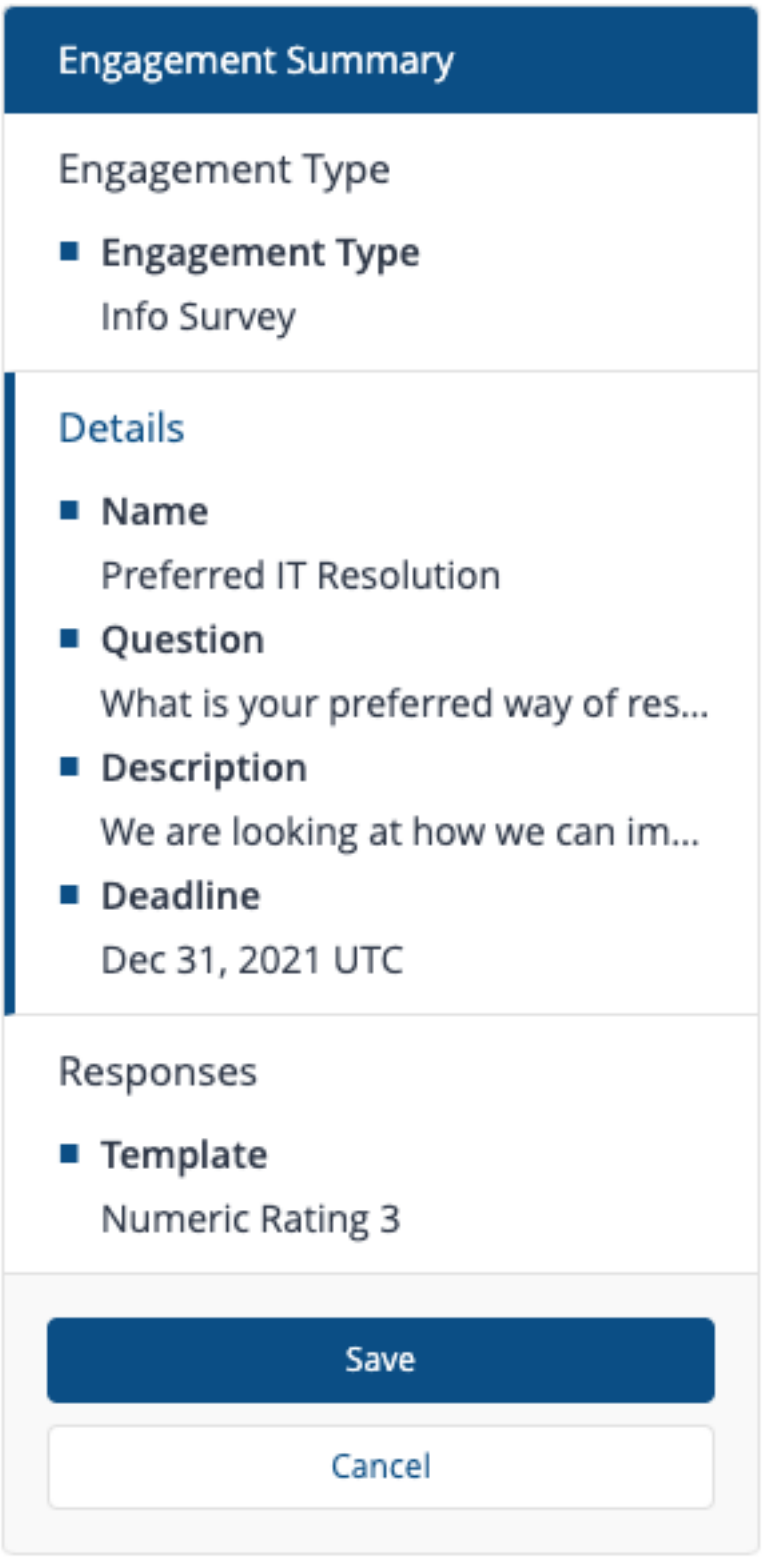
This section provides a summary of the entries that you've made in the **New Engagement** page. It also contains the **Save** and **Cancel** buttons.

There's a slight difference between the headings in the **Engagement Summary** for the different types of Surveys or Announcement. Sentiment Surveys have a heading called **Prompt**, Info Surveys have a heading called **Deadline** and Announcements have headings that include the **Sender Details and Actions**.

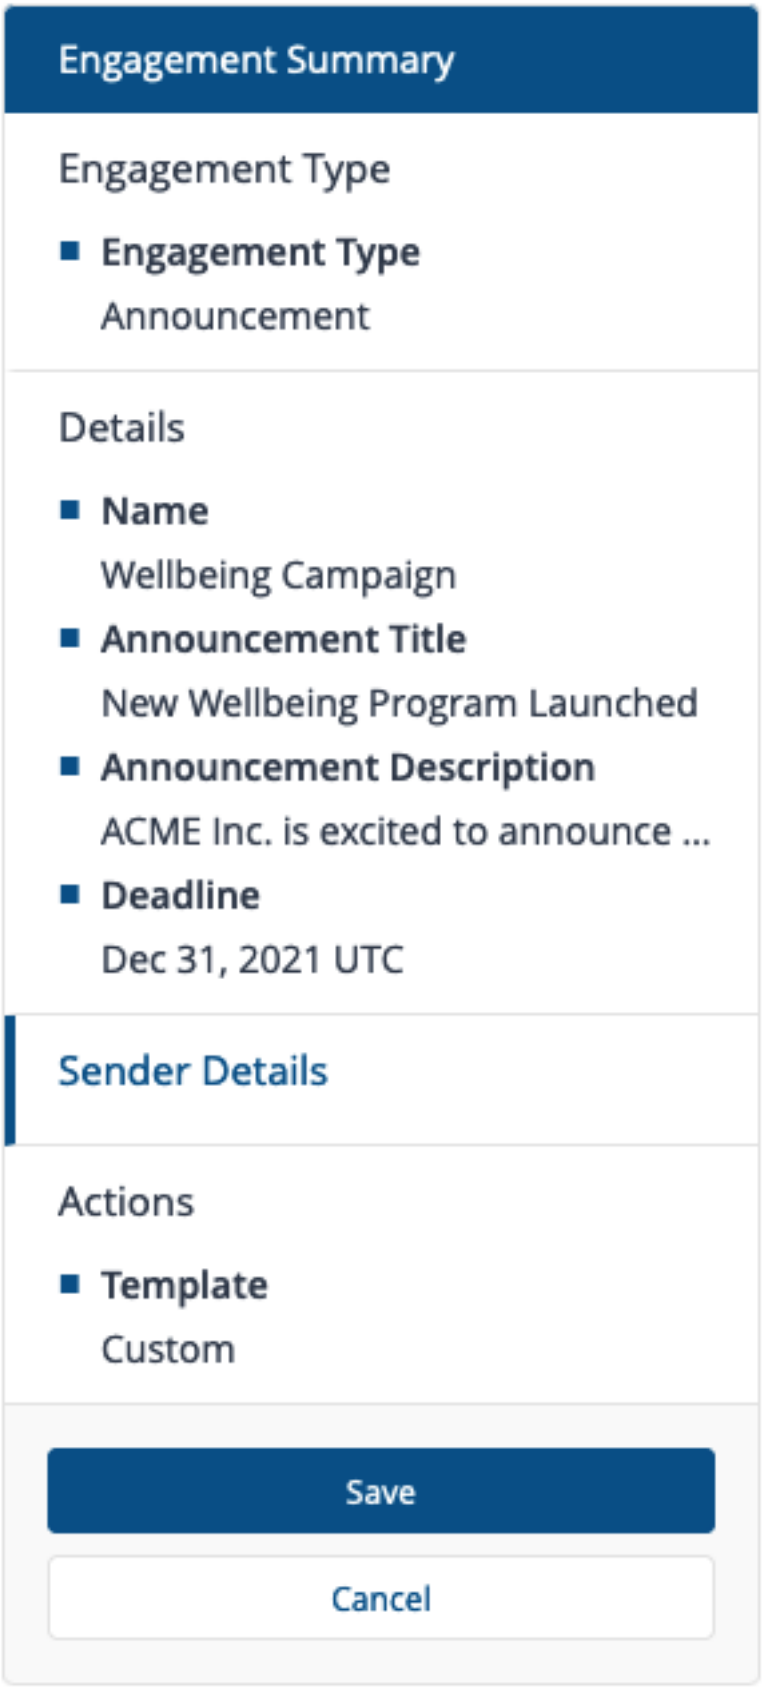
The picture opposite shows the **Engagement Summary** for a Sentiment Survey.



The picture opposite shows the **Engagement Summary** for an Info Survey.



The picture opposite shows the **Engagement Summary** for an Announcement.



Engagement Summary
Engagement Type
Engagement Type

Template
Custom
Save
Cancel

When you have finished making changes to your Survey, you click **Save** to close the **New Survey** page. At this point, your new Survey will need to be enabled and deployed before it appears to end-users. You will also check the Management Group assigned to the Survey.

5.5.1.4.3 Clone Selection

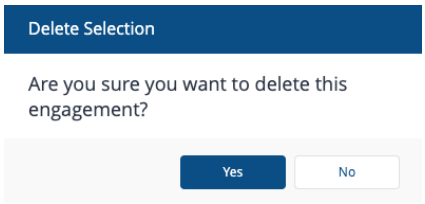
There are a number of reasons why you would choose to create a copy of a User Engagement. You may want to create a survey with a new question and description but keep everything else the same as an existing one. Also, User Engagements cannot be edited, once you have created a User Engagement the only way to change it is to create and edit a copy. Subsequently, you would then need to disable the previous one and enable and deploy the copy.

You can copy a single existing User Engagement by selecting it from the User Engagement table and clicking the **Clone Selection** button. This displays the **New Engagement** page pre-filled with all the details from the selected User Engagement. When doing this, you must change the name of the Engagement, so it doesn't clash with the previous one. You then modify the rest of the parameters as needed and click **Save** to save the copy.

5.5.1.4.4 Delete Selection

To delete one or more User Engagements, select them from the User Engagements table and click the **Delete Selection** button. An **Engagement Deletion** popup will be displayed asking you to confirm the deletion. Click **Yes** to remove the Selection from Experience.

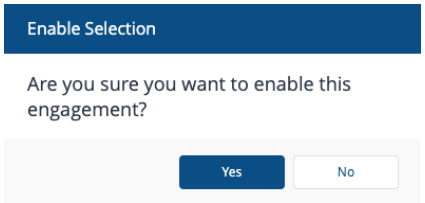
The User Engagement will no longer appear in the User Engagement table, however, before the deletions take effect on any previously targeted devices they must be deployed.



5.5.1.4.5 Enable Selection

To enable one or more User Engagements, select them from the User Engagement table and click the **Enable Selection** button. An **Enable Engagement** popup will be displayed asking you to confirm that you want to enable the selected Engagement. Click **Yes** to enable the selected Engagement.

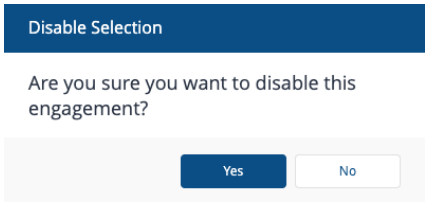
The selected User Engagement will appear as enabled in the User Engagement table, however, before the enablement changes take effect on any targeted devices they must be deployed.



5.5.1.4.6 Disable Survey

To disable one or more User Engagements, select them from the User Engagement table and click the **Disable Selection** button. A **Disable Engagement** popup will be displayed asking you to confirm that you want to disable the selected User Engagement. Click **Yes** to disable the selected User Engagement.

The selected User Engagement will appear as disabled in the User Engagement table, however, before the disablement changes take effect on any targeted devices they must be deployed.



5.5.1.4.7 Assign Mgmt Grp

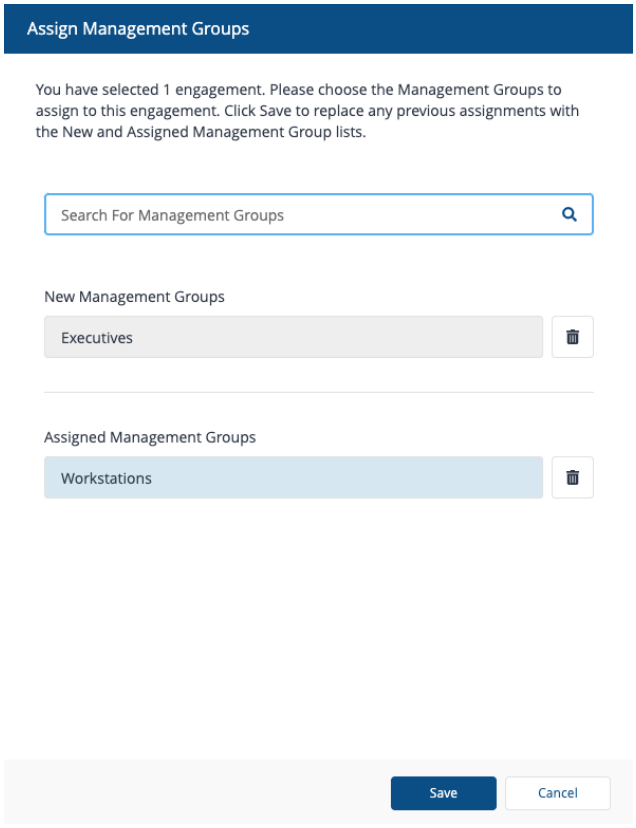
Before an Info Survey or Announcement can be deployed, you will need to set a Management Group to define the devices where the Survey and or Announcement will be sent. For Sentiment Surveys, the default **All Devices** Management Group is set when it is created.

You can set the Management Groups for one or more selected Surveys or Announcements in the User Engagement table by clicking the **Assign Mgmt Grp** button. Doing this displays the **Assign Management Groups** popup.

You can search for previously created Management Groups in the search field and add them to the **Assigned Management Groups** by clicking on the list of matches.

Clicking **Save** will assign the Management Groups to all the selected User Engagements.

Before changes to the Management Groups for a Survey or an Announcement take effect, you must deploy them.



5.5.1.5 Filters

Information about how to use the **Filters** bar that appears at the top of Experience pages.

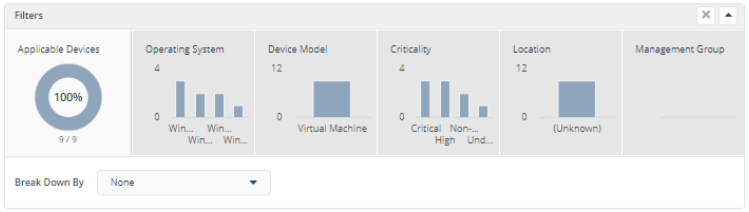
5.5.1.5.1 Experience Filters

The **Filters** bar appears at the top of most of the pages in Experience. Each section in the **Filters** bar allows a user to quickly and easily filter based on different categories. When a filter is set it applies to all the tiles on the page.

On the Stability, Responsiveness, Performance and Sentiment pages there is also a **Break Down By** selector that reconfigures the charts to show the data divided up into the selected category.

On the **Overview**, **Categories**, **Devices**, and **Software** pages there is no option for **Break Down By**.

On the **Users** and **Surveys** pages the **Filters** bar is not available.



5.5.1.5.2 The Filters bar

The following sections are displayed on the **Filters** bar:

Section	Description
Applicable Devices	This section shows the total number of devices that have been selected for the current view and the percentage of the environment those devices comprise. If no filtering is selected, the applicable devices will be 100% of the environment and will display the total number.
Operating System	This section will allow you to create a filter based on the Operating System. The bars represent the different operating systems that make up the environment.
Device Model	This section will allow you to create a filter based on the Model. The bars represent all the models that are in the environment.
Criticality	This section will allow you to create a filter based on the Criticality setting of the devices. Criticality is set using a Tachyon instruction. The details on setting Criticality can be found here Using Device Criticality.
Location	This section will allow you to create a filter based on the Location setting of the devices. Location is set using a Tachyon instruction. The details on setting Location can be found here Using Location.
Management Group	This section will allow you to create a filter based on the Management Group membership(s) of the devices. Each bar represents a Management Group in Tachyon. The details on Management Groups can be found here Management Groups page page.
Collapse/Expand	The Up or Down Arrow on the far right of the Filters and Breakdown bar allows you to collapse or expand the bar. Collapsing removes the details from view and leaves only the title of the bar. This allows you to focus on the details of the data when you have the filter of your choice created.

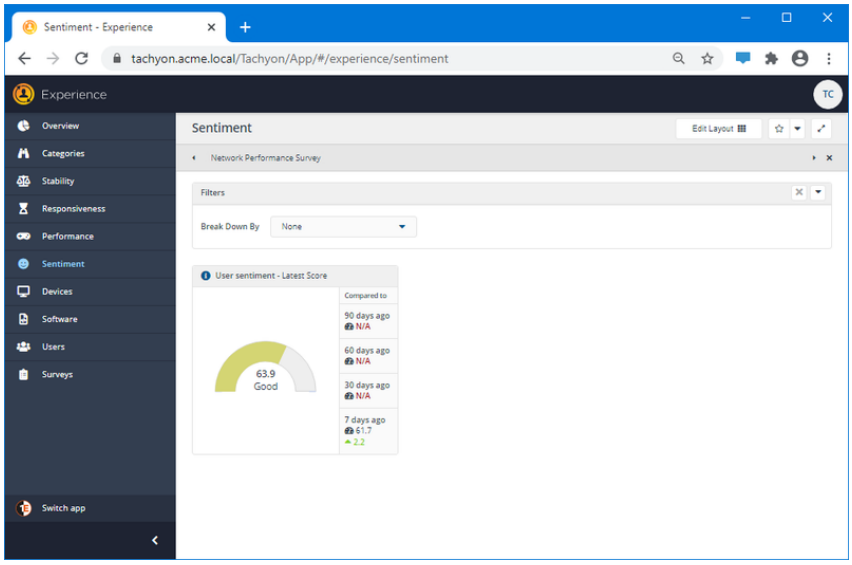
5.5.1.5.3 Using the Filters Bar

The Filters bar can be used to immediately apply filters and, on some pages, to also apply a break down to the data that is displayed.

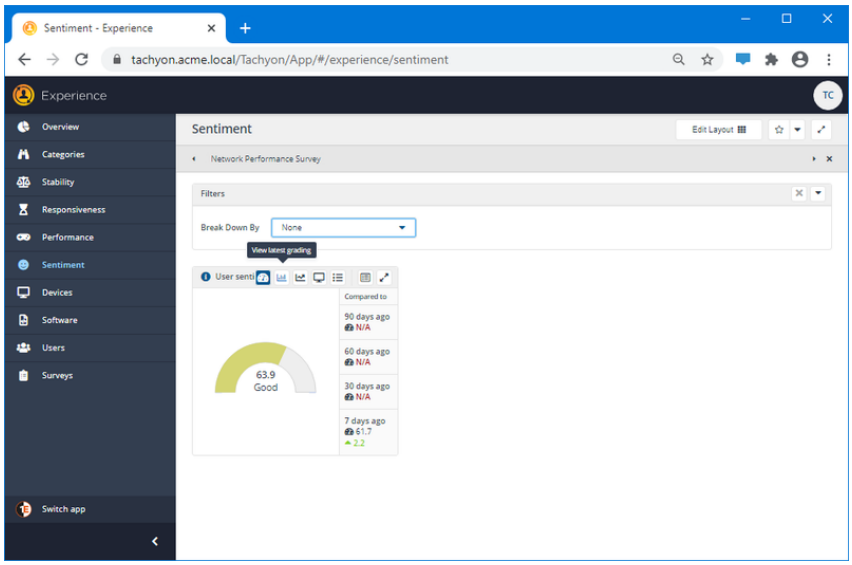
5.5.1.5.3.1 Using the Break Down By selector

We'll first take a look at the Break Down By selector, which is available on the Stability, Responsiveness, Performance and Sentiment pages.

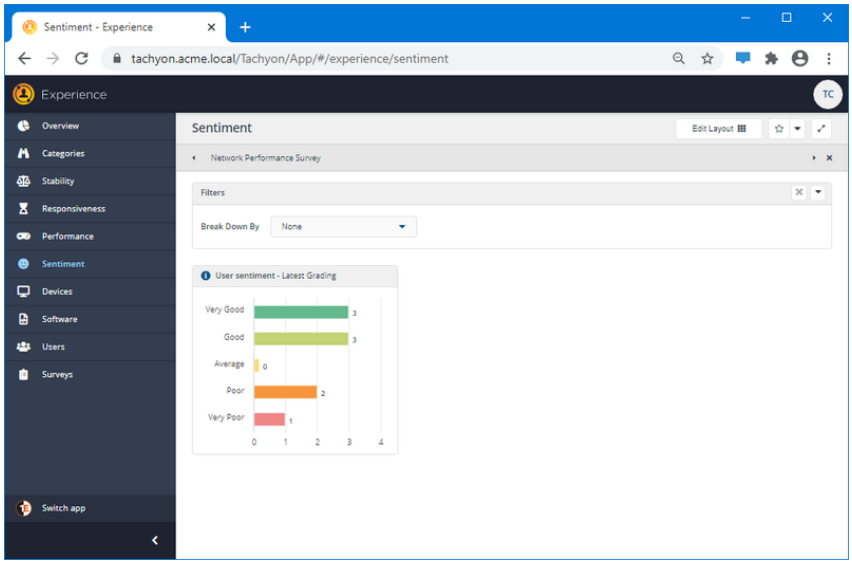
The picture opposite shows the **Sentiment** page with the **Break Down By** selector visible.



To show the effects of the **Break Down By** selector we are going to change the chart to **View latest grading**, which is done from the title bar of the chart - as shown in the picture opposite.



The picture opposite shows the **User sentiment - Latest Grading** chart before the **Break Down By** has been applied.



The **Break Down By** selector lets you choose from:

Operating System

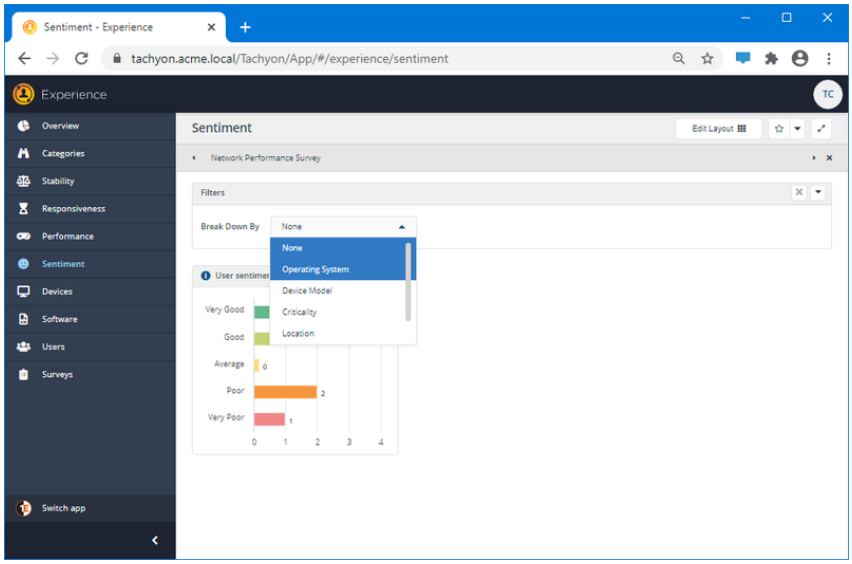
Device Model

Criticality

Location

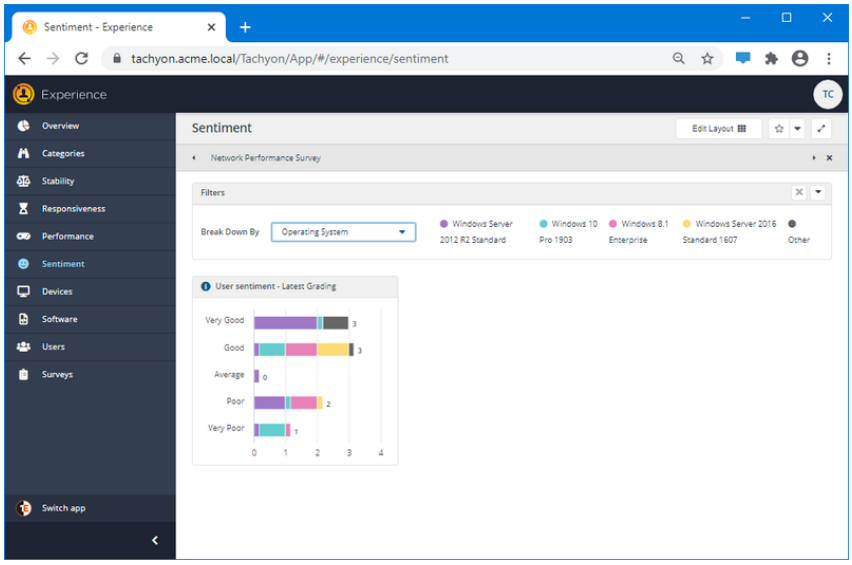
Management Group

In our example we're going to use the **Operating System** break down.

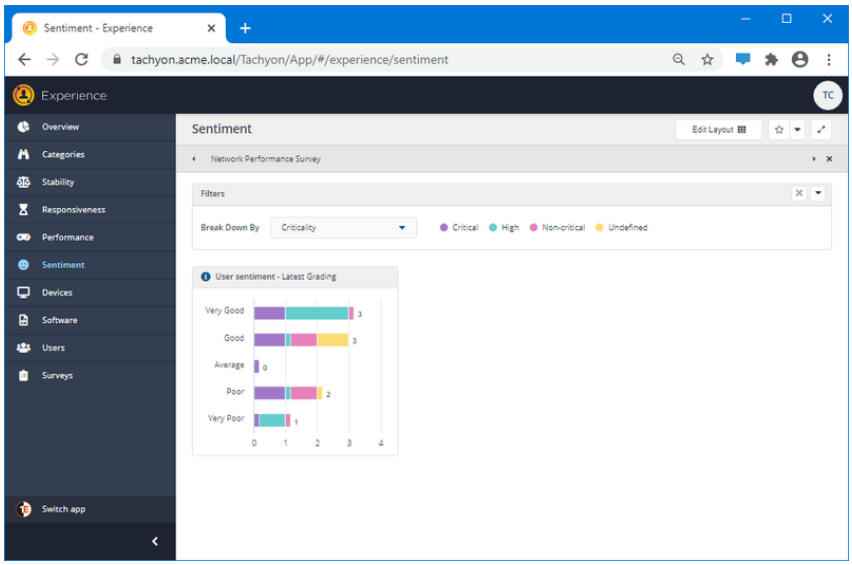


The picture opposite shows how the individual categories for the **User sentiment** break down according to the **Operating System**. The color for each different detected type of OS is displayed in the **Filters** bar and can be used as a key for the information displayed in the chart.

So here you can see that the **Good** grading is broken down into **Windows 10**, **Windows 8.1** and **Windows Server 2016** Operating Systems.



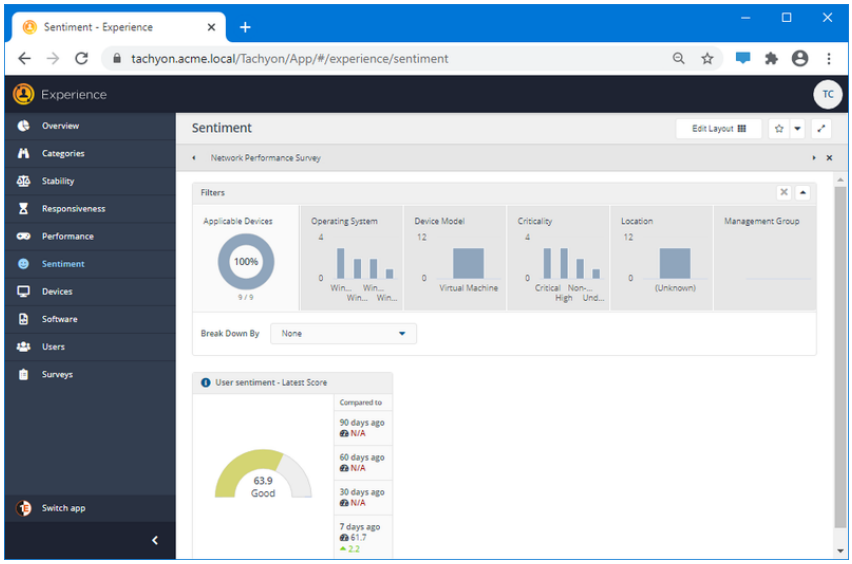
It's easy to change the parameter you break down by to see different aspects of the grading. Here the picture opposite shows the **User sentiment** chart broken down by the **Criticality** set for the devices. Here you can see the **Very Good** grading consists of **Critical** and **High** devices**.**



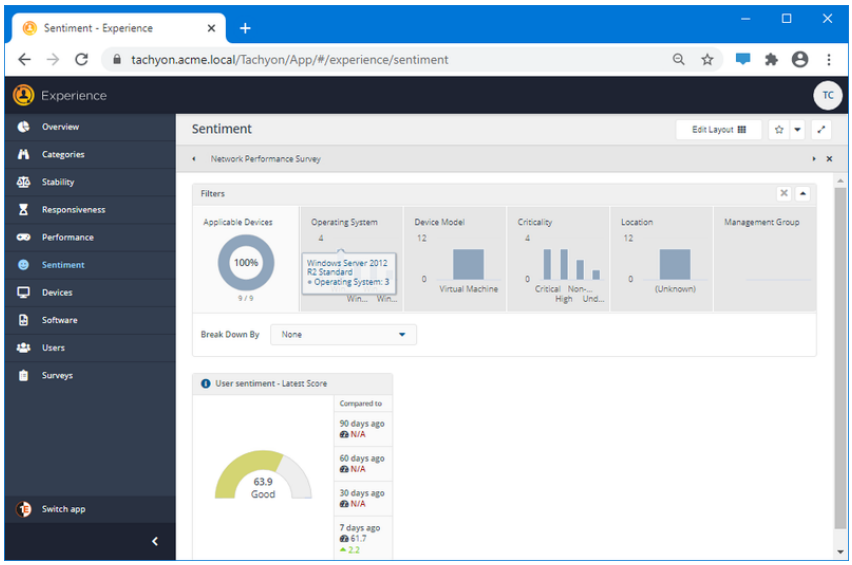
5.5.1.5.3.2 Applying filters with the Filters bar

It is possible to create filters for multiple categories using the Filters bar. The filters are applied as you make selections and additional sections can be selected in order to further refine your dataset. You can also combine filters with the break down, on pages where that option is available. The picture opposite shows the Sentiment page with the **Filters** bar displayed.

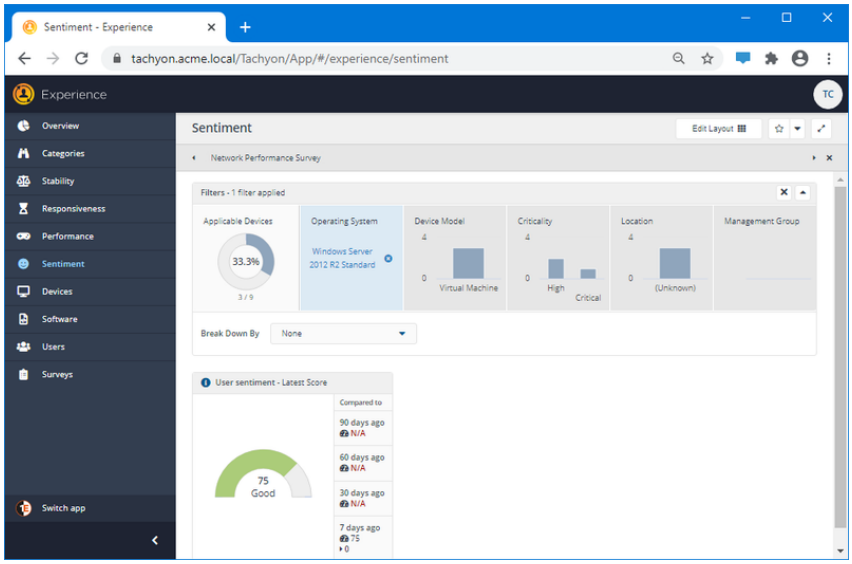
Each section in the bar provides a different way of instantly filtering the data that is displayed on the page and shows the different values available to choose from within that heading. The Operating System section, for example, shows a bar chart with all the different Operating Systems represented in the data being displayed. In the picture opposite this shows four values.



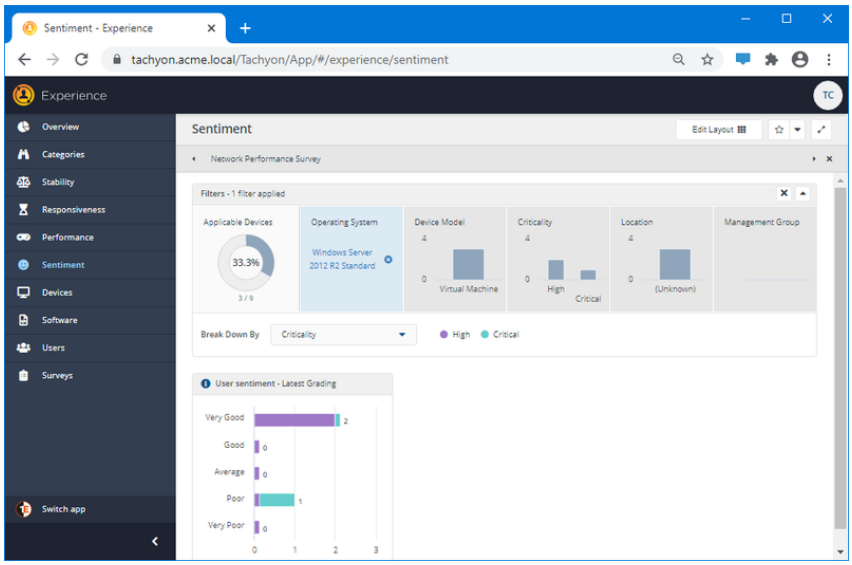
You can see what each of the columns in the bar chart represent by hovering over it with the mouse. In the picture opposite you can see that the first column is for the **Windows Server 2012 R2 Standard** OS and there are **3** instances of that type in the data.



Clicking on a bar filters the data to just show those devices that have that value. For example, the picture opposite shows the result of filtering on the **Windows 2012 R2 Standard** OS. The **Applicable Devices** section of the bar changes to show how much of the overall data is being displayed as a result of filtering, here you can see that the selected OS forms **33.3%** of the overall data. The **User sentiment - Latest Score** chart changes to show the score for just those devices.



You can combine the filter with a break down using the **Break Down By** selector. The picture opposite shows the **Criticality** break down for **Windows Server 2012 R2 Standard** OS across the 5 grades.



5.5.1.6 Tile Buttons

The Stability, Responsiveness, Performance, and User Experience pages all have a set of tiles that allow navigation or a change of view. Each tile has a set of menu buttons in its upper right. The buttons are hidden until you hover over the tile. Hovering over the button itself, brings up the name of the button.

This image shows the buttons exposed. The buttons in order from left to right are:

View Latest Score button

View Latest Grading button

View Trend button

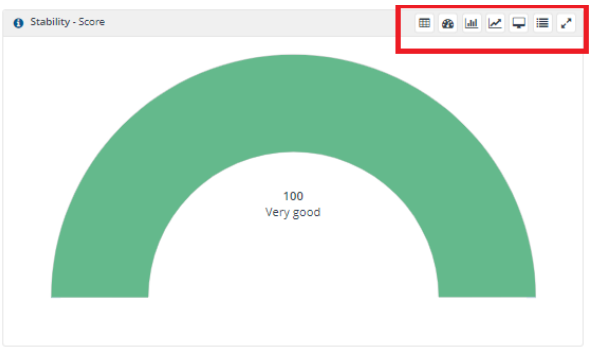
View Poorest Devices button

View What's Changed (last 7 days) button

View Detailed Data button

Expand button

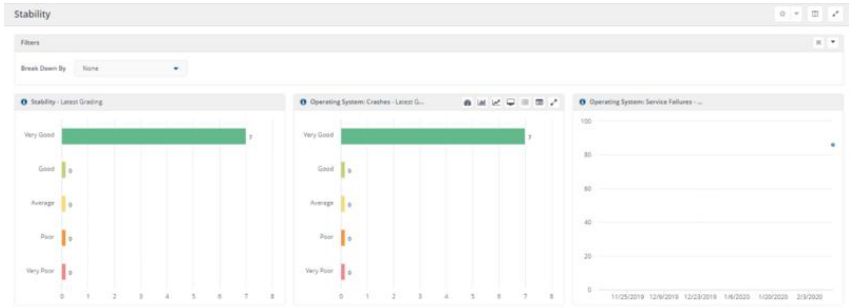
The first three of the buttons change that tile's focus to another view (if you do not have that one currently selected).



5.5.1.6.1 View Latest Score button

View Latest Score button does not do anything if the latest score tile is exposed in the first tile position. If you have changed the tile to View Latest Grading, clicking the first button will change it back to the default View Latest Score.

This image shows an example where the second button on the first tile (View Latest Grading) was selected previously. The first tile now shows the default view of the second tile.



5.5.1.6.2 View Latest Grading button

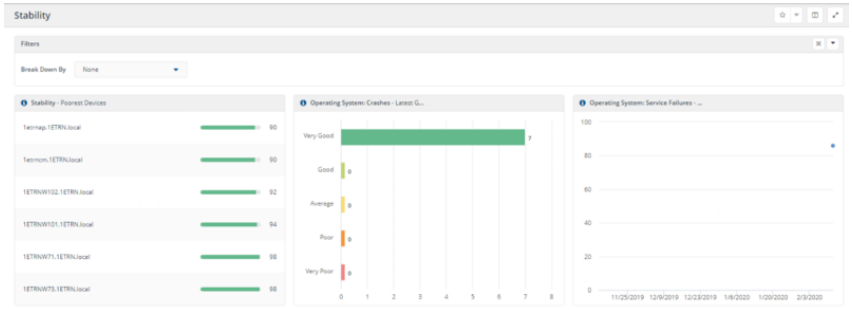
This button will change the view of the current tile to the latest grading tile.

5.5.1.6.3 View Trend button

This button will change the view of the current tile to Trend view.

5.5.1.6.4 View Poorest Devices button

This button will change the current view of the tile to the top 5 poorest devices for that category.

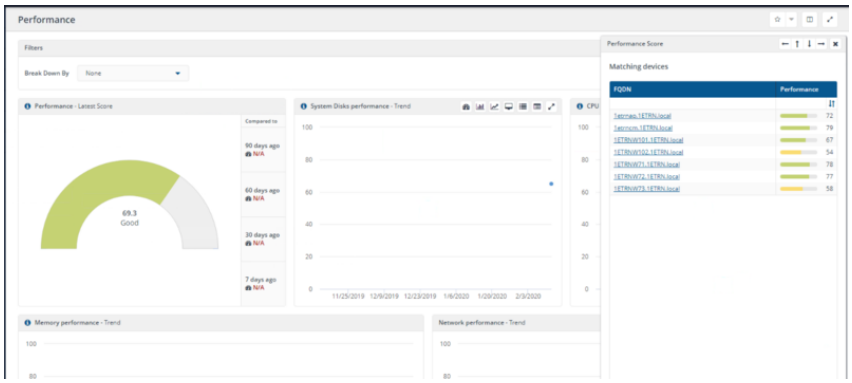


5.5.1.6.5 View What's Changed (last 7 days) button

This button will show what has changed over the last seven days.

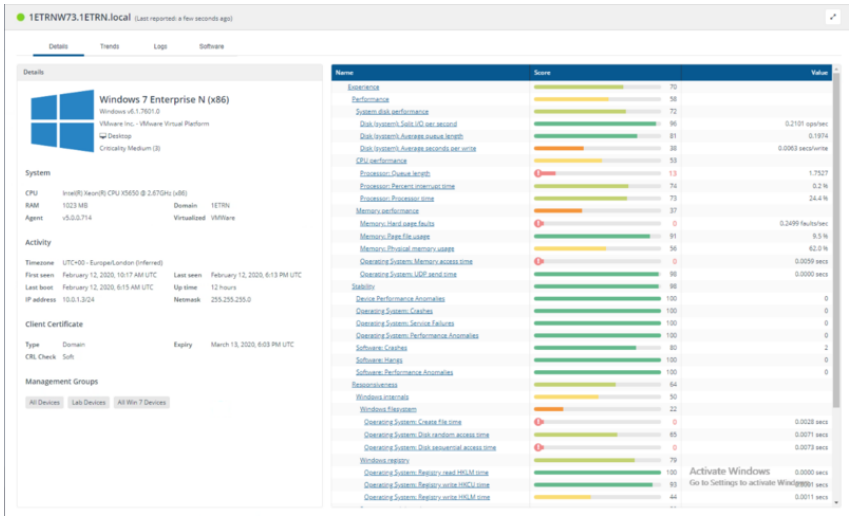
5.5.1.6.6 View Detailed Data button

The View Detailed Data button brings up a list of devices with each device's score for that category. This is the View Detailed Data from the Performance page - Performance Score tile. The colored bars show the grading category for that particular score (Very good, Good, Average, Poor or Very Poor).



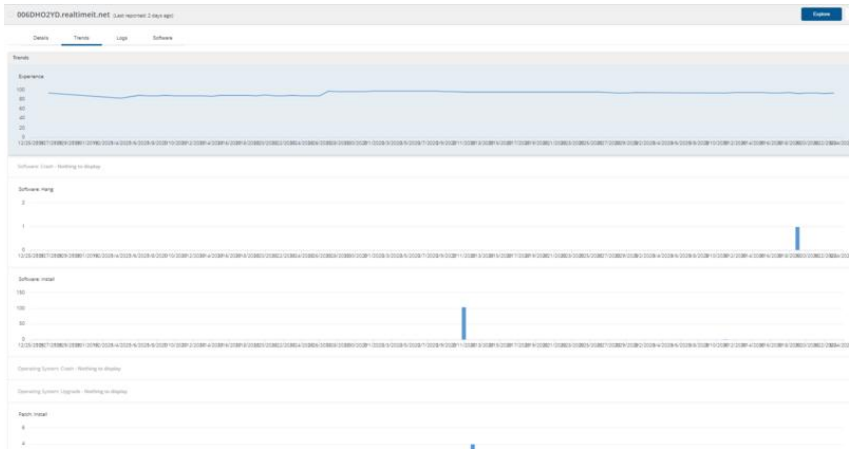
5.5.1.6.6.1 Details tab

Selecting one of the devices opens the Device's raw data. The Details tab shows all the metrics that make up the score for that device. The first line shows the overall Experience score. The subsequent lines shows the metrics under each category (Performance, Stability and Responsiveness).



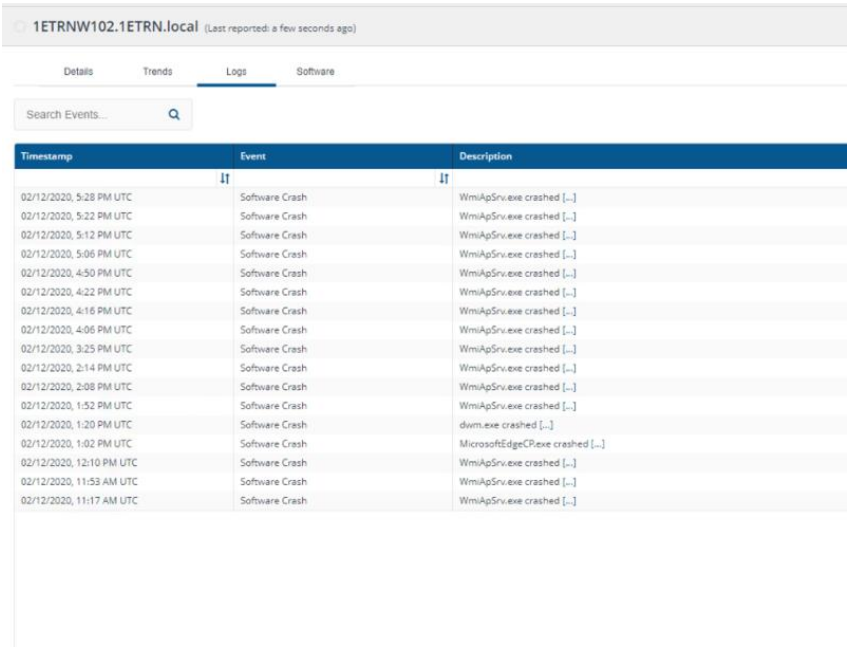
5.5.1.6.6.2 Trends tab

The Trends tab shows the changes in the scores over time. Hovering over any of the bars shows the details for that time and event. If the user viewing the device details also has the ability to at least ask a question in Explorer the Explore button will be visible.



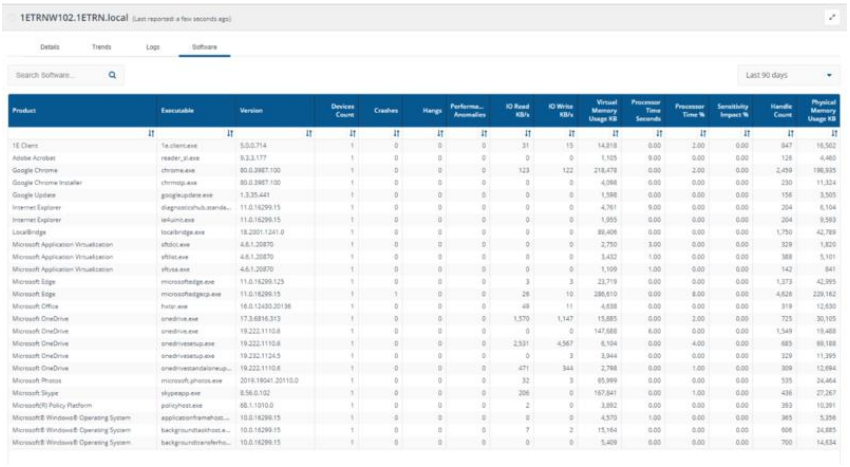
5.5.1.6.6.3 Logs tab

The Event Logs tab gives you a listing of the Windows Event log entries for that device. This brings that data to this view and is very useful when determining the root cause of an issue that has been reported on the device.



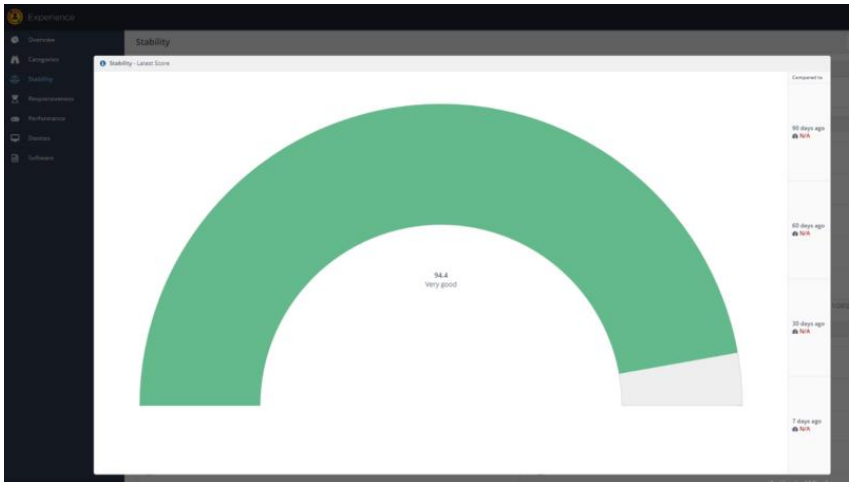
5.5.1.6.6.4 Software tab

The Software tab lists all the software that is installed on the device. This view also shows the metric data for that software. Clicking the ellipsis will show the entire list with the raw scores for each one.



5.5.1.6.7 Expand button

Clicking the Expand button in the far right pops the tile out of the dashboard and enlarges it.



5.5.2 Score reference

This reference provides details on how the scores are collected and calculated.

5.5.2.1 The Scores

5.5.2.1.1 How Experience calculates the scores

The Experience Score is an overall number that represents the user experience of a given device. It is a total of weighted scores in the four categories - Performance, Stability, Responsiveness, and User Sentiment. The total possible score overall or in any given category is 100.The scoring number is assigned a Grade based on the chart below. Grades appear in the user interface as different colors.

This information is provided to give you an understanding of the makeup of the scores.

5.5.2.1.2 Grading

Experience scores are divided into one of five gradings.

Very Good

Good

Average

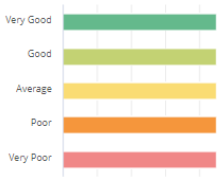
Poor

Very Poor

The ranges for each grading is listed in this table.

Grading	Score range	Bar Color
Very Good	100 - 81	Dark Green

Grading	Score range	Bar Color
Good	80 - 61	Olive Green
Average	60 - 41	Yellow
Poor	40 - 21	Orange
Very Poor	20 - 0	Red (Exclamation Point)



5.5.2.1.3 Categories

Experience uses four categories to calculate the overall Experience Score.

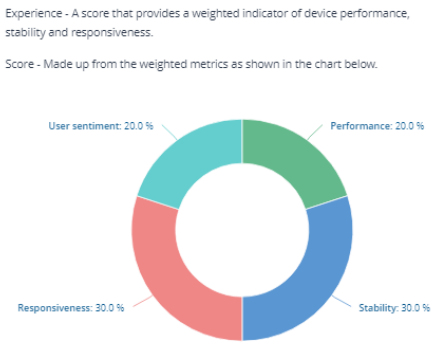
Category	Description
User sentiment	The score for this category is based on the responses to user surveys.
Stability	The score for this category is based on the "crashiness" of the applications and the Operating System that the applications are installed on.
Responsiveness	The score for this category is based on our patented technology that we call "Synthetic Micro-Transactions". We run these periodically on the device and perform different tests to measure the responsiveness of the device. This information cannot be obtained from any other solution.
Performance	The score for this category is based on the typical Windows performance type data - CPU usage, Memory Usage, Processes, etc.

5.5.2.1.4 Experience overall score

The User Experience score provides an indicator of device performance, stability and responsiveness. It is derived from weighted User sentiment, Performance, Stability and Responsiveness scores.

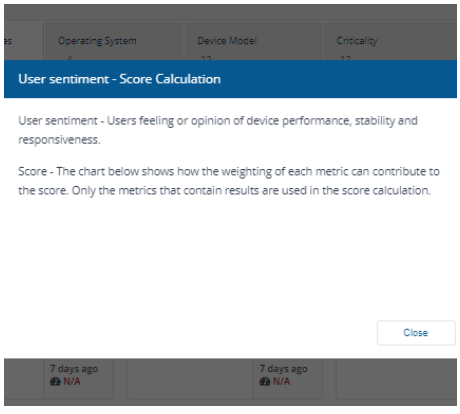
Metric	Description
User sentiment	A measure of end-users feelings about their experience based on user surveys.

Metric	Description
Performance	Hardware utilization
Stability	System stability
Responsiveness	System responsiveness



5.5.2.1.5 User sentiment

The User sentiment score is derived from the responses to user and metric surveys.

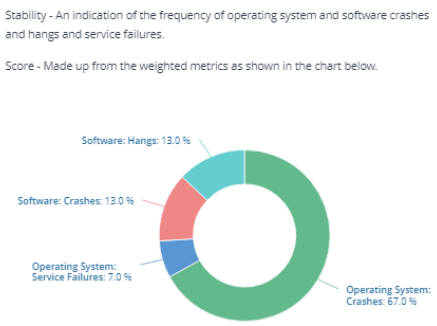


5.5.2.1.6 Stability

The Stability score is derived from four scores based on the number of crashes and hangs for software and for the Operating System itself.

What is measured	Description
Operating System: Crashes	Scores the frequency of operating system crashes (Blue Screens, or unexpected shutdowns). A lower score indicates crash activity, which is likely to be caused by a faulty or misconfigured device drive.

What is measured	Description
Operating System: Service Failures	Scores the frequency of service failures (where a service fails to start or shutdown correctly). A lower score indicates problematic services which may need to be investigated.
Software: Crashes	Scores the frequency of software crashes. A lower score indicates a high rate of crashes. The Devices screen Logs tab can assist with investigation of software crashes.
Software: Hangs	Scores the frequency of software hangs (where an application becomes unresponsive). A lower score indicates a high rate of hangs.



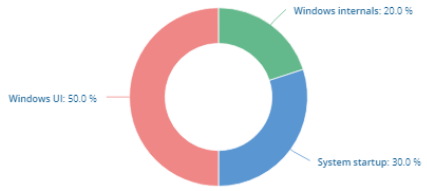
5.5.2.1.7 Responsiveness

The Responsiveness score is derived from the scores of Windows internals, system startup, and Windows UI.

What is measured	Description
Windows Internals	Windows internals provides an indication of the timeliness of Windows System resource creation and availability
System Startup	Derived from Operating System: Boot time
Windows UI	Provides an indication of windows creation and operation

Responsiveness - An indication of the timeliness of operating system startup and system resource creation and availability.

Score - Made up from the weighted metrics as shown in the chart below.



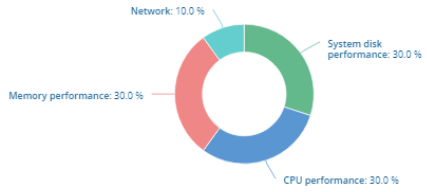
5.5.2.1.8 Performance

The Performance score is derived from the scores of disk performance, CPU performance, and memory performance.

What is measured	Description
System disk performance	System disk performance
CPU performance	CPU performance
Memory performance	Memory performance

Performance - A score that provides a weighted indicator of the load and throughput of processor, memory and disk resources.

Score - Made up from the weighted metrics as shown in the chart below.



5.5.2.1.9 Metrics and algorithms

Metrics are the datasets that are collected by the 1E Client and sent up the Tachyon server daily. Metrics are either Raw or Aggregate. Raw metrics have a scoring algorithm applied to them to derive a score. Operating System: Create file time is a raw value metric. The data will simply be the time it takes to create a file on that device. For example, the actual time it takes to create a file on a specific device is 0.008 seconds. So the value for the metric will be 0.008. Once the algorithm is applied the score will be 58.

An aggregated metric is calculated from other metrics.

An aggregate score will never have an associated value since it was never directly derived from Raw data.

For example, Performance score is calculated by applying weightings to three other scores - System disk performance, CPU performance and Memory performance. The weightings are determined by the impact to end user experience for that item. Things that impact the user greater are weighted higher.

5.5.2.1.10 Normalization algorithms

Tachyon Experience uses the following algorithms to derive a score for that metric.

Scoring Algorithm	Fixed Parameters	Description
SweetSpot	Minimum, maximum and sweet spot	**Sweet Spot Scoring Algorithm** Based on a bell curve. Define a range (minimum and maximum) and a sweet spot within that range. Score is based on the distance from the nearest edge (minimum or maximum) to the sweet spot value. **Example**: SweetSpot(0,100,15) given a value of 30 gives you a score of 83 which is a Good grading
Percentage	value	**Percentage Scoring Algorithm** Expect a value in the range of 0 - 100 and return that same value as the score. Dropping off any decimal points. **Example**: A 9.6 value would give you a score of 9 which is a Very Poor grading
Inverse Algorithm	Inner algorithm	**Inverting Algorithm** The result of this algorithm subtracts 100 from the value dropping any decimals. **Example**: A 9.6 value would give you a score of 91 (100 - 9 = 91) which is a Very Good grading
Constant	constant score	**Constant Scoring Algorithm** No matter the incoming value, return a constant score Example: A value of 42 would give you a score of 42 which is a Poor grading

Scoring Algorithm	Fixed Parameters	Description
Bounded Range	Minimum and maximum	**Bounded Range Scoring Algorithm** Expect a value in the range of (minimum, maximum) and return a score of 0-100 based on the position, dropping any decimals. **Example**: BoundedRange(10,120) given a score of 119 would give you a score of 1 which is a Very Poor grading

5.5.2.1.11 Experience Metrics

The following table outlines the Experience Metrics that are collected and scored for each device and how they are classified:

Experience	a score that provides a weighted indicator of device performance stability and responsiveness.		
Performance	a score that provides a weighted indicator of the load and throughput of processor memory and disc resources.		
	System disc performance	an indicator of system disc load and throughput	
		Disc (system): split I/O per second	scores the I/O operations that were broken into multiple requests on the system disc. A lower score may indicate excessive disc

		fragmentation.
	Disc (system) : average queue length	scores the average queue length for the system disc. A lower score indicates that this disc is not keeping up with the I/O backlog.
	Disc (system): average seconds per write	scores the average time taken for the system disc to perform a right. A lower score indicates that this disc is taking too long to service write requests.
CPU performance	an indication of processor load and throughput.	
	Processor: queue length	scores the CPU Q length (backlog of processing work). A lower score means that the CPU is not keeping up with the workload.

	Processor: percent interrupt time	scores the amount of time the CPU spent servicing interrupts. A lower score may indicate faulty or misconfigured hardware/ drivers.
	Processor: processor time	scores the CPU load. A lower score indicates that the CPU is fully loaded, and additional processing power may be required.
Memory performance	a score that indicates memory load and system paging activity.	
	Memory: hard page faults	Scores the amount of memory pages that had to be read from disc based storage. A lower score indicates this device is low on available physical memory.

Memory: page file usage	Scores the percentage of the page file that is in use. A lower score indicates more high page file use, which may mean the device is low on available physical memory.
Memory: Physical memory usage	Scores the percentage of physical memory in use. A lower score indicates higher memory consumption, and therefore less available physical memory.
Operating System: Memory access ti me	Score the time taken to allocate, zero and free a block of memory. A lower score indicates that the operating system is slow to server

		memory requests, which may affect application performance.
Network	A score that indicates the local network stack performance (not including physical network considerations, such as latency).	
	Operating System: UDP send time	Scores the time taken to perform a basic loopback UDP send. A lower score may indicate problems with the operating system network stack.
	Network: Output queue length	Scores the network transmission backlog based on the length of the output packet queue.
	Network: Wireless signal quality	Scores the signal quality of the wireless network connection

			on the device.
Stability	An indication of the frequency of operating system and software crashes and hangs and service failures.		
		Operating System: Crashes	Scores the frequency of operating system crashes (Blue Screens, or unexpected shutdowns). A lower score indicates crash activity, which is likely to be caused by a faulty or misconfigured device driver.
		Operating System: Service Failures	Scores the frequency of service failures (where a service fails to start or shutdown correctly). A lower score indicates problematic services, which may need to be investigated.

		Software: Crashes	Scores the frequency of software crashes. A lower score indicates a high rate of crashes. The Devices screen Logs tab can assist with investigation of software crashes.
		Software: Hangs	Scores the frequency of software hangs (where an application becomes unresponsive). A lower score indicates a high rate of hangs.
Responsiveness	An indication of the timeliness of operating system startup and system resource creation and availability.		
	Windows internals	An indication of the timeliness of Windows system resource creation and availability.	
	Windows filesystem	A score that indicates file system and disk access speed.	

Operating System: Create file time	Scores the time taken to create an empty, temporary file. A lower score indicates that the operating system may be underperforming in terms of basic file operations.
Operating System: Disk random access time	Scores the time taken to perform a random access disk operation on the system drive. A lower score indicates poor random disk access performance.
Operating System: Disk sequential access time	Scores the time taken to perform a sequential access disk operation on the system drive. A lower score indicates poor sequential

		disk access performance.
Windows registry	An indication of Windows registry access speed.	
	Operating System: Registry read HKLM time	Scores the time taken to read from the HKLM Windows Registry hive. A lower score indicates poor registry read performance, which in turn may affect application performance.
	Operating System: Registry write HKCU time	Scores the time taken to write to the HKCU Windows Registry hive. A lower score indicates poor registry write performance, which in turn may affect application performance.
	Operating System: Registry write HKLM time	Scores the time taken to write to the HKLM Windows Registry hive.

		A lower score indicates poor registry write performance, which in turn may affect application performance.
Processes and threads	A score that indicates Windows process and thread creation and startup speed.	
	Operating System: Create process time	Scores the time taken to create a new process. A lower score indicates that the operating system is taking a long time to create new processes.
	Operating System: Create thread time	Scores the time taken to create a new thread within a process. A lower score indicates that the operating system is taking a long time to create new threads.
	Operating System: OpenHandle time	Scores the time taken to acquire a

		basic operating system resource. A lower score indicates that applications may underperform because the operating system is slow to service resource requests.
	Operating System: Load DLL time	Scores the time taken to load and unload a DLL in a process. A lower score indicates library loading is slow, which may affect the startup time of applications.
System startup	An indication of the timeliness of operating system startup.	
	Operating System: Boot time	Scores the time taken for the device to boot to the logon prompt. A lower score indicates a long boot up

		duration, which may affect user satisfaction.
Windows UI	An indication of graphical window creation and operation speed.	
	Operating System: Create window time	Scores the time taken to generate an empty window. A lower score indicates poor Windows desktop performance, which may cause applications to appear unresponsive.
	Operating System: Message dispatch time	Scores the time taken to dispatch and confirm processing of a windows message. A lower score indicates poor message processing throughput, which may affect application

			responsiveness.
User sentiment	Users feeling or opinion of device performance, stability and responsiveness.		
	User Sentiment Survey metrics	These have been added by an Experience Survey administrator. The information shows the text of the question related to the survey metric.	

5.5.2.2 Metrics Collection Details

5.5.2.2.1 Metrics

Metrics are the data points that are collected by the 1E Client and sent to the Tachyon server. They are collected at different intervals depending on the type of data that is being collected.For example, CPU usage might be collected each hour but crash information is collected at the time of the crash. If the 1E Client cannot connect to the Tachyon switch, the client still collects the data but will hold the information until the next time the switch can be contacted. The 1E Client will send all the collected data at that time.

5.5.2.2.2

5.5.2.2.3 Data Collection Intervals

Some metrics for Experience are collected as daily summaries. These are sent to the Tachyon Switch each night at midnight. If the 1E Client cannot contact the server at midnight the daily digest data is saved at the device and is sent to the server the next time the server can be contacted. In this version, there is not the ability to force the 1E Client to send the information outside of the nightly cycle.

The data that is collected in the daily digest is:

Device resource usage

Device Performance, responsiveness and stability data

Software stability and resource usage

The Stability Data is reported in real-time to the Tachyon Switch. These include:

Software installs/uninstalls

Patch installs/uninstalls

Operating System reboots

Application crashes

Application hangs

Operating System crashes

Windows service failures

5.5.3 Experience Product Packs reference

Reference information for **Experience** feature-related Product Packs that are included in the **Tachyon Platform** zip. These Product Packs are required to support various features of **Experience.**

The **Tachyon Platform** zip is downloaded from the 1E Support Portal (1eportal.force.com/s/tachyontopicdetail). Additional Product Packs are available from Tachyon Exchange (tachyonexchange.1e.com) that are not documented here.

Classic Product Packs contain instructions, for use in Explorer and other Tachyon applications.

Integrated Product Packs contain policies, rules and fragments for use by Guaranteed State, and may also include instructions.

5.5.3.1 Instructions

This product pack contains Server instructions.

Server instructions are special type of instruction, which cannot be run in Explorer. They are for internal use only, run on the server, and used to carry out on-demand or scheduled processing of data across various datasources, such as SQL databases. For example, the Dashboards app uses them to populate tiles and charts with data from Tachyon Master and Experience databases.

5.5.4 Glossary

A glossary of Tachyon Experience terminology.

5.5.4.1 Experience alphabetical glossary

Term	Definition

Algorithms

Tachyon Experience uses the following algorithms to derive a score for that metric.

Scoring Algorithm	Fixed Parameters	Description
SweetSpot	Minimum, maximum and sweet spot	**Sweet Spot Scoring Algorithm** Based on a bell curve. Define a range (minimum and maximum) and a sweet spot within that range.

Term	Definition		
			Score is based on the distance from the nearest edge (minimum or maximum) to the sweet spot value. **Example**: SweetSpot(0,100,15) given a value of 30 gives you a score of 83 which is a Good grading
	Percentage	value	**Percentage Scoring Algorithm** Expect a value in the range of 0 - 100 and return that same value as the score. Dropping off any decimal points. **Example**: A 9.6 value would give you a score of 9 which is a Very Poor grading
	Inverse Algorithm	Inner algorithm	**Inverting Algorithm** The result of this algorithm subtracts 100 from the value dropping any decimals. **Example**: A 9.6 value would give you a score of 91 (100 - 9 = 91) which is a Very Good grading
	Constant	constant score	**Constant Scoring Algorithm** No matter the incoming value, return a constant score Example: A value of 42 would give you a score of 42 which is a Poor grading
	Bounded Range	Minimum and maximum	**Bounded Range Scoring Algorithm** Expect a value in the range of (minimum, maximum) and return a score of 0-100 based on the position, dropping any decimals. **Example**: BoundedRange(10,120) given a score of 119 would give you a score of 1 which is a Very Poor grading

Term	Definition
Categories	Experience uses four categories to calculate the overall Experience Score.

Category	Description
User sentiment	The score for this category is based on the responses to user surveys.
Stability	The score for this category is based on the "crashiness" of the applications and the Operating System that the applications are installed on.
Responsiveness	The score for this category is based on our patented technology that we call "Synthetic Micro-Transactions". We run these periodically on the device and perform different tests to measure the responsiveness of the device. This information cannot be obtained from any other solution.
Performance	The score for this category is based on the typical Windows performance type data - CPU usage, Memory Usage, Processes, etc.

Categories page

The Categories page shows a dashboard of the scores from each of the four categories:

Stability

Responsiveness

Performance

Sentiment

Daily Digest

Some metrics for Experience are collected as daily summaries. These are sent to the Tachyon Switch each night at midnight. If the 1E Client cannot contact the server at midnight the daily digest data is saved at the device and is sent to the server the next time the server can be contacted. In this version, there is not the ability to force the 1E Client to send the information outside of the nightly cycle.

The data that is collected in the daily digest is:

Device resource usage

Term	Definition
	Device Performance, responsiveness and stability data Software stability and resource usage
Device Criticality	**Using Device Criticality** Assigning Criticality to devices according to their importance within your organization.
Devices page	The **Devices** page provides a list of all devices visible to Tachyon Experience. You can see all of their **Experience**, **Stability**, **Performance** and **Responsiveness** statistics and sort them accordingly.
Experience Score	The Experience Score is an overall number that represents the user experience of a given device. It is a total of weighted scores in the four categories - Performance, Stability, Responsiveness, and User Sentiment. The total possible score overall or in any given category is 100.
Filters bar	The **Filters** bar appears at the top of most of the pages in Experience. Each section in the **Filters** bar allows a user to quickly and easily filter based on different categories. When a filter is set it applies to all the tiles on the page. On the Stability, Responsiveness, Performance and Sentiment pages there is also a **Break Down By** selector that reconfigures the charts to show the data divided up into the selected category. On the **Overview**, **Categories**, **Devices**, and **Software** pages there is no option for **Break Down By**. On the **Users** and **Surveys** pages the **Filters** bar is not available.
Grading	Experience scores are divided into one of five gradings. Very Good Good Average Poor Very Poor

Term	Definition
Location	Tachyon Explorer allows you to use Location when defining coverage for an instruction. For example, you can choose to target an instruction to be sent only to devices whose location has been set.
Metrics	Metrics are the datasets that are collected by the 1E Client and sent up the Tachyon server daily. Metrics are either Raw or Aggregate. Raw metrics have a scoring algorithm applied to them to derive a score.
Management Groups	**Management Groups page** Management Groups are containers used to group devices and the software installed on those devices. Management Groups are defined using configurable rules that look at various properties of the devices and their installed software, these are then evaluated to determine the group membership. This means that Management Group membership adapts to changes to the devices and software in your environment. Overview page	The **Overview** page is the starting place for any Tachyon Experience journey. Here you can get immediate answers to how your enterprise is performing from an end-user perspective and you can drill-down to get details on specific problem areas and find routes to immediate resolutions. Your key indicator is the **Experience - Latest Score** chart, which gives your enterprise a score out of 100 based on a combination of measured events and user surveys. The closer you are to 100 the better the IT experience your end-users are having. The **Experience - Latest Grading** chart provides a breakdown of the experience score showing how many devices and users fall into each of the five experience grades - ranging from **Very Good** to **Very Poor**. This helps

Term	Definition
	interpret the experience score and see how it maps onto end-user experiences. The **Experience - What's Changed (last 7 days)** chart provides an overview of the significant changes, good or bad, that have occurred during the past week. Finally you can use the **Experience - Trend** chart to check how well your enterprise is performing over time in terms of how your end-users see it. You could use this chart to help gauge progress on any improvement programs you might have put in place or act as an advanced warning that there are underlying issues that are affecting your end-users and need resolving.
Performance page	The performance score is derived by measuring the performance of the device using the Windows Performance Counters. These counters measure many data points on the device including CPU usage, disk usage, memory usage, and processes. The page allows you to drill into the Latest Score tile to see the different metrics that are collected. For information on the makeup of the score see Performance Score
Performance Score	The Performance score is derived from the scores of disk performance, CPU performance, and memory performance.
Responsiveness page	The responsiveness score is derived by measuring how well Windows application perform during our "Synthetic micro-transactions". The successful and timely operation of Windows and Windows applications is key to a positive user experience on that device. The page allows you to drill into the Latest Score tile to see the different metrics that are collected. For information on the makeup of the score see Responsiveness Score
Responsiveness Score	The Responsiveness score is derived from the scores of Windows internals, system startup, and Windows UI.
Scores	The Experience Score is an overall number that represents the user experience of a given device. It is a total of weighted scores in the four categories - Performance, Stability, Responsiveness, and User Sentiment. The total possible score overall or in any given category is 100.

Term	Definition
Software page	The Software page provides a tabular listing of all the Software products that are installed in the environment (including executable, version, architecture). The second set of columns in the list provide additional metrics or event details associated with the Software products.
Stability page	The stability score is derived by measuring the "crashiness" of applications and the operating system of a device. The different types of crashes have a differing impact on the score, based on the amount of impact on the end-user. An application crash is annoying but the crash of the entire operating system could cause data loss so has more weight on the score. The page allows you to drill into the tiles to see the different metrics that are collected. For information on the makeup of the score see Stability Score
Stability Score	The Stability score is derived from four scores based on the number of crashes and hangs for software and for the Operating System itself.
Tile buttons	The Stability, Responsiveness, Performance, and User Experience pages all have a set of tiles that allow navigation or a change of view.

5.5.5 Tachyon Experience release information

5.5.5.1 Tachyon Experience 8.1 Release Notes – last updated 02-August-2022

These notes contain late-breaking information about Tachyon Experience that you need to have to successfully install and use the product. For the most up-to-date information, please see the online readme. You should read these release notes and the online documentation for Tachyon thoroughly before installing the software.

5.5.5.2 New features in Tachyon Experience 8.1

No longer requires SQL Server Analysis Server (SSAS)

On the Software page, the **Product**, **Executable**, **Version** and **Architecture** columns have been removed from the table that is displayed after clicking on a particular row. This is because the subsequent table is filtered on the selected Product, Executable, Version and Architecture values and will be the same for every row in the table. The values are displayed anyway in the heading for the page, and the columns can be added back from the Column picker if needed

User Sentiment descriptions now highlight that User Sentiment is processed once a day, rather than real-time.

5.5.5.2.1 Online help

Tachyon comes with online help that shows you how to install, configure and use the product. Click the following link to view the help:

Tachyon platform.

For support queries, please:

Use https://support.1e.com/ where you can search the KB or submit a support case.

Contact support@1e.com.

5.5.5.2.2 Known issues

The current known issues related to the installation and running of Tachyon can be found in the Troubleshooting Known issues page of the Tachyon documentation.

5.5.5.3 Tachyon Experience Release History

5.5.5.3.1 Web Release - 8.1 (31 Mar 2022)

No longer requires SQL Server Analysis Server (SSAS)

On the Software page, the **Product**, **Executable**, **Version** and **Architecture** columns have been removed from the table that is displayed after clicking on a particular row. This is because the subsequent table is filtered on the selected Product, Executable, Version and Architecture values and will be the same for every row in the table. The values are displayed anyway in the heading for the page, and the columnscan be added back from the Column picker if needed

User Sentiment descriptions now highlight that User Sentiment is processed once a day, rather than real-time.

5.5.5.3.2 Web Release -8.0 (03 Nov 2021)

Works with Tachyon Platform 8.0

The user interface has been re-organized and provides several new pages and popups:

Experience Analytics:

The existing Overview, Categories, Stability, Responsiveness, Performance and Sentiment pages are now re-organized under Experience Analytics.

Advanced Analytics:

Network: includes scored and raw metrics for Bytes Sent/Received per Second, Outbound Packets Discarded, Packet Outbound Errors, Active TCP Connections, Network Retransmit Rates, Network Usage Overall, Network Bandwidth Utilization, Wireless Send and Receive Rate, Wireless Transmit Rate. Please refer to Investigating Network Performance for more information on how to use this feature

Boot and Login: includes scored and raw metrics for Policy Processing, Startup Apps Processing Time, Main Path Boot Time, Post Boot Time. Please refer to Investigating Boot and Login Performance for more information on how to use this feature.

Inventory Management:

Devices page - displays device-centric metrics including details such as network configuration (IP, Gateway, Connection Type, OS Install Date)

Software page - displays software products with the software associated metrics and inventory details

Users page - displays information on the users known to Tachyon via the 1E Client.

User Engagements. The existing Surveys feature has been renamed and re-organized under User Engagements and extended

Announcement Feature: Engage users via announcements and urgent announcements/notifications. Please refer to Broadcasting information via Announcements for more information.

User Sentiment Surveys are now called **Sentiment Surveys**. Please refer to Getting feedback via Sentiment Surveys for more information.

General Purpose Surveys are now called **Info Surveys**. Please refer to Getting feedback via Info Surveys for more information.

Root Cause Analysis tools - two new popups have been added to the Devices page:

Device comparison: highlights the differences between two selected devices related to Operating System Details, Hardware Details, Usage Details, Installed Software, Services and Processes

Scatter chart: Quadrant placement of devices, plots devices on a chart with customizable X and Y axes (align on the grid based on metrics, scores etc.)

A variety of data types are now available to add as columns in the table views:

Score - values that have been processed and normalized by Experience, this may include consolidation and combinations of other data

Raw - the unprocessed and un-normalized values retrieved from devices

Device Details - information related to devices, such as: IP Address, DHCP Server, Operating System etc.

Software Details - information related to software, such as: the Architecture supported by the software

Event - event information retrieved from devices, such as: Software uninstall, hang and crash events; Operating System boot and crash events, and many others

Network related scores have been added to enhance the overall user experience score:

Output queue length - scores the network transmission backlog, based on the length of the output packet queue

Wireless Signal Quality - scores the signal quality of the wireless network connection on the device.

5.5.5.3.3 Web Release -1.3 (03-Mar-2021)

Works with Tachyon Platform 5.2

Deploy button on Surveys page now only deploys Experience policies

Devices page links through to Device View

1E Experience product pack to support Experience features of the Device View

Users page "User session reactiveness" column has been renamed to "Application responsiveness"

5.5.5.3.4 Web Release -1.2 (03-Sep-2020)

Experience score enhanced to include User Sentiment

End-User Surveys - two types of survey are supported: User Sentiment and General Purpose

A Users page provides information about end-users on the devices in your network

Customizable pages.

5.5.5.3.5 Web Release -1.0 (24-JUN-2019)

Experience score is based on metrics that cover three categories: Stability, Responsiveness and Performance

View experience trends over time

Interactive Overview, Categories, Performance, Stability and Responsiveness experience pages

Investigate devices with Explorer

Filter pages

5.5.5.4 Tachyon Experience features by release

A list of the Tachyon Experience features organized by the release they were implemented in. Links through to the features have been provided for convenience.

5.5.5.4.1 New features in Tachyon Experience 8.1

No longer requires SQL Server Analysis Server (SSAS)

On the Software page, the **Product**, **Executable**, **Version** and **Architecture** columns have been removed from the table that is displayed after clicking on a particular row. This is because the subsequent table is filtered on the selected Product, Executable, Version and Architecture values and will be the same for every row in the table. The values are displayed anyway in the heading for the page, and the columns can be added back from the Column picker if needed

User Sentiment descriptions now highlight that User Sentiment is processed once a day, rather than real-time.

5.5.5.4.2 Tachyon Experience 8.0

Works with Tachyon Platform 8.0

The user interface has been re-organized and provides several new pages and popups:

Experience Analytics:

The existing Overview, Categories, Stability, Responsiveness, Performance and Sentiment pages are now re-organized under Experience Analytics.

Advanced Analytics:

Network: includes scored and raw metrics for Bytes Sent/Received per Second, Outbound Packets Discarded, Packet Outbound Errors, Active TCP Connections, Network Retransmit Rates, Network Usage Overall, Network Bandwidth Utilization, Wireless Send and Receive Rate, Wireless Transmit Rate. Please refer to Investigating Network Performance for more information on how to use this feature

Boot and Login: includes scored and raw metrics for Policy Processing, Startup Apps Processing Time, Main Path Boot Time, Post Boot Time. Please refer to Investigating Boot and Login Performance for more information on how to use this feature.

Inventory Management:

Devices page - displays device-centric metrics including details such as network configuration (IP, Gateway, Connection Type, OS Install Date)

Software page - displays software products with the software associated metrics and inventory details

Users page - displays information on the users known to Tachyon via the 1E Client.

User Engagements. The existing Surveys feature has been renamed and re-organized under User Engagements and extended

Announcement Feature: Engage users via announcements and urgent announcements/notifications. Please refer to Broadcasting information via Announcements for more information.

User Sentiment Surveys are now called **Sentiment Surveys**. Please refer to Getting feedback via Sentiment Surveys for more information.

General Purpose Surveys are now called **Info Surveys**. Please refer to Getting feedback via Info Surveys for more information.

Root Cause Analysis tools - two new popups have been added to the Devices page:

Device comparison: highlights the differences between two selected devices related to Operating System Details, Hardware Details, Usage Details, Installed Software, Services and Processes

Scatter chart: Quadrant placement of devices, plots devices on a chart with customizable X and Y axes (align on the grid based on metrics, scores etc.)

A variety of data types are now available to add as columns in the table views:

Score - values that have been processed and normalized by Experience, this may include consolidation and combinations of other data

Raw - the unprocessed and un-normalized values retrieved from devices

Device Details - information related to devices, such as: IP Address, DHCP Server, Operating System etc.

Software Details - information related to software, such as: the Architecture supported by the software

Event - event information retrieved from devices, such as: Software uninstall, hang and crash events; Operating System boot and crash events, and many others

Network related scores have been added to enhance the overall user experience score:

Output queue length - scores the network transmission backlog, based on the length of the output packet queue

Wireless Signal Quality - scores the signal quality of the wireless network connection on the device.

5.5.5.4.3 Tachyon Experience 1.3

Works with Tachyon Platform 5.2

Deploy button on User Engagement page now only deploys Experience policies

Devices page links through to Device View

1E Experience product pack to support Experience features of the Device View

Users page "User session reactiveness" column has been renamed to "Application responsiveness"

5.5.5.4.4 Tachyon Experience 1.2

Works with Tachyon 5.1

The Tachyon Experience score has been greatly enhanced to include User Sentiment - this means that, not only can you monitor the stability, responsiveness, and performance of the devices on your network to deduce your end-users satisfaction with their IT services, you can send out surveys and incorporate your end-users actual feedback directly into the picture. For more information on this subject please refer to Getting feedback via Sentiment Surveys, where you can find a complete end-to-end use case on creating, deploying, responding and processing responses to User Sentiment Surveys.

The Tachyon Experience score displayed on the Overview page includes user sentiment values, please refer to The Scores for more information.

The Categories page includes a Sentiment tile showing the current User Sentiment score.

The Sentiment page lets you view the User Sentiment score on its own and drill down to view users and monitor their feedback and pain points.

End-User Surveys - two types of survey are supported: User Sentiment and General Purpose. User Sentiment Surveys contribute towards the Tachyon Experience score, General Purpose Surveys can be used to ask one-off questions of your end-users and get their feedback on any issue. The User Engagement page is where you can create, enable and deploy surveys.

A Users page is provided that lets you get information on the end-users on the devices in your network. Please refer to the Users page for more details.

Customize the Tachyon Experience pages to view the interactive charts you want to focus on - including the display of the results from your User Sentiment surveys on the Sentiment page.

5.5.5.4.5 Tachyon Experience 1.0

Works with Tachyon Platform 5.0

Tachyon Experience score - lets you monitor the performance, stability and responsiveness of the devices on your network to deduce your end-users' satisfaction with their IT services. The experience score is based on metrics that cover three categories:

Stability - derived from the frequency of operating system and software crashes, hangs and service failures

Responsiveness - based on the speed of operating system startup, system resource creation and availability

Performance - a weighted indication of load and throughput for device processor, memory and disk resources.

View experience trends over time - Tachyon Experience not only captures data on how your network devices' experience is at the moment, it also lets you view trends in how the experience score is changing over time.

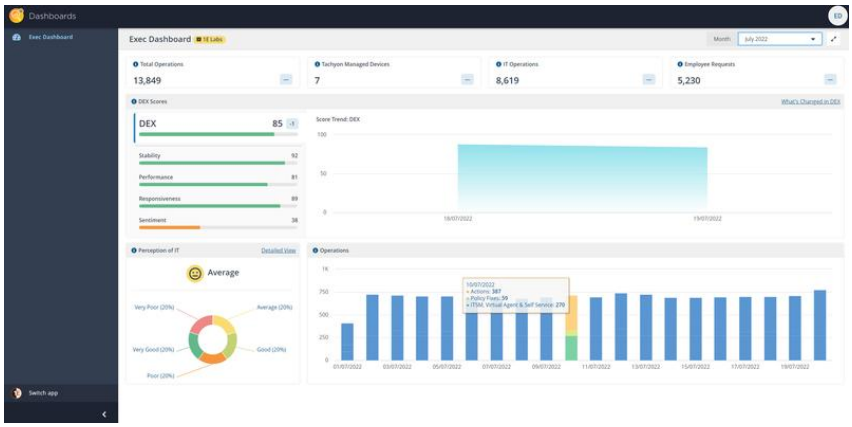
Interactive Overview, Categories, Performance, Stability and Responsiveness experience pages - let you drill down into the details of the experience scores to view the details for the performance, stability, responsiveness and associated metrics for your network.

Investigate devices with Explorer - after drilling down to identify experience issues with the devices in your network, you can make a selection and use that to prime Explorer to run instructions in real-time on just those selected devices.

Filter pages, so the interactive charts display just the data you want them to.

6 Tachyon Dashboards

Over time, Tachyon Dashboards will introduce a number of overview dashboards that give top-level information on the performance of an organization regarding various aspects of their business as measured by Tachyon applications.



6.1 Introducing Tachyon Dashboards

It's important to measure or evaluate the way that your organization is performing in terms of your employee Digital EXperience (DEX). This measure lets you know how good your employee day-to-day experience is of your company's IT systems, how happy they are working in your company, and how likely they are to stay with you.

In many organizations, the ability to gain insight into your DEX KPIs involves gathering data from multiple applications and departments, then analyzing and correlating it to determine if the user experience and sentiment are trending up or down. A bigger challenge is understanding if the tools and processes you have in place are improving end-user productivity.

Over time, Tachyon Dashboards will introduce a number of overview dashboards into the that give top-level information on the performance of an organization regarding various aspects of their business as measured by Tachyon.

The new Exec Dashboard is the first such dashboard. It solves this challenge by presenting your DEX score and key metrics on a single pane of glass in an easily consumable format. It also provides data on the adoption and usage of the various platform components, so you can quickly see how it is benefiting both end-user productivity and issue resolution. When combined with a measure of employee perception of your IT department - via Sentiment surveys, you are able to quickly see trends impacting DEX across your organization.

The Exec Dashboard displays insights into the following areas:

Coverage – Volumetric Data (how much is being managed/covered by Tachyon)

Experience Insights – Actual Values and Trends that influence your DEX score, including employee perception of IT.

This release of Tachyon Dashboards is a 1E Labs release, and introduces the following new features:

6.1.1 Exec Dashboard

Exec Dashboard is an overview page in the Tachyon portal, mainly aimed at CIO executives, showing the benefits that Tachyon provides and highlighting how the company has been performing in terms of DEX over the past few months.

The CIO wants to ensure that their IT department is supporting the business goals of the company. Using the information displayed in the Exec Dashboard, the Exec DashboardCIO delegates tasks to IT managers in order to focus on high-level IT strategy and growth. The provides a focused set of charts that give them the big picture without overwhelming detail, so they can initiate the right conversations with their IT team. The Exec Dashboard shows the following information:

Summary tiles, each tile displays a number that indicates:

Total Operations - the total number of issues that were resolved during the selected calendar month by: manual actions, automated policy fixes (resolved using Guaranteed State policies), ITSM actions (service desk tickets), actions (requested using the Virtual Assistant chatbot), and other self-service requests made by end-users

Tachyon Managed Devices - the number of devices where the installed 1E Client has contacted Tachyon platform during the selected calendar month

IT Operations - the number of issues resolved by manual actions and automated policy fixes (resolved via Guaranteed State Policies)

Employee Requests - the number of issues resolved by ITSM actions, Virtual Assistant actions, and other self-service requests made by end-users.

DEX Scores - you can use this as an indicator of how well your IT systems are working for your end-users.

A summary chart showing the Experience related overall DEX score and individual Stability, Performance, Responsiveness, and Sentiment scores during the selected calendar month.

Score Trend: DEX - A chart plotting the overall daily DEX scores during the selected calendar month.

The CIO can also select to view details on **What's Changed in DEX**. This displays a drawer showing the top 10 largest deltas, up or down, for Experience metrics that have changed during the selected calendar month.

Perception of IT - a tile that shows the feedback given by end-users about their experience of IT services. It consists of averaged responses to the **Perception Of IT** sentiment survey

Displayed at the top of the tile, the total average of all the responses during the selected calendar month as it falls into one of the Very Good, Good, Average, Poor and Very Poor response ranges.

Displayed beneath that, a donut chart showing the average scores per user - according to which of the five response ranges each user's average falls within - plotted as a percentage of the total number of users that responded.

The CIO can also select to view details on the survey responses by clicking on the **Detailed View** link.

Operations - a bar chart showing, for each day in the selected calendar month, three bars that represent: the Actions, Policy Fixes, and ITSM, Virtual Assistant & Self-service operations that took place on that day.

6.2 Implementing Tachyon Dashboards

Everything you need to know about getting Tachyon Dashboards installed and running in your environment.

6.2.1 Requirements

Information that will help you design and plan the implementation in your organization. This includes all the prerequisites and dependencies, which are necessary to get access to Dashboards.

6.2.1.1 License

To use Dashboards, you must have a suitable license included as a consumer in your platform license, which you can obtain from your 1E Account Team. You do not need the license to install the app, but you do need the license to see the app in the Tachyon portal and in the Switch app menu.

6.2.1.2 Hotfix Bundle installer account permissions

To install the Hotfix Bundle that contains Dashboards, you should use the same installation account used for the Tachyon platform.

For more information, please refer to Server installation account.

6.2.1.3 1E companion products

Dashboards currently provides a single **Exec Dashboard** page.

6.2.1.3.1 Exec Dashboard

The table below lists the tiles and charts provided by **Exec Dashboard** indicating which 1E products and apps they each depend on. If any of these products or apps are not installed or available, then the dashboard tile will show a zero, or no data, or not be included in a summed number.

Tile, chart or detail	Source
Total Operations	The sum of IT Operations and Employee Requests for the selected month. That is, the number of issues fixed either manually, by automation, ITSM actions, Virtual Agent actions, and Self Service actions.
Tachyon Managed Devices	The number of devices managed by Tachyon. These are the devices where the installed 1E Client has contacted Tachyon. The number on the dashboard is cached, but the cache is updated in real-time. It increases when new clients come online, and decreases when inactive clients are purged from the Tachyon Master database.
IT Operations	The number of issues fixed, either manually or by automation, and is the sum of the following: **Actions** are issues identified and resolved manually or scheduled. These are action instructions that have been run through Explorer, or any other app, but exclude actions run by ServiceNow ITSM and Virtual Assistant, and 1E Shopping. **Policy Fixes** are issues resolved automatically by **Guaranteed State** policies
Employee Requests	The number of issues fixed by ITSM, Virtual Agent, and Self Service. These are sum of actions instructions that have been run by ServiceNow and/or Shopping. **ITSM actions** are action instructions run by the 1E ServiceNow app **1E ITSM Connect** **Virtual Agent actions** are action instructions run by chatbots, for example the 1E ServiceNow app **1E Virtual Assistant** **Self Service actions** are self-service requests made by end-users of: **1E Shopping**, where a requested item causes an action instruction to be run on the end-user's device **1E Service Catalog Connect**, where a service request is submitted that causes an action instruction to be run. The current version of Exec Dashboard does not differentiate between actions run by the three ServiceNow apps (ITSM Connect, Virtual Agent and Service Catalog Connect) because they all use the same ServiceNow consumer. For more information about ingrating these self-service

Tile, chart or detail	Source
	products with Tachyon, please refer to: Shopping 6.1 - Enabling Tachyon integration and 1E Service Catalog Connect 2.0.
DEX Scores	The DEX score in Exec Dashboard is a combination of these Stability, Performance, Responsiveness, and Sentiment scores, obtained from **1E Experience**. The Score Trend chart shows data for selected score over the selected month. The above scores are a weighted combination of Experience metrics. The What's Changed popup shows the top and bottom 5 metrics that most significantly affected the selected month's DEX score.
Perceptions of IT	A sentiment survey that is optionally deployed using the sentiment feature of **1E Experience**.
Operations	The stacked bar chart shows the following detail for the selected month. **Actions** are issues identified and resolved manually or scheduled. These are action instructions that have been run through Explorer, or any other app, but exclude actions run by ServiceNow ITSM and Virtual Assistant, and 1E Shopping. **Policy Fixes** are issues resolved automatically by **Guaranteed State** policies **ITSM actions** are action instructions run by the 1E ServiceNow app **1E ITSM Connect** **Virtual Agent actions** are action instructions run by chatbots, for example the 1E ServiceNow app **1E Virtual Assistant** **Self Service actions** are self-service requests made by end-users of: **1E Shopping**, where a requested item causes an action instruction to be run on the end-user's device **1E Service Catalog Connect**, where a service request is submitted that causes an action instruction to be run. The current version of Exec Dashboard does not differentiate between actions run by the three ServiceNow apps (ITSM Connect, Virtual Agent and Service Catalog Connect) because they all use the same ServiceNow consumer. For more information about ingrating these self-service

Tile, chart or detail	Source

products with Tachyon, please refer to:Shopping 6.1 - Enabling Tachyon integration and 1E Service Catalog Connect 2.0.

6.2.1.4 Compatibility matrix for ServiceNow apps with and Tachyon platform

The following table contains details of all currently supported 1E ServiceNow integration apps. Use this table as a reference to ensure you are using the correct combination of apps for your needs. Each app is dependent on a 1E Core app and a Tachyon installation.

1E ServiceNow App	**Version**	**Supported versions of Tachyon platform**	**Supported versions of ServiceNow**	**Purpose**
1E ITSM Connect	3.2.1	5.2, 8.0, 8.1	Quebec, Rome, San Diego	Integrates ServiceNow ITSM with Tachyon, to provide real-time inventory and pre-approved automated fixes to first line teams from within the ServiceNow Incident page. Support for 1E Core (new in 2.0.0). Device View and Experience integration (new in v3.0). Support for domain separation

1E ServiceNow App	Version	Supported versions of Tachyon platform	Supported versions of ServiceNow	Purpose
				(multi-tenant) (new in v3.1). Support for 1E CMDB Connect app (new in v3.2).
1E Service Catalog Connect	2.0.1	5.2, 8.0, 8.1	Quebec, Rome, San Diego	Integrates ServiceNow Service Catalog with Tachyon. Provides a UI like 1E Shopping – allows WSA to be invoked by ServiceNow and report WSA requests. Guided Tour, and running any instruction (new in v2.0.1).
1E Virtual Assistant	2.0.1	5.2, 8.0, 8.1	Quebec, Rome, San Diego	Provides a Virtual Agent for ServiceNow, supporting various topics, some of which use instructions.
1E Core	2.1.0	5.2, 8.0, 8.1	Quebec, Rome, San Diego	Platform enabler.

1E ServiceNow App	Version	Supported versions of Tachyon platform	Supported versions of ServiceNow	Purpose
				Provides copy of instructions. Support for domain separation (multi-tenant) (new in v2.0). Support for 1E CMDB Connect apps (new in v2.1) including Service Graph Connector for Tachyon.
Service Graph Connector for 1E Tachyon	2.0.0	5.2, 8.0, 8.1	Quebec, Rome, San Diego	1E CMDB Connect, and Service Graph Connector for Tachyon, provide identical capabilities, your choice depends on your licensing. Either one can be optionally used for the following, among other features: populate device data in ServiceNow's CMDB through

1E ServiceNow App	Version	Supported versions of Tachyon platform	Supported versions of ServiceNow	Purpose
				1E Core and Tachyon provide the device FQDN required by other 1E ServiceNow apps, so they can use Tachyon. The latter requirement may also be met by any third party app capable of populating the device FQDN in the ServiceNow CMDB cmdb_ci_computer table. Change target from cmdb_ci_pc_hardware to cmdb_ci_computer (new in SGC 1.2.2). Populates installed software, disk usage and network attributes. Also provides custom table

1E ServiceNow App	Version	Supported versions of Tachyon platform	Supported versions of ServiceNow	Purpose
				for uninstalled software (new in SGC 2.0.0).
1.2.2	5.2, 8.0, 8.1	Paris, Quebec, Rome		
1E Tachyon CMDB Connect	1.0.0	5.2, 8.0, 8.1	Paris, Quebec, Rome	

6.2.2 Installing and upgrading

How to set up Dashboards, including a guide to upgrading, and using Tachyon Setup to install the Dashboards **Hotfix bundle**.

6.2.2.1 Installation

This version of Dashboards is available as a **Hotfix bundle**. The latest Accumulated Hotfix for Tachyon Platform Server 8.1 includes some platform changes that are required for the app to work. Dashboards is not included in the **1E Platform zip** that is used to install platform servers and other applications.

If you have not already installed Tachyon platform 8.1, please refer to Installing Tachyon.

You also need to have a Dashboards license added to your Tachyon license, which you can obtain from your 1E Account Team. It is included as a consumer in the Tachyon license file. You do not need the license to install the app, but you do need the license to see the app in the Tachyon portal and in the Switch app menu.

Next, download the latest Accumulated **Hotfix bundle** for Tachyon server 8.1 from the https://support.1e.com/. Then use setup to install the Hotfix bundle from the setup Maintenance screen. Please refer to Upload and apply a 1E Hotfix bundle.

6.2.2.1.1 What the Hotfix bundle does

Installing the Hotfix bundle using Tachyon Setup will:

Add a new **Dashboards** app to the Tachyon Platform portal

Upload a new **1E-ExecutiveDashboard.zip** product pack and create the **1E ExecutiveDashboard** instruction set from it

Create a new role **Dashboards User** that allows access to the Tachyon Dashboards app and has **Questioner** permissions to the **1E ExecutiveDashboard** instruction set.

6.2.2.2 Post-install configuration

To view and use Dashboards, a Tachyon user must be assigned to the new role **Dashboards User**, or be assigned to the **Full Administrator** role. The **Dashboards User** role, aside from allowing access to the app, also has permissions to run the questions in the **1E ExecutiveDashboard** instruction set that feed information to the tiles on the **Exec Dashboard** page.

Refer to Requirements for a list of 1E Companion products that provide source data for Dashboards features.

Refer to Dashboards post-installation tasks for enabling access to executives.

6.2.2.3 Tachyon Dashboards post-installation tasks

Post-installation tasks, which include verification checks and mandatory and optional configuration tasks.

6.2.2.3.1 Required tasks

The following tasks must be performed post-installation of the Dashboards patch, before enabling access to the application for your execs.

6.2.2.3.1.1 Accessing Tachyon Dashboards

The application will be available after installation using the following URL. For example:

> **Note**
>
> https://<platform URL>/1E/App/#/dashboards/overview

6.2.2.3.1.2 Configuring the Perception of IT survey

You have the following options:

Create a new sentiment survey called Perception of IT (recommended)

Clone an existing sentiment survey with the name **Perception of IT**

Do not use the feature - the tile will show no data, but the DEX Sentiment score will reflect any other Experience sentiment surveys that have been deployed.

For more details on creating Experience surveys, please refer to Getting feedback via Sentiment Surveys.

> **Note**
>
> The **Perception of IT** chart may show one of the following errors or messages:

Error no data - if the survey does not exist, or has been created with the wrong name. To remove error, you can create the survey, but you do not need to enable or deploy it

No Survey Responses - if the survey exists, but is not enabled and deployed

Experience Not Licensed- if your implementation does not have a license for Experience.

These messages and their error handling may change in a future version of Exec Dashboard.

6.2.2.3.1.2.1 Create a new sentiment survey called Perception of IT

Ensure you name the survey **Perception of IT**. In this version of Dashboards, it is not possible to specify a different survey name.

To create the survey, you will need to use Experience and have the **Experience Administrator** role:

Navigate to the **User Engagement** page in Experience.

Click on the **New Engagement** button.

On the **New Engagement** page, ensure the **Sentiment Survey** tab is selected.

Fill out the fields on the page according to the following recommendations:

Field	Recommendation
Name	This must be set to **Perception of IT**.
Question	This should be set to a question that is relevant to how you want your end-users to answer the response. For example, you could set this to: **How would you rate the performance of your IT department?**, as this matches with the **Visual Rating 5** template responses available to the end-users: **Very Poor**, **Poor**, **Average**, **Good** and **Very Good**. The exact wording of the question is down to your business requirements, but it should at least match the available responses to avoid confusion.
Description	This should be set to a description that helps your end-users understand why the survey is being asked and how they can respond appropriately. This provides your end-users with more context as to why they are being asked to respond. For example, this could be set to: **We would like to see if we're doing a good job of providing you with IT services.** The exact wording of the description is down to your business requirements, but it should be phrased to encourage your end-users to think about how to best respond to the survey.
'Read more' link	You could provide your end-users with more details on the importance of the survey with the **Read more** link, but this is entirely down to your own judgment as to how you want to guide them.
Prompt question every n days	This option determines when your end-users are prompted to answer the survey. You should select an appropriate period, so as not to repeatedly prompt them with requests to fill out the survey, but enough to remind them that it is there. A value of **7** days could be reasonable, this would mean that your end-users would be prompted to fill out the survey each week. Remember that they can choose to

Field	Recommendation
	fill out the survey using the Real-time Control Center menu at any time, regardless of how often they are prompted.
Use template	On the **Exec Dashboard** page, the results for the **Perception of IT** survey will be displayed according to the average responses for each user and how that average falls into the response options for the **Visual Rating 5** template. For this reason, we recommend that you set **Use template** to **Visual Rating 5** correspondingly, although the responses are averaged out, so it's not critical that this matches.
Select icon family	On the **Exec Dashboard** page, the results for the **Perception of IT** survey will be displayed using the smiley face icon family, so we recommend that you choose this option for the survey.
Allow free text entry	Setting this option is entirely your own choice. The display of the results for the **Perception of IT** survey on the **Exec Dashboard** page do not reflect this additional information, but this information can be viewed in the **Experience** App.

When the fields for the sentiment survey in the **New Engagement** page have been set, click **Save** to store them. You will be prompted that **Pending engagement changes to be deployed**. This indicates that extra steps are needed before the survey is active.

Check the checkbox at the left-hand end of the newly saved **Perception of IT** survey, and then click the **Enable Selection** button. Answer **Yes** to the **Enable Selection** prompt subsequently displayed.

Check the checkbox at the left-hand end of the newly enabled **Perception of IT** survey, and then click the **Assign Mgmt Grp** button.

In the **Assign Management Groups** popup, select a Management Group to assign to the survey. This will set the devices that will be targeted with the survey. Click **Save** to store the assignment.

> **Note**
>
> You might want to consider assigning the survey to a Management Group that contains some locally accessible test devices so that you can see how the survey will appear to your end-users. When you roll out the complete survey, you may want to target **All Devices** - or you may choose to send your survey to one department at a time, as long as you have created Management Groups that select those department devices. Bear in mind that the results in the Dashboards are presented as if they represent the responses for the end-users across the whole organization, so the most appropriate may be the **All Devices** Management Group, or one that specifically targets all end-user devices.

Click the **Deploy** button to send the survey to the devices targeted via the assigned Management Group.

6.2.2.3.1.3 *Verify installation*

Note

You must perform the verification tests provided on the Verifying page. Those tests reference each of the required tasks below.

6.2.2.4 Uninstalling Dashboards

Because this release of Dashboards is provided as a **Hotfix bundle**, it is not possible to uninstall completely. However, you can disable the **Dashboards** app and stop it from being displayed by disabling the **Dashboards** consumer using the **Settings** app.

6.2.2.4.1 Disabling the Dashboards consumer

To do this, you will need to have one of the following roles: **Full Administrator**, **Installer**, or a custom role with the **Consumer** global **Read** and **Write** permission.

Navigate to the **Configuration**→**Consumers** page in the **Settings** app.

Locate the **Dashboards** consumer in the consumer list and check the checkbox at the left-hand side of its entry in the list.

Click the **Edit** button.

In the **Edit consumer** popup uncheck the **Enabled** checkbox and click **Save**.

The **Dashboards** consumer will now be disabled. Refresh the browser and the **Dashboards** app will no longer be available.

Note

Before refreshing the browser, it will still be possible to view the Dashboards, and anyone else viewing this in another browser will still be able to see it until they refresh or login again to Tachyon platform.

6.2.2.4.2 Re-enabling Dashboards consumer

It is also possible to re-enable the Dashboards consumer to allow subsequent access to the Dashboards app. Follow the instructions above, but check the **Enabled** checkbox in step 4. instead.

6.2.2.4.3 More permanent disabling of Dashboards

If you no longer want to use the Dashboards feature or have access to this open beta, you can request 1E to remove it from your license. This will stop the application from displaying altogether and can only be reverted by requesting that it is added back into your license.

6.2.3 Verifying

Basic verification tests that cover the installation and basic use of Dashboards.These tests should be run in series. Depending on the decisions you have made during the design phase of your implementation, you may need additional tests to verify your implementation.

Note

Please ensure you complete all verification tests. They not only confirm your system is operational, but they also introduce you to concepts and tasks that you will use later when using Dashboards.

To run these tests, you need:

A valid license that includes Dashboards.

To have installed the **Hotfix bundle** that contains the Dashboards release.

To have completed all the steps on Tachyon Dashboards post-installation tasks.

6.2.3.1 Verify Tachyon Dashboards

The following verification steps check that the Tachyon Dashboards application has been installed correctly and is displaying the correct information.

6.2.3.1.1 Basic Hotfix bundle installation verification

To run the following verifications, log in with a user that has the **Full Administrator** role.

Ref	Test	Expected	Remediation
BH 01	Ensure that the application is displayed on the Tachyon home page.	Navigate to: https://<tachyonbaseurl>/tachyon/App/#/system/home Confirm the **Dashboards - 1E Labs**tile is visible.	If the tile is not visible, check that requirements 1. and 2. have been met.
BH 02	Ensure that the 1E ExecutiveDashboard.zip product pack has been loaded.	Navigate to the **Instructions→Instruction sets** page in the **Settings** app. Confirm the **1E ExecutiveDashboard** instruction set is visible and that it contains the 10 instructions from the product pack loaded by the hotfix bundle.	If the instruction set is not visible, check that requirements 1. and 2. have been met. If the instruction set is visible but does not contain any instructions, check the **Tachyon.Setup.log**, located in the same directory as **Tachyon.Setup.exe**, to see if there was an attempt to upload the instructions that failed due to licensing issues. Search for entries that contain the following text (time and date

Ref	Test	Expected	Remediation
			stamps have been left out of the text): *ERROR Tachyon.ProductPackDeploymentTool - The server reported an error while uploading ... ... [{"ErrorCode":"ProductPack.SsiIsNot1ESigned"* This may indicate that your license is not configured correctly to license the Dashboards app.
BH 03	Ensure that the new **Dashboards User** custom role has been added to the Tachyon Roles.	Navigate to the **Permissions→Roles** page in the Settings app. Confirm the **Dashboards User** role has been added. Click on the name link for the **Dashboards User** role to display the **Edit Role** page. Confirm the **Dashboards User** role has **Questioner** permissions on the **1E ExecutiveDashboard** instruction set. Exit the editor by clicking **Cancel**.	If the role has not been created there were probably errors during the installation of the **Hotfix bundle**, please check the **Tachyon.Setup.log** file, located in the same directory as **Tachyon.Setup.exe**.

6.2.3.1.2 Executive Dashboard data verification

To run the following verifications, log in with a user that has the **Full Administrator** role.

ED01	Ensure that the application is displayed after clicking on the **Dashboards - 1E Labs** tile.	The **Dashboards** app is displayed open on the **Exec Dashboard** page.	Check that you are accessing Tachyon with a user that has the **Full Administrator** role.
ED02	Ensure that the **Perception of IT** tile is showing data.	The **Perception of IT** tile displays information related to	If the tile displays the text **An error occurred**, this is usually an indication that the **Perception Of IT** survey has not

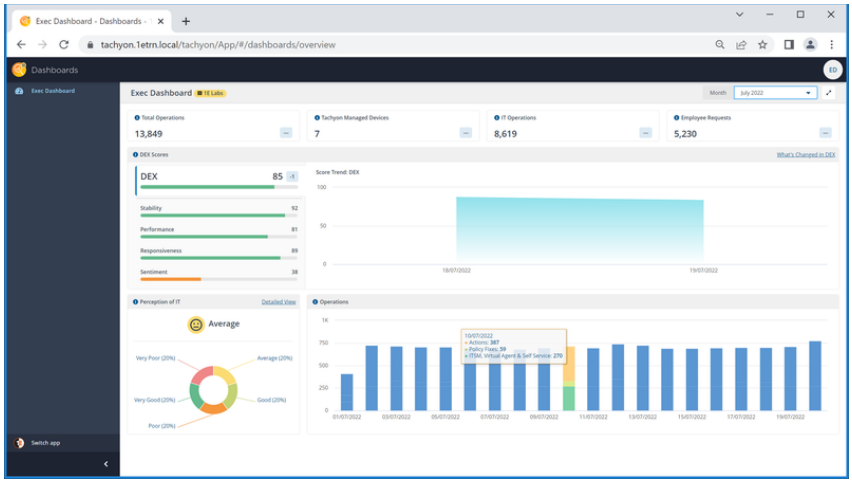
the **Perception Of IT** sentiment survey.	yet been created - ensure that requirement 3 has been fully met. If the tile displays the text **No Survey Responses**, this may be due to the following: no end-user has responded Tachyon Dashboards has not yet processed the response - this can take up to 3 minutes from when the response was received by Tachyon, as the front-end display is cached the **Perception Of IT** sentiment survey has been created but not yet deployed.

6.3 Using Tachyon Dashboards

How executive users use Tachyon Dashboards to monitor their organization's DEX performance.

6.3.1 Assessing how Tachyon contributes to company DEX performance

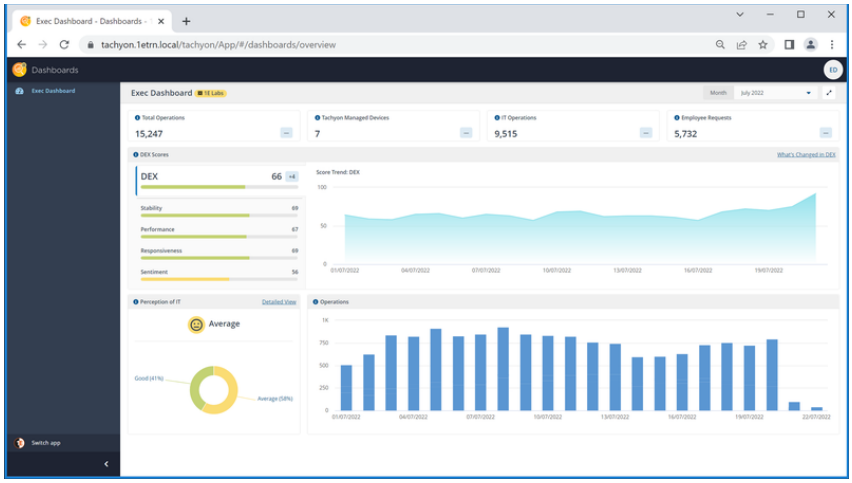
A CIO uses the dashboard to see how Tachyon is benefiting their organization, get a feel for how their company DEX is looking, and see how their users rate their IT department.



6.3.1.1 Viewing the headline information for the current month on the Exec Dashboard page

The CIO navigates to the page and sees the data for the current month displayed. Along the top row, they can see information about the way that Tachyon is performing in their environment: **Total Operations**, **Tachyon Managed Devices**, **IT Operations** and **Employee Requests**.

Tile	Description
Total Operations	The **Total Operations** figure for this month is calculated as **15,135**. This is the number of actions that have been performed on the network using Tachyon, and that's not including questions that have been asked to get back information that may have been useful in resolving end-user issues. There are a number of ways that Tachyon is prompted into action, and these fall into two main categories that are also displayed on the top-row: **IT Operations** and **Employee Requests**.
Managed Devices	This tile shows the number of devices that have connected to Tachyon during the selected month. This shows how many devices are being managed using Tachyon and having actions performed on them. In this example, we're showing a lab environment with only a few devices.
IT Operations	The **IT Operations** figure shows the number of Tachyon actions performed by the IT department using Tachyon, either run manually or using a scheduled instruction from Tachyon Explorer, or automatically performed using Guaranteed State.
Employee Requests	Employee requests show the number of Tachyon actions that have been run as a result of users requesting items via ITSM, through the Virtual Assistant or using Shopping to select an instruction.



6.3.1.1.1 Checking the daily details for Total Operations

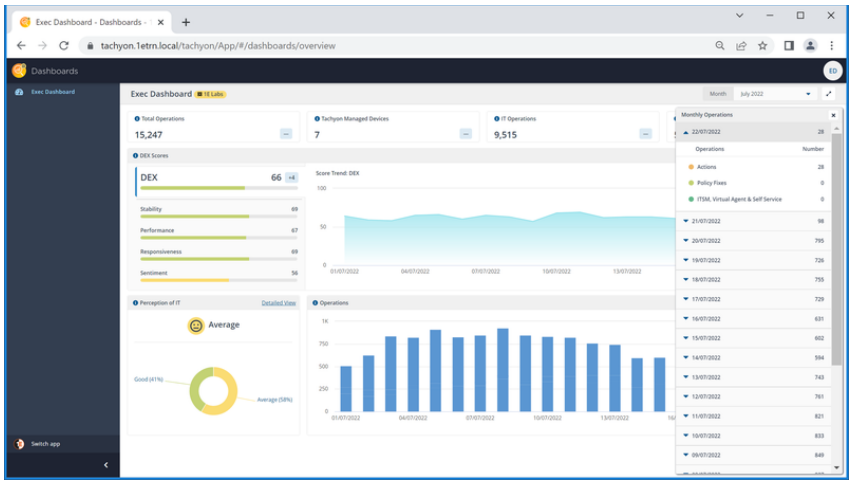
Clicking on the **Total Operations** tile provides details on how that figure is derived for each day in the current month. This shows the CIO that so far today:

Their IT team was responsible for **464** actions, either run manually from Tachyon Explorer or using a scheduled instruction

Guaranteed State has automatically made **54** fixes to devices

Users have requested via ITSM, Virtual Assistant and Self-service instruction items in Shopping, **270** actions

leading to a total of **788** Tachyon operations for the day so far.



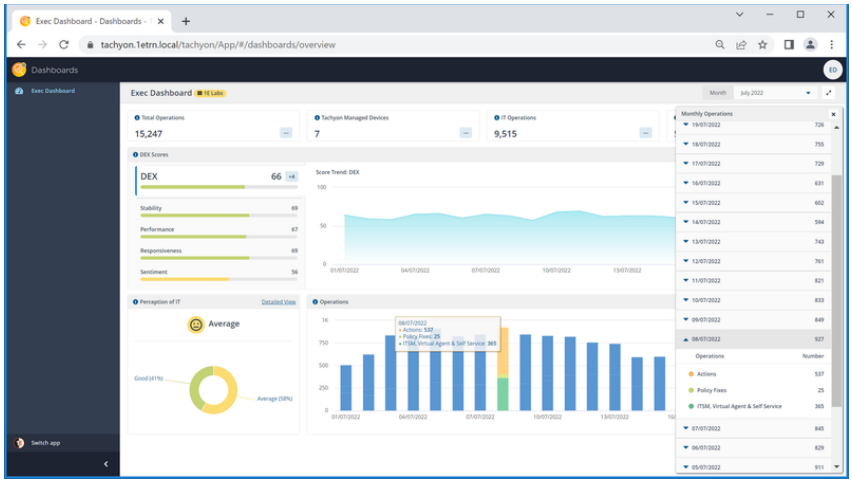
6.3.1.1.2 Checking the Operations chart for the highest number of Total Operations so far this month

The CIO can also see the breakdown of operations per day in the **Operations** tile along the bottom-right of the dashboard. Scanning across, they can see one day that stands out. Clicking on the bar for that day shows the make-up of the total:

537 actions

25 policy fixes

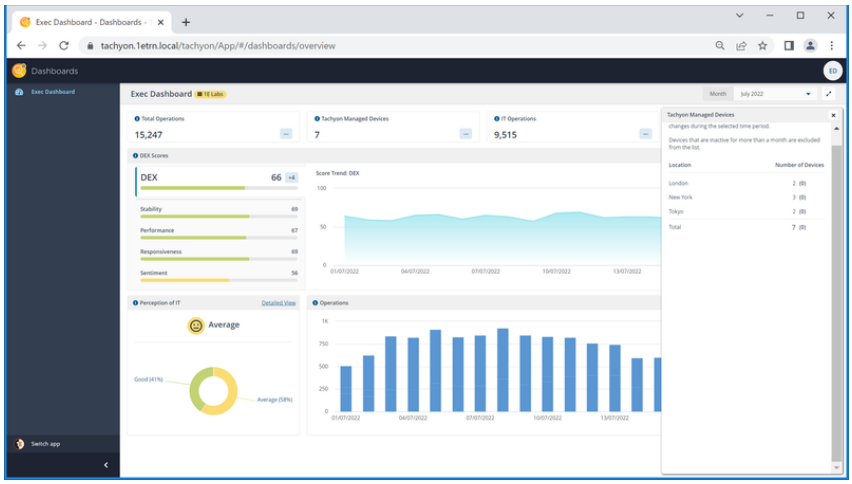
365 ITSM, Virtual Assistant & Self-service.



6.3.1.1.3 Viewing details for Tachyon Managed Devices

The CIO wants to find out more information about the devices that have connected to Tachyon during the current month. Clicking on the **Managed Devices** tile displays a breakdown of the devices organized into their locations, set using instructions.

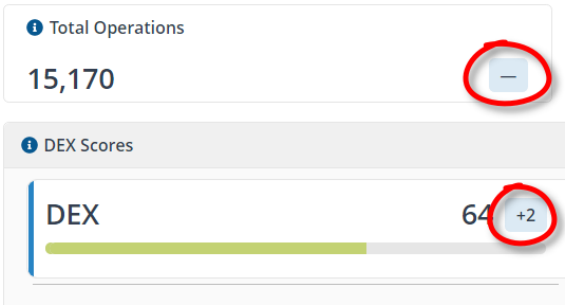
Here they can see that they've had devices reporting back from all their locations, **London**, **New York** and **Tokyo** (not in high numbers, but this is a lab example).



6.3.1.1.4 Change indicators

There is a change indicator at the bottom-right of each headline tile and at the top-right of the DEX score display. When the current month is displayed, the only indicator that shows any information is the DEX score display one, all the other ones display dashes. This is because the counted data in the headline tiles for the current month is incomplete, so comparisons with the previous month cannot be easily made.

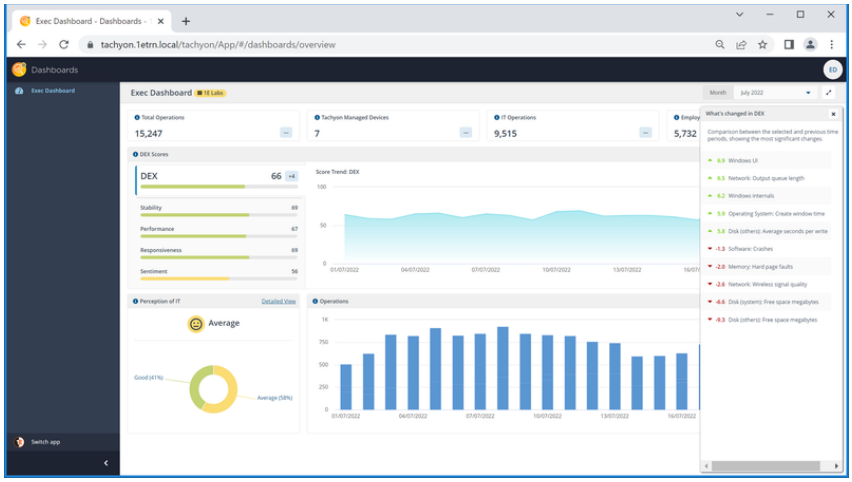
The DEX score, is calculated as an average and displayed as a change in the score, not a percentage.



6.3.1.1.5 Looking at What's changed in DEX

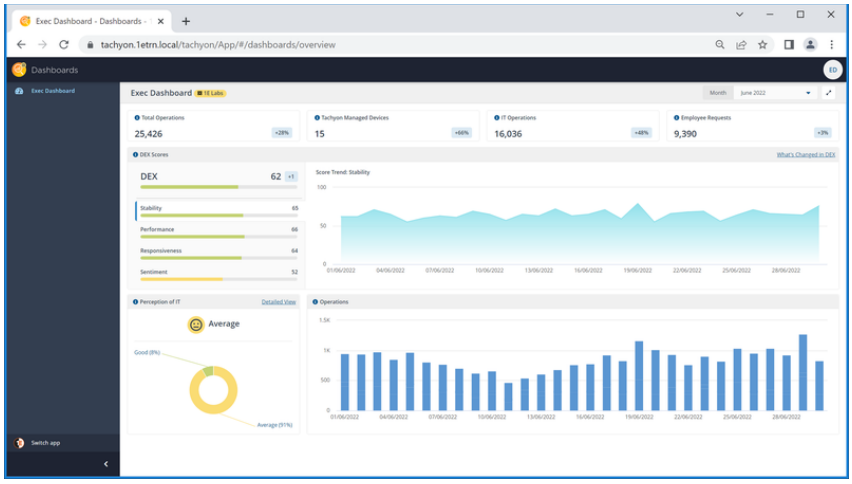
The dashboard shows information from Experience that highlights how the company is doing from a DEX perspective. The **DEX Scores** tile presents the CIO with an overall view of their DEX score and shows how it has changed since the previous month. This overall averaged score consists of the distinct **Stability**, **Performance**, **Responsiveness** and **Sentiment** scores (also averaged). Clicking on the **What's changed in DEX** link displays details on the metrics that are reported on by Experience have gone up or down in terms of their largest impact on DEX.

The **Sentiment** score is related to all the sentiment surveys that have been sent out and responded to by end-users. The **Perception of IT** tile is related to the responses of just the **Perception of IT** sentiment survey.



6.3.1.2 Comparing Operations with the Stability score

Scanning along the **Operations** chart, the CIO can see there's a peak of operations on the 19th of June, they can check through the DEX data to see if there are any correlations with this peak. Clicking on the **Stability** score shows the **Score Trend: Stability** chart. Here they can see that there's a corresponding peak in device stability, it might be that some remediation or actions that took place on that day were having a positive effect on system stability - and perhaps checking with their IT manager to see what the additional operations were related to.



6.3.1.3 How is my IT department doing?

The CIO can get a feel for how their IT department is perceived by their employees, by checking the **Perception of IT** tile. The values that are shown are the averages of each user's responses, which are then counted and placed into one of five buckets:

Very Good

Good

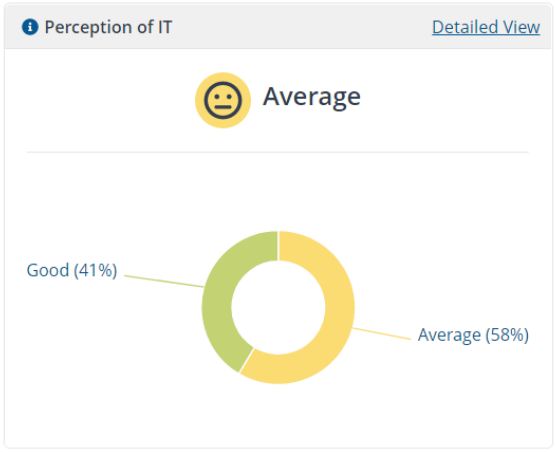
Average

Poor

Very Poor.

Each bucket with values is then plotted using a donut chart, and the largest segment is then displayed as the overall rating.

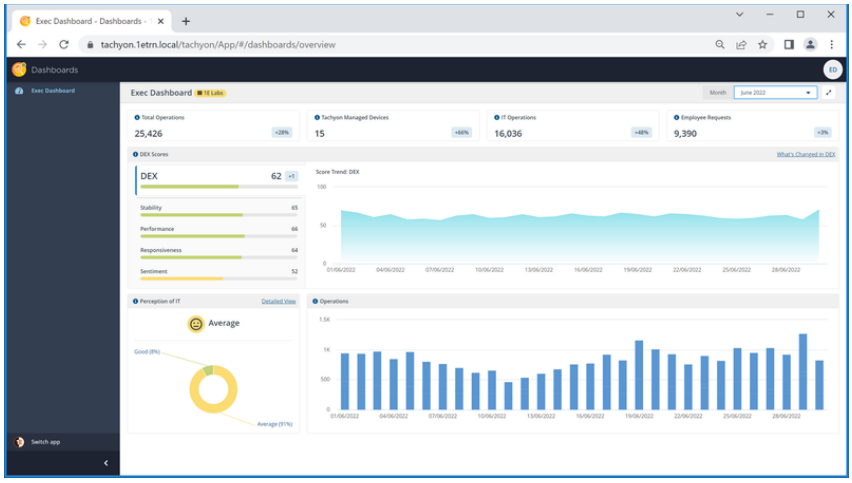
For example, in our example in July the largest segment with values is **Average**, which is used as the overall rating - with 58% of the respondents averages falling into that. All the other respondents averages fall into the **Good** rating - the percentage values displayed are rounded down. This tells the CIO that overall the responses are average, but with a large chunk tending towards good. So how does this compare with the previous month?



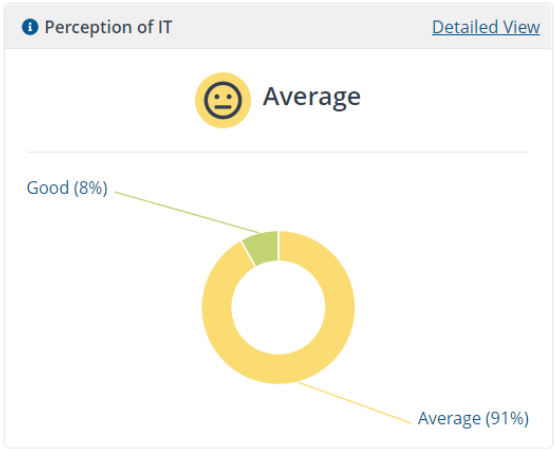
6.3.1.3.1 Looking at the data for previous months

Clicking on the **Month** selector, at the top-right of the **Exec Dashboard** page, lets the CIO change which calendar month of data is displayed on the screen. There are only three months covered, the partial data for the current month, the full aggregated data for the preceding two months.

For the months before the current one, the change indicator at the bottom-right of each headline tile displays the deltas between the selected month and the one before. For the month of June 2022, the CIO can see that the **Total Operations** for that month are up **28%** when compared with May 2022.

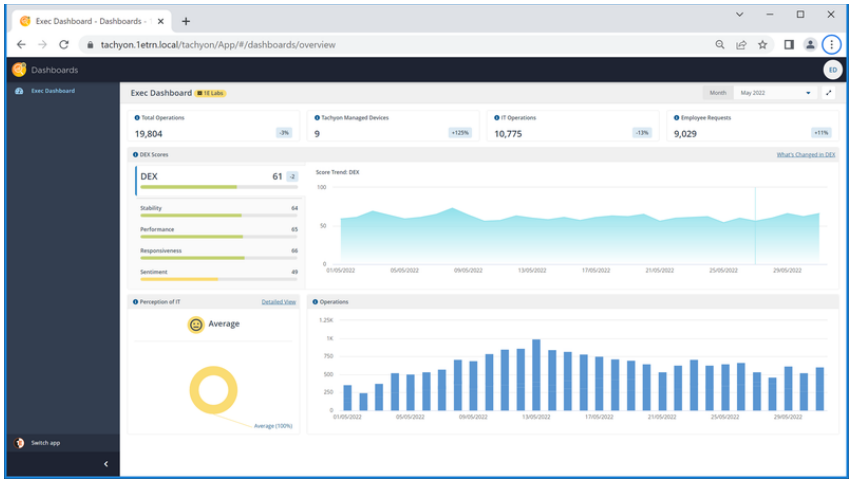


Focusing on the **Perception of IT** tile, the CIO sees that in the previous month there was a smaller percentage of respondents, just **8%**, where they averaged out to **Good**. So things have improved in July so far, where the number of **Good** respondents is up to **41%**.



6.3.1.3.2 Looking at the earliest month

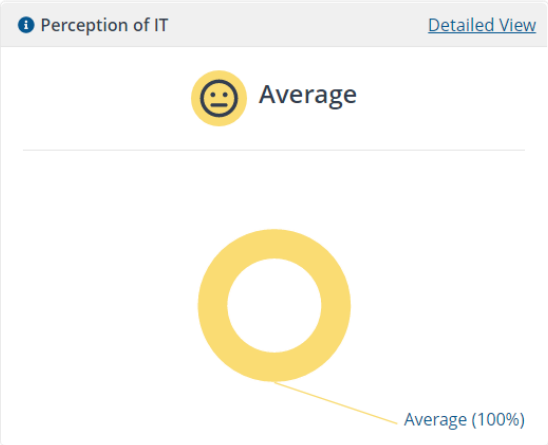
The CIO now uses the month selector to look at the data for the earliest available month.



Here they can see that their **Perception of IT** score has a completely average set of results. Indicating that the average for each user that replied to the survey is coming out as **Average**.

So in May the **Good** percentage was **0**, that is it didn't appear in the chart at all, in June it was up to **8%** and currently in July it's at **41%**.

So that's two months in a row where the **Perception of IT** responses have been improving. Even in the latest month they are still with the overall rating of **Average**, but the number of **Good** responses are increasing, and that may be a sign of a good trend for the CIO's IT department.



6.4 Troubleshooting

A general methodology for investigating issues with Dashboards, as well as identifying key issues and their resolutions.

6.4.1 1E Support contact details

6.4.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

6.4.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

US/Canada:	1-866-349-4032 (Toll-Free)
	1-917-339-2360 (Standard)
UK/Europe:	+44 (0)208 326 3499
India:	+91 120 402 4002

Australia: +61 739 111 118

6.4.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation.

support@1e.com

6.4.1.4 Maintenance

You are recommended to review and apply hotfixes on a monthly basis. Hotfixes are provided in **Hotfix Bundles** and in **Monthly Updates**, which are installed using Tachyon Setup. Please refer to Maintenance.

6.4.1.5 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

6.4.1.5.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

6.4.1.5.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

6.4.1.5.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

6.4.1.6 Log files

Below is a summary, please refer to the Log files page for more details.

6.4.1.6.1 Tachyon Setup log files

Tachyon Setup creates a Setup log file for itself and an Install log for each of the components (if used) in the same folder as itself:

BIInstall.log

CatalogInstall.log

ContentDistribution.log

SLAInstall.log

Tachyon.Setup.log

TachyonInstall.log

6.4.1.6.2 Tachyon Server log files

For any issue, please provide a zip containing log files from the following locations:

%ALLUSERSPROFILE%\1E\Catalog*.log

%ALLUSERSPROFILE%\1E\ContentDistribution*.log

%ALLUSERSPROFILE%\1E\Platform Consumers*.log

%ALLUSERSPROFILE%\1E\SLA Platform*.log

%ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

%ALLUSERSPROFILE%\1E\Licensing*

6.4.1.6.3 1E Client log files

1E Client logs on Windows

1E Client logs on macOS

1E Client logs on other non-Windows platforms

Nomad client log

PXE Everywhere Agent log

Shopping WSA client log

WakeUp client log

> **Note**
>
> By default, Windows resolves %ALLUSERSPROFILE% as C:\ProgramData\

6.4.2 Known issues

Lists of the current known issues for implementing, configuring and using Dashboards.

Issue	Description	Workaround
After initially installing the Hotfix bundle, when navigating to the **Exec Dashboard** page and then selecting to view earlier months, an error is displayed in the **Tachyon Managed Devices** tile.	This is because some of the data that is used for the **Tachyon Managed Devices** tile has not yet been generated.	You will need to wait for the first scheduled aggregated data sync to run at 23:59 UTC to happen. After this sync has run, the error will not be displayed.
If the **Tachyon Managed Devices** drawer is open on the **Exec Dashboard** page, and the month selector is used to change to another month, the data in the drawer is not updated to reflect the change.	The update is not being handled in the drawer correctly, so the information displayed is not updated when the month changes.	To view the correct data, close and then re-open the **Tachyon Managed Devices** drawer by clicking on the **Tachyon Managed Devices** tile.
An error occurred message appears when clicking on the **Detailed View** link on the **Perception of IT** tile to display the **Perception of IT** details drawer.	This occurs when the selected month doesn't have any data for the **Perception of IT** sentiment survey.	Refresh the page and the **Detailed View** option to display information on the **Perception of IT** survey results is no longer displayed.

Issue	Description	Workaround
The tooltips used to provide information on the screen refer to **manual actions**.	This text should refer to **manual or scheduled actions**.	n/a
The text **An error occurred** appears on the **Perception of IT** tile.	This text appears when the **Perception of IT** survey has not yet been created in Tachyon Experience.	An Experience administrator should create and save the **Perception of IT** survey.

6.4.3 Implementation Issues

Troubleshooting common issues that you may be having with implementing the Tachyon Hotfix bundle.

6.4.3.1 Post-application of the Hotfix bundle

6.4.3.1.1 Dashboards - 1E Labs not displayed

If the **Dashboards - 1E Labs** tile is not displayed on the Tachyon home page, check that you have a valid Tachyon license that includes the **Dashboards** app. You ask your 1E Account Team to get your license updated.

In a rare cases, if the **Dashboards - 1E Labs** tile is still not visible after the Hotfix bundle has been applied, an IIS reset might be required.

6.4.3.1.2 Issues with the 1E ExecutiveDashboard instruction set

If the instruction set is not visible on the **Instructions→Instruction sets** page in the **Settings** app, check that you have a valid Tachyon license that includes the Dashboards app.

If the instruction set is visible but does not contain any instructions, check the **Tachyon.Setup.log**, located in the same directory as **Tachyon.Setup.exe**,to see if there was an attempt to upload the instructions that failed due to licensing issues.

Search for entries that contain the following text (time and date stamps have been left out of the text):

```
ERROR Tachyon.ProductPackDeploymentTool - The server reported an error while uploading ... ... [{"ErrorCode":"ProductPack.SsiIsNot1ESigned"
```

This may indicate that your license is not configured correctly to license the Dashboards app.

6.4.3.1.3 Issues with the Dashboards User custom role

If the role has not been created, there were probably errors during the installation of the **Hotfix bundle**, please check the **Tachyon.Setup.log** file, located in the same directory as **Tachyon.Setup.exe**.

6.5 Reference

All the Dashboards related tables of information, such as supported platforms, communications ports etc.

6.5.1 Log files

Names and locations of log files created by Tachyon Server, 1E Client, and Tachyon tools.

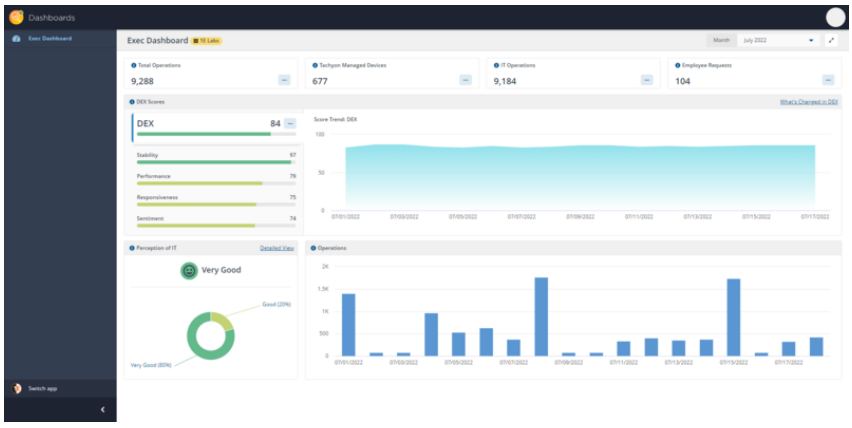
For full details, refer to Log files.

6.5.2 Page reference

A reference for the fields and tables on the pages in Dashboards.

6.5.2.1 Exec Dashboard page

The **Exec Dashboard** is an overview page in the Tachyon Portal, mainly aimed at CIO executives, showing the benefits that Tachyon is providing and highlighting how the company has been performing in terms of DEX over the past few months.



6.5.2.1.1 Time Period

Using the **Time period** filter at the top of the page, you can narrow down the results by date. You can choose from the current month's DEX score report, or one of the previous two months.

For the current month, the graph will show data from the 1st date of the calendar month to yesterday's date, for example:

July 2022 (current month until yesterday, so data doesn't change every second)

June 2022

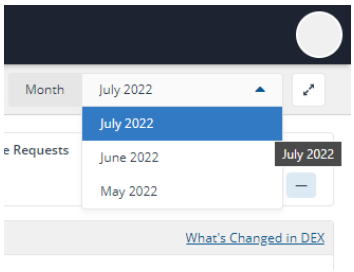
May 2022

When the **Time Period** is set to a period, the setting you choose is retained when you:

Manually refresh the page

Switch between Tachyon Platform apps

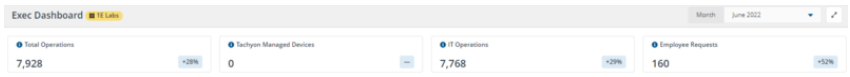
Close and reopen the app.



6.5.2.1.2 Exec Dashboard tiles

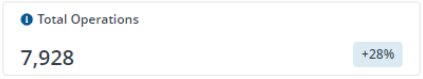
Thetilesat the top of the **Exec Dashboard**page. Each sectionallows you to quickly and easily view statistics based on the following categories.

> **Tip**
>
> The Delta for your DEX scores are only displayed once a month is complete. The examples shown are from **June 2022** in our environment. The Delta scores show the changes in the total category carried out in the selected calendar month.



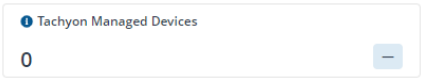
6.5.2.1.2.1 Total Operations

Total number of issues resolved by manual actions, automated policy fixes, ITSM actions, Virtual Assistant actions, and other self-service requests. In our example, the total is 160 (Employee Requests) + 7,768 (IT Operations) = 7,928 (Total Operations).



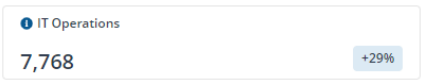
6.5.2.1.2.2 Tachyon Managed Devices

Number of devices managed by Tachyon. These are the devices where the installed 1E Client has contacted Tachyon.



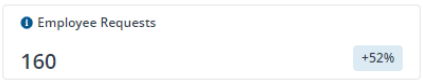
6.5.2.1.2.3 IT Operations

Number of issues resolved by manual actions, and automated policy fixes.



6.5.2.1.2.4 Employee Requests

Number of issues resolved by ITSM actions, Virtual Assistant actions, and other self-service requests.



6.5.2.1.2.5 Monthly Operations drawer

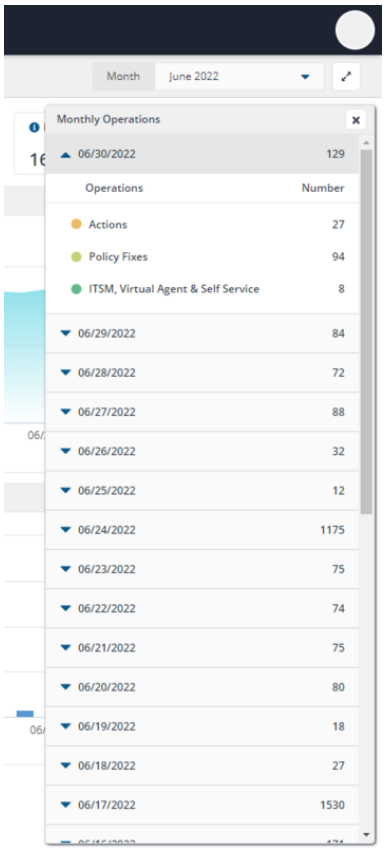
The **Monthly Operations** drawer is displayed when you click on the following tiles:

Total Operations

IT Operations

Employee Requests.

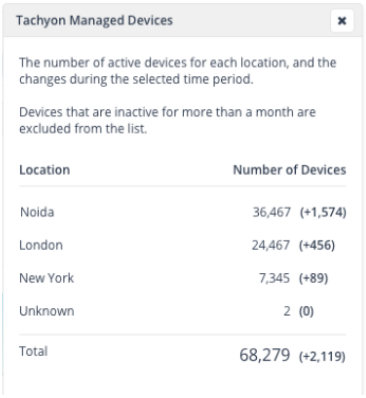
The Monthly Operations drawer displays the number of **Actions**, **Policy Fixes** and **ITSM, Virtual Agent & Self Service** per day for the currently selected month.



6.5.2.1.2.6 Tachyon Managed Devices

Displays the number of active devices for each location, and the changes during the selected time period.

Devices that are inactive for more than a month are excluded from the list.



6.5.2.1.3 DEX Scores

6.5.2.1.3.1 Score Trend

Displays the DEX score trends for the currently selected month:

DEX

Stability

Performance

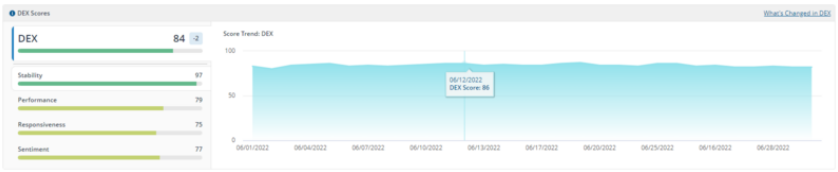
Responsiveness

Sentiment.

The DEX score includes a delta for changes in the average DEX score in the selected calendar month compared to the previous one.

The data shown is sourced from Tachyon Experience database and is aggregated for the selected time period. The DEX, Stability, Performance, Responsiveness, and Sentiment is not based on the latest score but is an average of the selected period. The DEX delta is taken from the difference between the selected time period and the previous time period.

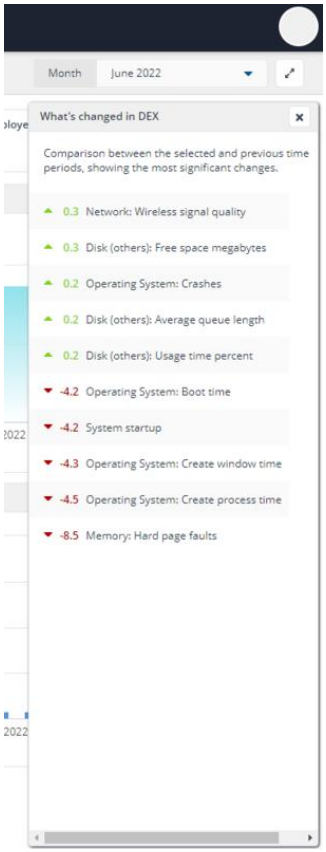
> **Note**
>
> The Tachyon Instruction **1E-Experience-DexScores** provides the data populating the DEX Scores tile.



6.5.2.1.3.2 What's changed in DEX

Shows the comparison between the selected and previous time periods, showing the most significant changes that increased and decreased.

For details of all the different metrics and scores you may see here, please review The Scores.

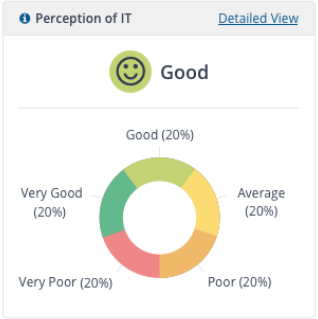


6.5.2.1.4 Perception of IT

The **Perception of IT** tile displays feedback given by end users about their experience of IT services.

Data is sourced from the Tachyon Experience database and is aggregated for your selected time period. The **Perception of IT** metric is not based on the latest score, but is based on an average of your selected period. To prevent bias in the results, multiple answers from the same user are averaged before the total scores are averaged. This ensures no single answer contributes more to the final **Perception of IT** scores than any other.

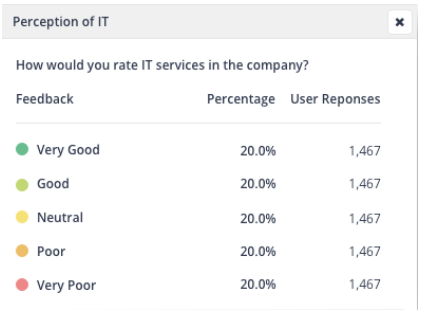
> **Note**
>
> The Tachyon Instruction **1E-Experience-SurveyResponses** provides the data populating the **Perception of IT** tile.



You can see a breakdown of the percentages by clicking on **Detailed View**.

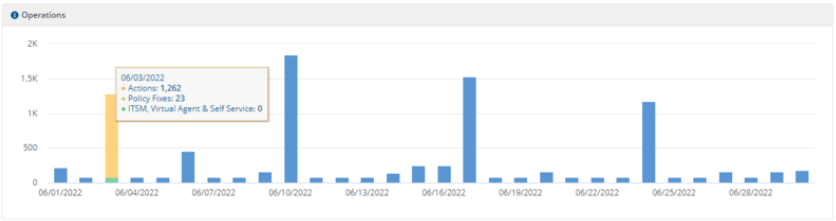
Note

The numbers show individual user responses, which can be more than one response from the same user, across multiple devices. The responses from each user are averaged.



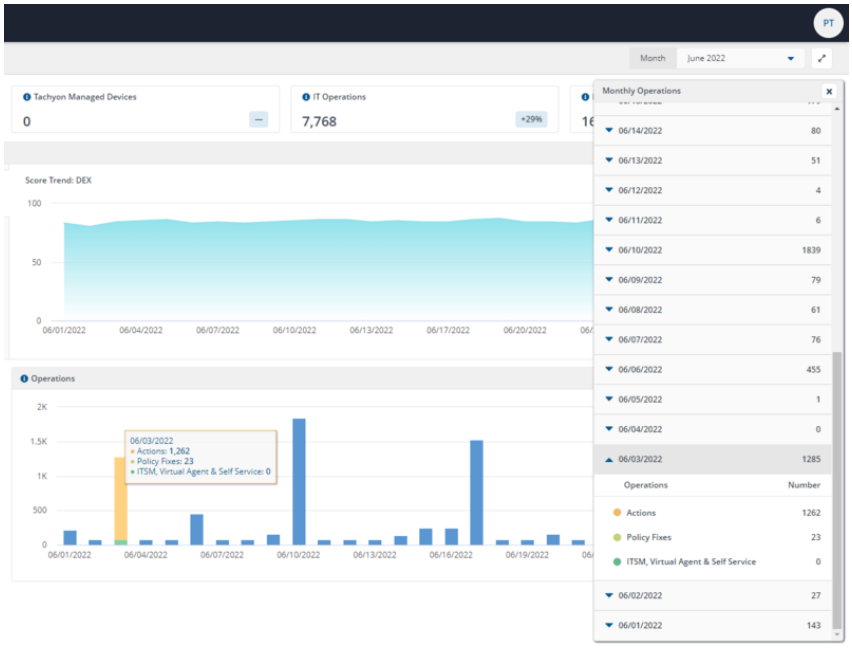
6.5.2.1.5 Operations

Number of issues resolved by manual actions, automated policy fixes, ITSM actions, Virtual Assistant actions, and other self-service requests. Hovering your mouse pointer over chart columns displays details for that time period.

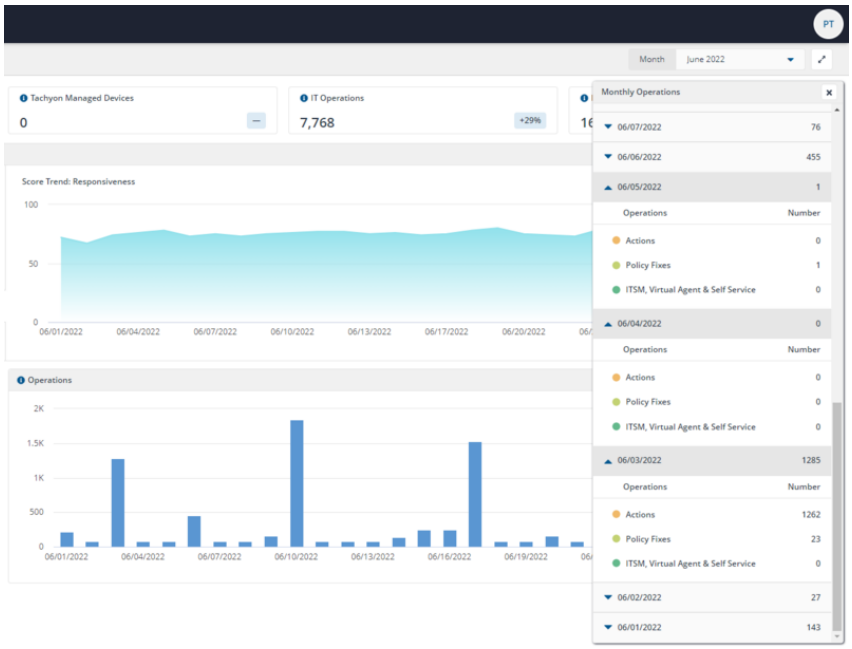


6.5.2.1.5.1 Monthly Operations drawer

Clicking on a chart column displays a drawer showing the Monthly Operations for the selected period.



You can expand the Monthly Operations chart by day to compare specific days in your chosen time period.



6.5.3 Dashboards Product Packs reference

Reference information for Tachyon feature-related Product Pack included in the **Hotfix bundle**.

Classic Product Packs contain instructions, for use in Explorer and other Tachyon applications.

Integrated Product Packs contain policies, rules and fragments for use by Guaranteed State, and may also include instructions.

6.5.3.1 1E ExecutiveDashboard product pack

Classic product pack used to create the **1E ExecutiveDashboard** instruction set, and supports retrieving data for Tachyon Dashboards.

The **1E ExecutiveDashboard** instructions are all used internally to retrieve information for the tiles on the **Exec Dashboard** page. They cannot be found or run from Explorer and do not appear in the Instructions History. If you have the right permissions, you can view the **1E ExecutiveDashboard** instruction set on the **Settings→Instructions→Instruction sets** page and see that it contains the following **Server question** instructions:

1E ExecutiveDashboard instruction payload
Get dex scores and delta for time period between <startDate> and <endDate>
Get impacted metric scores using the average scores from period <startDate> to <endDate> compared against the previous period of the same length
Get band distribution of responses to <survey> between <startDate> and <endDate>
Get band distribution of responses to <survey> and details between <startDate> and <endDate>
Get employee requests for <startDate> to <endDate>.
Get 1E managed device for <startDate> to <endDate>.
Aggregated 1E managed device count by location for <startDate> to <endDate>.
Get 1E operations for <startDate> to <endDate>.
Get 1E total IT operations for <startDate> to <endDate>.
Get 1E total operations for <startDate> to <endDate>.

Server questions are a specific type of instruction used internally to retrieve information from Tachyon platform.

6.5.4 Glossary

A glossary of Tachyon Dashboards terminology.

1E Labs | Actions | DEX | DEX Score | Employee Requests | Exec Dashboard | IT Operations | ITSM actions | ITSM, Virtual Agent & Self Service | Operations | Perception of IT | Performance | Policy Fixes | Responsiveness | Score Trend: DEX | Self Service actions | Sentiment | Stability | Tachyon Managed Devices | Total Operations | Virtual Agent actions | What's Changed in DEX

6.5.4.1 Tachyon Dashboards alphabetical glossary

Term	Definition
1E Labs	1E Labs highlights preview applications of features that are cutting edge in this version, giving you the opportunity to experience the benefits they offer and shape their development for future releases.
Actions	Part of the **Total Operations** counted by the Exec Dashboard and also plotted on its Operations chart. These relate to issues that have been resolved by running an Action. **Actions** are issues identified and resolved manually or scheduled. These are action instructions that have been run through Explorer, or any other app, but exclude actions run by ServiceNow ITSM and Virtual Assistant, and 1E Shopping. **Note** The statistics reported by Exec Dashboard include the number of action instructions that have been run. They do not include the number of questions. Although questions can be used to confirm an issue has been resolved, or used to identify an issue, it is an action that usually resolves the issue. This means the dashboard does not report on issues that were resolved outside of Tachyon, even if a Tachyon question was used to identify the issue.
DEX	DEX, or Digital Experience, provides a way of measuring the wellbeing of an organization's employees regarding their experience of the devices they use and their contact with their IT department.
DEX Score	The DEX score in Exec Dashboard is a combination of these Stability, Performance, Responsiveness, and Sentiment scores, obtained from **1E Experience**. The Score Trend chart shows data for selected score over the selected month. The above scores are a weighted combination of Experience metrics. The What's Changed popup shows the top and bottom 5 metrics that most significantly affected the selected month's DEX score.
Employee Requests	The number of issues fixed by ITSM, Virtual Agent, and Self Service. These are sum of actions instructions that have been run by ServiceNow and/or Shopping. **ITSM actions** are action instructions run by the 1E ServiceNow app **1E ITSM Connect**

Term	Definition
	Virtual Agent actions are action instructions run by chatbots, for example the 1E ServiceNow app **1E Virtual Assistant** **Self Service actions** are self-service requests made by end-users of: **1E Shopping**, where a requested item causes an action instruction to be run on the end-user's device **1E Service Catalog Connect**, where a service request is submitted that causes an action instruction to be run. The current version of Exec Dashboard does not differentiate between actions run by the three ServiceNow apps (ITSM Connect, Virtual Agent and Service Catalog Connect) because they all use the same ServiceNow consumer. For more information about ingrating these self-service products with Tachyon, please refer to:Shopping 6.1 - Enabling Tachyon integration and 1E Service Catalog Connect 2.0.
Exec Dashboard	The Exec Dashboard is an overview page in the Tachyon Portal, mainly aimed at CIO executives, showing the benefits that Tachyon is providing and highlighting how the company has been performing in terms of DEX over the past few months.
IT Operations	The number of issues fixed, either manually or by automation, and is the sum of the following: **Actions** are issues identified and resolved manually or scheduled. These are action instructions that have been run through Explorer, or any other app, but exclude actions run by ServiceNow ITSM and Virtual Assistant, and 1E Shopping. **Policy Fixes** are issues resolved automatically by **Guaranteed State** policies
ITSM actions	**ITSM actions** are action instructions run by the 1E ServiceNow app **1E ITSM Connect**
ITSM, Virtual Agent & Self Service	ITSM, Virtual Agent & Self Service is a combined number of the following: **ITSM actions** are action instructions run by the 1E ServiceNow app **1E ITSM Connect** **Virtual Agent actions** are action instructions run by chatbots, for example the 1E ServiceNow app **1E Virtual Assistant**

Term	Definition
	Self Service actions are self-service requests made by end-users of: **1E Shopping**, where a requested item causes an action instruction to be run on the end-user's device **1E Service Catalog Connect**, where a service request is submitted that causes an action instruction to be run. The current version of Exec Dashboard does not differentiate between actions run by the three ServiceNow apps (ITSM Connect, Virtual Agent and Service Catalog Connect) because they all use the same ServiceNow consumer. For more information about ingrating these self-service products with Tachyon, please refer to:Shopping 6.1 - Enabling Tachyon integration and 1E Service Catalog Connect 2.0.
Operations	The stacked bar chart shows the following detail for the selected month. **Actions** are issues identified and resolved manually or scheduled. These are action instructions that have been run through Explorer, or any other app, but exclude actions run by ServiceNow ITSM and Virtual Assistant, and 1E Shopping. **Policy Fixes** are issues resolved automatically by **Guaranteed State** policies **ITSM actions** are action instructions run by the 1E ServiceNow app **1E ITSM Connect** **Virtual Agent actions** are action instructions run by chatbots, for example the 1E ServiceNow app **1E Virtual Assistant** **Self Service actions** are self-service requests made by end-users of: **1E Shopping**, where a requested item causes an action instruction to be run on the end-user's device **1E Service Catalog Connect**, where a service request is submitted that causes an action instruction to be run. The current version of Exec Dashboard does not differentiate between actions run by the three ServiceNow apps (ITSM Connect, Virtual Agent and Service Catalog Connect) because they all use the same ServiceNow consumer. For more information about ingrating these self-service products with Tachyon, please refer to:Shopping

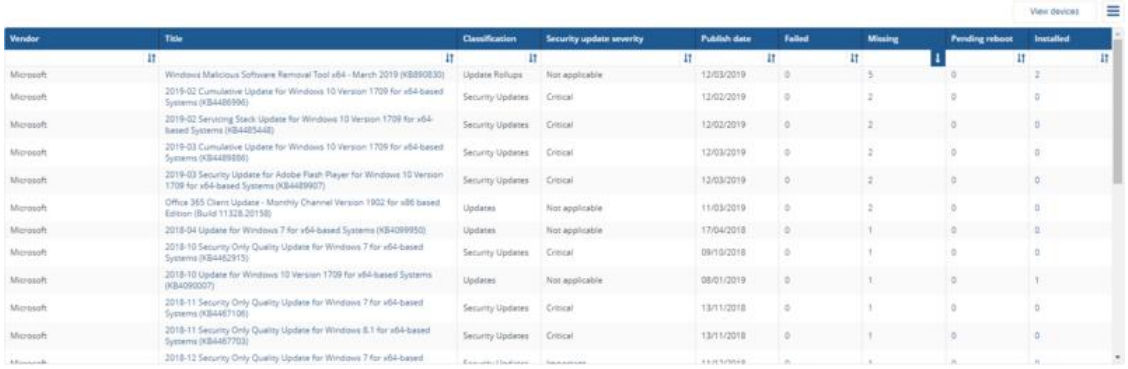
Term	Definition
	6.1 - Enabling Tachyon integration and 1E Service Catalog Connect 2.0.
Perception of IT	A sentiment survey that is optionally deployed using the sentiment feature of **1E Experience**.
Performance	Performance is a score provided by the Tachyon Experience app. Please refer to Score reference. The Performance score is derived from the scores of disk performance, CPU performance, and memory performance.
Policy Fixes	Part of the Total Operations counted by Exec Dashboard and also plotted on the Operations chart. **Policy Fixes** are issues resolved automatically by **Guaranteed State** policies
Responsiveness	Responsiveness is a score provided by the Tachyon Experience app. Please refer to Score reference. The Responsiveness score is derived from the scores of Windows internals, system startup, and Windows UI.
Score Trend: DEX	The Score Trend chart shows a trend for the selected score over the selected month, showing how the company is doing from a DEX perspective. You can hover over the chart, to see the score for a specific day of the month. Clicking on the What's Changed in DEX link displays details on the metrics that are reported on by Tachyon Experience have gone up or down in terms of their largest impact on DEX.
Self Service actions	**Self Service actions** are self-service requests made by end-users of: **1E Shopping**, where a requested item causes an action instruction to be run on the end-user's device **1E Service Catalog Connect**, where a service request is submitted that causes an action instruction to be run. The current version of Exec Dashboard does not differentiate between actions run by the three ServiceNow apps (ITSM Connect, Virtual Agent and Service Catalog Connect) because they all use the same ServiceNow consumer. For more information about integrating these self-service

Term	Definition
	products with Tachyon, please refer to: Shopping 6.1 - Enabling Tachyon integration and 1E Service Catalog Connect 2.0.
Sentiment	Sentiment is a score provided by the Tachyon Experience app. Please refer to Score reference. The User sentiment score is derived from the responses to user and metric surveys. The score for the Perception of IT survey is included in the Sentiment score.
Stability	Stability is a score provided by the Tachyon Experience app. Please refer to Score reference. The Stability score is derived from four scores based on the number of crashes and hangs for software and for the Operating System itself.
Tachyon Managed Devices	The number of devices managed by Tachyon. These are the devices where the installed 1E Client has contacted Tachyon. The number on the dashboard is cached, but the cache is updated in real-time. It increases when new clients come online, and decreases when inactive clients are purged from the Tachyon Master database.
Total Operations	The sum of IT Operations and Employee Requests for the selected month. That is, the number of issues fixed either manually, by automation, ITSM actions, Virtual Agent actions, and Self Service actions. **Actions** are issues identified and resolved manually or scheduled. These are action instructions that have been run through Explorer, or any other app, but exclude actions run by ServiceNow ITSM and Virtual Assistant, and 1E Shopping. **Policy Fixes** are issues resolved automatically by **Guaranteed State** policies **ITSM actions** are action instructions run by the 1E ServiceNow app **1E ITSM Connect** **Virtual Agent actions** are action instructions run by chatbots, for example the 1E ServiceNow app **1E Virtual Assistant** **Self Service actions** are self-service requests made by end-users of:

Term	Definition
	1E Shopping, where a requested item causes an action instruction to be run on the end-user's device **1E Service Catalog Connect**, where a service request is submitted that causes an action instruction to be run. The current version of Exec Dashboard does not differentiate between actions run by the three ServiceNow apps (ITSM Connect, Virtual Agent and Service Catalog Connect) because they all use the same ServiceNow consumer. For more information about ingrating these self-service products with Tachyon, please refer to:Shopping 6.1 - Enabling Tachyon integration and 1E Service Catalog Connect 2.0.
Virtual Agent actions	**Virtual Agent actions** are action instructions run by chatbots, for example the 1E ServiceNow app **1E Virtual Assistant**
What's Changed in DEX	The Score Trend: DEX chart includes a link **What's Changed in DEX**. The link displays details on the metrics that are reported on by Tachyon Experience, showing 5 that have gone up, and 5 that have gone down, in terms of their largest impact on DEX.

7 1E Patch Success

1E Patch Success lets you maximize success of enterprise-wide patch deployment. It provides a view of patch state of your estate, as well as supplementing your existing patch deployment methods.



7.1 Introducing Patch Success

Patch Success is a Tachyon application that lets you maximize success of enterprise-wide patch deployment. It provides a view of patch state of your estate, as well as supplementing your existing patch deployment methods.

For more information please refer to the Using Patch Success section of this documentation. Here's an overview of the features available in the Patch Success application.

7.1.1 Patch Success features

7.1.1.1 Overview page

The overview page contains three charts that show the current device patch status, the security updates by severity level and patch performance across all the devices connected to Tachyon.

The charts are interactive letting you easily drill-down into details on specific items in the display. The table can toggle between the status of devices or status of patches.

> **Note**
>
> For more information on the **Overview** page please refer to:

Patch Success Overview page.

7.1.1.2 Patches page

The **Patches** page shows a full list of patches that are applicable to devices within your estate and you can select an individual patch to view its details. From this page you can also launch the Explorer application with the coverage set to the selected devices.

> **Note**
>
> For more information on the **Patches**, **Patch installations** and **Patch details** page please refer to:

Patch pages.

7.1.1.3 Devices page

The **Devices** page shows a full list of devices within your estate and you can select an individual device to view its details.

> **Note**
>
> For more information on the **Devices**, **Device patches** and **Device details** page please refer to:

Device pages.

7.1.1.4 Monitoring

The Monitoring pages show a full list of instruction history created by Patch Success and you can select individual instruction to view its details.

> **Note**
>
> For more information on the **History**, **Instruction details** and **Responses** page please refer to:

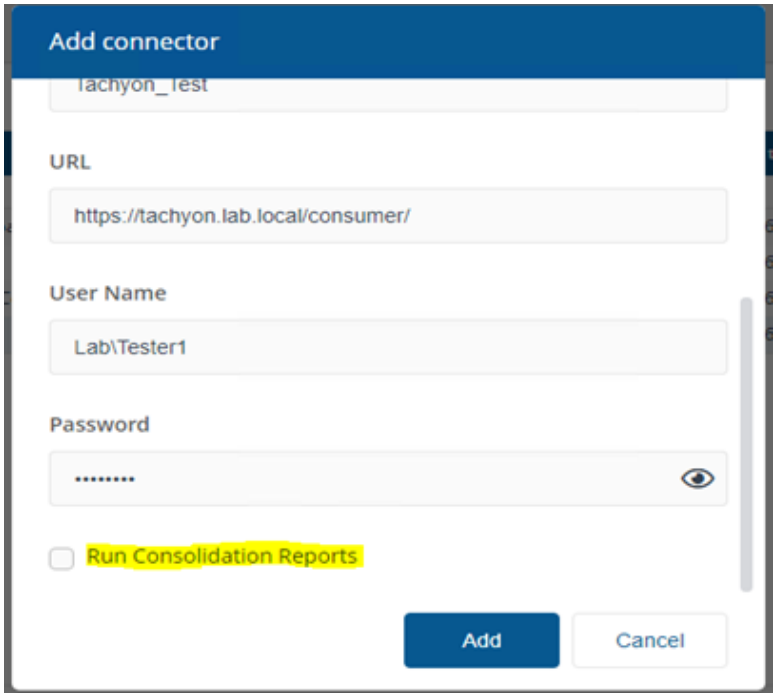
Monitoring pages.

7.2 Quick Start

7.2.1 Connector Usage Recommendations for Patch success customers

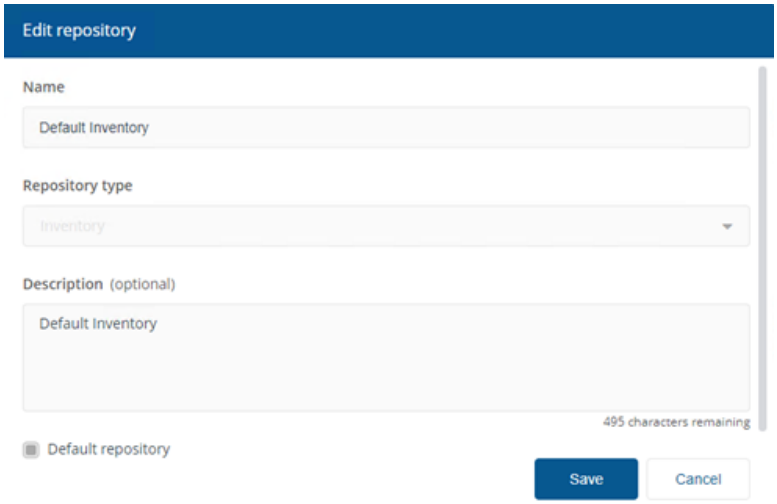
1. Create a connector :-

Create a tachyon connector and while adding connector uncheck the “Run Consolidation Reports” option so that BIC does not get triggered as a part of Sync



2. Select a repository :-

Choose default repository for performing action and If in case user wants to sync it with a different repository then create an inventory type Repository.



3. Execute sync :-

On execute action screen , select the following entities in “Data to sync” category before running the sync.

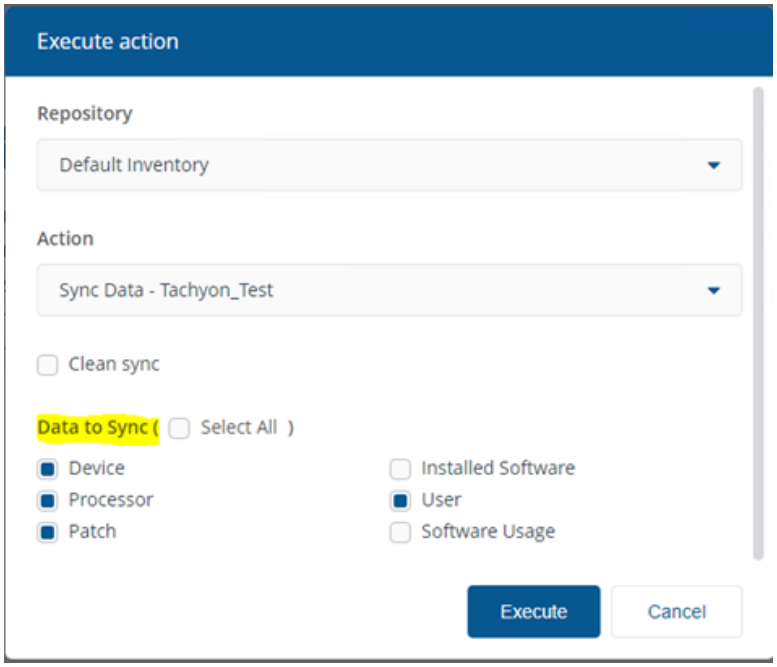
Device

Processor

User

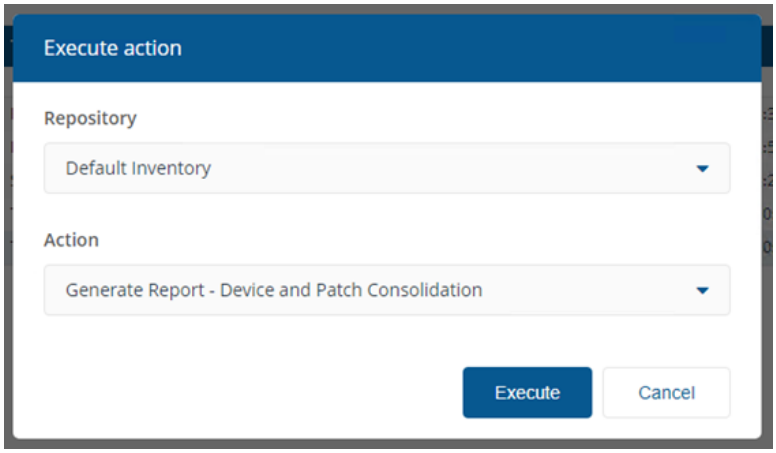
Patch

Sync category will help patch success users to only sync with selected data as they might not be interested for importing the Software Inventory Data.

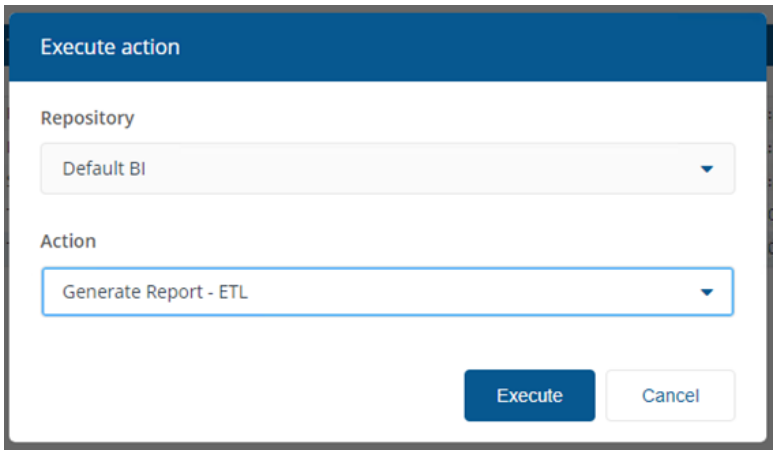


4. Execute consolidation and ETL Report :-

Run only “Device and Patch Consolidation” on execute action screen.



Now again go to execute action screen and Run ETL Report after selecting repository as Default BI.



Note :- In case user has upgraded tachyon from previous version , then run clear data for the repository so that Output record types gets cleared and then execute a fresh sync.

7.3 Implementing Patch Success

Everything you need to know about getting Patch Success installed and running in your network. This section is structured in a way that leads you through the three phases of a typical implementation project.

Design, including requirements

Install

Verify.

7.3.1 Requirements

What you will need to prepare in advance of implementing a Tachyon Server in your network. Typically these are tasks that may take some time to organize, depending on how your organization works.

7.3.1.1 Prerequisites

You will already have installed Patch Success using Tachyon Setup. To do this, you required the following:

A full installation of Tachyon Platform including deployments of clients

A SQL Server Analysis Services (SSAS) instance, preferably on the same server as the SLA databases.

Business Intelligence (BI) selected for installation using Tachyon Setup.

An appropriate Tachyon License to permit using Patch Success and Tachyon connector inventory instructions.

This is normally included in a standard Tachyon license

See Tachyon License details below.

7.3.1.2 Configuration overview

Create an instruction set called **1E Patch Success**, and upload its instructions

Create a custom role called **1E Patch Success Actioners**, assign permissions, assign to All Devices

Configure the **Tachyon connector**, its instruction set **1E Inventory** and custom role **1E Inventory Questioners**

Configure the inventory connector for Configuration Manager (SCCM) or WSUS

Create schedules for the above connectors

7.3.1.3 Configuration requirements

A **domain security group** representing Patch Administrators who will use the Tachyon Patch Success application.

The steps below describe how a Tachyon user will be created for this group, and a role which grants access to the Patch Success pages and instructions.

In our examples this role is called **1E Patch Success Actioners**.

A **domain user account** for use by the Tachyon connector to keep track of the inventory instructions.

The steps below describe how a Tachyon user will be created for this account and used in the configuration of the connector.

In our examples this user is **ACME\SLATACHYON**.

A **domain user account** for you to use, with:

SQL permissions to allow you to run SQL queries which modify the TachyonMaster database. This is required for:

Configuring the source for Patch downloads

Enabling Download only feature

Changing the maximum number of targeted devices

Tachyon roles assigned:

Connector Administrators to configure and test the Tachyon connector

Instruction Set Administrators role to upload the Tachyon Inventory Product Pack instructions and assign them to a new instruction set.

Inventory Administrators role to populate an inventory repository.

Log Viewers role to aid troubleshooting (optional).

Permissions Administrators role to create the **1E Patch Success Actioners** role.

WSUS or **Configuration Manager** (with Software Updates installed) is already implemented. One or both of these are required for:

Adding a connector for Patch meta-data

Configuring the source for Patch downloads

7.3.1.4 Tachyon License details

Ensure your Tachyon License file has the Inventory and PatchSuccess consumers enabled and includes the patterns for **1E-Inventory-*** and **1E-PatchSuccess-***

You can view your Tachyon license details using either of the following methods:

in the Tachyon Portal, navigate to **Settings→Configuration→License information**, look in the **Products** section and expand **Features** and instructions items

in the license file **Tachyon.LIC** found in **C:\ProgramData\1E\Licensing**

If either pattern does not exist, then the corresponding instructions will not run. You may have an old version of Tachyon, or your license needs to be updated.

```
   <Features>
      <Feature name="TachyonPlatform">
        <Consumer name="Inventory" enable="on"> </Consumer>
        <Instructions signersha="F08386A5318A8187D79B0A58253C65CB4E442570" patt
ern="1E-Inventory-*"> </Instructions>
        ...
      </Feature>
      ...
      ...
      <Feature name="PatchSuccess">
        <Consumer name="PatchSuccess" enable="on"> </Consumer>
        <Instructions signersha="F08386A5318A8187D79B0A58253C65CB4E442570" patt
ern="1E-PatchSuccess-*"> </Instructions>
        ...
      </Feature>
      ...
    </Features>
```

7.3.2 Configuring Patch Success

Configuring Patch Success after installation. The procedure below assumes that all users of Patch Success are permitted to see and use the buttons in the Patch Success application. Some guidance is provided for making buttons only available to specific users.

The steps for configuring Patch Success are:

Create an instruction set called **1E Patch Success**, and upload its instructions

Create a custom role called **1E Patch Success Actioners**, assign permissions, assign to All Devices

Configure the **Tachyon connector**, its instruction set **1E Inventory** and custom role **1E Inventory Questioners**

Configure the inventory connector for Configuration Manager (SCCM) or WSUS

Create schedules for the above connectors

7.3.2.1 Creating the 1E Patch Success instruction set and Actioners role

7.3.2.1.1 Creating the 1E Patch Success instruction set

The steps below create an instruction set called **1E Patch Success** and a custom role called **1E Patch Success Actioners.** Users who need to use Patch Success must be assigned to this custom role. The role allows the following:

Access to the Patch Success application and all its pages

Visibility and use of one or more of **Deploy**, **Download only**, **Explore** and **Check Status** buttons in the Patch Success pages, according to the permissions assigned to the role.

The **1E Patch Success** instruction set will contain 3 instructions from the **Patch Success Product Pack** described in the table below.

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
<action> patch(es) specified by <patchSpec> identifier(s) from <source> source to targeted device(s) Where: **<action>** is either **Deploy** or **Download only**	Action	Deploys a specific patch or patches to targeted devices. **Note** Unlike the other instructions, the **<patchSpec>** parameter in this instruction does not support **all**. You must be specific which KBs you want to deploy.	**1E-PatchSuccess-Deploy**	5

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
<patchSpec> is a list of comma separated GUIDs and/or KB numbers (without KB prefix) of patches to be installed **<source>** is the patch download source: **WSUSR** - Microsoft Update via the Internet **WSUSL** - WSUS **SCCM** - Configuration Manager **Default** - the value of **PatchSuccessSource** in the **GlobalSettings** table of the **TachyonMaster** database, as described in Configuring Patch Success: Configuring the source for Patch downloads.		This instruction is used by the **Deploy** and **Download only** buttons, which allow users to deploy selected patches to devices. The **1E Patch Success Actioners** role requires **Actioner** permissions to see the **Deploy** and the **Download only** buttons. See Patch.Deploy in the Tachyon SDK.		
Returns patch status from <source> for <patchSpec> identifier(s) Where : **<source>** is the patch download source, as above **<patchSpec>** is either **all**, or a list of comma separated GUIDs and/or	Question	Returns patch status for given KB article numbers on targeted devices. The instruction is used by the **Check Status** button, which allow users to check the patch status of the selected patches and represent the results in Explorer for further investigations. The **1E Patch Success Actioners** role requires **Questioner**	**1E-PatchSuccess-Explore**	5

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
KB numbers (without KB prefix) of patches to be reported.		permissions to see the **Check Status** button. See Patch.List in the Tachyon SDK.		
Returns patch status from <source> of given<patchSpec> identifier(s) for PatchSuccess consumption Where: **<source>** is the patch download source, as above **<patchSpec>** is either **all**, or a list of comma separated GUIDs and/or KB numbers (without KB prefix) of patches to be reported.	Question	Returns patch status for all known patches on targeted devices. Information is based on offline cache. When run, its response data is offloaded direct to the SLA-BI cube. The instruction is used by the **Update Status** button, which allows users to update the dashboard with the status of selected patches, to see for example **Pending reboot** and **Installed** states. The **1E Patch Success Actioners** role requires **Questioner** permissions to see the **Update status** button. See Patch.List in the Tachyon SDK.	**1E-PatchSuccess-Refresh**	5

Note

Patch Success also requires a further 5 instructions which are included in the **1E Inventory** instruction set created when setting up a Tachyon Connector. You can add a Tachyon Connector later when you get to Configuring connectors and schedules below. If you already have a Tachyon Connector then you need to ensure the **1E-PatchSuccess-PatchStatus** instruction has been added to the **1E Inventory** instruction set.

Click here for more details about 1E Inventory instructions...

The following is an extract from Tachyon connector.

Creating the 1E Inventory instruction set

These steps are only required if:

you have not already loaded the **1E Inventory** Product Pack using the Product Pack Deployment tool as part of the Tachyon Setup process

you will be using **Tachyon Powered Inventory**

The steps show how to create an instruction set called **1E Inventory**.

The **1E Inventory** instruction set will contain the 5 instructions listed in the following table:

Instruction (Readable Payload)	Type	Description	Data to Sync category	Instruction file name	Version
Whic	Ques	Processor details Uses Device.GetProcessors method. **Note**	Proc	**1E-I**	3

		MacOS Solaris Intel Solaris Sparc Android			
		Notes: To find additional software installed for specific users, use Software.GetUserInstallations.			

Instruction context (Readable Payload)	Type	Description	Data to Sync category	Instruction file name	Version
Method		**GetUserInstallations**			
Li		Core			

InstructionContext(ReadablePayload)	Type	Description	DataToSyncCategory	InstructionFilename	Version
	b r a r y				
	A c t i	Gets a list of the software installed for specific users, optionally filtered by product and/or publisher.			

InstructionContext (ReadablePayload)	Type	Description	DataToSyncCategory	InstructionFileName	Version
	Parameter	*Product* (string; optional): If specified, search for just this product. *Publisher* (string; optional): If specified, get just this publisher's software.			

Instruction context (Readable Payload)	Type	Description	Data to Sync category	Instruction file name	Version
	Returns	A table of: *Architecture* (string): Platform architecture of this installation (e.g. x86, x64)			

InstructionContext(ReadablePayload)	Type	Description	DataToSyncCategory	InstructionFilename	Version
	uses	*InstallDate* (string): If available, when the product was installed. *Product* (string): The product name. *Publisher* (string): The publisher of the product. *Sid* (string): The user identifier for whom this software has been installed.			

InstructionContext (ReadablePayload)	Type	Description	DataToSyncCategory	InstructionFilename	Version
		Username (string): Friendly representation of the *Sid* - this will only be resolved locally. *Version* (string): The version of the product.			
	Example	Get all user specific software: `Software.GetUserInstallations();`			

Instruction context (Readable Payload)	Type	Description	Data to Sync category	Instruction file name	Version
	Ie Platfor	Windows			

InstructionContext(ReadablePayload)	Type	Description	DataToSyncCategory	InstructionFilename	Version
	ms				
	Notes	*Sid* resolution may fail as this method will not go over the wire. In this case Username will be NULL.			
		The file modified and accessed time attributes of the NTUSER.dat directory entries under the %USERPROFILE%			

InstructionContext(ReadablePayload)	Type	Description	DataToSyncCategory	InstructionFilename	Version
		folder for each user and service principal might be updated to some time during the execution of this method. This is a side effect of loading and unloading the user hive and is housekeeping performed by Windows, not the 1E Client. This can cause "unused" profiles to appear to be used if the modified times are			

Instruction context (Readable Payload)	Type	Description	Data to Sync category	Instruction filename	Version
		employed to determine whether a user has logged in, which is not a reliable method of establishing this fact. This method reads user uninstall registry keys from HKU, but will not load hives. Installs for this function are retrieved from *HKU:\<SID>\Software\Micro*			

Instruction context (Readable Payload)	Type	Description	Data to Sync category	Instruction file name	Version
		soft\Windows\CurrentVersion\Uninstall			
Inventory	Question	User data inventory for SLA Uses the **$UserUsage_Daily** inventory table, if **Module.Inventory.UserUsage.Enabled** setting is true (default) in the 1E Client configuration file. Top Console User is also calculated from this table. Please refer to Capture source settings.	User	**1E-Invent**	3

InstructionContext(ReadablePayload)	Type	Description	DataToSyncCategory	InstructionFilename	Version
-summaryofw		**Note** Click here to expand details of data collected... Windows only. The following table shows fields available in the **$UserUsage_Daily** table.		**ory-UserUsa**

Tip

You can use the Product Pack Deployment tool to simultaneously Upload the instructions and Create the Instruction set, or use the manual steps below.

These instructions are included in the **1E Inventory** product pack, available in the **TachyonPlatform.v5.x.x.x.zip** file downloaded from the 1E Support Portal.

First upload the Patch Success instructions:

Download the **TachyonPlatform.v5.x.x.x.zip** file from the 1E Support Portal

Extract the **1E-PatchSuccess.zip** from the Classic folder

Logon to the Tachyon Portal using a Tachyon user account with the **Permissions Administrators** and **Instructions Administrators** roles

Open the **Settings** application

Navigate to the **Settings**→**Instructions**→**Instruction sets** page

Click on the **Upload** button

In the Open dialog navigate to the location of the **1E-PatchSuccess.zip** file

Select **1E-PatchSuccess.zip** and click **Open**.

All the instructions contained in the zip file will initially be added to the default **Unassigned** instruction set. Instructions in the **Unassigned** instruction set cannot be used, so you will need to add the instructions to a new instruction set:

Select the **3** instructions you want to add to the new set, by clicking the checkbox at the start of each instruction row in the list

Click the **Add new set** button in the button panel to the right of the page

In the **Add new instruction set** popup subsequently displayed, type **1E Patch Success** as the name

Optionally select a **custom icon** file

Ensure that the **Include 3 selected instructions** checkbox is checked

Click the **Add** button to add the new instruction set, with the selected instructions.

7.3.2.1.2 Creating the 1E Patch Success Actioners role

You must create the **1E Patch Success Actioners** role so that its member users can use all features of Patch Success, including buttons which cause instructions to run in Explorer. Instructions are configured in Creating the 1E Patch Success instruction set above.

> **Tip**
>
> Some **1E Patch Success** instructions are actions which require approval. Users cannot approve their own actions, but members of this role can approve each others actions. If you prefer other users or security groups to have **Approver** permissions, they would need an additional custom role, for example called **1E Patch Success Approvers**. Or you may use an existing approvers role and assign the **1E Patch Success** instruction set to it. Ensure the selected role has the **All Devices** management group assigned to it.
>
> The built-in (system) role **Patch Success Viewers** can be used for users who only need to view the Patch Success screens and dashboard with no access to any buttons.

To create a new user:

Navigate to the **Settings→Permissions→Users** page.

Click the **Add** button to start the add user process.

In the **Add user** popup subsequently displayed in the **Select user** field, type the name of the AD security group representing Patch Administrators who will use the Tachyon Patch Success application.

Select a name from the search list, and click the **Add** button.

The new user will be added to the **Users** table.

> **Tip**
>
> You may have already created a Tachyon user for this custom role. You can change or add other users later.

To create the custom role:

Navigate to the **Settings→Permissions→Roles** page.

Click the **Add** button to start the add role process.

In the **Add role** popup subsequently displayed set the name as **1E Patch Success Actioners**

Optionally enter a description

Click the **Add** button.

The new role will be added to the **Roles** table. Locate its entry and click on the link in the **Name** column for that row.

Select the **Members** tab and click the **Add** button.

In the **Add role member** popup subsequently displayed, search for the Tachyon user that you added in the earlier steps.

Click the **Add** button.

Select the **Permissions** tab and click the **Add** button.

In the **Add permission** popup subsequently displayed, scroll down the Type list and select **Repository:patch**

Select the **Read** checkbox.

Click the **Add** button.

In the **Add permission** popup subsequently displayed, scroll down the Type list and select **Instruction set**.

Scroll down the Name list and select the **1E Patch Success** instruction set.

Select checkboxes for each of the following from the list of permissions, and then click the **Add** button:

Questioner permission - allows users to see and use the **Explore** and **Check Status** buttons

Actioner permission - allows users to see and use the **Deploy** button

Approver permission - allows users to approve each other's use of the **Deploy** button instruction (see the note at the start of this section about alternative Approver roles).

Select the **Management groups** tab and click the **Add** button.

In the **Add management group** popup subsequently displayed, scroll down the list and select **All Devices**.

Click the **Add** button.

> **Warning**
>
> Only select **All Devices**. This is the same as the **All Devices** management group as seen in Patch Success Title and filter bars.

To verify:

Logon to the Tachyon Portal using a Tachyon user account with the new **1E Patch Success Actioners** role.

Navigate to the **Patch Success - Overview** page.

7.3.2.2 Configuring connectors and schedules

You must create the following connectors and schedules:

Tachyon connector and its **Sync Data** schedule - to import inventory and patch data into an inventory repository - this is normally the **Default inventory** repository

Configuration Manager or **WSUS** connector and its **Sync Data** schedule - to import meta-data for patches into the inventory repository

Generate Report - ETL schedule - for reprocessing of cube data in a **BI** repository - this is normally the **Default BI** repository

Patch data from all inventory repositories is reprocessed by an ETL (extract, transform, load) and stored in the BI cube to support dynamically updating interactive dashboards. The Patch Success application allows its users to view one inventory repository at any time.

7.3.2.2.1 Adding the Tachyon connector

You must add the Tachyon Connector in order to support **Tachyon Powered Inventory** which uses the **1E Inventory** instructions.

Please refer to Tachyon connector for detailed configuration steps. In summary these steps do the following:

Creates a user. In our example this is **ACME\SLATACHYON**

Configures the Tachyon connector. A by-product of this step means Management Group synchronization is enabled to support the use of Management groups

Creates the **1E Inventory** instruction set and **1E Inventory Questioners** role.

> **Note**
>
> The **1E Inventory** instruction set contains 4 instructions for inventory and 1 instruction for **Patch Success**. All of these instructions are necessary for Patch Success, but the

inventory instructions are also used for other purposes. If you have already created the Tachyon Connector using only the inventory instructions, then you will need to add the instruction for **Patch Success** to the same instruction set. For more details about these instructions please refer to Tachyon connector: Creating the 1E Inventory Instruction Set.

7.3.2.2.2 Adding a connector for Patch meta-data

Patch Success needs to get meta-data for patches. Ensure you add a connector for whichever one of the following sources that you use to approve patches:

Configuration Manager (SCCM) if it is configured to manage WSUS

Windows Server Update Services (WSUS)

If you are using Configuration Manager then you must add a System Center Configuration Manager connector.

If you are using WSUS then you must add a Windows Server Update Services connector.

7.3.2.2.3 Creating schedules for Patch processing

The following Patch Success schedule process is designed to reduce the data that is retrieved when performing Tachyon, Configuration Manager and WSUS connector syncs and to provide a separate Device and Patch consolidation that can be run without running the Basic Inventory Consolidation. This saves time and processing when using Patch Success on its own. We suggest configuring the following daily schedules, set to run on the same inventory repository in the order presented - leave enough time between the steps to allow the previous step to complete. You can test how long that takes by running the steps manually.

	Action	Frequency	Notes
1	**Sync Data - Configuration Manager** or **Sync Data - WSUS**	**Daily**	Pick a suitable time when there is the least amount of activity. If using the Configuration Manager sync be aware it may take a long time to run because as well as patch meta-data, it is also importing a lot of inventory, and usage data for processes and users. To work around this, when using the Configuration Manager connector only with Patch Success, you can configure the sync to

	Action	Frequency	Notes
			fetch just the **Device** and **Patch** data.
2	**Sync Data - Tachyon**	**Daily**	When configuring the Tachyon connector sync for use with Patch Success only, configure the sync to fetch just the **Device**, **Patch** and **User** data. You can schedule the **Sync Data** action to run at any time of day. Pick a suitable time when there is the least amount of processing activity. You must select the frequency that prevents the Sync Data actions for the Tachyon connector overlapping. In Tachyon Platform 5.2 and 8.x the duration that the Inventory instructions run for is a default of 24 hours, therefore select **Daily** or **Weekly**. In Tachyon Platform 5.1 the duration that the Inventory instructions run for is a default of 15 minutes, therefore select **Daily** or **Weekly**, or at least 20 minutes apart.
3	**Generate Report - Device and Patch consolidation**	**Daily**	This action can be run when using Patch Success on its own. If you are using AppClarity as well these reports are also included

	Action	Frequency	Notes
			as part of the Basic Inventory Consolidation.
4	**Generate Report - ETL**	**Daily**	This report reprocesses the cube data.

Steps for adding a schedule can be found on the Settings→Configuration→Schedules page.

For the **Sync Data** actions, the actual name of the action depends on the connector name. Also ensure you select the correct inventory repository, the default is **Default Inventory**.

7.3.2.3 Configuring the source for Patch downloads

Patch Success needs to be configured with the download source from which client devices will download and install patches. By default the download source is configured as **SCCM** (Configuration Manager) but you will need to change this to **WSUSL** (local WSUS) if you are using WSUS instead of Configuration Manager.

To change the download source, you must manually update the value of **PatchSuccessSource** in the **GlobalSettings** table of the **TachyonMaster** database:

If your client devices are using **Configuration Manager** to download and install patches then leave **PatchSuccessSource** as **SCCM** - this is the default

If your client devices are using **WSUS** to download and install your patches then change **PatchSuccessSource** as **WSUSL** using the following SQL script:

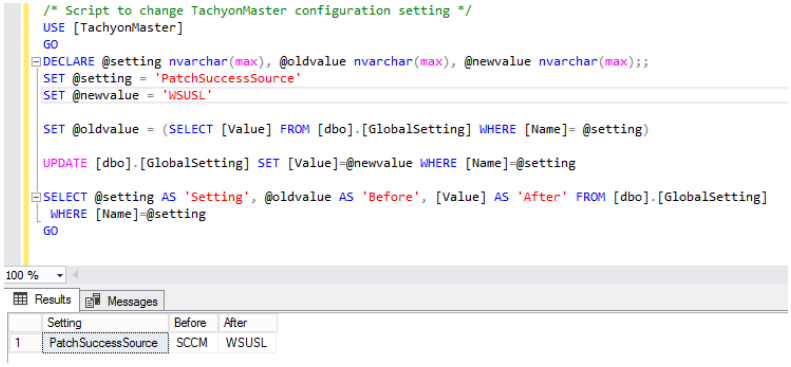
SQL script to configure PatchSuccessSource setting

```
/* Script to change TachyonMaster configuration setting */
USE [TachyonMaster]
GO
DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
);;
SET @setting = 'PatchSuccessSource'
SET @newvalue = 'WSUSL'

SET @oldvalue = (SELECT [Value] FROM [dbo].[GlobalSetting] WHERE [Name]= @setti
ng)

UPDATE [dbo].[GlobalSetting] SET [Value]=@newvalue WHERE [Name]=@setting

SELECT @setting AS 'Setting', @oldvalue AS 'Before', [Value] AS 'After' FROM [d
bo].[GlobalSetting]
 WHERE [Name]=@setting
GO
```



Note

Configuration of the **PatchSuccessSource** global setting (**SCCM** or **WSUSL**) is important to ensure that client devices use the correct source when instructed to download patches by the Tachyon Patch Success application. Patch Success administrators can expedite the patching process by using either **Download only** or **Deploy** (download and install) buttons. These buttons cause Tachyon to send the **1E-PatchSuccess-Deploy** instruction to multiple clients with details of which patches to download only or to also install. In addition, if the PatchSuccessSource global setting is configured as WSUSL then the buttons provide the option to download from Microsoft Update via the Internet instead of from WSUS. The buttons do this by overriding the gobal Setting **WSUSL** with **WSUSR** (in the database Patch Success refers to Microsoft Update as WSUS remote). If you want to know more about the methods used by the **1E-PatchSuccess-Deploy** instruction please refer to the Tachyon SDK - Patch.Deploy method documentation.

Note

If you set either WSUSR or SCCM (and intend allowing Windows Update to download the patches if they're not available on the Distribution Point) then the Windows Updates service must be allowed to download content from the internet and deploy the updates.

7.3.2.4 Additional configuration options

Following additional configuration options are available and can be changed if required.

7.3.2.4.1 Enabling Download only feature

Download only is a button to download only without deploying the patch. This is only available for **WSUSL** and **WSUSR** patch source.

To enable **Download only** feature for the patch source **WSUSL** and **WSUSR**, run the following SQL script.

SQL script to configure DownloadOnlyButtonVisibility setting

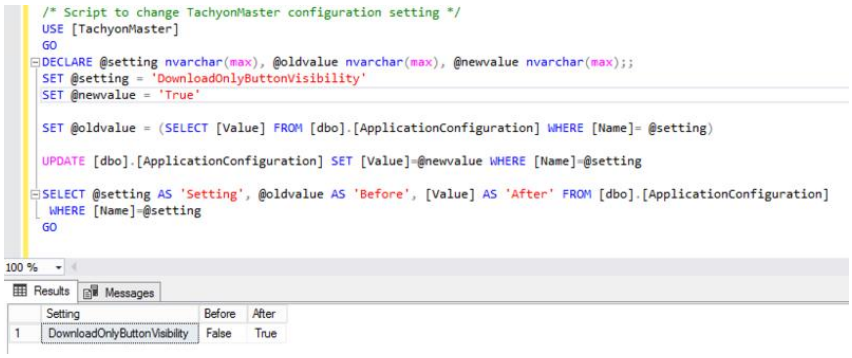
```
/* Script to change TachyonMaster configuration setting */
USE [TachyonMaster]
GO
DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
);;
SET @setting = 'DownloadOnlyButtonVisibility'
```

```
SET @newvalue = 'True'

SET @oldvalue = (SELECT [Value] FROM [dbo].[ApplicationConfiguration] WHERE [Na
me]= @setting)

UPDATE [dbo].[ApplicationConfiguration] SET [Value]=@newvalue WHERE [Name]=@set
ting

SELECT @setting AS 'Setting', @oldvalue AS 'Before', [Value] AS 'After' FROM [d
bo].[ApplicationConfiguration]
 WHERE [Name]=@setting
GO
```



7.3.2.4.2 Changing the maximum number of targeted devices

For the patch source **WSUSL** and **WSUSR** the UI will limit the number of devices that can be targeted for Downloads and Deployments to the maximum number. This limit is put in place to warn of the possible impact of deploying and downloading patches at scale, to the network infrastructure.

To change the maximum number of targeted devices run the following SQL script.

SQL script to configure MaxTargetedDevices setting

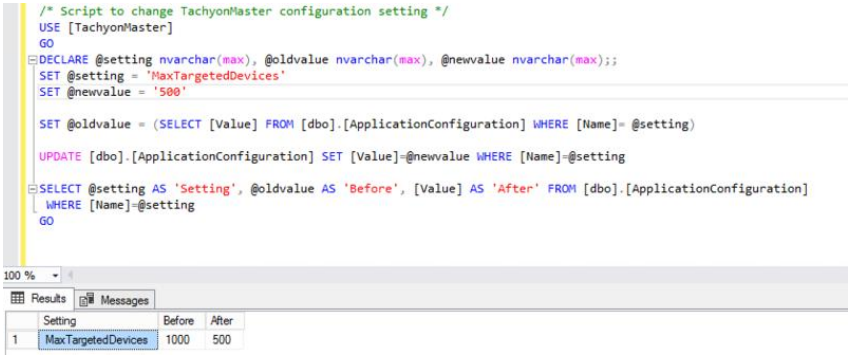
```
/* Script to change TachyonMaster configuration setting */
USE [TachyonMaster]
GO
DECLARE @setting nvarchar(max), @oldvalue nvarchar(max), @newvalue nvarchar(max
);;
SET @setting = 'MaxTargetedDevices'
SET @newvalue = '500'

SET @oldvalue = (SELECT [Value] FROM [dbo].[ApplicationConfiguration] WHERE [Na
me]= @setting)

UPDATE [dbo].[ApplicationConfiguration] SET [Value]=@newvalue WHERE [Name]=@set
ting

SELECT @setting AS 'Setting', @oldvalue AS 'Before', [Value] AS 'After' FROM [d
bo].[ApplicationConfiguration]
```

```
 WHERE [Name]=@setting
GO
```



7.3.2.5 Tachyon Platform zip

The Tachyon Platform zip file can be downloaded from the 1E Support Portal https://support.1e.com/.

Refer to Tachyon platform zip file for details.

7.3.3 Verifying

7.3.3.1 Verify Patch Success installation

To run the following tests you need:

Tachyon Server installed.

The name and password for the **server installation account**, the account must also be enabled.

Ref	Test	Expected	Remediation
TCNI01	Logon to the Tachyon Server using the **server installation account** Confirm 1E Tachyon Server is listed in Apps/Programs and Features	Programs and Features (appwiz.cpl) displays **1E Tachyon Server** with correct version number. If an MSP update has been installed, the Installed Updates displays **1E Tachyon Server Update (Qnnnnn)**. The following Windows services exist and are running. **1E Catalog Update Service** (Automatic) (Service account) **1E SLA Platform Engine** (Automatic Delayed start) (Network Service) **1E SLA Platform Integrate Agent** (Automatic Delayed start) (Network Service)	If any of the services are not running, then check the corresponding log(s). The **Switch Host** service will stop after several seconds if it is unable to

Ref	Test	Expected	Remediation
	Confirm Tachyon's Windows services are running.	**1E SLA Platform Integrate Manager** (Automatic Delayed start) (Network Service) **1E Tachyon Coordinator** (Automatic Delayed start) (Network Service) **1E Tachyon Switch Host**(Automatic Delayed start) (Local System) If you did not install Nomad, you may also have **1E ActiveEfficiency** (Automatic) (Network Service) remaining after an upgrade.	start any Switches. The **ConsumerAPI** log is not created until a user (the **server installation account**) successfully connects to the Tachyon Portal. The **Background API** log is not created until a 1E Client attempts to download content. The **1E-TachyonPlatform** product pack can be used to trigger this.
TCNI02	Check the Tachyon Server logs.	Click here to expand... The default location for all Tachyon logs is the folder *%ALLUSERSPROFILE%\1E* Subsystem / Component / 1E\Tachyon\ / *Tachyon.Portal.log* **Tachyon Master** / Tachyon Portal	

Ref	Test	Expected				Remediation
			UI and applications (Tachyon)			
		Consumer API	1E\Tachyon\	*Tachyon.ConsumerAPI.log*		
		Coordinator service	1E\Tachyon\	*Tachyon.Coordinator.log* *Tachyon.Instrumentation.log*		
		Experience web application	1E\Tachyon\	*Tachyon.Experience.log*		
		Catalog	Catalog UI (CatalogWeb - Admin sync)	1E\Catalog\	*Catalog.Integration.UI.log*	
		Catalog API				
		Catalog Update Service	1E\Catalog\	*Catalog.UpdateService.log*		
		Content Distribution	Content Distributio	1E\ContentDistribution	*ContentDistribution.log*	

Ref	Test	Expected				Remediation
			n web application			
		SLA	SLA/Platform APIs (Admin, Core External)	1E\Tachyon\	*Tachyon.AdminAPI.log*	
		SLA Platform UI (Platform)	1E\SLA Platform\	*Web.log*		
		SLA Engine	1E\SLA Platform\	*Engine.log*		
		SLA Integrate Services (Connector Manager)	1E\SLA Platform\	*1E.SLAPlatformIntegrateAgent.log* *1E.SLAPlatformIntegrateManager.log* *1E.SLAConnector.<type>_sync.log*		
		SLA Inventory	n/a	*n/a*		
		SLA Operations Provider (not	1E\Platform	*n/a*		

Ref	Test	Expected				Remediation
		currently used)	Consumer\			
		SLA databases (Data, Integrate, Shared)	n/a	*n/a*		
		BI	MDX API	SQL database	*[SLA-BI].[BI].[Event Log]*	
		Tachyon Response	Core	1E\Tachyon\	*Tachyon.CoreAPI.log*	
		Background Channel (Background)	1E\Tachyon\	*Tachyon.BackgroundAPI.log*		
		Switch(es) (also includes a single Switch Host service)	1E\Tachyon\	*Tachyon.Switch.4000.SW1.log* *Tachyon.Switch.Host.log*		

Please refer to Services and NTFS Security if changing the location of log files.

In this version of Tachyon Server, some installers do not support the LOGPATH property and the logs folder is not configurable during installation.

Each component has a configuration file in the Tachyon Server installation folder structure, which contains log configuration details. Defaults are:

Ref	Test	Expected	Remediation
		Filepath *%ALLUSERSPROFILE%\1E\<product>* where product is Tachyon, SLA Platform, and Catalog Filename as shown in the table above. Maximum size 10MB (2MB for Switch logs). 2 rollover files numbered 1 to 2 with the rollover number included as n.log (5 rollover files for Switch logs). Date and timestamps are UTC to help troubleshooters synchronize logs on systems in different timezones. Switch logs have the following names: The first Switch installed will typically have a log filename **Tachyon.Switch.4000.SW1.log** (where 4000 is the port it is listening on and SW1 is the **config name** in the SwitchConfiguration table in the TachyonMaster database). Other Switches on the same server will have different config names appended. The log filename will be unique on a server, but there may be the same named log on a different server. A Switch will continue to use the same log, unless the SwitchConfiguration table is modified so that a different ID is used. If you see a Tachyon.Switch.log without a config name appended, this is a special case where a Switch cannot find its correct configuration, and has fallen back to using the template * row which has ID=1. In which case you will need to troubleshoot how that happened. Rollover logs have numbers appended, for example Tachyon.Switch_A.1.log, up to a default maximum of 5. Tachyon server components use the **log4net RollingFileAppender** class. Details can be found in http://logging.apache.org/log4net.	

Ref	Test	Expected	Remediation
PSC01	Check the configuration of the Tachyon connector		

7.4 Using Patch Success

How to use the Patch Success application to report on and ensure successful patching of your enterprise.

Note

Patch Success can be reached directly using the following URL:

`https://<tachyon DNS Name FQDN>/Tachyon/App/#/patchsuccess/`

where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading DNS Names

7.4.1 Title and filter bars

Information about the title and filter bars that appear at the top of all Patch Success pages.

7.4.1.1 Patch Success title bar

The title bar shows information about the total number of devices and the patch status. The totals on the title bar are not affected by filters. The following table describes the function of each heading in the title bar.

Heading	Description
Inventory repository	A selected inventory repository. Changing the selection in this drop down will update the data on the Patch Success dashboards. Only one inventory repository can be selected at any one time.
Devices	The total number of devices in the selected inventory repository. If two numbers are shown, the first number is the total number of

Heading	Description	
	devices that reported patch data. A single number is shown if all devices reported patch data. The image above shows 8 devices have reported patch data.	
Fully patched	The number of fully patched devices.	**Note** The numbers shown are for the selected inventory repository. A device is counted only once under under each of these headings. The sum of these four numbers equals the total number of devices in the selected inventory repository. The totals shown on the title bar are only affected by the Repository filter, no other filter will affect these numbers. See below for more information about how 'Device Patch Status' is determined.
Require rebooting	The number of devices that require rebooting to complete installations.	
Require patching	The number of devices with missing patches.	
Require attention	The number of devices with failed patches.	
Management group	A management group filter. Changing the selection in this drop down will change the filter to the selected management group and update the data on the Patch Success dashboards.	

Heading	Description
	To filter multiple management groups you must use the Filter popup, and the title bar will show the first one in the filter list.
Last processed	This shows the last time the ETL and cube was last processed.
Avatar	The initials of the logged on user.

7.4.1.2 Page title bar

Each Patch Success page has refresh and expand buttons.

The refresh button is used to refresh the contents of the page.

The expand button toggles the size of the page inside the browser by hiding or showing the menu and main title bar.

7.4.1.3 Filter bar

The filter bar shows all currently selected filters. The **Filter** button open the **Filter** popup to allow filters to be managed, and **Clear Filters** removes all the currently selected filters.

You can add filters by using the Filters button, or cicking on headings in the Overview

7.4.1.3.1 Using the Filter popup to add and remove filters

Click the **Filter** button to display the **Filter** popup

Select a Filter type from the first column

Select or enter all the required filter options for the selected filter and click **Add**

Add multiple filters if required

Click **Apply** to close the **Filter** popup and apply the selected filters

You can add multiple filters of the same type if needed, the exception being range filters where only one filter per type can be added. The range filters are time to install and publish date. All filters of the same type are combined with **OR**, filters of different types are combined with **AND**. The **Filter** popup is divided into 3 columns as shown in the picture opposite and the table below:

Filter type	Filter options	Filter summary
Displays a list of Filter types. Select a Filter type by scrolling through the list and selecting one.	Displays options for the currently selected filter type. Click **Add** to add the filter with its selected options. Click **Clear** to reset the currently selected options. This will not affect filters that have already been added to the filter summary column.	Displays all the currently selected filters. Click the icon to remove a filter from the summary. Click **Apply** to apply the new filters and close the **Filter** dialog. Click **Cancel** to ignore any changes and close the **Filter** dialog.

7.4.1.3.2 Interacting with Overview page charts to add and remove filters

You can click on chart slices and labels to add filters. Clicking on a slice or label once adds its filter, and clicking on it again removes its filter. Clicking with the CTRL key down allows you to add and remove multiple filters. For range charts clicking with the SHIFT key down allows you to select a range of filters.

7.4.1.3.3 To remove a filter

click on the

icon to remove an invidual filter from the **Filter summary** or from the filter bar

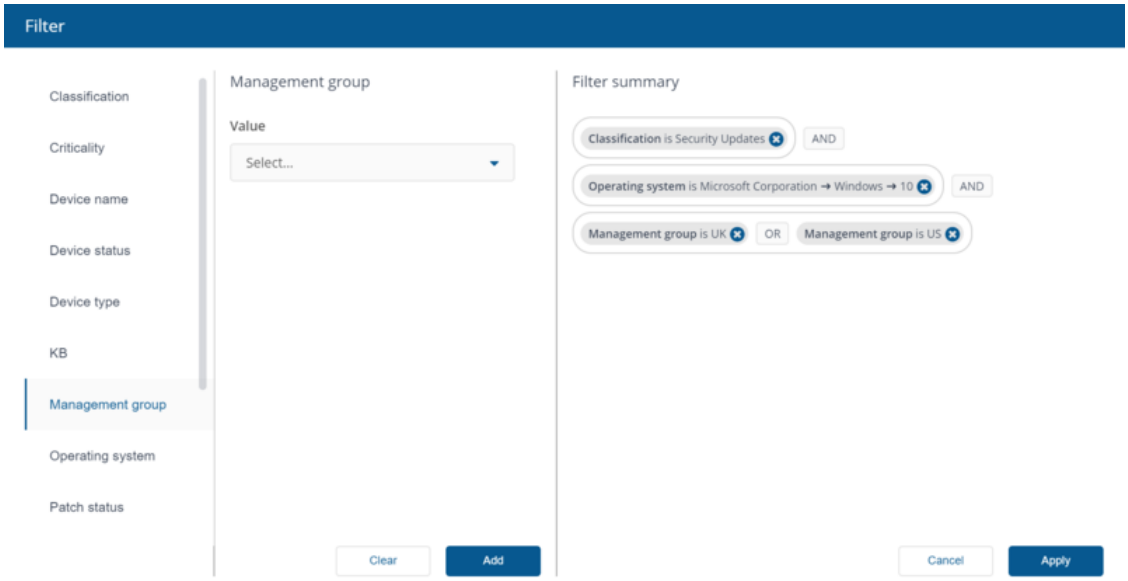
click on **Clear filters** to remove all filters from the filter bar

click on a

icon to remove an invidual filter from teh filter bar

open the Filter popup and use the the **Filter summary** or from the filter bar

The pictures below show an example of filters that have been added to show **Security Updates** on **Windows 10** devices in the **UK or US management groups**.



7.4.1.3.4 Filter types

The following table lists filter types and their avilable values. You can add multiple filters of the same type if needed, the exception being range filters where only one filter per type can be added. The range filters are time to install and publish date. All filters of the same type are combined with **OR**, filters of different types are combined with **AND**.

Type	Available values
Classification	Select a patch classification from the list of available values. The available values depend on which products and classifications have been specified in WSUS, as shown in the picture opposite. Critical Updates Definition Updates Drivers Feature Packs Security Updates Service Packs Tools Update Rollups Updates

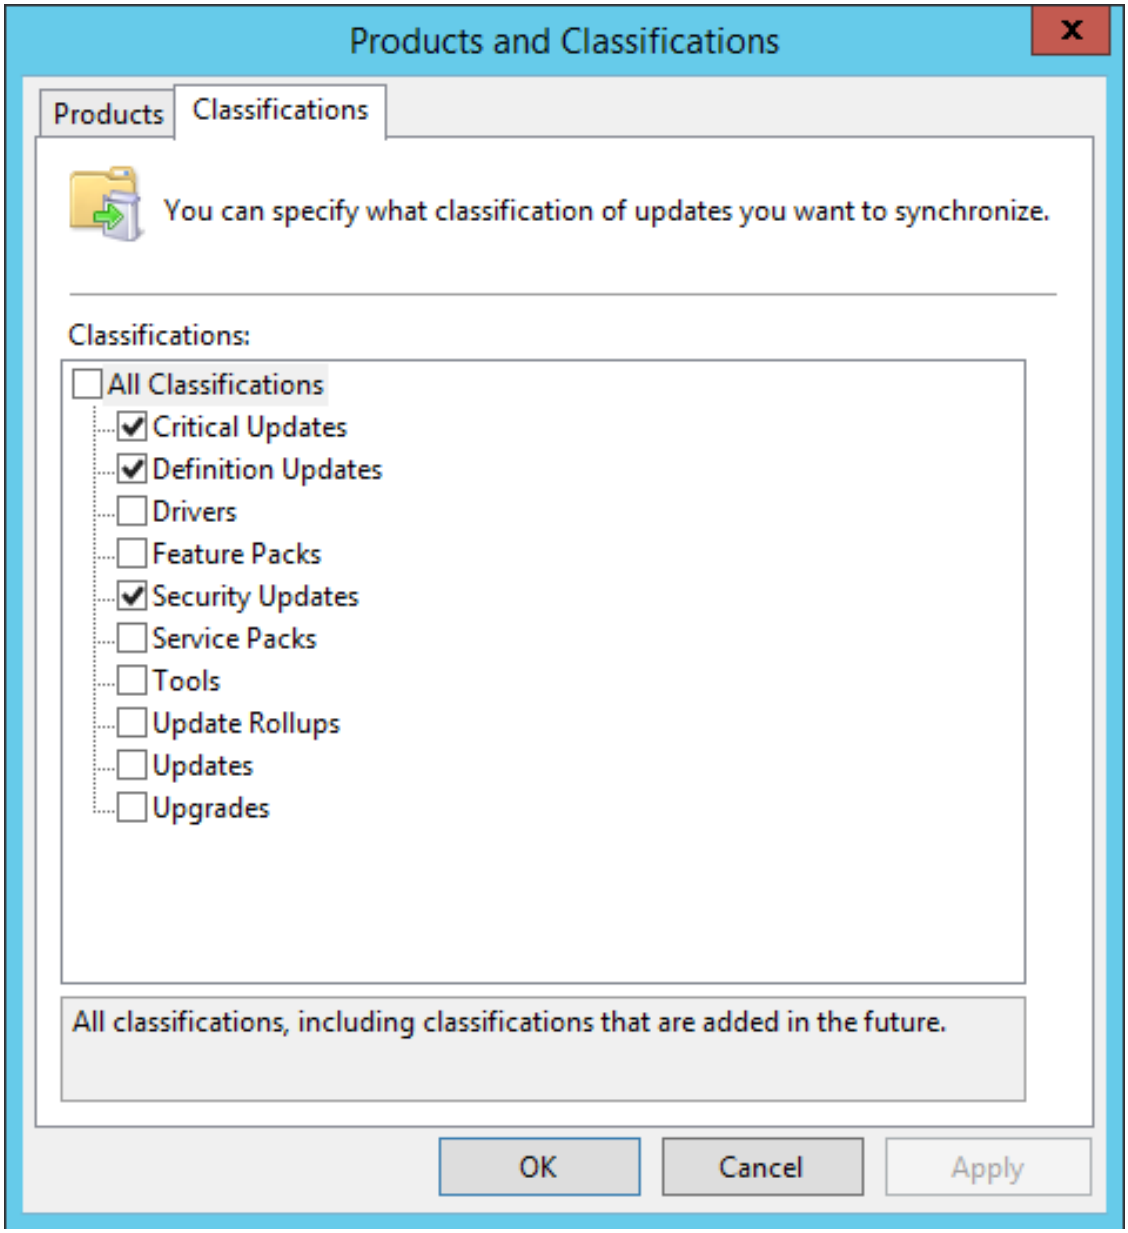
Type	Available values
	Upgrades And also: Unidentified - none of the above
Criticality	Select a device criticality from the list of available values. The available values shown opposite are default values provided by Tachyon and configurable in a lookup list in the **GlobalSettings** table in **TachyonMaster** database. 5: Critical 4: High 3: Medium 2: Low 1: Non-critical 0: Unidentified (not set) Device criticality is set on devices by the using the Device.SetCriticality method, as used for example by the instruction **1E-Explorer-TachyonAgent-SetCriticality**. The instruction sets the criticality number on the Tachyon client, which is returned as part of the Device details. If not set then the client returns 0. The system translates this number into a criticality value using a lookup table (in the TachyonMaster database). The criticality value is used in various dashboard tiles and tables, as well as Device details, and can be filtered using these values.
Device name	Select a specific device by name. Search by typing at least three characters and select a device from the search results. The filter itself cannot contain a wildcard, you must select a device and use its full name.
Device status	Select a device status from the list of available values: Fully patched - all patches are *succesfully installed* No patches - no patches are reported Requires attention - some patches *failed* to install or have an *error* Requires patching some patches are *missing* Requires rebooting - some patches are *pending a reboot*

Type	Available values
Device type	Select a device type category and sub-category: Physical Desktop Laptop Server Tablet Workstation Unidentified Virtual Virtualisation technology, for example: ESX, POWER, Solaris Zone, Solaris Container, Hyper-V, Oracle VM, RedHat VM Virtual Machine - if the virtualisation technology is unidentified, which typically occurs if the virtual host cannot be identified or is not included in the inventory repository
KB	Select a specific KB number. Search by typing at least three digits and select a KB from the search results. The search is based on KB meta-data available in your inventory repository as reported by Configuration Manager or WSUS. The list includes all KBs not just the ones that are actually installed, and may therefore return zero devices.
Management group	Select a management group from the available list. If the list is not up-to-date after creating a new management group then you may need to reprocess the cube data.
Operating system	Select an operating system by selecting **Vendor**, **Title** and **Colloquial version** from the available lists. The values available will depend on data in your selected inventory repository.
Patch status	Select a patch status from the available list: Failed Installed

Type	Available values
	Missing Pending reboot
Publish date	Select **from** and/or **to** dates for when patches were published. Dates are inclusive. **Note** Only one range filter is allowed when filtering.
Severity	Select a patch severity from the available list: Critical Important Low Moderate Unidentified
Time take to install	Specify **from** and/or **to** for the number of days a patch was installed after it was published. Days are inclusive. **Note** Only one range filter is allowed when filtering.
User	Select a specific user by name or enter **Unidentified**. Search by typing at least three characters and select a user from the search results. The filter itself cannot contain a wildcard, you must select a user and use their full name.

7.4.1.3.5 WSUS Products and Classifications

Please refer to https://docs.microsoft.com/en-us/sccm/sum/get-started/configure-classifications-and-products for a description of each classification.



7.4.2 Patch Success Overview page

The overview page shows a dashboard with three charts and a pivot table, that are dynamically recalculated based on applied filters.

Without filters the dashboard shows the status of all devices in the selected inventory repository and all patches affecting them. When filters are added, the dashboard is recalculated according to the applied filtered. For an explanation of filters, please refer to Title and filter bars.

The totals on the title bar are not affected by filters. For more details about the title bar please refer to Title and filter bars.

7.4.2.1 Dashboard charts

7.4.2.1.1 Patch status per device

Shows the overall patch status, after applying filters, by organizing devices into the following states ordered by priority:

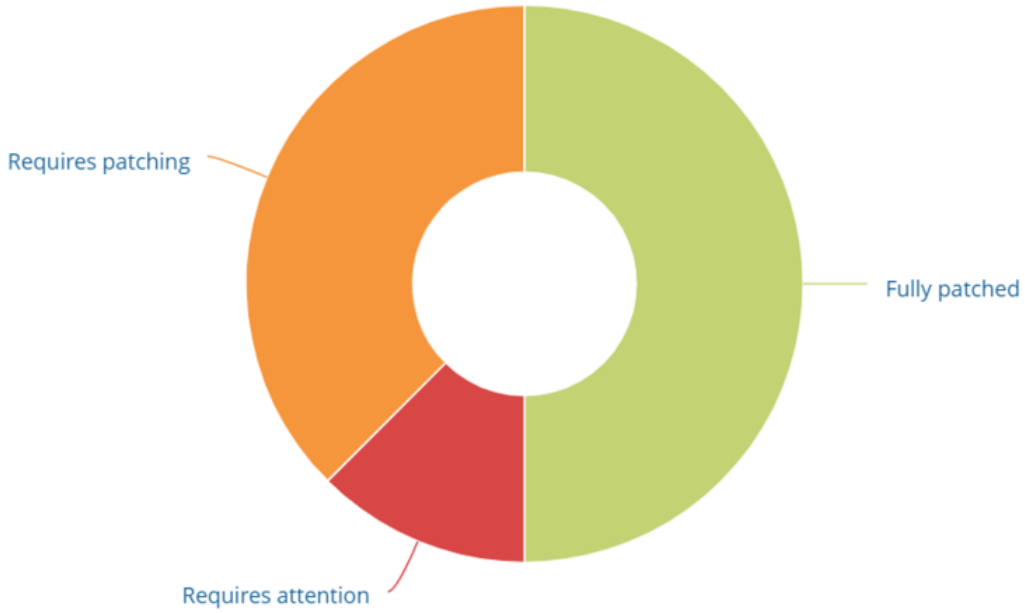
Requires attention: some required patches failed to install

Requires patching: some required patches are missing

Requires rebooting: some applied patches are pending a reboot

Fully patched: all required patches have been applied successfully

Selecting a chart slice or label will apply a **Patch status** filter to the whole dashboard, but not to the title bar. For details of this and other filter types please refer to Title and filter bars: Filter types.



7.4.2.1.2 Security updates by severity level

Shows the security update spread, after applying filters, by organizing the security updates into their Microsoft security bulletin severities:

Critical

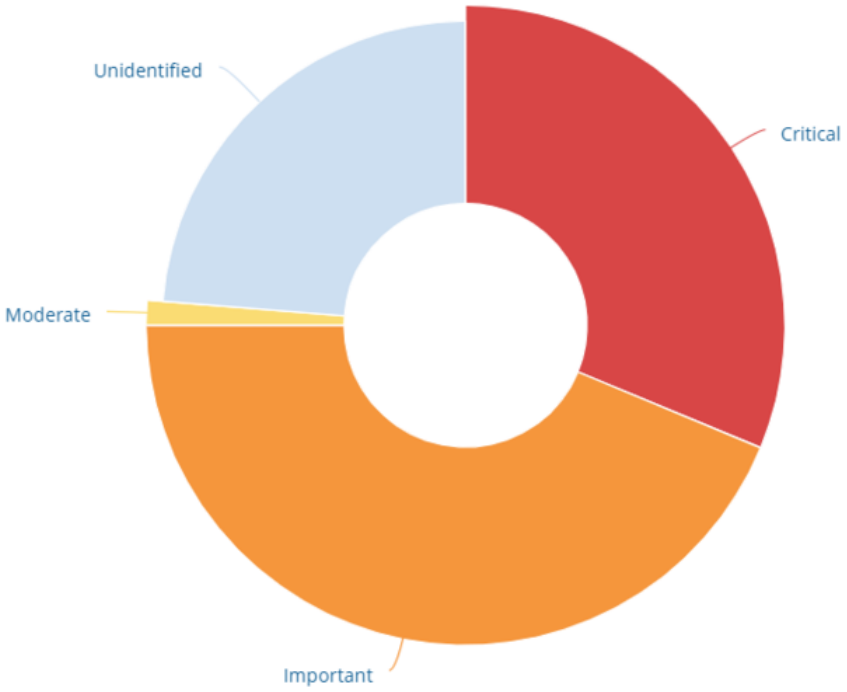
Important

Moderate

Low

Unidentified: no assigned severity.

Selecting a chart slice or label will apply a **Severity** filter to the whole dashboard, but not to the title bar. For details of this and other filter types please refer to Title and filter bars: Filter types.

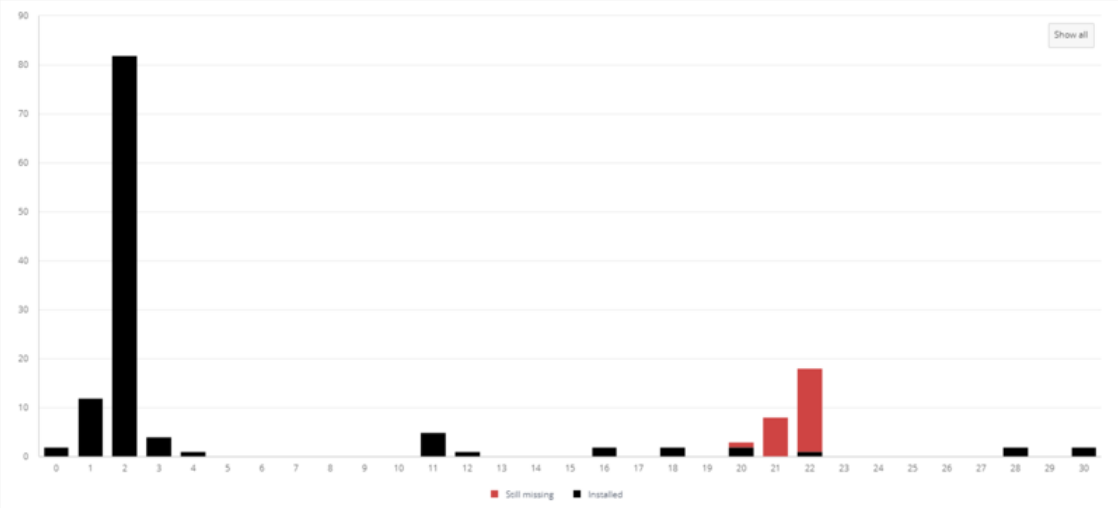


7.4.2.1.3 Patch performance

Shows the number of updates installed per day. The black column shows the days elapsed between the patch installation date and the publish date or the device's OS installation date (whichever is more recent). It also shows, as a red column, the required number of patches that are missing.

You can zoom in and out to highlight details of patches across time.

Selecting a chart bar or label will apply a **Time taken to install** range filter to the whole dashboard, but not to the title bar. For details of this and other filter types please refer to Title and filter bars: Filter types.



7.4.2.2 Interacting with the charts

You can click on chart slices and labels to add filters. Clicking on a slice or label once adds its filter, and clicking on it again removes its filter. Clicking with the CTRL key down allows you to add and remove multiple filters. For range charts clicking with the SHIFT key down allows you to select a range of filters.

The example picture opposite shows the dashboard with a filter for a single device. It has 10 patches, 5 are **Missing** and 5 are **Installed**.

As the device has 5 missing patches the device patch status is **Requires patching**.

When you hover a chart label you will see the number of devices and the percentage of the total for that label.

The device patch status chart shows:

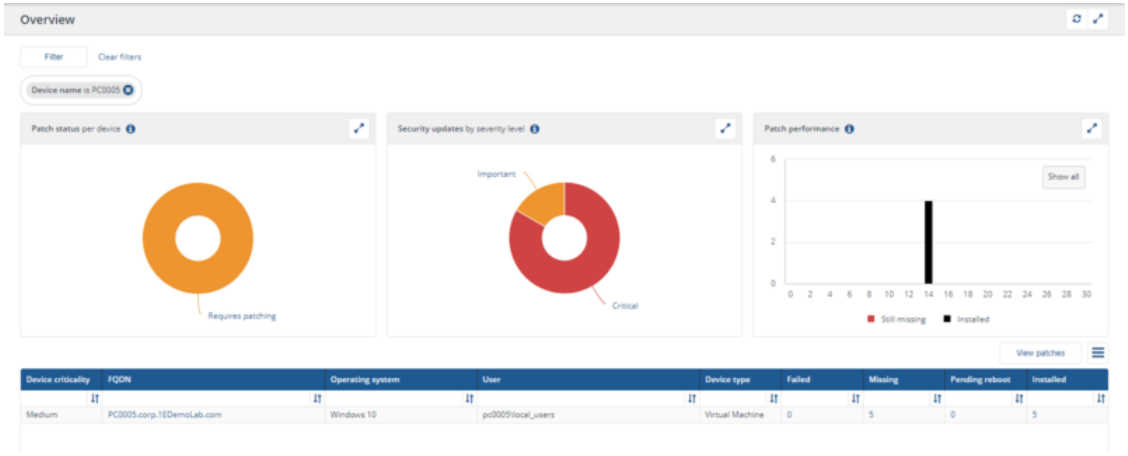
Requires patching 100% (1 device)

The security updates by severity level chart shows:

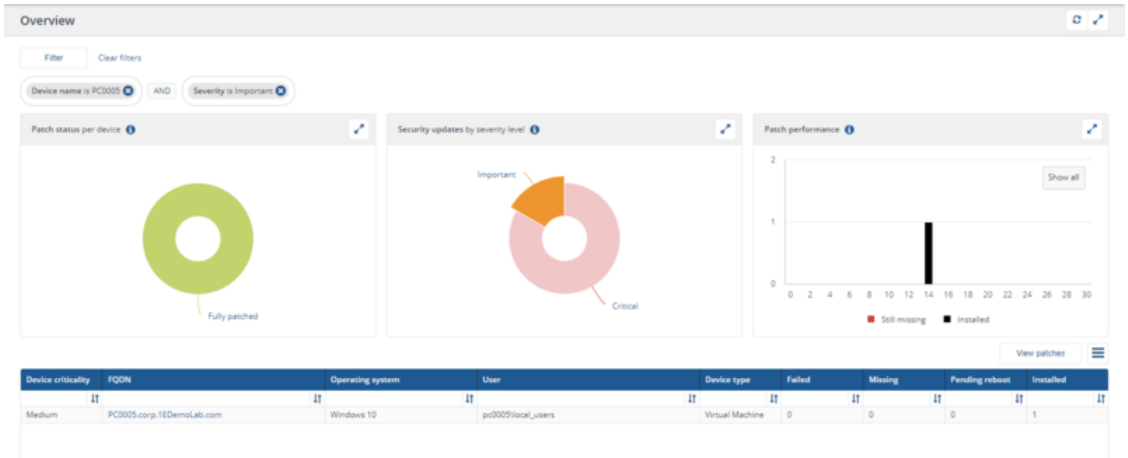
Important 17% (1 updates)

Critical 83% (5 updates)

> **Note**
>
> Patches that are not security updates do not have a severity and therefore appear as **Not applicable** and do not affect the severity chart.



Adding a filter to show only **Security Updates** that are important causes the set of patches for this device to be reduced to 1 patch in total, with 1 patch showing as installed. The device patch status now shows **Fully Patched**.



7.4.2.3 Pivot table

Clicking on the **View patches** button causes the table to pivot from a list of devices to a list of patches and the button changes to **View devices**. Clicking on the button again pivots the table back to a list of devices.

With the table in **View devices** mode, the list shows:

Device criticality

Device FQDN

Operating system

Primary user

Device type

Patch numbers according to their status:

Failed

Missing

Pending reboot

Installed

Clicking on a device **FQDN** takes you to the Device pages: Device View.

Clicking on one of the **Patch numbers** takes you to the Device patches page.

The example picture opposite shows a filtered view of devices in a specific management group.

With the table in **View patches** mode, the list shows:

Vendor

Title

Classification

Security update severity

Publish date

Patch numbers according to their status:

Failed

Missing

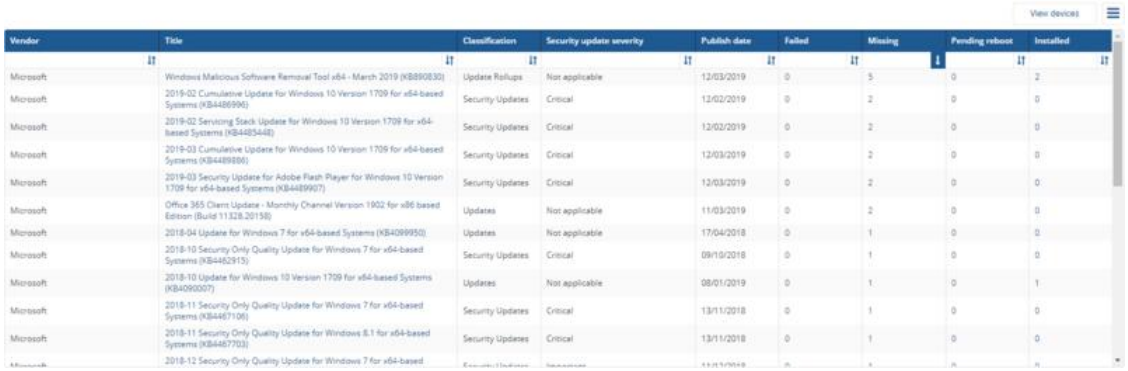
Pending reboot

Installed

Clicking on a patch title will take you to the Patch details page.

Clicking on one of the **Patch numbers** takes you to the Patch installations page.

The example picture opposite shows the previously filtered device and its 6 patches.



7.4.3 Patch pages

Information about the patch pages:

Patches page

Patch installations page

Patch details page

7.4.3.1 Patches page

This page is accessed from the Patch Success menu.

The page shows a full list of patches applicable to devices within your estate.

KB - is a patch knowledge base number.

Vendor - is a patch vendor name.

Title - is a patch title.

Classification - is classification of a patch.

Security update severity - is severity of security updates.

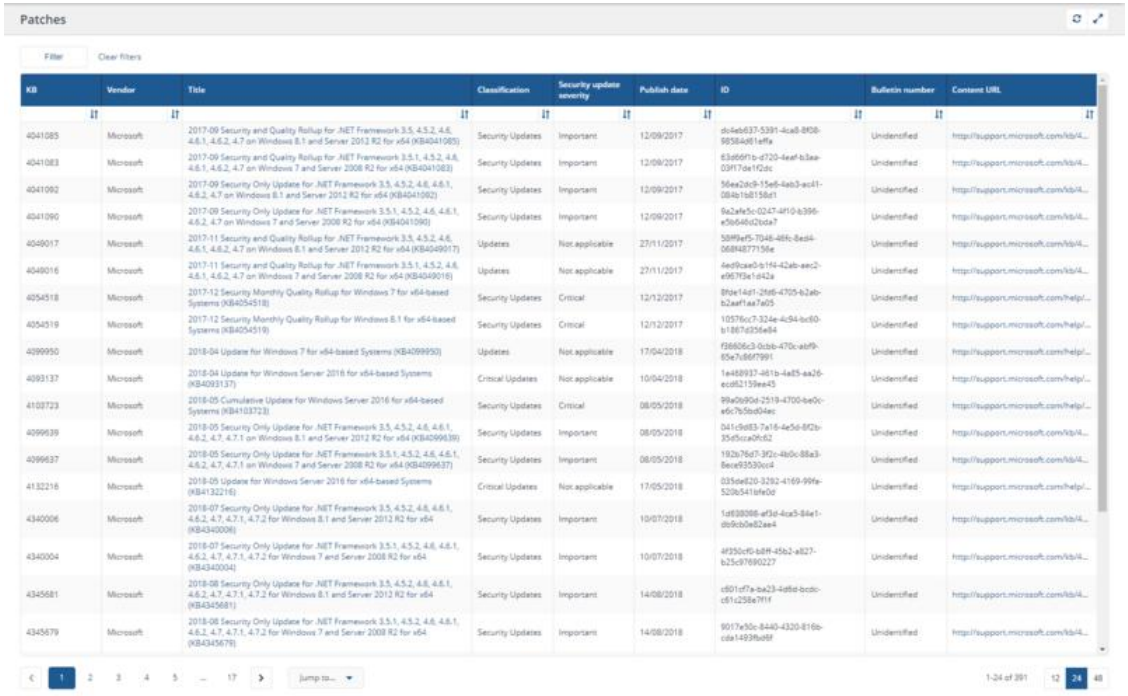
Publish date - is a date on which the patch was published.

ID - is a patch identifier.

Bulletin number - bulletin number for the patch.

Content URL - external content URL which provides more details about the patch.

Clicking on a patch title takes you to the Patch details page.



7.4.3.2 Patch installations page

This page is accessed by clicking on one of the **Patch numbers** on the Patch Success Overview page table in **View patches** mode.

The page shows details of the selected patch and all the respective devices where the patch is applicable.

Clicking the **Explore** button takes you to the **Home** page of the **Explorer** application, with coverage scope predefined for the selected devices. There you use any instructions (questions and actions) that you have permission to use.

Clicking the **Check Status** button runs the **1E-PatchSuccess-Explore** instruction:
Returns patch status for <patchSpec> identifier(s) for the current patch on the selected devices, and takes you to the **Explorer** application to monitor progress of the status instruction.

Clicking the **Update status** button will run the **1E-PatchSuccess-Refresh** instruction:
Returns patch status of given <patchSpec> identifier(s) for PatchSuccess consumption for the current patch on the selected devices and the response will be used to update the dashboards. This can be used to refresh the status of a patch within the dashboard without running the full reprocessing ETL.

Clicking the **Download only** button will run the **1E-PatchSuccess-Deploy** instruction:
Download only patch(es) specified by <patchSpec> identifier(s) from <source> source to targeted device to trigger a download without a deployment of the current patch to the selected devices, and takes you to the History page to monitor progress of the download instruction.

> **Note**
>
> Download only functionality is not available for SCCM based deployments. Download only functionality is disabled by default and can be enabled in configuration.

Clicking the **Deploy** button will run the **1E-PatchSuccess-Deploy** instruction:
Deploy patch(es) specified by <patchSpec> identifier(s) from <source> source to targeted device

to trigger deployment of the current patch to the selected devices, and takes you to the History page application to monitor progress of the deploy instruction.

For more details about Patch Success instructions, please refer to Configuring Patch Success: Create the 1E Patch Success Instruction Set.

Patch details:

Vendor and respective products of the patch

Publish date and Knowledge Base number of the patch

Patch classification and security update severity

The table shows a list of devices with the following details:

Device criticality - is criticality of a device

FQDN - is the fully qualified domain name of a device

Operating system - is the operating system of a device

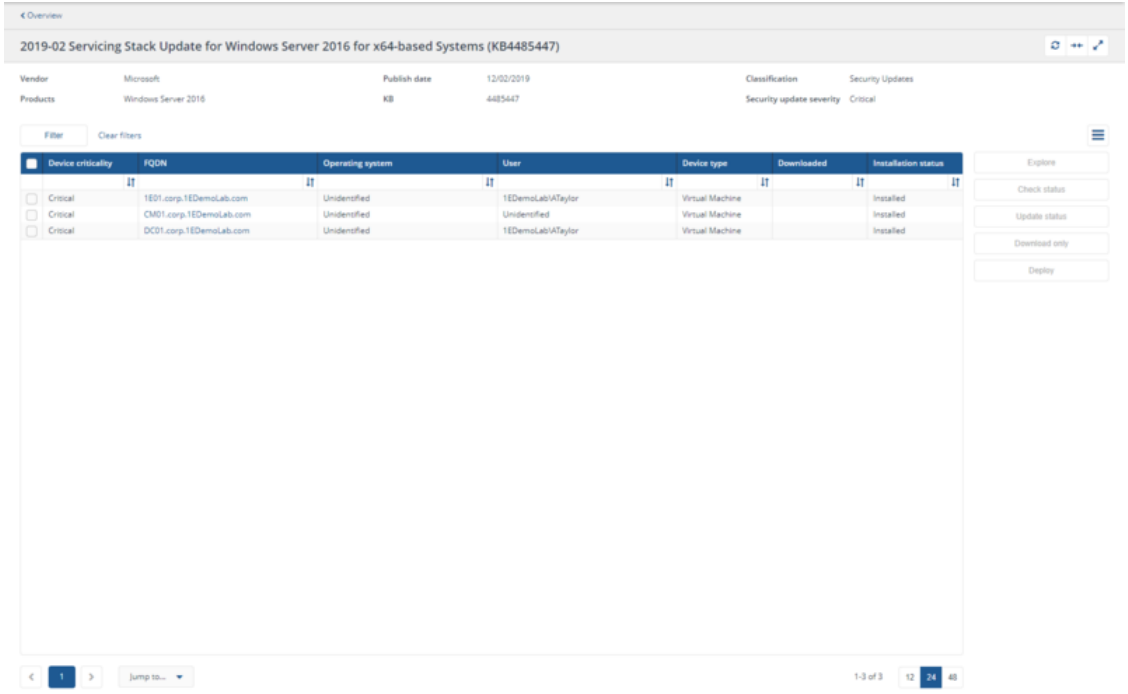
User - is primary device user

Device type - is type of device

Downloaded - is a flag to indicating if the patch downloaded on the device

Installation status - is the status of the patch on the device

Clicking on a device **FQDN** will take you to the Device details page.



7.4.3.3 Patch details page

This page is accessed by clicking a patch title on:

Patches page

Patch Success Overview page table in view patches mode.

The page shows details for the selected patch:

Description of the selected patch

Vendor

Related products

Publish date

ID guid

Knowledge Base number

Bulletin number

Classification

Security update severity

Reboot behaviour

If the patch is uninstallable

Supercedence

Source of patch information

Content URL

Also shows total numbers of device where the patch is:

Failed

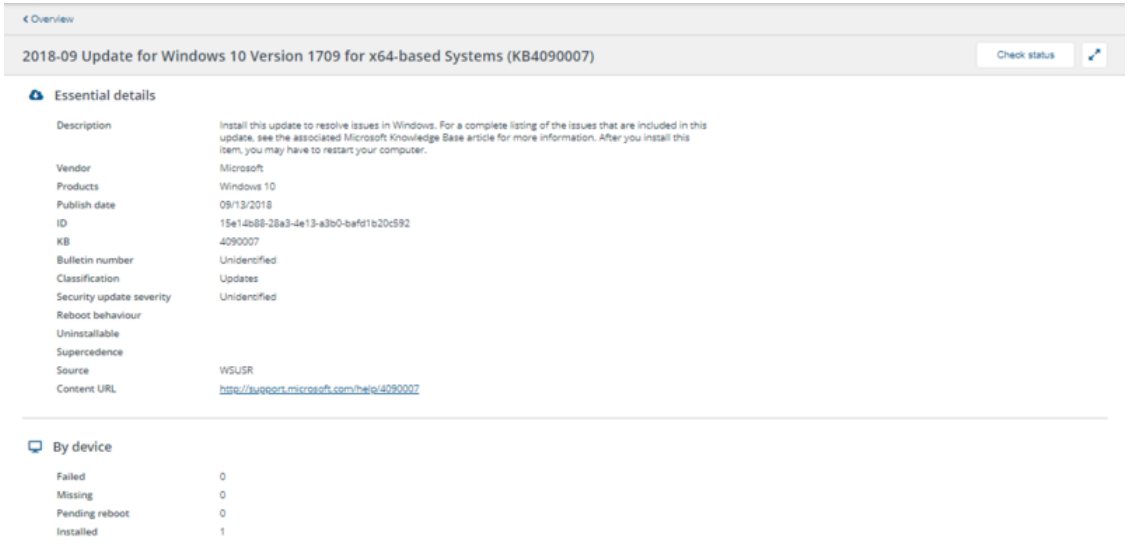
Missing

Pending reboot

Installed

The **Check Status** button runs the **1E-PatchSuccess-Explore** instruction:
Returns patch status for <patchSpec> identifier(s) for all devices, and takes you to the **Explorer** application to monitor progress of the instruction.

For more details about Patch Success instructions, please refer to Configuring Patch Success: Create the 1E Patch Success Instruction Set.



7.4.4 Device pages

Information about the device pages:

Devices page

Device patches page

7.4.4.1 Devices page

This page is accessed from the Patch Success menu.

Shows all the devices and their current patch status.

FQDN - is the fully qualified domain name of a device

User - is the primary user of a device

Device criticality - is the criticality of a device - please refer to Using Device Criticality

Device type - is the type of device, physical or virtual

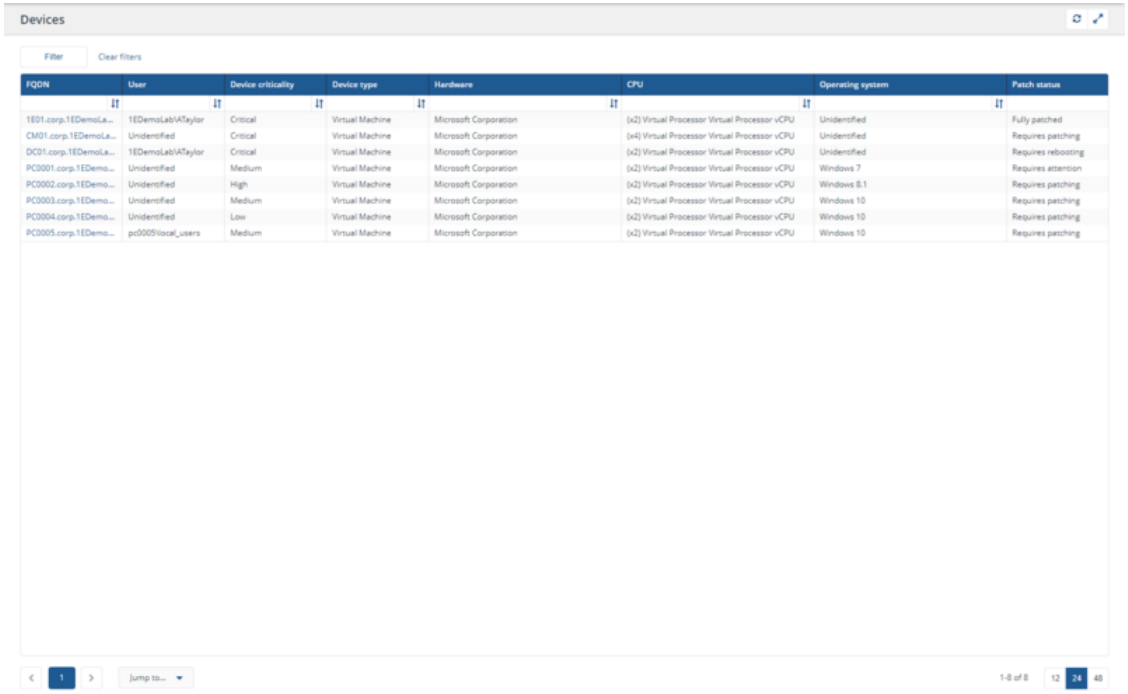
Hardware - the device make and model

CPU - the device CPU

Operating system - the device operating system

Patch status - the patch status of the device

Clicking on a device **FQDN** will take you to the Device View.



7.4.4.2 Device patches page

Shows details of the selected device and all the patches related to the device.

This page is accessed by clicking on one of the **Patch numbers** on the Patch Success Overview page table in **View devices** mode.

Clicking the **Explore** button takes you to the **Home** page of the **Explorer** application, with coverage scope predefined for the selected device. There you use any instructions (questions and actions) that you have permission to use.

Clicking the **Check Status** button runs the **1E-PatchSuccess-Explore** instruction:
Returns patch status for <patchSpec> identifier(s) for the selected patches on the current device, and takes you to the **Explorer** application to monitor progress of the status instruction.

Clicking the **Update status** button will run the **1E-PatchSuccess-Refresh** instruction:
Returns patch status of given <patchSpec> identifier (s) for PatchSuccess consumption for the selected patches on the current device and the response will be used to update the dashboards. This can be used to refresh the status of a patch within the dashboard without running the full ETL.

Clicking the **Download only** button will run the **1E-PatchSuccess-Deploy** instruction:
Download only patch(es) specified by <patchSpec> identifier(s) from <source> source to targeted device to trigger a download without a deployment of the current patch to the selected devices, and takes you to the History page to monitor progress of the download instruction.

> **Note**
>
> Download only functionality is not available for SCCM based deployments. Download only functionality is disabled by default and can be enabled in configuration.

For more details about Patch Success instructions, please refer to Configuring Patch Success: Creating the 1E Patch Success instruction set and Actioners role. Clicking the **Deploy** button will run the **1E-**

PatchSuccess-Deploy instruction:
Deploy patch(es) specified by <patchSpec> identifier(s) from <source> source to targeted device to trigger deployment of selected patches to the current selected device, and takes you to the History page to monitor progress of the deploy instruction.

Device details :

Operating system title and edition

Device make, model and type

CPU make, model and speed

Online status of the device

Device criticality

The table shows a list of patches with the following details:

Vendor - is a patch vendor name

Title - is a patch title

Classification - is classification of a patch

Security update severity - is severity of security updates

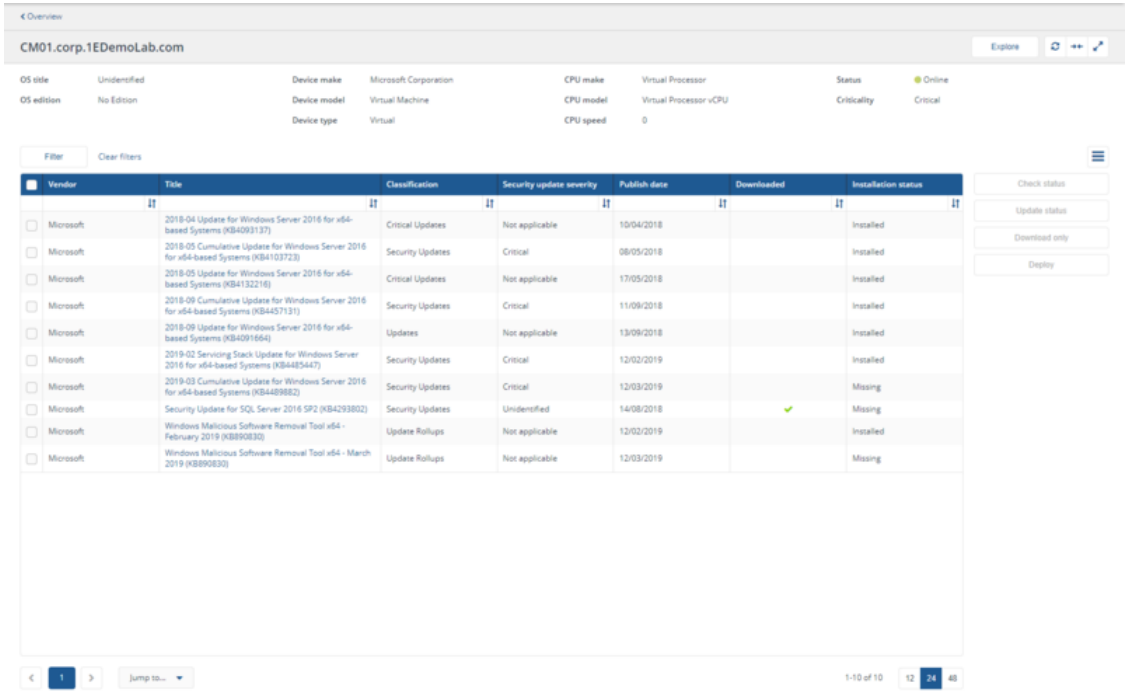
> **Tip**
>
> The severity classification is provided by the vendor, for example Microsoft.
> **Not Applicable** is not related to the device, it simply means the vendor has not given a severity classification for the patch.

Publish date - is a date on which the patch was published

Downloaded - is a flag to indicating if the patch downloaded on the device

Installation status - is the current status of the patch

Clicking on a device **FQDN** will take you to the Patch details page.



7.4.5 Monitoring pages

Information about the device pages:

History page

Responses tab

Targeted Devices tab

Patches tab

Responses page

7.4.5.1 History page

This page is accessed from the Patch Success menu.

Shows all the Patch Success instructions and their current status.

Instruction performed - is a user friendly description of the instruction showing targeted patches and devices covered by the issued instruction.

Creator- is the user that has created the instruction.

Creation - is the time at which the instruction was created.

Start - is the time at which the instruction has started.

Deletion - is the the time at which the instruction has ended.

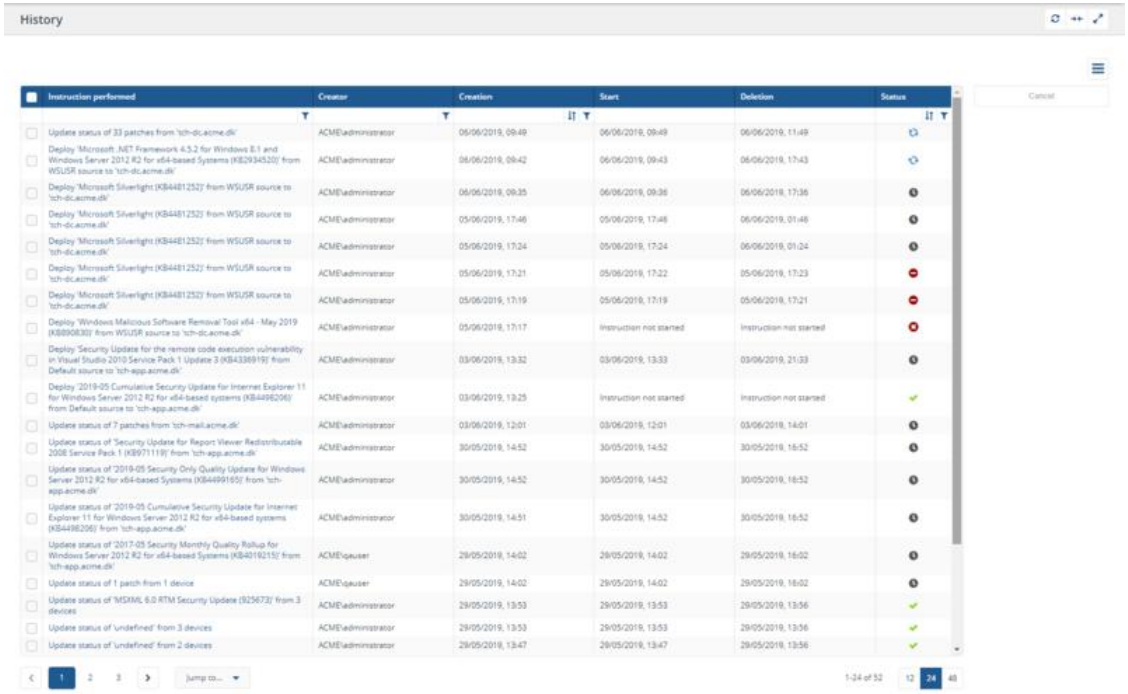
Status - is the device status of the instruction.

Icon	Description
	This instruction has been created
	This instruction is awaiting approval
	This action has been rejected by an approver
	This instruction is in progress and still gathering responses
	This instruction has responses that can be viewed
	This instruction's responses have expired
	This instruction is being cancelled
	This instruction has been cancelled
	This instruction has failed
	This instruction is awaiting authentication

Clicking on a device **Instruction performed** will take you to the Responses tab.

Clicking the **Cancel** button cancels the selected instructions.

> **Note**
>
> Cancelling instructions will not undo already completed actions and will simply stop any outstanding actions from completing. To determine which actions have been completed, navigate to responses tab by clicking the**Instruction performed**name in the instruction row.



7.4.5.2 Responses tab

Shows all the responses returned from an instruction.

Response time - is the time at which the response was received.

FQDN - is the fully qualified domain name of the device from which the response was received from.

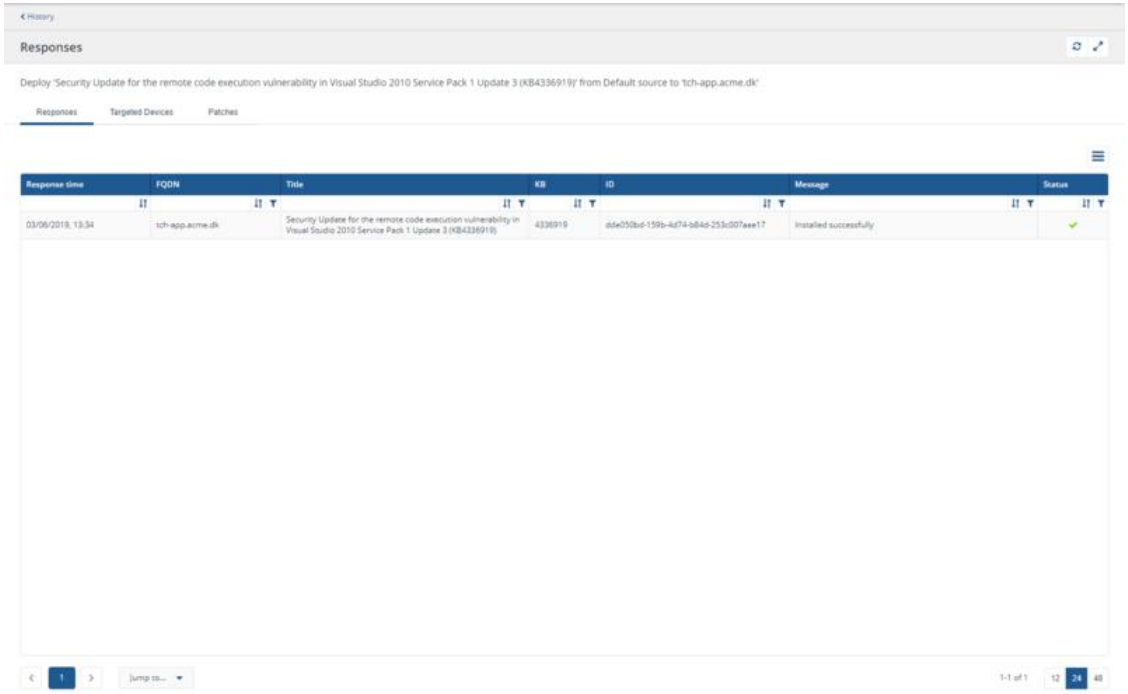
Title - is the title of the patch targeted by the instruction.

KB - is the Knowledge Base number of the patch targeted by the instruction.

ID - is the identified of the patch targeted by the instruction.

Message - is the result of the update or deployment.

Status - is the status of the update or deployment.



7.4.5.3 Targeted Devices tab

Shows all the target devices for an instruction.

FQDN - is the fully qualified domain name of a device from which the response was received from.

User - is the primary user of a device.

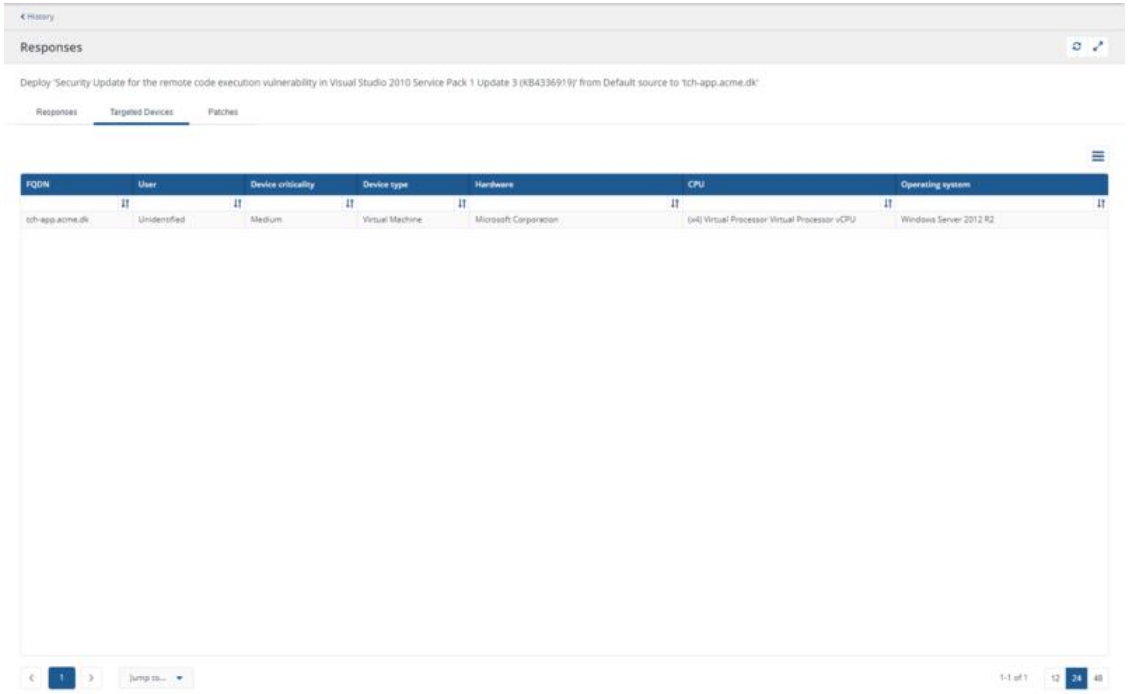
Device criticality - is the criticality of a device.

Device type - is the type of device, physical or virtual.

Hardware - the device make and model.

CPU - the device CPU.

Operating system - the device operating system.



7.4.5.4 Patches tab

Shows all the patches for an instruction.

KB - is a patch knowledge base number.

Vendor - is a patch vendor name.

Title - is a patch title.

Classification - is classification of a patch.

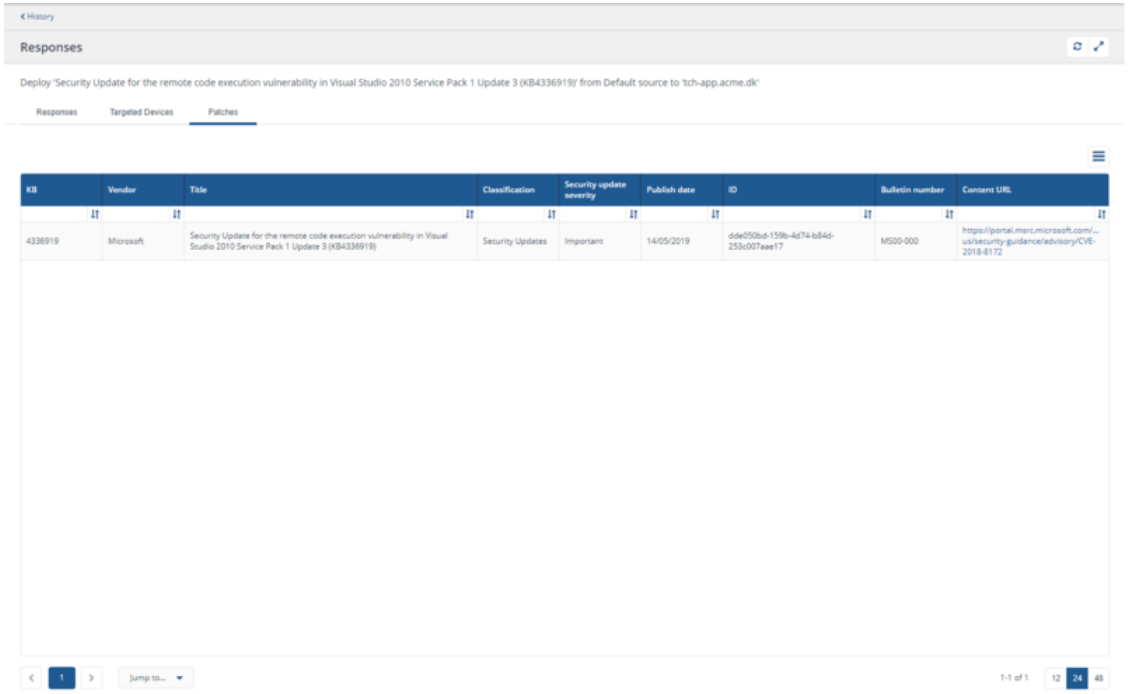
Security update severity - is severity of security updates.

Publish date - is a date on which the patch was published.

ID - is a patch identifier.

Bulletin number - bulletin number for the patch.

Content URL - external content URL which provides more details about the patch.



7.4.5.5 Responses page

Shows all the responses returned from all Patch Success instructions.

Response time - is the time at which the response was received.

FQDN - is the fully qualified domain name of the device from which the response was received from.

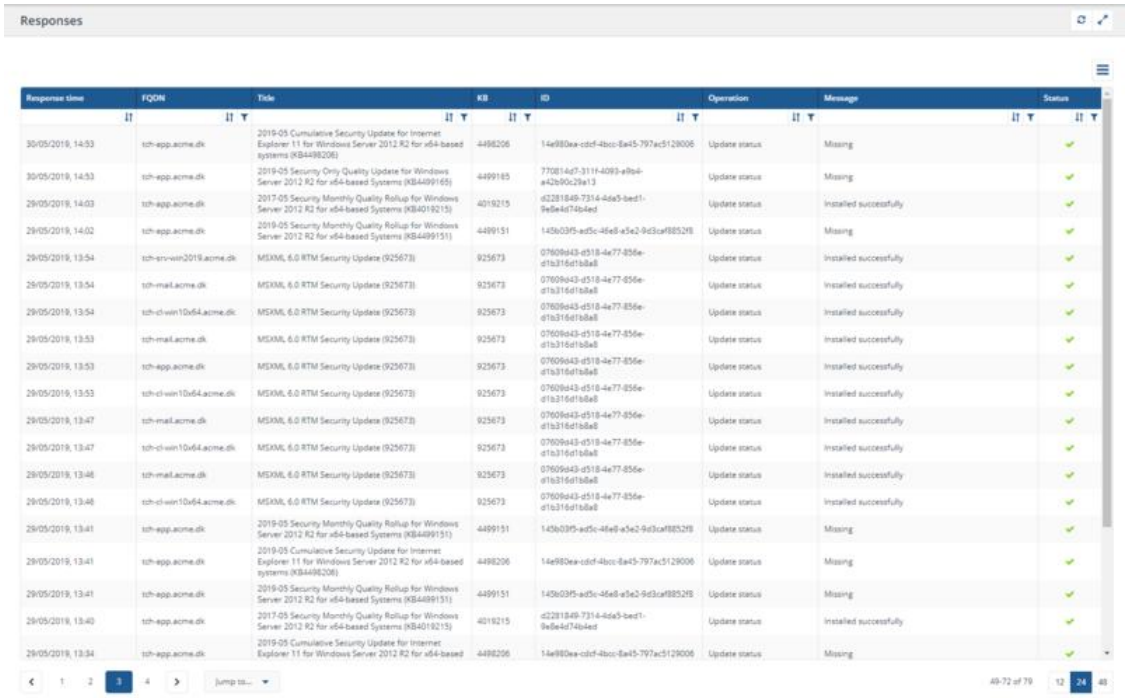
Title - is the title of the patch targeted by the instruction.

KB - is the Knowledge Base number of the patch targeted by the instruction.

ID - is the identified of the patch targeted by the instruction.

Message - is the result of the update or deployment.

Status - is the status of the update or deployment.



7.4.6 Reporting and successfully patching a management group for a single KB - tutorial

A worked example of using Patch Success.

In this tutorial

In this tutorial an emergency patch has been deployed using Configuration Manager, but the Security team have concerns that some devices have not received that patch and could become vulnerable to an exploit.

In this tutorial we will demonstrate:

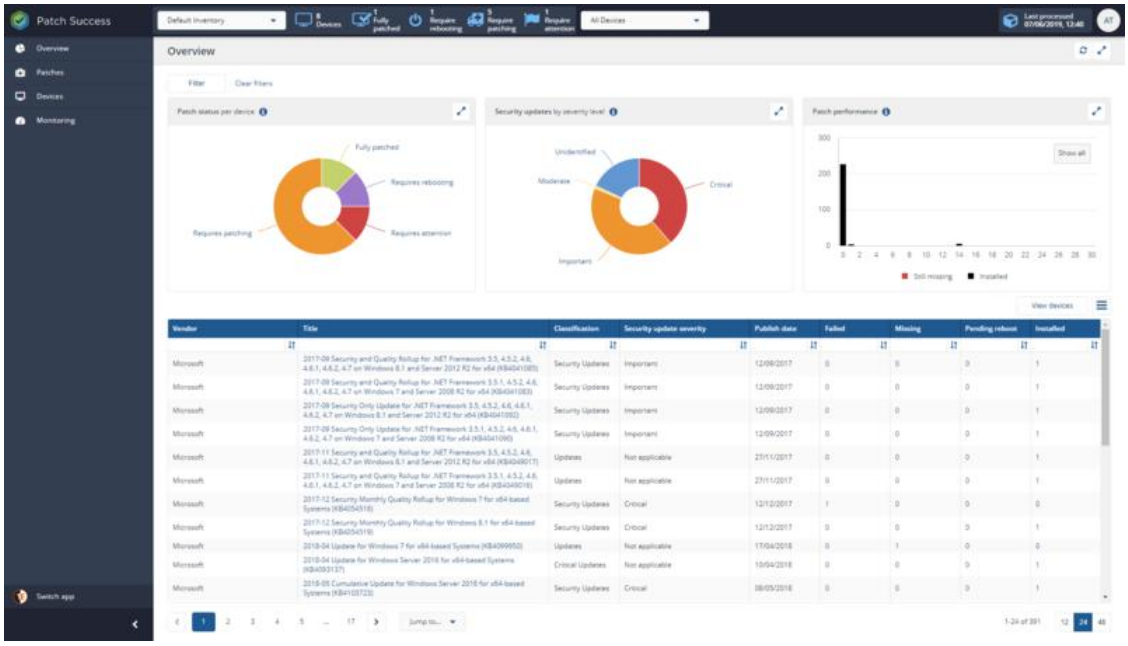
Checking the performance of the specific KB against a management group

Patching immediately any device or devices in the management group which haven't received it

7.4.6.1 Checking the performance of the specific KB against a management group

Navigate to **Patch Success→Overview**

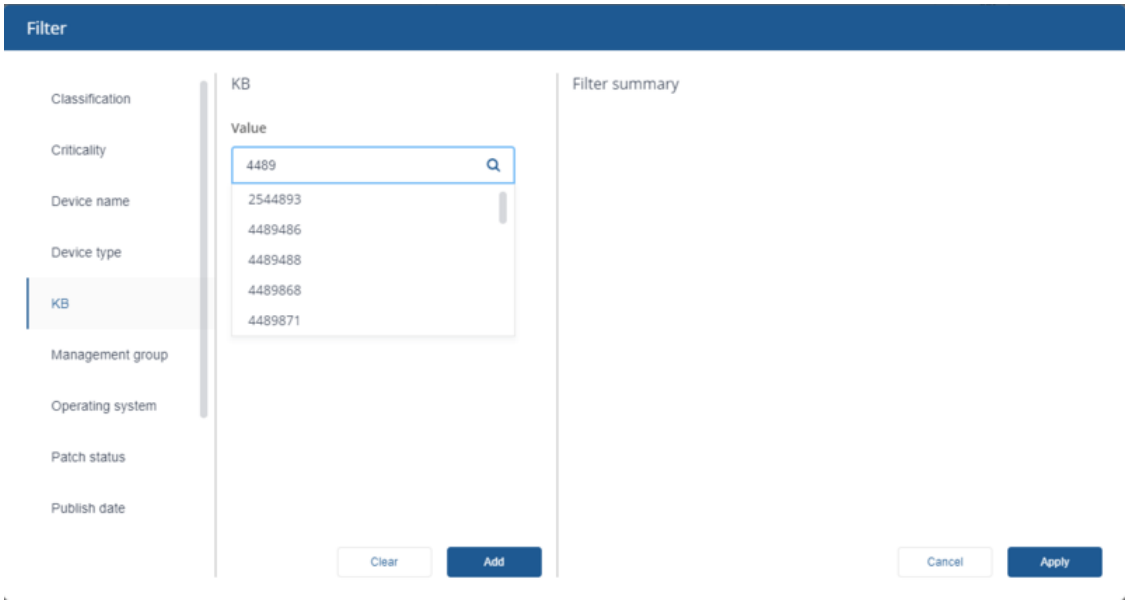
In the title bar, click on the management group drop-down list. By default this will show **All Devices**. If you change the selection, notice the name of the selected management group is added to the filter bar. You can select only one management group using this method. In our example we will select the **All Devices** management group.



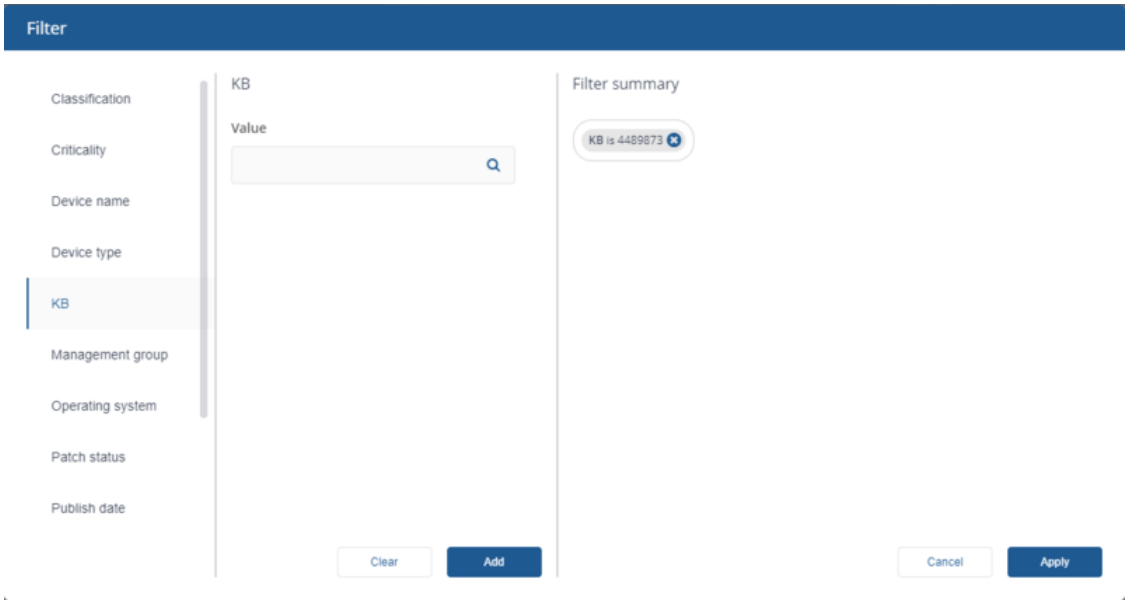
Click on the **Filter** button and the **Filter** popup appears.

Select the **KB** filter and enter a value for the KB and a drop-down auto-fills a list of KBs, select the chosen KB, and click **Add**.

Select the **Management group** filter and select a management group from the value drop-down list, and click **Add**. You can select more than one Management group using this method. Remove all selected groups, because we are using **All Devices** in this tutorial.



In the **Filter** popup, click the **Apply** button.



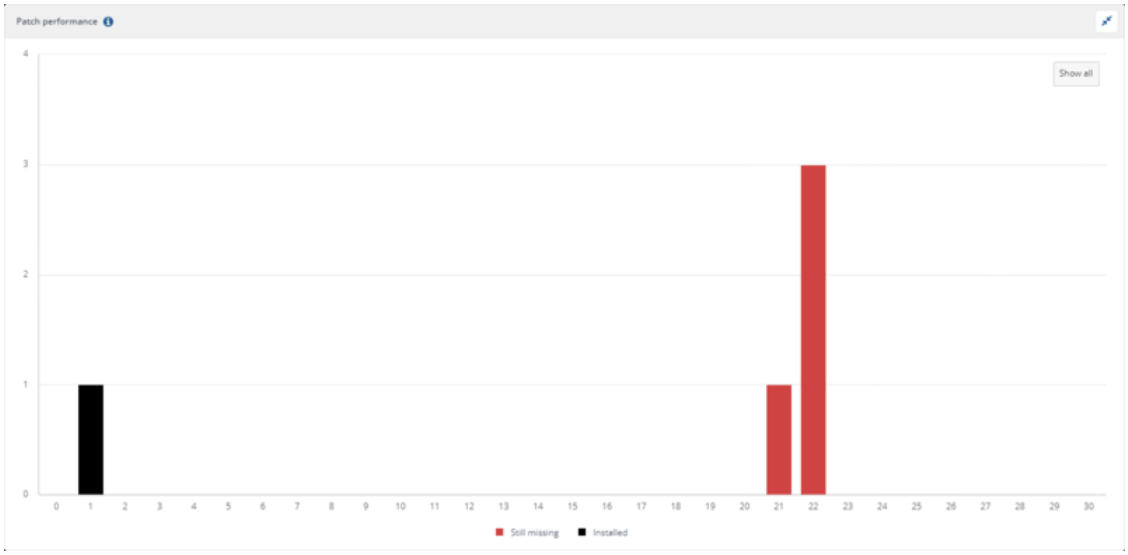
This chart displays the Performance in the last 30 Days by default, but by clicking "Show all" will show the period where the patch is missing.

The black column shows the Installed trend over time for that patch in the management group

The red column indicates the number of devices missing patches and when the patches should have been installed.

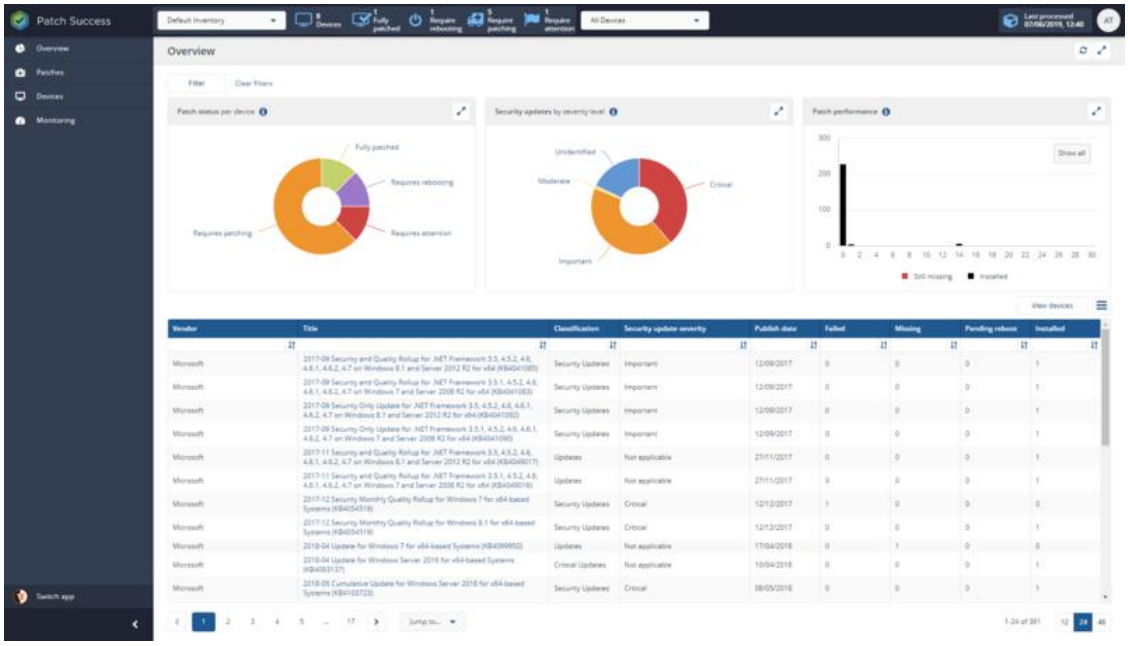
The diagram shows that the patch is still missing on 1 device in the last 21 days and 3 devices in the last 22 days in the management group. It also shows that 1 device had the patch installed 1 day after the release date.

In the **Overview** page, expand the **Patch performance** chart which has been filtered based on the selected KB.



7.4.6.2 Patching immediately any device or devices in the management group which haven't received it

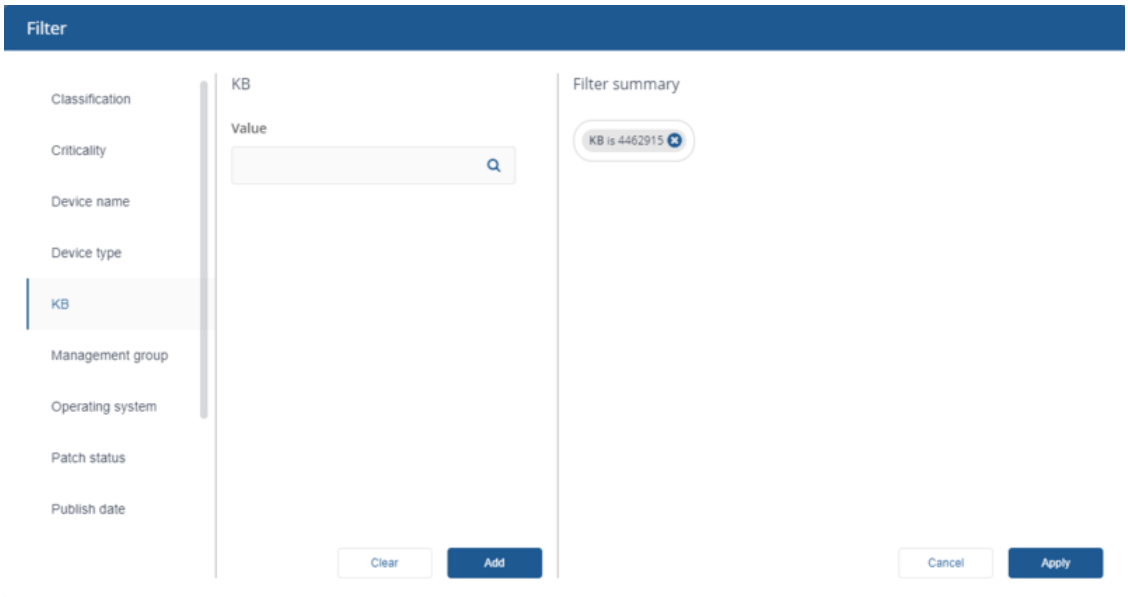
Navigate to **Patch Success→Overview**



Click on the **Filter** button and the **Filter** popup appears.

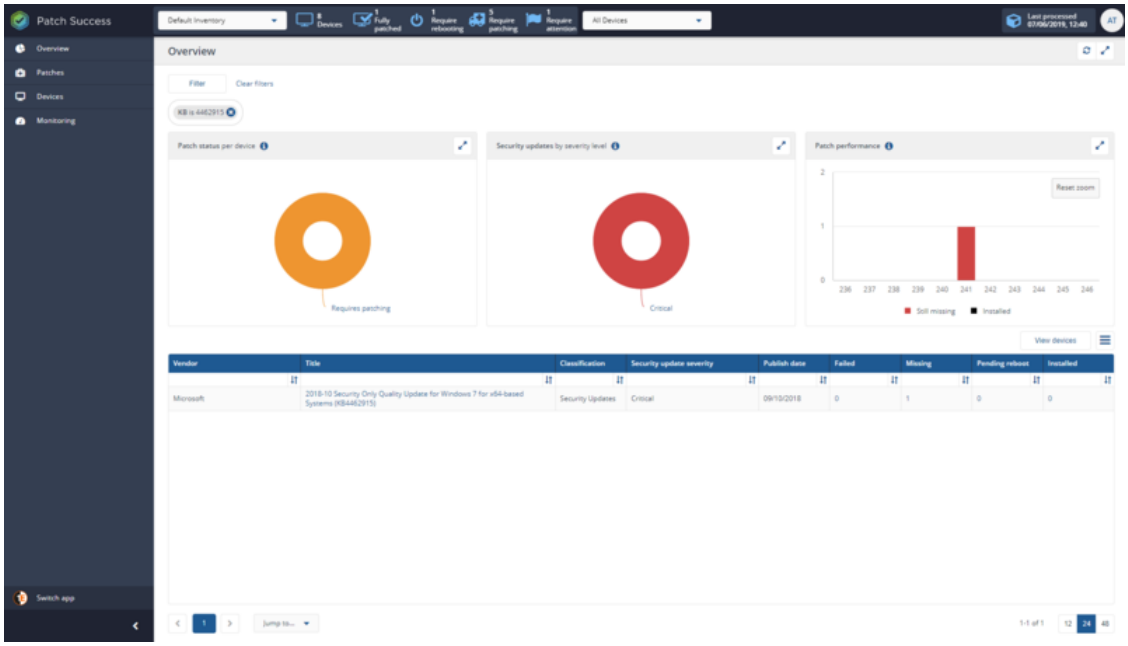
Select the **KB** filter and enter a value for the KB and a drop-down auto-fills a list of KBs, click **Add**.

In the **Filter** popup, click the **Apply** button.



In the **Overview** page, the filter has been applied to the all the charts, showing the overall status of the KB.

Click on the number in the **Missing** column. This opens a page for the specific device.



Device criticality - is criticality of a device

FQDN - is the fully qualified domain name of a device

Operating system - is the operating system of a device

User - is primary device user

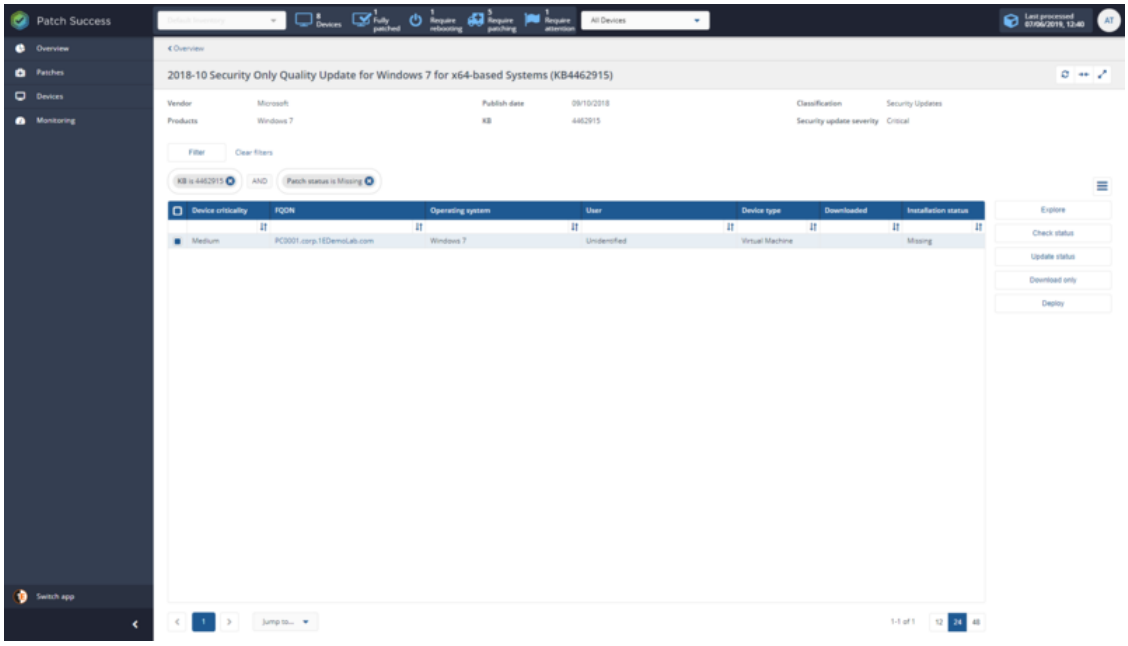
Device type - is type of device

Downloaded - is the patch already downloaded on the device

Installation status - is the status of the currently selected patch per device

On the displays patch with filter of the KB and Missing , and the List of devices shows a full list of devices where selected patch is applicable. Where:

Click the **Deploy** button. This will start an instruction to deploy the currently selected patch on the selected devices and switch to the **History** page to show the progress of the **deploy** instruction.



In **Monitoring→History** page. This shows the list of all the instructions issued by Patch Success with following details:

Instruction performed - a description of the instruction.

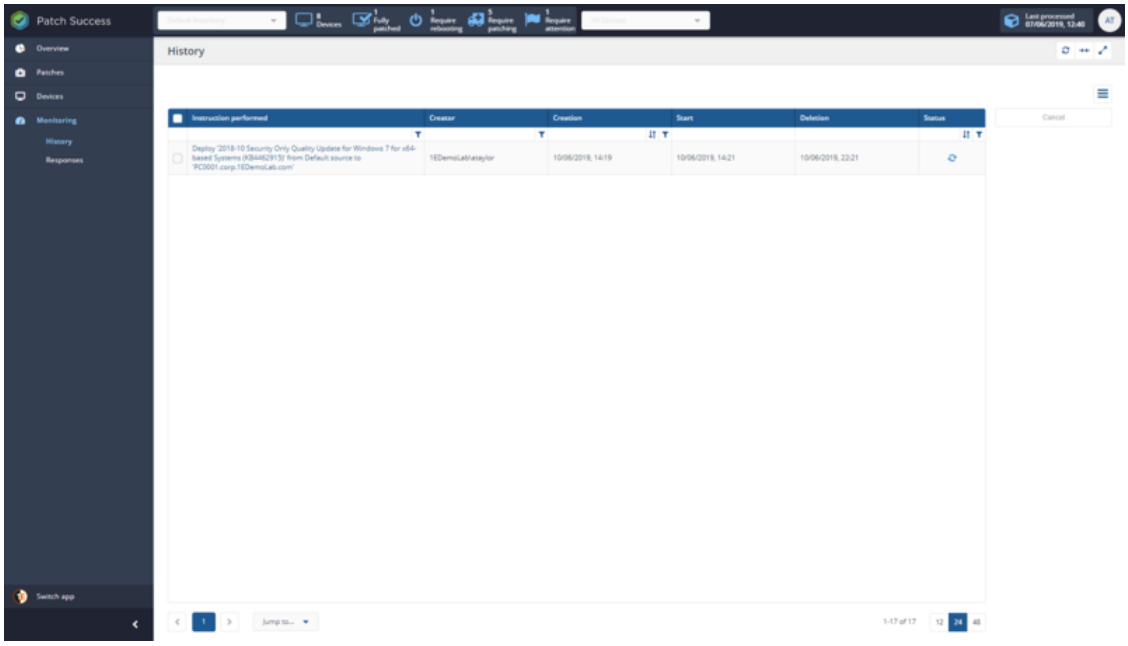
Creator - user that has created the instruction

Creation- creation time

Start - time at which the instruction was started

Deletion - time at which the instruction has ended

Status - current status of the instruction



In **Instruction Responses** page. This shows the list of all the responses received by Patch Success from the issued instruction, with following details;

Response time - time at which the response was received

FQDN - fully qualified name of the device that has responded

Title - title of the targeted patch.

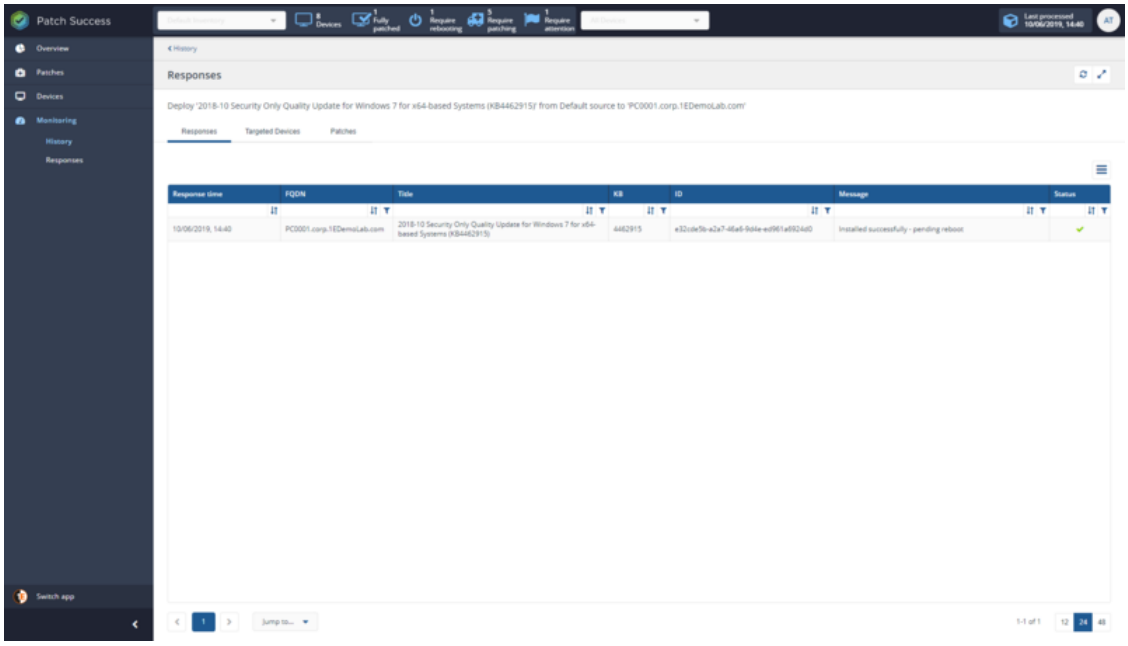
KB - knowledge base number for the corresponding patch.

ID - identifier for the corresponding patch.

Message - the result of the instruction.

Status - the status of the response.

Once the response is completed, navigate back to **Overview**. If you have remained in session then your previous filter will still be current. The missing patch will no longer display and will now show as installed. Furthermore, when you look at the **Device Patch Status** chart the device no longer reports as requiring attention, but rather as **Fully patched**.



7.5 Troubleshooting

A general methodology for investigating issues with Patch Success, as well as identifying key issues and their resolutions.

For known issues relating to specific components, please refer to the respective troubleshooting pages:

Clients	Platform	Applications	Integration
1E Client	1E	Endpoint Automation	1E Core for ServiceNow
1E Client Deployment Assistant		Experience Analytics	1E ITSM Connect for ServiceNow
PXE Everywhere		Endpoint Troubleshooting	1E Service Catalog Connect for ServiceNow
		Writing 1E Instructions (1E SDK)	1E Virtual Assistant

7.5.1 1E Support contact details

7.5.1.1 Support Web portal

Maintenance support customers can log onto the 1E Support Web Portal at https://support.1e.com/ using the login details provided with their maintenance contract. This provides issue tracking, product hotfixes, and knowledge base articles related to each product.

7.5.1.2 Telephone support

Maintenance support customers can contact the technical support department at 1E through the following support numbers. Just phone the relevant number for your area, so your call can be routed quickly and efficiently to the correct support group:

US/Canada:	1-866-349-4032 (Toll-Free)
	1-917-339-2360 (Standard)
UK/Europe:	+44 (0)208 326 3499
India:	+91 120 402 4002
Australia:	+61 739 111 118

7.5.1.3 Email support

Maintenance customers can use the following email for additional support. Evaluation customers can also use this email with the temporary access code that is provided through customercare@1e.com as part of their evaluation.

support@1e.com

7.5.2 The technical support process

Read through the Troubleshooting pages to see if there are known issues, or quick resolutions to any problems you may have encountered.

Maintenance support customers can use the 1E Support Web Portal to review knowledge base articles and download hotfixes.

If still encountering problems, create a technical report (log files and details) and then contact the 1E technical support team.

7.5.2.1 Creating a technical report

If possible, please obtain the following details and log files before contacting 1E, to include in your technical report.

7.5.2.1.1 Version details

The OS, version number, and patch level for:

Tachyon Servers

1E Client

Configuration Manager - if used

Other 1E Server software, for example, Shopping, Nightwatchman, and WakeUp.

For Nomad and Shopping, please provide OS, version number, and patch level for:

Configuration Manager DPs

Nomad extensions used on Configuration Manager Consoles

ActiveEfficiency Server.

7.5.2.1.2 Environmental details

If there were any recent changes made to your configuration

The name of the machines, Configuration Manager Application and/or Package IDs for when the issue occurred

7.5.2.1.3 Problem details

When did the issue occur, ensure log files cover this period

The scope of the issue – did it affect a particular geographical location, group of users, or client machines

Details of any self-help troubleshooting steps you carried out

In the event of a service crash or if you are experiencing high CPU or memory usage, provide us with the dump file, event viewer logs, and traces. We will provide you with FTP details to upload these files.

7.5.2.2 Log files

7.5.2.2.1 Tachyon Server log files

For any issue, please provide a zip containing log files from the following locations:

%ALLUSERSPROFILE%\1E\Catalog*.log

%ALLUSERSPROFILE%\1E\ContentDistribution*.log

%ALLUSERSPROFILE%\1E\Platform Consumers*.log

%ALLUSERSPROFILE%\1E\SLA Platform*.log

%ALLUSERSPROFILE%\1E\Tachyon*.log

If you are having licensing issues, please include:

%ALLUSERSPROFILE%\1E\Licensing*

Please refer to the Tachyon Platform 8.1 - Log files page for more details.

7.5.2.2.2 1E Client logs on Windows

%ALLUSERSPROFILE%\1E\Client\1E.Client.log (used by 1E Client and Tachyon features, and Shopping client)

%ALLUSERSPROFILE%\1E\Client\NomadBranchUninstall-YYYY_MM_HHTMM_HH_SS_000Z.log

7.5.3 Known Issues

Lists of the current known issues with implementing, configuring, and using 1E Patch Success.

If you cannot find an issue and its workaround on this page:

Refer to Known issues for the Platform and other applications.

Try searching the 1E Support Portal https://support.1e.com/ for issues that have hotfixes.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

Issue	Description	Workaround
Patch Success instructions that are using SCCM as a patch source log remote connections to Microsoft WSUS server.	1E Client logs creating a remote connection to Microsoft WSUS Server with a CheckOnline property set to false to indicate that 1E Client is using Windows Update Agent local cache to retrieve data. This log can easily be interpreted as an attempt to connect to the internet to collect data, which is not what the 1E Client is doing. Instead, the instructions are collecting additional information from WUA local cache in order to supplement missing data collected by ConfigMgr client and will therefore be regularly logged during normal operation of Patch Success instructions. ConfigMgr client omits Patch IDs for all installed patches and therefore requires additional information to be collected from a different source to match missing Patch IDs.	The log message should be interpreted as 1E Client performing a query against a Windows Update Agent local cache.
Deploying a missing patch directly via the internet returns the following error	If a missing patch is deployed onto a target device, but the Windows Update service is not running or	Ensure the Windows Update service is running

Issue	Description	Workaround
"overallDownloadResult is Null"	stopped, the 1E Client will return error: "overallDownloadResult is Null" In later versions of the 1E Client, the returned error will be: "End search for updates because: (0x8024001E). Operation did not complete because the service system was being shutdown"	before attempting to re-deploy the patch.
Deploying a missing patch to 1E Client may result with it logging "WARN - No updates to install" and the patch gets updated as "Not applicable"	If a missing patch is deployed, but there is no associated deployment package in ConfigMgr then the response will be returned as "Not applicable".	Ensure the patch has been packaged and deployed through ConfigMgr so that it is available to the CM clients before attempting to re-deploy the patch.
Patch Success charts and tables have inconsistent data.	Tachyon sync schedule process leads to new patch data being replaced with stale patch data when BI ETL is run. When syncs are scheduled in the recommended way then the nightly BI ETL will replace all device and patch data in the BI star schema and cube with potentially stale SLA inventory data.	Execute a new Tachyon sync, once the expected devices have reported in patch data (check Tachyon Explorer → Instructions → History → "Returns Patch status for...") then execute a new BI ETL. This will result in up to date device and patch data in both the BI star schema and the cube.
Deploying a patch directly via the internet may return failure "End search for updates failed because: Not enough storage is available to complete this operation" and WindowsUpdate.log will show an associated error:	On Windows 7 / Server 2008 R2 there is a known issue with the Windows Update that causes it to return an "8007000E" error message. This may be seen if in the Patch Success page, a patch is deployed with the check box enabled for	Please ensure the update that contains the improvements to Windows Update Client is applied in order to allow for further Patch Success deployments to function correctly.

Issue	Description	Workaround
"WARNING: WU client failed Searching for update with error 0x8007000e"	"Enable patches to be downloaded onto devices directly from the internet instead of the default (SCCM)".	
History page should be hidden when user only has Patch success viewer permissions	The history page is displayed when a user has no access to Patch Success instructions.	None
Patch Success will show all devices irrespective of the permissions on management groups.	BI cube does not have the permissions model required to filter the management groups correctly. In addition, the permissions model only assigns management groups to instructions therefore will not cater for BI cube permissions.	None

7.6 Reference

All the list type information, such as installer properties, in alphabetical lists etc.

7.6.1 Patch Success release information

7.6.1.1 1E Patch Success 8.1 release information – last updated 04-August-2022

These notes contain late-breaking information about this release of Patch Success. For the most up-to-date information, please see the online readme. You should read these release notes and the online documentation for Patch Success thoroughly before using the software.

7.6.1.1.1 New features in 1E Patch Success 8.1

Works with Tachyon Platform 8.1

No features or feature changes added in this release, but includes any hotfixes from previous versions.

7.6.1.1.2 Online help

Tachyon comes with online help that shows you how to install, configure and use the product. Click the following link to view the help:

1E Patch Success documentation.

For support queries, please:

Use https://support.1e.com/ where you can search the KB or submit a support case.

Contact support@1e.com.

7.6.1.1.3 Known issues

The current known issues related to Patch Success can be found on the Troubleshooting Known Issues page of the Patch Success documentation.

Known issues for the Platform and other applications can be found in the1E platform - Known issues documentation.

7.6.1.2 Patch Success Release History

Patch Success is a separately licensed application in the Tachyon Platform. Please refer to Tachyon release information for latest information, where you will also find details of previous releases, and hotfixes.

7.6.1.3 Patch Success features by release

A list of the Patch Success features organized by the release they were implemented in. Links through to the features have been provided for convenience.

7.6.1.3.1 New Features

Works with Tachyon Platform 8.1

No features or feature changes added in this release, but includes any hotfixes from previous versions.

7.6.1.3.2 Release History

7.6.1.3.2.1 Patch Success 8.1

Works with Tachyon 8.1

No features or feature changes added in this release, but includes any hotfixes from previous versions.

7.6.1.3.2.2 Patch Success 8.0

Works with Tachyon 8.0

No features or feature changes added in this release, but includes any hotfixes from previous versions.

7.6.1.3.2.3 Patch Success 1.3

Works with Tachyon 5.2

Unidentified patch publish dates show 'Not available' instead of 1970-01-01.

7.6.1.3.2.4 Patch Success 1.2.104

Works with Tachyon 5.1

No changes to this application for this release.

7.6.1.3.2.5 Patch Success 1.2

Works with Tachyon 5.0

The Patch and Device details pages now allow updating of all devices and patches for a given patch or a device respectively

Performance improvements.

7.6.1.3.2.6 Patch Success 1.1

Works with Tachyon 4.1

The **Patch performance** dashboard tile can now be used to interactively filter the page

A new **Monitoring** menu has been added that displays the history and responses for the Patch Success instructions

Download only functionality

Integration with Guaranteed State via **CM Patch Health** policy link.

7.6.1.3.2.7 Patch Success 1.0

Works with Tachyon 4.0

Patch module included in Tachyon Agent 4.0

7.6.2 1E Companion Products

A list of the feature dependencies between Patch Success and other 1E companion products.

This page describes the dependencies to and from Patch Success in regard to certain features that are implemented across companion 1E products. To view the general platform related dependencies for Tachyon please refer to Tachyon 8.1 - Supported Platforms.

7.6.2.1 1E companion products that 1E Patch Success 8.1 depends on

Supported versions of 1E companion products that 1E Patch Success 8.1 features depend on.

Products and features that Patch Success depends on	Supported versions of companion products	
1E SLA Business Intelligence	Business Intelligence and a SQL Server Analysis Server (SSAS) instance. Business Intelligence is installed using Tachyon Setup.	Business Intelligence 8.1 (included in Tachyon Platform 8.1)
1E Catalog	1E Catalog is installed using Tachyon Setup.	1E Catalog 8.1 (included in Tachyon Platform 8.1)

Products and features that Patch Success depends on	Supported versions of companion products	
1E Client	Tachyon requires the 1E Client (with Tachyon client features enabled) to be installed on all client computers. This replaces the legacy Tachyon Agent. Tachyon client features: the Patch Success application # command and script execution content distribution device criticality manipulation of files and processes manipulation of registry and WMI # security # software uninstallation user sessions, including Primary User Real-time response to instructions, which supports the retrieval of information using questions, and running actions Tags (freeform and device/coverage) Criticality and Location 1E Client UI to support the Real-Time Control Center, Announcements, Surveys, and Sentiment features of the Experience application # Inventory, including process usage, to support: the Tachyon Activity Record feature the Inventory and other consumer applications	1E Client 8.1 (with Tachyon client enabled) 1E Client 8.0 (with Tachyon client enabled) 1E Client 5.2 (with Tachyon client enabled)

Products and features that Patch Success depends on	Supported versions of companion products	
	Performance metrics features to support the Experience application # Policy feature to support consumer applications: Guaranteed State ##, Experience #, and Nomad # Modules to support: # not supported on non-Windows, ## partially supported on non-Windows Tachyon clients can optionally use the Nomad client module of 1E Client to more efficiently download content.	
Tachyon Platform	Patch Success is a consumer application of the Tachyon Platform, installed on the Tachyon Master Stack, and requires a full Tachyon infrastructure.	Tachyon Platform 8.1

Note

Tachyon Platform, 1E Catalog, Business Intelligence, and Patch Success, are all installed using Tachyon Setup.

7.6.2.2 1E companion products that depend on 1E Patch Success 8.1

Supported versions of 1E companion products with features that depend on 1E Patch Success 8.1.

Products and features that depend on Patch Success	Supported versions of companion products	
None	n/a	n/a

7.6.3 1E Patch Success product pack

Classic Product Pack used to create the **1E Patch Success** instruction set required by the Patch Success application.

For more details please refer to:

Configuring Patch Success for steps required to upload this product pack and create set

Using Patch Success.

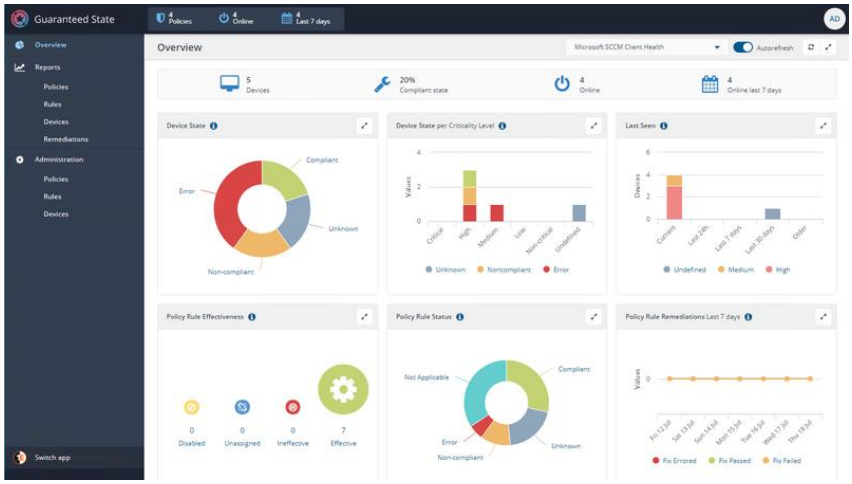
Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
<action> patch(es) specified by <patchSpec> identifier(s) from <source> source to targeted device(s) Where: **<action>** is either **Deploy** or **Download only** **<patchSpec>** is a list of comma separated GUIDs and/or KB numbers (without KB prefix) of patches to be installed **<source>** is the patch download source: **WSUSR** - Microsoft Update via the Internet **WSUSL** - WSUS **SCCM** - Configuration Manager **Default** - the value of **PatchSuccessSource** in the **GlobalSettings** table of the **TachyonMaster** database, as described in Configuring Patch Success: Configuring the source for Patch downloads.	Action	Deploys a specific patch or patches to targeted devices. **Note** Unlike the other instructions, the **<patchSpec>** parameter in this instruction does not support **all**. You must be specific which KBs you want to deploy. This instruction is used by the **Deploy** and **Download only** buttons, which allow users to deploy selected patches to devices. The **1E Patch Success Actioners** role requires **Actioner** permissions to see the **Deploy** and the **Download only** buttons. See Patch.Deploy in the Tachyon SDK.	**1E-PatchSuccess-Deploy**	5

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
Returns patch status from <source> for <patchSpec> identifier(s) Where : **<source>** is the patch download source, as above **<patchSpec>** is either **all**, or a list of comma separated GUIDs and/or KB numbers (without KB prefix) of patches to be reported.	Question	Returns patch status for given KB article numbers on targeted devices. The instruction is used by the **Check Status** button, which allow users to check the patch status of the selected patches and represent the results in Explorer for further investigations. The **1E Patch Success Actioners** role requires **Questioner** permissions to see the **Check Status** button. See Patch.List in the Tachyon SDK.	**1E-PatchSuccess-Explore**	5
Returns patch status from <source> of given<patchSpec> identifier(s) for PatchSuccess consumption Where: **<source>** is the patch download source, as above **<patchSpec>** is either **all**, or a list of comma separated GUIDs and/or KB numbers (without KB prefix) of patches to be reported.	Question	Returns patch status for all known patches on targeted devices. Information is based on offline cache. When run, its response data is offloaded direct to the SLA-BI cube. The instruction is used by the **Update Status** button, which allows users to update the dashboard with the status of selected patches, to see for example **Pending reboot** and **Installed** states. The **1E Patch Success Actioners** role requires **Questioner** permissions to see the **Update status** button.	**1E-PatchSuccess-Refresh**	5

Instruction text (ReadablePayload)	Type	Description	Instruction file name	Version
		See Patch.List in the Tachyon SDK.		

8 Guaranteed State

Tachyonis a systems management tool that turns the traditional systems management model on its head. Guaranteed State is based on the concept that a device is aware of its own current state more accurately than any centrally held repository. Also, if you can query the device directly then the need to store masses of data becomes unnecessary.



8.1 Introducing Guaranteed State

An overview of Guaranteed State is presented; what it does and how it can benefit your organization.

8.1.1 Guaranteed State Concepts

Concepts used by the Guaranteed State application, which ensures device compliance with enterprise IT policies.

8.1.1.1 Overview

Guaranteed State allows you to easily check and enforce device state. Device state can represent just about anything you'd like to be set in a certain way for a collection of devices.

> **Note**
>
> Before using Guaranteed State you need to configure it and upload some policies (with their rules, triggers and preconditions), please refer to:

Configuring Guaranteed State

Uploading Integrated Product Packs

Deploying a Policy.

Once you have imported an Integrated Product Pack you can configure and deploy policies to manage various device attributes. For example:

Registry keys

Services

Config Manager metrics such as client cache usage

Disk free space

WMI namespaces and classes.

8.1.1.2 Integrated Product Packs

Integrated Product Packs are Zip files containing Guaranteed State policies, but can also contain instructions (as an alternative to classic Product Packs which can only contain instructions). They have a folder structure and files as shown in the following table (except for manifest.xml) all folders and files are optional.

You can upload these Zip files into Tachyon using the Tachyon Product Pack deployment tool, please refer to Uploading Integrated Product Packs for details.

Folder	Sub-folder	Files
Fragments	Check	xml files, each containing the definition of a **check fragment**
Fix	xml files, each containing the definition of a **fix fragment**	
Precondition	xml files, each containing the definition of a **precondition fragment**	
InstructionSets	<Instruction Set Name>	xml files, each containing the definition of an **instruction**
Policies	xml files, each containing the definition of a **policy** (a list of rules)	

Folder	Sub-folder	Files
Rules	xml files, each containing the definition of a **rule** (a list of fragments, triggers, and their parameter values)	
TriggerTemplates	xml files, each containing the definition of a **trigger template** and its available parameters	
manifest.xml	xml file containing name, description and version details that are only used for display by the **Product Pack Deployment tool** The presence of this file indicates the zip file is an Integrated Product Pack.	
<policy>.ico	icon file that is referenced in the manifest.xml (Not currently used).	

1E provide a number of ready-made policies which are described in the Integrated Product Packs pages:

MEMCM Client Health Policy

Implementing MEMCM Client Install fix

Nomad Client Health Policy

Windows Client Health Policy

Tachyon Core Utilities

These pages include lists of instructions, policies, rules, fragments (preconditions, checks and fixes) and trigger templates. The lists have links to more detailed information about each pack in the Tachyon Product Packs reference.

You can also create your own policies using rules, fragments and triggers from other Integrated Product Packs, for example, the Tachyon Core Integrated Product Pack.

8.1.1.3 Policies and Rules

Guaranteed State is enforced by the Tachyon client at each device using one or more policies that are deployed to devices according to their management group memberships.

A policy consists of one or more rules, which fall into two primary categories:

Category	Explanation
Check	Allow you to verify that a device has a particular state, such as a registry key having a specific value. You can then view summary and detail reports which show devices that are compliant and not compliant with the check rules.
Fix	Allow you to define a desired state for the device and then enforce that state. For example, you could mandate that a registry key exists and contains a specific value. Again, you can report on the application of these fix rules to devices.

Management groups use rules to determine device membership, enabling the devices to be administered as a group. For example, you can select devices based on their Active Directory Organizational Unit, or their operating system version, or any other criteria available to the management group rules. Please refer to Management Groups page page for details.

You can also create your own policies using rules, fragments and trigger templates from any Integrated Product Pack that you have uploaded, which are fully configurable, please refer to Defining your own policy for details.

The following are examples of check and fix rules provided by the **Tachyon Core Integrated Product Pack**:

1E-GuaranteedState-General-Check-RegistryValue

1E-GuaranteedState-General-Fix-RegistryValue

1E-GuaranteedState-General-Check-ServiceState

1E-GuaranteedState-General-Fix-ServiceState

8.1.1.4 Fragments

Fragments is a collective term for Rules, Trigger templates and Preconditions which are written in the Tachyon instruction language SCALE.

8.1.1.5 Triggers

Triggers define the conditions which will cause a rule to be evaluated. Each check rule and fix rule must have a rule trigger defined using a trigger template.

The following are examples of trigger templates provided by the **Tachyon Core Integrated Product Pack**:

TriggerTemplate-IntervalHours

TriggerTemplate-IntervalMinutes

TriggerTemplate-IntervalSeconds

TriggerTemplate-ProcessCrash

TriggerTemplate-ProcessLaunch

TriggerTemplate-ServiceStatusChange

TriggerTemplate-WindowsEventLog

TriggerTemplate-WindowsRegistryChange.

8.1.1.6 Preconditions

Both check rules and fix rules may have optional preconditions defined.Preconditions allow you to define a conditional test that must be met before the rule is evaluated.

> **Note**
>
> A precondition is not required. If you do not specify a precondition, then the rule is always evaluated when the trigger fires.

The following are examples of preconditions provided by the **Tachyon Core Integrated Product Pack**:

1E-GuaranteedState-General-PreCondition-InstalledSoftware

1E-GuaranteedState-General-PreCondition-MinWindowsVersion

1E-GuaranteedState-General-PreCondition-MinWindowsVersionAndVariant

1E-GuaranteedState-General-PreCondition-OperatingSystem

1E-GuaranteedState-General-PreCondition-OSAndSoftware

1E-GuaranteedState-General-PreCondition-OsTypeAndArchitecture

1E-GuaranteedState-General-PreCondition-Service

1E-GuaranteedState-General-PreCondition-WindowsDevice

8.1.1.7 Dependencies

Check rules require a:

Trigger

Check.

You can also optionally add a precondition.

Fix rules require a:

Trigger

Check

Fix.

You can also optionally add a precondition.

> **Note**

Be sure that you understand the key differences between **Check Rules** and **Checks and Fix Rules** and **Fixes**:

A **Check Rule** defines a **Check**, including a trigger and optional preconditions

A **Fix Rule** defines a **Check and a Fix**, including a trigger and optional preconditions. a fix is applied when a check is performed and the check result indicates a compliance failure.

8.1.1.8 Rule outcomes

A rule always returns two items to the Tachyon subsystem. One is a Pass/Fail value and the second is an arbitrary data item. A rule can also return an error status to the subsystem. This can occur if the rule logic terminates unexpectedly, for example, because a file could not be found etc.

Guaranteed State history will show the result of rule evaluation. It will clearly indicate whether a check rule returned a success (compliance), failure, or error. It will also show whether a fix rule (if applicable) indicated success, failure, or returned an error.

Note

Four things you should know about rule outcomes:

A check or fix rule that fails or results in an error causes a device to remain non-compliant from a Guaranteed State perspective.

History entries are only created in Guaranteed State when an overall compliance transition occurs, for example from false to true or true to false.

If the precondition for a rule returns failure on a device when evaluated, then the Guaranteed State subsystem indicates 'not applicable' against the device compliance status for the rule.

Rules that return 'not applicable' do not affect device compliance status. If all rules for a device returned 'not applicable' the device would still be regarded as compliant.

8.1.2 Guaranteed State Features

An overview of Guaranteed State features.The Guaranteed State application gives you the ability to ensure device compliance with enterprise IT policies. For more information please refer to the Using Guaranteed State section of this documentation.

Note

1E provide Integrated Product Packs contain some ready-made policies. Please refer to Uploading Integrated Product Packs for more details.

8.1.2.1 Policies and Rules

The Guaranteed State of a device is enforced by the Tachyon client at the device. One or more policies are deployed to devices according to the management groups the devices belong to. Each policy consists of one or more rules that are either check rules or fix rules.

Rule	Explanation
Check	Allow you to verify that a device has a particular state, such as a registry key having a specific value. You can then view summary and detail reports which show devices that are compliant and not compliant with the check rules.
Fix	Allow you to define a desired state for the device and then enforce that state. For example, you could mandate that a registry key exists and contains a specific value. Again, you can report on the application of these fix rules to devices.

For an explanation of management groups, please refer to the Management Groups page page. Management groups allow devices to be flexibly grouped, based on management group rules. This means you can easily administer devices based on, for instance, their Active Directory Organizational Unit, or their operating system version, or any other criteria supported by the management group rules.

Note

For more information on policies and rules please refer to:

Defining your own policy

Integrated Product Packs.

8.1.2.2 The Guaranteed State Overview page

The **Overview** page lets you view the current state of your enterprise in terms of the devices and policies that have been defined and applied. It consists of a number of charts that let you monitor the state in real-time.

Note

For more information on the Guaranteed State Overview page please refer to:

Guaranteed State Overview page

8.1.2.3 Guaranteed State Reports

The Guaranteed State application provides three reports that let you view the details for the currently defined **Policies**, **Rules** and **Devices**. The information in these reports is consolidated into the **Guaranteed State Overview** page charts.

Note

For more information on the **Policies**, **Rules** and **Devices** reports pages please refer to:

Guaranteed State Overview page

8.1.2.4 Exploring devices

Guaranteed State provides a **Devices** page where you can view the currently connected devices. On this page you can also select one or more of the devices and click an **Explore** button that

launches the **Explorer** application. You can then run an instruction using the selected devices as the coverage for the instruction.

> **Note**
>
> For more information on exploring devices please refer to:

Using Explorer to investigate devices in Guaranteed State.

8.1.2.5 Device Criticality

Device criticality is an attribute of a device that defines its importance within an organization. The default definition in Tachyon has these settings:

Undefined (or not set)

Non-critical

Low

Medium

High

Critical.

At present, criticality settings do not affect the primary operation of Guaranteed State. However, it is possible to use Tachyon to set device criticality and to view it within Guaranteed State.

Tachyon also supports the use of the criticality setting when defining coverage for an instruction. For example, you can target an instruction to be sent only to devices whose criticality is not **Critical**.

> **Note**
>
> For more information on device criticality please refer to:

Using Device Criticality.

8.2 Implementing Guaranteed State

Everything you need to know about getting Guaranteed State installed and running in your network. This section is structured in a way that leads you through the three phases of a typical implementation project.

Design, including requirements

Install, including preparation

Verify.

8.2.1 Design Considerations

The Design Considerations for Guaranteed State can be found on the Implementation Overview page.

8.2.2 Requirements

The Requirements for Guaranteed State can be found on the Planning for Tachyon pages.

8.2.3 Preparation

The Preparation for Guaranteed State can be found on the Preparation page.

8.2.4 Installing and upgrading

How to set up Tachyon Serverand deploy Tachyon clients, including a guide to upgrading.

At its minimum, Tachyon consists of two components: Tachyon Server and 1E Client (with Tachyon features enabled). Additionally, you may install Tachyon applications on the server.

You install Tachyon Server and its applications using **Tachyon Setup**.

You deploy 1E Client on Windows PCs using the **MSI installer**, or if you have Configuration Manager you can use **1E Client Deployment Assistant** (CDA).

8.2.4.1 Tachyon Product Pack deployment tool

The Tachyon Product Pack deployment tool can be used to upload multiple Classic and Integrated Product Packs into Tachyon.

8.2.5 Uploading Integrated Product Packs

How to upload the Product Packs provided with the Tachyon release.

1E provides a number of Guaranteed State policies and Instructions with the Tachyon release on the support portal.

8.2.5.1 Getting started

Integrated Product Packs are loaded into Tachyon using the Tachyon Product Pack deployment tool. For more details please refer to Tachyon Product Pack deployment tool.

8.2.5.2 Uploading Integrated Product Packs

After installation, Guaranteed State has no immediately available policies, you will first need to load some from the **tachyonproductpacks.<version>.zip** file - this can be done using the Tachyon Product Pack deployment tool. The following steps describe how this is done:

8.2.5.2.1 Checking the status of Guaranteed State just after installation

Log on to the Tachyon portal as a Guaranteed State administrator and navigate to the **Guaranteed State→Overview** page.

Before running the Tachyon Product Pack deployment tool, you will see at the top of the **Overview** page that there are **0 Policies** available.

8.2.5.2.2 Running the Tachyon Product Pack deployment tool

Navigate to the directory where the **tachyonproductpacks.<version>.zip** file has been unzipped.

You will see two directories: **Classic** and **Integrated**.

Navigate to the **Integrated** directory.

Double-click on **Tachyon.ProductPackDeploymentTool.exe**.

Click on **Yes** in any UAC dialog displayed.

The **Tachyon Product Pack deployment tool v5.0** dialog will appear.

You must specify the URL of the Tachyon Consumer API in the **Server** field and then click on **Test Connection** to verify that you have entered the correct value. If you run the tool on the Tachyon Server, the tool will automatically prefill the URL.

The **Style** column of the **Available Product Packs** table indicates whether each **Product Pack** is **Classic** or **Integrated**. The Available Product Packs table will be populated with all the Product Pack zip files encountered in the directory the tool was launched from and all its sub-directories.

The **Select all** box can be used to select or deselect all the items in the **Available Product Packs** table.

There are five **Integrated Product Packs** provided with the release and these are listed, and also selected, in the **Available Product Packs** table:

Endpoint Performance

Microsoft SCCM Client Health

Nomad Client Health

Tachyon Core

Windows Client Health

Uploading Product Packs is done by clicking the **Upload selected** button, which uploads all the selected items in the **Available Product Packs** table.

The progress of the upload is displayed in the **Results** field. When the upload has finished the word **Done.** will be displayed in the **Results** field.

After uploading has completed you can click the **Close** button on the deployment tool.

> **Tip**
>
> You can specify the parameters on the command-line as decribed in Tachyon Product Pack deployment tool:
>
> **-url "<ConsumerAPI>"** for example: **-url "https://tachyon.acme.local/Consumer"**.
>
> **-log <level>** for example **-log DEBUG**

8.2.6 Configuring Guaranteed State

What you need before using Guaranteed State.

In this version of Tachyon, you only need to configure users with the following roles to use and administer Guaranteed State:

Guaranteed State Viewers role, who can view the dashboards or an administrator

Guaranteed State Administrators role to upload, create and manage policies.

8.2.6.1 Prerequisites

To configure Guaranteed State, you will need the following:

An appropriate Tachyon License to permit using Guaranteed State. This is normally included in a standard Tachyon license.

A **domain security group** representing Guaranteed State Administrators who will use the Tachyon Guaranteed State application.

The steps below describe how a Tachyon user will be created for this group, and a role which grants access to the Guaranteed State pages and instructions.

A Tachyon user with the following role permissions:

Permissions Administrators role in order to create the above Tachyon user for the security group

Guaranteed State Administrators role to upload, create and manage policies (optionally member of the above security group)

Instruction Set administrator role to upload instructions

Log Viewers role to aid troubleshooting (optional).

One or more Integrated Product Packs.

> **Note**
>
> This process assumes you have already verified your Tachyon installation and have Tachyon clients deployed on some Windows devices.

8.2.6.2 Assigning users to the Guaranteed State Administrators role

To optionally create a new user:

Navigate to the **Settings**→**Permissions**→**Users** page.

Click the **Add** button to start the add user process.

In the **Add user** popup subsequently displayed, type the name of an Active Directory account or security group in the **Select user** field.

Select a name from the search results list and click the **Add** button.

The new user will be added to the **Users** table.

To assign the new user to the **Guaranteed State Administrators** role in the:

Users table, locate the row for the new user and click on the link in its **Name** column.

User : <user/group> page, click the **Edit** button.

Edit roles assigned to user popup, scroll down the list and check the checkbox for the **Guaranteed State Administrators** role.

Click **Save**.

To verify:

Logon to the Tachyon Portal using a Tachyon user account with the new **Guaranteed State Administrators** role.

> **Note**
>
> Guaranteed State can be reached directly using the following URL:
>
> `https://<tachyon DNS Name FQDN>/Tachyon/App/#/guaranteedstate/`
>
> where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading Preparation: DNS Names.

Navigate to the **Guaranteed State→Overview** page.

8.2.7 Verifying

The verifying considerations for Guaranteed State can be found on the 1E platform - Verifying page.

8.3 Using Guaranteed State

How to use Guaranteed State to ensure endpoint compliance to enterprise IT policies.

> **Note**
>
> Guaranteed State can be reached directly using the following URL:

`https://<tachyon DNS Name FQDN>/Tachyon/App/#/guaranteedstate/`

> where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading Preparation: DNS Names.

8.3.1 Integrated Product Packs

Guaranteed State includes a set of out-of-the-box policies known as Integrated Product Packs.

This section provides information on these Integrated Product Packs which are provided with the Tachyon release and includes details on how to upload them into Tachyon.

> **Note**

The Integrated Product Packs provided with the Tachyon release include predefined values determined through testing at 1E. Some of these values can be modified to meet specific environmental requirements. You should review the Integrated Product Pack pages below for guidelines, details of the predefined values and the available customization options, prior to deploying in your environment.

If you need to further customize any of the Policies, please contact 1E.

Note

A list of the instructions, policies, rules, and fragments is provided on each of the Integrated Product Pack pages. For more detailed information, please click on the link for an instruction, policy, rule, or fragment, to see a description in the Tachyon Product Packs reference.

8.3.1.1 MEMCM Client Health Policy

Many businesses rely on Microsoft Endpoint Manager Configuration Manager (MEMCM) to deploy software, patches and updates across their company networks. It is crucial that Configuration Manager is working effectively.

The MEMCM Client Health policy monitors Configuration Manager client health and performance. It checks for cache availability, inventory cycles, service availability and Configuration Manager WMI integrity - common causes of Configuration Manager client problems on devices.

The MEMCM Client Health policy replaces the previous SCCM Client Health policy and covers the following:

Ensure the correct version of the CM client is installed and running and assigned to the correct site

Ensure the CM client is not stuck in provisioning mode

Ensure that heartbeat discovery, inventory and state messages are being sent regularly

Ensures the CM client cache is set to the correct size

Ensure the CM client log settings are correct

Ensure the BITS service exists, configured to start up automatically and is running

Ensure the Windows Time service exists with correct startup settings

Ensure the Windows Management Instrumentation (WMI) service exists, configured to start automatically and is running

Ensure WMI is healthy, the core CIMv2 and ccm namespaces and classes exist and that the WMI repository is consistent

Ensure the Windows Update service exists with correct startup settings, is configured to use the correct source (CM, WSUS or Microsoft Update) and that the service can connect to the source

Note

This policy is intended for deployment to Windows devices only.

8.3.1.1.1 Important considerations

Before deploying the MEMCM Client Health Policy you need to be familiar with its contents and comfortable that you want to apply it to the devices in your network.

By default, automated fixes in the Policies provided by 1E are not enabled, this means you will have to specifically enable the ones you want to use before they can take effect.

A new or updated Policy should first be verified by deploying it to a Management Group containing a small number of devices, reviewing the Guaranteed State reports, and confirming the checks and enabled fixes are working as expected.

When you are comfortable with the results you can then deploy to larger Management Groups.

8.3.1.1.2 MEMCM Client Health Policy reference

For details on the policy, rules, triggers, preconditions, checks and fixes available in the MEMCM Client Health Policy please refer to MEMCM Client Health Integrated Product Pack.

8.3.1.1.3 Implementing MEMCM Client Install fix

8.3.1.2 Nomad Client Health Policy

Nomad is included as part of the 1E Client, and as part of that integration, we offer a Nomad client health compliance policy in Guaranteed State. This verifies common Nomad requirements such as ACP registration, disk availability, firewall exceptions, crash notifications and cache monitoring.

The Nomad client health policy replaces the client health tile in the Nomad dashboard plus additional remediation steps:

Keeps content distribution services up and running on Nomad clients, so that users are secure and productive

Ensures Alternative Content Provider (ACP) registration configuration is set

Maintains optimal disk availability and monitors cache size for storage capacity planning

Enforces Firewall exceptions.

> **Note**
>
> This policy is intended for deployment to Windows devices only.

8.3.1.2.1 Important considerations

8.3.1.2.1.1 Configuring and verifying

Before deploying the Nomad Health Policy you need to be familiar with its contents and comfortable that you want to apply it to the devices in your network.

By default, automated fixes in the Policies provided by 1E are not enabled, this means you will have to specifically enable the ones you want to use before they can take effect.

A new or updated Policy should first be verified by deploying it to a Management Group containing a small number of devices, reviewing the Guaranteed State reports, and confirming the checks and enabled fixes are working as expected. When you are comfortable with the results you can then deploy to larger Management Groups.

Please review the following specific considerations before verifying and deploying:

Rule	Considerations
Check rule: Ensure Nomad does not have its content indexed by ConfigMgr software inventory checks	Disable this check rule if the Nomad cache location has been changed from the default C:\ProgramData\1E\NomadBranch. The corresponding fix rule is disabled by default.

8.3.1.2.1.2 Deploying

Target the Policy at separate Management Groups for Distribution Points and Nomad clients, containing only Windows devices.

If you have deployed your Nomad clients with different baseline settings then consider creating different Management Groups for them, so that it will be easier to identify the potental differences in compliance. Target all clients to begin with and then target different groups as required.

> **Note**
>
> This policy is intended for deployment to Windows devices only, so in a cross-platform estate it is advisable to deploy this policy to a Management Group that is scoped to Windows devices. If you do target non-Windows devices then preconditions for the rules ensure those devices are unaffected and rules are reported as **Not Applicable**.

8.3.1.2.2 Nomad Client Health Policy reference

For details on the following instructions, policies, check rules, fix rules, triggers and preconditions, that are included in the Nomad Client Health Policy, please refer to Nomad Client Health Integrated Product Pack.

> **Note**

8.3.1.3 Windows Client Health Policy

Over time Windows devices can develop performance problems related to device or service availability. This policy verifies the available storage capacity on devices, notifies of application crashes, monitors WMI health and service function and also checks the behavior of core Windows services.

The Windows client health policy covers all of the following:

Manages Windows devices and service availability performance problems

Safeguards disk space integrity, ensuring sufficient storage capacity

Ensures optimum performance of the Configuration Manager client and that WMI is active and integrated

Notifies of application crashes and remediation assists. Investigates root cause for specific issues.

Note

This policy is intended for deployment to Windows devices only.

8.3.1.3.1 Important considerations

Before deploying the Windows Client Health Policy you need to be familiar with its contents and comfortable that you want to apply it to the devices in your network.

By default, automated fixes in the Policies provided by 1E are not enabled, this means you will have to specifically enable the ones you want to use before they can take effect.

A new or updated Policy should first be verified by deploying it to a Management Group containing a small number of devices, reviewing the Guaranteed State reports, and confirming the checks and enabled fixes are working as expected.

When you are comfortable with the results you can then deploy to larger Management Groups.

The policy contains the rule Check application crash count which by default specifies the Application Name as MyApplication.exe. You do not need to change this before deployment, but you can edit the rule to specify an the executable that you want to monitor, or clone the rule to monitor other executables. You will need to edit the rule and change the name in the Trigger and the Check tabs.

8.3.1.3.2 Windows Client Health Policy reference

For details on the policy, rules, triggers, preconditions, checks and fixes available in the Windows Client Health Policy please refer to Windows Client Health Integrated Product Pack.

8.3.2 Deploying a Policy

How to deploy a Policy in Guaranteed State.

8.3.2.1 Overview

If you have uploaded the Product Packs provided with the Tachyon release using the PPDT, you will already have several Guaranteed State policies and Instructions available in the application. Please refer to Tachyon Product Pack deployment tool for details.

> **Important**
>
> When any policy artifacts are altered, the Policy infrastructure is marked as "dirty," prompting a **Deploy Policy** notification. This happens even if the modified artifacts are not utilized by any active Policy. If you are certain that none of the altered artifacts are in use, deployment is not necessary. However, if you are uncertain, you can proceed with the deployment without concern, as it will not impact anything if there are no changes. Refer to Instructions and product packs.

The policies included with the release are:

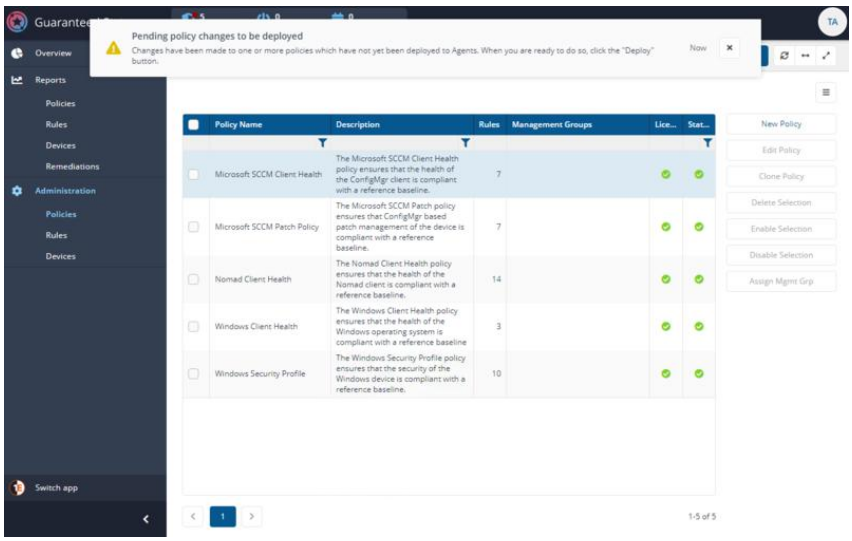
Policy name	Description
Microsoft SCCM Client Health	The Microsoft SCCM Client Health policy ensures that the health of the ConfigMgr client is compliant with a reference baseline.
Microsoft SCCM Patch Policy	The Microsoft SCCM Patch policy ensures that ConfigMgr based patch management of the device is compliant with a reference baseline.
Nomad Client Health	The Nomad Client Health policy ensures that the health of the Nomad client is compliant with a reference baseline.

Policy name	Description
Windows Client Health	The Windows Client Health policy ensures that the health of the Windows operating system is compliant with a reference baseline.
Windows Security Profile	The Windows Security Profile policy ensures that the security of the Windows device is compliant with a reference baseline.

When you first open the **Administration→Policies** page, you'll see a popup message advising that you have policy changes that can be deployed to Agents. This refers to the new policies in the above table that can be uploaded using the PPDT.

The next steps to using these new policies is to add them to one or more Management Groups and to deploy them to clients.

> **Note**
>
> For a new or updated policy to become effective, it must be deployed. Policies are deployed by clicking the **Deploy** button from the **Guaranteed State→Administration→Policies** page. Deployment affects all visible policies that are enabled, please refer to the section Deploying policies for details.



8.3.2.2 Assigning a policy to a management group

Before deploying a policy we must first define the devices to which the policy will be sent. We do this by assigning a policy to a management group.

To do this, go to **Guaranteed State→Administration→Policies** select the policy and click the **Assign Mgmt Grp** button.

By default, there will always be a management group for **All Devices**. We select this and then click **Save**.

> **Warning**

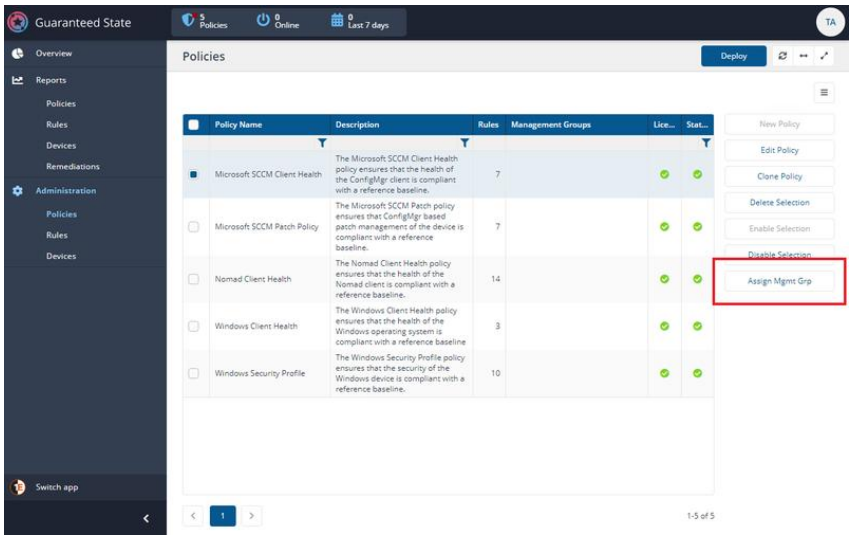
If you select **All Devices**, Guaranteed State will apply the policy to all devices including ones that are not currently online, which may include other OS or device types, for example servers.

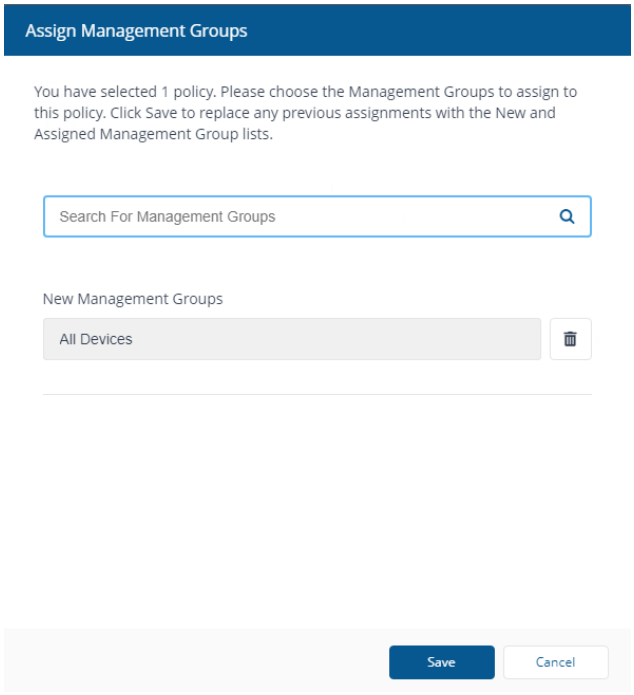
For this reason we recommend that you define a specific Management Group for your policy to limit its scope to just the devices included in the Management Group.

The Integrated Product Packs provided by 1E contain policies for Windows devices, therefore when you deploy these please ensure your Management Groups include only Windows devices.

Note

In Guaranteed State you can create your own custom polices and associated rules, refer to Defining your own policy for details.

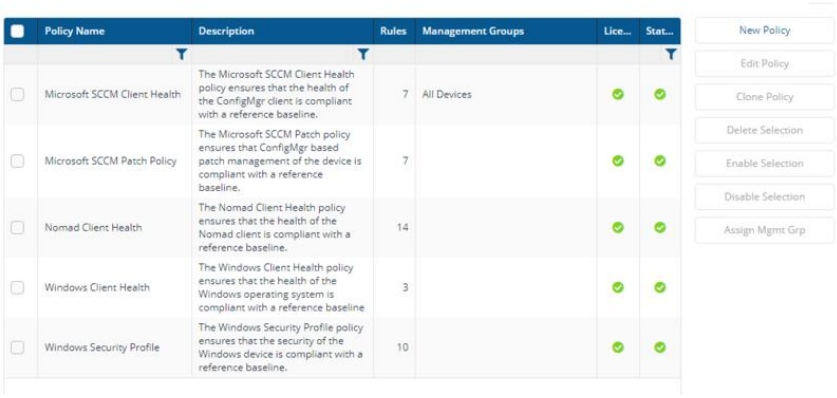




We should now see the assigned policy.

Note

The policy is now shown with its assigned management groups, in this case, the **All Devices** group.



8.3.2.3 Deploying policies

For a new or updated policy to become effective, it must be deployed. Policies are deployed by clicking the **Deploy** button from the **Guaranteed State→Administration→Policies** page. Deployment affects all visible policies that are enabled.

You can enable or disable a policy from this screen by selecting it and then clicking the **Disable Selection** or **Enable Selection** button (which will change the **Status** as appropriate based on the current state of the policy).

Policy state	Description
Deleted policies and deployment	If a policy is deleted, then clicking **Deploy** will also cause any Tachyon client that receives the deployment to remove the policy and to cease to enforce it.
Disabled policies and deployment	If a policy is disabled, then clicking **Deploy** will also cause any Tachyon client that receives the deployment to remove the policy and to cease to enforce it. If the policy is subsequently re-enabled, then the next time **Deploy** is clicked, it will be sent out again and become effective.

Note

Currently, you are prompted to deploy a policy as soon as you save it, after creating or editing. However, deploying a new policy where any of the following is true will not result in any action being taken by the 1E Client on devices because:

No rules have been assigned to the policy

All rules assigned to a policy are disabled

The policy has not been assigned to any Management Group.

However, once a policy has been deployed, re-deploying the policy will always affect the devices to which the policy was previously deployed. In the case where a re-deployed policy meets any of the above criteria, it will cease to be effective on the devices

If the change removes a policy from any management groups, devices affected by this change will receive a policy update. For example, suppose you had a policy P1 assigned to management group MG1 and you then re-target P1 to management group MG2 instead and re-deploy it. All the devices which ever received policy P1 previously will have that policy removed if they now fall outside management group MG2.

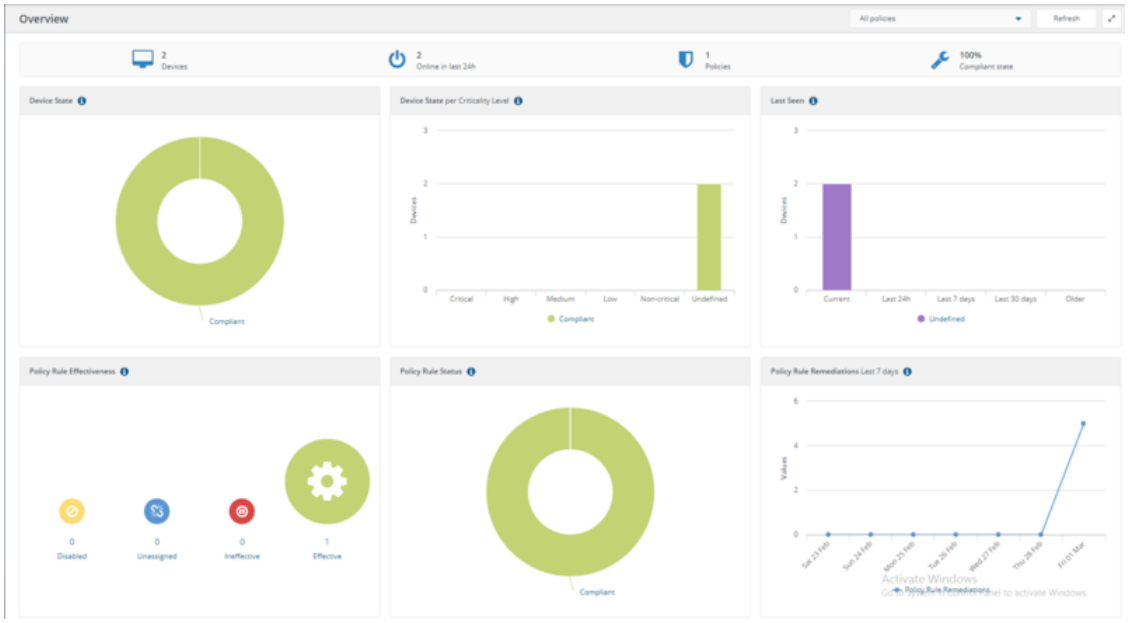
The distribution of policies to devices is staggered. The stagger period associated with this activity is designed to avoid excessive network traffic. It is not related to the DefaultStaggerRangeSeconds parameter which is defined during 1E Client installation, refer to Tachyon client settings for details.

8.3.2.4 Verifying policies

You can verify policy enforcement on the **Guaranteed State→Overview** page and confirm policy download and applications on the devices.

8.3.2.4.1 Verifying policy enforcement

The Guaranteed State overview shows us all compliant devices.

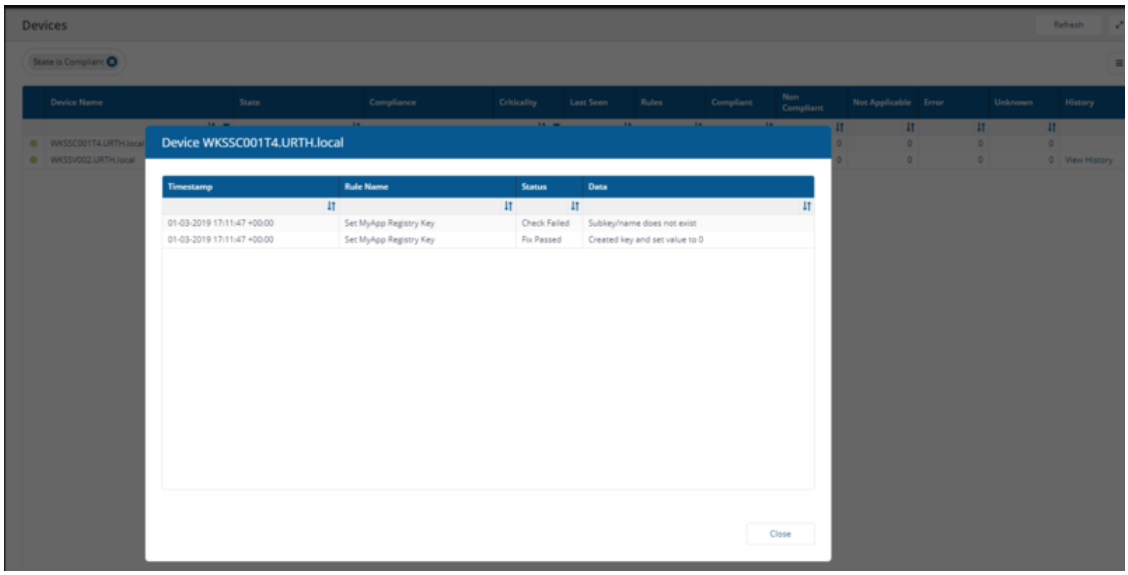


You can drill down on each chart. For example, clicking on the **Device State** chart allows us to see the specific devices that are associated with the chart. From there we can examine the history of each device, for example.

Note

History entries are only created when the status changes state from pass to fail or vice-versa. Even though you may have a rule evaluated periodically by the 1E Client, a history entry is not created for each evaluation cycle. The 1E Client only communicates a state change when the rule status changes.

This means that if the cause of a failure changes, you may not receive a history entry with the revised cause, because no updates are received until the compliance state changes. This limitation may be revised in a future release.



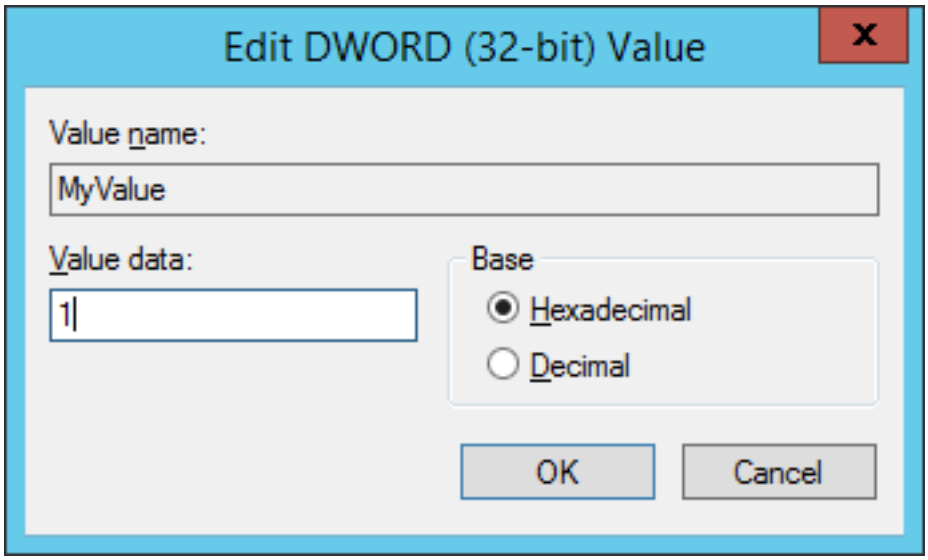
8.3.2.4.2 Verifying policy on 1E Client

We can also confirm that the policy was downloaded and applied on 1E Client by examining the 1E Client log on the device. Here we see that the policy was downloaded and successfully applied.

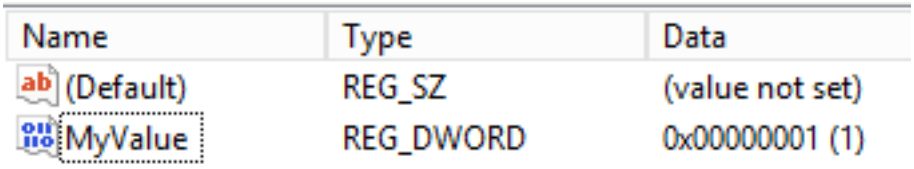
```
2019-03-01 17:11:47.268 [ 6892] INFO  - Downloaded and applied new policy with 1 rule(s) (829 bytes)
2019-03-01 17:11:47.271 [ 6892] INFO  - [Policy Rule 'Set MyApp Registry Key' (ID 4) (check)] Successfully processed instruction
2019-03-01 17:11:47.271 [ 6892] INFO  -  -> Policy Rule 'Set MyApp Registry Key' (ID 4) - check failed; running fix rule
2019-03-01 17:11:47.274 [ 6892] INFO  - [Policy Rule 'Set MyApp Registry Key' (ID 4) (fix)] Successfully processed instruction
2019-03-01 17:11:47.280 [ 6892] INFO  -  -> New Policy Rule 'Set MyApp Registry Key' (ID 4) evaluated; notifying status of 'fix passed'
```

If we now start the registry editor on the device, we can see that the **Value name** and **Value data** exist.

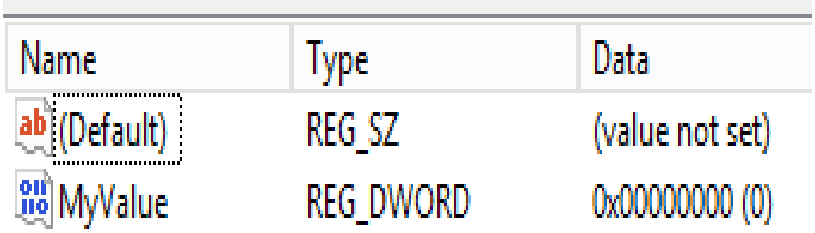
If we attempt to change the **Value data** to **1**.



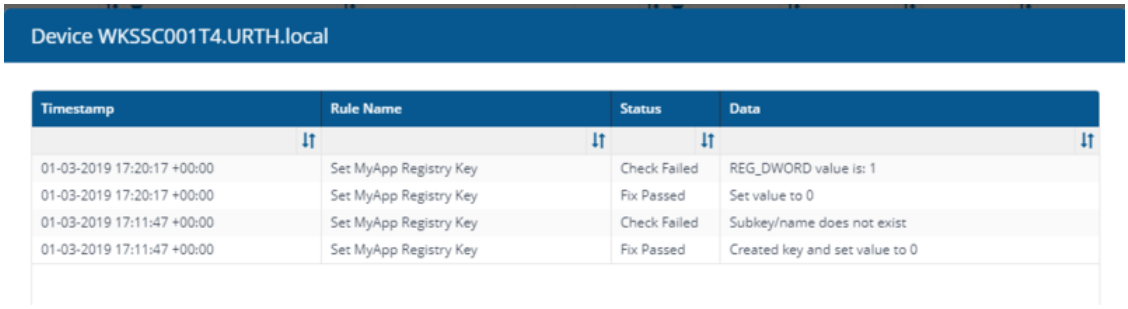
We see that, temporarily, it is out of compliance with the check rule.



However, after 30 seconds, it is automatically reset to be compliant.



If we view the device history from the Guaranteed State Overview screen, we see that the momentary compliance failure has been logged.



8.3.2.5 Device Status

The device status view in Guaranteed State shows the status of policies and rules for each device.

A device is shown as either **Compliant** or **Noncompliant**. The associated columns show more information on the status of rules on the device:

Column	Description
Rules	The number of rules which are active for the device. If there are several active policies applicable to the device, the rules count will be the sum of all the distinct rules associated with those policies. (i.e, if the same rule is included in two active policies against the device, the count of distinct rules is 1).
Compliant	The number of rules which returned a compliance status of success (specifically each rule which returned a boolean value of **True** when the rules were last evaluated).
Non-compliant	The number of rules which returned a compliance status of failure (specifically each rule which returned a boolean value of **False** when the rules were last evaluated).
Not applicable	The number of rules for which the precondition for the rule meant that for this device, the rule was not regarded as applicable and hence was not evaluated.
Error	The number of rules for which an error was raised during the execution of the rule. This means that the SCALE code associated with the rule failed with an error that caused the code to be terminated, or that the code deliberately raised an error using the SCALE Error function.
Unknown	The number of rules for which no status has yet been returned from the device.

8.3.3 Defining your own policy

How to define a policy in Guaranteed State.

For details of policy objects you can use to create your own policies, please refer to Tachyon Product Packs reference.

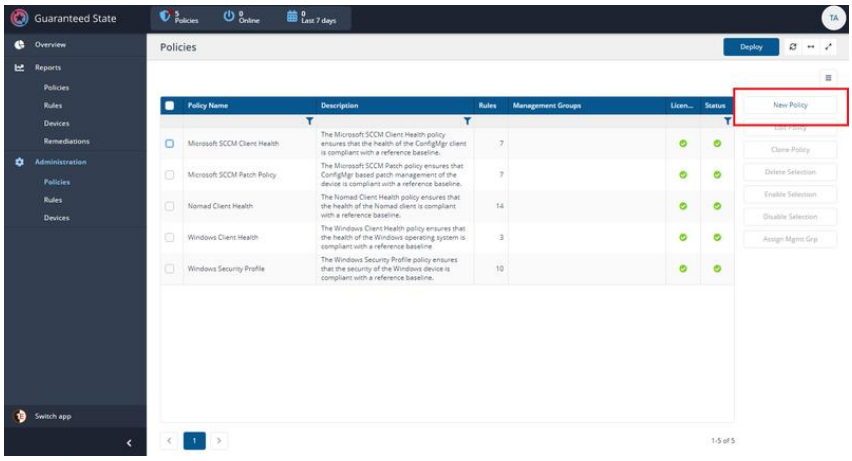
8.3.3.1 Defining a policy

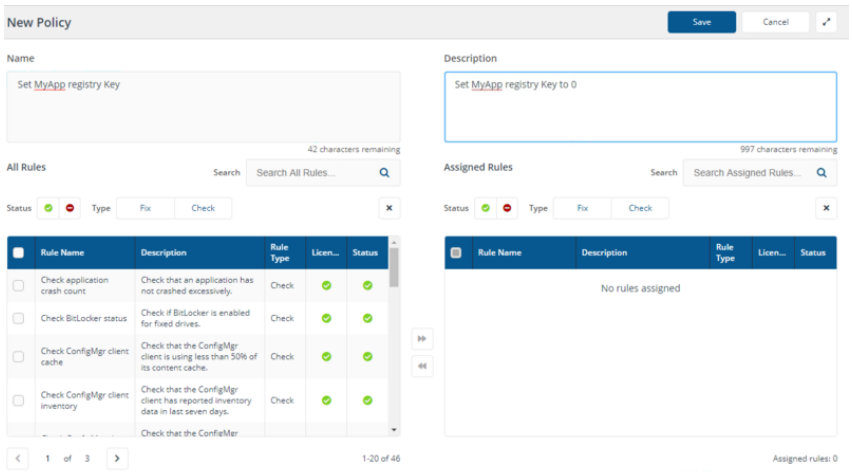
You define a policy from **Guaranteed State->Administration->Policies**.

Click **New Policy**, enter a name and description for the policy and click **Save**.

Note

The Managing rules section explains how to create and add rules for the new Policy.



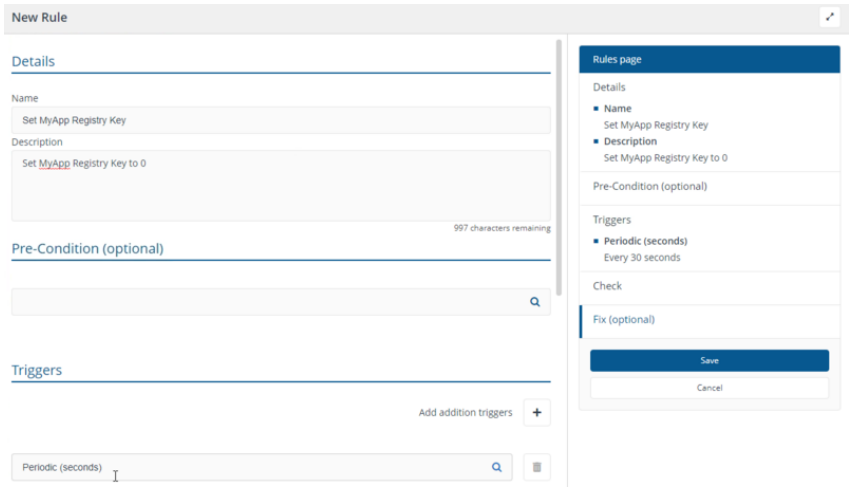


8.3.3.2 Managing rules

Policies need rules in order to be of any use. The following headings show how to define rules, caveats for editing rules and how to associate rules with policies.

8.3.3.2.1 Defining a rule

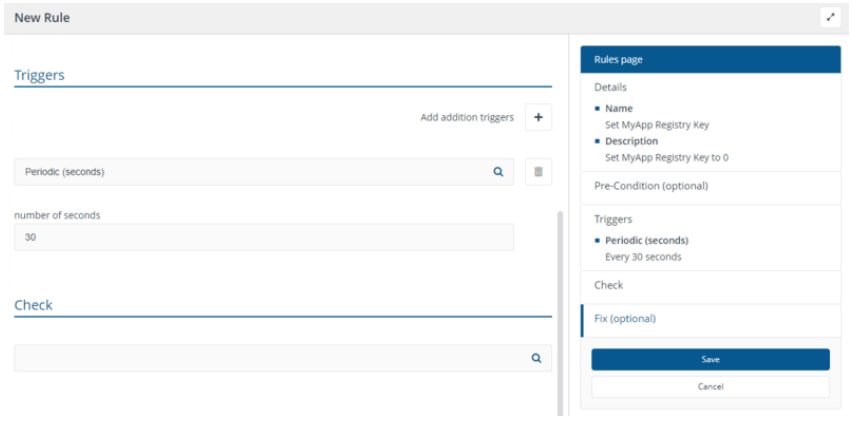
You define a rule from **Guaranteed State->Administration->Rules**. Click **New Rule** then enter a name and description.



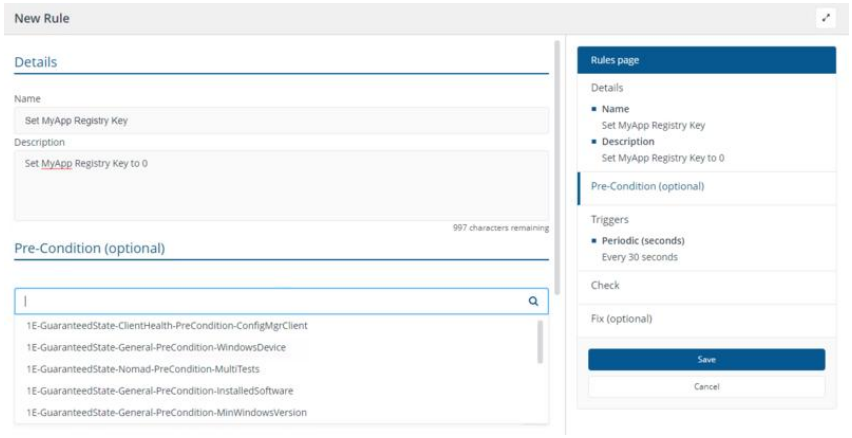
In the **Triggers** section we're going to define that the rule should be evaluated periodically, every 30 seconds. In the search window we choose **Periodic (seconds)** and set the **number of Seconds** to **30**.

You can add multiple **Triggers** using the add triggers plus sign, in this example we'll just use one.

> **Note**
>
> Do not specify a period less than 30 seconds. The rule may be accepted by the management interface but the 1E Client will not apply it.

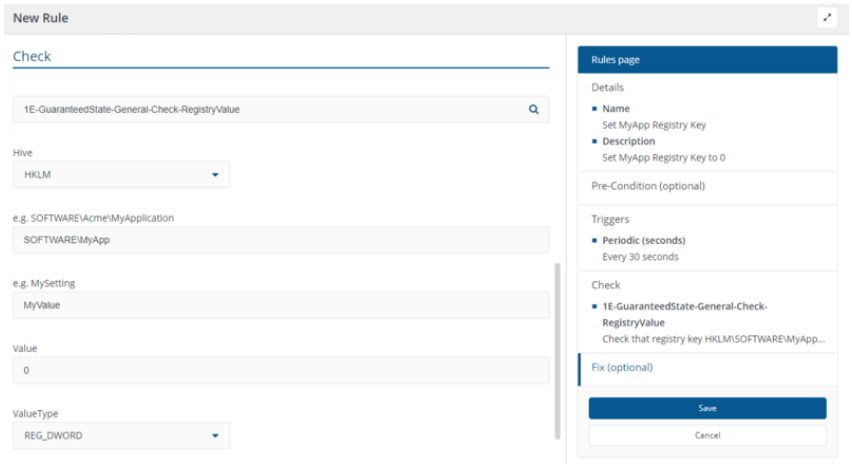


In the **Precondition** section, we will not define a precondition rule, but you can review the available choices, if you do want to set one.



In the **Check** section, we'll define a check rule that requires that there is a value **MyValue** in the registry hive HKLM and subkey **SOFTWARE\MyApp**. Its value should be of type **REG_DWORD** and it should be **0**.

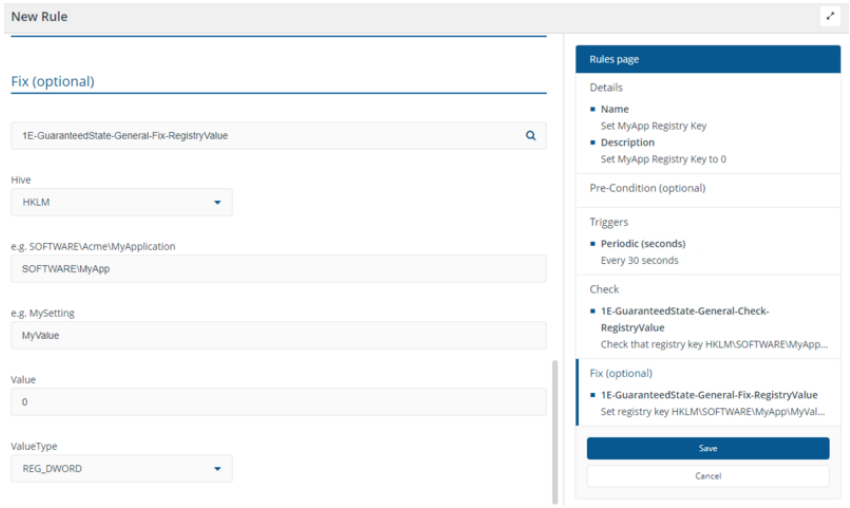
If any part of the **Subkey** is missing, or the **Name** or **Value** fail to match this check rule, then the fix rule will be applied.



In the **Fix** section, the fix rule will be identical to the check rule. This means that if the registry is not consistent with the check rule, it will be made consistent.

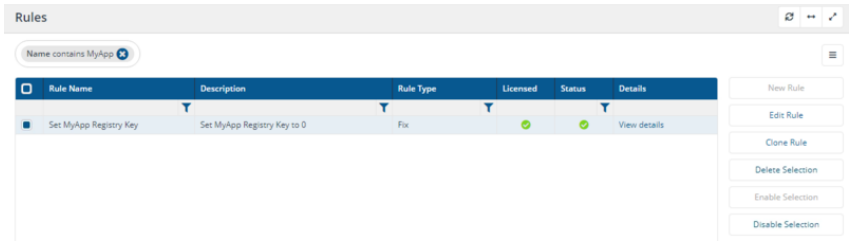
If any part of the **Subkey** does not exist, or the **Value** or **Name** is missing or has a different value or type, then all of these discrepancies will automatically be corrected and the registry value made to be consistent with the check rule.

Then click **Save**.



8.3.3.2.2 Editing existing rules

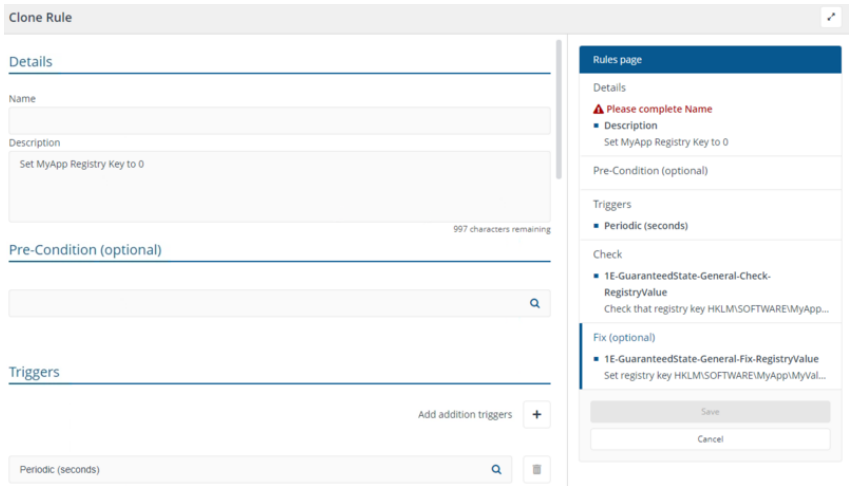
You can edit a rule by selecting it with the checkbox on the left and then selecting**Edit Rule**.



8.3.3.2.3 Cloning a rule

You can clone (copy) a rule by selecting it with the checkbox on the left and then selecting **Clone Rule**. When you do this, a copy of the rule is made.

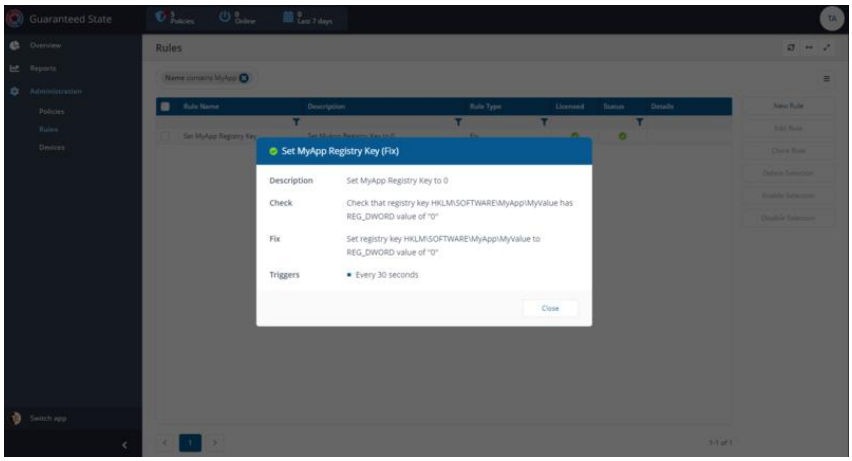
You will be prompted to enter a new name for the cloned rule. After this you can modify any property of the cloned rule and save it.



8.3.3.2.4 Viewing Rule Details

You can view the rule details for a rule by clicking the **View Details** link displayed on the rules page under the **Details** column, showing:

Heading	Description
Description	Rule description entered when the rule was created.
Check	The verification that a device has a particular state.
Fix	The defined desired state for the device and the enforcement that state.
Triggers	The definition of the conditions causing a rule to be evaluated.



8.3.3.2.5 Enabling and disabling rules

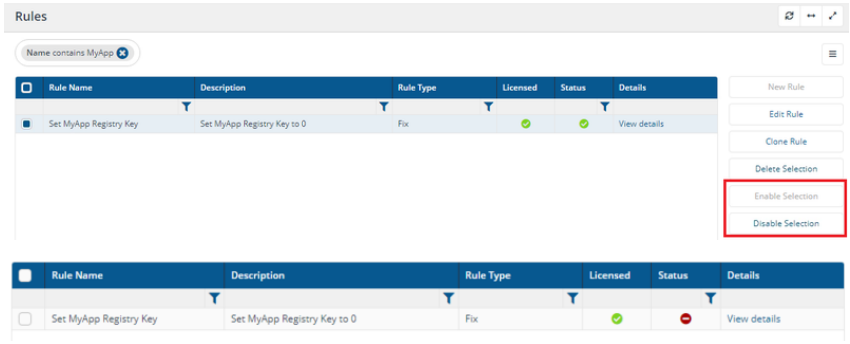
You can enable and disable rules by selecting the rule with the checkbox on the left and then selecting **Disable Selection**, if the rule is enabled, or **Enable Selection**, if the rule is disabled.

Disabled rules are shown with a disabled icon against them .

A disabled rule ceases to have effect within any policy that refers to that rule, when that policy is redeployed. In effect, a disabled rule acts as if the rule is not part of the policy.

You must redeploy any policies which contain a disabled rule for the change to become effective on any devices targeted by the policies.

If you enable a previously disabled rule then the rule becomes active again. You must redeploy any policies containing the rule for the change to become effective on any devices targeted by the policies.

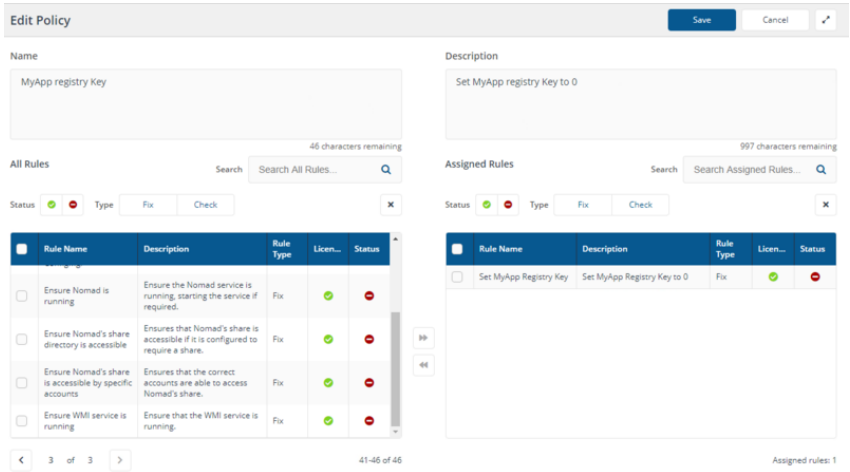


8.3.3.2.6 Associating a rule with a policy

You associate a rule with a policy from Guaranteed State →**Administration**→**Policies** by selecting the policy using with the checkbox on the left, then selecting **Edit Policy**.

The available rules are on the left of the page. You select the rule(s) you want to associate with the policy using the checkboxes and then click the button.

After selecting all the rules you want to associate, click **Save**.

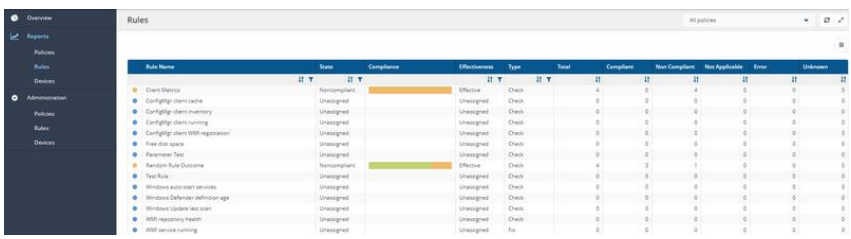


8.3.4 Using Explorer to investigate devices in Guaranteed State

How to investigate devices displayed in the Guaranteed State pages using Explorer.

8.3.4.1 Using Guaranteed State to define coverage for a question in Explorer

Selecting the **Rules** view from the **Reports** page in Guaranteed State shows the compliance status for each rule.

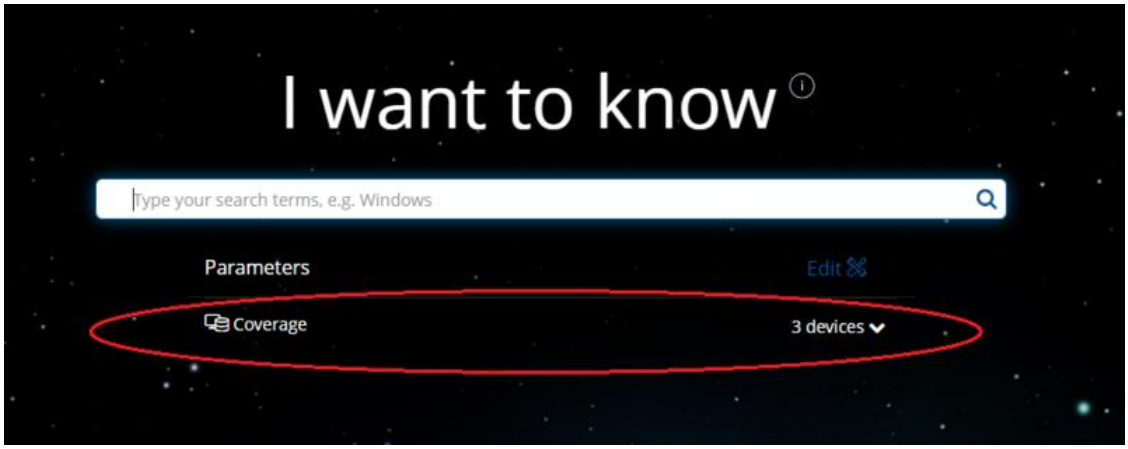


You can filter by policy, by selecting the applicable policy from the dropdown box at the top of the screen.

If you now click on the rule name, you will be taken to the devices against which the rule has been evaluated. You can then select one or more devices by clicking the selection checkbox to the left of each device row.

Having done this you can now click the **Explore** button. This switches to the **Explorer** application **Home** page, but note that the device coverage for any question or action has been set automatically, as shown opposite.

This makes it easy to follow up compliance issues by addressing questions only to devices with a specific compliance state.



8.3.5 Guaranteed State Overview page

The overview page shows a dashboard with six charts, reflecting the currently selected policy or all policies.

The dashboard is refreshed (recalculated) when:

Opened or the page is refreshed in the browser

A different policy is selected

Autorefreshed when the **Autorefresh** switch is enabled

The refresh button is clicked.

8.3.5.1 Dashboard charts overview

The Guaranteed State dashboard presents a number of panels:

Overview header pane

Device State

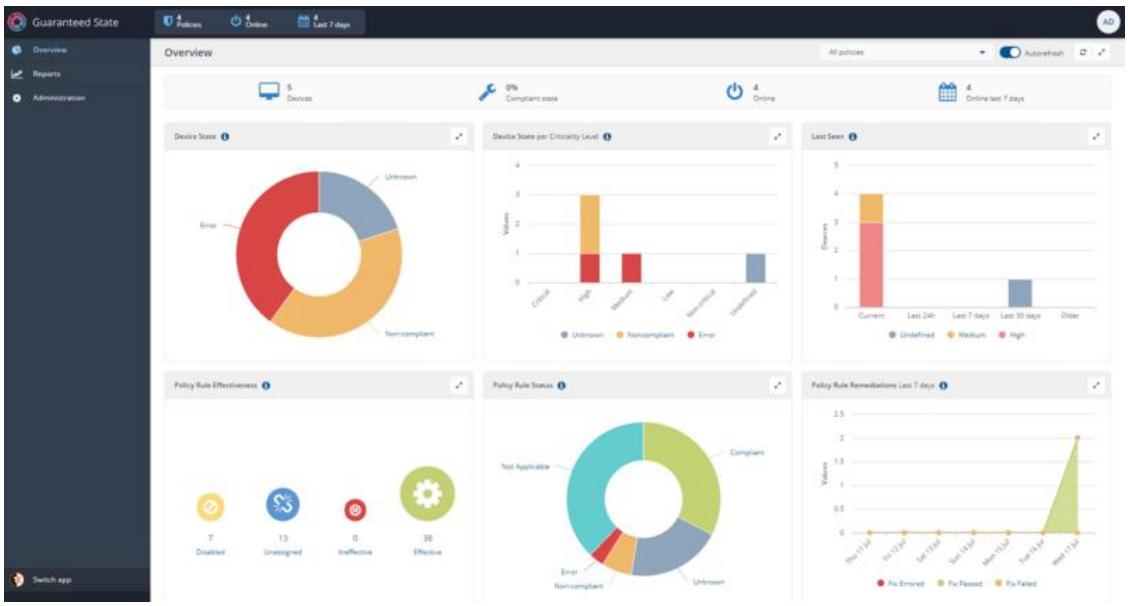
[Device State per Criticality Level]

[Last Seen]

[Rule Effectiveness]

[Rule Status]

[Policy Rule Remediations Last 7 days]



8.3.5.1.1 Overview header pane

The Overview header pane has three rows:

Top row:

Policies - shows the number of policies currently enabled, and is a shortcut to the Policies administration pane

Online - shows the number of devices currently online, and is a shortcut to the Devices administration pane

Last 7 days - shows the number of devices seen in the last 7 days, and is a shortcut to the Devices administration pane.

Middle row:

Policies drop-down list - filter on all policies or an individual policy, for example a selection of the Microsoft SCCM Client Health policy displays a filtered overview

Autorefresh toggle switch

A refresh button

A resize button to display the central panes with and without the Guaranteed State border panes.

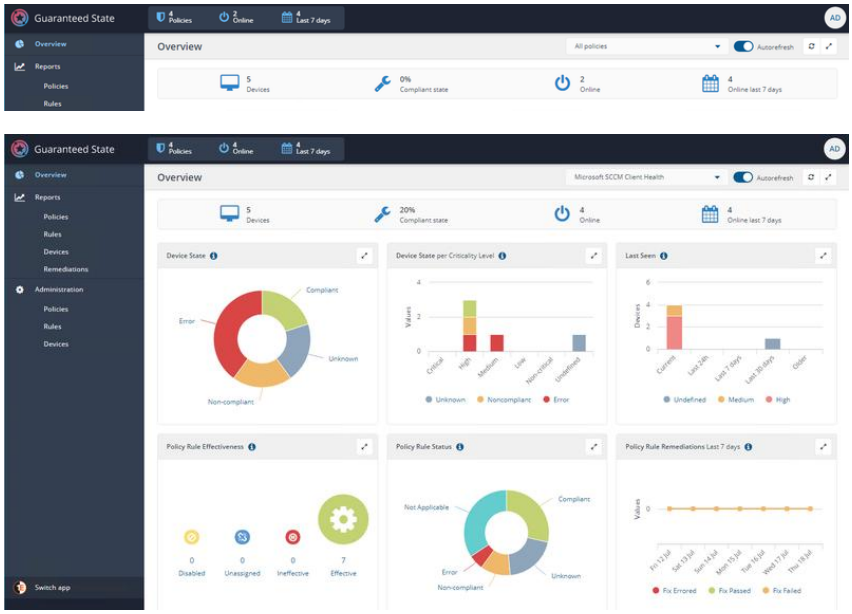
Bottom row:

Devices - shows the number of devices targeted by the selected policy, and is a shortcut to the Devices report pane

Compliance state - percentage of devices compliant with the selected policy filter - shortcut to the Devices report filtered on State is Compliant

Online - number of devices online - Shortcut to the Devices report filtered on **LastSeen is current**

Online the last 7 days - shortcut to Devices Report filtered on **LastSeen** is current OR **LastSeen is 24h** or **LastSeen is 7 days**.



8.3.5.1.2 Device State

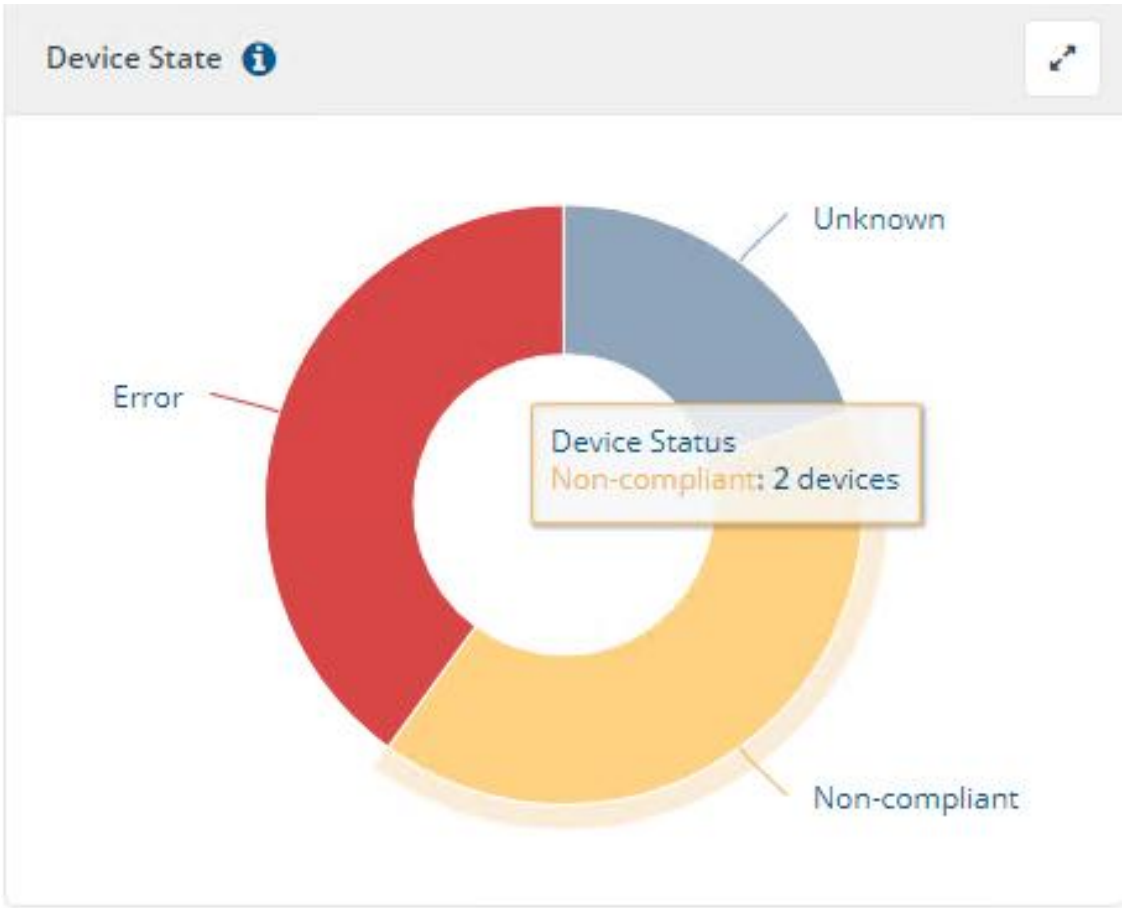
The state of devices where Guaranteed State policies have been deployed is represented in this form.

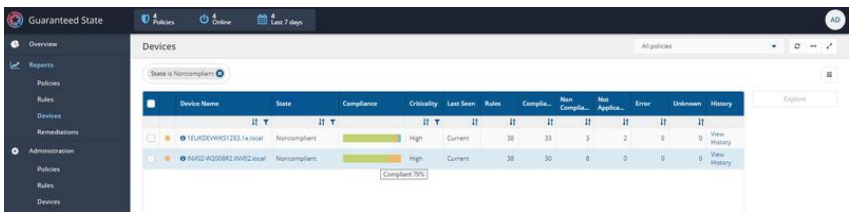
The user has the ability to drill down into the percentage of failures for each group of device states. For example, where the meaning of device states and their precedence is as follows:

State	Description
Unknown	The device has yet to receive, evaluate or report back on its compliance state for at least one rule.
Error	The device has failed to evaluate at least one deployed rule. For example a device may report 97% of deployed rules as **Not Applicable**, but since 3% of the deployed rules reported as Error this means the whole Device State is marked as **Error**.
Not Applicable	At least one rule deployed to the device is not applicable.

State	Description
	For example, this would occur if a Windows specific rule was deployed to a non-Windows device.
Non-compliant	At least one rule deployed to the device failed compliance checks. For example in the example above 86% of policy rules are compliant for the high-lighted device, but since 8% of the rules are Non-compliant the state of the whole device is marked as Non-compliant.
Compliant	The device passed compliance checks for every deployed policy rule.

The drill down navigates to the **Devices** report filtered on the selected **Device State** such as **Noncompliant**.

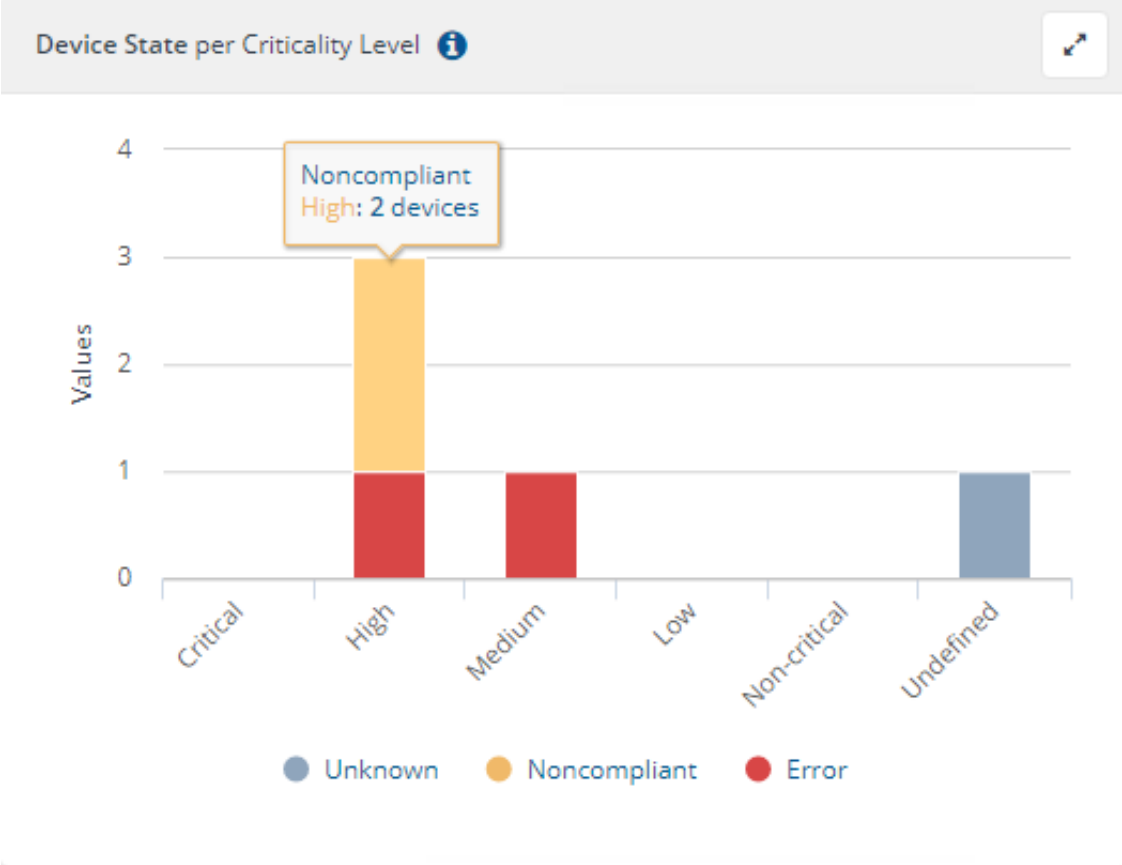


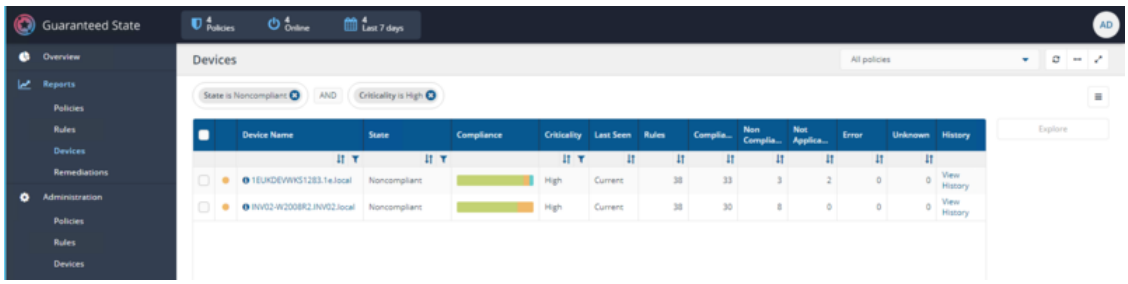


8.3.5.1.3 Device State per Criticality Level

This pane presents a breakdown of the number of devices reporting against each compliance state against the device criticality groups.

The drill down navigates to the **Devices** report filtered by **Device State** and **Criticality Level**, such as **State is Noncompliant** AND **Criticality is High**.

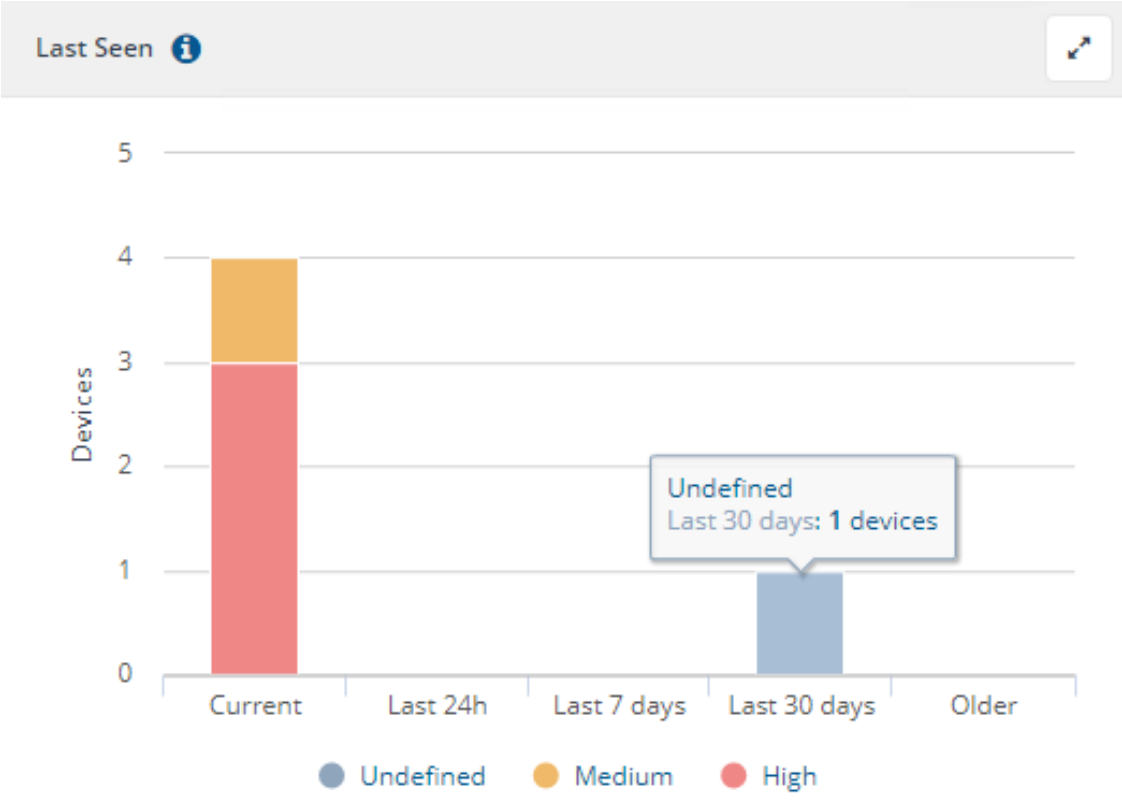


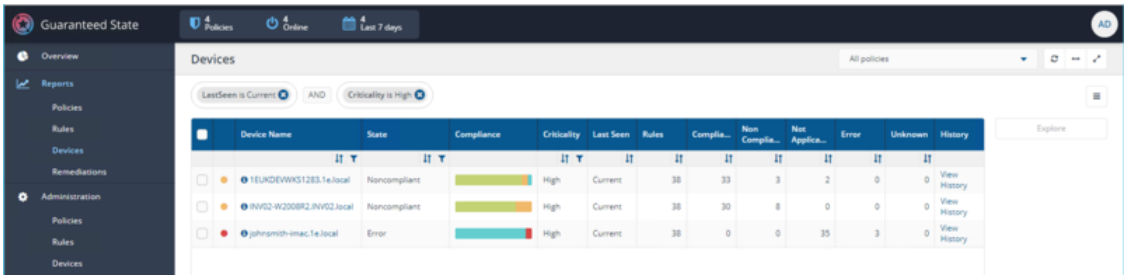


8.3.5.1.4 Last Seen

This panel shows a summary of when devices last made contact with the Tachyon server, grouped by the criticality level assigned to each device.

The drill down navigates to the **Devices** report filtered by **LastSeen** and criticality, such as **LastSeen is Current** AND **Criticality is High**.





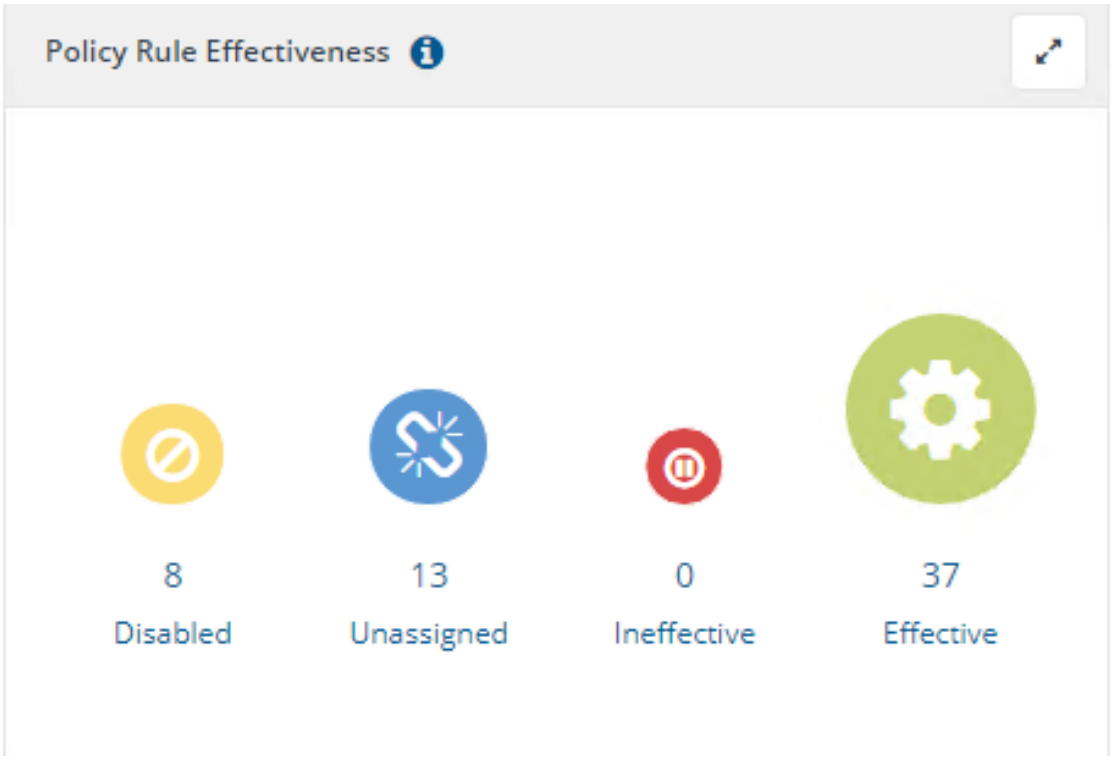
8.3.5.1.5 Policy Rule Effectiveness

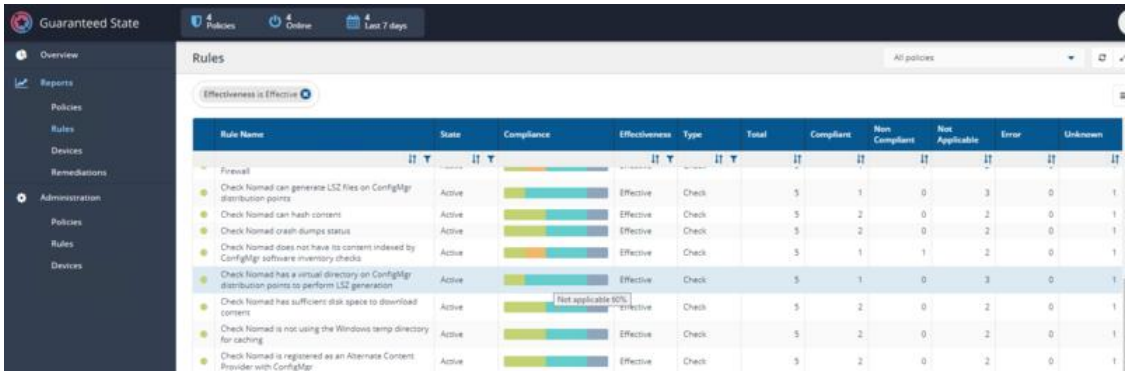
Policy rule effectiveness is the usefulness of policy rules and is represented as follows:

State	Description
Disabled	The rule has not yet been enabled from the Guaranteed State Rule Administration page, so it is not currently active.
Unassigned	The rule is enabled, but has not been deployed to any devices. To deploy a rule : The rule must be included in at least one policy.

State	Description
	That policy must be assigned to a Management Group containing at least one device. The policy must be deployed.
Ineffective	The rule has been deployed, but no devices have changed their compliance position for this rule in the last thirty days. (The thirty day limit is received from the **EffectiveThresholdDays** row within the SQL **TachyonMaster GlobalSetting** table).
Effective	The rule has been deployed and at least one device has changed its compliance position for this rule in the last thirty days. (The thirty day limit is received from the **EffectiveThresholdDays** row within the SQL **TachyonMaster GlobalSetting** table). Effective plus Ineffective gives the total number of Policy Rules deployed.

The drill down navigates to the **Rules** report filtered by **Effectiveness**, such as **Effectiveness is Effective**.





8.3.5.1.6 Policy Rule Status

A user has the ability to drill down into a segment, for example, to examine exactly which policy rules reported failures across all the devices for which it was deployed.

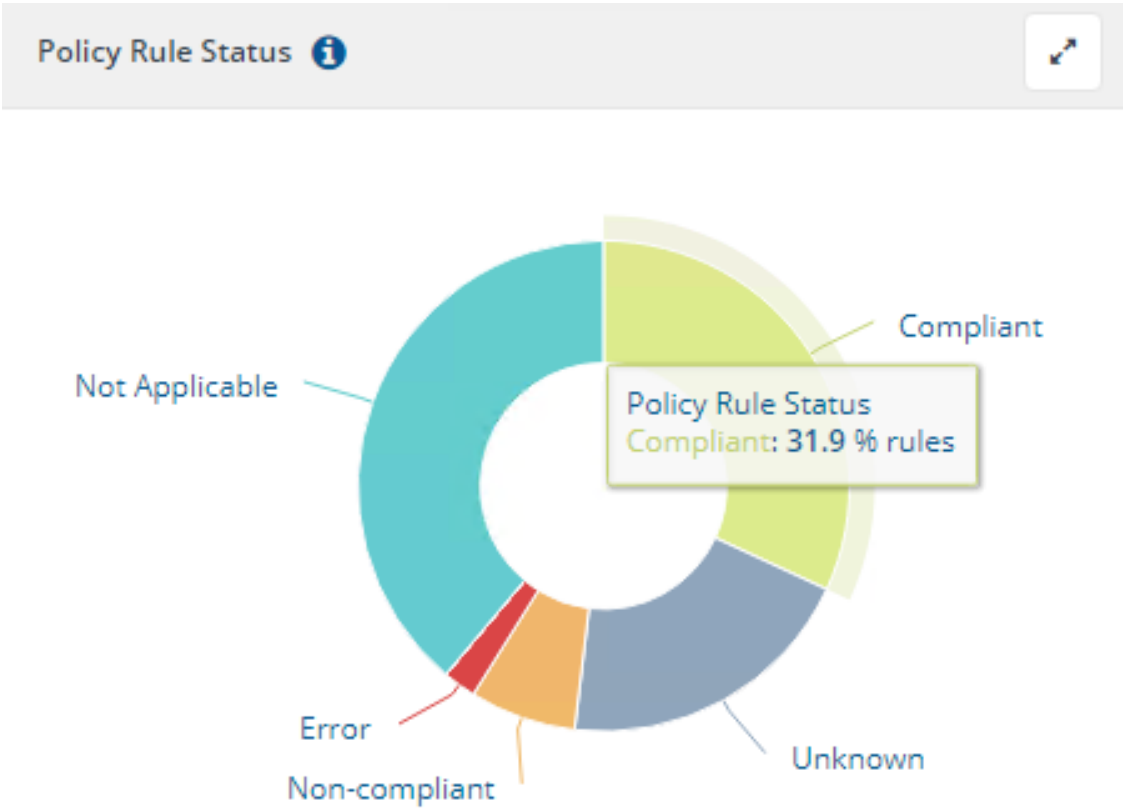
In the above example, 37 rules were deployed to a representative sample of 5 devices across the IT estate. This gives 185 policy rule deployments of which 59 rule deployments reported Compliance giving an overall Policy Rule compliance of 31.9%.

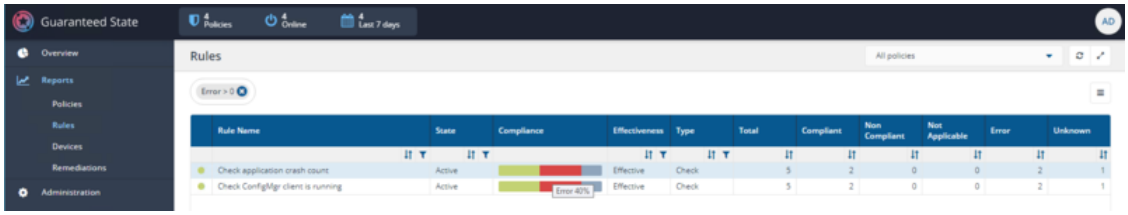
State	Description
Compliant	The proportion of policy rule deployments for which devices reported compliance.
Non-compliant	The proportion of policy rule deployments for which devices reported non-compliance.
Error	The proportion of policy rule deployments for which devices reported rule evaluation failure.
Not Applicable	The proportion of policy rule deployments for which devices reported not applicable. Typically, this would occur for devices to which a deployed rule was applicable only for a different platform, such as deploying Windows Client Health policy rules to macOS devices.
Unknown	The proportion of policy rule deployments for which devices have yet to receive, evaluate or report back on their compliance position. In the example above 20% of the policy rule deployments report as Unknown because one of the five devices to which policies have been deployed has remained offline for several days.

After the hotfix:

State	Description
Compliant	Rule check passed.
Non-compliant	Rule check failed.
Error	Rule could not evaluate its precondition, triggers, check or fix.
Not Applicable	Rule precondition did not pass. Typically, this would occur for devices to which a deployed rule was applicable only for a different platform, such as deploying Windows Client Health policy rules to macOS devices
Unknown	Rule hasn't yet been delivered, evaluated or reported a compliance status. In the example above 20% of the policy rule deployments report as Unknown because one of the five devices to which policies have been deployed has remained offline for several days.

The drill down navigates to the Rules Report filtered by Policy Rule Status, such as Policy Rule Status is Error.

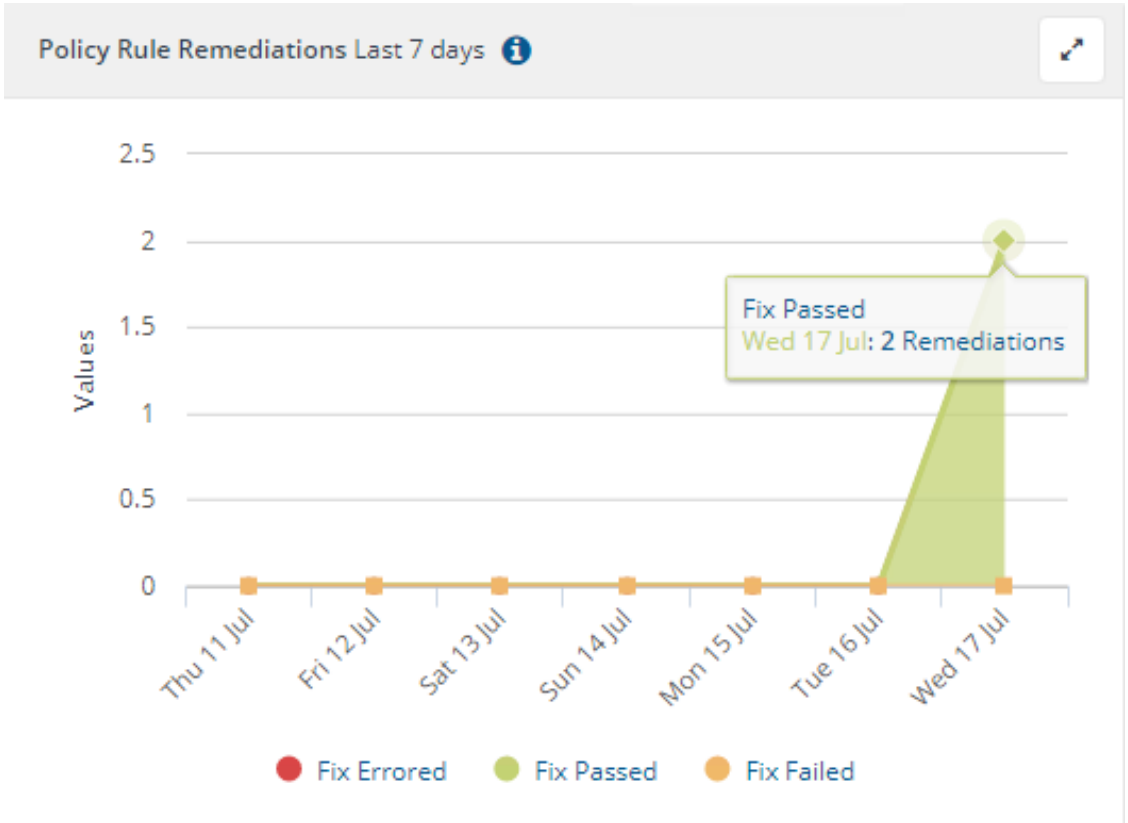


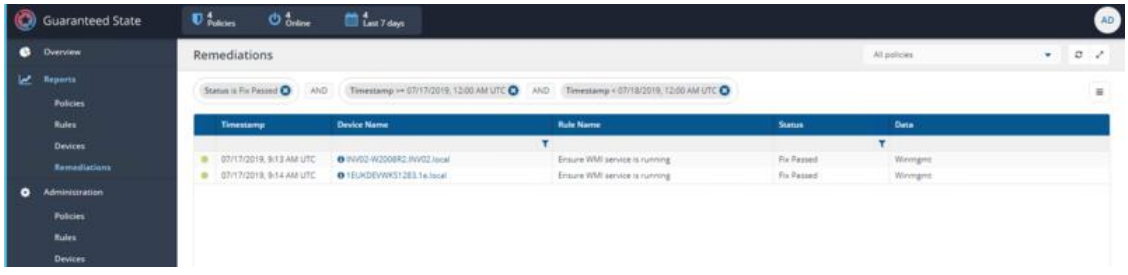


8.3.5.1.7 Policy Rule Remediations Last 7 days

This pane shows a daily remediation summary applied to non-compliant devices by policy rules.

The drill down navigates to the **Remediation** report filtered by remediation status and timestamp period, such as remediation status is fixed and timestamp in a given time period.





8.3.6 Administration menu

Creating and configuring Guaranteed State Policies.

Note

Guaranteed State can be reached directly using the following URL:

`https://<tachyon DNS Name FQDN>/Tachyon/App/#/guaranteedstate/`

where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described under the heading Preparation: DNS Names.

8.3.6.1 Policies page

The **Policies** page lets you view and manage the current Guaranteed State policies. From this page you can:

Create a **New** policy and assign and unassign existing rules

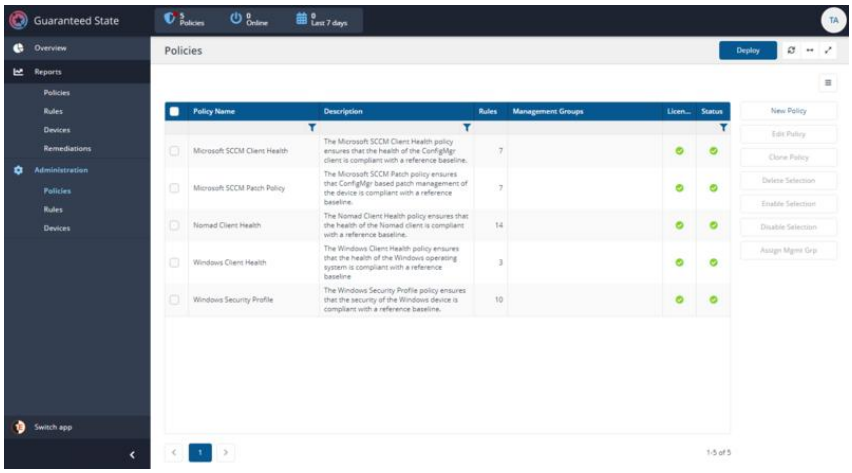
Edit an existing policy and assign and unassign existing rules

Clone an existing policy

Delete an existing policy

Enable or **Disable** an existing policy

Assign (or unassign) an existing policy to one or more Management Groups.



8.3.6.1.1 Creating a new policy

To create a new policy from selected Instructions:

<some instructions here>

8.3.6.1.2 Editing an existing policy

<some instructions here>

8.3.6.1.3 Cloning a policy

<some instructions here>

8.3.6.1.4 Deleting an existing policy

<some instructions here>

8.3.6.1.5 Enabling or Disabling an existing policy

<some instructions here>

8.3.6.1.6 Assigning or unassigning an existing policy

<some instructions here>

8.3.6.2 Rules page

The **Rules** page lets you view and manage the Guaranteed State rules. From this page you can:

Create a **New** rule and configure it

Edit an existing rule and configure it

Clone an existing rule with a new name

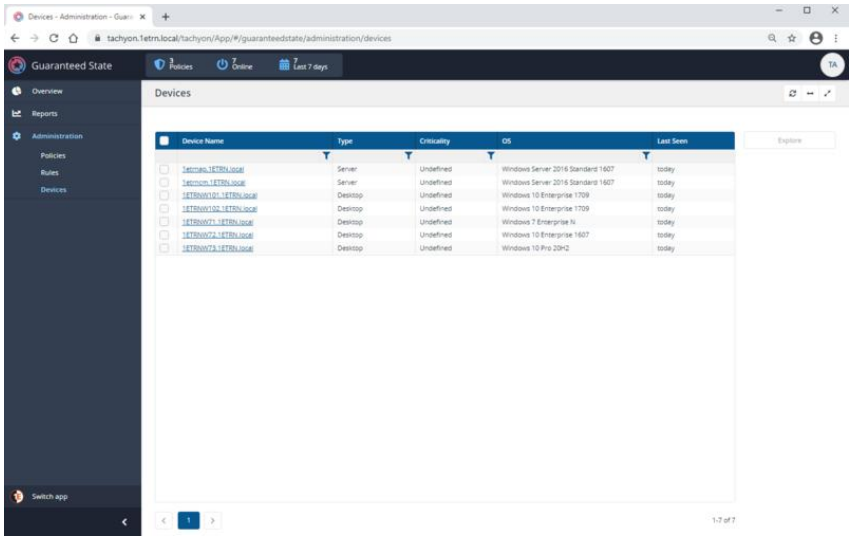
Delete an existing rule

Enable or **Disable** an existing rule

<picture>

8.3.6.3 Devices page

The **Devices** page provides a list of all devices visible to Guaranteed State. You can display a Device view for a selected device by clicking on its link in the **Device Name** column. You can also select one or more entry from the list and choose to use that selection as the scope for an Explorer session.

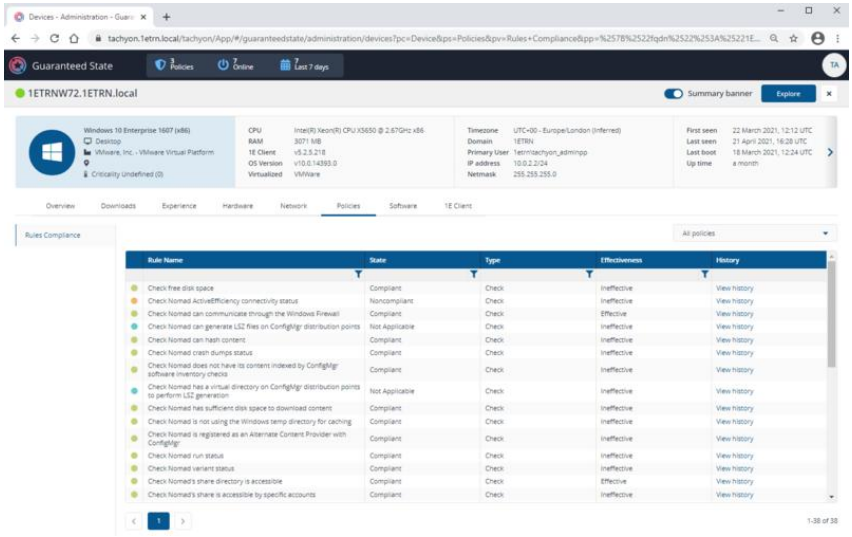


8.3.6.3.1 The Devices view Policies tab

The default view in the Guaranteed State devices view is Policies. The remaining tabs display information corresponding to an app, feature or data set implemented in Introducing Tachyon. Other tabs are visible if an app has been installed and licensed, and the user has permissions to use the app.

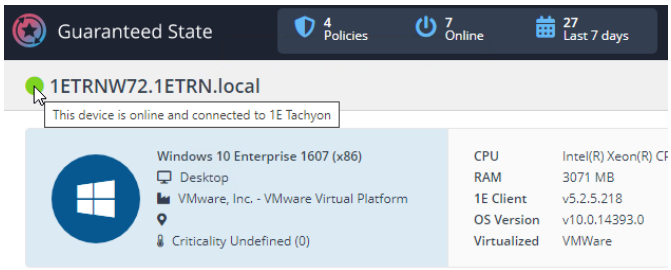
Clicking on one of the links in the **Device Name** column of the **Devices** page displays the Device view for the selected device. The aim of the Device view is to provide a combined overview of all the information known about a device along with the ability to retrieve information about the device in real time. When displaying the Device view from a Guaranteed State page the view defaults to the **Policies** tab. The **Policies** tab contains information derived from and useful for using Guaranteed State.

The **Summary banner** toggle at the top of the page (the default toggle setting is off), shows general device details, and the **Explore** button navigates you to the Explorer app, refer to Using Tachyon Explorer for details.

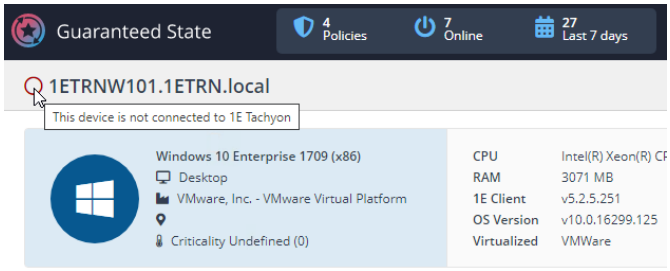


8.3.6.3.1.1 Is the Device is online and connected to Tachyon

In the picture opposite the device 1ETRNW72 is showing as online and connected to Tachyon, this is indicated by the green traffic light next to the device name at the top of the page. Hovering your mouse over the traffic light displays the message
This device is online and connected to 1E Tachyon.



In the picture opposite the device 1ETRNW101 is showing as not connected to Tachyon, this is indicated by the gray traffic light next to the device name at the top of the page. Hovering your mouse over the traffic light displays the message **This device is not connected to 1E Tachyon**.

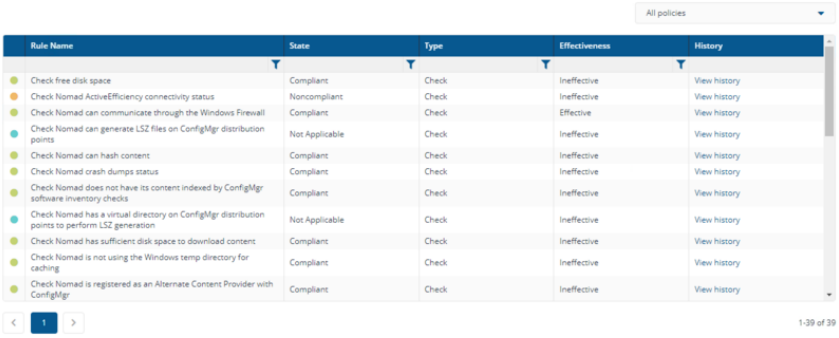


8.3.6.3.1.2 Device View table

In the Device View you can see if a device is compliant to the rules deployed in your environment, if they are effective and view information to assist with troubleshooting.

Column	Description
Traffic light	Traffic light status relates to the **State** column. Green - Device is **Compliant** Orange - Device is **Noncompliant** Blue -Device is **Not Applicable**.
Rule Name	Name of a specific rule.
State	Device state per rule, for example: **Compliant** - rule check passed. **Noncompliant** - rule check failed. **Not Applicable** - rule precondition did not pass.
Type	Whether the rule is one of two types: **Fix** - allows you to define a desired state for the device and then enforce that state. For example, you could mandate that a registry key exists and contains a specific value. Again, you can report on the application of these fix rules to devices. **Check** - allows you to verify that a device has a particular state, such as a registry key having a specific value. You can then view summary and detail reports which show devices that are compliant and not compliant with the check rules.
Effectiveness	Rule effectiveness, either:

Column	Description
	Effective - the rule has been deployed and at least one device has changed its compliance position for this rule in the last thirty days **Ineffective** - the rule has been deployed, but no devices have changed their compliance position for this rule in the last thirty days.
History	Clicking View history displays the related history per rule for the selected device. **Timestamp** - for example **29-04-2021 11:34:01 UTC** **Status** - if the Check or Fix failed or passed **Data** - details related to the event. For example, a message related to the rule **Check Nomad's share directory is accessible** , with a **Check Failed** message showing as the **Status** might return a message like, **Permissions on the Nomad share are not valid**.



8.3.6.3.1.3 Policies filter

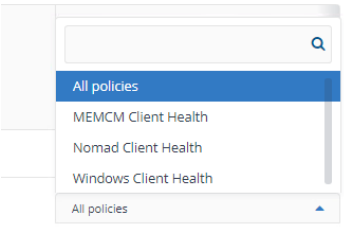
You can use the policies filter to differentiate between device compliance for the different policies you have deployed in your environment, the default view is **All Policies**.

In our example we have deployed three policies:

MEMCM Client Health

Nomad Client Health

Windows Client Health.



In the example we have filtered the view on the **Windows Client Health** policy which shows two Rules:

Check free disk space

Check WMI repository health.

For more information about Guaranteed State policies and using them refer to Using Guaranteed State for the following:

Integrated Product Packs

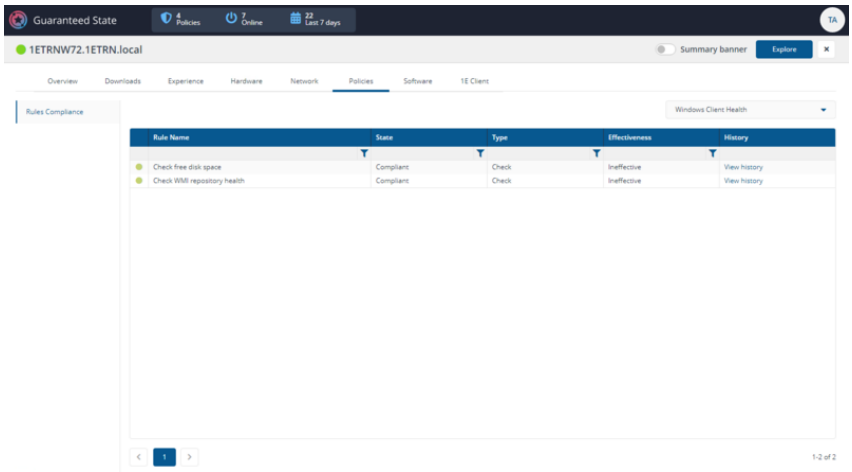
Deploying a Policy

Defining your own policy

Using Explorer to investigate devices in Guaranteed State

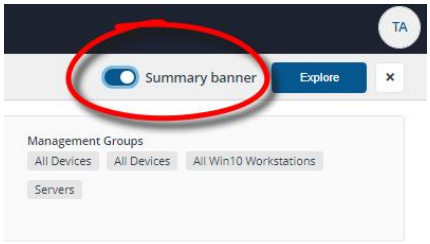
Guaranteed State Overview page

Administration menu.



8.3.6.3.2 The Device View Summary banner

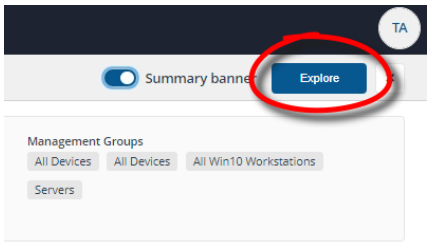
The Summary banner displays a quick summary of the information provided in the various tabs displayed in the Device View. It can be viewed by toggling the **Summary banner** switch to on.



The following image shows the Summary banner displayed for a particular device.

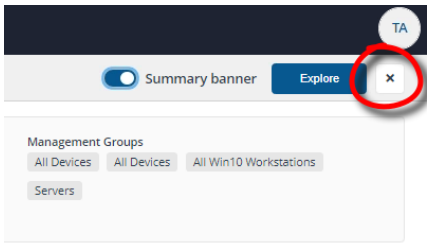
8.3.6.3.3 Launching the Explorer from the Device View

You can click on the **Explore** button in the Device View to launch Explorer with the current device set as the scope.



8.3.6.3.4 Closing the Device View

The Device View is a popup that is displayed when clicking on the name of a device on a page where devices are displayed. To return to the page you came from you need to click the x button.



8.3.6.3.5 Additional Device View tabs

In addition to the **Policies** tab, there are a number of other tabs, each corresponding to an app, feature or data set implemented in Introducing Tachyon:

The **Overview** and **1E Client** tabs are always present in the **Device View**. Other tabs are visible if an app has been installed and is licensed.

Each tab has one or more panels with tiles populated with data from various sources, some by instructions that are run instantly, with results cached for 3 minutes. An appropriate error message is displayed instead of a tile in the following circumstances:

If the device is offline, as indicated by the color of the icon in the top left

The user does not have at least Viewer permission to view use the license the tab or panel

The user does not have questioner permission to run the instruction

An instruction has not been uploaded.

The Device View tabs and panels page lists the names of tabs and their panels, and a description of each tile indicating how the tile is populated.

Tab	Panel	Description	Data source
Overview	**Details**	Displays a number of tiles sorted into **Identification**, **Hardware and Operating System** and **Connectivity and Activity** columns that show information for the selected device retrieved from the online status information stored in the Tachyon Master database. The columns and tiles are shown in the following table: Column / Tile / Description **Identification** / Identification / Display's the current device: FQDN Name Domain	Data from Tachyon Master (the latest online status message)

Tab	Panel	Description			Data source
				Criticality Serial Number 1E Client Tachyon GUID.	
			Location	Displays the device's: Timezone Offset Location Locale.	
			Grouping	Displays the device: Tags - freeform tags applied to	

Tab	Panel		Description		Data source
				the device Coverage Tags - any device tags applied to the device Mgmt. Groups - lists the management groups the device is a member of.	
		Hardware and Operating System	Hardware	Shows hardware details for the device:	

Tab	Panel	Description		Data source
			Virtual /Physical	
			Manufacturer	
			Model	
			Device Type	
			Chassis Type	
			RAM	
			CPU Type	
			CPU Architecture	
			SMBIOS GUID.	
		Operating System	Shows operating system, type and version for example:	

Tab	Panel	Description			Data source
				Type	
				Version	
				Version Number	
				Architecture	
				Installation.	
		Connectivity and Activity	Connectivity	Shows current device connectivity status:	
				Status	
				Last Connected	
				First Connected	
				Certificate Type	
				Certificate Expiry	

Tab	Panel	Description			Data source
				Connection State Local IP Address MAC Address Connecting IP.	
			Activity	Shows Last Boot date and time and current user.	
Env. Variables	Shows a list of the environment variables set on the device.				
Resource Usage	Two panels: **Resource Usage over the last hour** - shows system disk, CPU and memory usage per minute for the last one hour **Resource Usage at** *day/month/year time* - shows executable resource usage for a specific minute:	1E-TachyonPlatform-Hardware-ResourceUsage 1E-TachyonPlatform-Hardware-ResourceUsageByMinute			

Tab	Panel		Description	Data source
	Column	Description		
	Product	Resource name, for example 1E Client		
	Executable	Resource executable, for example 1e.client.exe		
	Instance Count	Number of currently running instances.		
	Cpu Percent	Perentage of CPU currently being consumed.		
	Memory Virtual Mb	Virtual memory consumed in Mb.		
	Memory Physical Mb	Physical memory consumed in Mb.		
	Io Read Kb Per Second	Number of associated read input/output operations per second.		
	Io Write Kb Per Second	Number of associated write input/output operations per second.		
	Handle Count	The number of object handles.		
Downloads	**Summary**		Download activity and status for the device. Whenever you click on an FQDN on any of the Nomad pages then the **Device View** will be displayed with the **Downloads** tab selected.	Data from Content Distribution.

Tab	Panel	Description	Data source
Content	Content Titles on the selected device, the default view is from **All Sources**, **All Types** and **All Status**. **Note** You may see a difference in the number of items in a device's Nomad cache versus that displayed in the Nomad app Device View. This is because if downloaded content has been deleted from Configuration Manager, the content titles cannot be resolved in the Nomad app and are not displayed. This is under consideration for re-design and may be revised in future versions of Nomad.	Data from Content Distribution.	
Nomad Configuration	**1E Nomad Branch Settings .**	1E-Nomad-NomadBranchSettings	
Experience	**Metrics**	Metrics are the data points that are collected by the 1E Client and sent to the Tachyon server. They are collected at different intervals depending on the type of data that is being collected.	Data from Experience metrics
Trends	The Trends tab shows the changes in the scores over time. Hovering over any of the bars shows the details for that time and event. If the user viewing the device details also has the ability to at least ask a question in Explorer the Explore button will be visible.	Data from Experience metrics	

<table>

</table>

Tab	Panel	Description	Data source
	Version	Product version number.	
	Devices count	How many devices are reporting.	
	Crashes	Number of times this software crashed during the last 24-hour reporting period.	
	Hangs	Number of times this software crashed during the last 24-hour reporting period. **Note** Software crash and hang information is obtained from Windows event data. For background information on Windows events and the event viewer refer to https://support.microsoft.com/en-gb/help/302542/how-to-diagnose-system-problems-with-event-viewer-in-microsoft-windows	
	Performance anomalies	Number of performance anomalies detected in this software during the last 24-hour reporting period.	
	I/O write KB/s	Average disk I/O read rate per second during the last 24-hour reporting period.	

Tab	Panel	Description	Data source
	I/O write KB/s	Average disk I/O write rate per second during the last 24-hour reporting period. **Note** For background information on analyzing disk storage performance refer to https://docs.microsoft.com/en-gb/archive/blogs/cotw/analyzing-storage-performance	
	Virtual Memory Usage KB	Average Virtual Memory Usage KB during the last 24-hour reporting period. **Note** For an explanation of Windows Virtual Memory organization refer to https://answers.microsoft.com/en-us/windows/forum/windows_10-performance/physical-and-virtual-memory-in-windows-10/e36fb5bc-9ac8-49af-951c-e7d39b979938 and https://support.microsoft.com/en-us/help/2160852/ram-virtual-memory-pagefile-and-memory-management-in-windows	
	Processor Time Seconds	Each instance of the executable will burn processor time. This column gives the average of the total time consumed by each process instance per second. Each instance uses the sum of all time used by each core in parallel. Therefore, it is possible to see more seconds here than in a day	

Tab	Panel	Description	Data source
		(usually 60 x 60 x 24 = 86400) for the whole column, if your system is working extremely hard 24x7. The theoretical maximum would be somewhere near ***number of cores*** x ***seconds per day*** . Hence, 'Processor Time' rather than 'Human Time'	
	Processor Time %	This is an easier notion than Processor Time Seconds. This is the average of the processor consumption of each instance. Each instance of this process will have caused different percentages of compute resource in all the processors and cores to be used over time (unless they have specifically requested certain core affinity). For each minute each process is running, a profile of the usage is built for the whole day. This value is the average of all of those samples. There is no way to work out, for any one of the process instances involved, how long any particular instance was running for. This could indicate a process that is going wild with resources, but it would take more investigation on the device to discover for how long this is happening. It is perfectly possible to see all the values in this column adding up to more than 100% as the processes were not necessarily running at the same time. **Note** For further information on Processor time refer to https://social.technet.microsoft.com/wiki/contents/articles/12984.understanding-processor-processor-time-	

Tab	Panel	Description	Data source

and-process-processor-time.aspx

Responsiveness Impact %

An indicator of how reactive a process is to activity by other processes on the device. Typically, anti-virus products watch and respond to potentially suspicious activity such as increased network traffic. Anti-virus products will differ in their impact on the overall performance of a device.

Note

Responsiveness Impact % is used to indicate how sensitive a process appears to be to the use of system resources by other processes on a device. For example, Security Protection software present on a device may reveal a spike in its activity whenever a new process is started on that device.

This would typically be because the Security Protection software may wish to ensure that the new process starting on the device is present in a security white list. Other software may also react to activity by other processes and by reacting they impact system resource uses, thereby adversely affecting the user's experience. So it is useful to be able to identify

Tab	Panel	Description	Data source
		software with the highest Responsiveness Impact on a device and potentially investigate further. **Note** Responsiveness Impact % represents the proportion of the increased CPU activity detected by the 1E Client as a result of performing a set of operating system-level operations that can be attributed to a given running process. Examples of these would be Windows registry and resource creation operations. It is reported as a percentage to normalize results across devices that offer a range of computing power. For example, if *software.exe* on a device is attributed a Responsiveness Impact of 53% this means that more than half of the spike in CPU usage caused by software monitoring activity on that device can be attributed to *software.*	
	Handle Count	Average number of Windows handles used by this software during the last 24-hour reporting period. **Note**	

Tab	Panel		Description	Data source
		For further information on Windows handles refer to https://docs.microsoft.com/en-us/windows/win32/sysinfo/handles-and-objects For tips on examining open handles for any Windows process refer to https://docs.microsoft.com/en-us/sysinternals/downloads/handle and https://techcommunity.microsoft.com/t5/windows-blog-archive/pushing-the-limits-of-windows-handles/ba-p/723848		
	Physical Memory Usage KB	Average Physical Memory Usage KB during the last 24-hour reporting period. **Note** Please refer to https://docs.microsoft.com/en-us/sysinternals/downloads/rammap for a useful tool to examine physical memory allocation on a device.

8.4 Troubleshooting

For a general methodology for investigating issues, as well as identifying key issues and their resolutions, and for known issues relating to specific components, please refer to their troubleshooting pages, refer to 1E Troubleshooting.

8.4.1 Known issues

Lists of the current known issues with implementing, configuring, and using Guaranteed State.

If you cannot find an issue and its workaround on this page:

Refer to Known issues for the Platform and other applications.

Try searching the 1E Support Portal https://support.1e.com/ for issues which have hotfixes.

If you need further help, please refer to the Troubleshooting page for how to contact 1E Support and the technical support process.

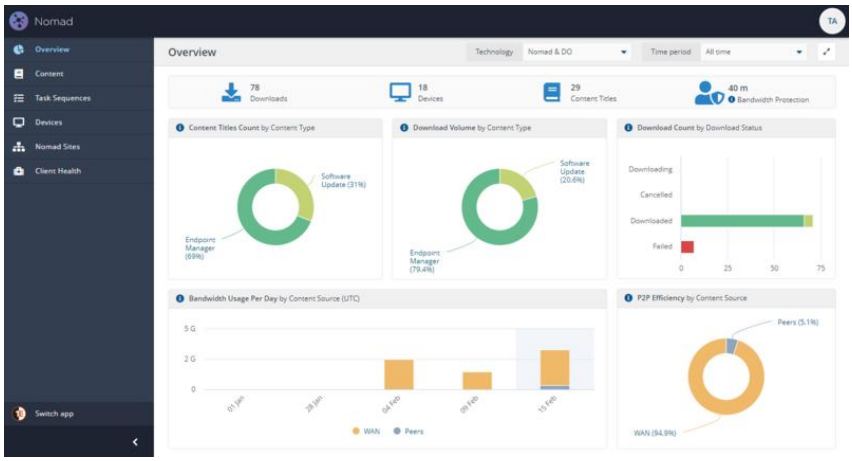
Issue	Description	Workaround
Any pending changes in Guaranteed state and/or Experience applications that are	Tachyon Setup runs a post installation action to automatically deploy all	Ensure any pending deployment changes under review are either deployed

Issue	Description	Workaround
deployed during upgrade process from Tachyon Platform v5.1 to v5.2 or v8.0. This is also true if there is an already deployed unlicensed rule/recondition/check or fix.	policies and event subscriptions.	prior to upgrade process is initiated or respective rule/policy/Survey should be marked as disabled to prevent deployment during upgrade process
Guaranteed State Overview pages show incorrect devices when Policy with no Rules have been assigned to a Management Group.	On the Guaranteed State Overview page, the Online, Online last 7 days and Last seen per Criticality Level charts all show incorrect counts when a Policy is assigned to a Management Group, but no Rules have been assigned yet. This will display correct values once Rules are assigned and devices have responded to the events.	None
Opening an instruction or fragment that has been exported using the Consumer API displays the following message when viewed in TIMS: "This instruction definition was signed by CN=Tachyon Explorer Instructions but the content has been tampered with.	An instruction exported through Postman can generate file with whitespace differences and file size between the original file which is not accepted by TIMS as it's considered to be tampered.	Use alternative API tools (e.g Fiddler).
"Ensure Nomad can communicate through the Windows Firewall" remediation is being executed even when firewall is disabled from the GPO.	"Ensure Nomad can communicate through the Windows Firewall" remediation is being carried out when there is a firewall policy which has been disabled through group policy. This means that when firewall policy has been	None

Issue	Description	Workaround
	disabled explicitly, instead of ignoring the fix, the firewall is being set to enabled and the firewall exceptions are set for Nomad.	
On a ConfigMgr Distribution Point, the Rule to "Check the Nomad has a virtual directory on ConfigMgr distribution points to perform LSZ generation" always passes even though a failure reason may be returned in the Data field.	The check fragment should verify that the LSZFILES website setup by Nomad on a DP has certain characteristics, but even when errors are found the check status is "Passed". The logic in the PowerShell parts of the fragments uses a $errorOccurred variable to set the exit code, but this variable is initialized to $false and then never changed even when an error is detected. e.g Data field returns: "Windows authentication not enabled. Require SSL flag is not disabled. Directory browsing not correctly set."	None
1E Client logs several unsuccessful remediation attempts within a 24hr period.	There is currently no longer a cap on the number of time a remediation step can occur on a machine within 24hrs. This differs from 1E Client Health where after 3 failures to remediate an issue, further remediation would not occur until 24hrs have passed.	None

9 1E Content Distribution

Nomad removes the need for distributed servers and intelligently uses only available bandwidth for all content distribution. This means the business is never impacted by Configuration Manager or Windows deployments.



9.1 Introducing Nomad

Nomadremoves the need for distributed servers and intelligently uses only available bandwidth for all content distribution. This means the business is never impacted by Configuration Manager or Windows deployments.

9.1.1 New features in Nomad

Many Nomad features are available with minimal configuration of the 1E Client. However, some features require additional configuration of the 1E Client on Configuration Manager Distribution Points.

9.1.1.1 Platform

Works with Tachyon 8.1

Insights on how Nomad enhances user experience - with the rapid shift to a Work From Anywhere (WFA) workforce and an increased focus on the Digital End-User eXperience, Nomad on Tachyon Platform now provides insights into how it helps to ensure a great user eXperience. With the introduction of Nomad's Bandwidth Protection Reporting, you can now see how Nomad is preventing end-user disruption due to software and update deployments. Bandwidth Protection Reporting will allow you to see the positive impact Nomad is having across the organization, to individual sites, subnets, all the way down to a single client.

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Feature improvements - as Configuration Manager evolves and new features are released, Nomad on Tachyon Platform is being continuously maintained to ensure it works seamlessly with new releases.

9.1.1.2 Client

NomadBranch 8.1 client is the Nomad module in 1E Client 8.1

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, and there is an increased reliance on Cloud Distribution Points for distributing content.

Enhancements:

Improvements to the Certificate Selection criteria to authenticate with a DP (or any download source)

Download reporting now includes back-off data, for Bandwdith Protection Reporting.

9.1.1.3 Tools

Nomad AdminUI Console Extensions now require .NET Framework 4.8

Cloud infrastructure support

Enhancements:

Provide a way for SCCM Console users to use alternate credentials to authenticate with ContentDistribution/Platform, for details refer to Using Nomad pre-caching.

PlatformUrl validation is improved, by logging a warning during installation. In UI mode users have the option of continuing with the installation, for details refer to Installing Nomad Branch Tools.

9.1.2 Nomad overview

An overview of features and enhancements.

Nomad removes the need for distributed servers and intelligently uses only available bandwidth for all content distribution, so the business is never impacted by Configuration Manager or Windows deployments.

In the world of Windows 10 and modern management, there is more content being distributed on your network than ever before to get Windows and applications deployed and keep them up to date. While you are carefully managing some of those deployments through Microsoft Endpoint Manager, others are out of your control. Modern applications self-update, Windows updates may be pulled as required based on policies and users have access to download apps from the Microsoft Store or Store for Business. A lot of that activity is currently invisible to you and may be causing you to miss compliance deadlines.

There is no single, comprehensive view of exactly what is being distributed, to where and from which sources, so you don't really have a clue how it is all affecting your network. How well are peer-to-peer technologies (Nomad, Delivery Optimization) working to reduce the effect this content distribution has on your WAN bandwidth usage? How can you make them more effective? These are the questions we can answer with the Nomad.

9.1.2.1 Simple Nomad Architecture

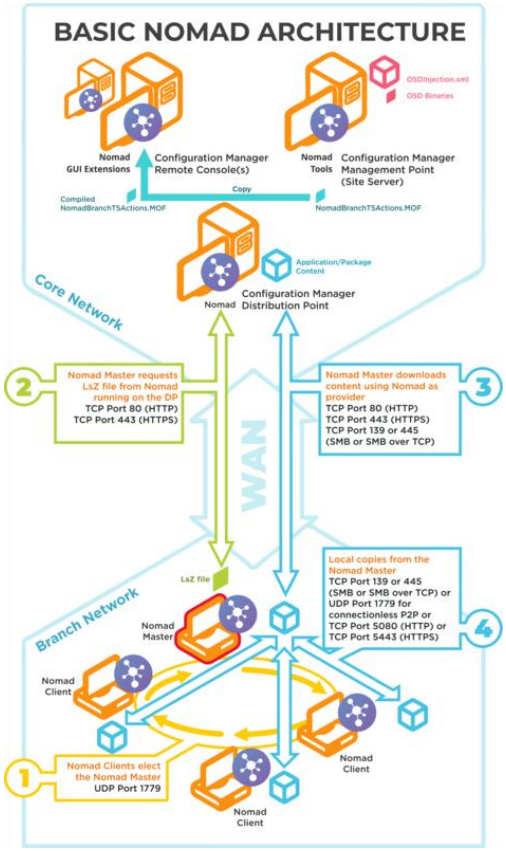
In response to customer demand to simplify the deployment, we've made two architectural changes:

Reduced the number of agents required - 1E has merged the client functionality of Nomad, PXE Everywhere, WakeUp, Shopping and Tachyon into a single 1E Client.

Modernized the back-end infrastructure - Nomad requires a back-end server, which was previously our legacy ActiveEfficiency platform. This now is replaced with the unified Tachyon Platform.

The 1E single agent and platform is a remote endpoint management solution designed to significantly improve IT's ability to support the Work From Anywhere Enterprise. Built around a revolutionary real-time engine, and providing both holistic digital experience monitoring and remediation, it's a powerful tool that helps IT to deliver great employee experiences, anywhere.

Once you are on the Tachyon Platform, you can enable further features including Experience, User Sentiment, Guaranteed State and Patch Success, as well as opening up real-time management to any task by acquiring the appropriate license. To find out more, refer to Introducing Tachyon.



Ports	Notes
UDP 1779	**Step 1** By default, Nomad uses UDP Port 1779 to communicate during the election process for determining the master on a subnet. The Nomad installer will automatically add *NomadBranch.exe*,*NomadPackageLocator.exe* and *PackageStatusRequest.exe* to the list of excepted programs in the native Windows Firewall. The default value for the port may be changed at install time using the MODULE.NOMAD.P2PPORT installer property or post-installation by changing

Ports	Notes
	the P2P_Port registry value. If you change the default port, you must ensure all Nomad clients communicate using the same port. The Nomad port (by default UPD Port 1779) must be open on all wireless access points to facilitate Nomad peer-to-peer communications. Not all vendors enable this port by default, please refer to the specific device vendor's documentation for details on how to enable ports on each WAP device.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 2** Nomad Master requests LSZ file from Nomad running on the DP.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 3** Nomad Master downloads content using Nomad as provider. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager the default setting is HTTP or HTTPS.
TCP 139 (SMB) TCP 445 (SMB over TCP) UDP 1779 (used for connectionless P2P) TCP 5080 (HTTP) TCP 5443 (HTTPS)	**Step 4** Local copies from the Nomad master. The recommended way to facilitate Nomad cache access is to enable Windows File and Print Sharing. If this is not feasible on your network environment you can configure Nomad to use different means to access network shares, see Nomad cache for more details on configuring this option. Connections may use one of the following: SMB SMB over TCP Connectionless P2P HTTP

Ports	Notes
	HTTPS

9.1.2.2 Nomad Security

Nomad is a peer-to-peer technology that works by using HTTP/HTTPS or the native Windows OS File and Print Sharing services to share content among computers.

With Nomad, you get improved security features like:

Certificate-based client authentication for peer-to-peer communication, removing the need for a local user account.

Support for Enhanced HTTP in Configuration Manager, including support for removal of the CM Network Access Account support for multiple Certificate Authorities when using HTTPS for peer-to-peer communication.

For more details about Nomad security refer to Ensuring Nomad is secure.

9.1.3 Nomad fundamentals

An overview of the fundamental concepts and terminology needed to understand what Nomad will do for you.

9.1.3.1 What is Nomad?

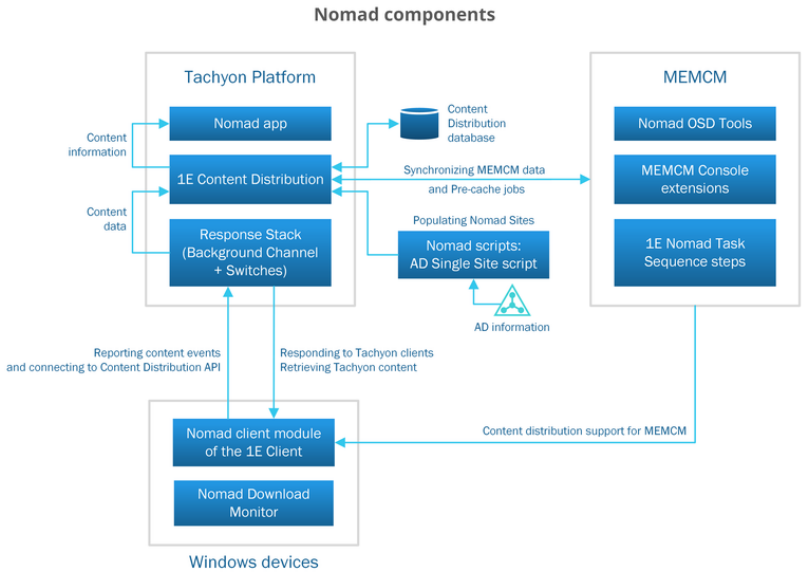
Nomad removes the need for distributed servers and intelligently uses only available bandwidth for all content distribution, so the business is never impacted by Configuration Manager or Windows deployments.

Nomad uses Configuration Manager console extensions to enhance the Configuration Manager Admin console, so you can configure Nomad settings, pause and resume Nomad downloads, use Nomad pre-caching and create baseline configuration items. By integrating with your OSD strategies Nomad maximizes the efficiency of distributing large OS content across the network. It does this by providing a number of Task Sequence steps that can be integrated directly into your OSD Task Sequences. Nomad also supports content distribution for Configuration Manager and Tachyon with the 1E Client.

A new Tachyon Platform component, called 1E Content Distribution, provides support for a number of Nomad features such as Single Site Download. Nomad clients send information back to Content Distribution related to the Nomad features and the performance of Nomad. Content Distribution is a replacement for ActiveEfficiency used in earlier versions of Nomad.

In addition, with the Tachyon Platform there is the new Nomad app replacing the Configuration Manager Nomad Dashboard. The Nomad app provides a high level view of the current status of content throughout the entire network.

The picture opposite shows the high-level relationship between the Nomad components listed in the Nomad components table.



9.1.3.1.1 Nomad components

Nomad component	Description	Dependency
1E Client	The 1E Client, includes the Nomad module which supports content distribution for Configuration Manager and Tachyon. The 1E Client includes other features and modules which are optionally enabled and configured, including: Tachyon PXE Everywhere Shopping Wakeup. The 1E Client is installed on each Windows device as a service, and the 1E Client Deployment Assistant (CDA) can be used with Configuration Manager to deploy it.	Tachyon Platform
Nomad app	The Nomad app provides visibility of content distribution activity and cache status for content distributed by both Nomad and Delivery Optimization. The Nomad app is installed through Tachyon Setup. After installation the Nomad app is available on the Tachyon Platform portal homepage and can be accessed using the Tachyon DNS Alias FQDN. For example:	Tachyon Platform 1E Client

Nomad component	Description	Dependency
	https://tachyon.acme.local/Tachyon	
1E Content Distribution	Content Distribution is a Tachyon Consumer providing control and visibility on content deployments and delivery and is installed through Tachyon Setup. Content Distribution offers visibility for the following via the Nomad app: The status of all deployments, including both delivery and execution of content The effectiveness of Peer to Peer technologies like Delivery Optimization (DO), Nomad and BranchCache Historical trends like Peer to Peer effectiveness Where content is located or cached by a Peer to Peer technology.	Tachyon Platform Configuration Manager
Background Channel	The Background Channel is a Introducing Tachyon component which provides a means for the Nomad module of the 1E Client to retrieve large data items from Tachyon without loading the Tachyon Switch: Stores Tachyon content provided by the Consumer API in the Background Channel for Tachyon clients to retrieve Responds to Tachyon clients retrieving Tachyon content from the Background Channel.	Tachyon Platform
Configuration Manager console extensions	The Nomad Configuration Manager console extensions are installed where its Console is installed. The extensions add the custom Task Sequence steps among other Configuration Manager console extensions. The Nomad Configuration Manager console extensions provide the following capabilities in the Configuration Manager Console:	Configuration Manager

Nomad component	Description	Dependency

Configuration Manager capability	Description
Configure Nomad settings	In software deployment and client settings policies associated with packages, applications and software updates.
Nomad Download Pause	Buttons to pause and resume Nomad downloads, monitoring report to view paused content.
Nomad Pre-caching	Menu item to start the Pre-cache Wizard, monitoring report to view pre-cached content.
Nomad Baseline wizard	Menu items to create and edit baseline configuration items.

The additional Nomad attributes are configured through the Configuration Manager console using custom console extensions. These add properties pages to the standard package, task sequence and client settings dialog boxes and wizards.

Nomad component	Description	Dependency
Nomad OSD Tools	Nomad OSD Tools are required for integrating Nomad with OSD task sequences in Configuration Manager. The tools are installed on the CM Site server(s) and SMSProvider server(s) and install the Nomad files that get injected into a boot image.	Configuration Manager
Nomad download monitor	The Nomad Download Monitor tool is useful for administrators to view the status of downloads on local and remote Nomad client devices. The tool is required only for testing and troubleshooting on selected devices, and is not required or recommended for general deployment.	None

Nomad component	Description	Dependency
Nomad scripts	Sample PowerShell scripts for populating the Content Distribution database to support the following Nomad features: Single Site Download (SSD) Single-site Peer Backup Assistant (SSPBA) High Availability Peer Backup Assistant (HAPBA) WakeUp integration Located in the zip's Scripts folder.	Configuration Manager
1E Nomad Task Sequence steps	Nomad can integrate with OSD to maximize the efficiency of distributing large OS content across the network. The three areas where Nomad integrates with OSD are: WinPE support – providing Nomad functionality when imaging a device Custom task sequence actions – enabling Nomad functionality to be integrated directly into OSD task sequences Configuring PBA hosts – enabling Nomad functionality to be used during OSD to back up user files and settings (USMT data). To support the above, Nomad provides a number of Task Sequence steps that can be integrated directly into your OSD Task Sequences: 1E Nomad task sequence actions 1E Nomad PBA task sequence actions 1E Nomad Pre 6.0 task sequence actions 1E OSD task sequence actions Peer Backup Assistant - PBA.	Configuration Manager

9.1.3.2 Distributing software with Nomad and Configuration Manager

Nomad integrates with the Configuration Manager (CM) client content download process. When Nomad is installed, it registers with the Configuration Manager client as an Alternate Content Provider (ACP), which means the CM client will use Nomad as an alternative to BITS when it requires content if Nomad is enabled for the requested content object. Nomad can be enabled on individual packages (including Driver Packages, Operating System Images, Operating System Upgrade Packages and Boot Images) and Task Sequences.

For Applications and Software Updates, Nomad is enabled on each client for all Applications and Software Updates through Default Client Settings. When the CM client requires Nomad-enabled content, it passes a request to Nomad, which in turn downloads the content, places it in the CM client cache and passes back to the CM client for execution. The 1E Client (with Nomad client module enabled) must be installed on all CM client machines and on all Distribution Points (DP).

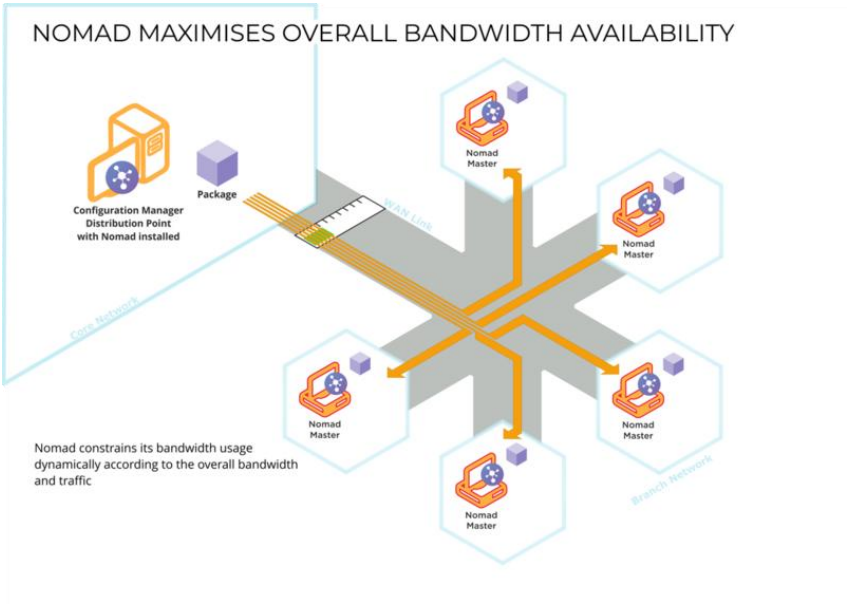
9.1.3.3 Bandwidth Protection

Nomad dynamically analyzes the overall WAN traffic to ensure that it only uses a percentage of the total. It is also aware of mobile devices and knows the difference between wireless and wired connections and is able to select the most efficient available connection to use.

9.1.3.3.1 Full control over WAN link usage

Nomad respects business data on the network – it detects the true end-to-end available bandwidth and monitors this throughout the duration of the download. This is calculated using a sophisticated algorithm that looks beyond the receiving capabilities of each device's network card. If bandwidth is available, the transfer speeds up; if it becomes restricted, the transfer slows down. As a result, overall WAN availability is maximized and the impact on the critical link between the branch networks and the central network is minimized.

To avoid placing a burden on office wireless bandwidth and to use the most efficient transfer system possible, Nomad can be configured to switch from a wireless to a wired network connection automatically when one becomes available. (Please refer to Design Considerations - Managing stable LAN connections).



9.1.3.3.2 Maximizing download speed for high-bandwidth links using Dynamic Block Sizes

The Dynamic Block Size (DBS) feature increases block size on high-bandwidth links to get maximum efficiency, and reduces it on low-bandwidth links to reduce the impact. Using DBS, Nomad is able to automatically decide the appropriate block size for a given link bandwidth and also adjust it as needed during the download if the link conditions change. As a result, Nomad is far more efficient and faster on all types of connection bandwidths while retaining its minimal impact on other link traffic.

> **Note**
>
> DBS is enabled or disabled by configuring Bit 25 in the CompatibilityFlags registry. Setting Bit 25 disables DBS and clearing Bit 25 enables DBS.
>
> In Nomad 7.0 onwards, the DBS feature is turned off by default for new installations, and not changed for upgrades.
>
> Prior to v6.3 the default value of BlockSize registry setting was 32KB (0x8000). From v6.3 onwards the default is 128KB (0x20000).
>
> The installer automatically sets this to 128KB for both fresh installs and upgrades from previous versions. The only exceptions to this are:

It will use the specified value if the BLOCKSIZE property is used in the installation command line or in a MST transform, when doing a fresh install or upgrade

It will retain the previous value of BLOCKSIZE if it was set to anything other than 32KB (the older default), when doing an upgrade.

9.1.3.3.3 Download once to branch

Nomad ensures that software packages are only ever copied once per branch over the WAN, utilizing local computers as temporary file caches to distribute the software locally. This reduces

the bandwidth required for delivering software updates and means that small offices or sites connected by poor network links can receive software updates more reliably.

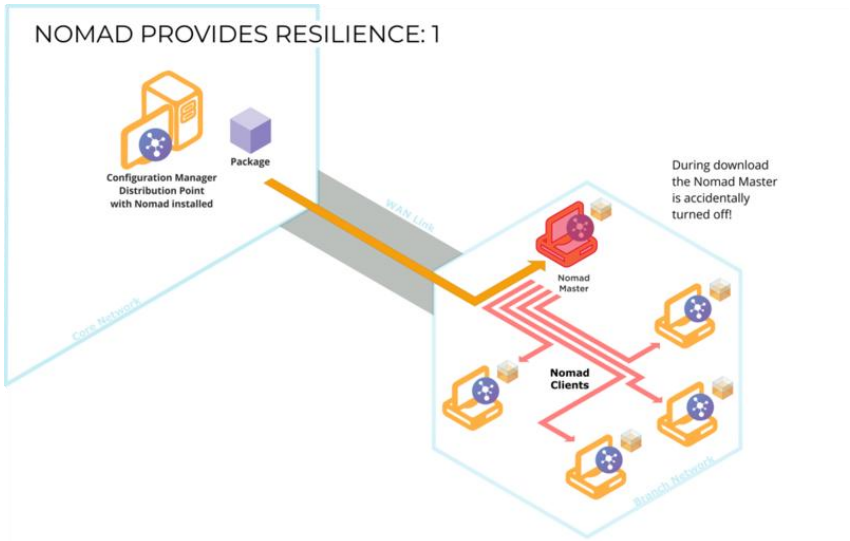
The Nomad clients with local copies of the package can themselves act as the master if the need arises. This significantly reduces the number of Configuration Manager servers required to manage a Configuration Manager hierarchy, thereby reducing initial and ongoing maintenance costs.

9.1.3.3.4 Nomad master elections

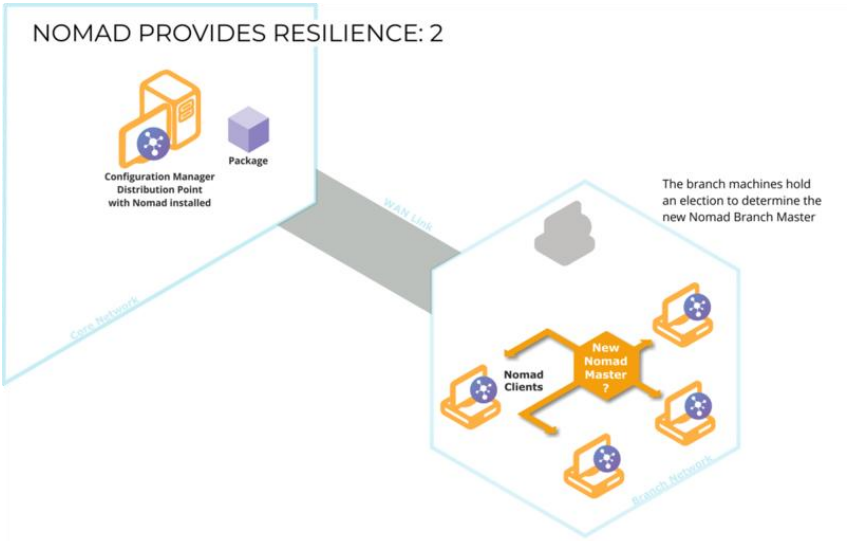
When a software package is deployed to the Nomad clients, an election is held per subnet in the branch to find an appropriate Nomad master, this Nomad master then downloads the software. The software is stored in the Nomad share which is then accessed by the other Nomad clients on the same subnet that require the software package.

Nomad is installed on each computer in the branch and on the distribution point. The computers on the branch network elect a local master. This acts as the single contact point for downloading packages from the distribution point and handles the local redistribution.

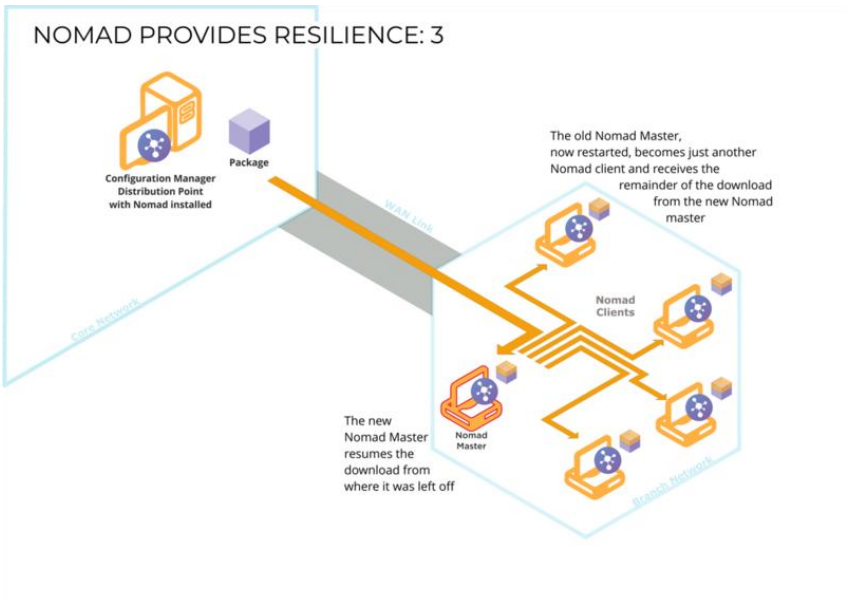
It is possible that a particular Nomad master may be affected in some way during the download. It could be turned off or disconnected from the network for example. If this is the case Nomad ensures that the download continues.



During download, elections continue to be held periodically to determine if the current Nomad master is still the most suitable candidate. If the local Nomad master is affected some way, for example if it is turned off during a download, the other Nomad clients on the branch network interact to elect a new master. The elections are weighted towards the most suitable candidate using a combination of rules.



Once a new master is elected, the download continues to this new master starting from the point at which the download is currently at in that client's cache. The other treat this new master in exactly the same way as the previous master. In fact, if the previous master is turned back on, it may receive the rest of its interrupted download from the new master instead.



See Election rules and master elections for more details about the election process.

9.1.3.4 Download resumption and consistency checking

To minimize repeated downloads of the same content from the Distribution Point, Nomad supports download resumption and consistency checking.

9.1.3.4.1 Download resumption

Nomad downloads include checkpoint recovery, so if the connection to the distribution point is disrupted during a download, it is resumed when the connection is next available. Download resumption starts from the point it had reached when the connection was lost. This means that no previous time spent downloading the package is wasted.

9.1.3.4.1.1

9.1.3.4.2 Consistency checking

Nomad must be installed on all the Configuration Manager DPs. This not only lets central multicast work, but also enables package file checksums to be calculated centrally allowing efficient recovery from file transfer issues if one exists. The central creation of the checksums also minimizes the computational overhead.

Nomad uses manifest files to describe the download contents of Configuration Manager applications and packages. This enables it to provide file-level transfer and, when integrated with Configuration Manager remote differential compression (RDC), file delta downloads. The Nomad client automatically generates a manifest for each version of each package. The generation request occurs as the first Nomad client attempts to download the newest version of a package.

9.1.3.4.3

9.1.3.5 Nomad cache

An overview of the Nomad cache including different methods used by Nomad peers to access the cache on the elected master. The Nomad cache is essential to Nomad's download once to branch feature. The cache enables Nomad to hold its downloaded content so that it can be distributed locally to other Nomad peers. The Nomad cache contains downloaded content (such as packages, applications, and software updates) which can vary in size from relative small patches to rather large OS image files.

9.1.3.5.1 Cache management

The downloaded content in the Nomad cache consume disk space, therefore management of the cache is critical. Because files may be re-used and distributed to other devices on the same subnet or site, the simple solution of deleting the files as soon as they have finished downloading and executing is not sufficient. Instead, Nomad has a cache cleaner utility that automatically but intelligently maintains control over the cache's disk usage.

9.1.3.5.2 Peer copy over HTTP or HTTPS

Nomad peer-to-peer content transfer uses SMB by default, which requires File and Print services to be enabled in order for it to share the content. For better security Nomad can be configured to use HTTP or HTTPS for peer-to-peer content transfer, removing the requirement for file shares. When Nomad is configured to use HTTP/S, if Peer Backup Assistant is enabled it will also use HTTP/S.

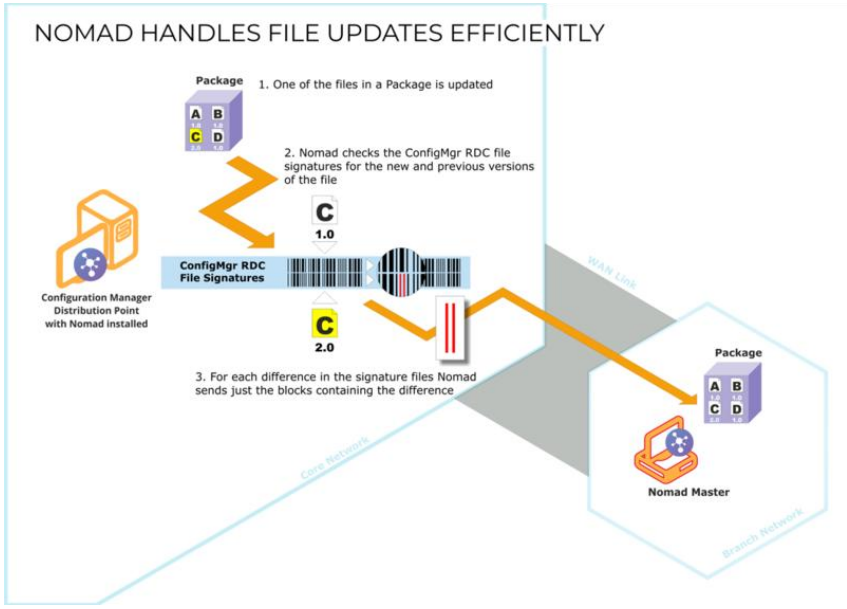
9.1.3.5.3 The Nomad share

The Nomad cache is configured as a share that enables peer-to-peer distribution of downloaded content. Nomad provides control over the accounts that have access to the share and also provides an advanced Nomad FanOut mechanism that can overcome the connection limit to shares on workstations to ensure that content is distributed efficiently and securely.

9.1.3.6 Remote differential compression (RDC) integration

Not only is Nomad aware of the file level differences between different versions of a package so that only changed files are downloaded, it is also aware of the differences within individual files, refer to File-level delta downloads for details.

In our example, a package that has been previously downloaded has one of its files updated. Nomad compares the Configuration Manager RDC signature file (where each block in the file is given a number that identifies it according to its contents) for the new version of the file and the one before it. By identifying the changes, Nomad is able to download just the file blocks containing the differences.



9.1.3.7 Nomad app

The Nomad app provides visibility of content distribution activity and cache status for content distributed by both Nomad and Delivery Optimization. This includes Configuration Manager content distributed with Nomad and Software Updates content distributed with either Nomad or Delivery Optimization.

9.1.3.8 Content Distribution

1E Content Distribution is a Tachyon Consumer, providing control and visibility on content deployments and delivery in an organization.

9.1.3.9 Support for IPv4 and IPv6

Nomad supports IPv4 by default, and optionally supports IPv6, which is commonly required when clients connect to the corporate network using the DirectAccess.

9.1.3.10 App-V support

Nomad supports application virtualization (App-V) applications which are deployed as streamed content by Configuration Manager.

9.1.3.11 FIPS compliant communication encryption

Nomad has always provided encryption for most of its communications and uses an advanced FIPS compliant encryption algorithm. The United States Federal Information Processing Standard (FIPS) http://en.wikipedia.org/wiki/FIPS_140-2 is a standard that defines security requirements for software used by the U.S. federal government. It stipulates that applications that encrypt any sensitive data should use only a certain set of approved encryption algorithms.

9.1.3.12 Nomad Pre-caching

Pre-caching lets you preload the Nomad caches of particular machines directly from the Configuration Manager console. This enables downloads to be available on the branch prior to a deployment taking place, which can be very useful in large-scale deployment scenarios.

9.1.3.13 Nomad FanOut

Windows imposes a limit on the number of concurrent connections on the Nomad share. The FanOut featurecompensates for this limitation by enabling any peer that has more content than the requester to respond to the FanOut request. It is not limited to peers that have an active connection to the master.

9.1.3.14 Single-site download - SSD

Nomad's Single Site Download (SSD) feature ensures a download across the WAN only happens once per site. It does this by maintaining information about which subnets are neighbors of each other (accessible on LAN rather than WAN), so that when an elected master considers a download from a DP rather than a peer in its subnet, it can discover which other local subnets already has the package. These subnets are typically at a single customer site, specifically a single geographical location.

Nomad SSD uses Content Distribution. When a Nomad client downloads a package, it registers this information with Content Distribution, enabling a profile to be created on which Nomad clients hold particular packages.

9.1.3.15 Peer Backup Assistant - PBA

The Peer Backup Assistant (PBA) feature enables files and settings data to be backed-up to a peer device so that they can be maintained when the device is being migrated to a new Operating System. Using PBA, you can avoid the cost of State Migration Point servers to hold the backup

data, as peer devices can be used to provide this storage. The risk of losing user data through the migration process is also greatly reduced in the process.

9.1.3.15.1 Single Site Peer Backup Assistant - SSPBA

Peer Backup Assistant (PBA) enables Nomad clients to use local storage on peers to temporarily store user state data during an OS deployment, removing the need for Configuration Manager State Migration Points. By default, it uses network broadcasts to identify peers with available storage on the local subnet. Single Site Peer Backup Assistant (SSPBA) uses Single Site Download (SSD) features to enable Nomad to use storage available on PBA hosts in adjacent subnets. This enables you to:

Designate appropriate devices to provide the Nomad PBA data store for all devices on the site, not just the local subnet

Avoid the issue where clients on particular subnets do not have sufficient disk space to offer the role of a Nomad PBA data store.

9.1.3.16 Support for Software Updates

9.1.3.16.1 Deploying Office 365 updates

Configuration Manager introduced support for Office 365 agents in Current Branch 1602, and Nomad introduced support in version 6.1.100. This section describes how Office 365 deployments differ in terms of ACP requirements and goes on to describe how Nomad behaves during the download.

9.1.3.16.2 Windows 10 Express Installation Files and Delta Content for Updates

As Windows 10 cumulative updates get very big, very quickly (often in excess of 1GB a few months after any given Feature Upgrade), Microsoft started publishing express installation files for these updates in addition to the traditional full update files. Configuration Manager introduced support for Windows 10 Express Installation File updates in Current Branch 1802 hotfix KB4163547.

Express installation files are a much larger payload on the Distribution Point compared to traditional software update files, but the feature enables clients to download delta byte-ranges from these files, so each month the amount of data a client has to download is typically much smaller. Configuration Manager Current Branch can be configured to support express installation files (refer to https://docs.microsoft.com/en-us/configmgr/sum/deploy-use/manage-express-installation-files-for-windows-10-updates for more details).

With the release of Windows 10 1809, Microsoft replaced express update files with a new way of managing deltas within software updates. In Configuration Manager 1902 the **Enable installation of Express installation files on clients** option in Software Update Client Settings was replaced with **Allow clients to download delta content when available**.

> **Note**
>
> Nomad supports the download of Express installation files and delta content for updates.

9.1.3.16.3 Downloading content for CM Software Updates from Microsoft Update

This feature enables Nomad to download content from Windows Update / Microsoft Update (WUMU). Starting in CB version 1806, software updates can be deployed to devices without first downloading and distributing content to Distribution Points, instead clients download updates directly from the cloud.

9.1.3.17 Integrating Nomad with WakeUp

Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.

The wake up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution and a NightWatchman infrastructure. The feature is enabled during installation of PreparationNightWatchman Management Center. Please refer to Nomad Preparation for requirements.

9.1.3.18 OS deployment task sequences

Nomad can integrate with OSD strategies to maximize the efficiency of distributing large OS content across the network. It does this by providing a number of Task Sequence steps that can be integrated directly into your OSD Task Sequences.

9.1.3.19 Nomad Download Monitor

The Nomad Download Monitor tool (also known as NomadBranchGUI) is useful for administrators for troubleshooting downloads as they view the status of downloads on local and remote Nomad client devices.

9.1.3.20 Cloud Support

Nomad supports the following Configuration Manager (CM) on Azure scenarios:

Infrastructure as a Service (Iaas) - your host CM infrastructure servers are in Azure virtual machines

Cloud based Distribution Points - CM distribution points are hosted in Microsoft Azure as a cloud service

Cloud Management Gateway (CMG) - CM management points are hosted in the cloud, including support for CMG VM scale sets.

9.1.3.21 Nomad Baseline Wizard

The Nomad Baseline wizard is used to create a Configuration Manager (CM) Baseline from the Configuration Manager console for settings related to Nomad.

9.1.3.22 Nomad Download Pause

Nomad integrates with Tachyon to enable pausing or resuming Nomad downloads throughout the estate. This feature provides a safety measure for situations when a faulty or harmful deployment is made by mistake. In such situations, pausing Nomad downloads on all targeted devices can prevent or limit the potential damage.

It can also be used to facilitate troubleshooting, making it possible to pause all Nomad downloads across the network and enable IT teams to eliminate content distribution from their assessment of network bandwidth usage.

9.2 Implementing Nomad

Everything you need to know about getting Nomad installed and running in your environment. This section is structured in a way that leads you through the three phases of a typical implementation project.

Design, including requirements

Install, including preparation

Verify.

9.2.1 Design Considerations

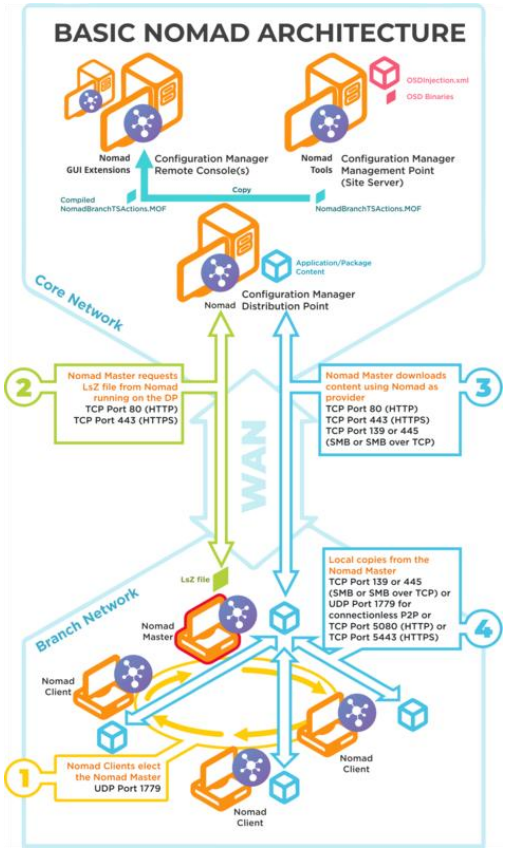
Information that will help you design and plan the implementation of Nomad in your organization.

This page is part of the design phase of implementation.

9.2.1.1 Nomad architecture

The architecture for Nomad. This describes the customer-facing components and how they connect to provide the functionality in Nomad.

> **Note**
>
> For a full description of Tachyon Platform Stacks, their components, the clients and how they connect to provide Tachyon Platform features, refer to Tachyon Architecture.



Ports	Notes
UDP 1779	**Step 1** By default, Nomad uses UDP Port 1779 to communicate during the election process for determining the master on a subnet. The Nomad installer will automatically add *NomadBranch.exe*,*NomadPackageLocator.exe* and *PackageStatusRequest.exe* to the list of excepted programs in the native Windows Firewall. The default value for the port may be changed at install time using the P2PPORT installer property or post-installation by changing the P2P_Port registry value. If you change the default port, you must ensure all Nomad clients communicate using the same port. The Nomad port (by default UPD Port 1779) must be open on all wireless access points to facilitate Nomad peer-to-peer communications. Not all vendors enable this port by default, please refer to the specific device vendor's documentation for details on how to enable ports on each WAP device.
TCP 80 (HTTP)	**Step 2**

Ports	Notes
TCP 443 (HTTPS)	Nomad Master requests LSZ file from Nomad running on the DP.
TCP 80 (HTTP)	**Step 3**
TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	Nomad Master downloads content using Nomad as provider. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager the default setting is HTTP or HTTPS.
TCP 139 (SMB)	**Step 4**
TCP 445 (SMB over TCP) UDP 1779 (used for connectionless P2P) TCP 5080 (HTTP) TCP 5443 (HTTPS)	Local copies from the Nomad master. The recommended way to facilitate Nomad cache access is to enable Windows File and Print Sharing. If this is not feasible on your network environment you can configure Nomad to use different means to access network shares, see Nomad cache for more details on configuring this option. Connections may use one of the following: SMB SMB over TCP Connectionless P2P HTTP HTTPS

9.2.1.2 Installation scenarios

9.2.1.2.1 New installation

Nomad is included with the Tachyon Platform, so you'll need to use the Tachyon setup wizard to install it. To activate Nomad, you'll need a valid license file.

1E will provide you with a **Tachyon.lic** license file that defines the products and features your Tachyon System is able to use, for how long, and how many devices it supports, this may be an evaluation or subscription license.

The license must be activated. Once activated, it may be used only by the Tachyon System that activated it.

Licenses can be renewed or updated, but if allowed to expire, then the affected products or features will not be usable.

For a new installation, the Tachyon Setup program will let you select the license file from any folder on disk.

For an existing installation, the license file is copied into the folder: %PROGRAMDATA%\1E\Licensing on your Tachyon Server.

For details of what the license file needs to contain, please refer to License requirements for consumer applications.

Before installing the Tachyon Platform, please refer to Installing Tachyon, this includes details of server sizing. The addition of Nomad does not affect sizing, as it is included with the Tachyon Platform.

9.2.1.2.2 Existing Nomad installation

If you already have Nomad configured in your environment, you can install Nomad as a local consumer application on your existing Tachyon web server, if it is Tachyon Platform 8.1

Please refer to Upgrading Nomad for guidance on:

Upgrading to the latest version of Nomad within a Configuration Manager operating environment

Additional guidance on upgrading ActiveEfficiency to Content Distribution

Upgrading Configuration Manager when Nomad is in use.

9.2.1.3 Infrastructure dependencies

9.2.1.3.1 Tachyon platform

Although not a requirement for generally using Nomad, the Tachyon Platform must be installed and available before you can use certain features.

The following features use Content Distribution and require Tachyon platform and platform features of Nomad to be enabled:

Nomad app provides visibility of content distribution activity.

Single Site Download (SSD) (SSD).

Single Site Peer Backup Assistant - SSPBA (SSPBA).

High Availability PBA (HAPBA) (HAPBA).

Get Migration Settings task sequence action used to manage computer associations.

Nomad Pre-caching.

Nomad Download Pause.

Note

Nomad versions prior to Nomad 7.1 used ActiveEfficiency to support similar features. Tachyon platform previously included ActiveEfficiency.

The following features were provided in versions older than Nomad 7.1

1E Client Health - now provided by the Guaranteed State feature of the platform.

Nomad Dashboard - now provided by Nomad app feature of the platform.

For everything you need to know about getting the platform installed and running in your network, please refer to Planning for Tachyon.

These features require the full deployment of the platform infrastructure, including Master and Response Stacks, with an optional DMZ Server for Internet-based clients.

Tachyon platform is installed using Tachyon setup, which should also be used to install the following components, included in the Tachyon platform download zip.

Nomad app - this consumer application replaces the legacy Nomad Dashboard.

Content Distribution - this web service is required by the Nomad app, and replaces the legacy ActiveEfficiency Server.

Please refer to:

Requirements for prerequisites.

Introducing Tachyon for details about the Tachyon platform and other optional applications and features.

9.2.1.3.2 Implementing a Tachyon Platform DMZ server

If you have internet-based clients you will need a Tachyon Platform DMZ Server to support your Internet-facing Tachyon clients. The DMZ Server is a type of Response Stack used to provide Tachyon Real-time and Inventory services to Internet-based clients. For details about installing a Tachyon DMZ Server to support Internet-facing Tachyon clients refer to Implementing a Tachyon DMZ Server.

9.2.1.3.3 Tachyon client integration with Nomad

When Tachyon and Nomad clients are both enabled in the 1E Client, then the clients and Tachyon instructions will - by default - automatically use Nomad to download content. Tachyon client uses Nomad to download content from the Tachyon Background Channel, or from any website, without any dependency on Configuration Manager.

For more information, from a Tachyon perspective, please refer to Downloading client content and Nomad integration.

9.2.1.4 Nomad components

To understand what Nomad can do for you, please refer to Nomad overview and Nomad fundamentals. Once you have decided what features you will use, then you will need to deploy relevant components to clients and servers.

In addition to the **Nomad app** and **Content Distribution** components described above, the following sections provide a brief overview of Nomad components:

1E Client

Configuration Manager Console extensions

Configuration Manager OSD Tools

Download Monitor tool.

9.2.1.4.1 1E Client

The Nomad client is the core component of Nomad and can be used on its own without any other components.

Nomad client is part of the 1E Client and is only supported on Windows devices. You must deploy the 1E Client (with Nomad enabled) to:

In-scope client devices - use 1E Client Deployment Assistant 8.1 (CDA) to help deploy 1E Client via Configuration Manager

Configuration Manager Distribution Points - use the installer transform file created by CDA edited as required to suit the type of DP, ensuring LSZ Generation is enabled (enabled by default in SpecialNetShare).

The 1E Client also includes the following clients that must be enabled to support optional Nomad features:

Tachyon client - provides real-time features required by the Download Pause feature

Shopping/WSA client - provides Windows Servicing Assistant (WSA) features

PXE Everywhere Agent - allows computers to automatically boot up into Windows PE, which then allows a Windows Operating System to be installed.

Please refer to:

Deployment and configuration options for an overview of Nomad configuration and deployment options

Requirements for prerequisites

Deploying the Nomad client using Configuration Manager for detailed steps

Introducing 1E Client for details about 1E Client and other optional client modules (Tachyon, Shopping/WSA, PXE Everywhere, WakeUp).

9.2.1.4.2 Configuration Manager Console extensions

The extensions must be installed on all computers where Configuration Manager administrators use their CM Admin Console to :

edit OSD Task Sequences

configure Nomad content download settings for applications, packages, software updates

use the Nomad Download Pause feature

use the Nomad Baseline wizard feature.

Please refer to:

Requirements for prerequisites.

9.2.1.4.3 Configuration Manager OSD Tools

The Configuration Manager OSD Tools (also known a NomadBranch Tools) must be installed on all Site Servers (except Secondary) and all SMS Provider servers. Specifically servers which Configuration Manager Consoles may connect to.

The installer copies the Nomad binaries to the ConfigMgr site installation folder .\OSD\bin\<Architecture> on the SMS Provider server. This enables the files to be injected into the OSD boot image allowing Nomad to be used during the WinPE deployment phase. The installer will also extend the Configuration Manager Site WMI namespace to include definitions of the 1E Nomad built-in task sequence steps.

Please refer to:

Requirements for prerequisites

9.2.1.4.4 Download Monitor tool

Also known as NomadBranch GUI, the Nomad Download Monitor tool is optionally installed on client devices alongside the Nomad client, and is used for troubleshooting and testing only. It should not be installed generally in your network.

9.2.1.5 Client deployment and common configuration settings

9.2.1.5.1 1E Client Deployment Assistant (CDA)

The **1E Client Deployment Assistant (CDA)** is the recommended method of deploying 1E Client to Windows computers if you have Microsoft System Center Configuration Manager, and also for deploying 1E NightWatchman Agent. 1E Client may be deployed independently using alternative software distribution methods.

The CDA creates Packages, Applications, empty Collections and Deployments with custom Windows Installer transforms to simplify the installation and initial configuration of the 1E Client and its modules. You can then simply add devices into the Collections to upgrade Nomad on those devices.

> **Note**
>
> The wizard allows you to configure commonly used settings. The template **.mst** contains many additional installer properties, but not all of them. You should review your requirements and decide which installer properties to modify or add. The full list is available in Nomad installer properties.
>
> Some less common settings are described in more detail further below.

Connection to a Configuration Manager site is required even if you only want to use the CDA wizard to create the MST transform files. The site must have software distribution features enabled.

> **Tip**

CDA helps create everything you need to deploy clients and agents in your Configuration Manager environment. If you prefer, you can use CDA in a lab or other environment to create the Configuration Manager application and/or package content (including MST transform files). Then you can copy the content to your production environment and manually create your deployments.

If you don't want CDA to create objects in Configuration Manager then you can use Microsoft's Orca to edit the base MST transform files supplied with CDA, and manually create your deployments.

Orca is a Microsoft tool for creating and editing Windows Installer packages (MSI) and merging modules (MST transforms). It is available from the Windows Installer Development Tools - https://docs.microsoft.com/en-us/windows/desktop/msi/orca-exe.

Nomad OSD tools and Nomad Configuration Manager Console extensions are both available in the **NomadBranchTools.msi** installer. The installer will automatically choose which components to install based on the server where the installer is running. For Configuration Manager sites and SMS Providers the Nomad OSD tools will be installed and if the Configuration Manager Console is present the Nomad Configuration Manager Console extensions will be installed.

So, in addition to deploying 1E Client (with Nomad client module enabled) on all computers and on Configuration Manager Distribution Points, the following locations require the **NomadBranchTools.msi** to be run:

Configuration Manager sites and SMS Providers.

Configuration Manager site servers, any other computer that has the Configuration Manager Console installed.

Note

For full documentation on the 1E Client Deployment Assistant, refer to Introducing 1E Client Deployment Assistant including:

Preparation.

Running the wizard - where you configure commonly used settings.

Configuration Manager objects.

Supported platforms.

Installer properties.

9.2.1.5.2 Nomad client settings

Nomad client installer properties are associated with each area of functionality in Nomad, and are mostly configured in the registry, it's only the enabling of Nomad and Tachyon that's completed in the 1E Client configuration file.

They can be specified during installation of the 1E Client as Windows installer properties, and must be specified in upper-case. Settings that exist in the 1E Client configuration file can be mixed-case, and can be reconfigured after installation using 1E Client command-line parameters.

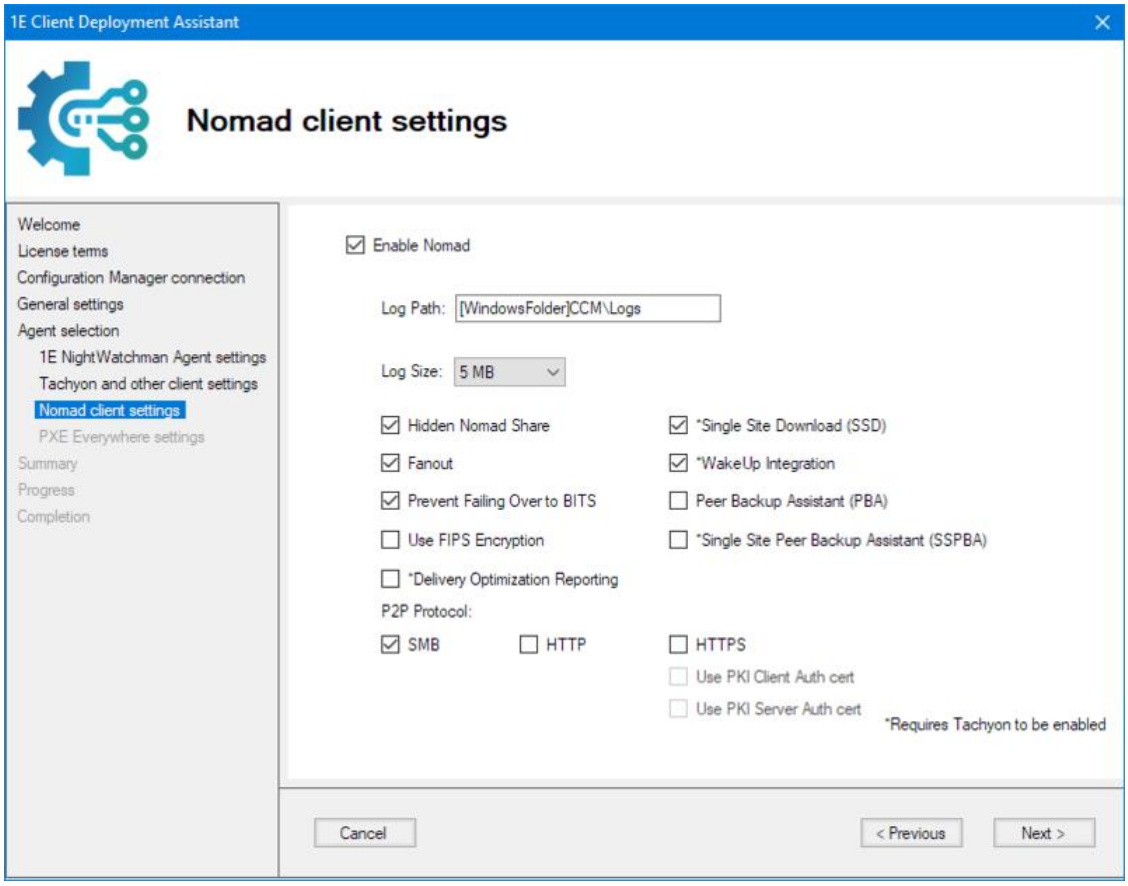
Note

For a full list of the 1E Client installer properties available for the Nomad client module refer to Nomad client alphabetic installer properties.

9.2.1.5.3 Common configuration settings

These are settings that most frequently vary between organizations, and are therefore presented as options in CDA.

9.2.1.5.3.1 Nomad client settings in CDA



9.2.1.5.3.2 Nomad client settings in 1E Client installer

9.2.1.5.3.3

Each of the following features is optional. Although not a requirement for generally using Nomad, Introducing Tachyon must be installed and available before you can use certain Nomad features.

Nomad feature	Description	Installer properties	Infrastructure requirement
Hidden Nomad Share	The Nomad cache is configured as a share that enables peer-to-peer distribution of downloaded content. Nomad provides control over the accounts that have access to the share and also provides an advanced Nomad FanOut mechanism that can overcome the connection limit to shares on workstations to ensure that content is distributed efficiently and securely.	MODULE.NOMAD.SPECIALNETSHARE	Nomad Administration Tools Microsoft System Center Configuration Manager
Single Site Download (SSD)	Nomad's Single Site Download (SSD) feature ensures a download across the WAN only happens once per site. It does this by maintaining information about which subnets are neighbors of each other (accessible on LAN rather than WAN), so that when an elected master considers a download from a DP rather than a peer in its subnet, it can discover which other local subnets already has the package. These subnets are typically at a single customer site, specifically a single geographical location. Nomad SSD uses Content Distribution. When a Nomad client downloads a package, it registers this	MODULE.NOMAD.SSDENABLED MODULE.NOMAD.CONTENTREGISTRATION	Introducing Tachyon Nomad Administration Tools Microsoft System Center Configuration Manager

Nomad feature	Description	Installer properties	Infrastructure requirement
	information with Content Distribution, enabling a profile to be created on which Nomad clients hold particular packages. **Note** When SSD is enabled in the CDA wizard, then Content registration is also enabled.		
FanOut	Windows imposes a limit on the number of concurrent connections on the Nomad share. The FanOut featurecompensates for this limitation by enabling any peer that has more content than the requester to respond to the FanOut request. It is not limited to peers that have an active connection to the master.	MODULE.NOMAD.SPECIALNETSHARE	Nomad Administration Tools Microsoft System Center Configuration Manager
Peer Backup Assistant (PBA)	The Peer Backup Assistant (PBA) feature enables files and settings data to be backed-up to a peer computer so that they can be maintained when the computer is being migrated to a new Operating System. Using PBA, you can avoid the cost of State Migration Point servers to hold the backup data, as peer computers can be used to	MODULE.NOMAD.SSPBAENABLED	Nomad Administration Tools Microsoft System Center Configuration Manager

Nomad feature	Description	Installer properties	Infrastructure requirement
	provide this storage. The risk of losing user data through the migration process is also greatly reduced in the process.		
Prevent Failing Over to BITS	If Nomad generates a return code that is not in the list, it passes a fail to the CTM component which causes the Configuration Manager client to try downloading the content itself using BITS, or use another Alternate Content Provider (ACP). This process may itself succeed or fail depending on the conditions that resulted in the original Nomad return code, and may have an undesirable impact on the network. **Note** The special code 0x9999 can be added to the list, or used on its own, to cause Nomad to always return a success to CTM. As a consequence this code is also known as "prevent failover to BITS".	MODULE.NOMAD.SUCCESSCODES	Nomad Administration Tools Microsoft System Center Configuration Manager
Single Site Peer	SSPBA can be enabled at install time using the	MODULE.NOMAD.SSPBAENABLED	Introducing Tachyon

Nomad feature	Description	Installer properties	Infrastructure requirement
Backup Assistant (SSPBA)	MODULE.NOMAD.SSPBAENABLED installer property. Post-installation SSPBA can be enabled by setting the following registry values: Update the SSPBAEnabled registry value to 1. Update the SSDEnabled registry value to 0x3 to enable Content Distribution integration required for this feature to work. When SSPBA is enabled, PBA will initially attempt to find suitable PBA data stores on the local subnet. If it does not find one, it will send the request to neighboring subnets using the information held in Content Distribution.		Nomad Administration Tools Microsoft System Center Configuration Manager
Use FIPS Encryption	FIPS encrypts the following types of Nomad data: Data sent over a network in peer-to-peer communications, including: Election communications Connectionless data transfer Nomad FanOut requests Sign-on/sign-off communication	MODULE.NOMAD.USEFIPS	Nomad Administration Tools Microsoft System Center Configuration Manager

Nomad feature	Description	Installer properties	Infrastructure requirement
	SSD Package Status Requests PBA communications.		
Delivery Optimization Reporting	Monitor and report on Delivery Optimization (DO) downloads. This feature is only supported in full versions (OS with UI) of Windows Server 2016 and Windows 10 Version 1909 onwards.		
P2P Protocol SMB HTTP HTTP(S)	If you are installing Nomad for the first time, consider how your peers are going to communicate for content transfer. You will need to make sure your clients are configured to use the same protocol. Depending on whether you use either SMB, HTTP or HTTP/S the configuration steps will be slightly different, for example if you decide to use a PKI certificate for server or client authentication HTTP/S. Nomad peer-to-peer content transfer uses SMB by default, which requires File and Print services to be enabled in order for it to share the content. For better security Nomad can be configured to use HTTP	MODULE.NOMAD.P2PENABLED	Nomad Administration Tools Microsoft System Center Configuration Manager

Nomad feature	Description	Installer properties	Infrastructure requirement
	or HTTPS for peer-to-peer content transfer, removing the requirement for file shares. When Nomad is configured to use HTTP/S, if Peer Backup Assistant is enabled it will also use HTTP/S. Refer to Peer copy over HTTP or HTTPS for more information, including: Enabling HTTP/HTTPS Authentication Certificate Selection Firewall exceptions Windows PE support Configuring use of PKI-issued certificates post-installation.		

9.2.1.6 Other configuration settings

In general, the default values using in the CDA template .mst file will suit most organizations, however you should consider the following to ensure you have the optimum configuration for your organization.

9.2.1.6.1 Maximizing download speed for high-bandwidth links using Dynamic Block Sizes

The Dynamic Block Size (DBS) feature increases block size on high-bandwidth links to get maximum efficiency, and reduces it on low-bandwidth links to reduce the impact. Using DBS, Nomad is able to automatically decide the appropriate block size for a given link bandwidth and also adjust it as needed during the download if the link conditions change. As a result, Nomad is far more efficient and faster on all types of connection bandwidths while retaining its minimal impact on other link traffic.

Note

DBS is enabled or disabled by configuring Bit 25 in the CompatibilityFlags registry. Setting Bit 25 disables DBS and clearing Bit 25 enables DBS.

In Nomad 7.0 onwards, the DBS feature is turned off by default for new installations, and not changed for upgrades.

Prior to v6.3 the default value of BlockSize registry setting was 32KB (0x8000). From v6.3 onwards the default is 128KB (0x20000).

The installer automatically sets this to 128KB for both fresh installs and upgrades from previous versions. The only exceptions to this are:

It will use the specified value if the BLOCKSIZE property is used in the installation command line or in a MST transform, when doing a fresh install or upgrade

It will retain the previous value of BLOCKSIZE if it was set to anything other than 32KB (the older default), when doing an upgrade.

Note

For more information click here to expand...

The following is a duplicate of the BlockSize page.

Value (in bytes) for the minimum size of each block of data Nomad copies from the package source folder.

Note

Any change to this value requires a manual service restart before it can take effect.

Registry value	Default value	Notes	Installer property
BlockSize	131072(128KB)	Must be between 4096(4KB) to 4194304(4MB) inclusive. The default block size is 128KB The maximum block size is 4MB Multicast environments can only use the	MODULE.NOMAD.BLOCKSIZE

Registry value	Default value	Notes	Installer property
		default block size. If you define a larger value for multicast environments, Nomad automatically resets it to the default. Clients use the block size defined in the registry and ignore the values from the LSZ	

The Dynamic Block Size (DBS) feature increases block size on high-bandwidth links to get maximum efficiency, and reduces it on low-bandwidth links to reduce the impact. Using DBS, Nomad is able to automatically decide the appropriate block size for a given link bandwidth and also adjust it as needed during the download if the link conditions change. As a result, Nomad is far more efficient and faster on all types of connection bandwidths while retaining its minimal impact on other link traffic.

Note

DBS is enabled or disabled by configuring Bit 25 in the CompatibilityFlags registry. Setting Bit 25 disables DBS and clearing Bit 25 enables DBS.

In Nomad 7.0 onwards, the DBS feature is turned off by default for new installations, and not changed for upgrades.

Prior to v6.3 the default value of BlockSize registry setting was 32KB (0x8000). From v6.3 onwards the default is 128KB (0x20000).

The installer automatically sets this to 128KB for both fresh installs and upgrades from previous versions. The only exceptions to this are:

It will use the specified value if the BLOCKSIZE property is used in the installation command line or in a MST transform, when doing a fresh install or upgrade

It will retain the previous value of BLOCKSIZE if it was set to anything other than 32KB (the older default), when doing an upgrade.

9.2.1.6.2 Managing stable LAN connections

Nomad provides extra stability by managing a machine's network connections as they move between a wireless and a wired LAN. Depending on the OS version or other factors, once an SMB or HTTP session is running on a wireless connection, it will remain on wireless even when a wired LAN becomes available. Nomad uses **WLanBlipSecs** to temporarily drop a wireless connection when it detects a wired LAN connection, to give time for the OS and Nomad to automatically switch to the LAN connection.

For example, if a Nomad master was initiated when a machine was on a wireless connection and a wired connection subsequently became available, Nomad disables the wireless adapter for a long enough period to enable a switchover to the wired connection. As a result of this, the IP address and the share path will change and peers will log error messages until each peer re-establishes its connection to the master and the new share location.

This feature is turned off by default.

> **Note**
>
> Other applications may be affected when switching from wireless to wired connection.

Irrespective of the **WLanBlipSecs** setting, you can also control which service set identifier (SSID) Nomad connects to by managing a list. To do this, update the NomadBranch WLanProfileList registry value with a comma-delimited list of SSIDs or use the wildcard (*) character for any SSID.

> **Note**
>
> For more information click here to expand...
>
> The following is a duplicate of the WLanBlipSecs page.
>
> The duration for temporarily disabling a wireless connection when a wired LAN connection becomes available, to provide time for the OS and Nomad to switch to the LAN connection. This is useful for OS versions and drivers that do not automatically switch to a preferred wired connection.
>
> | Registry value | Default value | Notes | Installer property |
> |---|---|---|---|
> | WLanBlipSecs | 0 | The value must be 20 seconds or more. | MODULE.NOMAD.WLANBLIPSECS |
>
> Nomad provides extra stability by managing a machine's network connections as they move between a wireless and a wired LAN. Depending on the OS version or other factors, once an SMB or HTTP session is running on a wireless connection, it will remain

on wireless even when a wired LAN becomes available. Nomad uses **WLanBlipSecs** to temporarily drop a wireless connection when it detects a wired LAN connection, to give time for the OS and Nomad to automatically switch to the LAN connection.

For example, if a Nomad master was initiated when a machine was on a wireless connection and a wired connection subsequently became available, Nomad disables the wireless adapter for a long enough period to enable a switchover to the wired connection. As a result of this, the IP address and the share path will change and peers will log error messages until each peer re-establishes its connection to the master and the new share location.

This feature is turned off by default.

Note

Other applications may be affected when switching from wireless to wired connection.

Irrespective of the **WLanBlipSecs** setting, you can also control which service set identifier (SSID) Nomad connects to by managing a list. To do this, update the NomadBranch WLanProfileList registry value with a comma-delimited list of SSIDs or use the wildcard (*) character for any SSID.

Examples:

```
WLanProfileList REG_SZ WIFIGAP,GUEST
WLanProfileList REG_SZ *
```

9.2.1.6.3 Setting intra-day work rates

Nomad allows hourly variable work rates to be set throughout the day enabling organizations to use different maximum percentage of available bandwidth during the working day and in the evenings. Intra-day work rates are set on the client using the *MaxWorkRates*registry value. If the intra-day work rate is less than that defined on the command-line, it will override the command-line value. If the intra-day work rate is higher than that defined on command-line, the command-line value is used in preference.

Note

Work rates only apply to transfers from a DP not to P2P transfers within a LAN.

Note

For more information click here to expand...

The following is a duplicate of the MaxWorkRates page.

MaxWorkRates is a registry key, that must be created, to hold registry values for each day of the week (Day0 to Day6) where the hourly maximums for the variable work rates are set.

Registry values	Default value	Notes	Installer property
MaxWorkRates\Day#		Hourly variable workmates can be set throughout the day. The days of the week are labelled: **Day0** to **Day6** where **Day0** = Sunday, **Day1** = Monday etc. Each day value is REG_SZ string set as a comma separated list of 24 hourly work rates for that day. Each value can be set from 1-100. The following is an example for setting for the Day# values where on Sunday, a maximum work rate of 20% will be used. On	None.

Registry values	Default value	Notes	Installer property
		Monday, the max work rate between 0:00-05:59 is 80%, between 06:00-17:59 is 20% and between 18:00-23:59 is it 80% again. For the rest of the week, the work rate specified on the command-line is used. If neither work rate is specified, the default is 80%.	

```
Windows Registry Editor Version 5.00

[HKEY_LOCAL_MACHINE\SOFTWARE\1E\NomadBranch\MaxWorkRates]
"Day0"="20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20,20"
"Day1"="80,80,80,80,80,80,20,20,20,20,20,20,20,20,20,20,20,20,80,80,80,80,80,80"
```

Registry values	Default value	Notes	Installer property
		"Day2"="" "Day3"="" "Day4"="" "Day5"="" "Day6"=""	

Nomad allows hourly variable work rates to be set throughout the day enabling organizations to use different maximum percentage of available bandwidth during the working day and in the evenings. Intra-day work rates are set on the client using the *MaxWorkRates* registry value. If the intra-day work rate is less than that defined on the command-line, it will override the command-line value. If the intra-day work rate is higher than that defined on command-line, the command-line value is used in preference.

Note

Work rates only apply to transfers from a DP not to P2P transfers within a LAN.

Work rate override arguments

The intra-day work rates can be overridden using the --wro and --wr Nomad command-line arguments.

If these two arguments are combined, the value for the --wr switch is used in preference to the intra-day work rate set in the registry

If only the --wro argument is used, any intra-day value is overridden with a default maximum of 80%

If using intra-day work rates and the --wr argument only, the lower of the two values is used.

9.2.1.6.4 Inhibiting subnets and sites

You can define subnets and AD sites where machines will download from the DP (these machines will not relay download status messages) and not participate in Nomad elections. This feature only supports IPv4 subnets and is useful for sites that have a:

Local DP

VPN without isolation. Typically, VPN solutions isolate each client using single-node subnets (i.e. each client is in its own subnet with a 32-bit subnet mask) to prevent broadcast traffic between VPN clients that are typically geographically dispersed and not on the same local network. If the VPN solution is not configured in this manner and clients get an IP address with a subnet mask less than 32 bits, broadcasts can be exchanged between the VPN clients enabling Nomad to elect a master that is not on the same local network.

The Nomad additional setting *++pr* will not override the download priority.

The Nomad NomadInhibitedSubnets or NomadInhibitedADSites registry values can be set with a comma separated list of sites or subnets in which Nomad functionality should be inhibited. If the client machine exists

in either an inhibited subnet or an inhibited site, peer functionality is disabled, the agent will not participate in elections and will download from the DP.

9.2.1.6.4.1 Inhibit files and formats

You can append the inhibited subnet and AD site lists with content from text files to make it easier to manage if there are many sites and subnets to be defined. Inhibited sites or subnets are defined in text files with a *.inh* extension and must reside in the *%INSTALLDIR%\Inhibits* directory.

Each file should contain a list of the inhibited subnets in a classless inter-domain routing (CIDR) format, or a list of inhibited AD sites. Each site or subnet must be on a separate line or be separated by commas. For example, the following defines two subnets and one AD site to be inhibited:

```
192.168.0.0/24, 192.168.1.0/24
ACMEDOM1
```

When the Nomad service starts or is reset, any .inh files in the Nomad *%INSTALLDIR%\Inhibits* directory are read in. Both the registry values and the contents of these files are used together to determine the list of inhibited subnets and sites.

A service reset occurs when the Nomad registry is updated or there is a change of subnet. So, if a laptop moves to another subnet half way through a download, the Nomad service will reset and check the current subnet against its list of inhibited subnets. If the check determines that the new subnet is an inhibited subnet, Nomad's peer-to-peer functionality is disabled – the service stops downloading from the peer and will instead download from the local DP.

9.2.1.6.5 Support for IPv4 and IPv6

Nomad supports IPv4 by default, and optionally supports IPv6, which is commonly required when clients connect to the corporate network using the DirectAccess.To configure support for IPv4 and/or IPv6, update the Nomad SpecialNetShare registry value:

Bit 1 - 0x0002 - Enable IPv6

Bit 2 - 0x0004 - Disable IPv4

9.2.2 Requirements

A checklist of typical infrastructure prerequisites and dependencies to install Nomad.

This page is part of the design phase of implementation.

Review Design Considerations first if you need to design and plan the implementation of Nomad in your organization.

9.2.2.1 Installation account permissions

Installer	Rights required
Nomad client is now part of the 1E Client. Please refer to Introducing 1E Client for details of how to deploy the 1E Client with the Nomad client enabled.	Local Administrator to install.

Installer	Rights required
The 1E Client should be installed on all Windows clients. You must use the correct installer file according to the Windows architecture of the device: **1E.Client-x64.msi** is for 64-bit architectures **1E.Client-x86.msi** is for 32-bit architectures You must also deploy the 1E Client (with Nomad enabled) to Configuration Manager Distribution Points.	
Download GUI tool installer for optional installation on clients: **NomadBranchGui.msi.** **Note** This is a troubleshooting, testing, and administrative tool only. It should not be installed generally on devices in your network.	Local Administrator to install.
ConfigMgr console extensions: **NomadBranchAdminUIExt.msi** ConfigMgr administrators use console extensions to configure Nomad content download, custom task sequence steps and Nomad Download Pause features. **Note** The installer should be run on all Windows workstations and servers that have Configuration Manager Console installed, including Site servers.	Local Administrator to install.
ConfigMgr OSD Tools: **NomadBranchTools.msi** The installer copies the Nomad binaries to the ConfigMgr site installation folder .\OSD\bin\<Architecture> on the SMS Provider server. This enables the files to be injected into the OSD boot image, allowing Nomad to be used during the WinPE deployment phase. The installer will also extend the ConfigMgr site WMI namespace to include definitions of the 1E Nomad built in task sequence steps. **Note** The installer must be run on all Site Servers (except Secondary) and all SMS Provider servers. Specifically, servers which Configuration Manager Consoles may connect to.	Local Administrator to install.

9.2.2.2 Server requirements

9.2.2.2.1 Tachyon Platform

Although not a requirement for generally using Nomad, the Tachyon Platform must be installed and available before you can use certain features.

The following features use Content Distribution and require Tachyon platform and platform features of Nomad to be enabled:

Nomad app provides visibility of content distribution activity.

Single Site Download (SSD) (SSD).

Single Site Peer Backup Assistant - SSPBA (SSPBA).

High Availability PBA (HAPBA) (HAPBA).

Get Migration Settings task sequence action used to manage computer associations.

Nomad Pre-caching.

Nomad Download Pause.

> **Note**
>
> Nomad versions prior to Nomad 7.1 used ActiveEfficiency to support similar features. Tachyon platform previously included ActiveEfficiency.

The following features were provided in versions older than Nomad 7.1

1E Client Health - now provided by the Guaranteed State feature of the platform.

Nomad Dashboard - now provided by Nomad app feature of the platform.

For everything you need to know about getting the platform installed and running in your network, please refer to Planning for Tachyon.

9.2.2.2.2 Nomad Administration Tools

Please refer to Supported Platforms - Nomad Administration Tools for a list of all the platforms supported by Nomad, and the software required to allow Nomad to be installed or to work.

9.2.2.3 Client requirements

9.2.2.3.1 1E Client

Please refer to Supported Platforms - Nomad client for a list of all the platforms supported by Nomad, and the software required to allow Nomad to be installed or to work.

9.2.3 Preparation

What you will need to prepare in advance of implementing Nomad in your network. Typically, these are tasks that may take some time, depending on how your organization works. A more complete checklist of tasks is provided in Requirements.

9.2.3.1 Nomad preinstallation checks

If you are upgrading, please refer to Upgrading Nomad. You must upgrade in the following order to avoid potential forward compatibility issues:

Upgrade all site servers and Distribution Points first. Old and new clients can then be sure to connect to the latest version on servers

Upgrade all Nomad clients running on a single subnet at the same time. This avoids potential issues with older clients attempting to peer connect with new clients on the same subnet, even if the client configuration remains the same.

Ensure DNS is working properly

Ensure client side firewalls have exceptions in place for *NomadBranch.exe*, *NomadPackageLocator.exe* and *PackageStatusRequest.exe*

Ensure local broadcasts are enabled on each subnet that Nomad operates in

> **Note**
>
> Some wireless access points may be configured to prevent broadcasts, which will prevent Nomad peer-sharing features from working. See the Wireless Access Points prerequisite for details on WAP configuration.

Ensure the Configuration Manager client is healthy and functioning properly

The latest version of Tachyon Platform should be installed to support certain features, please refer to the Tachyon Platform section

If you want **Nomad integration with WakeUp** then you will need the following:

Tachyon Platform

The Nomad app must be installed on the latest version of Tachyon Platform, and the single-site download feature enabled as described in Single Site Download.

NightWatchman Management Center with WakeUp Server infrastructure

NightWatchman Management Center 7.0 or later must be installed

> **Note**
>
> During installation, you must tick the **Enable ActiveEfficiency** checkbox on the **1E ActiveEfficiency** server screen, and enter the base FQDN:port of the Tachyon server that hosts the Content Distribution service. For example: tachyon.acme.local:443

WakeUp Server 7.0 or later must be installed

1E Client 7.0 or later (with the WakeUp component enabled and reporting turned on) must be deployed to all the clients on the required subnets.

> **Note**
>
> You will need a valid NightWatchman Enterprise license to use these components.

On Nomad peers:

Content Registration must be enabled on all machines where the WakeUp feature is to be used.

On Nomad devices requesting the download:

Enable the 1E Client WakeUp component

Enable Single Site Download if you require site-wide wake-up.

On the devices where you use wake-up:

The BIOS on each client must be configured to support wake from off

The network adapter on each client must be configured to support wake from sleep (1E Services can help configure this using vendor utilities and scripts).

To support enhanced package consistency checking, the Nomad client must be installed on each Configuration Manager DP. This client enables file-level consistency checking by creating a manifest file on the DP for every version of each package created, enabling Nomad to verify that each file it downloads is consistent with the version available on the DP.

> **Note**
>
> LSZ generation using HTTP/HTTPS is automatically configured only on DPs that are also Site servers. For standalone DPs (those not on a site server), enable the following on the Nomad client running on the DP either during installation or by updating the Nomad registry:

Installer property	Registry value	Description
SIGSFOLDER	SigsFolder	Nomad is able to leverage Configuration Manager's binary differential replication (BDR) if the Windows remote differential compression

Installer property	Registry value	Description
		feature is installed on the DP server using the Windows Server Manager. On the Nomad side, set this registry value on the DP to point to the Configuration Manager RDC signatures folder.
SPECIALNETSHARE	SpecialNetShare	The 0x4000 bit must be set to enable the Nomad client to handle LSZ file generation requests coming from HTTP/HTTPS enabled clients.
PERMITTEDLSZSHARES	PermittedLSZShares	When installed on a standalone DP (not on a site server), ensure that this registry value contains the local share names used on the server (e.g. *SMSPKGF$*; *SMSPKGG$*; etc) to host

Installer property	Registry value	Description
		Configuration Manager packages. The default value satisfies the default locations used by Configuration Manager.

If you are using the **BIOS to UEFI** feature, ensure you meet its prerequisites described in BIOS to UEFI 1.4 - Requirements.

9.2.3.2 Accounts needed to install Nomad

9.2.3.2.1 Tachyon Server Installation Account

The server installation account has the following requirements on the server.

Local admin rights on the Tachyon Server. It must be an Directory domain user account that is a direct or indirect member of the Administrators local group on the server where Tachyon Server will be installed.

Can be disabled (not deleted) in Directory after additional Tachyon admin users have been created in Tachyon, and installation has been verified.

In addition, the server installation account requires SQL rights as described in SQL Databases and SSAS Databases.

The server installation account is granted the following permissions as a Tachyon user, configured during installation of the Tachyon Server.

It is the first Tachyon user account and is a System Principal, which means it cannot be deleted or assigned any other rights

It is assigned to the Tachyon system role of Installer

It should be used to add additional Tachyon users and administrators, assign them to Tachyon roles, which should then be used for ongoing use and management of Tachyon.

It may be included in any AD security group assigned to a Tachyon system or custom role.

Refer to Roles and Securables for a complete reference of Tachyon system roles, custom roles, securables and operations.

9.2.3.3 Tachyon

The following features require Tachyon platform, and Nomad features of 1E Client to be enabled:

Nomad app provides visibility of content distribution activity

Single Site Download (SSD) (SSD)

Peer Backup Assistant - PBA (SSPBA)

High Availability PBA (HAPBA) (HAPBA)

Get Migration Settings task sequence action used to manage computer associations

Nomad Pre-caching

Nomad Download Pause.

9.2.3.4 Nomad Download Pause

Nomad Download Pause is available if you implement a Tachyon server infrastructure, including enabling the **Tachyon client** features in 1E Client in addition to the Nomad client. It also requires Single Site Download.

9.2.3.5 NightWatchman Enterprise

Nomad integration with WakeUp is available if you enable this feature when installing NightWatchman Management Center. You should install the Tachyon Platform first and then install NightWatchman Management Center.

In summary, you require the following:

Tachyon Platform

NightWatchman Management Center server

WakeUp Server installed on each Configuration Manager site server

WakeUp client module enabled in the 1E Client on all client computers

Wake-on-LAN enabled on all client computers.

Please refer to Integrating Nomad with WakeUp.

PXE Everywhere

If you are also implementing a PXE Everywhere solution using Nomad, ensure you meet its prerequisites. Please refer to PXE Everywhere Requirements.

9.2.3.6 Certificates

You can use digital certificates to certify the identity of entities in your network. We support the use of Public key infrastructure (PKI) based certificates or self-signed certificates. If you are using PKIs to digitally sign entities from the outset, ensure that they are deployed to all agents. Alternatively, you can deploy PKIs post-installation. Things to bear in mind when using the HTTPS protocol:

Define the certificate type using P2PSSLSETTINGS (0 – self-signed certificates or 1 – PKI certificates). By default, self-signed is enabled.

When self-signed is enabled, a self-signed certificate is created by the installer and stored in *MY* store.

Diagrams and tables with all the external Nomad communication ports. Useful, if needed, for network and device firewalls.

9.2.3.7 Networking

Due to the nature of how proxy servers can be implemented, some of which can be quite complex, you may need to consult your networking specialist to see if exceptions need to be added to enable Nomad's peer-copy over HTTP or HTTPS.

The following are the ports used by Nomad client on clients and on Distribution Points. The table does not include Configuration Manager communications, which can be found here: https://docs.microsoft.com/en-us/sccm/core/plan-design/hierarchy/communications-between-endpoints.

Ports	Notes	Configurable
UDP 1779	Default port Nomad uses for listening to elections to determine the master on a subnet, control traffic and for content transfer if you have Connectionless enabled. A firewall exception must exist for this port. Nomad will create one automatically for Windows firewall, but not for other firewall software.	Yes, during installation.
TCP 80 (HTTP) or TCP 443 (HTTPS)	Used when the Nomad master requests LSZ files from Nomad running on the DP and when the Nomad master downloads content using Nomad as provider. Communications depend on how the DP is configured. Configuration Manager is configured to use either HTTP or HTTPS. If Nomad clients and Content Distribution are configured to use HTTP/S, Nomad clients using SSD register and query for content.	No, for communications with CM components. Nomad service on startup reads the configured ports from CM client registry and uses the same for LSZ generation. Yes, for communications with Tachyon Platform using Nomad's PlatformURL setting.
TCP 5080 (HTTP) or TCP 5443 (HTTPS)	Default HTTP port to use for peer copy. If you are using a custom port, ensure that all agents use the same custom port. From Nomad 6.2, peer copy can be enabled over HTTP (default 5080) or HTTPS (default 5443). You can customize the ports for this feature in the host registry but a change to the default impacts	Yes, during installation.

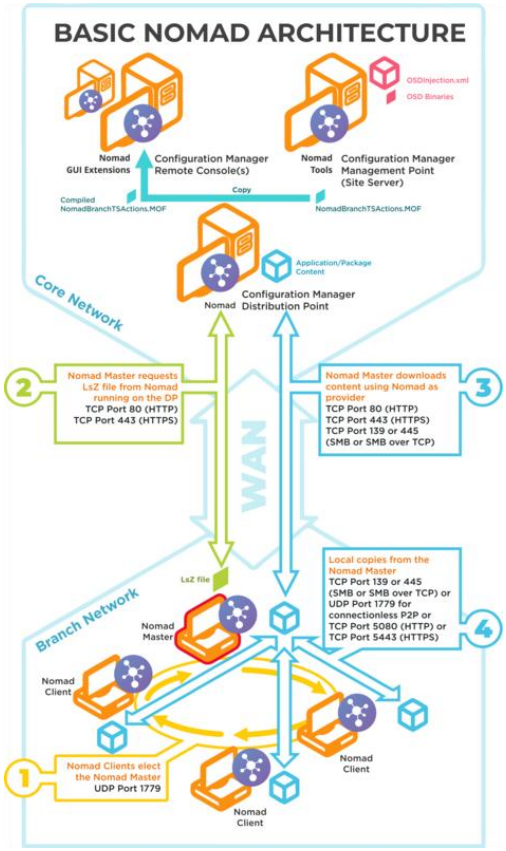
Ports	Notes	Configurable
	Nomad's peer backup assistant which is used to capture user data on remote peers during OS deployments.	
TCP 139 (SMB) and TCP 445 (SMB over TCP)	Required only if SMB is enabled. Used for peer-to-peer content transfer between the Nomad master and Nomad peers. Communications depend on how the DP is configured. That is HTTP, HTTPS, SMB or SMB over TCP. For Configuration Manager the default is HTTP or HTTPS. Windows Firewall automatically adds the exception when you enable **File and Print Sharing** but you may have to do this manually if you are using a different firewall product.	No. SMB ports cannot be configured.
TCP 137 (SMB) and TCP 139 (SMB)	Required only if SMB is enabled. Used by SMB for data transfer and related communications. It is used to resolve NetBIOS names during a transfer. UDP NetBIOS name query packets are sent to this port. Windows Firewall automatically adds the exception when you enable **File and Print Sharing** but you may have to do this manually if you are using a different firewall product.	No. SMB ports cannot be configured.

Nomad can use ephemeral ports (not discussed here). Ephemeral or high ports can either be UDP or TCP depending on the protocols used and are used to send information out. In a typical client-server communication, these are ports opened by the client on its own machine in order to send something to the server and they are closed as soon as the transmission is done, hence the term ephemeral. From a security perspective, it is not an issue.

Most firewalls will allow outgoing communications by default so in all likelihood, you will not need to do any firewall configuration. However, if your firewall blocks these outbound communications, consult the documentation for your firewall on how to enable these types of communications.

9.2.3.8 Basic Nomad architecture

Click image to enlarge.

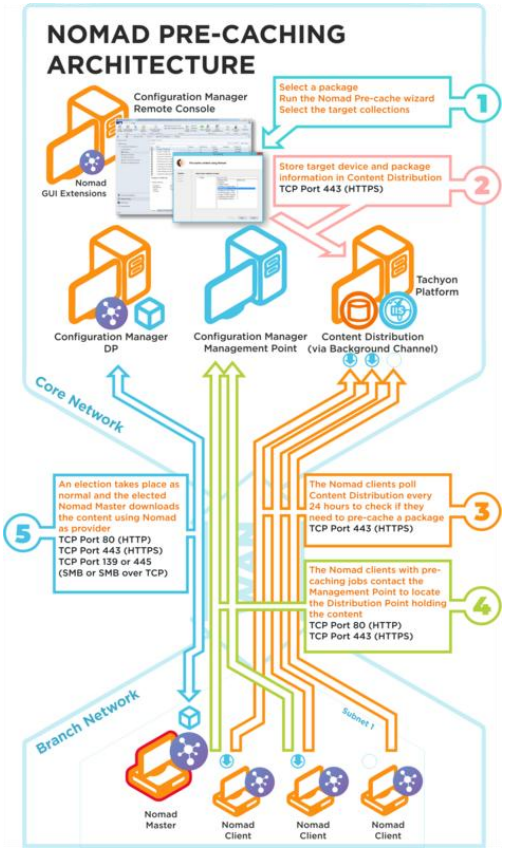


Ports	Notes
UDP 1779	**Step 1** By default, Nomad uses UDP Port 1779 to communicate during the election process for determining the master on a subnet. The Nomad installer will automatically add *NomadBranch.exe*,*NomadPackageLocator.exe* and *PackageStatusRequest.exe* to the list of excepted programs in the native Windows Firewall. The default value for the port may be changed at install time using the MODULE.NOMAD.P2PPORT installer property or post-installation by changing the P2P_Port registry value. If you change the default port, you must ensure all Nomad clients communicate using the same port. The Nomad port (by default UPD Port 1779) must be open on all wireless access points to facilitate Nomad peer-to-peer communications. Not all vendors enable this port by default, please refer to the specific device vendor's documentation for details on how to enable ports on each WAP device.
TCP 80 (HTTP)	**Step 2**

Ports	Notes
TCP 443 (HTTPS)	Nomad Master requests LSZ file from Nomad running on the DP.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 3** Nomad Master downloads content using Nomad as provider. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager the default setting is HTTP or HTTPS.
TCP 139 (SMB) TCP 445 (SMB over TCP) UDP 1779 (used for connectionless P2P) TCP 5080 (HTTP) TCP 5443 (HTTPS)	**Step 4** Local copies from the Nomad master. The recommended way to facilitate Nomad cache access is to enable Windows File and Print Sharing. If this is not feasible on your network environment you can configure Nomad to use different means to access network shares, see Nomad cache for more details on configuring this option. Connections may use one of the following: SMB SMB over TCP Connectionless P2P HTTP HTTPS

9.2.3.9 Nomad pre-caching architecture and ports

Click image to enlarge.



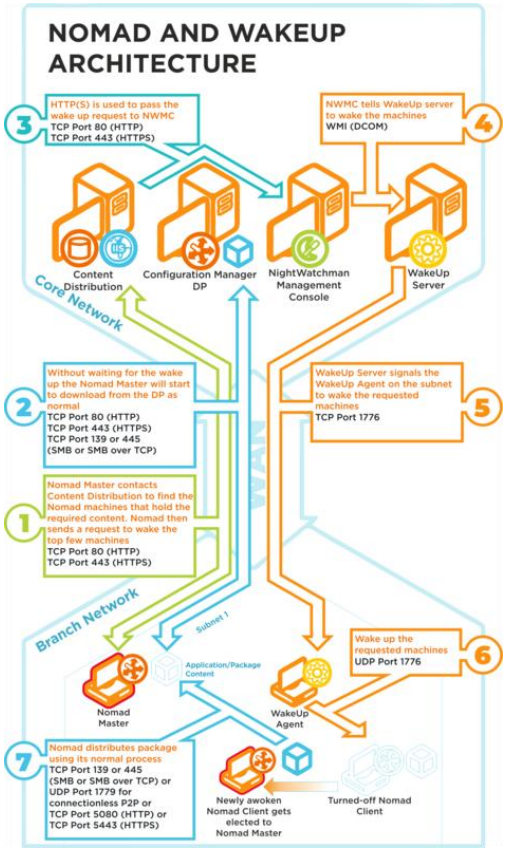
The Nomad pre-caching uses the following ports in its communications. If a site server is configured to use custom ports, pre-caching will use those ports to communicate with a management or distribution points. To ensure high-availability, pre-caching falls back to next available site server if it fails to communicate with a management or distribution point.

Ports	Description
N/A	**Step 1** Choose a package and run the Nomad pre-caching wizard, selecting the target device collection. This step does not require any port configuration but the Nomad Configuration Manager console extensions must be installed in the Configuration Manager Console.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 2** The Nomad pre-caching wizard stores the target device and package information in Tachyon.
TCP 80 (HTTP)	**Step 3** The Nomad clients, where the pre-cache feature has been enabled, poll Tachyon every 24 hours to see if they need to pre-cache some content. This takes the form

Ports	Description
TCP 443 (HTTPS)	of pre-caching notifications that tell the Nomad clients they need to process a download job to fetch the specified content.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 4** The Nomad clients, with pre-caching notifications, contact the Management Point to locate the Distribution Point that holds the content. This may use HTTP or HTTPS depending on how the Management Point is configured.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 5** A Nomad Master election takes place and the elected master processes the job by downloading the pre-cache content using Nomad as provider. This is then distributed locally to the Nomad peers that also require the pre-cached content. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager the default setting is either HTTP or HTTPS.

9.2.3.10 Nomad and WakeUp integration architecture and ports

Click image to enlarge.

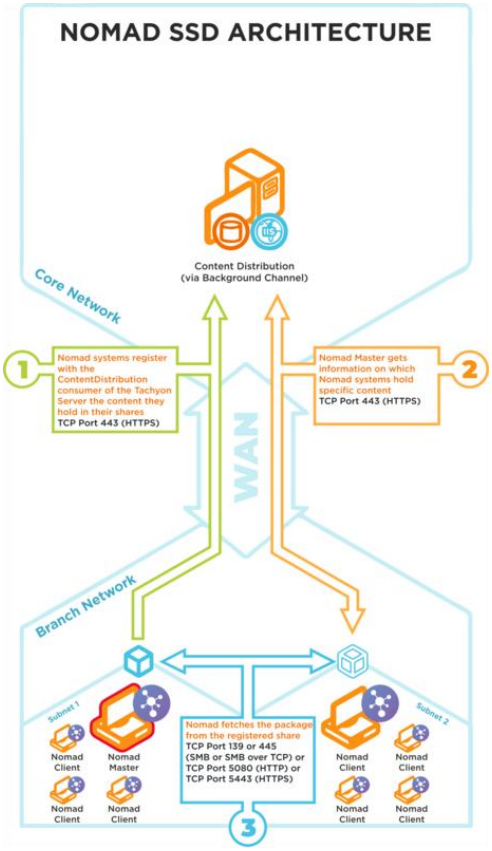


Ports	Description
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 1** Nomad Master contacts Content Distribution and gets a list of Nomad devices that hold the content it requires. Nomad sends a request to wake the top 5 devices on the list. Refer to WakeUpBatchSize for details about how you can set the maximum number of machines to wake up in a single call.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 2** Without waiting for any devices to be awoken, the Nomad master starts to download content from the DP. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB

Ports	Description
	SMB over TCP For Configuration Manager, the default setting is HTTP or HTTPS.
TCP 80 (HTTP)	**Step 3**
TCP 443 (HTTPS)	Content Distribution posts the wake message from Nomad to the NightWatchman Management Center Web API.
WMI (DCOM)	**Step 4**
	NightWatchman Management Center tells the WakeUp server to wake the requested devices.
TCP 1776	**Step 5**
	WakeUp Server signals the WakeUp Agent on the appropriate subnet to wake the requested devices.
UDP 1776	**Step 6**
	The WakeUp agent on the subnet sends a wakeup request to the requested devices.
TCP 139 (SMB)	**Step 7**
TCP 445 (SMB over TCP) UDP 1779 (connectionless P2P)	As part of its standard behavior, Nomad holds regular elections (every 5 minutes) to determine the most appropriate master. If a device is found (i.e. one that has been recently awoken) that holds more of the required content, it stops downloading from the DP and fetches the content from the new device's cache. This may be via SMB or via connectionless P2P, depending on the configuration of Nomad.

9.2.3.11 Nomad SSD architecture and ports

Click image to enlarge.



Nomad SSD uses the following ports in its communications:

Ports	Notes
TCP 80 (HTTP)	**Step 1**
TCP 443 (HTTPS)	Nomad systems on the branch site register in Content Distribution the content they hold in their shares
TCP 80 (HTTP)	**Step 2**
TCP 443 (HTTPS)	Nomad Masters get information on which Nomad systems hold specific content
TCP 80 (HTTP)	**Step 3**
TCP 443 (HTTPS)	Nomad Master fetches a package from the registered Nomad share on a neighboring subnet
TCP 139 (SMB)	
TCP 445 (SMB over TCP)	

We recommend that the latest version of Tachyon Platform is installed to support this feature, please refer to Requirements for more details.

9.2.4 Installing Nomad

How to install Nomad.

9.2.4.1 Installing Nomad overview

Nomad installation requirements including installers and installation order.

9.2.4.1.1 Nomad installers

Before installing Nomad, make sure your infrastructure meets the Requirements.

Nomad requires the installation of:

1E platform.

1E Client (with the Nomad client module enabled) installed on Windows devices.

1E Client (with the Nomad client module enabled) installed on Configuration Manager Distribution Points.

For full details, refer to:

Installing Tachyon

Installing the 1E Client for Nomad

Deploying the Nomad client using Configuration Manager.

9.2.4.1.1.1 Nomad Branch Tools

Note

You can download the 1E Content Distribution Tools from the **Releases** page for your platform version at https://support.1e.com/.

NomadBranchGui.msi	Installer for a useful troubleshooting tool to monitor Nomad activity. It has no dependency on Configuration Manager. For information about using this tool, please refer to Nomad Download Monitor.
NomadBranchTools.msi	Installer for 1E NomadBranch Tools (for OSD) on Configuration Manager site servers

	1E Nomad Branch Admin Extensions on Configuration Manager consoles (previously *NomadBranchAdminUIExt.msi*) For information about installing these tools, please refer to Installing Nomad Branch Tools.
Scripts\CDPurgeSettings.ps1	A sample PowerShell script to view or update Purge Configuration in the Content Distribution Service defined in the ContentDistribution PurgeSettings table if it is configured. For details of how to use this script, please refer to Content Distribution purge configuration script.
Scripts\ExampleSitesAndSubnets.ps1	Sample script that provides two functions to update sites and subnets in the Content Distribution locations table: DeleteAllLocations and AddLocation(). For details of how to use this script, please refer to Example Single Site script.
Scripts\LocationDiscovery.ps1	Sample script to enable and disable the location discovery feature, along with the option to run it and load site, subnet and information in Content Distribution. For details of how to use this script, please refer to Example Location Discovery script.
Scripts\PostADSitesandSubnets.ps1	Sample script that scans the Active Directory (AD) environment for all sites and subnets and stores the information in the Content Distribution locations table. For details of how to use this script, please refer to Example Active Directory Single Site script.

Note

The sample PowerShell scripts can be used to populate the Content Distribution database, to support the following Nomad features:

Single Site Download (SSD)

Single-site Peer Backup Assistant (SSPBA)

High Availability Peer Backup Assistant (HAPBA).

1E Client

Note

You can download the 1E Client from the **Releases** page for your platform version at https://support.1e.com/.

1E.Client-x86.msi	Installer for computers that have a **32-bit** platform architecture.
1E.Client-x64.msi	Installer for computers that have a **64-bit** platform architecture, including **Distribution Points**.

Note

The Nomad client is a client module in the 1E Client, which also includes Tachyon and client modules for Shopping/WSA and WakeUp. Please refer to Introducing 1E Client for installation and configuration details.

Please refer to Introducing 1E Client Deployment Assistant for information about a wizard that assists Configuration Manager with the deployment of 1E Client and PXE Everywhere, guiding you through common settings for clients and deployments.

9.2.4.1.2 Installation Order

We recommend you install Nomad in the following order:

1	Tachyon Platform	If you have purchased a Tachyon license, then you can install and use Tachyon for additional features. To prepare for and install Tachyon, please refer to Planning for Tachyon.
2	Nomad Tools for Operating System Deployment (OSD) on Configuration site servers	Install Nomad Branch Tools for OSD on the Configuration Manager primary sites (and extra SMS Providers, if they exist) if Nomad's OSD features are required, refer to Installing Nomad Branch Tools. **Note** Configuration Manager Console should not be running on the computer when **NomadBranchTools** is installed/upgraded. **Tip** If you are also implementing PXE Everywhere, you may wish to install PXE Everywhere Central on your site

server at this point. Please refer to Implementing PXE Everywhere.

3	Install Console extensions on Configuration Manager site servers	Install Nomad Branch Toolson any computers that have Configuration Management Console installed, refer to Installing Nomad Branch Tools. **Note** Configuration Manager Console should not be running on the computer when **NomadBranchAdminUIExt** is installed/upgraded.
4	Deploy 1E Client to selected Configuration Manager Distribution Points	Install 1E Client (with Nomad client module enabled) on Configuration Manager Distribution Points. Enable Tachyon features and other client modules if required. By default, IIS is configured to prevent certain file types from being downloaded. You will need to allow Nomad to download all content as it does not use the Configuration Manager workaround to bypass this Microsoft security feature. We recommend you read Nomad post-installation tasks: IIS request filtering which describes how to update the filtering on all distribution points to enable Nomad to function as expected. You might also want to configure any virus checkers running on your network to make exceptions for the Nomad executables and support files, as described in Nomad post-installation tasks: Antivirus exceptions. **Tip** You can also optionally install PXE Everywhere Responders to selected clients if you have DHCP snooping enabled in your network. Please refer to DHCP Snooping.
5	Deploy 1E Client to selected Configuration Manager clients	Install 1E Client (with Nomad client module enabled) on Configuration Manager Distribution Points. Enable Tachyon features and other client modules if required. **Tip** You can also optionally enable PXE Everywhere Agent in the 1E Client.

6	Post-installation tasks	Verify selected clients before deploying the 1E Client to remaining Distribution Points and client devices. Deploy Console extensions to administrator workstations.

9.2.4.1.3 Licensing Nomad in 1E Client

The Nomad client module in 1E Client 4.1 and later does not require a license key. Nomad does not require input of a license key, or relicencing when upgrading or updating. Customers are legally bound to use the software within the terms of the 1E software license agreement.

9.2.4.2 Installing the Nomad app and 1E Content Distribution

An overview of the Tachyon Platform, and the interactive installation of Nomad and 1E Content Distribution using Tachyon Platform Setup, with screenshots.

9.2.4.2.1 Tachyon Platform setup

The Nomad app and 1E Content Distribution are installed through Tachyon Platform setup.

For full details on how to set up Tachyon Platform, please refer to Tachyon Setup. You choose to install Nomad on the following two screens during setup:

Select Configuration - allows you to choose whether to install Tachyon Platform

Configure Nomad - allows you to specify your Configuration Manager (CM), SQL database instance, and Nomad sync interval.

After installation, you should refer to the following:

9.2.4.2.1.1 Tachyon Platform post installation tasks

Post-installation tasks, which include verification checks and mandatory and optional configuration tasks. For details refer to Tachyon Server post-installation tasks.

9.2.4.2.1.2 Deploying the 1E Client

How to deploy 1E Client, including a guide to upgrading. 1E Client provides Tachyon client features and client modules for Nomad, PXE Everywhere, Shopping/WSA, and WakeUp. For details refer to Deploying 1E Client.

9.2.4.2.1.3 Basic verification tests

Basic verification tests that cover a single-server installation of Tachyon Server. These tests only cover Tachyon and do not verify the configuration of 1E client modules with other 1E products. For details refer to Verifying.

9.2.4.2.2 Nomad app

The Tachyon Portal website will be available after installation. You can access the Nomad app directly using a URL similar to the following:

Note

https://tachyon.acme.local/Nomad

The Nomad app will be available on the Tachyon Platform portal homepage and as an app from the left-hand navigation in the Tachyon Platform portal, under the **Switch app**.

For details about each page in the Nomad app, please refer to:

Overview page - provides a visual snapshot of download activity

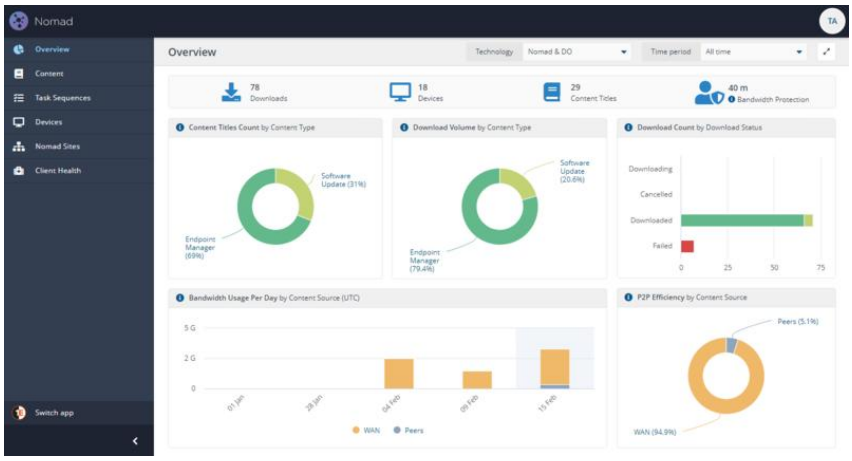
Content page - lists the unique contents synced from Configuration Manager

Task Sequences page - lists the configured task sequences

Devices page - lists every device registered to Nomad

Nomad Sites page - shows how the network is being used for content distribution in different locations

Client Health page - shows Nomad related device status information from the Guaranteed State app.



Tip

You should check each of these pages, and verify you are able to access them, and they present no issues.

For example, by default, the Client Health page will not show any data until you have completed configuration of the **Nomad Administrators** role, and uploaded the Client Health policies. Both of these tasks are described below.

9.2.4.2.3 Nomad roles and permissions

As part of the installation process, Tachyon Platform adds the **Nomad Administrator** role described in the Nomad Administrator section. The Nomad Administrator role includes permissions to view Guaranteed State and Client Health Policies and requires Configuration Manager permissions.

9.2.4.2.3.1 Nomad Administrator role

The Nomad Administrator role, allows a Tachyon user to use Nomad, manage Pre-cache jobs and view the results of related Instructions and Client health policies. As part of the installation

process, Tachyon Platform adds the **Nomad Administrator** role, with the following default permissions, viewable in the Tachyon Platform **Settings**app.

Name	Type	Permissions	Purpose
GuaranteedState	Global Permissions	Read	Allows access to Guaranteed State features, including the Client Health page.
Nomad	Global Permissions	Read, Write, Delete	Allows the Nomad app to be used.
1E Nomad	Instruction Set	Actioner	Allows instructions from the **1E Nomad** instruction set to be run. See Product Packs section below. This pack includes instructions required by Nomad Pre-caching and Nomad Download Pause features.

Typically, you would assign your Configuration Manager administrator AD group to this role, as described below in Configuration Manager permissions, to allow them access to relevant Nomad features in the Tachyon Platform.

The Nomad Administrator role can only be applied at the All Devices Management Group level, because it is defined as a non delegatable custom role.

> **Note**
>
> Delegation in Tachyon is a concept where an administrator can delegate some of their own responsibility to other users and limit the area where they can use that responsibility. In Tachyon, a Full administrator can create and modify Roles. They can also assign any Role to a Tachyon user or group using Management Groups, there are exceptions, like the **Group Administrator** Role which cannot be assigned to **All Devices**.
>
> For example, a local security administrator with the **Group Administrator** role cannot create or modify Roles, but they can assign any Role that is marked as delegatable to a Management Group they have the security permission on or any of its child Management Groups.
>
> Refer to the Permissions Menu for details about configuring Tachyon users, roles, and management groups.

9.2.4.2.3.2 Upgrading Nomad and the Nomad Administrator role

When you upgrade from a previous Tachyon version to Tachyon Platform 8.0 note the **Nomad Administrators** role has been renamed to **Nomad Administrator**.

In addition, please note that:

Before upgrading to Tachyon 8.0	Post upgrade to Tachyon 8.0
If a user had the **Nomad Administrators** role without any management group assigned.	**Nomad Administrator** role with the **All Devices** management group will be assigned to that user.
When a user has the **Nomad Administrators** role assigned with one or more management groups except **All Devices**.	**Nomad Administrator** role with**All Devices** along with all other existing management groups would be assigned to the existing user.

The only difference would be for Nomad Pause jobs which would be applicable to the **All Devices** management group in Tachyon.

9.2.4.2.3.3 Guaranteed State and Client Health Policies

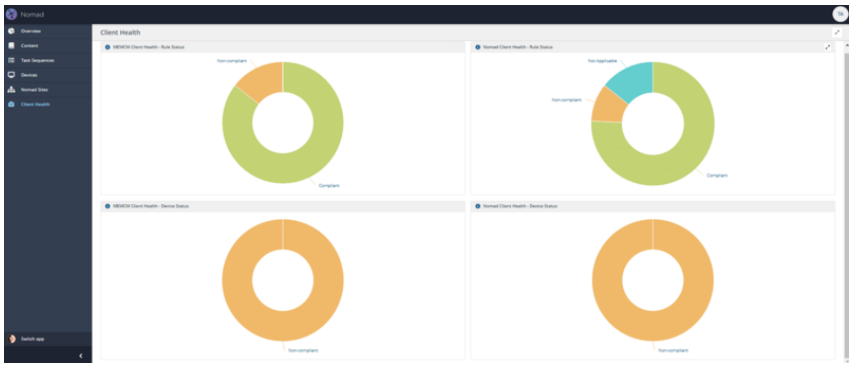
TheClient Health page shows Nomad related device status information from the Guaranteed State app.

The Nomad Administrator role allows a user to view information from Integrated Product Packs, including the two packs provided with the Tachyon Platform:

MEMCM Client Health Policy

Nomad Client Health Policy.

These Integrated Product Packs are represented on the Client Health page in the Nomad app.



Note

Guaranteed State can be reached directly using the following URL:

```
https://<tachyon DNS Name FQDN>/Tachyon/App/#/guaranteedstate/
```

where <tachyon DNS Name FQDN> is the one set up during the preparation phase, as described in DNS Names.

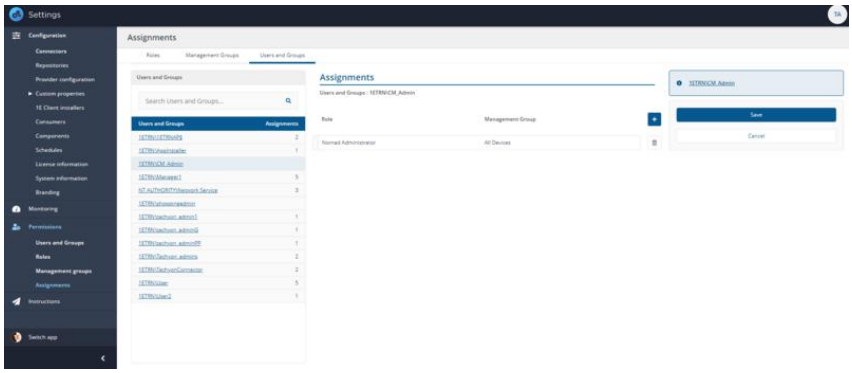
Configuration Manager administrators

If you have a single AD security group for your Configuration Manager administrators, you should assign it as a member of the **Nomad Administrator** group. This allows them to use the Nomad app, view and delete pre-cache and paused collections, and use Guaranteed State features if installed.

However, if you have decided to use different roles for Nomad app and Guaranteed State features, then you can assign the same or different AD security groups to the **Nomad Administrator** and **Guaranteed State User** roles.

For more information about these features, please refer to Nomad app overview, Nomad Pre-caching, Nomad Download Pause, and the Client Health page.

The example shows a Universal group called **CM_Admin** of which our Configuration Manager administrator account(s) are members.



Note

Active Directory security groups are strongly recommended for role-based access control (RBAC) but are not mandatory. AD security groups can be assigned to Tachyon roles after installation, they are not required during installation. They are added as Tachyon users and configured in the same way as AD user accounts.

A Tachyon user can therefore be a domain user account or a security group. Groups are not mandatory because users can be assigned to roles and managed within Tachyon instead of AD, or a combination.

9.2.4.2.4 1E Nomad product packs

Nomad feature-related Product Packs are included in the **Tachyon Platform** zip. These Product Packs are required to support various features of **Nomad**.

1E Nomad product pack - contain instructions, for use in Explorer and other Tachyon applications.

Nomad Client Health integrated Product Pack - contain policies, rules and fragments for use by Guaranteed State, and may also include instructions.

Refer to Adding Product Packs and configuring Instruction Sets for details about how to load instructions into Tachyon and create Instruction Sets for them.

9.2.4.2.4.1 1E Nomad product pack

Classic product pack used to create the **1E Nomad** instruction set in Tachyon, required by the following Nomad features:

Downloads tab on Device views - instructions used to populate details about Content download and other Nomad features

Nomad Download Pause - instructions used by the CM Admin Console extensions

Instructions to help with the following Nomad features: Nomad cache, CacheCleaner, Single Site Download, Nomad jobs, NomadBranch service.

For a full list of the instructions in the 1E Nomad product pack, including:

Associated Nomad feature

The instruction Type

Instruction description.

Refer to 1E Nomad product pack for more information.

9.2.4.2.4.2 Nomad Client Health integrated Product Pack

Nomad is included as part of the 1E Client, and as part of that integration, we offer a Nomad client health compliance policy in Guaranteed State. This verifies common Nomad requirements such as ACP registration, disk availability, firewall exceptions, crash notifications and cache monitoring.

The Nomad client health policy replaces the client health tile in the Nomad dashboard plus additional remediation steps:

Keeps content distribution services up and running on Nomad clients, so that users are secure and productive

Ensures Alternative Content Provider (ACP) registration configuration is set

Maintains optimal disk availability and monitors cache size for storage capacity planning

Enforces Firewall exceptions.

> **Note**
>
> This policy is intended for deployment to Windows devices only.

For a full list of the instructions in the Nomad Client Health Integrated Product Pack, including:

Instructions

Policies

Rules

Fragments

Trigger templates.

Refer to 1E Nomad product pack for more information.

9.2.4.2.4.3 Adding Product Packs and configuring Instruction Sets

You can either load instructions into Tachyon and create Instruction Sets for them automatically using Tachyon Setup and the **Tachyon Product Pack deployment tool**, or you can also load the product packs and create their associated instruction sets by hand.

For details about how to:

Manually load Instruction Definitions into Tachyon and then create, populate and delete Instruction sets – refer to Instruction sets page

Automatically upload instructions using the **Tachyon Product Pack deployment tool** – refer to Uploading with the Tachyon Product Pack Deployment Tool.

The **ProductPacks** folder in the Tachyon Platform zip file contains a number of **Classic** and **Integrated** product pack zip files. Reference information for Product Packs is included in the **Tachyon Platform** zip. These Product Packs are required to support various features of Tachyon.

> **Note**
>
> The **Tachyon Platform** zip is downloaded from the 1E Support Portal (1eportal.force.com/s/tachyontopicdetail). Additional Product Packs are available from Tachyon Exchange (tachyonexchange.1e.com) that are not documented here.

9.2.4.3 Installing the 1E Client for Nomad

For guidance on deploying the 1E Client onto Windows computers, including installation and uninstallation, refer to Deploying 1E Client on Windows.

9.2.4.4 Deploying the Nomad client using Configuration Manager

A step-by-step guide for using Configuration Manager to deploy the Nomad client to computers with the Nomad module enabled.

> **Note**
>
> The client component of Nomad 7.0 and later is the Nomad module of the 1E Client. This module is a direct replacement of NomadBranch used by previous versions of Nomad. The 1E Client includes modules for other 1E products, including Tachyon, Shopping and WakeUp. You can optionally enable these modules during deployment, or later by configuring the 1E Client configuration file.

9.2.4.4.1 Using Configuration Manager to deploy the Nomad client

Using Configuration Manager to deploy Nomad to all the Configuration Manager client machines is a relatively simple and efficient way of configuring all the Nomad client installations in one go. **1E Client Deployment Assistant (CDA)** is recommended as the most efficient way of creating Configuration Manager applications and deployments for clients, and packages for use in Task Sequences, or you can follow the instructions below to manually create applications. Please refer to Introducing 1E Client Deployment Assistant.

> **Note**
>
> If you are upgrading Nomad or any other client modules in 1E Client (Tachyon, Shopping, WakeUp) then please refer to Upgrading Nomad especially the note about **Application Supersedence**.
>
> **Tip**

Please also refer to Using Configuration Manager to enable and reconfigure the 1E Client after installation. The page describes how to use a **Configuration Manager Configuration Baseline**, and includes a zip file with template Configuration Items that can be imported into Configuration Manager.

9.2.4.4.2 Creating a Configuration Manager application to install the Nomad client

There are two installers for the Nomad client, one for 32-bit OS and the other for 64-bit OS:

1EClient-x86.msi is used for 32-bit OS

1EClient-x64.msi is used for 64-bit OS

The following headings show how to define an application and deployment types for each of these installers.

9.2.4.4.2.1 Creating an application with a deployment type for the 64-bit Nomad client installer

To create an application to install the Nomad client:

In the Configuration Manager console, open **Software Library**→**Application Management**.

Right-click **Applications** and choose **Create Application**.

On the **General settings** screen in the **Create Application Wizard**, select **Manually specify the application information**.

Click **Next**.

Populate the details for the application as follows:

Name: **Nomad client**

Publisher: **1E**

Software Version: **8.1**

Select the option:
Allow this application to be installed from the Install Application task sequence action without being deployed.

On the **Software Center** screen, click **Next**.

On the **Deployment Types** screen, click the **Add...** button.

From the **Type** drop-down in the **Create Deployment Type Wizard**, ensure that **Windows Installer (*.msi file)** is selected.

Ensure **Automatically identify information about this deployment type from installation files** is selected.

Set the **Location** of the **1EClient-x64.msi** installer using the **Browse...** button and locating the file from the share where the file has been stored.

Click **Next**.

On the **Import Information** screen, (assuming the import from the *msi* was successful), click **Next**.

On the **General Information** screen, set the **Name:** field to **Nomad client (64-bit)**.

Change the **Installation program** to something similar to the following:

```
> msiexec /i 1EClient-x64.msi MODULE.NOMAD.ENABLED=true MULTICASTSUPPORT=
0 LOGPATH=C:\Windows\CCM\Logs [other properties] /qn
```

In the above command line:

MULTICASTSUPPORT=0 turns off multicast (it makes the logs noisy if multicast hasn't been set up).

LOGPATH=C:\Windows\CCM\Logs sets the location of the Nomad client log files. When troubleshooting, it can be useful for Configuration Manager administrators to have the Nomad client log files in the same location as the Configuration Manager client log files.

You might also consider using a Windows Installer Transform (.mst) if there are a number of properties to define making the installer command-line long.

When the **Installation program** edit field has been set click **Next** to continue.

On the **Requirements** screen, click **Add...**

In the **Create Requirement** dialog, populate the requirements as follows:

Category: **Device**

Condition: **Operating system**

Rule type: **Value**

Operator, select **One of** from the dropdown list and then check any of the 64-bit OS you may encounter in your environment, for example **All Windows 10 (64-bit)**.

Click **OK**.

Click **Next**.

On the **Dependencies** screen, click **Next**.

On the **Summary** screen, click **Next** to start apply these settings.

You should see the heading **The Create Deployment Type Wizard completed successfully**, on the **Completion** screen of the **Create Deployment Type Wizard**. Click **Close** to close the wizard.

A new deployment type called **Nomad client (64-bit)** will have been added to the **Deployment types** field in the **Create Application Wizard**. At this point you could create another deployment type for the 32-bit version of Nomad, as described in Adding a deployment type for the 32-bit version of Nomad below.

Once you've finished creating the deployment types, click **Next** on the **Deployment Types** screen to continue.

On the **Summary** screen, click **Next** to start the creation of the application.

You should see the heading **The Create Application Wizard completed successfully**, on the **Completion** screen of the **Create Application Wizard**. Click **Close** to close the wizard

The **Nomad client** application should now be created in Configuration Manager.

9.2.4.4.2.2 Adding a deployment type for the 32-bit version of Nomad client

During or after the creation of the Nomad client application you can also add a deployment type for the 32-bit version of Nomad client using one of the following methods:

During creation: on the **Deployment Types** screen of the **Create Applications Wizard**

After creation on the **Deployment Types** tab of the application **Properties** dialog in Configuration Manager

After creation by right-clicking on the application in Configuration Manager and selecting **Create Deployment Type** from the context menu

The steps for each method are the same, to add a deployment type for the 32-bit version of Nomad repeat steps 7 to 22 under the heading Creating an application with a deployment type for the 64-bit Nomad installer - making the following changes:

At **step 10** set the location for the **1EClient-x86.msi** instead

At **step 13** on the **General Information** screen set the **Name:** field to **1E Client (32-bit)**

At **step 14** change the **Installation program** field to something similar to the following (essentially the same as the 1E client (64-bit) command line, except that the msi file name is **1E.Client-x86.msi**):

```
msiexec /i 1E.Client-x86.msi MODULE.NOMAD.ENABLED=true MULTICASTSUPPORT=t
rue LOGPATH=C:\Windows\CCM\Logs [other properties]/qn
```

At **step 17** when you set the operator check any checkboxes for the 32-bit OS you have in your environment instead, for example: **All Windows 8.1 (32-bit)** and **All Windows 10 (32-bit)**

9.2.4.4.3 Adding content to your distribution point

To add content to your distribution point:

From the **Applications** node in the **Software Library** workspace, right-click the **Nomad client** Application and from the context menu, choose **Distribute Content**.

On the **General** screen of the **Distribute Content Wizard**, click **Next**.

On the **Content** screen, click **Next**.

On the **Content Distribution** screen, click **Add** and choose **Distribution Point** from the drop-down list.

In the **Add Distribution Points** dialog, choose the distribution point.

Click **OK** to close the **Add Distribution Points** dialog and add the selected distribution points.

Click **Next** on the remaining screens of the Distribute Content Wizard to start adding the content to the selected distribution point(s).

If everything goes well you should see the message **The Distribute Content Wizard completed successfully**. Click **Close** to close the wizard.

9.2.4.4.4 Deploying the Nomad client to All Desktop and Server Computers

To deploy the Nomad client:

From the **Applications** node in the **Software Library** workspace, right-click the **Nomad client** application and from the context menu, choose **Deploy**.

On the **General** screen of the **Deploy Software Wizard**, click **Browse...** next to the **Collection:** field to open the **Select Collection** dialog.

From the drop-down list, choose **Device Collections**, then select **All Desktop and Server Clients**.

Click **OK** to return to the **General** screen.

Click **Next** to continue.

On the **Content** screen, ensure the content has been deployed to your distribution point (see step 6 under the Adding content to the Distribution Point heading). Click **Next** to continue when you have confirmed the distribution points.

On the **Deployment Settings** screen, ensure **Install** is selected on the **Action:** field drop-down list and select **Required** from the **Purpose:** field drop-down list, then click **Next** to continue.

On the **Scheduling** screen, click **Next** to accept the default deadline (**As soon as possible after the available time**).

On the **User Experience** screen, choose **Display in Software Center, and only show notifications for computer restarts** from the drop-down list.

Click **Summary** to skip to the **Summary** screen.

On the **Summary** screen, check the settings and click **Next** to start the deployment.

If everything goes well you should see the message **The Deploy Software Wizard completed successfully**. Click **Close** to close the wizard window.

9.2.4.4.5 Speeding up and monitoring the progress of the installation

To speed up and monitor the progress of the installation:

In the Configuration Manager console, select the **Assets and Compliance** workspace.

Select the **Device Collections** node, right-click **All Desktop and Server Clients** and choose **Client Notification→ Download Computer Policy**.

A dialog is displayed showing the number of resources in this collection. Click **OK**.

> **Note**
>
> This process causes each of the Configuration Manager clients to download the new deployment policy you just created rather than waiting for them to do it on their regular schedule. This may speed up the uptake of the new deployment.

Select the **Monitoring** workspace and choose the **Deployments** node.

Right-click the **Nomad client** deployment and choose **View Status** from the context menu. You can view the next task when the current one finishes.

9.2.4.4.6 Reviewing the installation on the client

To review the installation on a Windows 10 client (Previous version of Windows may differ):

Login to the client with administrative privileges.

From the **Start menu**, type services in the search box to open the **Services** app, note the **1E Nomad Branch** service is running.

Leave the Services App open, and from the **Start menu**, select **Computer Management**.

In **Computer Management**, expand **Local Users and Groups** and click **Users**. Note that the local user **SMSNomadP2P&** has been created.

Expand the **Shared Folders** node and click **Shares**, note that **NomadSHR** has been created – this is the Nomad cache.

Right-click **NomadSHR** and from the context-menu, choose **Properties**.

In the **NomadSHR** Properties dialog, note the path to the share as well as the 6 user (connection) limit.

Click the **Share Permissions** tab and note the permissions for the share.

Cancel the **NomadSHR** Properties dialog.

Leave **Computer Management** open and return to the **Services** app.

Right-click the **1E Nomad Branch** service and select **Stop**.

Return to **Computer Management** and refresh the **Shares** node, note the **NomadSHR** is deleted when the service is stops.

Switch to **Services** and start the **1E Nomad Branch** service.

Return to **Computer Management** and refresh **Shares**, note that the **NomadSHR** is recreated when the service starts.

Close **Services** and **Computer Management**.

Start Windows Explorer, and click folder **Options**.

On the **View** tab, ensure **Hidden Files and Folders** can be viewed, and uncheck **Hide extensions for known file types** and click **OK**.

Browse to **C:\ProgramData\1E\NomadBranch**, this is the folder that is shared as **NomadSHR** and is the root of the Nomad cache.

Browse to **C:\Windows\CCM\Logs** and double-click the **NomadBranch.log** to open it. Observe the **Nomadservice** startup activity in the log, note the client detected it is running on a Configuration Manager client and automatically enables the option to use HTTP and SMB.

Date/Time	Log Text
22/03/2013 19:46:26	CM 2012 client - Auto Enabling Http
22/03/2013 19:46:26	0x2000 SMB and Http

Close the log file.

From the **Start menu**, run **regedit**.

Navigate to **HKLM\Software\1E\NomadBranch**. This registry key contains all the configuration options used by Nomad.

9.2.4.4.7 Reviewing the installation on a distribution point

The installation on the Distribution Point (DP) server results in the same components being installed on the server, however the service will automatically perform the LSZ generation and RDC processing if it identifies that it is running on Configuration Manager on a Site Server and DP. For standalone DPs (distribution point not on a site server) the SIGSFOLDER and SPECIALNETSHARE installer properties will need to be correctly configured to enable the LSZ generation and RDC processing to take place, and PERMITTEDLSZSHARES may also need to be configured.

To review the installation on a site server distribution point:

Login to the server with administrative privileges.

From the Start screen, click **Services**. Note the **1E Nomad Branch** service is running. Close the **Services** console.

From the Start screen, start typing **regedit** and click **regedit** when it appears in the search results. Note the **HKLM\Software\1E\NomadBranch** registry key.

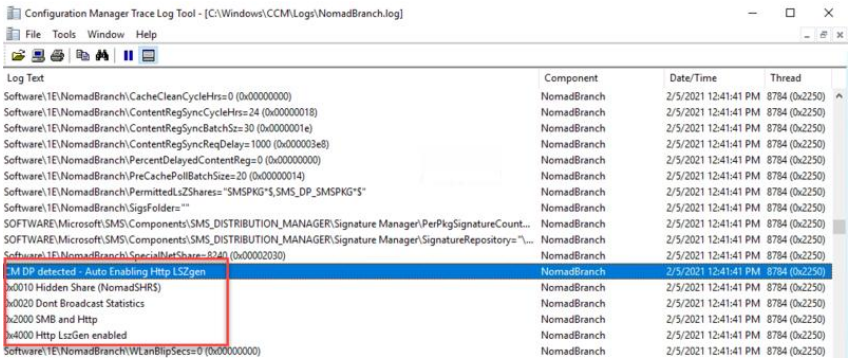
From the Start screen type **C:\ProgramData** and press Enter to open the folder. Browse to the **1E\NomadBranch** folder. Note that as this is a DP, the client has created the LSZFILES folder.

Browse to **C:\Windows\CCM\Logs** and open **NomadBranch.log** using cmtrace.exe

Near the top of the log file, notice that the computer has been identified as an SMS Site Server and an SMS distribution point.

Note

The HTTP LSZ generation option (normally set in **SpecialNetShare**) has also been enabled as Nomad has detected this is a Configuration Manager DP and will therefore be using HTTP.



The LSZFILES folder is also established as a virtual directory in IIS.

9.2.4.5 Installing Nomad Branch Tools

A step-by-step guide to installing Nomad Branch Tools which contains the Nomad Configuration Manager console extensions and Nomad OSD tools.

> **Note**
>
> If you intend using 1E Application Migration in your Task Sequences, then you will also need to install the 1E Task Sequence Tools alongside Nomad OSD Tools, as described in Using Application Migration in a task sequence.
>
> Nomad OSD Tools includes the Task Sequence action Get migration settings, which is also required by 1E Application Migration new computer (Replace scenario).

9.2.4.5.1 Before you start

Nomad Branch Tools is available as **NomadBranchTools.msi** in the NomadBranch zip. You can download this zip by clicking on the **Nomad Tools** link in the 1E Support Portal at https://support.1e.com/.

The **NomadBranchTools.msi** installer contains the following tools:

Nomad OSD tools

Nomad Configuration Manager console extensions.

> **Note**
>
> Nomad Branch Tools uses 64-bit architecture, and can only be installed on 64-bit operating systems.
>
> Previous versions of the Nomad Configuration Manager console extensions (NomadBranchAdminUIExt) supported 32-bit operating systems. However, this is no longer supported from Nomad 8.0.

9.2.4.5.1.1 Nomad OSD tools

The tools required for integrating Nomad with OSD task sequences in Configuration Manager.

Each Nomad tool executable has a corresponding .pdb file.

Nomad tool	Description
NBCacheActions.exe	Performs specific functions on the Nomad cache.
NomadBranch.exe	The Nomad service.
NomadPackageLocator.exe	Locates content in local Nomad caches.
SMSNomad.exe	The Nomad executable.
SMSTSNomad.exe	Nomad executable used in task sequences.
SnoItfPS.dll	The Nomad Enterprise COM/DCOM interface.
TSEnv2.exe	Sets environment variables in task sequences.

9.2.4.5.1.2 Nomad Configuration Manager console extensions

The Nomad Configuration Manager console extensions provide the following capabilities in the Configuration Manager Console:

Configuration Manager capability	Description
Configure Nomad settings	In software deployment and client settings policies associated with packages, applications and software updates.
Nomad Download Pause	Buttons to pause and resume Nomad downloads, monitoring report to view paused content.
Nomad Pre-caching	Menu item to start the Pre-cache Wizard, monitoring report to view pre-cached content.
Nomad Baseline wizard	Menu items to create and edit baseline configuration items.

9.2.4.5.1.3 Install permissions

All users require the following to install and use the Nomad Configuration Manager console extensions component of the Nomad Branch Tools:

Local administrator rights on the computer to install the console extensions

The Configuration Manager Console, installed on the computer to install and use the console extensions

A Configuration Manager user with **Full Administrator** rights to be able to use the Download Pause feature

Tachyon installed and working, you must know and enter the full URL for the Tachyon website in the installer.

> **Note**
>
> If you have an existing Nomad 7.0.200 installation, and you upgrade to Tachyon Platform 8.1 you should also upgrade your Nomad Configuration Manager console extensions to the current version, doing this ensures you can view your pre-existing Nomad pre-cache jobs. When you upgrade from earlier versions of Nomad to Tachyon Platform, ActiveEfficiency is upgraded to Content Distribution. As a result, if you have an earlier version of the Nomad Configuration Manager console extensions, you may not be able to view your existing Nomad pre-cache jobs until you upgrade.

9.2.4.5.1.4 Nomad Download Pause

Before installing or upgrading Nomad Branch Tools, you should consider the following:

The feature requires:

Tachyon Platform 8.x installed

Uploaded Tachyon instructions

Permissions allowing Configuration Manager (CM) administrators to execute the uploaded instructions.

These steps should be completed by a user that has Global Admin role in Tachyon, refer to Installing the Nomad app and 1E Content Distribution for details about Tachyon Platform setup, **Nomad Administrator** role and the 1E Nomad product pack.

> **Upgrading**
>
> If you are upgrading Nomad or Tachyon and you have previously installed **Nomad Download Pause** then you can continue using your existing setup, you do not need to do anything further, and you can ignore the information and steps below.
>
> However, you are recommended to rename the old instruction set from**Nomad Core Instructions**to**1E Nomad**to match the name used in the steps below for new installations. The renamed set will retain the permissions you previously configured.
>
> Prior to Nomad 7.0.200, you were advised *not* to change the name of the instruction set. This was because the **NomadBranchAdminUIExt.msi** installer uploaded the instructions into an instruction set named **Nomad Core Instructions**. From version 7.0.200 onwards, this restriction no longer applies, because the instructions are no longer in the installer, and instead are only available in the **1E-Nomad** product pack.
>
> The installation steps below use the Settings app to create the **1E Nomad** instruction set and upload instructions for a new installation. However, if you instead use the **Tachyon Product Pack Deployment Tool** to upload the **1E Nomad** product pack, the tool will create an instruction set called **1E Nomad** and place *new* instructions there. If the instruction set **Nomad Core Instructions** has not been renamed, any *existing* instructions

in it will remain or be updated if they are new versions. You may end up with two instruction sets. You can keep both sets, or you can do the following, which will retain the permissions you previously configured:

move the new instructions from **1E Nomad** to **Nomad Core Instructions**

delete the now empty instruction set **1E Nomad**

rename the old instruction set from **Nomad Core Instructions** to **1E Nomad**

The **1E-Nomad** product pack is provided in the Tachyon Platform download zip, and includes new versions of the same instructions. A list of these instructions is provided below under the heading 1E-Nomad product pack, which include the two instructions required by Nomad Download Pause.

9.2.4.5.2 Installing Nomad Branch Tools

In previous versions of Nomad, you installed Nomad Configuration Manager console extensions and Nomad OSD tools with two separate installers, now these are included in one installer, **NomadBranchTools.msi.** When you run the **NomadBranchTools.msi** installer it will upgrade any currently installed tools by removing older versions of Nomad Configuration Manager console extensions (NomadBranchAdminUIExt) and Nomad OSD tools (Nomad Branch Tools), and installing the newer versions.

Note

You will need to first upgrade your Tachyon Platform installation to 8.1 to benefit from the Nomad and Platform Integration feature of the Nomad Branch tools.

Before running the installation, you should check that you have:

Elevated Administrative privileges on the server where you're running the installation

The Configuration Manager Console installed on the server where you want to use the Nomad Configuration Manager console extensions

The Site server or SMS Provider configured on the server, so you can install and use the Operating System Deployment support (OSD Tools).

If you want to use both tools on the same server, you will need to have configured both Configuration Manager Console and Site Server/SMS Provider on that server. The installer will deploy either, or both the OSD Tools or Nomad Configuration Manager console extension depending on the above conditions.

9.2.4.5.2.1 Installing interactively

Install Nomad Branch Tools on the same device as the Configuration Manager Console, you can do this is done by running **NomadBranchTools.msi** from an elevated command prompt.

Note

The Configuration Manager Console must not be running when you run **NomadBranchTools.msi**

To install:

Download the Nomad Branch software zip. from https://support.1e.com/.

Extract **NomadBranchTools.msi** from the downloaded ZIP file.

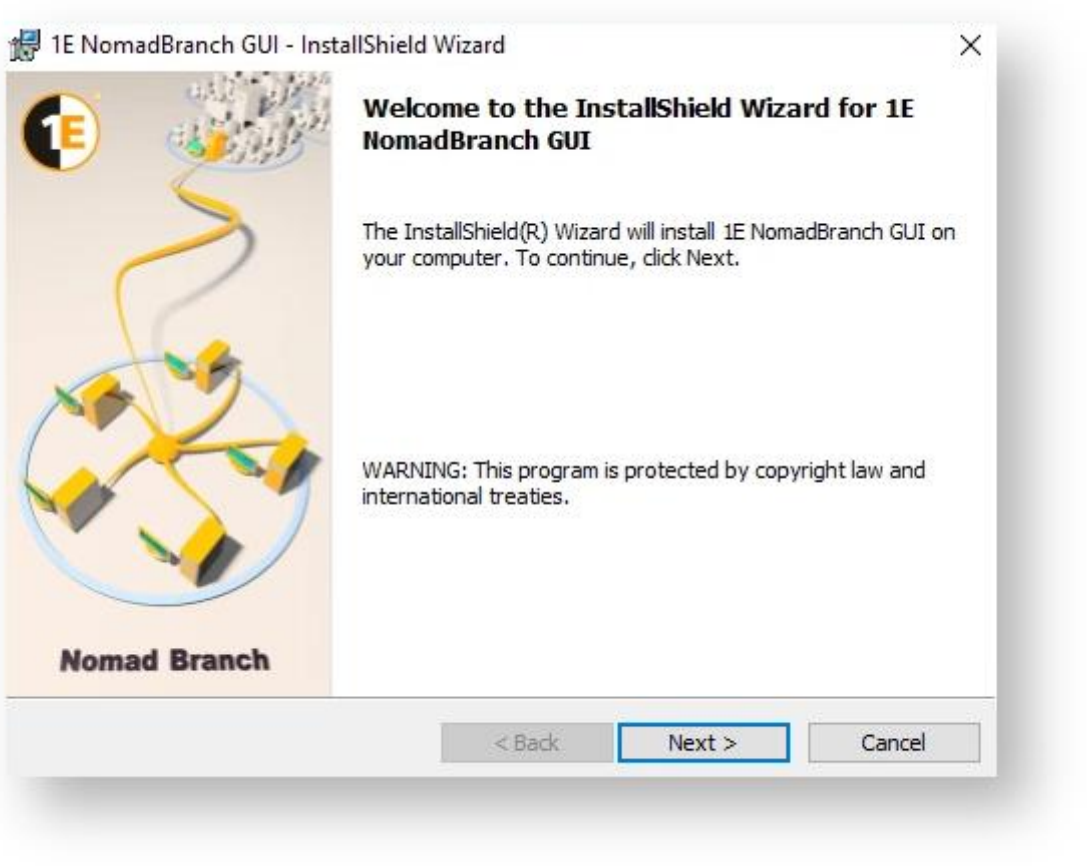
Start a Command Prompt with elevated rights, navigate to the location where you extracted **NomadBranchTools.msi** and run it with the following command-line:

```
> msiexec /i NomadBranchTools.msi /l*v NomadBranchInstall.log REBOOT=REALLYSUPPRESS
```

The following describes each of the screens in the installation wizard:

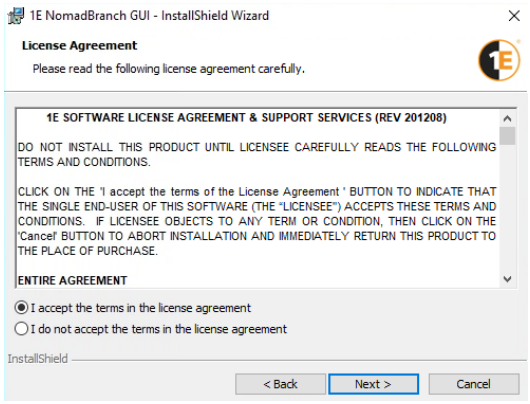
9.2.4.5.2.1.1 Welcome

The welcome screen, just click **Next** to continue.



9.2.4.5.2.1.2 License Agreement

You must read and then accept this license information by clicking the **I accept the terms in the license agreement** option before you can continue with the installation. Once this is done click **Next.**

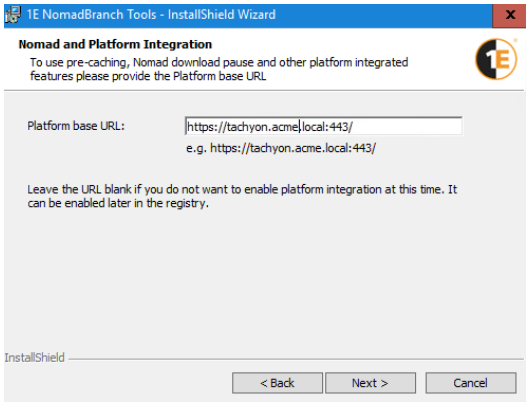


9.2.4.5.2.1.3 Nomad and Platform Integration

> **Note**
>
> Before installing this feature, please refer to Nomad Download Pause, for steps on configuring the prerequisites.

You need to supply the root URL to the Tachyon API. Which will be in the form: **https://<Tachyon DNS Alias FQDN>** using the Tachyon DNS Alias FQDN defined when you installed Tachyon.

For example if you installed Tachyon using **tachyon.acme.local** as the DNS Alias FQDN then the Tachyon API Root URL should be set to:



```
https://tachyon.acme.local
```

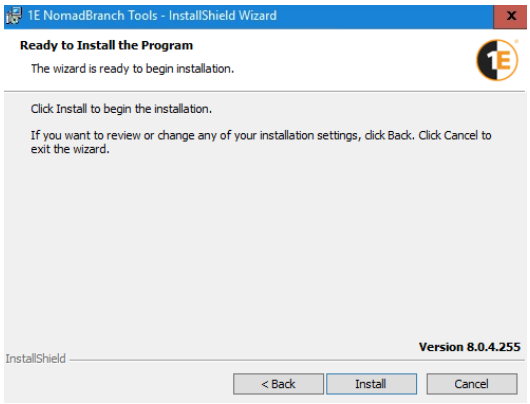
> **Note**
>
> The Tachyon API is Tachyon's Consumer API. You can learn more about Tachyon in Introducing Tachyon.

> **Note**
>
> From Nomad 8.1 there is support for providing alternate credentials to authenticate with the Tachyon Platform. If your Tachyon Platform instance resides in another domain or the cloud, you will be prompted to enter alternate credentials for that location, which get stored in the credential store for any future requests.

Click **Next** to continue.

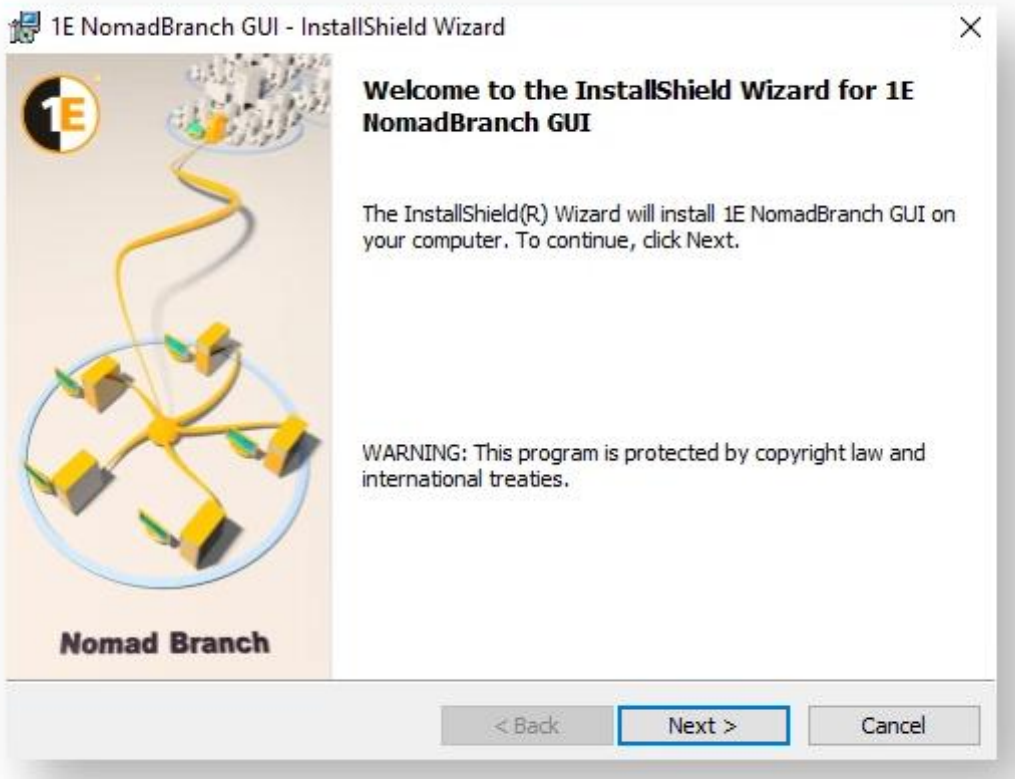
9.2.4.5.2.1.4 Ready to Install the Program

Click **Install** to start the installation process



9.2.4.5.2.1.5 Installing 1E Nomad Branch Admin Extensions

This screen shows the current progress of the installation. If a User Account Control dialog pops-up, click **Yes** to continue.



9.2.4.5.2.1.6 InstallShield Wizard Completed

If the installation has succeeded, the **InstallShield Wizard Completed** will be displayed.

Here, you can check the **Show the Windows Installer log** checkbox to view the installer log. Click **Finish** to close the installer wizard.

9.2.4.5.2.2 *Installing from the command line*

> **Note**
>
> You can download the 1E Content Distribution Tools from the **Releases** page for your platform version at https://support.1e.com/.

To install from the command line:

Extract **NomadBranchTools.msi** from the zip.

Start a Command Prompt with elevated rights, navigate to the location where you extracted **NomadBranchTools.msi** and run it with a command-line similar to the following:

```
> msiexec /i NomadBranchTools.msi /qn PLATFORMURL=https://<TCNserver> REB
OOT=REALLYSUPPRESS /l*v install.log
```

> **Note**
>
> Where <TCNserver> must be set to the DNS alias FQDN for the Tachyon server. This command-line will also enable the Tachyon integration to support the Nomad Download Pause feature.

9.2.4.5.3 Verifying installation

To confirm Nomad Branch Tools have been successfully installed, refer to:

Nomad Configuration Manager console extensions

Nomad tools for Operating System Deployment OSD.

9.2.4.5.3.1 *Nomad Configuration Manager console extensions*

To confirm the extensions have been successfully installed, start the Configuration Manager console, check Nomad extensions have been added for:

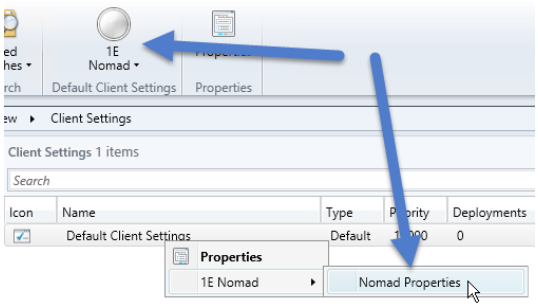
Default Client Settings

Package Properties.

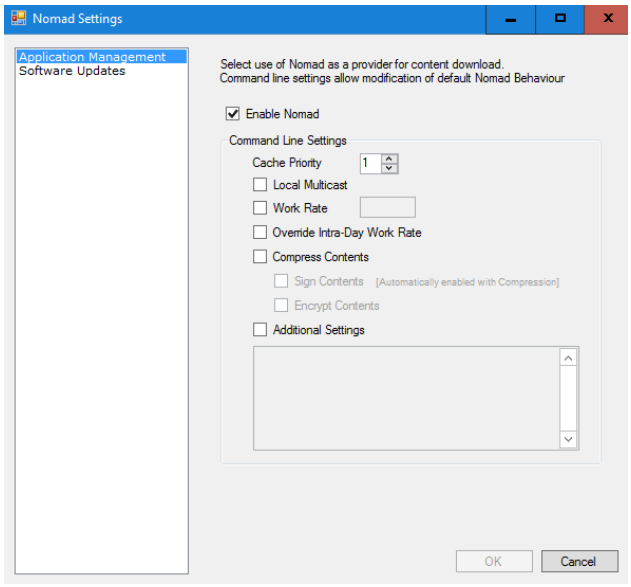
9.2.4.5.3.1.1 Default Client Settings

Open the **Administration** workspace and select the **Client Settings** node.

The ribbon has a **1E Nomad** button. Click it and choose **Nomad Properties** (as shown in the image) or, right-click the **Default Client Settings** and choose **1E Nomad→Nomad Properties**.



The **Nomad Settings** dialog allows you to configure settings for **Application Management** and **Software Updates**. Click **Cancel** to close the dialog without making any changes.

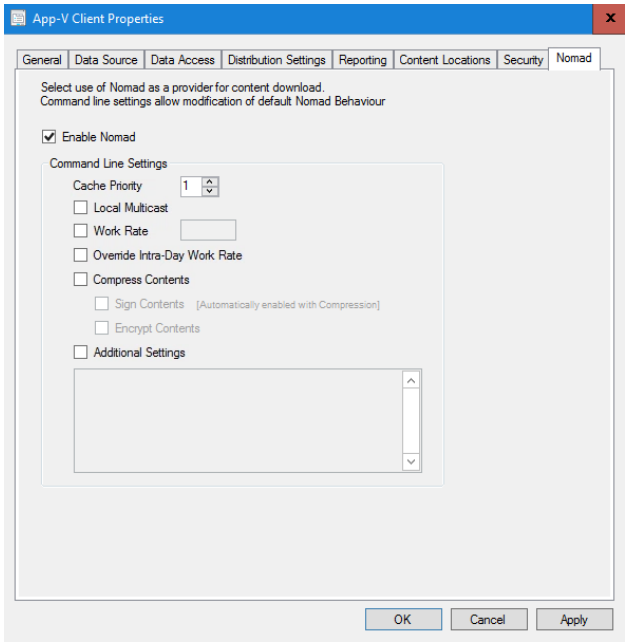


For details about the available options for setting Nomad as a download provider for applications and software updates in Configuration Manager, refer to Distributing software with Nomad and Configuration Manager and Distributing software with Nomad and Configuration Manager- Configuration Manager client settings.

9.2.4.5.3.1.2 Package Properties

Open the **Software Library** workspace and select the **Packages** node under the **Application Management** node. Right-click a package and from the context menu, choose **Properties**.

A **Nomad** tab has been added to the **Package Properties** dialog box. Click **Cancel** to close the dialog without making any changes.



For more details about the available options for setting Nomad as a content provider for Configuration Manager Packages, refer to Distributing software with Nomad and Configuration Manager - Nomad tab.

9.2.4.5.3.2 Nomad tools for Operating System Deployment OSD

If you upgrade Configuration Manager after installing the Nomad OSD tools, you will need to reinstall them as the Configuration Manager upgrade overwrites the *osdinjection.xml* and *TaskSequenceProvider.mof* files that are updated by Nomad OSD tools.

To verify that the tools have been successfully installed:

Open the Configuration Manager console.

Navigate to **Software Library→Operating Systems→Task Sequences**.

Choose an existing Task Sequence or create a temporary one. Right-click on an existing Task Sequence and click **Edit**.

In the **Task Sequence Editor**, click **Add** – note the new Nomad tasks that can be added to a task sequence.

Click **Cancel** to close the Task Sequence editor without saving any changes.

Browse to **C:\Program Files\Microsoft Configuration Manager\OSD\bin\i386** and **\x64** folders where you will find the following files:

> The page: **NMD81:@self** was not found. Please check/update the page name used in the 'multiexcerpt-include' macro.
>
> **Tip**
>
> To list the files together, you can sort by Date modified. Or you can add sort columns for Company or Product name.

Open *C:\Program Files\Microsoft Configuration Manager\bin\x64\osdinjection.xml* in Notepad.

Note

This manifest defines the files that are to be added into the Windows PE boot image when it is updated on a distribution point. The additional tools are added to this manifest, ensuring that they are included in all boot images that are updated on a distribution point from this point on.

9.2.4.5.3.2.1 Updating boot images

After installing the tools into your Configuration Manager environment, you must update any existing boot images that have been distributed to a Distribution Point or Distribution Point Group so that the tools will be included in those images.

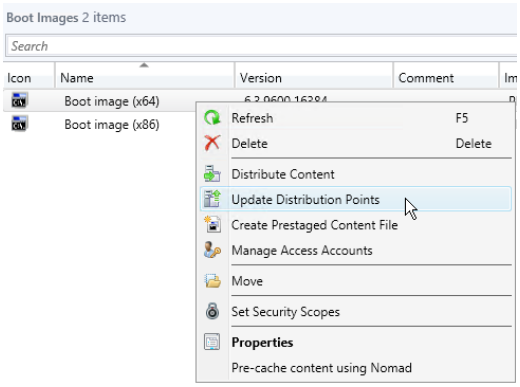
To do this:

In the Configuration Manager Console, navigate to the **Software Library** → **Operating Systems** → **Boot Images**.

Select an existing boot image.

Right-click the boot image and from the context menu, choose **Update Distribution Points**.

On the **Update Distribution Points Wizard**, click Next.



Verify that the wizard completed successfully and click **Close**. The selected boot image will now contain the latest Nomad Tools for OSD.

Repeat this process for any other boot images that are used.

9.2.4.5.4 Uninstalling Nomad Branch Tools

To uninstall Nomad Branch Tools:

Start a Command Prompt with elevated rights, navigate to the location where you extracted the ***NomadBranchTools.msi*** and run it with the following command-line:

```
> msiexec /x NomadBranchTools.msi /l*v NomadBranchToolsUninstall.log REBOOT=REALLYSUPPRESS
```

On the **Welcome** screen, click **Next**.

Click **Finish** when the uninstallation is done.

9.2.4.6 Installing the Nomad download monitor

A step-by-step guide to interactively installing the Nomad download monitor (also known as NomadBranchGUI).

9.2.4.6.1 Installing the Nomad download monitor

The Nomad branch download monitor is a tool for observing Nomad activity on either the local or a remote computer. The tool is required only for testing and troubleshooting on selected computers, and is not required or recommended for general deployment to all computers.

Generally, you only install the download monitor to administrators workstations in Advanced UI mode (UI=1) to enable them to connect any Nomad client.

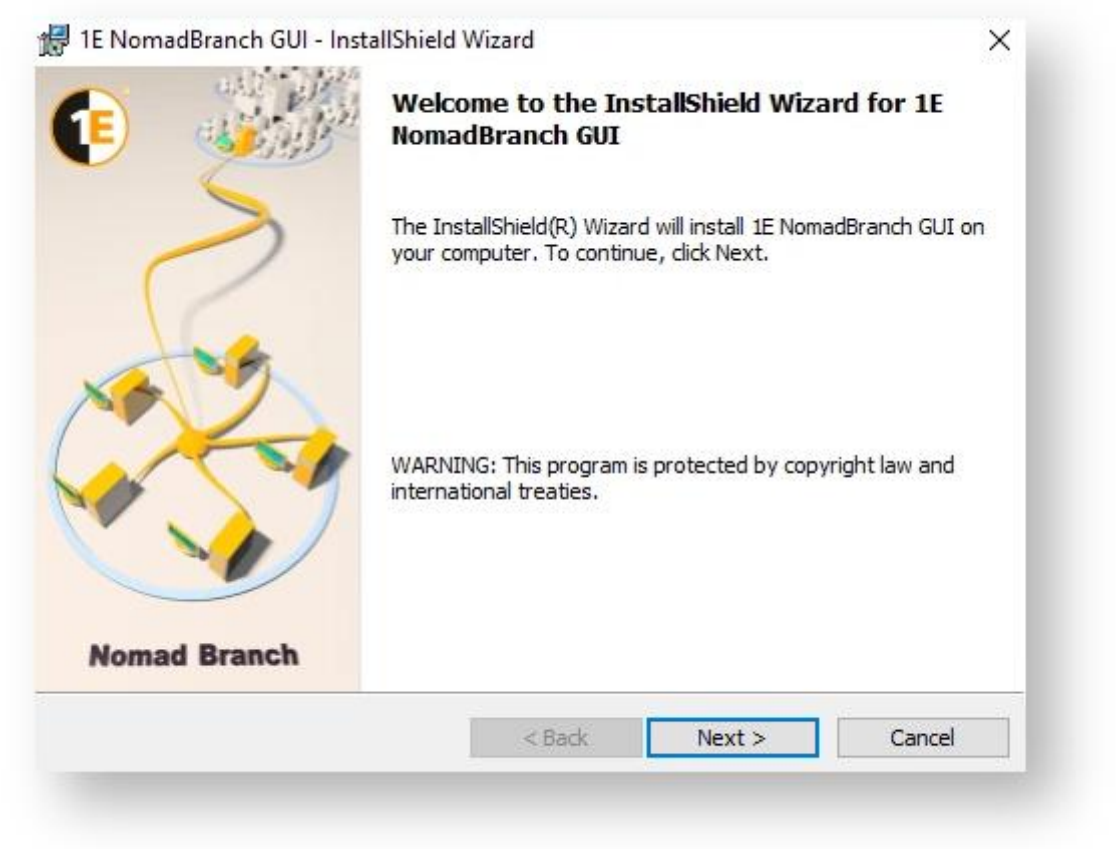
To find out more about this tool, refer to Nomad Download Monitor.

9.2.4.6.1.1 Installing interactively

The following describes each of the screens in the installation wizard, double click **NomadBranchGUI.msi**

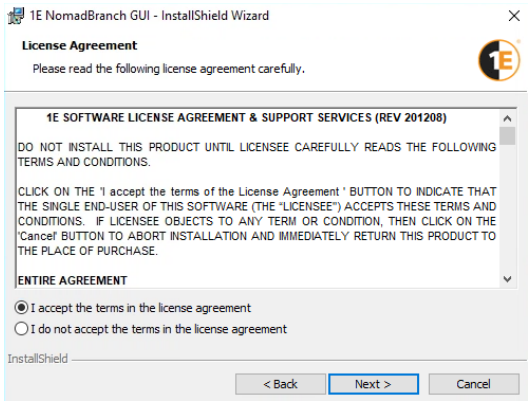
9.2.4.6.1.1.1 Welcome

The welcome screen, just click **Next** to continue.



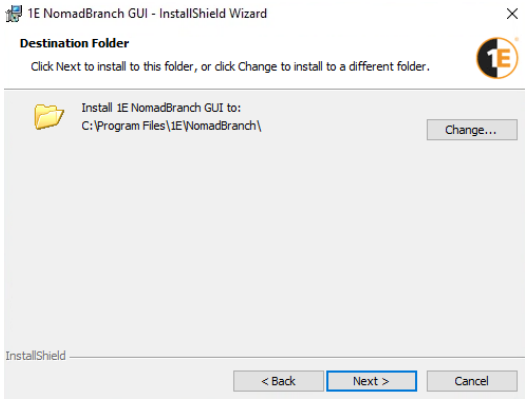
9.2.4.6.1.1.2 License Agreement

Accept the license agreement and click **Next**.



9.2.4.6.1.1.3 Destination Folder

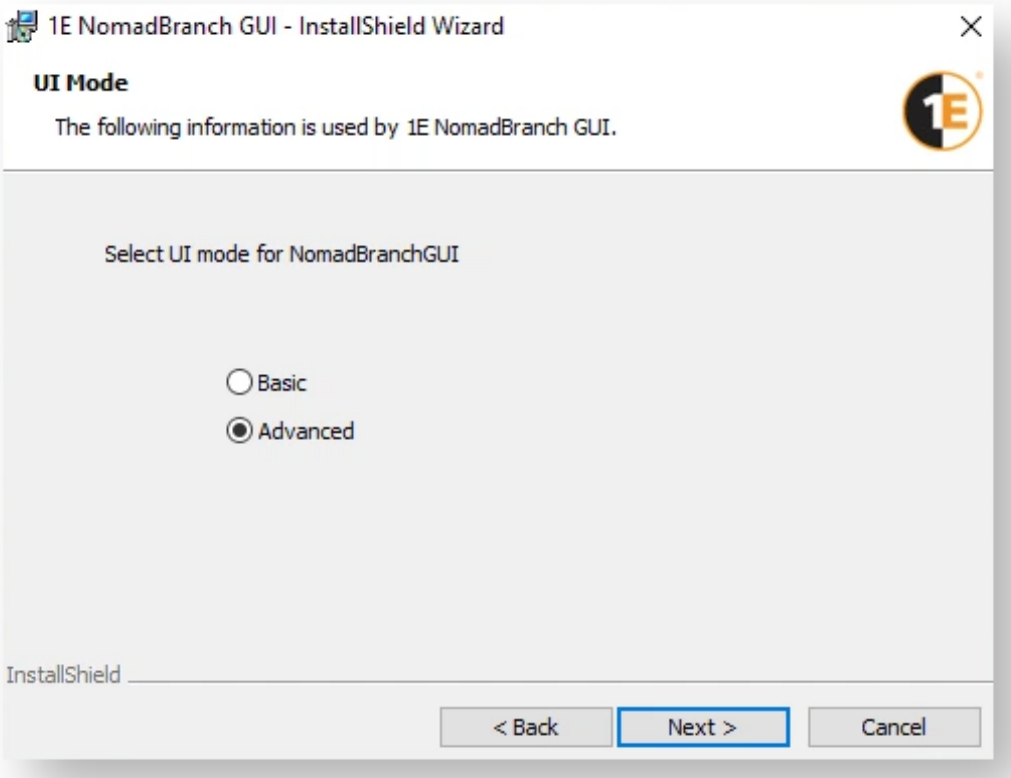
On the **Destination Folder** screen, click **Next** to accept the default location (*C:\Program Files\1E\NomadBranch* or *C:\Program Files\1E\NomadBranch (x86)*) or **Change...** to select a new location.



9.2.4.6.1.1.4 UI Mode

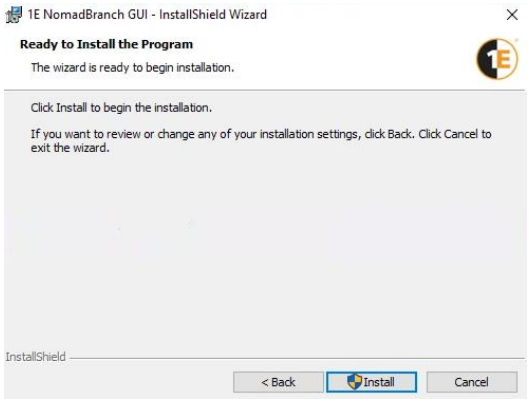
On the **UI Mode** screen, choose either **Basic** or **Advanced** mode.

Mode	Description
Basic	You will only see progress bars in the UI. Useful for those who only need to see the status of the downloads.
Advanced	You will see an extended UI – useful for administrators to troubleshooting downloads as they can connect to remote devices to view the status of the downloads, provided they have sufficient Remote Activation DCOM permissions. By default, the Download Monitor connects to the local machine.



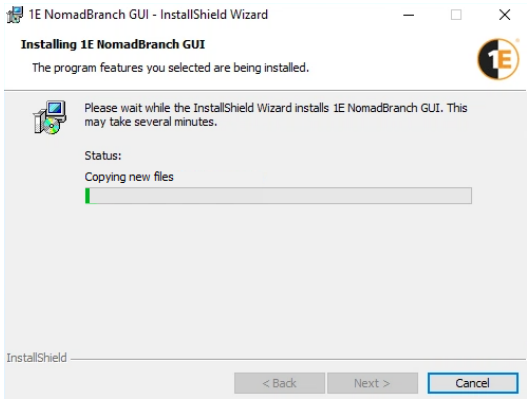
9.2.4.6.1.1.5 Ready to Install the Program

On the **Ready to install the program** screen, click **Next** to start the installation.



9.2.4.6.1.1.6 Installing 1E NomadBranch GUI

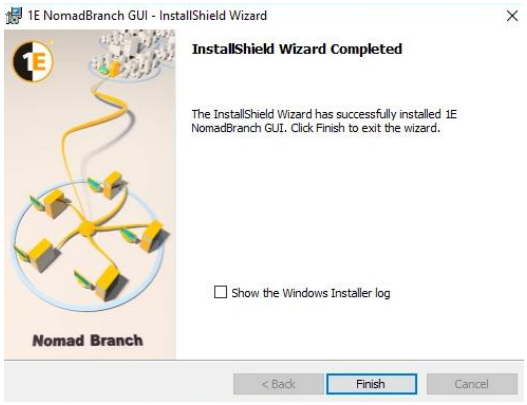
This screen shows the current progress of the installation. If a User Account Control dialog pops-up, click **Yes** to continue.



9.2.4.6.1.1.7 InstallShield Wizard Completed

If the installation has succeeded the **InstallShield Wizard Completed** will be displayed.

Here you can check the **Show the Windows Installer log** checkbox to view the installer log. Click **Finish** to close the installer wizard.



Alternatively, you can install the monitor in unattended mode. The installer has two properties which determines the behavior of the monitor:

0 – sets the UI to basic mode and is the default value

1 – sets the UI to advanced mode.

To install the monitor in basic mode in unattended mode, open a command prompt and run:

```
> msiexec.exe /i NomadBranchGUI.msi /qn
```

To install the monitor in advanced mode silently, open a command prompt and run:

```
> msiexec.exe /i NomadBranchGUI.msi UI=1 /qn
```

9.2.4.6.2 Reviewing the installation

A status icon is added to the system tray after installation to display the download status:

Icon	Description
	Download in progress
	No downloads.

To open the download monitor, double-click the status icon. If you see the basic UI, you have installed the monitor in basic mode, if you see the expanded UI, you installed the monitor in advanced mode.

UI Mode	Displayed UI
Basic UI	
Advanced UI	
9.2.4.6.3 Changing the behavior of the monitor

You can change the behavior of the download monitor by updating its registry value after installation. The installer has two properties which determines the behavior of the monitor:

0 – sets the UI to basic mode and is the default value

1 – sets the UI to advanced mode.

To change the behavior, you can set the appropriate registry Value:

On 32-bit machines, go to *HKLM\software\1e\NomadBranch\UI*

On 64-bit machines, go to *HKLM\software\Wow6432Node\1e\NomadBranch\UI*

Note

A restart might be required when changing from advanced mode to basic mode.

9.2.4.7 Nomad post-installation tasks

Post-installation tasks that may be necessary to ensure that Nomad will work correctly in your environment.

You may need to make some post-installation configurations to your environment to ensure that Nomad works effectively. These areas may need attention.

9.2.4.7.1 Basic verification tests

For installations and upgrades:

1E Client software is installed

1E Client and **Nomad Branch** services both exist and running

Default path for Nomad Branch service is
C:\Program Files\1E\Client\Extensibility\NomadBranch\NomadBranch.exe

System PATH environment variable has been added **C:\Program Files\1E\Client\Extensibility\NomadBranch**

Open a command prompt and type the following commands (Commands are in bold, example responses below):

>**where nomadbranch**

C:\Program Files\1E\Client\Extensibility\NomadBranch\NomadBranch.exe

>**nomadbranch -version**

NomadBranch version 8.1.2.xxx (mmm dd yyyy)

Nomad registry values are as expected - using default values unless specified differently in the installer, command-line or in the MST transform file

In addition, for upgrades from Nomad 6.3.201 or Tachyon Agent 4.0 - the example is for x64 but may be for x86.

1E NomadBranch x64 / 1E Tachyon Agent x64 products are uninstalled

Tachyon.Agent service is removed

System PATH environment variable has removed **C:\Program Files\1E\NomadBranch**

After upgrade, the following Nomad registry settings are changed:

InstallationDirectory changed to C:\Program Files\1E\Client\Extensibility\NomadBranch

ProductVersion changed to 8.1.2.xxx

TachyonAgentVersionchanged to 8.1.2.xxx

9.2.4.7.2 IIS Request Filtering

By default, IIS is configured to prevent certain file types from being downloaded. You may need to configure these to allow Nomad to download all content as it does not use the Configuration

Manager workaround that Microsoft had to implement to bypass its own security feature. This is done by configuring **Request Filtering** on each website hosting the Configuration Manager DP. The example process given below does the following:

Removes file extensions from **File Name Extensions**, for example **.config**

Removes folders from **Hidden Segments**, for example **bin**

Confirms that **double escaping** is enabled, to allow files with special characters in their names, for example **+**

Microsoft introduced IIS Request Filtering in Windows Server 2008 R2 – a security feature enabling administrators to configure IIS to block requests for specific file types and URL paths that include specific folder names or special characters. By default, IIS Request Filtering blocks a number of file extensions and folder paths that may be present in normal software distribution content (packages, applications and software updates).

Although, Microsoft's documentation highlights this issue (see link below), the Configuration Manager client bypasses this security measure by using a custom method and querying for the file rather than a standard HTTP GET for it directly. Nomad does not use the same workaround but instead adheres to Microsoft's security best-practice policy of using a standard HTTP GET for the file which is filtered out by the IIS Request Filtering feature. As a result, it is necessary to remove or configure the IIS Request Filtering feature on all distribution points to allow any file extensions, paths and special characters that may exist in your Configuration Manager content.

> **Note**
>
> Microsoft IIS Request Filtering for distribution points reference - https://docs.microsoft.com/en-us/previous-versions/system-center/system-center-2012-R2/gg712264(v=technet.10)?redirectedfrom=MSDN#BKMK_RequestFiltering.

> **Note**
>
> The following examples apply to the Default Web Site. You should only configure Request Filtering at a site level or below, not at the server level.
>
> The commands also assume the Default Web Site is configured with default settings as **Allow unlisted file name extensions** and **Allow unlisted verbs** both enabled, as shown in the picture opposite.

9.2.4.7.2.1 Identifying existing restrictions

To discover files extensions and URL paths elements that are disallowed by default:

Start IIS Manager.

Locate your IIS server in the tree view and navigate to the website, for example Default Web Site.

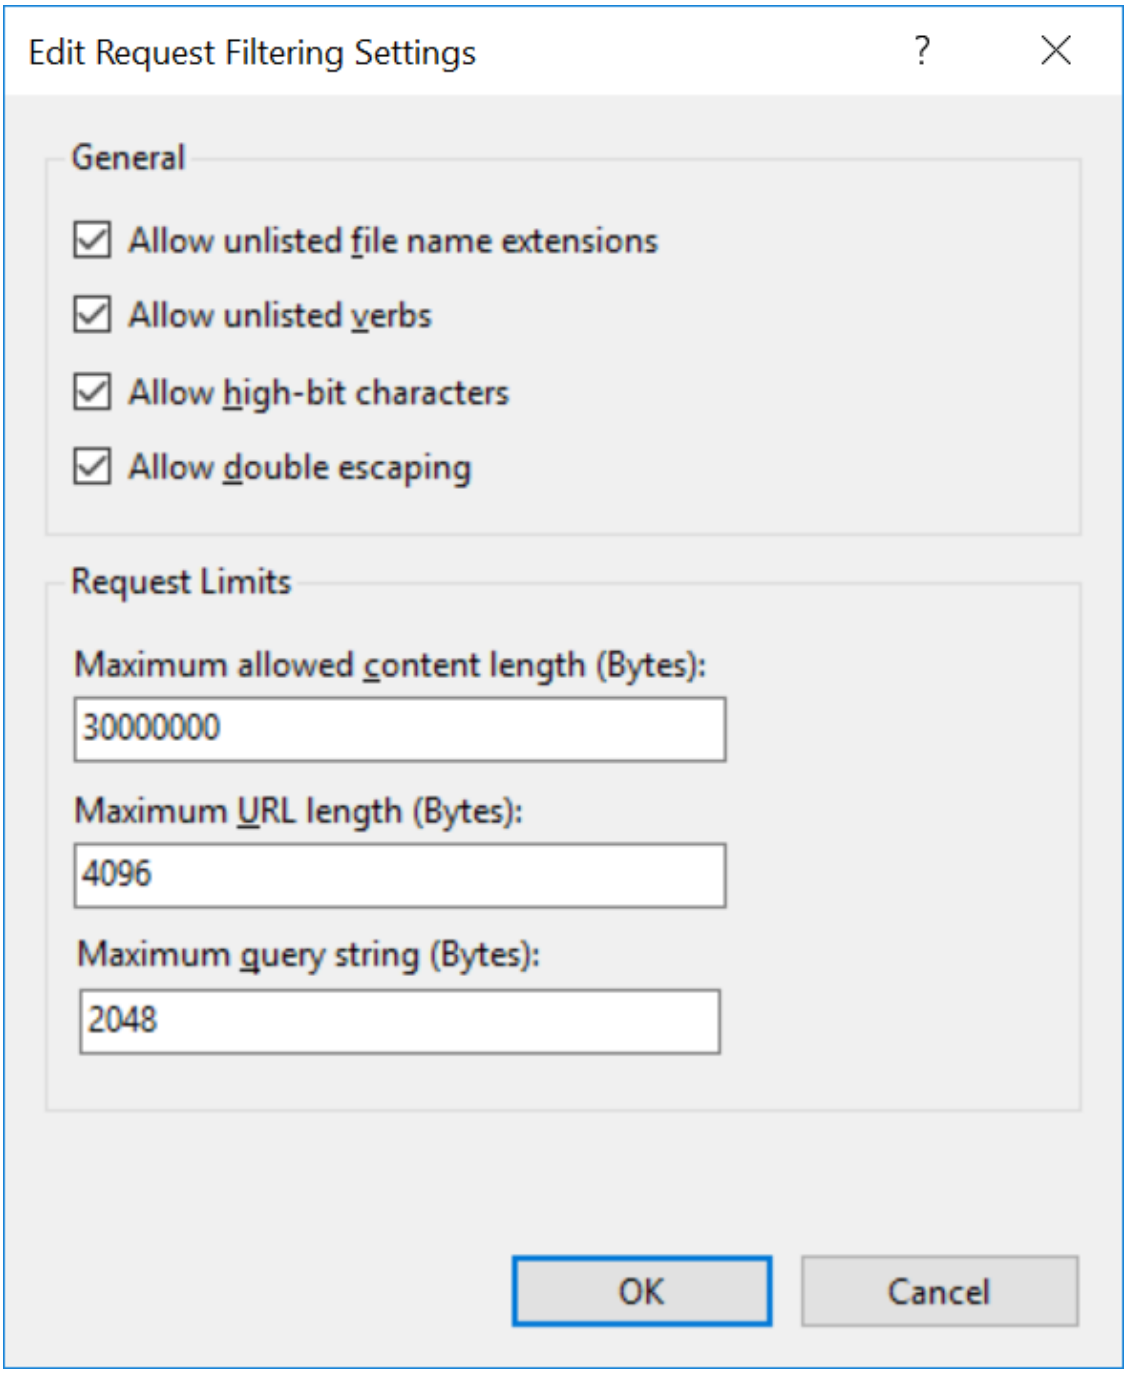
In the right pane, double-click the **Request Filtering** icon (grouped under IIS).

Click the **File Name Extensions** tab to view a list of all the file extensions that are blocked by default. Disallowed file extensions commonly found in Configuration Manager content are: *.resources*, *.mdb*, *.config*, *.java*, *.osdx*, *.skin*, *.cs*, *.vbproj*.

Click the **Hidden Segments** tab to view all the folder names that are blocked by default.

In the action pane, click on **Edit Feature Settings...**

In the **Edit Request Filtering Settings** dialog confirm that **Allow Double Escaping** is enabled.



You can review the **NomadBranch.log** on clients to see details of any file types that are blocked in your download, for example:

NomadBranch.log

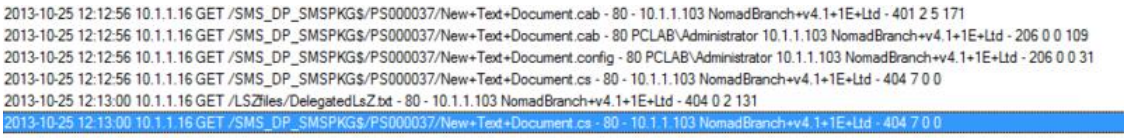
```
Error Reading. "path\bin\file name" - DP Path not found
TransferFiles::CopyError: "path\bin\file name" - DP Path not found
```

```
NomadBranch finished with exit code 0x205d     Job_Content_Package ID
Source : "Inaccessible DP path" Job_Content_package ID

Error Reading. "path\filename.config" - DP Path not found
TransferFiles::CopyError: "path\filename.config" - DP Path not found
NomadBranch finished with exit code 0x205d     Job_Content_Package ID
Source : "Inaccessible DP path" Job_Content_package ID

Error Reading. "path\filename++.exe" - DP Path not found
TransferFiles::CopyError: " path\filename++.exe" - DP Path not found
NomadBranch finished with exit code 0x205d     Job_Content_Package ID
Source : "Inaccessible DP path" Job_Content_package ID
```

Whilst the IIS logs for the Configuration Manager distribution points serving the Nomad download requests details the blocked files types, for example a 404.7 error:



Note

Please see http://support.microsoft.com/kb/943891 for more details about HTTP status codes, for example:

404.7 - File extension denied

404.8 - Hidden namespace

404.11 - Request contains double escape sequence.

9.2.4.7.2.2 Updating the restricted list

Now that you have discovered what file types and folders are blocked by default, you can reconfigure the filtering to allow specific the file types and folders to be used by Nomad. To update the filtering:

Start a command prompt (run as administrator).

Change directory to *C:\Windows\System32\inetsrv*

To remove a restricted file type, run:

```
appcmd set config "Default Web Site" /section:requestfiltering /-fileExte
nsions.[fileextension='.config']
```

To remove all file restrictions, run:

```
appcmd set config "Default Web Site" /section:requestfiltering /-fileExte
nsions
```

To change a file extension from restricted to allowed (change Allowed from false to true), run:

```
appcmd set config "Default Web Site" /section:requestFiltering /fileExten
sions.[fileExtension='.config'].allowed:true
```

There is more information on restricted file types at: https://learn.microsoft.com/en-us/previous-versions/orphan-topics/ws.11/hh831621(v=ws.11)

To remove a restricted folder, run:

```
appcmd set config "Default Web Site" /section:requestfiltering /-hiddense
gments.[segment='bin']
```

To remove all folder restrictions, run:

```
appcmd set config "Default Web Site" /section:requestfiltering /-hiddense
gments
```

There is more information on restricted folders at: http://technet.microsoft.com/en-us/library/hh831621.aspx#HiddenSeg

By default, any path or filename that includes special escape characters are blocked. To allow filenames or paths with special characters (double escaping) to be downloaded, run:

```
appcmd set config "Default Web Site" /section:requestfiltering /allowdoub
leescaping:true
```

There is more information on double escaping at: http://support.microsoft.com/kb/942076

Repeat the steps in Identifying existing restrictions to ensure that:

.config is not listed under **File Name Extensions**

bin is not listed under **Hidden Segments**

Note

It is likely that you may have to refresh the screen if IIS Manager is already open on the Request Filtering page.

Note

Alternatively, you can manually edit the *web.config* file for the Default Web Site normally found in *C:\inetpub\wwwroot* . It will contain only the differences between the Default Web Site and the Server configuration. IIS requires a restart for manual edits to take effect.

```
<configuration>
    <system.webServer>
        <security>
            <requestFiltering allowDoubleEscaping="true">
                <fileExtensions>
                    <remove fileExtension=".config" />
                </fileExtensions>
                <hiddenSegments>
                    <remove segment="bin" />
                </hiddenSegments>
```

```
            </requestFiltering>
        </security>
    </system.webServer>
</configuration>
```

The server configuration is stored in *%windir%\System32\inetsrv\config\applicationHost.config*.

9.2.4.7.3 Antivirus exceptions

Nomad functionality may be impaired by antivirus programs, so you may also want to configure any antivirus systems running on your network to make exceptions for the Nomad executables and support files. Although we generally advise that no malware exclusions are used, it is justifiable in certain cases to isolate specific locations and files that are used by specific software. Here is a list of exclusions that could be added for Nomad, but ensure that these are compatible with any exclusions already defined for Configuration Manager before you implement them.

9.2.4.7.3.1 Nomad installed on a DP

%SystemDrive%\ProgramData\1E\NomadBranch*.LSZ

%SystemDrive%\ProgramData\1E\NomadBranch\LogFiles\NomadBranch.log

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\NomadBranch.exe

HKLM\Software\1E\NomadBranch

9.2.4.7.3.2 Nomad installed on a Configuration Manager client

%SystemDrive%\ProgramData\1E\NomadBranch*_Cache* (if the Configuration Manager cache is not excluded, do not exclude this)

%SystemDrive%\ProgramData\1E\NomadBranch*.LSZ

%SystemDrive%\ProgramData\1E\NomadBranch\LogFiles\NomadBranch.log & *.lo_

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\CacheCleaner.exe

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\IEMNomad.exe

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\NBCacheActions.exe

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\NomadBranch.exe

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\NomadPackageLocator.exe

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\PackageStatusRequest.exe

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\SMSNomad.exe

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\SMSTSNomad.exe

%SystemDrive%\Program Files\1E\Client\Extensibility\NomadBranch\TSEnv2.exe

.pdb files for each executable

HKLM\Software\1E\NomadBranch

9.2.4.8 Uninstalling Nomad

How to uninstall Nomad. Follow these recommendations if you want to reinstall Nomad instead of upgrading.

If you are uninstalling Nomad, we recommend you do it in the following order.

9.2.4.8.1 Uninstalling the Nomad app and Content Distribution

Nomad is installed and uninstalled using Tachyon setup. You can manage your Nomad installation using Tachyon setup Maintenance. You can start**Tachyon.Setup**and click directly on the**Maintenance**link in the left-hand menu. Refer to Tachyon Setup for details.

9.2.4.8.1.1 Maintenance

From this screen, you can:

Uninstall... all or part of the components deployed from Tachyon.Setup

Install, re-install or update any **Applications...**

Change the **Server certificate...** used by the Tachyon website, switches and services – or fix their bindings

Upload and apply a 1E Hotfix bundle by clicking on **Hotfixing...**

> **Note**
>
> A 1E Hotfix bundle consists of a manifest XML file containing one of commands, and hotfix files. Examples of hotfix files are MSP files and scripts.

9.2.4.8.1.2 Uninstall

From this screen, you can **uninstall** all or some of the components deployed from **Tachyon Setup**.

> **Note**
>
> **Tachyon Setup** is the recommended method of uninstalling all or individual components instead of using the Windows Control Panel.
>
> This is because Tachyon Setup can undo any changes that were done after deploying the components, which would not be undone by the standard application uninstaller.

9.2.4.8.1.3 Applications

In this dialog, you can select to install or re-install any Applications used by the Portal.

The top grid displays the Applications that are already installed and their versions.

To install or re-install applications:

Type or select a folder in the **Applications folder** field.

Click on **Show Applications**. Doing this displays all the Tachyon Applications that are found under the selected folder. The Applications are displayed using the **Name**, **Title** and **Version**.

Click on **Install Applications**. This will upload the Applications into the server:

Any new uploaded Applications are added to the server

Any uploaded Applications with a newer version number will replace the older versions

If any uploaded Application has a version number prior to an existing Application, an error message will be generated and the version will not be downgraded.

9.2.4.8.2 Configuration Manager Consoles

Close the Configuration Manager Admin Console before you uninstall the Configuration Manager Console extensions and Nomad Tools for OSD.

9.2.4.8.3 Nomad clients

If you have installed the Nomad download monitor, uninstall this before Nomad.

Ensure there are no running jobs before you uninstall 1E Client or permanently disable the Nomad client module.

Content in the cache may not be automatically deleted when you uninstall Nomad (and some MSI-based installations and files may be required for future application repairs etc). You can delete these files/folders manually or run CacheCleaner.exe -deleteall *before* you uninstall Nomad.

9.2.4.8.4 Manual uninstallation

1E Client can be uninstalled manually by using Windows Apps and Features (appwiz.cpl). A reboot is not normally required.

9.2.4.8.5 Disabling a feature or client module

Please refer to Reconfiguring 1E Client for examples of how to use the **-reconfigure** command-line to reconfigure the 1E Client.

9.2.4.8.6 Uninstallation using the Windows Installer

1E Client can be uninstalled automatically by using a Windows Installer command line, where the {product code} is dependent on the version of the 1E Client. The example below also includes switches that prevent prompting and restart and creates a log file.

```
msiexec /x {BF6F5FA9-64C8-4B72-A6B6-14A582BF96B8} /qn /norestart /l*vx C:\Windo
ws\temp\1EClient-uninstall.log
```

9.2.4.8.7 Tidy up after uninstallation

After uninstallation of 1E Client, the following is left behind. As with other Windows installers, uninstallation will leave behind any files, folders and registry entries that were created after installation.

Location	Artifacts	Recommendation
Installation folder	None.	
Logs folder	Log files remain. Please refer to Log files for log file locations of 1E Client and its client modules.	The log files can be deleted or renamed. If not deleted, then a new installation that uses the same logs folder will continue to use the old log file.
Client\Persist folder remains.	Leave this folder which contains status information about current instructions. The Persist folder should be deleted only if you do not intend re-installing the 1E Client with Tachyon enabled, or when preparing OS images.	
Tachyon client registry	HKLM\SOFTWARE\1E\Client\Persist	This registry exists if the Tachyon client feature of the 1E Client is enabled. It is used to keep a record of hash values for its persistent storage files, which includes status information about current instructions. This registry key should be deleted only if you do not intend re-installing the 1E Client with Tachyon enabled, or when preparing OS images.
Nomad Cache	%ALLUSERSPROFILE%\1E\NomadBranch	The folder should be deleted only if you do not intend re-installing the 1E Client with Nomad enabled. Downloaded content is retained so that if Nomad client is re-enabled it will be scanned and re-registered, to make it available for peer

Location	Artifacts	Recommendation
		sharing with other Nomad clients.

Note

HKLM\SOFTWARE\1E\Common and HKLM\SOFTWARE\1E\NightWatchman are used by the 1E NightWatchman Agent, previously part of the 1E Agent.

9.2.5 Upgrading Nomad

This page provides guidance on:

Upgrading to the latest version of Nomad within a Configuration Manager operating environment.

Additional guidance on upgrading ActiveEfficiency to Content Distribution.

Upgrading Configuration Manager when Nomad is in use.

Nomad 8.1 - 1E Client - Tachyon Platform

In response to customer demand to reduce the number of agents required, 1E has merged the client functionality of Nomad, PXE Everywhere, WakeUp, Shopping and Tachyon into a single 1E Client, and are merging server functionality into a single Platform.

The Nomad client is installed and enabled as a module of the 1E Client. When the 1E Client is installed with the Nomad module enabled on a device that has Nomad 6.3 or earlier installed, the previous version will be removed, and the new Nomad module will be implemented. Any custom configuration defined in the registry (for example through Configuration Baselines) will be retained. Existing Configuration Baselines will continue to work with the 1E Client. Nomad 8.1 versions of Nomad Branch Tools and Nomad Branch Admin Console Extensions are distributed and deployed in a combined installer called NomadBranchTools.

From Nomad 7.1 onward, ActiveEfficiency Server and the Nomad Dashboard are replaced by Content Distribution and the Nomad app on the Tachyon Platform.

Nomad licensing

Nomad client does not require a license key (Nomad 6.3 and earlier versions did). However, you must continue to adhere to the terms of your license agreement.

The Nomad app and Content Distribution component on the Tachyon Platform requires a Nomad license

9.2.5.1 Supported upgrade scenarios

Below is an overview of three basic upgrade and migration scenarios for customers who already have ActiveEfficiency Server.

In-place upgrade of ActiveEfficiency Server to Tachyon Platform

In-place upgrade of Tachyon Platform

Installation or upgrade of Tachyon Platform side-by-side an existing ActiveEfficiency Server

The overall objectives are:

Continued support of the following Nomad features that were supported by ActiveEfficiency Server:

Single Site Download (SSD)

Pre-caching

Single Site Peer Backup Assistant

Nomad Download Pause

ConfigMgr Computer Association.

Continued support of downlevel (old) clients during the phased upgrade of clients as CD upgrades from an existing AE.

9.2.5.1.1 Upgrading Nomad only

In this scenario, Nomad is upgraded separate from any Configuration Manager Current Branch upgrade. This is the simplest and most common scenario that typically occurs when you want to keep your software current, take advantage of new features and improvements in the latest versions, or your current version is nearing end of support. In some cases, new features in Nomad may require your ActiveEfficiency server to be upgraded or additional solutions such as Tachyon to be implemented.

> **Product Support Lifecycle**
>
> For details of the support lifecycle of each of the 1E Products, refer to https://support.1e.com/.

Upgrading Nomad involves upgrading the server, tools and console components first before upgrading Distribution Points and finally clients. Nomad is generally backward compatible and unless otherwise stated in the product documentation, existing features will be supported by the new version. 1E realizes the importance of compatibility to maintain client operations during the upgrade process.

Nomad 7.1 onward uses the Tachyon Platform to provide Content Distribution and Dashboard features. Content Distribution replaces ActiveEfficiency Server. Content Distribution continues to provide legacy features for legacy (before 7.1) Nomad clients, which function independently alongside new Nomad clients. To install or upgrade to Tachyon Platform, either from ActiveEfficiency or from Tachyon, please refer to Upgrading to Tachyon Platform. If you are currently using Active Efficiency Server it will either be upgraded to Tachyon Platform, or be decommissioned in the side-by-side scenario.

To upgrade clients, 1E recommends using the 1E Client Deployment Assistant. The CDA creates Packages, Applications, empty Collections and Deployments with custom Windows Installer transforms to simplify the installation and initial configuration of the 1E Client and its modules. You can then simply add devices into the

Collections to upgrade Nomad on those devices. CDA is required if you are installing or upgrading PXE Everywhere.

If previous versions of Nomad have been deployed as an Application in Configuration Manager, you should define supersedence on the Application that installs the new version so that it supersedes the previous versions. This is very important, as it prevents attempts at downgrading Nomad through Application Deployment Enforcement if there are still active deployments for the previous versions.

Upgrading Nomad may also require updates to existing Task Sequences. Existing Nomad Task Sequence steps will continue to work after upgrade, but it may be necessary to remove and replace them after upgrade to implement any fixes or improvements included in the new version.

Important

It is advised that before starting any Nomad upgrades, you should stop services to your CM database before you start the upgrade.

9.2.5.1.2 Upgrading Configuration Manager

Configuration Manager (CM) Current Branch (CB) is updated three times a year. In most cases, updates to Configuration Manager do not affect core Nomad functionality. 1E endeavor to test all supported versions of all products and release a support statement within 30 days of General Availability ('slow ring') of a CM CB release. If any issues are identified, 1E will endeavor to fix the issue within the 30-day period, provide a workaround or communicate when the issue is expected to be resolved. Any such fixes will usually be implemented as a hotfix (that will be rolled into future versions) rather than an upgrade.

1E Support for CM CB releases

Before upgrading Configuration Manager, refer to https://1eportal.force.com/s/support-for-msft-rapid-release-cycle to confirm your currently installed versions of Nomad and ActiveEfficiency are supported on the new CM CB version.

If your currently installed versions of Nomad and ActiveEfficiency support the version of CM that you are upgrading to, you can go ahead and upgrade CM. Even though your currently installed versions are supported, you may like to take this opportunity to upgrade to the latest versions, or at least apply the latest hotfixes, to keep your software current. In that case, upgrade CM first, then update / upgrade Nomad and ActiveEfficiency accordingly, following the process for upgrading Nomad only.

If your currently installed versions of Nomad or ActiveEfficiency do not support the version of CM that you are upgrading to, you will need to update (hotfix) or upgrade them before upgrading CM.

NomadBranchTools and OSDInjection.xml

CM upgrades are likely to overwrite the OSDInjection.xml file that defines the files that are injected into Windows PE boot images. Nomad Branch Tools updates OSDInjection.xml to include the Nomad binaries that need to be added to the boot image. After upgrading CM you should uninstall and reinstall Nomad Branch Tools on the CM site server and any remote SMS Providers to ensure the Nomad binaries are included next time the boot image is redistributed.

9.2.5.1.3 Side-by-Side Migration of Configuration Manager and Nomad

If you are implementing a new Configuration Manager hierarchy with the intention of migrating devices from a separate hierarchy to the new hierarchy. Nomad Branch Tools and Nomad Admin Console Extensions would need to be installed in the new hierarchy. If those devices to be migrated already have a version of Nomad installed that is supported on the CM version of the new hierarchy, they can be migrated to the new hierarchy with no further changes needed to Nomad. If the currently installed version of Nomad is not supported on the new hierarchy's CM version, you will need to upgrade Nomad before migrating clients to the new CM hierarchy.

If ActiveEfficiency is being used in the old hierarchy you have two options.

Reconfigure the existing ActiveEfficiency server to synchronize with the new CM hierarchy. This option has the benefit of retaining SSD site definitions and historical data for content distribution and pre-caching. If package objects have been migrated from the old hierarchy, thereby retaining their content ID, this option will also enable clients that have not been migrated to share content with those that have across subnets (using SSD). However once ActiveEfficiency is synchronizing with the new CM hiearchy, you will no longer be able to manage pre-cache jobs from the old hierarchy and the dashboard will only be updated with activity from clients reporting into the new CM hierarchy.

Implement a new ActiveEfficiency server configured to sync with the new hierarchy. As clients are migrated to the new hierarchy, they should be reconfigured to report to the new ActiveEfficiency server. Pre-caching, SSD and dashboard reporting can be managed independently from each hierarchy until all clients are migrated to the new hierarchy.

9.2.5.2 Preparing for Upgrade

You should include the following steps in your preparation for upgrading:

Step	Action	Details
1	Review how you are currently using Nomad	The new Nomad client is a module of 1E Client, which also includes clients for Tachyon, PXE Everywhere, Shopping/WSA and WakeUp. Confirm which components you have implemented and where (clients, Nomad Branch Tools, Nomad Admin Console Extensions, ActiveEfficiency) Confirm which features you are currently using (SSD, FanOut, PBA etc.) and ensure your current configuration settings are recorded. Be aware that newer versions of Nomad may change the default values of some configuration settings. In most cases the original settings will be preserved when Nomad is upgraded, however it is important that

Step	Action	Details
		new clients are deployed with a configuration that is compatible with existing (upgraded) clients. Identify any clients that have a special Nomad configuration. For example, you might consider some clients to be sensitive and consequently have adjusted their Nomad election weighting so that they never become Nomad masters. You should review whether there are any such exceptions and incorporate them in your plan accordingly If you are using PXE Everywhere, identify.
2	Familiarize yourself with the features that have been introduced and other differences between your currently installed version and the new version.	Check the Nomad features by release page in the Nomad documentation Check the Preparation and Requirements pages in the Nomad documentation as there may be new requirements and some versions of Windows, CM and SQL Server may no longer be supported. Determine how the new features can benefit your organization and then learn the details to make them effective. You may prefer to wait for the upgrade to complete and settle down before enabling new features.
3	Check if any hardware upgrades or new hardware are required for any new features you intend to implement (for example, Tachyon is required for the Nomad Download Pause feature) and plan for these sufficiently in advance.	n\a
4	Obtain the latest software versions and hotfixes from the 1E Support Portal	n\a
5	Review CM health. You will be using CM to deploy the upgrade to clients, so any effort in ensuring CM is	n\a

Step	Action	Details
	functioning well will ease the upgrade.	
6	Plan your upgrade	You should have a lab or pre-production environment that closely reflects your production environment to test your upgrade process before going into production. Document an upgrade plan and validate it in the lab or pre-production environment. Validation should include all features that you are currently using. Where practical, upgrade all clients on a subnet at the same time. This minimizes the potential for version-specific issues such as hash or election differences (specifically when taking advantage of newer Nomad features such as the Cloud DP and CMG support functionality). Nomad elections are subnet based, so any Nomad client on the subnet could respond to another Nomad client, regardless of Nomad version or Configuration Manager differences. If the Configuration Manager clients that Nomad is installed on are the same version and reporting to the same hierarchy then issues related to Configuration Manager differences are avoided. Start small. Build Collections for pilots. The wider upgrade can be deployed to a Collection of all clients with the old version installed. As clients are upgraded they will move out of the Collection. Validate each stage before progressing to the next stage. Things to check: The correct versions are now in place Configuration Manager hardware and software inventory reports can confirm this Core functionality is working – downloads over the WAN and peer-to-peer content distribution

Step	Action	Details
		Manual inspection, including log reviewing, is ideal to confirm this in the early stage The Nomad Dashboard can confirm it on a broader scale Core scenarios are working – deployment of the various content types you use, representative operating systems and hardware Nomad Dashboard can be used for this No negative side effects Thorough lab testing is important Stay alert to help desk incidents and other means of reporting anomalous behavior All components are upgraded – clients, Nomad Configuration Manager Admin Console UI components and ActiveEfficiency as appropriate to your environment Configuration Manager hardware and software inventory reports can confirm this as well Secondary functionality and scenarios are working as desired Status reporting for OSD deployments or similar efforts provides this Server workloads do not change unexpectedly, and the server performance continues to be acceptable at all times Standard server monitoring and alerting After all clients are targeted with your Nomad client upgrade, the targeting collection will become smaller (since it is targeting clients that are not the correct version). It may take some time to become empty due to clients that are offline

Step	Action	Details
		A few collections will be involved, so use manual inspection in the Configuration Manager console.
7	Follow your upgrade plan in the production environment	n\a

9.2.5.3 Upgrade Sequence

The upgrade process presented within this document implements three simple maxims

If you are upgrading Configuration Manager and your currently installed versions of Nomad or ActiveEfficiency are not supported on the new CM version, you must upgrade these before upgrading CM

If you are upgrading Configuration Manager and Nomad at the same time and your currently installed versions of Nomad and ActiveEfficiency are supported on the new version of CM, upgrade CM first then upgrade Nomad and ActiveEfficiency

Upgrade server components before clients.

The figures below describe the principal processes and the sequence of steps involved when performing an upgrade. Described, is the logical progression of an upgrade process based upon the following possible scenarios:

Nomad only upgrade

Configuration Manager only upgrade

Configuration Manager and Nomad upgrade

Side-by-side migration of Configuration Manager and Nomad.

9.2.5.3.1 Upgrading Nomad and / or Configuration Manager

If you are only upgrading CM and your currently installed versions of Nomad and ActiveEfficiency support the new version of CM, follow Microsoft documentation to upgrade CM then reinstall the Nomad Branch Tools and redistribute the boot images.

If you are upgrading CM and your currently installed versions of Nomad or ActiveEfficiency are not supported on the new version of CM, follow the process below for upgrading Nomad first, then follow Microsoft documentation to upgrade CM.

Use the following process to upgrade Nomad.

9.2.5.3.1.1 Install or upgrade Nomad server components

If you are going to introduce features that require additional infrastructure (e.g. SSD, Dashboard and Pre-caching require ActiveEfficiency, Download Pause feature requires Tachyon), install these first as you will need to specify the server names when upgrading the Nomad Admin UI extensions and 1E Client

Upgrade the existing Nomad server components as follows:

ActiveEfficiency (optional component for SSD, Dashboard and Pre-caching)

Tachyon (optional component for real-time client management)

Nomad Admin UI extensions (on Site Servers and remote CM consoles)

Nomad Branch Tools (on Site Servers and SMS Providers)

Nomad on Distribution Points. Use the 1E Client installer to upgrade to Nomad 8.1 on DPs.

Hotfix required

If you are using ActiveEfficiency, Nomad 8.1 requires ActiveEfficiency 1.10 (or later) with the latest accumulated hotfix.

9.2.5.3.1.2 Update Task Sequences

Existing Task Sequence steps will continue to work after upgrading Nomad. However, the following steps should be updated in due course after upgrading the Nomad Admin UI extensions and Nomad Branch Tools.

Current step	Changes	
Install and Configure Nomad in WinPE	Before 7.1	7.1 and onward
	ActiveEfficiency URL Legacy clients will continue reporting to the ActiveEfficiency Server. If this has been upgraded and replaced by Content Distribution, then legacy clients will use HTTP	1E Platform Background Channel URL List This is a list of URLs containing each of the Tachyon Platform Background Channels in your organization and is normally the same list as used by your 1E Client devices. Please refer to #UUID4b0c8700283e161c086960470cc47bc0_id_TachyonclientsettingsBackgroundChannelUrl. **Note** Nomad clients connect to Content Distribution via Tachyon Switches and a proxy feature of Background Channel. **Tip** Any attempt to edit and save a Task Sequence for the first time using the new version of the Admin UI extensions will fail and prompt for this field to be completed.

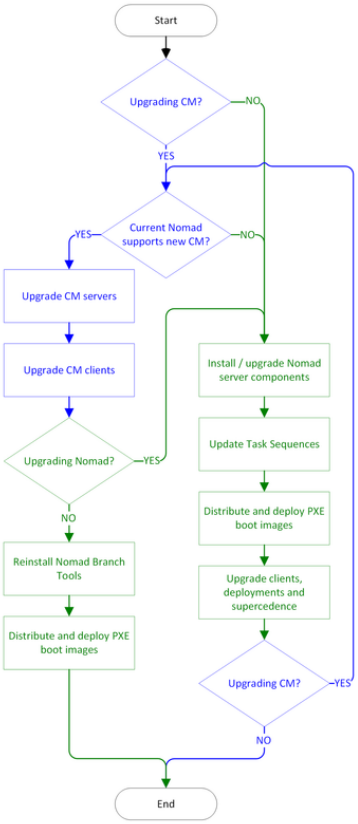
Current step	Changes	
	Redirection feature and continue to work.	
	Max. machines from ActiveEfficiency	Max. machines from 1E Platform
	WakeUp (Local only)	These settings have been removed. Content Distribution does not provide integration with WakeUp.
	WakeUp batch size	
Stage Nomad Package Only if you are upgrading from a version of Nomad earlier than Nomad 8.1	Remove the step and replace it with **Stage 1E Client Package** , and reference the 1E Client package created earlier.	
Install Nomad Only if you are upgrading from a version of Nomad earlier than Nomad 8.1	Remove the step and replace it with **Install 1E Client** . Before you remove the old step, make a note of any **Additional installation commands** in the existing step properties, and decide if you need to add them to the new step. **Installer Properties** Note that the installer property names in the 1E Client installer that relate to Nomad are different from the property names in previous versions of the Nomad installer. Generally, the original property name is prefixed with MODULE.NOMAD, but some have changed and there are new properties available since Nomad 7.0. Refer to Nomad installer properties for full details. If you are using Client Deployment Assistant to deploy the 1E Client, you should check to see if that has already configured your settings for you.	

9.2.5.3.1.3 Distribute and deploy PXE boot images

Nomad Branch Tools updates the Nomad files that are injected into Windows PE boot images. After upgrading Nomad Branch Tools, right-click existing boot images and select Update Distribution Points. CM will then generate an updated boot image, incorporating the updated Nomad files, and update it on DPs to which the boot image was previously distributed to. You will then need to deploy the updated boot image to any PXE Everywhere clients (see Preparing and deploying 1E PXE Everywhere boot images).

9.2.5.3.1.4 Upgrade clients

The 1E Client installer is used to upgrade from Nomad 6.3 to Nomad 8.1. 1E recommends using the Client Deployment Assistant (CDA) to create deployment objects (Applications, Packages, Collections and Deployments) in CM that can be used to roll out the client upgrade. The Applications and Packages created by CDA include Windows Installer transforms (.MST files) that configure the 1E Client according to options selected in the CDA.



Supported Upgrade path

The 1E Client supports upgrading from Nomad 6.3.100 and 6.3.201. Nomad 6.2 is now out of support. If you are still running Nomad 6.2, you will need to upgrade to Nomad 6.3.201 before upgrading to Nomad 8.1 with the 1E Client.

Application Supersedence

If you use Configuration Manager Applications (rather than Package) to deploy Nomad and still have active Application deployments for previous versions of the Nomad client, be sure to either:

delete those deployments

or define supersedence on the 1E Client Application such that it supersedes all Applications that install older versions of Nomad.

This will prevent Configuration Manager attempting to downgrade Nomad, which can leave the client in an unstable state.

9.2.5.3.2 Side-by-side Configuration Manager migration

When performing a sire-by-side Configuration Manager migration, you will need to perform a number of tasks in the new hierarchy to get Nomad up and running. The steps below summarize the process.

9.2.5.3.2.1 Build new CM hierarchy

Follow Microsoft documentation to build the new CM hierarchy.

9.2.5.3.2.2 Migrate CM objects as required

This is an optional step. You may choose to migrate some or all of your packages and other objects from your old hierarchy rather than recreating them manually in the new hierarchy. This has the added benefit of retaining content IDs, which means that Nomad clients assigned to the new hierarchy will be able to source content for those migrated packages from peers still assigned to the old hierarchy.

9.2.5.3.2.3 Install Nomad server components

You will need to install the Nomad server components in the new hierarchy as if installing Nomad for the first time.

ActiveEfficiency (optional component for SSD, Dashboard and Pre-caching). See Side-by-Side Migration of Configuration Manager and Nomad for options with ActiveEfficiency

Tachyon (optional component for real-time client management)

Nomad Admin UI extensions (on Site Servers and remote CM consoles)

Nomad Branch Tools (on Site Servers and SMS Providers)

Nomad (1E Client) on Distribution Points.

9.2.5.3.2.4 Distribute and deploy PXE boot images

Nomad Branch Tools updates the Nomad files that are injected into Windows PE boot images. After upgrading Nomad Branch Tools, right-click existing boot images and select **Update Distribution Points**. CM will then generate an updated boot image, incorporating the updated Nomad files and update it on DPs to which the boot image was previously distributed to.

You will then need to deploy the updated boot image to any PXE Everywhere clients (see Preparing and deploying 1E PXE Everywhere boot images).

9.2.5.3.2.5 Use CDA to create 1E Client deployment objects in new hierarchy

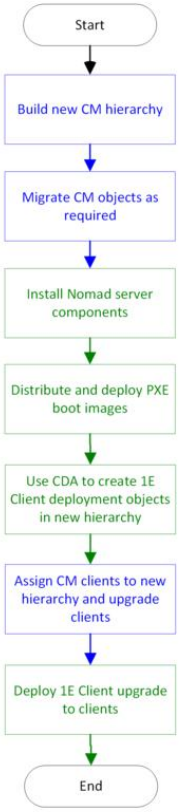
1E recommend using the Client Deployment Assistant (CDA) to create deployment objects (Applications, Packages, Collections and Deployments) in CM that can be used to roll out the 1E client to new clients in the new hierarchy and also to upgrade existing clients if they are on Nomad 6.3, and you wish to upgrade them to Nomad 8.1. The Applications and Packages created by CDA include Windows Installer transforms (.MST files) that configure the 1E Client according to options selected in the CDA. If you chose to implement a new ActiveEfficiency server in the new hierarchy, remember to specify the new server when running the CDA in this environment.

9.2.5.3.2.6 Assign CM clients to new hierarchy and upgrade clients

Follow the Microsoft documentation to assign CM clients to the new hierarchy and upgrade the CM client if appropriate.

9.2.5.3.2.7 Deploy the 1E Client upgrade to clients

If you are upgrading Nomad as you migrate clients to the new hierarchy, deploy the 1E Client application to upgrade them. If you used the CDA to create the deployment objects, simply add devices to the Collection created by CDA to upgrade them.



9.2.5.4 Upgrade FAQ

9.2.5.4.1 Client Upgrade FAQ

This section will attempt to answer some common questions related to upgrading the Nomad client.

Application Supersedence

If you use Configuration Manager Applications (rather than Package) to deploy Nomad and still have active Application deployments for previous versions of the Nomad client, be sure to either:

delete those deployments

or define supersedence on the 1E Client Application such that it supersedes all Applications that install older versions of Nomad.

This will prevent Configuration Manager attempting to downgrade Nomad, which can leave the client in an unstable state.

Question	Answer
What versions of Configuration Manager does Nomad support	Refer to Supported Platforms. **Product Support Lifecycle** For details of the support lifecycle of each of the 1E Products, please refer to the 1E Support Portal (https://1eportal.force.com/apex/ProductLifeCycleSupportMaintenance).
How do I upgrade?	Follow the process described above.
Do I need a new license key when I upgrade Nomad?	No. Old versions of Nomad required a license key, but a license key is not required to install 1E Client with Nomad enabled. However, your organization must still buy a license to use Nomad.
Why use the 1E Client Deployment Assistant during the upgrade?	The Client Deployment Assistant (CDA) was developed to allow easy installation and configuration of all 1E Client modules and the PXE Everywhere client. CDA includes all the client installation packages and is updated and released alongside new client releases. CDA is an installation wizard that guides you through the configuration creation and deployment of Applications and Packages that install the 1E Client modules (Nomad, WakeUp, Shopping and Tachyon) and the PXE Everywhere and NightWatchman clients. The CDA is designed to speed up client

Question	Answer
	deployment and ensure consistency of their configuration with the CDA providing a set of recommended configuration settings that can be changed either through the wizard or by editing the AppImport.xml file and running CDA in unattended mode. For more information on how to use the CDA, refer to Introducing 1E Client Deployment Assistant.
During an upgrade, are my customized registry settings preserved?	Yes. All upgrades will preserve the Nomad registry settings, as well as any content that exists in the Nomad Cache. However, it is recommended that users always deploy the upgrade using their desired transform (MST) in order to ensure that any existing clients that may be misconfigured are brought into line. Users should consult new release documentation in order to understand the settings related to implementing new features present in the release.
Are Nomad 8.1 clients backward compatible with previous versions?	Yes. Nomad 8.1 is backward compatible with Nomad 6.3. Older versions of Nomad are no longer supported.
Do I need to upgrade my clients at once?	It is recommended that you endeavor to upgrade clients by subnet where practical. Mobile clients moving from on-premises to Cloud DP locations should be upgraded as soon as possible. For customers not using Cloud DPs and mobile clients, it is generally not necessary to upgrade a set of particular clients at once. 1E always makes sure Nomad clients are backward compatible in terms of being able to download and share new and existing content between clients of different versions.
If you need to upgrade both the Configuration Manager and Nomad clients, which is done first?	The best practice is to upgrade the Configuration Manager client prior to the Nomad client. The exception is when the currently installed Nomad agent does not support the new version of CM. Under normal operation, Nomad is designed to instantly recognize and remediate if it is not configured as the Alternate Content Provider (ACP) for the Configuration Manager client. When upgrading the Configuration Manager client or Nomad client, no additional steps are required to make sure Nomad remains configured as the ACP.

Question	Answer
	The one exception is when the Nomad client installation is run on a host that does not have the Configuration Manager client installed. In this case, if installing the Configuration Manager client after installing Nomad, then you will need to perform a restart of the NomadBranch service for successful ACP registration. As a precaution, *if reinstalling both agents clients*, it is recommended that the Configuration Manager client is always installed/upgraded before Nomad.

9.2.5.4.2 Content FAQ

This section will attempt to answer some common questions related to Nomad content during a 1E Nomad upgrade.

Question	Answer
What happens to my existing cached content when I upgrade?	An upgrade of the Nomad client does not delete content from the Nomad cache. Similarly, an upgrade to the Configuration Manager client will not result in content being deleted from its cache. The new Cache Optimization (CO) feature introduced in Nomad 6.3 is turned off by default. CO allows content to be automatically purged from the cache based upon the last time it was copied by a peer or downloaded – whichever came last.
Does Nomad support the use of shared DPs during a side-by-side migration?	Yes, for a shared environment, provided the content version is consistent between the old and new site/hierarchy, the content locations will be supplied to the Nomad client by the Configuration Manager client and accessed by Nomad in the usual way. This is true for native Configuration Manager deployments as well as Nomad Pre-caching when the Nomad client performs its own content request. The Nomad client installed on the shared DP will continue to function as normal.
For a side-by-side migration, can existing cache content be used in the new infrastructure?	Yes. Migrating objects in Configuration Manager is performed using migration jobs and content identifiers are maintained after migration. This means all content metadata gathered by the Nomad client in the old hierarchy will be valid in the new.

Question	Answer
When performing a side-by-side migration, will Nomad reuse cached software updates?	Yes, the software update identifiers and metadata generated by Nomad in the source site remains valid in the new hierarchy.
When performing a side-by-side migration and executing Configuration Manager migration jobs, are Nomad settings preserved on migrated content?	For packages, no. Users must manually configure the Nomad settings on their migrated content in the new site. This can be automated by running a post migration script in order to set the required Nomad properties. Because of this, it is recommended that deployments are set to disabled in the package migration jobs. For applications and software updates, this is not a concern since the setting to use Nomad is made in the Configuration Manager Client Settings policy, rather than against individual pieces of content.

9.2.5.4.3 Content Distribution FAQ

This section will attempt to answer some common questions related to ActiveEfficiency and Content Distribution when upgrading Nomad.

Question	Answer
When upgrading ActiveEfficiency are custom configuration settings preserved?	No. Prior to upgrading, it is recommended to take note of any customizations. If you have customized settings such as IIS bindings or changed the *service.exe.config* file, then these will need to be reapplied after the upgrade.

9.2.5.4.4 Operating System Deployments FAQ

This section will attempt to answer some common questions related to OSD when upgrading Nomad.

Question	Answer
Is there a new version of PXE Everywhere released with Nomad 8.1?	No. PXE Everywhere 4.0 is the latest version, released earlier in 2019.

Question	Answer
Do I need to recreate my PXE boot images after the upgrade?	Unless you are upgrading the Windows ADK, you do not need to recreate your Nomad enabled PXE boot images. Admins do however need to update and deploy their boot images to include updated Nomad 8.1 program files when upgrading the Configuration Manager site server, SMS provider components, or the Nomad Branch Tools. Updating is achieved by simply redistributing the boot image package using the Configuration Manager console. The PXE boot image must then be re-deployed to your PXE Everywhere endpoint agents.
Do I need to update my OSD task sequences after the upgrade?	1E are always looking for ways to simplify and enhance our customer's OSD experience and will often release new built-in task sequence steps as part of a Nomad release. 1E recommends that whenever possible, users take advantage of any new task sequence steps and update their task sequences accordingly. If users wish to retain the configuration of their existing task sequences, then the older steps will typically remain supported, unless otherwise stated in the release documentation. Where existing steps are supported into the latest release, no action is required on existing task sequences once the Nomad Branch Tools and Configuration Manager Admin Console UI extensions have been upgraded. Configuration Manager admins are then able to open and edit their existing task sequences, and they will continue to function in the same way.

9.2.5.5 Upgrading to Tachyon Platform

Guidance for upgrading Tachyon, SLA, and ActiveEfficiency platforms to Tachyon Platform.

Before you attempt an upgrade, please ensure you thoroughly read all sections that apply to you. Combine the steps if your system matches multiple upgrade scenarios. If you cannot find a complete match, please contact 1E.

Refer to Upgrading to Tachyon Platform for full details.

9.2.5.6 Upgrading to 1E Client

Guidance for upgrading Tachyon and other legacy 1E agents to 1E Client. This page contains detailed steps for upgrading Tachyon Agent and a summary of considerations for upgrading other legacy agents. The 1E Client contains clients for 1E products and solutions, and their upgrade documentation should be consulted before upgrading their clients and agents.

For full details, refer to Upgrading 1E Client.

9.2.5.7 Nomad upgrade checklist

Quick checklist for upgrading Nomad and PXE Everywhere.

Main Step	Step Outline
Upgrade Tachyon Platform	Upgrade Tachyon Platform (or upgrade from ActiveEfficiency Server to Tachyon Platform).
Prepare 1E Client installation files	Use the1E Client Deployment Assistant 8.0 (CDA) wizard to create applications, collections, deployments and packages for the 1E Client in Configuration Manager. The Nomad client is now part of the 1E Client, and you must enable the Nomad client module of the 1E Client during installation. The1E Client 8.0 documentation also explains how to deploy the 1E Client with the Nomad client module enabled. Before running the CDA wizard, review AppImport.xml. Subject to the settings required in your organization, make changes to the file as appropriate. If the settings available in the wizard or AppImport.xml do not cover those that need to be configured within your organization, customize the automatically generated MST as described in the 1E Client Deployment Assistant (CDA) documentation. (Re)Distribute the 1E Client application and package contents to all DPs.
Upgrade Nomad on the Primary Site server	Extract the Nomad ZIP file onto the server Upgrade NomadBranchTools Upgrade NomadBranchAdminUIExt Upgrade Nomad client by installing 1E Client

Main Step	Step Outline
Upgrade Nomad on the Distribution Point server(s)	Upgrade the 1E Client with Nomad enabled on all the Distribution Point servers (before upgrading clients).
Upgrade Nomad on test client(s)	Create a test collection and deploy the 1E Client application or package to one computer – to test successful deployment.
Upgrade Nomad on all clients	Create a new deployment or use application supersedence to upgrade client computers.
Update/Create Compliance Baseline	(Optional) Update an existing Compliance Baseline, or use the new Nomad Baseline Wizard to create a new Compliance Baseline/configuration items by importing your 1E Client 5.1 MSI/MST. If you are updating an existing baseline, review specific Nomad settings (such as BLOCKSIZE=131072) making sure you only deploy this to Nomad clients.
Update 1E PXE Boot Image(s)	Update your 1E PXE Boot Image(s) by right-clicking the Boot Image and selecting “Update Distribution Points” - this will recreate the Boot Image and automatically inject the updated Nomad binary files into the Boot Image. Create a new deployment of your specific Task Sequence to pre-stage the Boot Image onto PXE Everywhere clients. Ensure you select the Rerun behavior to “Always rerun program” and the Deployment Option of “Download all content locally before starting the task sequence”. **Note** Nomad will only download the block differences (that is, deltas), so your clients won’t be

Main Step	Step Outline
	downloading the entire Boot Image all over again.
Update OSD Task Sequences (with new Nomad package) and Pre-Cache new Nomad package	If you already have OSD Task Sequences, then you'll need to update the **Stage Nomad Package** or **Stage 1E Client Package** step to point towards the new Nomad client installation package. The new 1E Client installation package will need pre-caching to remote clients, usually already setup by the Nomad Pre-cache Wizard. In the background, the content from the old 1E Client installation package to the new 1E Client installation package will automatically be cached onto clients after updating your OSD Task Sequences, but this can take up to 24 hours. You can speed this up by manually initiating the Nomad Sync (*C:\Program Files (x86)\1E\ActiveEfficiency\Service\ServiceHost.exe -NomadSyncAll* on the AE server), and then perform the *NomadBranch.exe -precache* command on remote clients.

9.2.6 Verifying

Basic verification tests that cover the installation and basic use of Nomad. Depending on the decisions you have made during the design phase of your implementation, you may need additional tests to verify your Nomad implementation.

> **Note**
>
> Please ensure you complete all verification tests. They not only confirm your system is operational, but they also introduce you to concepts and tasks that you will use later when using Nomad.

9.2.6.1 Basic verification tests

To run these tests you need, for installations and upgrades:

1E Client software is installed.

1E Client and **Nomad Branch** services both exist and running.

Default path for Nomad Branch service is
C:\Program Files\1E\Client\Extensibility\NomadBranch\NomadBranch.exe

System PATH environment variable has been added **C:\Program Files\1E\Client\Extensibility\NomadBranch**

Open a command prompt and type the following commands (Commands are in bold, example responses below):

>**where nomadbranch**

C:\Program Files\1E\Client\Extensibility\NomadBranch\NomadBranch.exe

>**nomadbranch -version**

NomadBranch version 8.1.2.xxx (mmm dd yyyy)

Nomad registry values are as expected - using default values unless specified differently in the installer, command-line or in the MST transform file.

In addition, for upgrades from Nomad 6.3.201 or Tachyon Agent 4.0 - the example is for x64 but may be for x86.

1E NomadBranch x64 / 1E Tachyon Agent x64 products are uninstalled.

Tachyon.Agent service is removed.

System PATH environment variable has removed **C:\Program Files\1E\NomadBranch**

After upgrade, the following Nomad registry settings are changed:

InstallationDirectory changed to C:\Program Files\1E\Client\Extensibility\NomadBranch.

ProductVersion changed to 8.1.2.xxx

TachyonAgentVersionchanged to 8.1.2.xxx

9.2.6.2 Platform verification tests

You should run basic verification tests If you have installed the platform as part of your Content Distribution installation.

Platform verification tests should be run in series. They start with basic server checks, then testing 1E Clients, and finally using the verification instructions from the **1E-Tachyon-Platform** Product Pack to do end-to-end tests that confirm all components are working. Depending on the decisions you have made during the design phase of your implementation, you may need additional tests to verify your implementation.

To run these tests you'll need:

Tachyon Server installed.

Remote workstation with a supported browser.

The name and password for the **server installation account**.

The AD account must be enabled.

The account may already be assigned to other platform roles either directly or using membership of an AD group role.

Two AD User accounts, **Test User 1** and **2**.

Must not be existing platform users because they will be assigned specific roles for the purpose of these tests.

Must have email addresses and be able to read emails.

The **1E-Tachyon-Platform** instruction set with two verification instructions.

The verification steps describe how to create this instruction set by uploading the 1E Tachyon Platform Product Pack.

You may have already uploaded this pack using the Product Pack Deployment Tool, either during Setup or after.

The 1E Tachyon Platform pack is included in the **TachyonPlatform zip** file that you can download from the 1E Support Portal https://support.1e.com/.

At least one test device on which the 1E Client will be installed.

1E Client installation source files and configuration details required by your platform implementation.

Basic verification tests cover a single-server installation of Tachyon Server. These tests only cover the platform and do not verify the configuration of 1E client modules with other 1E products. For details refer to Verifying.

9.3 Using Nomad

How systems administrators use Nomad to deploy software, software updates and operating system upgrades.

9.3.1 Deploying software with Configuration Manager

Scenarios for deploying Applications and Packages where Nomad is integrated with Configuration Manager.

Nomad integrates with the Configuration Manager (CM) client content download process. When Nomad is installed, it registers with the Configuration Manager client as an Alternate Content Provider (ACP), which means the CM client will use Nomad as an alternative to BITS when it requires content if Nomad is enabled for the requested content object. Nomad can be enabled on individual packages (including Driver Packages, Operating System Images, Operating System Upgrade Packages and Boot Images) and Task Sequences.

For Applications and Software Updates, Nomad is enabled on each client for all Applications and Software Updates through Default Client Settings. When the CM client requires Nomad-enabled content, it passes a request to Nomad, which in turn downloads the content, places it in the CM client cache and passes back to the CM client for execution. The 1E Client (with Nomad client module enabled) must be installed on all CM client machines and on all Distribution Points (DP).

Refer to Distributing software with Nomad and Configuration Manager for more information about how Nomad works with Configuration Manager. For example, Nomad supported CM content sources and the types of content Nomad can act as a content provider for.

To enable the Configuration Manager client to interpret Nomad settings and ensure Content Transfer Manager hands-over to Nomad to download content, we need to extend the standard software deployment and client settings policies associated with packages, applications and software updates. The additional Nomad attributes are configured through the Configuration Manger console by way of custom console extensions, which add properties pages to the standard package, task sequence and client settings dialog boxes and wizards.

To find out more, refer to Installing Nomad Branch Tools.

> **Note**
>
> You can use the Nomad app, powered by the Tachyon Platform to get a visual snapshot of download activity in your environment. The Nomad app will be available after you install the Tachyon Platform and can be accessed using the Tachyon DNS Alias FQDN, for example https://tachyon.acme.local/Tachyon
>
> The section Monitoring Nomad on this page provides an overview of how you can use the app to view download progress for large and small scale deployments.

9.3.1.1 Enabling Nomad for Application Management

Nomad is enabled or disabled for all Application deployments through the Client Settings. In our example we will enable Nomad for Application Management in the **Default Client Settings** and see how Nomad takes part in the download process and shares the content.

In our example in Configuration Manager:

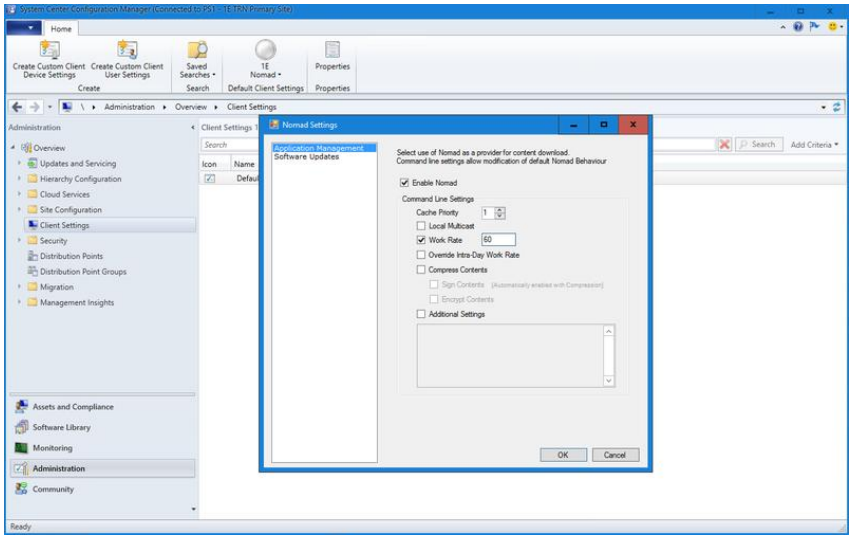
We select the **Administration** workspace and choose the **Client Settings** node.

Then click **Default Client Settings** in the right-hand pane and select **1E Nomad→ Nomad Properties** from the displayed Ribbon.

In the Nomad Properties dialog box, we select **Application Management** on the left and make the following changes.

Check **Enable Nomad**

Check **Work Rate (%)** and set the value to **6 0**.

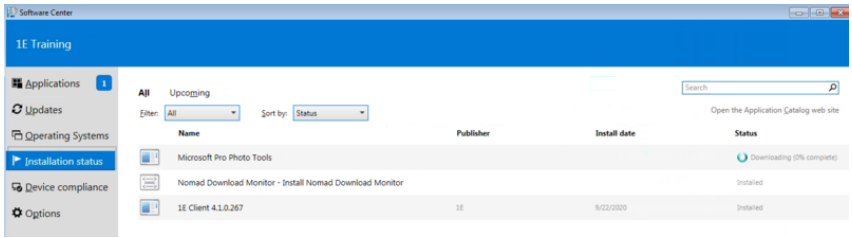


In this example, we will deploy **Microsoft Pro Photo Tools** to our collection containing our workstations called **Workstations**. Because we have enabled Nomad for Application Management, Nomad will be used to obtain the content for these clients when executing the deployment.

We then created a deployment for **Microsoft Pro Photo Tools** to our computers using the default deployment settings, but making sure on the **Deployment Settings** page we set the **Purpose** to **Required.**

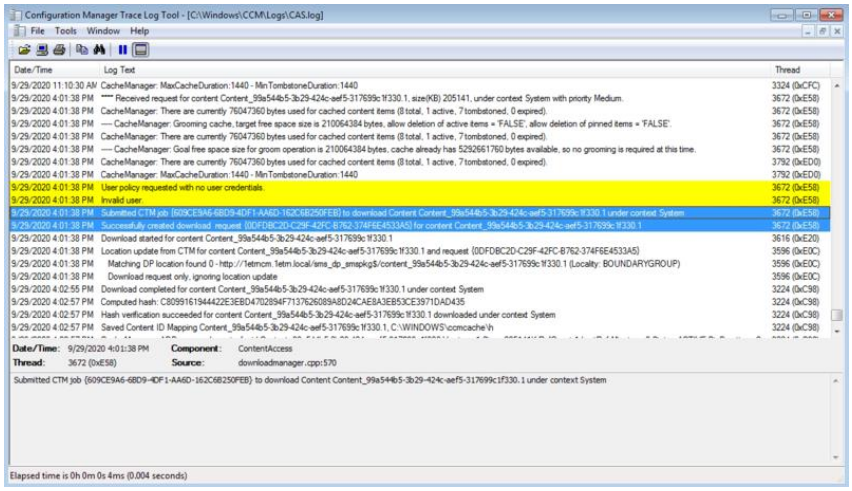
9.3.1.1.1 Tracing the Application download progress

We then observe the computers as they receive the Software Updates policy and begin to download the content. Using **Software Center** we can see the content being downloaded.

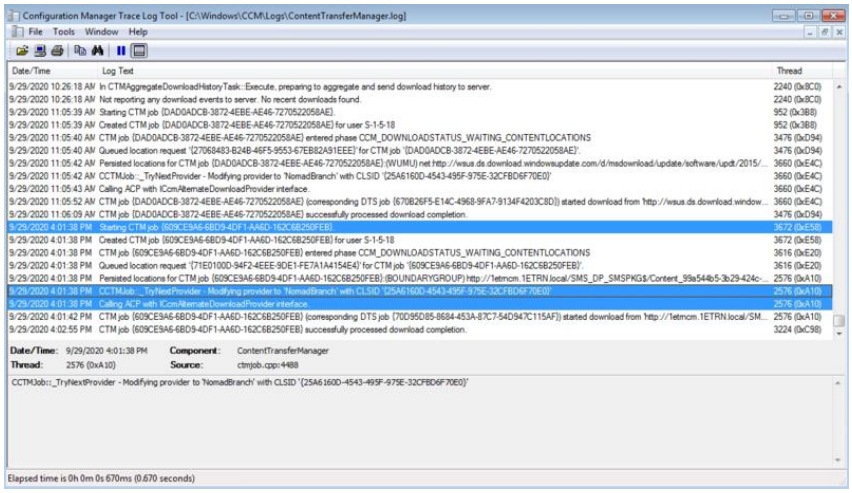


On **1ETRNW71** Using CMTrace.exe we open the **CAS.log** from **C:\Program Files\SMS_CCM\Logs** and can Identify the point when the content request is initiated.

We do this using the Application's Content ID: **Content_99a544b5-3b29-424c-aef5-317699c1f330**



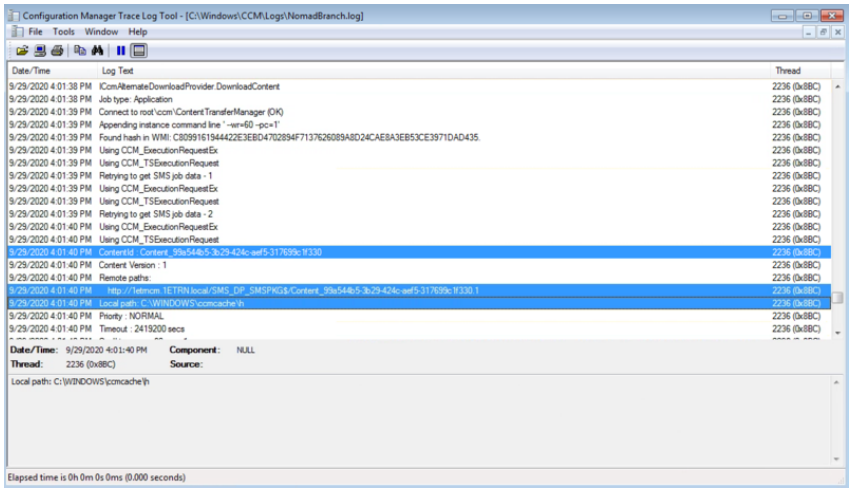
In the **ContentTransferManager.log** we can see where the CTM job started and that the Content Transfer Manager modifies the content provider to NomadBranch.



We look at the **NomadBranch.log** and identify the point where Nomad is called by the Content Transfer Manager as the Alternate Content Provider.

Note

The log extract shows the **ICcmAlternateDownloadProvider.DownloadContent** being called when the ContentTransferManager modified the provider to NomadBranch.



In the **NomadBranch.log** we can also see where the 1E Client names the Nomad options we defined in the Application Management section of Nomad settings.

We can identify the point where the list of available content locations presented to Nomad appears.

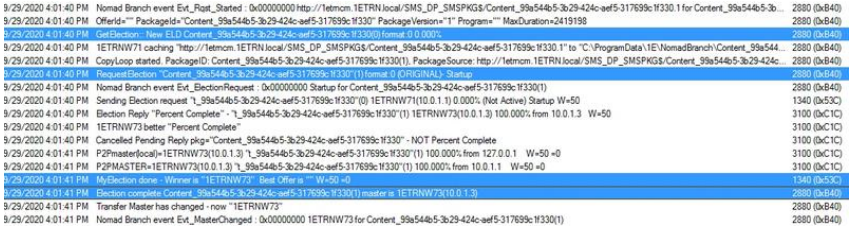
There is also a point where the election starts, and we can identify that **1ETRNW73** wins the election.

> **Note**
>
> Nomad ensures that software packages are only ever copied once per branch over the WAN, utilizing local computers as temporary file caches to distribute the software locally. This reduces the bandwidth required for delivering software updates and means that small offices or sites connected by poor network links can receive software updates more reliably.
>
> The Nomad clients with local copies of the package can themselves act as the master if the need arises. This significantly reduces the number of Configuration Manager servers required to manage a Configuration Manager hierarchy, thereby reducing initial and ongoing maintenance costs.
>
> Refer to Download once to branch for full details about Nomad elections work including:

Nomad master elections

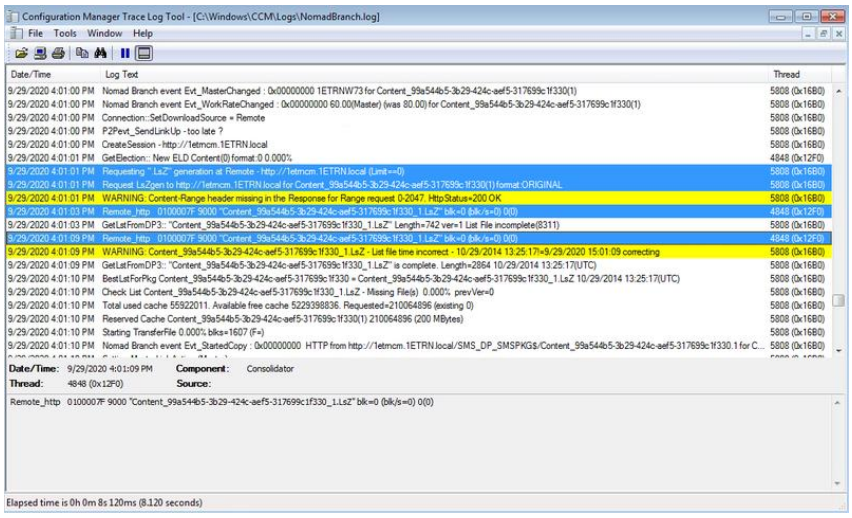
Nomad cache

Election rules and master elections.

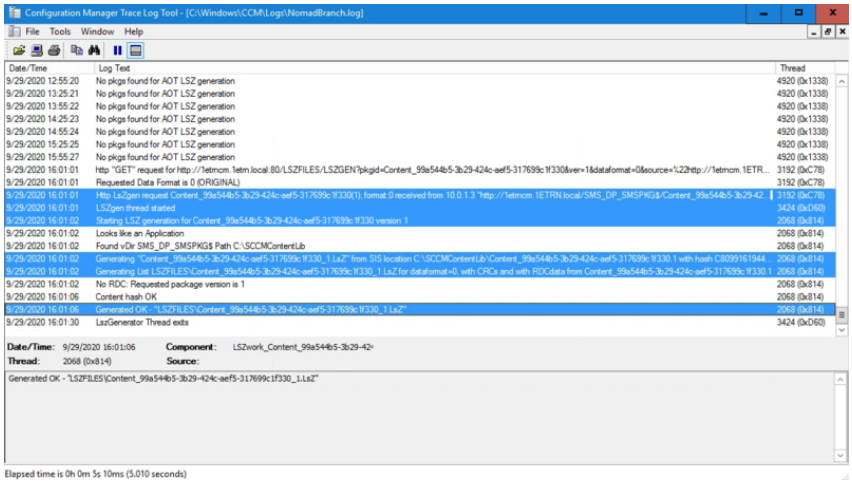


Because the elected master is **1ETRNW73** we switch to this computer and look at the NomadBranch.log, we then identify where the elected master requests the LsZ Manifest file to be generated on the DP.

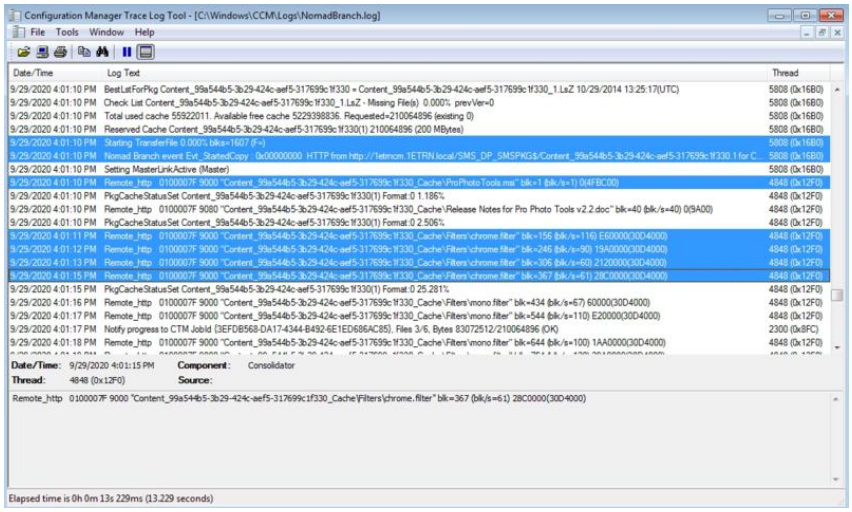
> **Note**
>
> The manifest, a *LSZ* file, is stored in the root of the Nomad cache. This lists each file, its time stamp, a CRC checksum and the Configuration Manager hash value for the content. Nomad uses this manifest to ensure that the correct files have been downloaded for each package and to enable the rapid detection of changes between versions of packages.



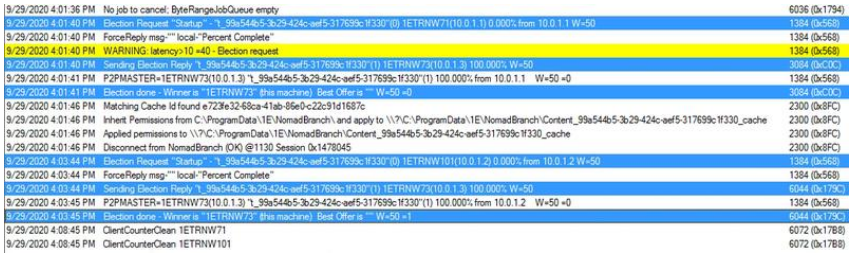
We switch to our Configuration Manager Server and open **c:\Windows\CCM\Logs\NomadBranch.log** where we can identify the point where the agent on the DP intercepts the request and generates the LsZ file.



By switching to the elected master **1ETRNW73** it's possible to track the download of content from the DP. This is highlighted by **Remote_http**.



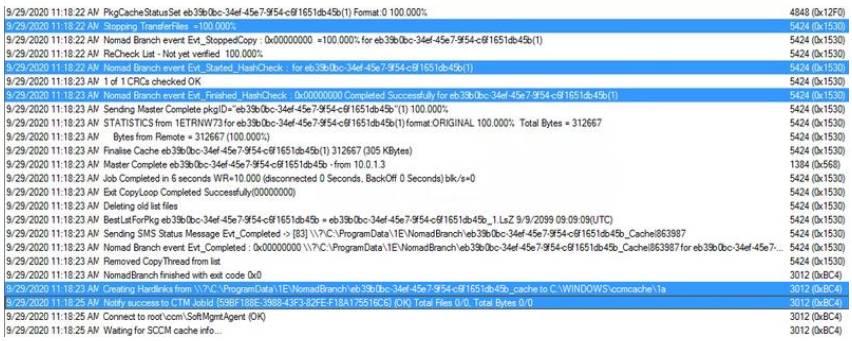
On the same computer **1ETRNW73** we can see other clients initiating an election as they process their content request.



Finally we can see the point where the master completes the download and performs the content hash check.

Note

The **STATISTICS** log entry indicates that this client (the master) got 100% of the content from the DP. The hardlinks are created shortly afterwards.



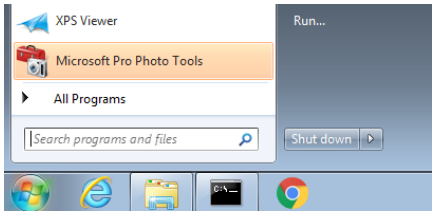
Once this process is complete **Microsoft Pro Photo Tools** is installed and available from the start menu.

Note

You can also use the Nomad app in the Nomad app to get a visual snapshot of download activity in your environment. The Nomad app will be available after you install the Tachyon Platform, it can be accessed using the Tachyon DNS Alias FQDN. For example:

https://tachyon.acme.local/Tachyon

See the section Using the Nomad app for an overview of how you can use the app to view download progress for large and small scale deployments for Content Titles and by device.



9.3.1.2 Enabling Nomad for Package Deployments

While you can use the same settings for all Applications, settings for Packages must be defined for each package you want to deploy.

Nomad can be set as a content provider for individual instances of the following types of Configuration Manager (CM) content. In the Configuration Manager Console, navigate to **Software Library**→**Overview** and then to one of the following:

CM Console node	Sub-node	Action
Application Management	**Packages**	Select a package.
Operating Systems	**Driver Packages**	Select a driver package.
Operating System Images	Select an operating system image.	
Operating System Upgrade Packages	Select an operating system upgrade package.	
Boot Images	Select a boot image.	
Task Sequences	Select a task sequence.	

Right-click and select **Properties**or click on**Create** to start a **New Wizard**. Nomad properties is then accessible on the **Nomad** tab.

In our example we will deploy a Package called **Phonebook** to the computers in our collection.

In Configuration Manager:

We select the **Software Library** workspace and choose the **Application Management**→**Packages** node.

We right-click the Phonebook package in the right-hand pane and select the**Nomad** tab from the displayed properties.

On the Nomad Properties tab, we select make the following changes:

Check **Enable Nomad**

Check **Work Rate (%)** and set the value to **10** we slow the rate to 10 to make the deployment easier to follow.

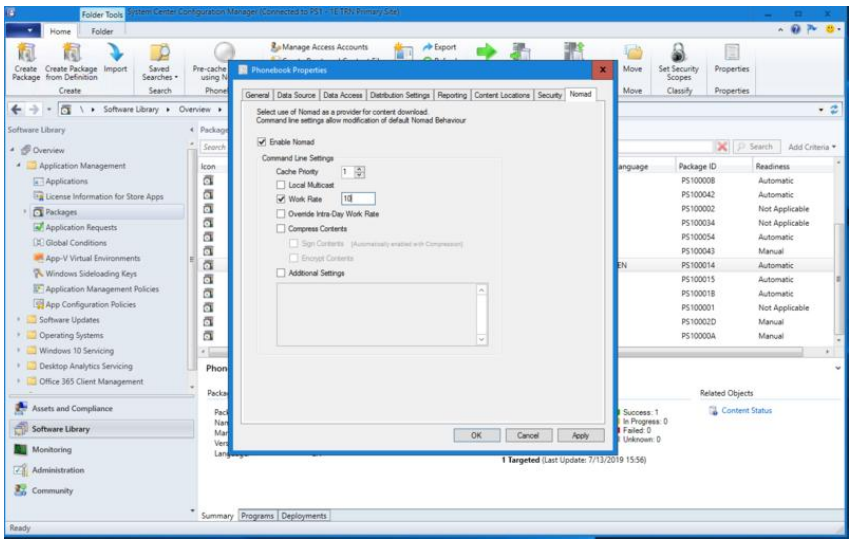
> **Note**
>
> Work Rate (%) – determines the percentage of available bandwidth to use for the download. The default value is 80%. If you have set intra-work rates, (the lower of these two values is used unless you enable the Override Intra-Day Work Rate option. Please refer to MaxWorkRates for details about intra-day work rates.

We then deploy the Phonebook Package to our workstations using the default deployment settings, but making sure we have set:

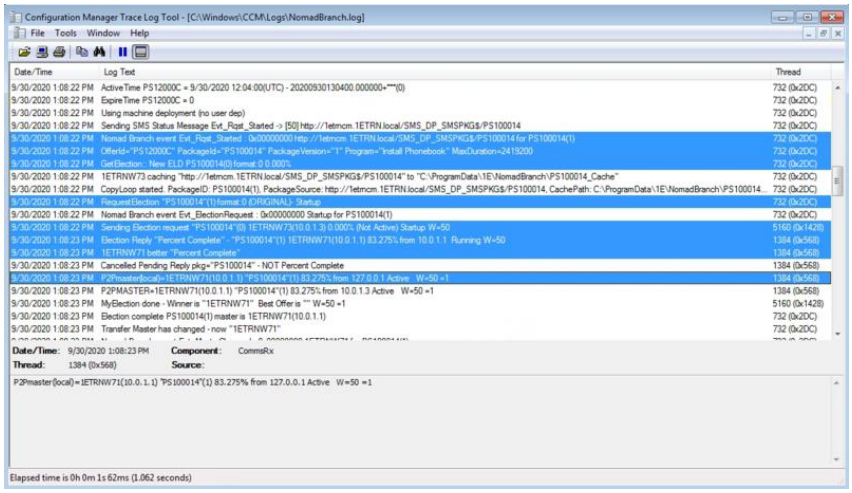
Deployment Settings - Type of deployment is **Required**

Scheduling - Create an assignment schedule of **Assign immediately after this event** with the deadline **As soon as Possible**

Distribution Points - we set both to **Download content from distribution point and run locally**.



On **1ETRNW73** Using CMTrace.exe we open the **NomadBranch.log** from **C:\Windows\CCM\Logs** and Identify the election for the Phonebook Package which has a content ID of **PS100014**.



When the master is elected the computer starts copying from the master, refer to Download once to branch for details about Nomad elections.

The method for deploying Packages is the same as for Applications and software updates, as detailed in Tracing the Application download progress.

9.3.2 Deploying software in large networks

Scenarios for deploying software in large networks, introducing FanOut and Single-Site Download (SSD).

Our environment is configured to represent two distinct locations (a datacenter and a remote office), with the servers all located in the datacenter and the computers are all located in the remote office. It just so happens that the remote office has two subnets.

In our example, we'll use Single Site Download, which enables a 1E Client to obtain content from a peer in an adjacent subnet (within the same defined location) if that content is not available on a peer in its own local subnet.

We'll then enable FanOut and watch when this feature is enabled to allow multiple 1E Clients to serve content simultaneously within the same subnet instead of relying on a single elected master. In our example computers with a name ending in an odd number are in subnet 10.0.1.0, while those with a name ending in an even number are in subnet 10.0.2.0.

> **Note**
>
> Not only is Nomad aware of the file level differences between different versions of a package so that only changed files are downloaded, it is also aware of the differences within individual files.
>
> This is sometimes known as binary differential replication or binary deltas but is more commonly known as remote differential compression (RDC) integration, for details refer

to https://docs.microsoft.com/en-us/previous-versions/windows/desktop/rdc/about-remote-differential-compression.

Note

You can use the Nomad app, powered by the Tachyon Platform to get a visual snapshot of download activity in your environment. The Nomad app will be available after you install the Tachyon Platform and can be accessed using the Tachyon DNS Alias FQDN, for example https://tachyon.acme.local/Tachyon

The section Monitoring Nomad on this page provides an overview of how you can use the app to view download progress for large and small scale deployments.

9.3.2.1 Using Single-Site downloads to deal with multi-subnet sites

Nomad's Single Site Download (SSD) feature ensures a download across the WAN only happens once per site. It does this by maintaining information about which subnets are neighbors of each other (accessible on LAN rather than WAN), so that when an elected master considers a download from a DP rather than a peer in its subnet, it can discover which other local subnets already has the package. These subnets are typically at a single customer site, specifically a single geographical location.

Nomad SSD uses Content Distribution. When a Nomad client downloads a package, it registers this information with Content Distribution, enabling a profile to be created on which Nomad clients hold particular packages.

Before enabling Nomad clients to use SSD, you need to ensure the following:

Tachyon Platform 5.2 or later is installed and running successfully

The Content Distribution database is populated with information about sites and their associated subnets

9.3.2.1.1 High-level overview of how to enable SSD

The following information applies to both new and existing installations of Nomad:

Make sure that Tachyon Platform is installed in your environment and is used as a content location metadata repository, for more information refer to Introducing Tachyon

Within Content Distribution, populate the SSD sites and subnet information. A sample PowerShell script called **PostADSitesandSubnets.ps1** is included in the Nomad installation files, which reads sites and subnets from AD

Nomad captures a list of background channels from the 1E Client in the BackgroundChannelUrl and uses the first working URL as the PlatformURL by appending /Proxy/ContentDistribution/ if this PlatformURL is unreachable it attempts to connect to the next BackgroundChannelUrl, for details about BackgroundChannelUrl refer to Nomad architecture

Enable SSD on all Nomad agents, by modifying **HKLM\Software\1E\NomadBranch\SSDEnabled** to 3, this enables SSD for both "Provide" and "Consume" modes, specifically Nomad will provide content to other peers and consume content from other peers

If you already have Nomad installed and are only now enabling SSD, then ensure **HKLM\Software\1E\NomadBranch\Platform\ContentRegistration** is set to 1, in other words, Nomad will register downloaded content with Content Distribution, this is automatically enabled for new installations of Nomad and SSD.

Tip

If you have clients on networks where broadcasts are disabled (for example wireless) then enable local SSD by setting SSDEnabled=7. Also set ContentProviderOnWifi=1.

9.3.2.1.2 Building a subnet profile in Content Distribution

For Content Distribution to build a subnet profile for SSD and the peer backup assistant feature, Nomad must communicate with its web service. When the Nomad service starts, it connects and registers the hosting device by name with Content Distribution, which returns a device ID in the form of a GUID that enables it to uniquely identify the Nomad client and its default subnet. If it is unable to communicate with Content Distribution, it retries every 5 minutes until it succeeds (as long as SSD is enabled). An attempt to communicate with Content Distribution is also made prior to a package download to register its status.

Please refer to Enabling SSD in WinPE to make use of Nomad SSD in OS Deployment.

The following points should be noted:

On a multi-NIC host, only one NIC gets registered, and a wired interface takes precedence over a wireless interface during registration

If Nomad fails initially to register an adapter, it retries every 5 minutes (for as long as SSD is enabled) until it succeeds

Wireless adapters can be configured to act as SSD content providers and consumers. Use the ContentProviderOnWiFi registry setting to do this

If the initial device registration was successful when the Nomad service started, but Content Distribution later becomes unavailable, when Nomad subsequently downloads and caches a package it will not be able to register the package with Content Distribution (see below for details). Nomad does not re-attempt package registration, so Content Distribution will not know that this particular Nomad host has the package.

9.3.2.1.3 Example PowerShell scripts

You can get information about sites and subnets from AD, or by other means. Example PowerShell scripts can be used for retrieving information about sites and their associated subnets from the AD and updating the Content Distribution database.

Example Active Directory Single Site script — Sample script that scans the Active Directory (AD) environment for all sites and subnets and stores the information in the Content Distribution locations table.

Example Single Site script — Sample script that provides two functions to update sites and subnets in the Content Distribution locations table: DeleteAllLocations and AddLocation().

Example Location Discovery script — Sample script to enable and disable the location discovery feature, along with the option to run it and load site, subnet and information in Content Distribution.

Content Distribution purge configuration script — Sample script to view or update Purge Configuration in the Content Distribution Service defined in the ContentDistribution PurgeSettings table if it is configured.

9.3.2.1.4 Enabling a Nomad package for Single-Site downloads

Nomad is enabled or disabled for each Configuration Manager package in**Configuration Manager**, **Software Library** workspace, **Packages** node. In our example we will enable Nomad for legacy package and see how Nomad takes part in the download process and shares the content.

> **Note**
>
> If you enable Single Site Download when you install the 1E Client, you only need to define the **SSDENABLED** and **PLATFORMURL** installer properties. However, if you enable the feature after installation through modification of the registry, you must also explicitly set the **ContentRegistration** value to 1.

In this example, we will configure a legacy package to use Nomad and then deploy it to our example Workstations Collection.

Before deploying our package, we are going to amend the Work Rate for our deployment. The Work Rate determines the percentage of available bandwidth to use for the download.

In this example we have changed this from the default 80% of available bandwidth to 10% to slow down the deployment and so making it easier to monitor.

For more details about the Nomad tab, and how you can use Work Rates, refer to Distributing software with Nomad and Configuration Manager - Nomad taband Design Considerations: Setting intra-day work rates.

In our example in Configuration Manager:

We select the **Software Library** workspace and choose the **Packages** node.

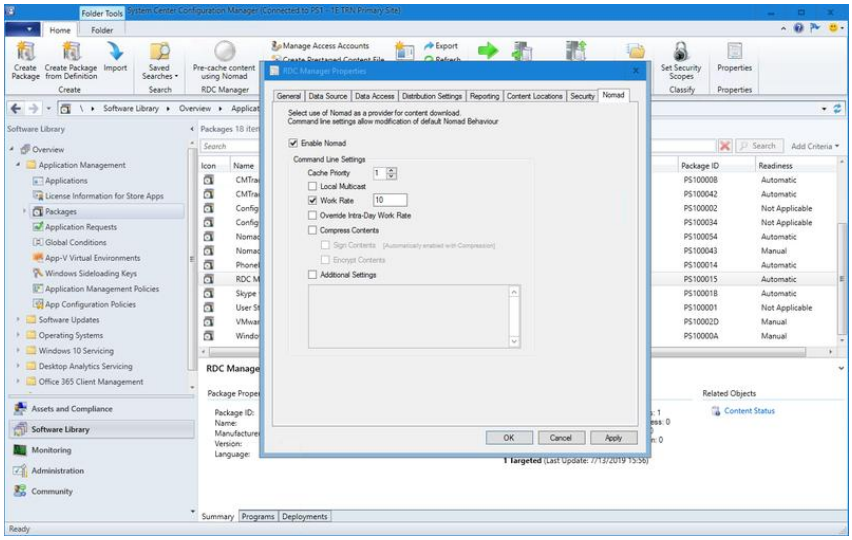
Then right-click the **Remote Desktop Connection Manager (RDCMan)** package in the right-hand pane and select the **Nomad** tab.

In the Nomad Properties dialog box, we check:

Enable Nomad

Work Rate (%)and set the value to**10**.

Once this is done, we force a policy update on the collection containing our workstations called **Workstations**.

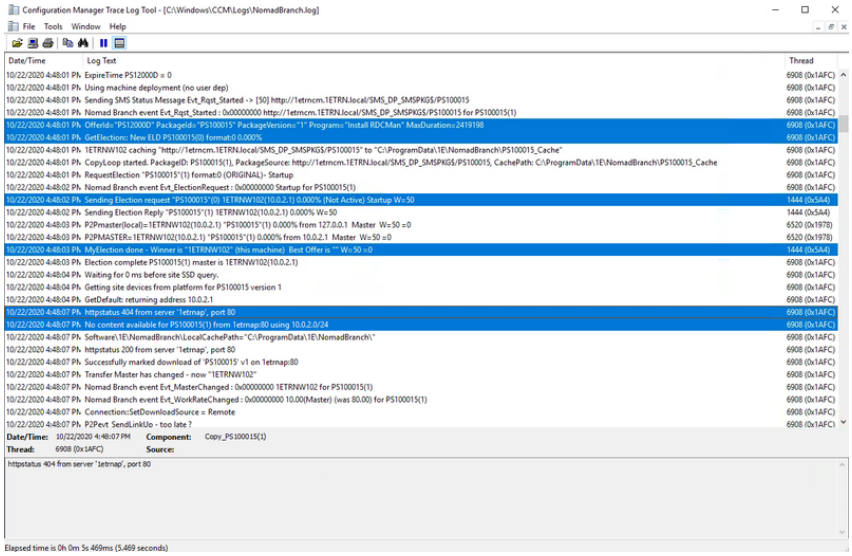


9.3.2.1.5 Deploying a legacy package with Nomad

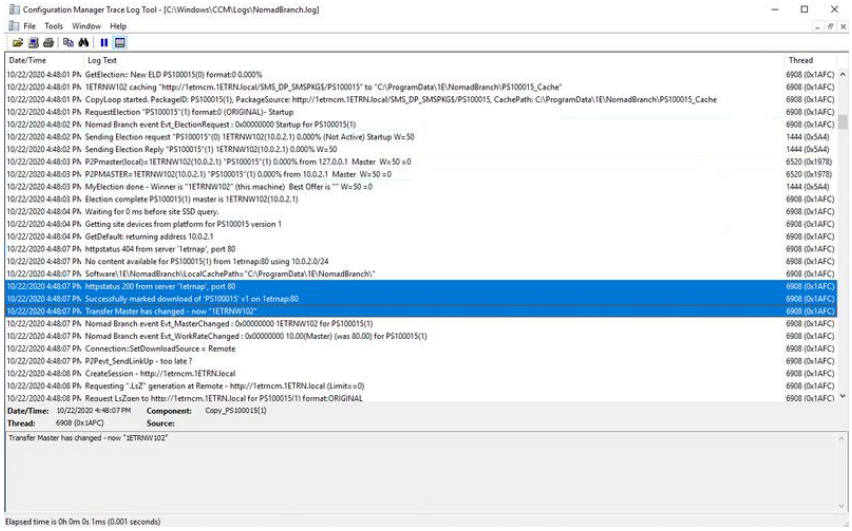
We then deploy the updates to our workstations using the following Deploy Software Wizard page settings:

Deploy Software Wizard Page	Setting
General	Selected the **Workstations** Collection
Content	Made sure the content is present on the DP
Deployment Settings	Set the **Purpose** to **Required**.
Scheduling	Created a new assignment schedule to run at the current time
User Experience	Checked **Allow users to run the program independently of assignments**
Distribution Points	Selected both Deployment Options to **Download content from distribution point and run locally**

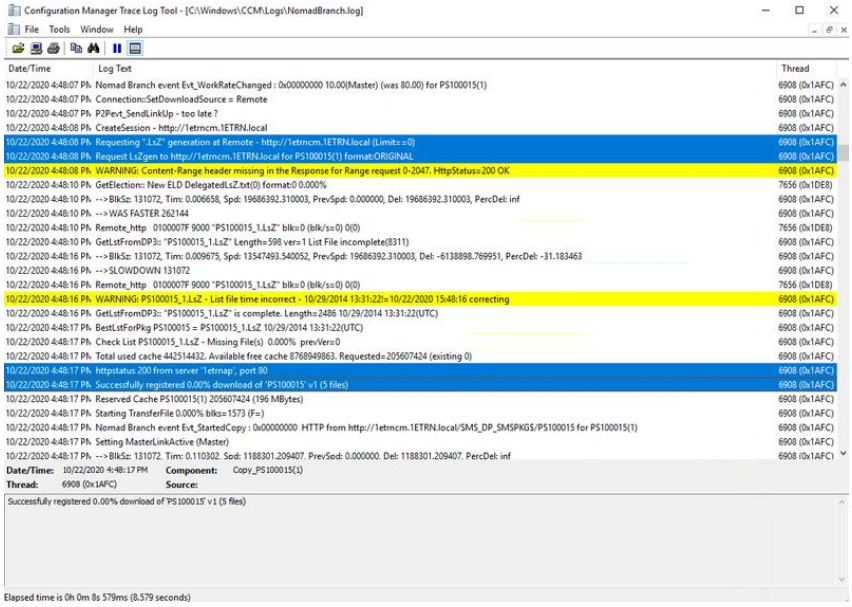
Our elected master is 1ETRNW102 in subnet 10.0.1.0 in the **C:\Windows\CCM\Logs\NomadBranch.log** we can see the normal election process. This is followed by a request for content for the **RDCMan** package but there is no content available.



From this point onwards 1ETRNW102 will be returned by the Content Distribution Consumer as a content source for other clients in its subnet within the same location.

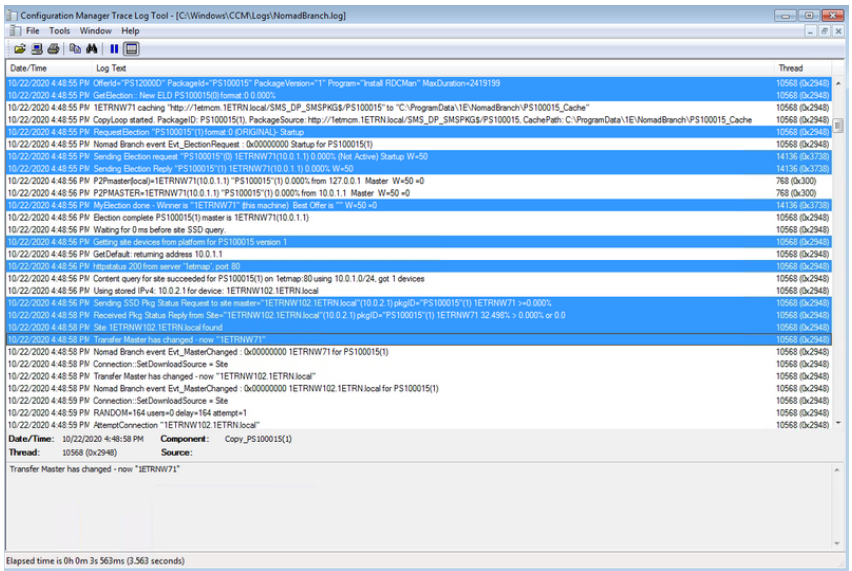


We can see 1ETRNW102 downloading the .LsZ file from the DP and updates the Content Distribution Consumer to indicate the download has started.



If we now look at the other subnet in our example, 10.0.2.0 and identify the first election request from this subnet which is from 1ETRNW71.

In the **NomadBranch.log** we see the normal activity where 1ETRNW71 is elected as the master.



Following this 1ETRNW71 queries the Content Distribution Consumer to see if the content is available on and adjacent subnet. The query returns 1ETRNW102 as a potential candidate, Nomad then sends a Package Status Request to the returned client and selects it.

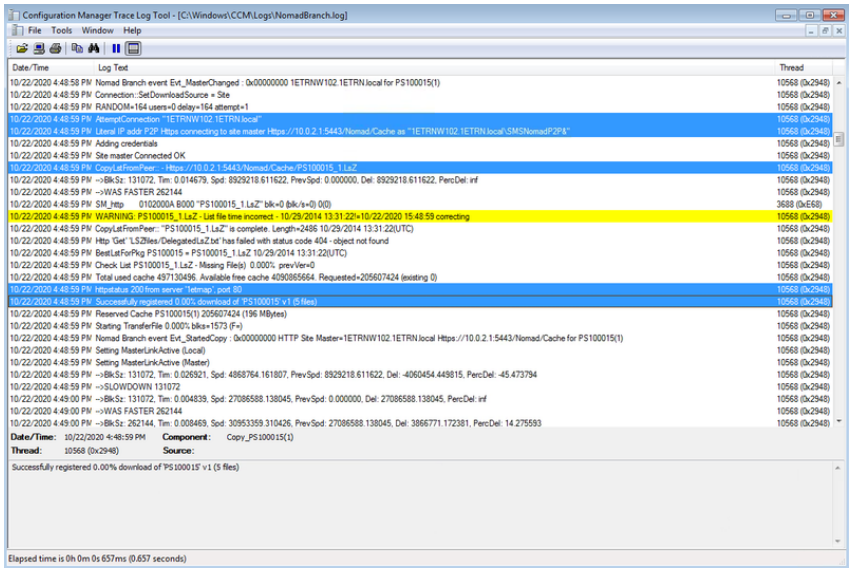
> **Note**
>
> If more than one client had been returned, the client with the most content already cached becomes the Site Master.

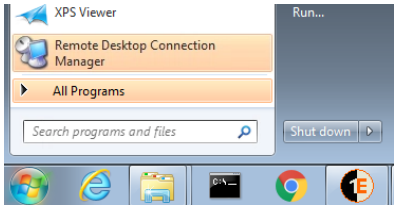
The elected subnet master starts to download content starting with the .LsZ file and the agent registers with the Content Distribution Consumer that it's now started the download. Every client

with ContentRegistration enabled will update the Content Distribution Consumer in this way whenever it starts to download content.

The **Remote Desktop Connection Manager (RDCMan)** package is then installed on our computers.

We have seen that Single Site Download allows you to deploy content to a large network, for example where you have a datacenter and a remote office and the computers are located in the remote office on two different subnets. Using Single Site Download allowed the 1E Client to obtain content from a peer in an adjacent subnet (within the same defined location) when that content was not available on a peer in its own local subnet.





9.3.2.2 Using FanOut for large subnets

Windows imposes a limit on the number of concurrent connections on the Nomad share. The FanOut featurecompensates for this limitation by enabling any peer that has more content than the requester to respond to the FanOut request. It is not limited to peers that have an active connection to the master.

The Nomad cache share (NomadSHR$) is created with a connection limit of six, this also applies for HTTP(S) transfers. This means that up to six Nomad peers can get content from the master at a time. If a 1E Client tries to connect to the master and all six connections are in use on the master, that agent would back off and retry later. The Fanout feature enables the 'rejected' agent to ask for an alternative peer in the same subnet that has the content it needs. Any other peer on the subnet can respond to this request, but will only do so if it has:

More content than the agent requesting it

Available connections and is not already be connected to a Fanout peer.

To find out more about how FanOut works refer to Nomad FanOut - How FanOut Works.

9.3.2.2.1 Enabling FanOut

To use FanOut, the Nomad*SpecialNetShare*registry value must be updated to include bit 6 (*0x40*or 64 decimal) on all computers hosting Nomad. To do this in our example, we imported a Configuration item and used Configuration Manager Settings Management to update our 1E Clients using a configuration baseline.

> **Note**
>
> The Nomad Baseline wizard is used to create a Configuration Manager (CM) Baseline from the Configuration Manager console for settings related to Nomad. Refer to Nomad Baseline wizard for more information.

In our example, we'll reinstall the RDC Manager package we installed in Using Single-Site downloads to deal with multi-subnet sitesusing two computers, 1ETRNW71 and 1ETRNW73 in our 10.0.1.0 subnet to prompt Nomad to re-download the content when the NomadSHR connection limit (1) is reached on the elected master which should be 1ETRNW101 as it has the content in its cache. For the purpose of this example we have reduced the connection limit to 1 to demonstrate FanOut behavior with a couple of clients. This is not something we recommend you do in a production environment.

> **Note**
>
> In our computers with a name ending in an odd number are in subnet 10.0.1.0, while those with a name ending in an even number are in subnet 10.0.2.0.

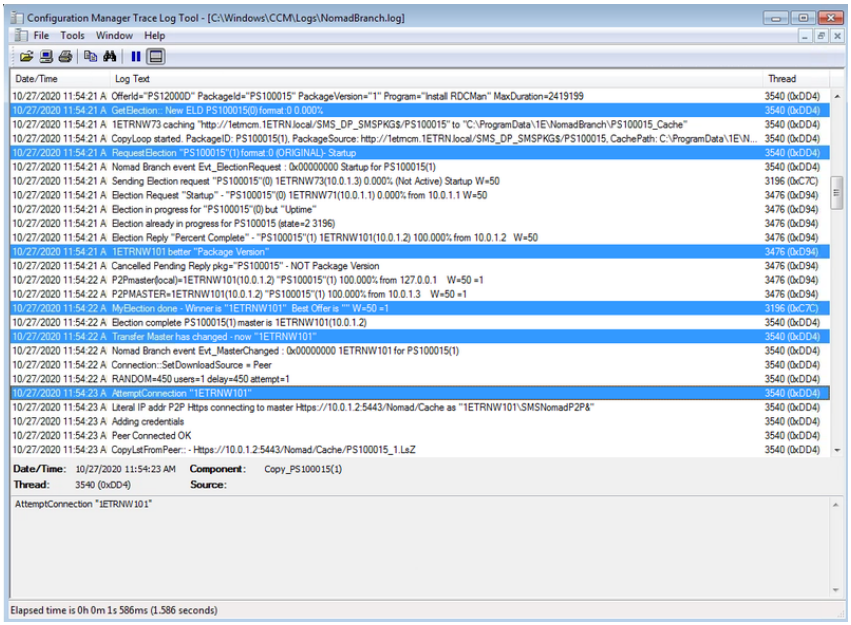
On both 1ETRNW71 and 1ETRNW73 we reinstalled RDC Manager using Software Center.

When we open **NomadBranch.log** on 1ETRNW73 there's an election where 1ETRNW101 wins as it has 100% of the content in its cache.

The elected master does not change for 1ETRNW71, but as there is only one connection available on **NomadSHR** which is being used by 1ETRNW73, 1ETRNW71 would fail to connect to the master. 1ETRNW71 then polls for a FanOut and receives a reply from 1ETRNW73 and then starts downloading the content from 1ETRNW73.

In this example we saw how FanOut can be enabled to allow multiple peers within a subnet to serve content to others in the situation where there are insufficient connections available on the elected master. This feature will typically enable faster distribution of content in larger subnets compared to the behavior seen in Using Single-Site downloads to deal with multi-subnet , where a maximum of six clients (in addition to the master) can be simultaneously obtaining content within the subnet.

> **Note**
>
> We recommend using Configuration Baselines as the best way to manage the configuration of your 1E Clients in a production environment. Refer to Nomad Baseline wizard for more information.



9.3.3 Deploying software updates using Configuration Manager

Nomad integrates with the Configuration Manager (CM) client content Distribution Point (DP) download process, and can be enabled on individual packages (including Driver Packages, Operating System Images, Operating System Upgrade Packages and Boot Images) and Task Sequences. For Applications and Software Updates, Nomad is enabled on each client for all Applications and Software Updates through Default Client Settings in Configuration Manager.

In addition, Nomad can also download content from Windows Update / Microsoft Update (WUMU). Starting in CB version 1806, software updates can be deployed to devices without first downloading and distributing content to Distribution Points, instead clients download updates directly from Microsoft Update.As a system administrator, we'll show how you can use Nomad to deploy software updates with CM from a CM Distribution Point or directly from Microsoft Update. While Nomad is enabled or disabled for all Software Update deployments through CM Client Settings, downloading from Microsoft Update is enabled by default. The settings are defined inCompatibilityFlags and you will need to ensure the relevant bits remain set if you are using that registry value to configure other options.

For details about the types of updates enabled by default in the Nomad client (1E Client 4.1 and later), refer to Downloading content for CM Software Updates from Microsoft Update.

> **Note**
>
> You can use the Nomad app, powered by the Tachyon Platform to get a visual snapshot of download activity in your environment. The Nomad app will be available after you install the Tachyon Platform and can be accessed using the Tachyon DNS Alias FQDN, for example https://tachyon.acme.local/Tachyon
>
> The section Monitoring Nomad on this page provides an overview of how you can use the app to view download progress for large and small scale deployments.

9.3.3.1 Enabling Nomad for Software Updates

Nomad is enabled or disabled for all Software Update deployments through the Client Settings. In our example we will enable Nomad for Software Updates in the **Default Client Settings** and see how Nomad takes part in the download process and shares the content.

Before deploying our software updates, we are going to amend the Work Rate for our deployment. The Work Rate determines the percentage of available bandwidth to use for the download.

In this example we have changed this from the default 80% of available bandwidth to 10% to slow down the deployment and so making it easier to monitor.

For more details about the Nomad tab, and how you can use Work Rates, refer toDistributing software with Nomad and Configuration Manager - Nomad tabandDesign Considerations: Setting intra-day work rates.

In our example in Configuration Manager:

We select the **Administration** workspace and choose the **Client Settings** node.

Then click **Default Client Settings** in the right-hand pane and select **1E Nomad→Nomad Properties** from the displayed Ribbon.

In the Nomad Properties dialog box, we select **Software Updates** on the left and make the following changes.

Check **Enable Nomad**

Check **Work Rate (%)** and set the value to**10**.

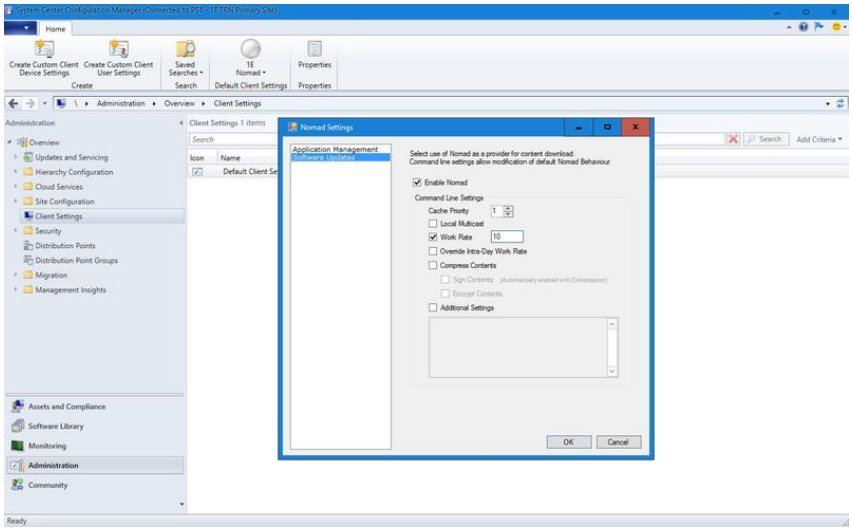
Once this is done, we force a policy update on the collection containing our workstations called **Lab Workstations**.

> **Note**
>
> As Windows 10 cumulative updates get very big, very quickly (often in excess of 1GB a few months after any given Feature Upgrade), Microsoft started publishing express installation files for these updates in addition to the traditional full update files. Configuration Manager introduced support for Windows 10 Express Installation File updates in Current Branch 1802 hotfix KB4163547.
>
> Express installation files are a much larger payload on the Distribution Point compared to traditional software update files, but the feature enables clients to download delta byte-ranges from these files, so each month the amount of data a client has to download is typically much smaller. Configuration Manager Current Branch can be configured to support express installation files (refer to https://docs.microsoft.com/en-us/configmgr/sum/deploy-use/manage-express-installation-files-for-windows-10-updates for more details).
>
> With the release of Windows 10 1809, Microsoft replaced express update files with a new way of managing deltas within software updates. In Configuration Manager 1902 the **Enable installation of Express installation files on clients** option in Software Update Client Settings was replaced with
> **Allow clients to download delta content when available**.

Note

Nomad supports the download of Express installation files and delta content for updates.

Refer to Windows 10 Express Installation Files and Delta Content for Updates for more details.



9.3.3.2 Deploying Windows updates from a DP

We have created a **Software Updates** group called **Windows 7 Updates** containing three updates for the Windows 7 computers on our network:

2018-05 Security Only Quality Update for Windows 7 for x86-based Systems (KB4103712)

2018-07 Security Only Quality Update for Windows 7 for x86-based Systems (KB4338823)

Security Update for Windows 7 (KB3000483).

We then deploy the updates to our workstations using the default deployment settings, but making sure we have set:

Deployment Settings - the Purpose is **Required**

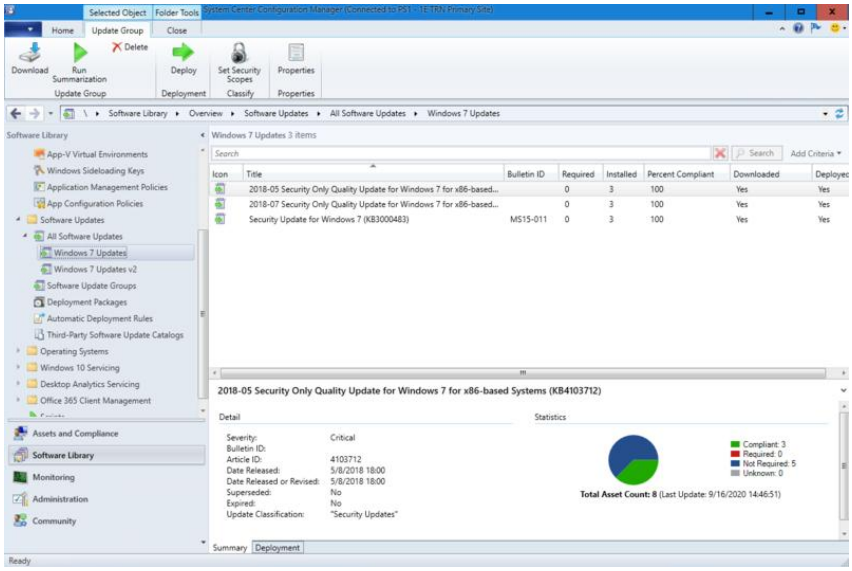
Scheduling - Installation deadline is **As soon as Possible**

Download Settings - we selected both **Download** options.

Note

Software Update Deployments always download the required content and install it from the local cache. By default, clients connected within a boundary defined by an administrator as slow or unreliable will not download the content and therefore the update will not be deployed to those clients.

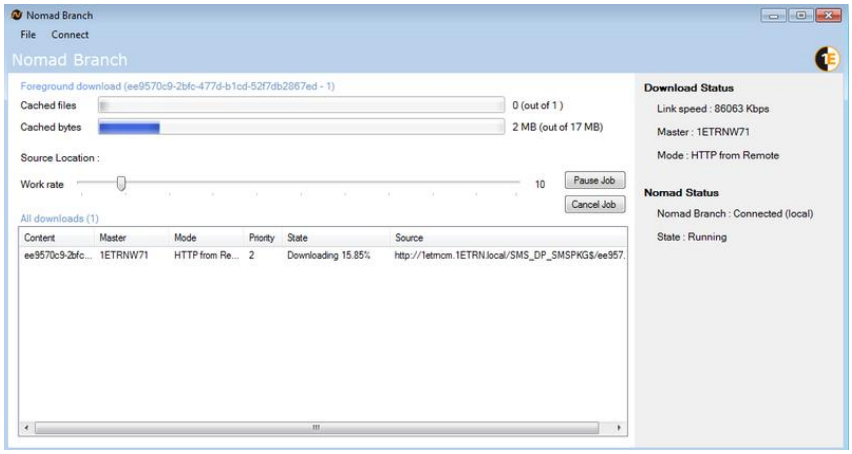
Because we are using Nomad to distribute the content, we always want the content to be downloaded, as we are not concerned about the bandwidth when using Nomad.

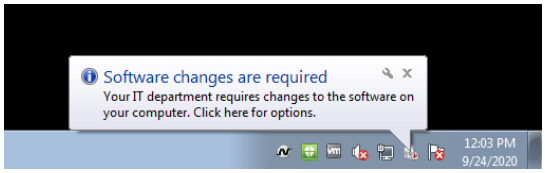


9.3.3.2.1 Tracing update download progress

We then watch the computers in our as they receive the Software Updates policy and begin to download the content. Using the Nomad download UI we can see the content being downloaded. We can also see that the 1ETRNW71 computer has been elected as Master.

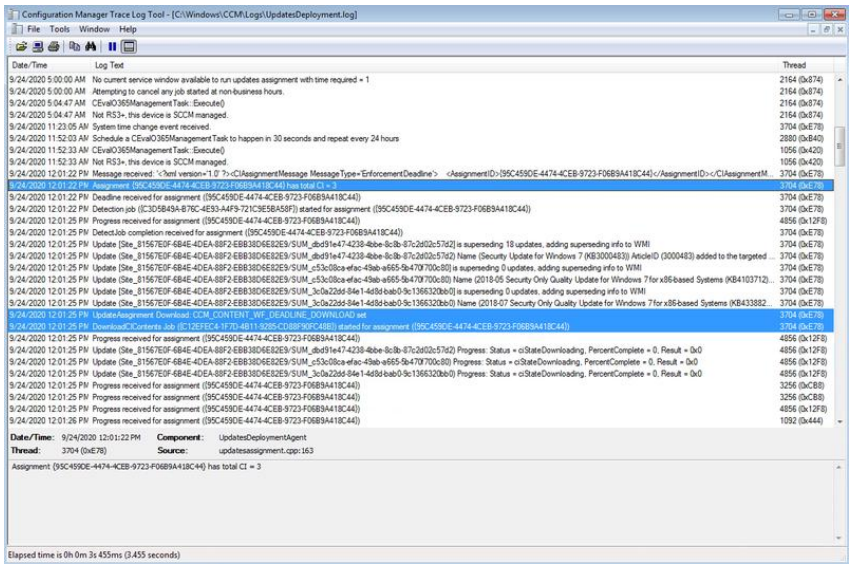
> **Note**
>
> Nomad ensures that software packages are only ever copied once per branch over the WAN, utilizing local computers as temporary file caches to distribute the software locally. This reduces the bandwidth required for delivering software updates and means that small offices or sites connected by poor network links can receive software updates more reliably.
>
> The Nomad clients with local copies of the package can themselves act as the master if the need arises. This significantly reduces the number of Configuration Manager servers required to manage a Configuration Manager hierarchy, thereby reducing initial and ongoing maintenance costs.
>
> Refer to Download once to branch for details.



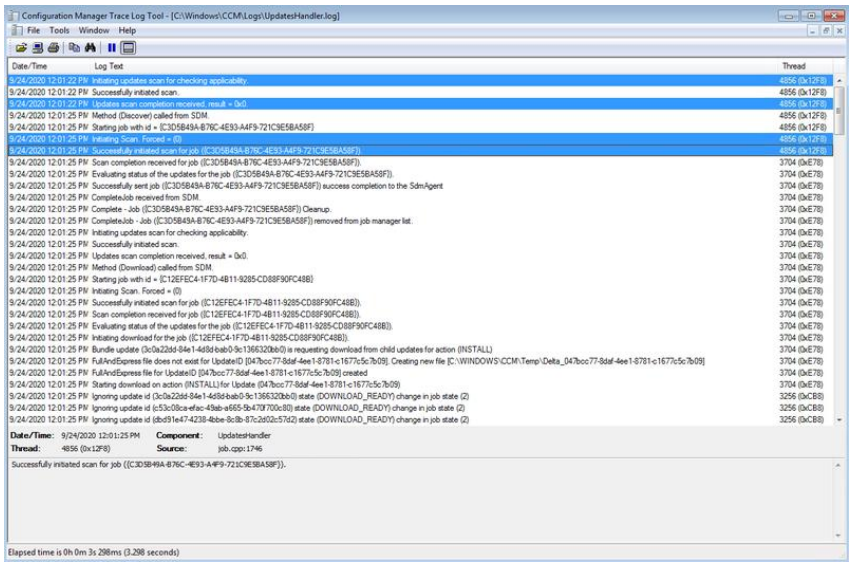


Using CMTrace.exe we open the **UpdatesDeployment.log** from **C:\Program Files\SMS_CCM\Logs** and can Identify the point when the Configuration Manager client receives the software updates assignment. We can also see log entries indicating that each of the updates have been added to the targeted list and that the **DownloadCIContents** Job has started.

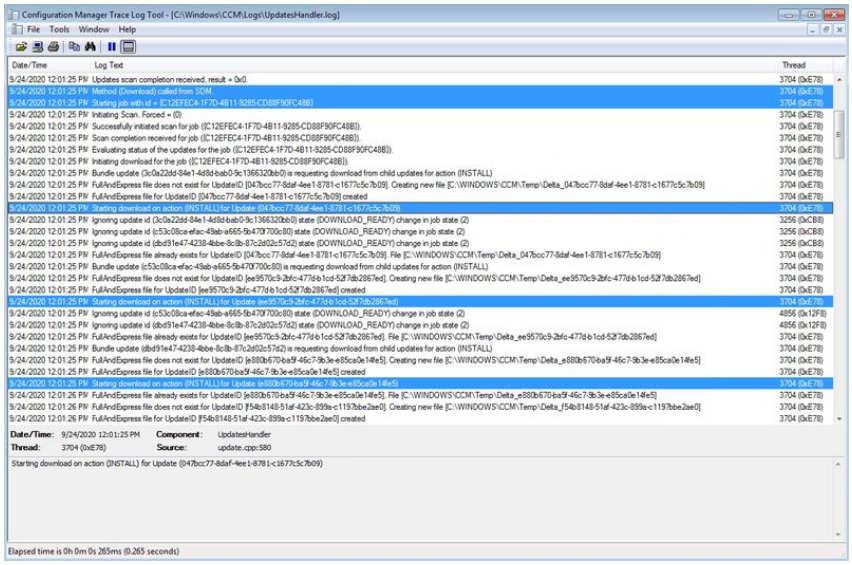
In our example we can see this process for Security Update for Windows 7 (KB3000483).



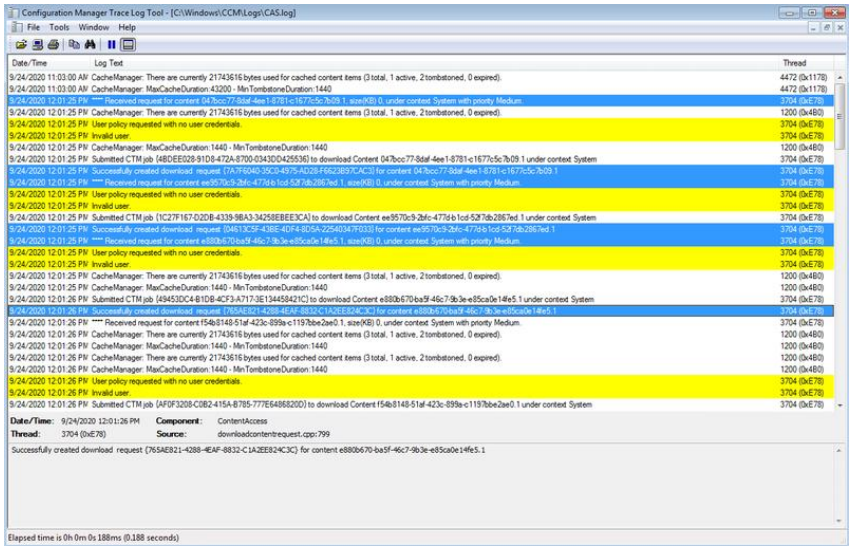
We then open **UpdatesHandler.log** and identify the point where the updates handler initiates a scan to determine which of the updates included in the deployment are applicable.



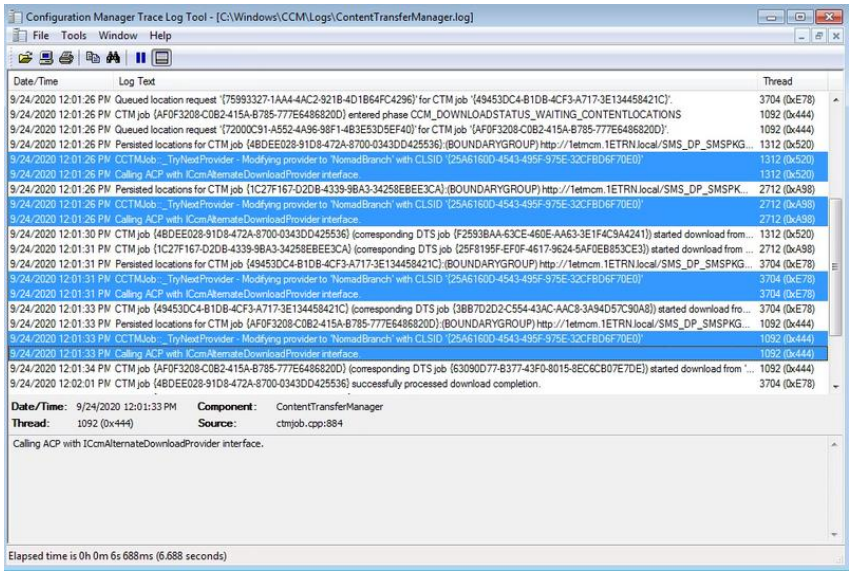
Eventually the scan determines the required updates and initiates download.



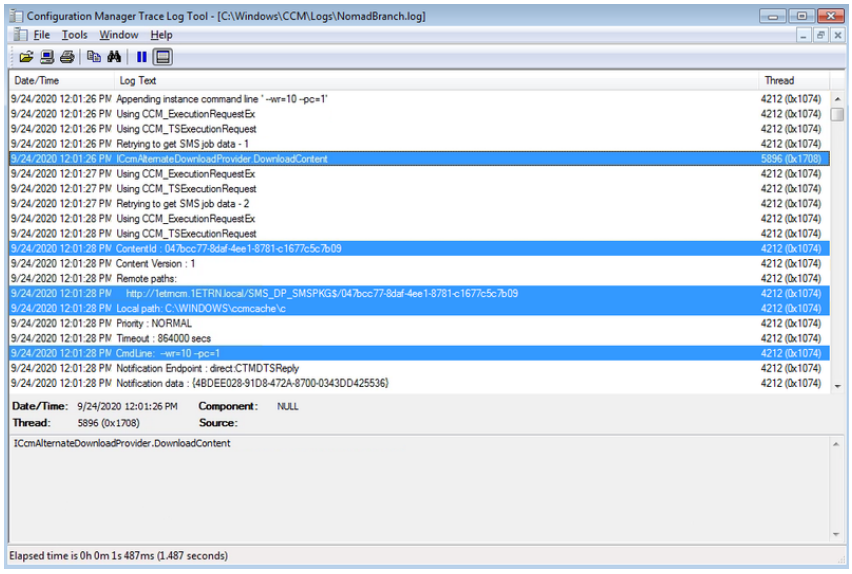
We then open **CAS.log** and identify the point where the Content Access Service requests the content for the requested updates in the deployment.



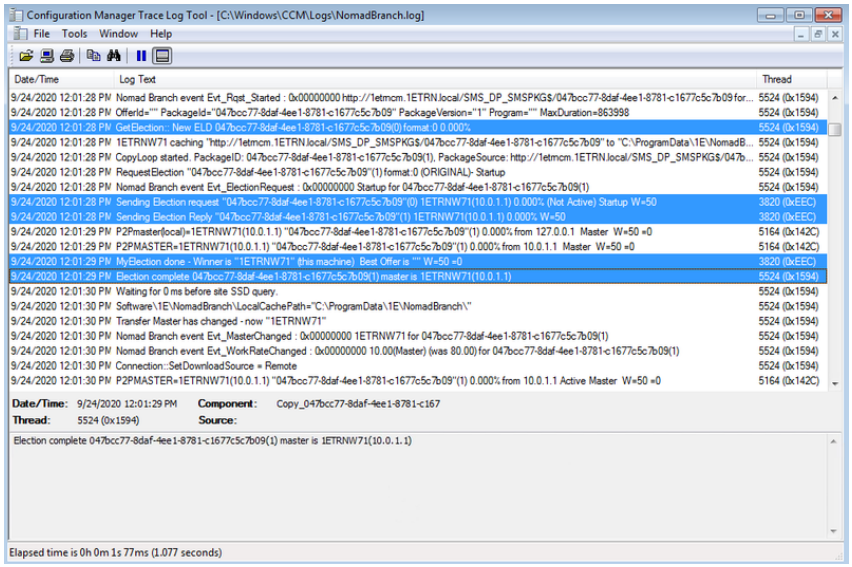
In the **ContentTransferManager.log** we identify the points where CTM calls the NomadBranch provider for each of the required updates.



We look at the **NomadBranch.log** from C:\Windows\CCM\Logs and identify the point where Nomad is called by the Content Transfer Manager as the Alternate Content Provider.

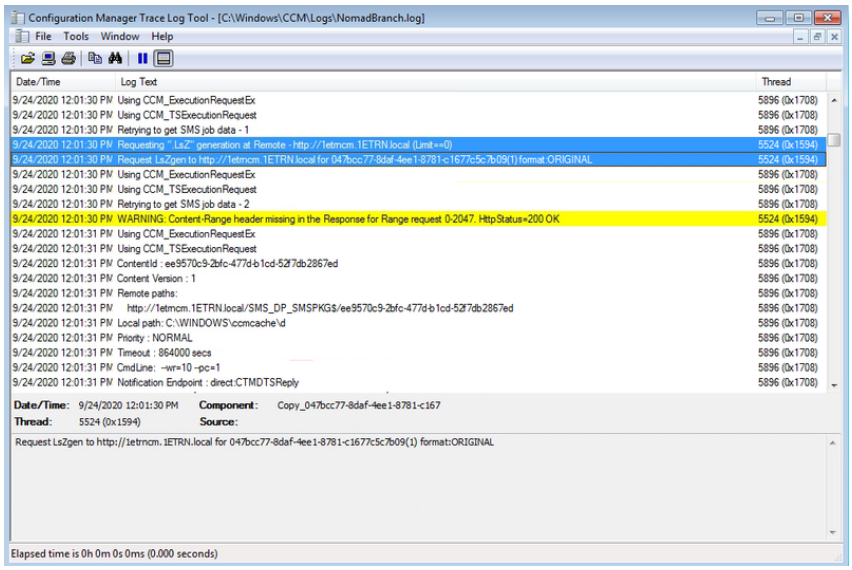


We locate the point where Nomad initiated the election for the content associated with the first update. From the log entries, we can then see which computer became the master.

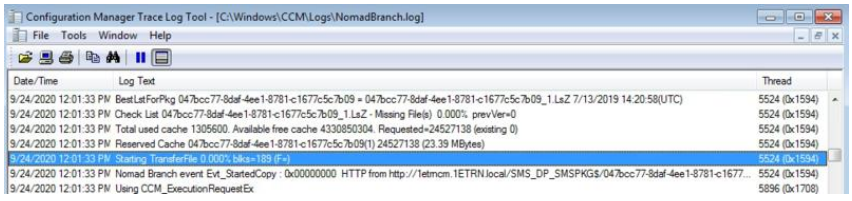


Then we locate the point where the client gets the **LsZ** file. As we are looking at the **NomadBranch.log** file on the master, we see the LsZ generation request (as this is the first time the content has been requested from the DP) and the LsZ file will then be downloaded from the DP.

> **Note**
>
> If we looked at the log file on one of the other clients, the LsZ file will be downloaded from the master.



Finally we identify the point where the client downloads the content for the first update (either from the DP or from the master). The client will then complete the hash check and create the hard-link to the Configuration Manager cache.



We have seen that each update is identified as an individual piece of content, resulting in an election for each Software Update. Because all computers on our network might not need the same updates, every update will have its own election, and different masters may emerge for different updates.

9.3.3.3 Deploying Windows updates directly from Microsoft Update

In this example, the source of our updates are from Microsoft Update and Nomad shares the content as it would if the content was available from Configuration Manager.

9.3.3.3.1 Configure and confirm settings

We have created a **Software Updates** group called **Windows 7 Updates v2** containing two updates for the Windows 7 computers on our network:

Security Update for Windows 7 (KB3004375)

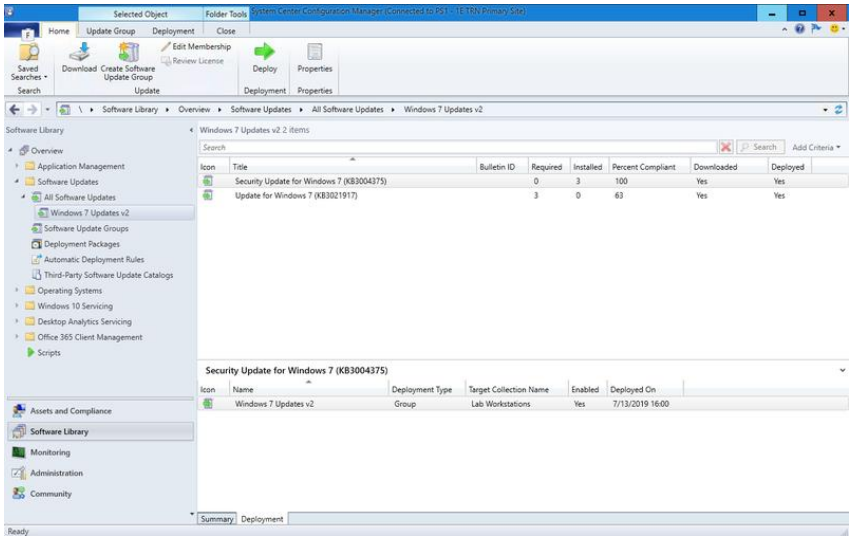
Update for Windows 7 (KB3021917).

We then deploy the updates to our lab workstations using the default deployment settings, but making sure we have set:

Deployment Settings - Type of deployment is **Available**

Download Settings - we selected both **Download** options and checked
If software updates are not available on distribution point in current, neighbour or site boundary groups, download content from Microsoft Updates.

We then install the update using **Software Center→Updates** on our Windows 7 computers.



We open the **NomadBranch.log** on our computer 1ETRNW72 and see the start of the download from Windows update and the calls for an election with this computer winning.

1ETRNW72 wins the election because it is the only targeted device the subnet.

Note

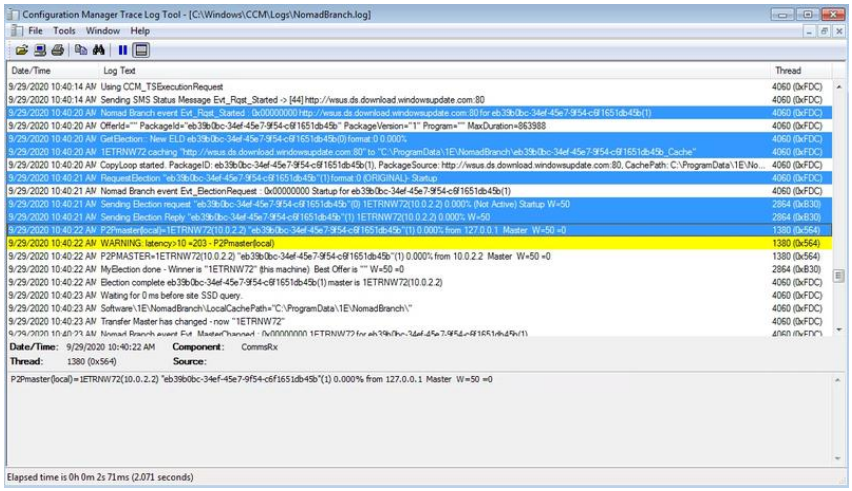
Nomad ensures that software packages are only ever copied once per branch over the WAN, utilizing local computers as temporary file caches to distribute the software locally. This reduces the bandwidth required for delivering software updates and means that small offices or sites connected by poor network links can receive software updates more reliably.

The Nomad clients with local copies of the package can themselves act as the master if the need arises. This significantly reduces the number of Configuration Manager servers required to manage a Configuration Manager hierarchy, thereby reducing initial and ongoing maintenance costs.

Refer to Download once to branch for details.

In this example, we have seen how Nomad can be used to download Software Updates content. From both a Config Mgr deployment where content is available and when it is not and connecting to Microsoft Update has been allowed.

In addition, we have seen that Nomad is enabled within the Software Updates Client Agent settings rather than in the individual Software Update Deployments, so once enabled Nomad is used for all Software Update Deployments. The process of getting content is the same as with Applications and Packages – the Content Transfer Manager invokes Nomad as an Alternate Content Provider, which downloads the content then passes back control to CTM.



9.3.4 Deploying updates for Office 365

Configuration Manager introduced support for Office 365 updates in Current Branch 1602, and Nomad introduced support in version 6.1.100. This section describes how Office 365 deployments differ in terms of ACP requirements and how Nomad behaves during the download.

Downloading the following types of updates is enabled by default in the Nomad client (1E Client 4.1 and later). Downloading from Microsoft Update is also enabled by default.

The settings are defined in CompatibilityFlags and you will need to ensure the relevant bits remain set if you are using that registry value to configure other options, refer to Downloading content for CM Software Updates from Microsoft Update - Configuration for more details.

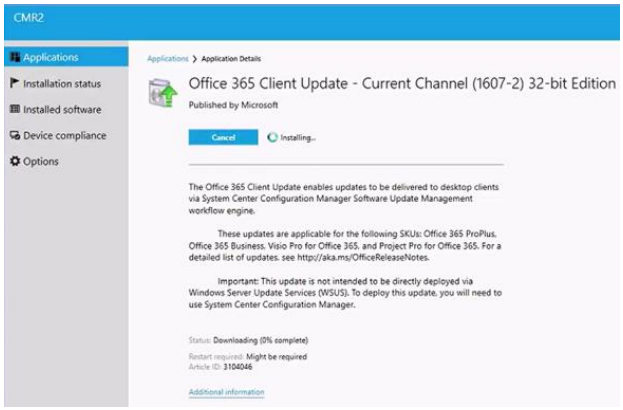
Refer to Deploying Office 365 updates for details about Nomad and Office 365 including, how it works, Nomad app integration for Office 365 and other supported Nomad features.

> **Note**
>
> You can use the Nomad app, powered by the Tachyon Platform to get a visual snapshot of download activity in your environment. The Nomad app will be available after you install the Tachyon Platform and can be accessed using the Tachyon DNS Alias FQDN, for example https://tachyon.acme.local/Tachyon
>
> The section Monitoring Nomad on this page provides an overview of how you can use the app to view download progress for large and small scale deployments.

9.3.4.1 Deploying Office 365 updates

We will start by installing an update that is not cached locally on one Nomad client and therefore all download activity is from the Distribution Point. After that, we initiate an installation of the update on the second Nomad client and walk through the download from the first Nomad client's cache.

From Software Center, the Installation of the Office 365 update is initiated. During the download, its status is displayed at the bottom of the screen.



Browsing to the NomadBranch.log location (typically, located with Configuration Manager agent logs). When Nomad receives the download request (job) and manifest file from the Configuration Manager agent:

It checks its query results store (QRS) to see if any peer has broadcast that it is already downloading the content.

If the broadcast is not found, an election (network query) is initiated in an attempt to obtain the content from a peer.

If no peer responds, a download is initiated from a DP (4).

Once the download is complete, the data is copied into the location described in the manifest file.

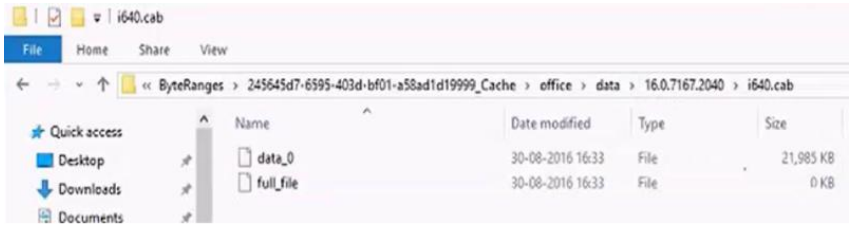
The log extract below shows all five events with the successful download (i641033.cab) from a DP. Office 365 downloads can be either a file or part of a file (byte-range). Our example illustrates a download for an entire file.

The downloaded data is copied to the CTR location described in the manifest and is also retained in the Nomad cache. Our example illustrates the location of the Nomad cache with the file downloaded and a marker (full_file) to indicate that this is not a byte-range.

For an Office 365 Update deployment, multiple jobs are passed to Nomad by the Configuration Manager agent. Once the downloaded job is completed, another BEGIN JOB appears in the log for the same update deployment.

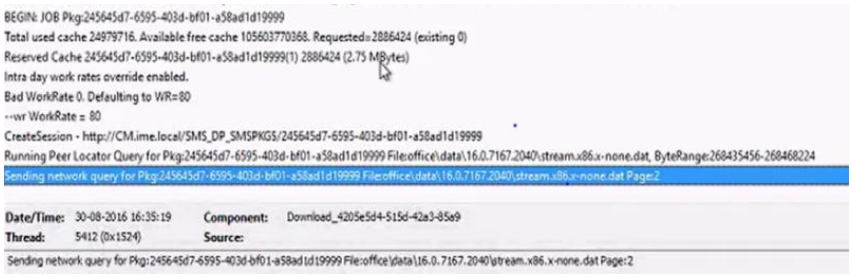
The same process is followed in the attempt to obtain the content locally. Our example illustrates a larger i640.cab file being downloaded.

And the Nomad cache when the job completes.

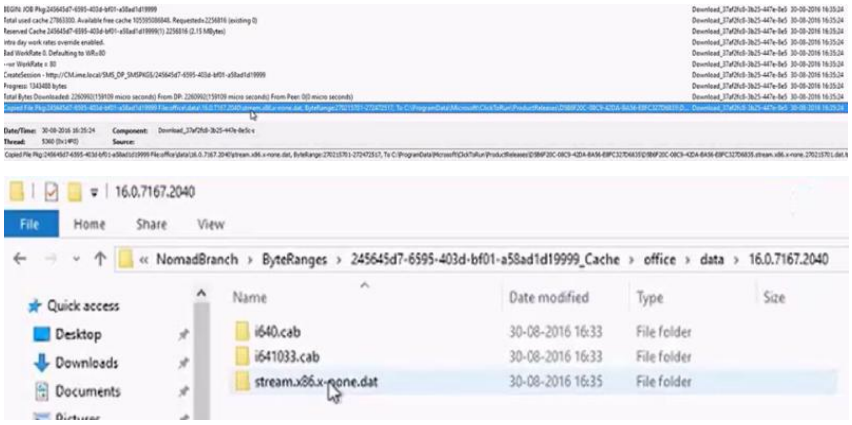


The third job to be passed to Nomad contains an instruction to download a byte-range for Stream.x86.x-none.dat.

An entry in the log describes the range (the byte-range is 268435456-268468224, a 32KB chunk that must reside in the second page file. Update files are broken down into 128MB page files.) and the subsequent election request attempting to locate it.



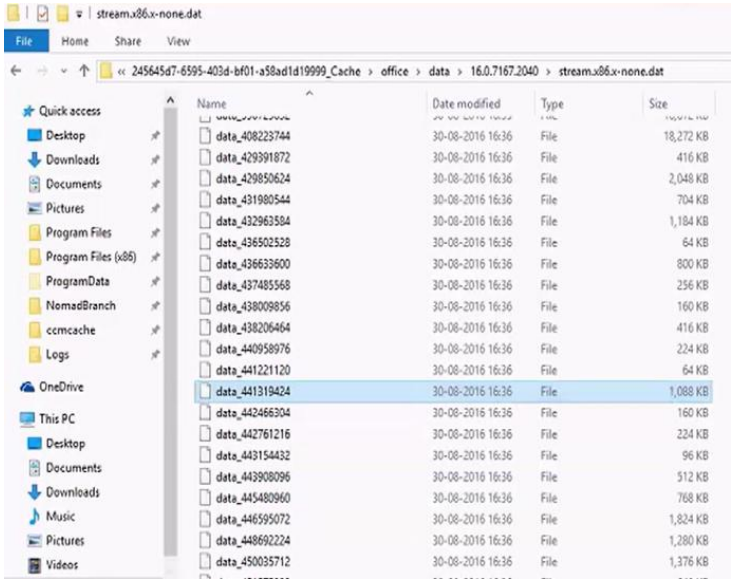
When the download completes and copied to the CTR location, more byte-range jobs related to the same file are logged.



Successive byte-range jobs are passed to the Nomad client, downloaded into the cache and copied to the CTR location.

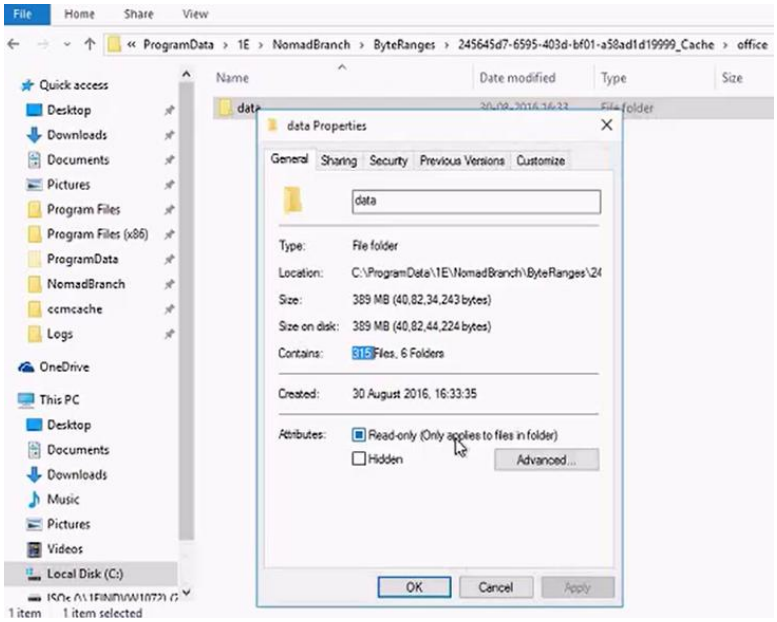
Once byte-range downloads are complete, Nomad copies them into the CTR update location at:

C:\ProgramData\Microsoft\ClickToRun\ProductReleases\<ProductCode>\<ProductCode>.<FileName>.tmp



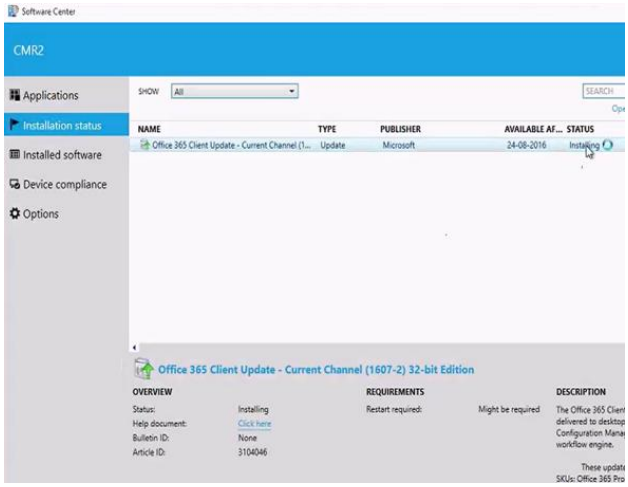
It will be likely that hundreds of jobs are passed to Nomad for a single Office 365 update download.

In our example, a total of 315 download jobs were requested by the Configuration Manager agent.

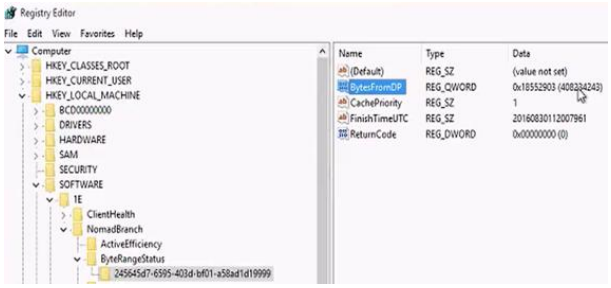


When a job completes, Nomad monitors the CTR agent interface to determine if actual update installation is successful. Once the CTR agent has all the files and byte-ranges that it needs, it merges the byte-ranges, performs a hash check on the contents and attempt to install the update.

The status indicates **Installing** at this point and changes **Installed** when it is done.

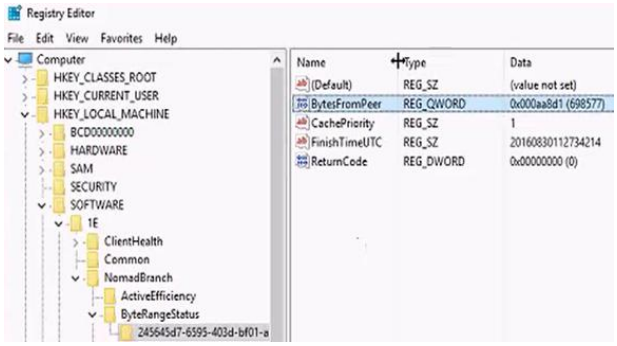


For an Office 365 Update download, you can verify the total amount of data downloaded from the DP by inspecting the registry. If you do not see a BytesFromPeer value, it means that all your downloads were from the DP.

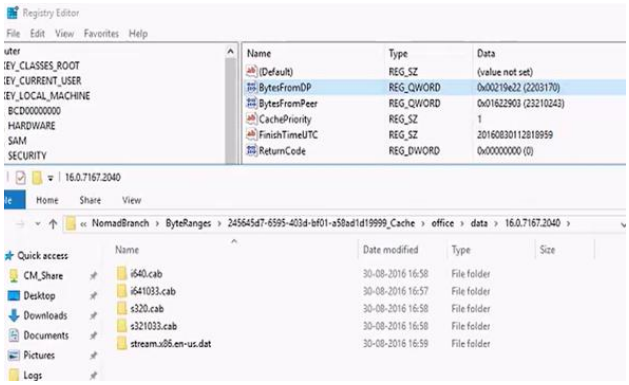


Log on to the second Nomad client and initiate the update installation from Software Center.

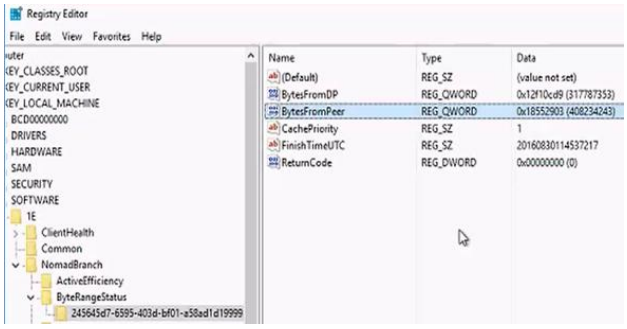
Browse to NomadBranch.log. The Standard P2P connecting to... and SMB Connected OK log entries indicates that it is initiating a download from the first Nomad client. Initially, the Nomad client registry does not display BytesFromDp as the second Nomad client is able to obtain content from the first Nomad client.



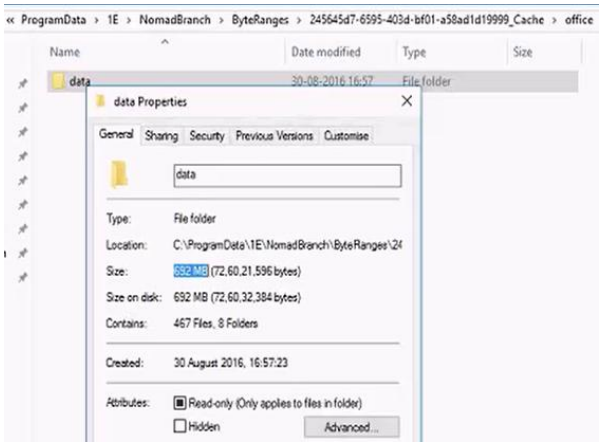
Due to differences in the state of the Office 365 installation on the second host, the CTR agent requested content that is not present on the first Nomad client. Consequently, it switches to download from the DP. Our example illustrates this event in the second Nomad client's registry.



When the download is complete, the values in the registry are updated.



We can see the extent of the differences in the update installation on the two Nomad clients if we inspect the total downloads on the second Nomad client; 467 downloads compared to 315 on the first Nomad client.



9.3.5 Using Nomad with Operating System Deployment OSD

Nomad can integrate with Operating System Deployment (OSD) strategies to maximize the efficiency of distributing large OS content across the network. It does this by providing a number of Task Sequence steps that can be integrated directly into your OSD Task Sequences.

As a system administrator you can use Nomad for OSD refresh. In the following scenario we'll show how you can use Nomad to integrate with the ConfigMgr OS Deployment process to refresh workstations in remote locations that do not have a local server. This will involve:

Preparing the boot image to allow content to be sourced from a local peer

Preparing the deployment Task Sequence to use Nomad

Deploying the modified task sequence to target clients.

OSD integration requires both **NomadBranchTools.msi** and **NomadBranchAdminUIExt.msi** to be installed:

NomadBranchTools.msi - are installed on the CM Site server(s) and SMSProvider server(s) and install the Nomad files that get injected into a boot image

NomadBranchAdminUIExt - is installed wherever the ConfigMgr console is installed. It adds the custom Task Sequence steps, among other ConfigMgr console extensions.

Refer to Installing Nomad Branch Toolsfor more details about installing the Nomad OSD tools.

> **Note**
>
> You can use the Nomad app, powered by the Tachyon Platform to get a visual snapshot of download activity in your environment. The Nomad app will be available after you install the Tachyon Platform and can be accessed using the Tachyon DNS Alias FQDN, for example https://tachyon.acme.local/Tachyon
>
> The section Monitoring Nomad on this page provides an overview of how you can use the app to view download progress for large and small scale deployments.

9.3.5.1 Preparing a task sequence to use Nomad

In this scenario, we will use an pre-existing example Task Sequence we have called **Nomad Windows 10 Ent** to upgrade a device to Windows 10, and make modifications to integrate Nomad. This will ensure that content is obtained from a local peer whenever available or downloaded from the Distribution Point in a bandwidth controlled manner using Nomad. Additionally, we will add actions to store the captured User State on a local peer and retrieve the User State after the new operating system is in place.

> **Note**
>
> For details beyond the scope of this example about using Nomad to carry out an OSD refresh including task sequence deployments, refer to OS deployment task sequences - Using Nomad for an OSD Refresh.

9.3.5.1.1 Set Nomad as the Download Program

To support an Alternate Content Provider in a Task Sequence, Microsoft introduced the SMSTSDownloadProgram task sequence environment variable. The SMSTSDownloadProgram task sequence environment variable contains the path to the download program's executable file.

In the case of Nomad, this file will be **SMSTSNomad.exe** , the Nomad OSD Tools use a custom task sequence action that we use in this task to set the SMSTSDownloadProgram variable to**SMSTSNomad.exe**.

To set Nomad as the **Download Program**, we can:

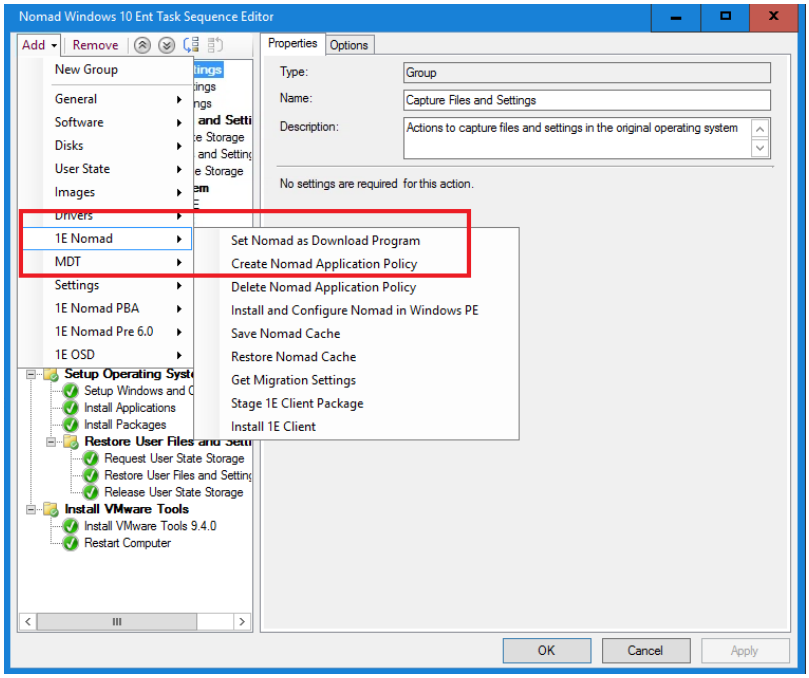
Right-click our **Nomad Windows 10 Ent** task sequence from **Software Library**→**Operating Systems**→**Task Sequences** and select **Edit**.

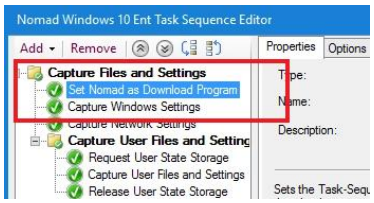
Select the **Capture Files and Settings** group.

Select the **Add** dropdown we select **1E Nomad** and select **Set Nomad as Download Program**.

Right-click the **Set Nomad as Download Program** task and select **Move Up**. We then make sure the **Set Nomad as Download Program** task now appears above the **Capture Files and Settings** group at the top of the Task Sequence before any content is needed.

Click **Apply** to save the change.





9.3.5.1.2 Install and Configure Nomad in Windows PE

We install and configure Nomad in WinPE so that Nomad is used to download content during the Windows PE stage of a task sequence.

The NomadBranchTools updates the OSDInject manifest with the Nomad files to be added to the boot image. The process of updating the boot image on Distribution Points injects them into the boot image, When the boot image is loaded the Nomad files are there but the Nomad service is not installed.

> **Note**
>
> This manifest defines the files that are to be added into the Windows PE boot image when it is updated on a distribution point. The additional tools are added to this manifest, ensuring that they are included in all boot images that are updated on a distribution point from this point on.

We set this step up by:

Selecting the **Restart in Windows PE** step in the *Install Operating System* group.

Clicking **Add > 1E Nomad** and select **Install and Configure Nomad in Windows PE**.

Changoing the **SpecialNetShare** value to **8240** (0x2030).

Setting the **Compatibility Flags** value to **538443786** (0x2018000A).

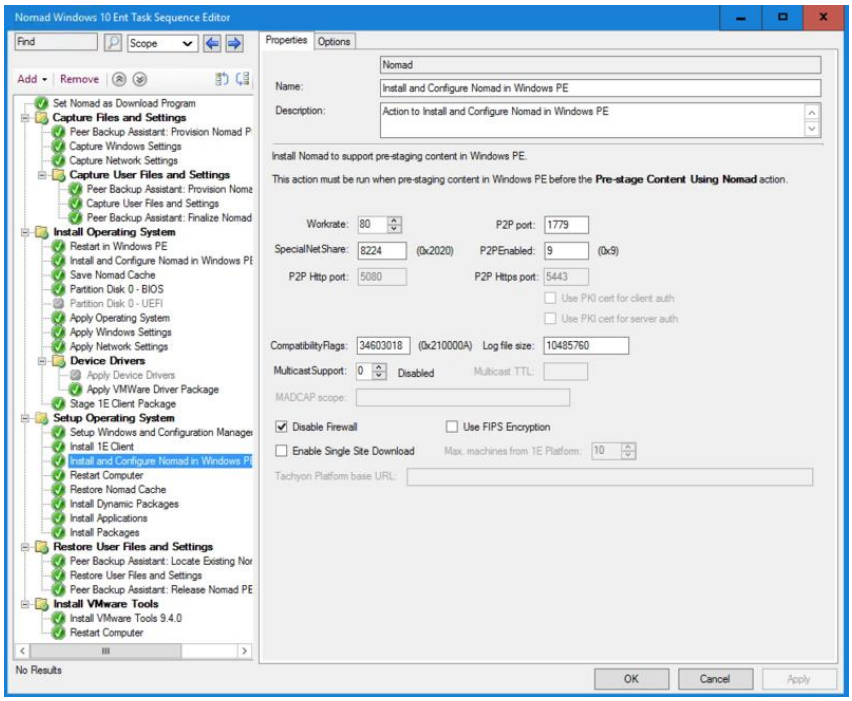
Setting the **P2PEnabled** value to **73** (0x49).

Clicking **Apply**.

Selecting the **Install and Configure Nomad in Windows PE** step, click **Add→1E Nomad** and select the **Save Nomad Cache** task. The **Operation** value will be **Move** and the **Wipe CCM Cache** option is selected.

Clicking **Apply** to save the task sequence.

> **Note**
>
> The settings we used for **SpecialNetShare , Compatibility Flags** and **P2PEnabled** match those on the Nomad clients installed in our environment, the settings for your environment may be differant. If there is a mismatch in certain settings between clients, Nomad may might not work as expected.



9.3.5.1.3 Install the 1E Client in the New Operating System

Once the ConfigMgr client is installed in the new operating system, we need to install the 1E Client so it can register as the Alternate Content Provider (ACP) and retrieve the content for all the other packages, applications and software updates to be installed in the new operating system. We achieve this by:

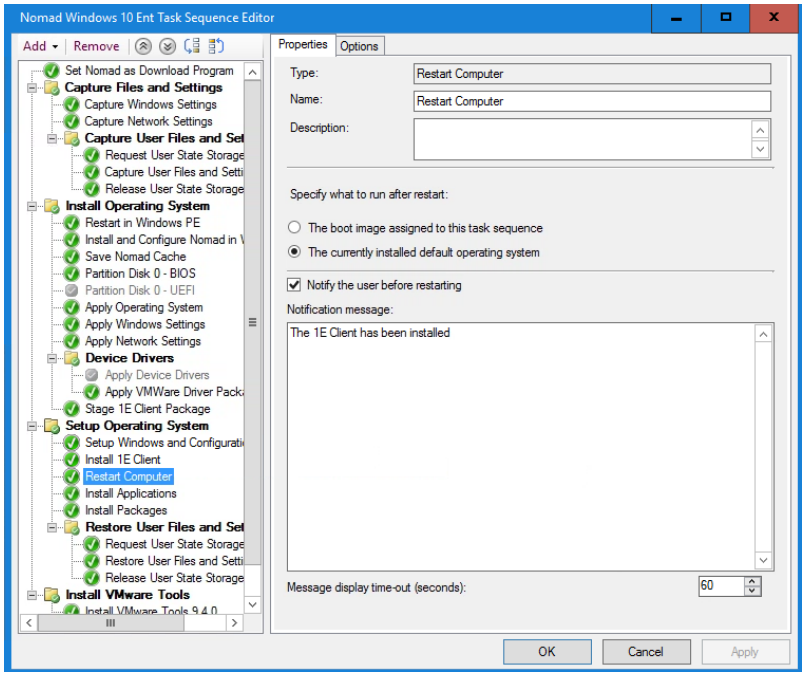
Selecting the **Setup Windows and Configuration Manager** task In the *Nomad Windows 10 Ent* Task Sequence Editor and from the **Add** dropdown selecting **1E Nomad→Install 1E Client**.

Clicking **Add→General→Restart Computer** with the **Install 1E Client** step selected.

Choosing **The currently installed default operating system** in the *Specify what to run after restart:* section. We ensure the **Notify the user before restarting** check box is checked and change the **Notification message** to **The 1E Client has been installed**. We then click **Apply**.

Note

A reboot is required after the Install 1E Client task to ensure the system path is properly updated so the Nomad tools (like, **NBCacheActions**) can be located by the operating system.



9.3.5.1.4 Restore the Nomad Cache

Once Nomad is installed, we want to restore the content that was used during the build into the Nomad cache of the newly built OS.

In the Install and Configure Nomad in Windows PE section the added Save Nomad Cache is used to save the Nomad cache either in WinPE or a full Microsoft Windows operating system. The **Save Nomad Cache** step copies, links or moves previously downloaded content to the protected task sequence runtime folder so that it is not deleted by the standard **Apply Operating System** task sequence action.

We now do this by:

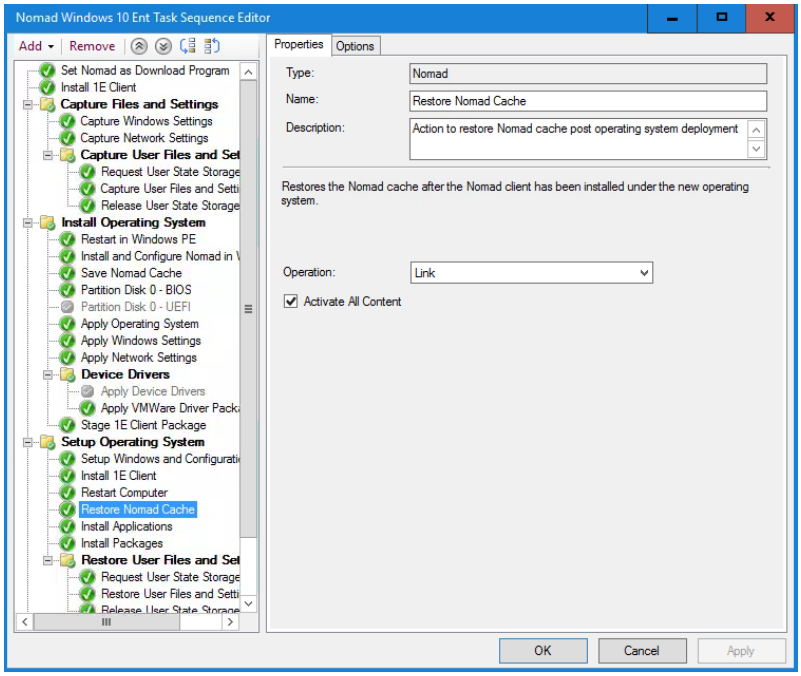
Selecting the **Restart Computer** task and from the **Add** dropdown select **1E Nomad > Restore Nomad Cache**.

In the **Properties** tab, ensuring **Link** is the operation and selecting **Activate All Content** then click **Apply** to save the task sequence.

Note

This task will restore the Nomad cache from the persisted **_SMSTaskSequence** folder to the newly installed Nomad cache. The option to Link the content (i.e. create a link from the folder in _SMSTaskSequence to the Nomad Cache folder) is optimal in this scenario; copying would take a long time and moving it may prevent subsequent tasks (such as MDT tasks) from completing properly.

The Nomad cache is essential to Nomad's download once to branch feature. The cache enables Nomad to hold its downloaded content so that it can be distributed locally to other Nomad peers. The Nomad cache contains downloaded content (such as packages, applications, and software updates) which can vary in size from relative small patches to rather large OS image files. For more details refer to Nomad cache.



9.3.5.2 Working with Dynamic Packages

We now add a package to be installed using a variable. We will manually set the variable to demonstrate the behavior, but any means of populating the variable will give the same result. Nomad will be called by the task sequence by SMSTSNomad.exe being specified as the default task sequence download program.

9.3.5.2.1 Add the dynamic package to the Task Sequence

We will add an Install Package task to the *Nomad Windows 10 Ent* task sequence that uses a variable name to define the Package and Program to be executed at runtime. For the purpose of this example, we will define this variable directly within the task sequence to demonstrate how Nomad handles dynamic packages. We do this by:

Selecting the **Restore Nomad Cache** task in the Setup Operating System group.

Clicking **Add** and selecting **Software→Install Package**.

In the Properties tab, entering **Install Dynamic Packages** as the name.

Selecting **Install software packages according to dynamic variable list** and entering a Base variable name of **NOMADOSD**. Select **If installation of a software package fails, continue installing other packages in the list** and click **Apply**.

Selecting the **Restore Nomad Cache** task again, clicking Add and selecting **General→Set Task Sequence Variable**.

In the Properties tab, naming the task **Set NOMADOSD001.** Enter **NOMADOSD001** as the Task Sequence Variable and set the Value to **PS10001B:Install Skype**.

Clicking on the **Options** tab on the task, and checking the **Continue on error** box.

Clicking **Apply**. The task sequence now looks like image on the right, we click **OK** to save the updated Task Sequence.

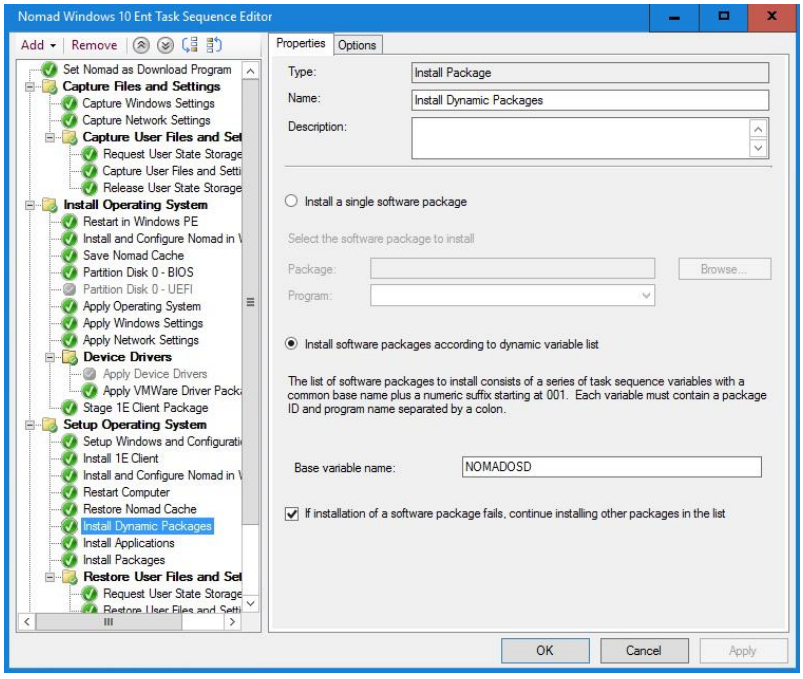
Note

In this step we are defining the first (and only, in this case) dynamic package through the NOMADOSD001 Task Sequence variable before the Install Dynamic Packages task executes. The value of this variable is in the format **<PackageID>:<Program Name>**. The Skype Package has a Package ID of PS10001B.

In a production environment, variables associated with dynamic packages are commonly set by scripts or other processes that determine what applications are required at runtime.

Note

Packages deployed in a task sequence using a dynamic variable will not be listed on the references tab of a task sequence. For that reason, we must initiate a separate pre-cache job for any packages deployed using a dynamic variable. In the **Nomad Windows 10 Ent task** sequence, the Skype package is installed using a dynamic variable.



Now we return to the CM console and select **Packages** from the **Application Management** folder in the **Software Library** node of the ConfigMgr console, then we:

Right-click on the **Skype for Windows 7** package, select **Properties** and go to the **Nomad** tab.

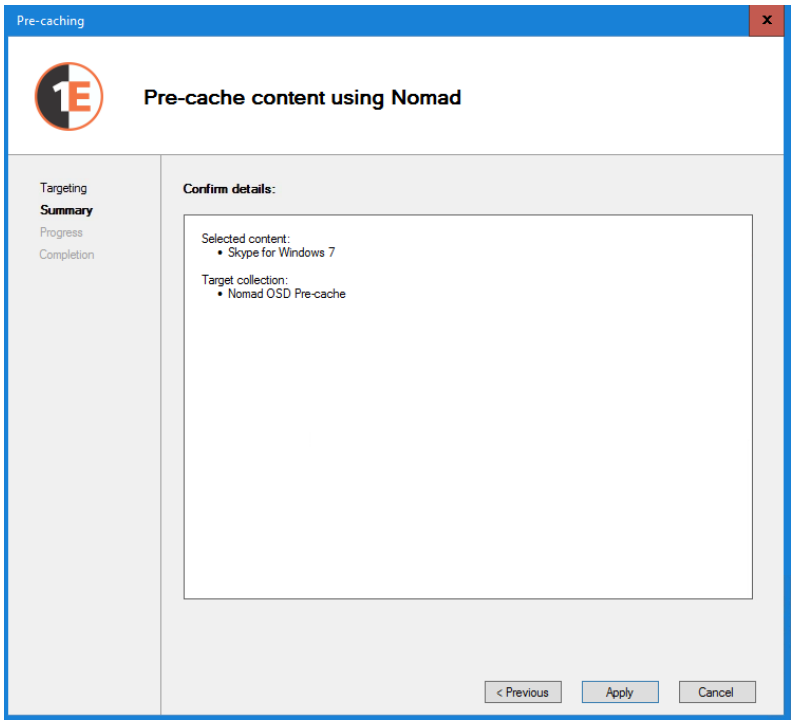
Enable Nomad for the Skype package and click **OK**.

Right-click on the **Skype for Windows 7** package, select **Pre-cache content using Nomad** to launch the Nomad Pre-caching wizard.

On the *Targeting* page, select the **Nomad OSD Pre-cache** collection and click **Next**.

Click **Apply** on the *Summary* page.

When the job completes, click **Finish** on the *Completion* page.



9.3.5.3 Using Peer Backup Assistant (PBA)

In an OS refresh or replace scenario, you will typically need to migrate user data and settings using the **User State Migration Tool (USMT).** In refresh scenarios, USMT will typically achieve this by saving the user state locally in the preserved **_SMSTaskSequence** folder and restoring it after the new OS has been installed, for more details refer to https://docs.microsoft.com/en-us/mem/configmgr/develop/reference/osd/sms_tasksequence-server-wmi-class.

> **Note**
>
> There are two common scenarios where a ConfigMgr State Migration Point would normally be required, such as:

Where the computer is being replaced, so the data needs to be stored off the old device

In a refresh scenario where the task sequence includes a step to format the disk before installing the new OS image, in which case the local **_SMSTaskSequence** folder is lost.

Nomad includes the PBA functionality, which allows a local peer to be used to temporarily store the user state from the computer being built. This removes the need for a User State Migration Point, keeping the user data local. In this example, we enable the Nomad clients as Peer Backup Assistant hosts, allowing them to store user state data that USMT has collected from their peers. We then configure the Task Sequence to include the necessary steps to capture and restore the user state using USMT and the selected Nomad peer as the store location.

Refer to Peer Backup Assistant - PBA for more background and further details, including:

Single-site PBA

High-availability PBA

Configuring PBA hosts

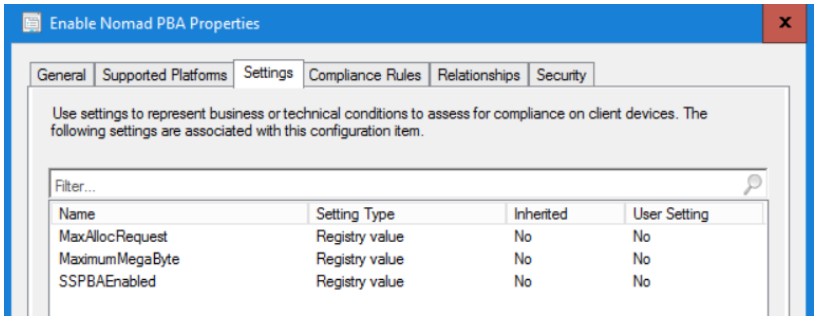
Using PBA with HTTP and HTTPS P2P

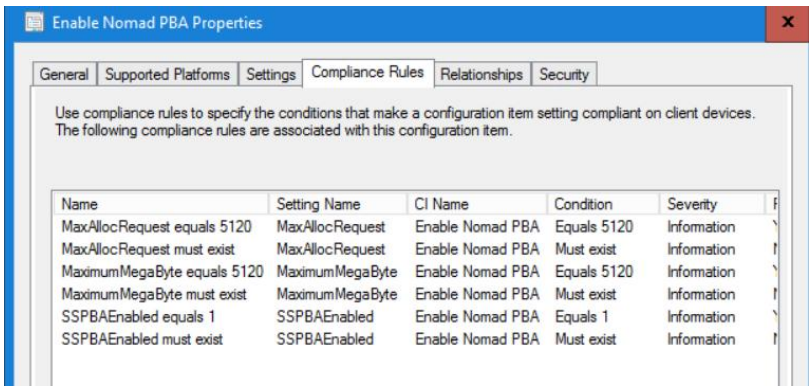
Using PBA with Configuration Manager task sequences.

9.3.5.3.1 Enable Peer Backup Assistant

Peer Backup Assistant (PBA) functionality needs to be enabled on Nomad clients to enable them to become potential hosts for storing user state information from other computers on the subnet. Enabling PBA involves setting the MaximumMegaByte and MaxAllocRequest registry values, the following example uses a ConfigMgr Configuration Item to apply them.

This example shows how you can enable PBA on existing Nomad clients and makes use of a preconfigured ConfigMgr Configuration Item called **Enable Nomad PBA** with the opposite **Settings** and **Compliance Rules**.





From the **Assets and Compliance** workspace we select the **Configuration Baselines** node, right-click our **1E Client Configuration** baseline and select **Properties**.

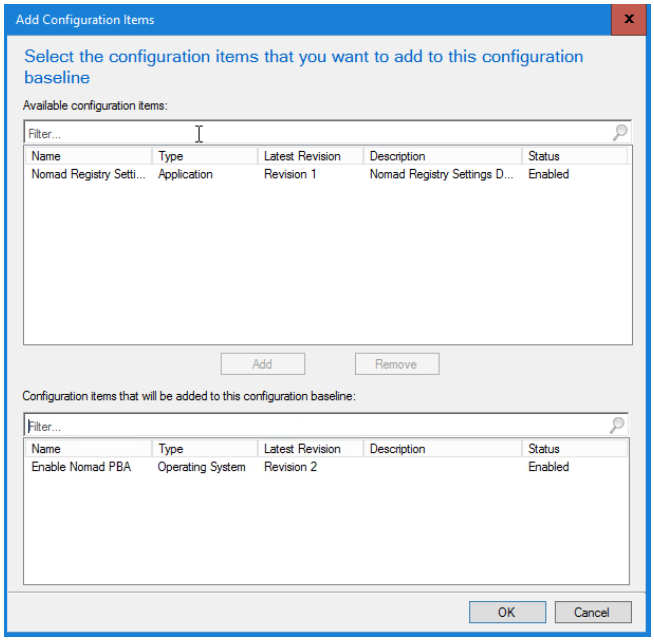
From the **1E Client Configuration Properties** dialog box, we select the **Evaluation Conditions** tab, then click **Add** and select **Configuration Items**

In the **Add Configuration Items** dialog box we select the **Enable Nomad PBA** Configuration Item and click **Add** to add this to the **1E Client Configuration** baseline. We click **OK** to return to the **1E Client Configuration Properties** dialog box, then click **OK** to save the changes.

From the **Assets and Compliance** workspace we select the **Device Collections** node.

Right-click our **Lab Workstations** Collection and then select **Client Notification→Download Computer Policy** to ensure all our clients get the updated configuration baseline.

> **Note**
>
> The Enable Nomad PBA Configuration Item configures the following registry values under the **HKLM\Software\1e\NomadBranch** key in the registry:
>
> **\NMDS\MaximumMegaByte=5120:** The MaximumMegaByte setting defines the maximum space which can be allocated by the peer machine for PBA. This is the amount of disk space you want to allow Nomad to use for PBA functionality.
>
> **\NMDS\MaxAllocRequest=5120:** The MaxAllocRequest is the maximum space that any single machine can use during a PBA task. In a production environment, multiple machines might be offloading user state data onto a single machine, so this setting needs to be defined based on the maximum data expected from any single machine. In our lab, we will only be executing a single task sequence using PBA, so we have configured the setting to the same value as MaximumMegaByte.
>
> **SSPBAEnabled=1:** The SSPBAEnabled setting enables PBA to work in conjunction with Single Site Download.



9.3.5.3.2 Configure the Task Sequence to Capture User State

In this example we add tasks to the **Nomad Windows 10 Ent** task sequence to redirect the store location to a local peer selected at runtime and then capture the user state:

In the ConfigMgr console, we right-click our **Nomad Windows 10 Ent** Task Sequence and select **Edit**.

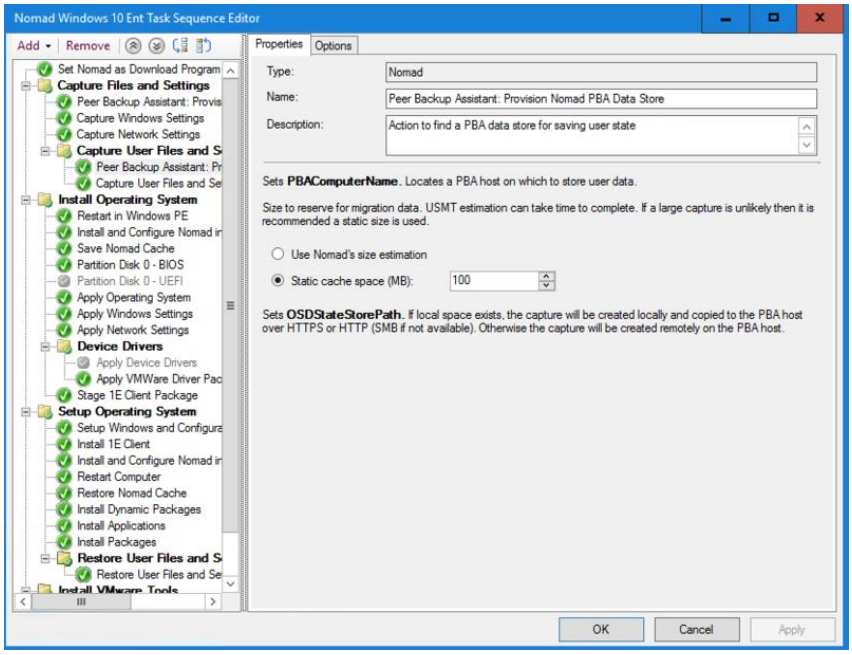
We delete the **Request User State Storage** and **Release User State Storage** tasks in the **Capture User Files and Settings** task group and click **Apply**, then repeat this for the **Restore User Files and Settings** task group.

We select the **Capture User Files and Settings** *task group*, click **Add** and select **1E Nomad PBA→Peer Backup Assistant: Provision Nomad PBA Data Store** .

In the Properties tab, we check the Cache space (MB) is set to **100** and then click **Apply**.

> **Note**
>
> Using the **Peer Backup Assistant: Provision Nomad PBA Data Store** step replaces the native ConfigMgr Request User State Storage step.
>
> Similarly the **Peer Backup Assistant: Finalize Nomad PBA Data Store** step replaces the native ConfigMgr Release User State Storage step in the **Capture User Files and Settings** task group.

> **Note**
>
> In this step, we are setting an arbitrary estimated capacity requirement (100MB) for storing user data. If the Microsoft Deployment Toolkit (MDT) has been integrated into the ConfigMgr environment, using **ZTIUserState.wsf** will estimate how much space is required to store the user state from the current computer and write this to the **USMTESTIMATE** Task Sequence variable, in which case you can enter **%USMTESTIMATE%** in this field.



With the **Capture User Files and Settings** *task* selected, we click **Add** and select **1E Nomad PBA→Peer Backup Assistant: Finalize Nomad PBA Data Store**.

We check the **Enable High Availability** box. By using **Enable High Availability**, we can automatically store additional backup copies of the PBA data store, after the primary data store has been created with **Peer Backup Assistant: Provision Nomad PBA Data Store** and after the USMT data has been saved and closed with **Peer Backup Assistant: Finalize Nomad PBA Data Store**.

In the **Properties** tab, we set the following properties and click **Apply**.

Minimum number of additional backups: **1**

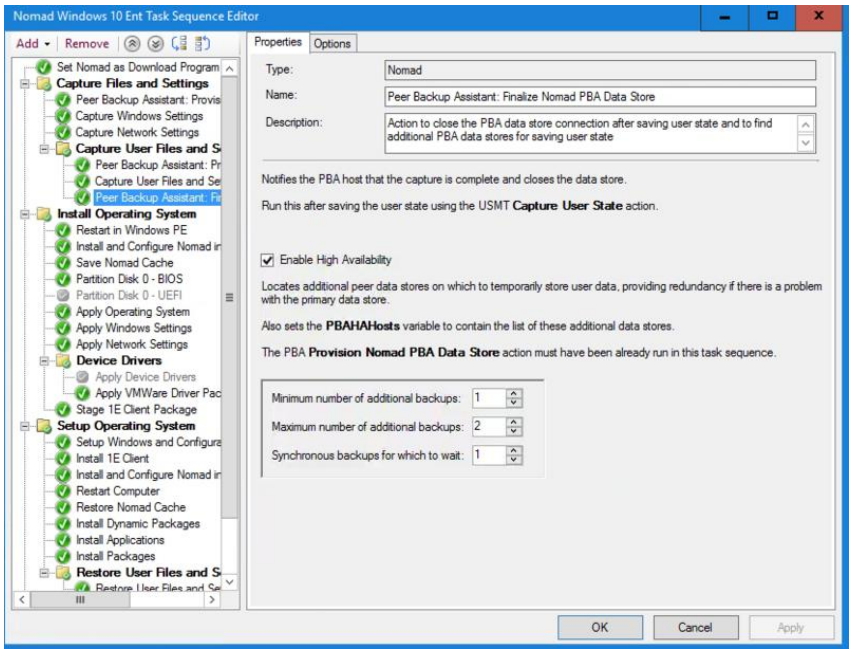
Maximum number of additional backups: **2**

Synchronous backups for which to wait: **1**

Note

The Peer Backup Assistant: Finalize Nomad PBA Data Store step releases the connection to the state store share on the remote computer and results in the saved user state content being preserved for 7 days (configurable using the PostCompleteTimeoutHours value in the **NomadBranch\NMDS** registry key on the store host).

Unless this task is executed, the content is only available for 3 hours (configurable using the PreCompleteTimeoutHours value in the NomadBranch\NMDS registry key on the store host).



9.3.5.3.3 Configure the Task Sequence to Restore User State

In this next step, we add the State Restore steps that complement the State Capture steps configured in the previous task to restore the user state from the local peer when the new OS has been installed.

We right-click the **Restore User Files and Settings** *task group,* select **Move down** so the group is no longer indented within the Setup Operating System group, then we click **Apply**.

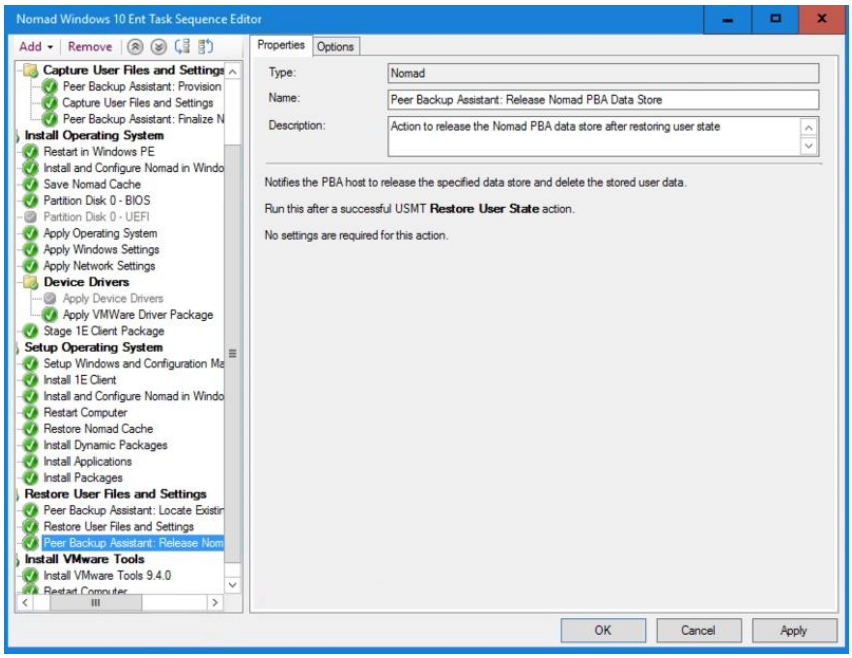
With the **Restore User Files and Settings** *task group* selected, we click **Add** and select **1E Nomad PBA→Peer Backup Assistant: Locate Existing Nomad PBA Data Store** .

> **Note**
>
> Using the **Peer Backup Assistant: Locate Existing Nomad PBA Data Store** step replaces the native ConfigMgr **Request User State Storage** step in the **Restore User Files and Settings** task group.
>
> Similarly the **Peer Backup Assistant: Release PBA Data Store** step replaces the native ConfigMgr **Release User State Storage** step in the **Capture User Files and Settings task group**.
>
> **Note**
>
> This task will get Nomad to locate the user state store location for the computer being built (defined by the COMPUTERNAME Task Sequence variable) and set the OSDStateStore variable to this path in the Task Sequence environment.

With the **Restore User Files and Settings** *task* selected, we click **Add** and select **1E Nomad PBA→Peer Backup Assistant: Release Nomad PBA Data Store**, then click **Apply**.

> **Note**
>
> This step will delete the user state from the peer client and release the disk space for other clients to use for storing state during a migration.

The **Restore User Files and Settings** group now looks like the picture opposite.



9.3.5.4 Performing an OSD refresh using Nomad

Now we have completed our preparation, our **Nomad Windows 10 Ent deployment** task sequence can be used to refresh a Windows 7 client, and migrate it to Windows 10 Enterprise.

9.3.5.4.1 Deploy the Nomad Windows 10 Ent task sequence

To deploy the task sequence and migrate our Windows 7 client to Windows 10:

In the ConfigMgr console, in the **Assets and Compliance** workspace we select the **Device Collections** node and create a Collection named **Nomad Windows 10 Refresh** with **Lab Workstations** as the Limiting Collection and add **1ETRNW72** to the Collection.

We then open the **Software Library** workspace, expand the **Operating Systems** node and select the **Task Sequences** node, then we right-click the **Nomad Windows 10 Ent** task sequence and select **Deploy** to start the *Deploy Software Wizard*.

On the *General* page, we select **Nomad Windows 10 Refresh** as the target Collection and click **OK**.

On the *Deployment Settings* page we ensure the Purpose is set to **Available** and click **Next**.

On the *Scheduling* page we select the **check box** next to **Schedule when this deployment will become available** and keep the default setting.

On the *User Experience* page and the *Alerts* page we click **Next**.

Finally on the *Distribution Points* page, we select:
Download content locally when needed by running task sequence (default).

> **Note**
>
> We chose **Download content locally when needed by running task sequence** to avoid a potential failure due to lack of disk space.

On our computer 1ETRNW72 we open **Software Center** from the desktop, and navigate to the **Operating Systems** node. Then we select **Nomad Windows 10 Ent** and click **Install**.

A dialog box will be displayed asking for confirmation of the of a new operating system. We then click **INSTALL** to run the task sequence.

> **Note**
>
> As an Administrator you will want to know where the content your Task Sequence requires has been cached. You can use the Nomad app to do this using the Task Sequences page to identify things like:

Download Status by Network Site

Device Count by Operating System

P2P Efficiency by Content Source.

In this example, we introduced how Nomad is used to obtain content while a task sequence is executing. The task sequence variable, **SMSTSDownloadProgram**, is set to **SMSTSNomad.exe**, which defines it as the default download program for the task sequence.

The Save Nomad Cache step not only saves the Nomad cache in WinPE to use the reserved folder location, but also gets the content of the offline Nomad cache (in the current OS) and sets that location as the new default cache path and renames and moves the logs into that location as well.

We have shown how the Nomad Peer Backup Assistant can be configured within a task sequence to enable user state to be stored temporarily on a local peer. The process involves:

Enabling the peers for Peer Backup Assistant by modifying values in the NMDS registry key

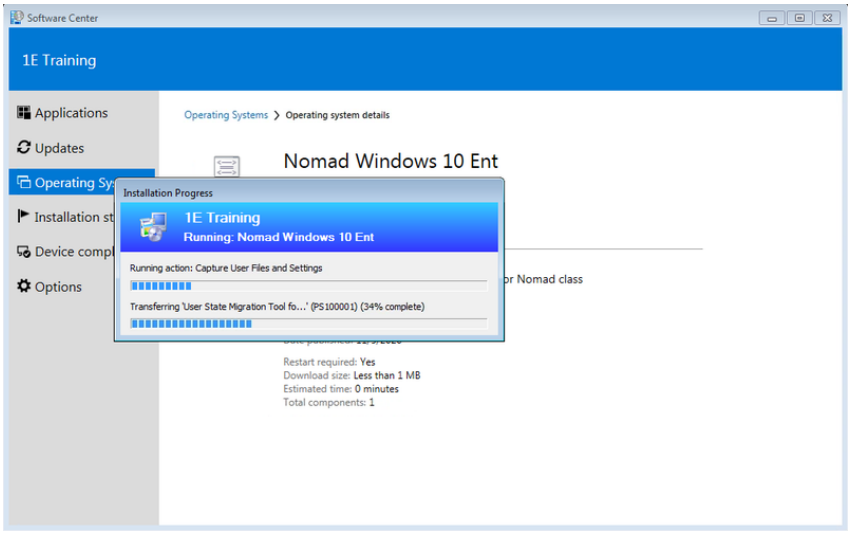
Using the Peer Backup Assistant custom Task Sequence steps to provision a data store on a local peer and setting the OSDStateStorePath variable to that store location

Running the Capture User State task, which copies the user state to the selected peer

Completing the capture to release the connection to the data store and retain the content for 7 days

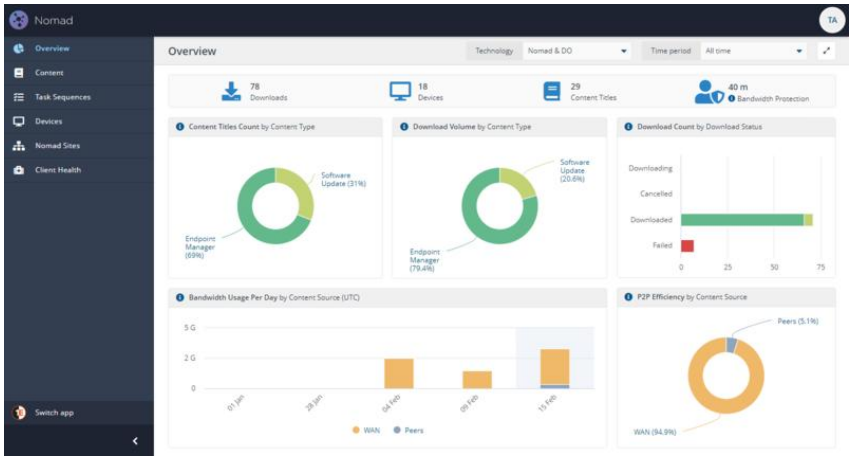
Using High Availability and SSD to offload the USMT data to multiple machines across a defined site

Once the new operating system has been installed, the user state is restored from the same location and finally, the content is deleted from the peer data store to free up space for other peers.



9.3.6 Monitoring Nomad

The Nomad app provides visibility of content distribution activity and cache status for content distributed by both Nomad and Delivery Optimization. This includes Configuration Manager content distributed with Nomad and Software Updates content distributed with either Nomad or Delivery Optimization.



9.3.6.1 Explaining content versions

In Configuration Manager (CM), the content associated with a Package or Application Deployment Type may be updated by an administrator. In the case of Packages, CM increases the Package Version property, and for Application Deployment Types, CM generates a new Content ID for the Deployment Type.

The Nomad Overview page displays summarized distribution data for a selected period. The displayed data shows all downloads and download activity for all versions of content for that period. For example, if a device downloaded Package A version 1 a month ago and later downloaded version 2 of the same Package, the Overview page would reflect both downloads.

In this version it has not been possible to reflect previous versions in the **Content Titles** summary in the top status bar, or in the **Content Titles Count by Content Type** and **Download Volume by Content Type** tiles. These will only represent download activity for the latest version of content. This may result in apparent 'loss' of data (e.g. a reduction in the number of content titles or download volume) when content for an existing Package or Application is updated in CM, as these metrics will only include download activity for the latest version. This will be addressed in a later version of Nomad.

> **Note**
>
> Other pages in the app, such as the Content page, only show the latest version of any given **Content Title**. Those pages concern the current state of things (e.g. where content is available) because only the latest version is usable by CM deployments. As a result, showing older versions would be misleading for users.

The **Overview** page gives a brief snapshot of download activity. The page has multiple tiles showing:

Content Titles by Content type

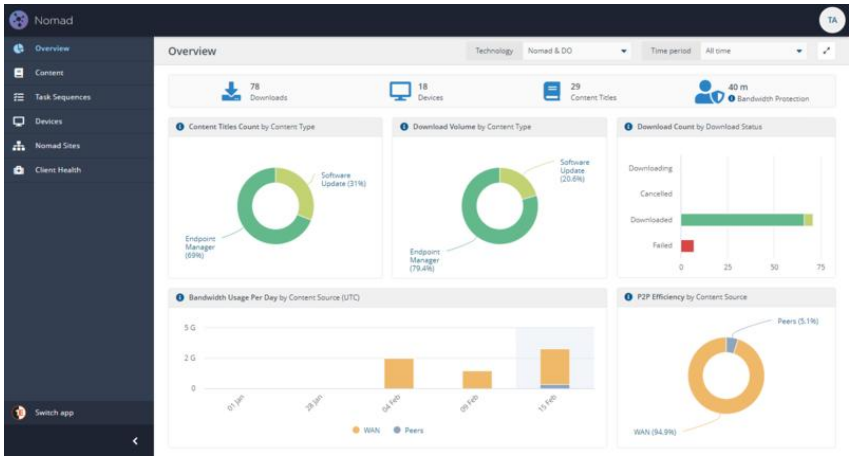
Download Volume by Content Type

Download Count by Download Status

Bandwidth Usage Per Day by Content Source (UTC)

P2P Efficiency by Content Source (Peer to Peer - P2P).

The results can further be narrowed down by using the **Technology** and **Time period** filters on the page.



9.3.6.2 Navigation and Filtering

By default, the view shows activity and status for all time and will show activity and status for both Nomad and Delivery Optimization. These defaults can be modified using the **Technology** filter and the **Time period** filter.

> **Note**
>
> Each content tile can be expanded using the **Expand** button on the top right-hand corner of each tile.

9.3.6.2.1 Time period filter

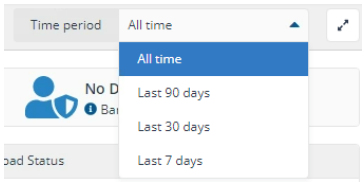
Using the **Time period**filter at the top of the page, you can narrow down the results by date. You can choose from the following options:

Last 90 days

Last 30 days (Default)

Last 7 days.

> **Note**
>
> If these filters are applied to any app page, it is reflected on all other pages in the Nomad App.



9.3.6.2.2 Technology filter

You can use the **Technology** filter to differentiate between downloads through Nomad or Delivery Optimization (DO).

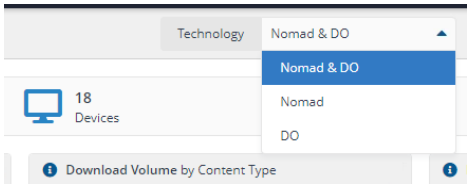
The following options are available:

Nomad & DO (Default)

Nomad

DO.

> **Note**
>
> If this filter is applied to any app page, it is reflected on all other pages in the Nomad App.



9.3.6.3 Top status bar

The status bar along the top of the page shows high-level statistics for the currently selected **Technology** (Nomad or DO) and **Time period**. The bar is shown on the Overview page and includes four icons, **Downloads**, **Devices**, **Content Titles** and **Bandwidth Protection**.

Item	Description	Icon
Downloads	Downloads reflect the total number of content downloads. This includes both Delivery Optimization (DO) and Nomad downloads. The results can be filtered on the **Time period** and **Technology** filters and display the total number of downloads of any version of content that occurred in the selected period. A download counts as any download activity for a given Content Title on a given device. For example, if there are 10 content titles downloaded by 50 devices, the total count of download instances would be 500. For CM Applications, each Application Deployment Type counts as a separate Content Title.	

Item	Description	Icon
	Clicking on this icon navigates to the **Content** page filtered to show **Content Titles** reporting download activity within the selected **Time period**.	
Devices	Displays the total number of devices that have reported download activity for any content version in the selected **Time period**, including: Packages Applications Updates from Configuration Manager. Clicking this icon navigates to the **Devices** view, filtered to show devices where download activity was reported within the selected **Time period**.	
Content Titles	Displays the total number of unique **Content Titles** where download activity of the latest version of the content titleis reportedin the selected**Time period.** For CM content, a**Content Title**is a single Application or Package. Clicking on this icon navigates to the Content view filtered to show the **Content Titles** that have reported download activity within the selected**Time period.** **Note** Applications in CM may have many Deployment Types. This summary counts an Application as a single Content Title.When viewing the Content view, Content Titles for CM Applications are further identified with the Deployment Type thatwas downloaded. So, the total number of Content Titles identified on the top status bar may be lower than the corresponding list of Content Titles on the Content page. This is because the Content page reports download activity for individual Deployment Types of CM Applications.	
Bandwidth Protection	Displays the total time that Nomad backed off when downloading content to protect end-user bandwidth.	

Item	Description	Icon
	Bandwidth Protection allows Nomad to adjust the speed of ongoing downloads to save bandwidth for other business use. Bandwidth Protection ensures Nomad doesn't consume excess bandwidth and hinder other business activity.It does that by tracking the download time of data packets. If the time increases, it slows itself down (backing off) by sleeping for a few moments before downloading another packet.	

9.3.6.4 Content tiles

Content tiles display statistics for content download activity in the following panes:

Content Titles Count by Content Type

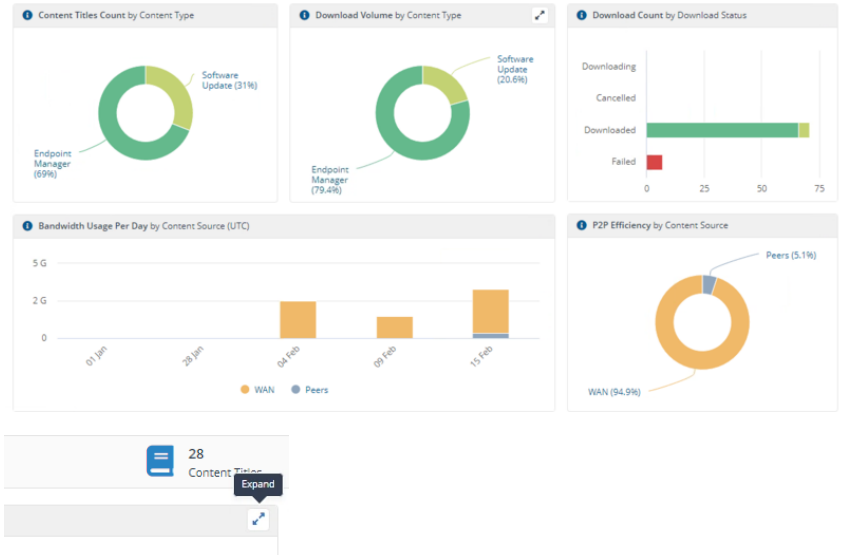
Download Volume by Content Type

Download Count by Download Status

P2P Efficiency by Content Source

Bandwidth Usage Per Day by Content Source UTC.

> **Note**
>
> Each content tile can be expanded using the **Expand** button on the top right-hand corner of each tile.



9.3.6.4.1 Content Titles Count by Content Type

The **Content Title Count by Content Type** tile shows the total number of unique **Content Titles** for where there is download activity reported for the latest version of the content within the selected **Time period**.

The data is grouped by **Content Type** and displayed as a donut chart. The app currently reports on two **Content Types**:

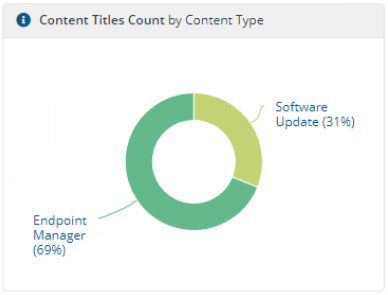
Endpoint Manager - CM applications and packages that are not delivered by DO

Software Update - includes any Microsoft Software Updates deployed through CM or Windows Update.

> **Note**
>
> Applications in CM may have multiple **Deployment Types**. This tile counts an Application as a single **Content Title**. When viewing the **Content view**, **Content Titles** for CM Applications are further identified with the **Deployment Type** that was downloaded.
>
> As a result, the total number of **Content Titles** identified on the top status bar may be lower than the corresponding list of Content Titles on the Content page (which reports download activity for individual **Deployment Types** of CM Applications).

Hovering over a **Content Type** segment of the chart displays the count of **Content Titles** of that type, also represented as a percentage of all **Content Titles**.

Clicking on a **Content Type** segment of the chart will navigate to the **Content** view, filtered to show related **Content Titles**.



9.3.6.4.2 Download Volume by Content Type

The **Download Volume by Content Type** tile shows the cumulative volume of content of the latest version of content downloaded by all devices within the selected **Time period**. The data is grouped by **Content Type** and displayed as a donut chart.

The chart enables you to see the effect that different types of content have on your network, in terms of the volume of data associated with them. It shows the percentage of packages and software updates by volume for:

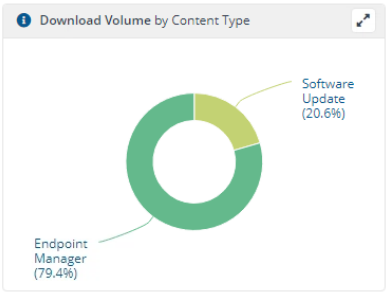
Endpoint Manager - CM applications and packages that are not delivered by DO

Software Update - content that can be delivered by Nomad, or DO if you're using Windows Update directly.

For example, if a single content title is 100MB and it is downloaded by 100 devices, the cumulative **Download Volume** reported for that particular **Content Title** would be 10,000MB. The chart shows the cumulative volume for all **Content Titles** on all devices, grouped by **Content Type**.

Hovering over a **Content Type** segment of the chart displays the total volume of downloaded content of that type. This is also shown as a percentage of total volume of downloaded content.

Clicking on a **Content Type** segment of the chart navigates to the **Content** view, filtered to show **Content Titles** of the selected segment.



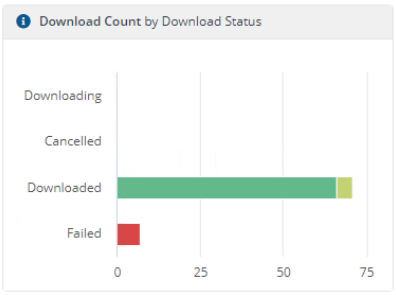
9.3.6.4.3 Download Count by Download Status

The **Download Count by Download Status** tile shows the status of download activity within the selected **Time period**, displayed as a bar chart by:

Status	Description
Downloading	Number of downloads currently in progress, where a download has been reported as started but has not yet reported complete, failed or cancelled.
Cancelled	Number of downloads whose last reported status was **Cancelled**, downloads may be cancelled by the user, or by the system, for example if the system is shut down or higher priority downloads are queued.
Downloaded	Number of successful downloads, if the downloaded content is still cached on a given device, it's represented by the dark green part of the Downloaded bar labelled **(Downloaded (Cached)** when you hover over it. If the downloaded content was subsequently deleted from the cache on a given device, it's represented in the light green part of the **Downloaded** bar labelled **(Downloaded (Deleted)** when you hover over it.
Failed	Number of downloads whose last reported status was **Failed**.

Hovering over any of the bars displays the number of downloads in the selected download state.

Clicking on any of the bars navigates to the **Content** view, filtered to include **Content Titles** where one or more devices is in the selected download state.



9.3.6.4.4 Bandwidth Usage Per Day by Content Source (UTC)

The **Bandwidth Usage Per Day by Content Source (UTC)** tile represents daily download activity throughout the entire network during the selected **Time period**.

A column is displayed for each day when there was download activity. Each column indicates the volume of content downloaded over the WAN (in orange) or from peers (in grey). Hovering over a segment of the column will display the volume of content downloaded on that day.

This view demonstrates the value that Nomad and Delivery Optimization are providing through reduced WAN traffic. If the majority of content is being downloaded over the WAN, it could indicate that peers are simply not available (e.g. users working from home) or it could be an indication that Nomad or Delivery Optimization are not correctly configured to optimize content from peers.

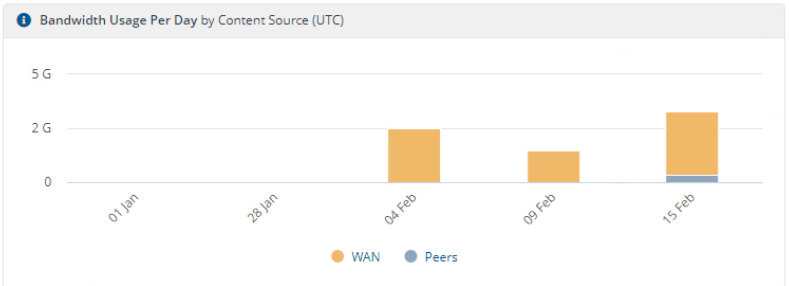
The columns on this chart are not clickable, they are for data visualization only and do not navigate to another view of the data.

> **Tip**
>
> On the Overview page, when you select the **All Time** filter, the **Bandwidth Usage Per Day by Content Source (UTC)** graph displays a maximum 365 days of data.

> **Note**
>
> This chart only displays content that was downloaded over the network either from a peer or from the source (e.g. a CM Distribution Point), if a device:

Requests content that is already in its cache, it will not be represented in this chart

Only has some content in its cache and downloads the remainder of the content from peers or the source, the content that was downloaded will be shown.



9.3.6.4.5 P2P Efficiency by Content Source

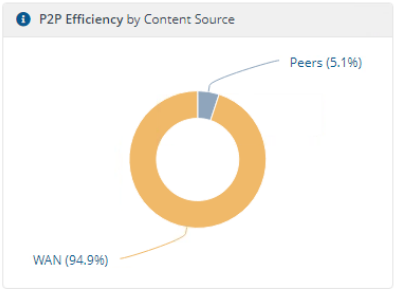
The **P2P Efficiency by Content Source** tile represents the overall peer-to-peer efficiency across the entire network during the selected **Time period**.

The data is grouped by source (Peers and WAN) and displayed as a donut chart showing the volume of content downloaded from peers (in grey) and from the source over the WAN (in orange). This gives an indication of the overall value of Nomad and Delivery Optimization across your organization.

Ideally, more content will be downloaded from peers than from the source over the WAN, which saves network bandwidth. Where this is not the case, it could be due to many users working remotely without any local peers, or it could be due to configuration settings on the client that are not optimized for peer-to-peer caching and availability.

This chart is not clickable, it is summary data visualization only and does not navigate to another view of the data.

> **Note**
>
> In this chart, the volume of content downloaded from peers includes any content requested by a device during the selected **Time period** and was already in the cache at the time (i.e. 'already cached' is represented as content obtained from a peer). If the content was downloaded from a peer or over the WAN during the selected **Time period**, it will be represented accordingly.



9.3.7 Ensuring Nomad is secure

An overview of Nomad security methods, and how to customize default Nomad security settings.

Nomad is a peer-to-peer technology that works by using HTTP/HTTPS or the native Windows OS File and Print Sharing services to share content among computers.

In this section we explain details of Nomad file sharing mechanisms and offer configuration advice related to your desired level of security. Additionally, we describe settings that will affect the sharing of deployment content, as well as settings related to storing user migration data when using Peer Backup Assistant - PBA.

9.3.7.1 Configuration Manager content security

Nomad does not replace existing Configuration Manager (CM) security, so any content distributed by CM, whether it involves Nomad or not, undergoes a hash checking process before it is actioned by the CM client. CM provides a hash of content using the SHA-256 algorithm. CM content on a Distribution Point (DP) has a hash value provided to the CM client through its deployment policy.

When the CM client has received all of its requested content, a hash value of all the content received is generated at the client. This value is compared to the one provided in the policy from the DP source. If a single byte of the content has changed during the transfer between the DP and the client these values will not match, and that content will be deemed to fail the hash check, this ensures that any content that fails the hash check is not executed.

9.3.7.2 Nomad security methods

This table summarizes security methods for Nomad operations, including both content deployment and user data migration.

Component	Detail
Election Process	AES 256 is used when you enable FIPS compliant communication encryption during the Nomad agent install FIPS compliance is disabled by default When FIPS compliance is disabled, RC2 block encryption is used.
Nomad Share and NTFS Permissions	SMSNomadP2P&-Local Account Nomad known pwd (SMB Share-Read) Authenticated Users-Domain Authenticated Account (SMB Share-Read) SYSTEM-NTFS Write-Option to limit to Machine Account (SMB Share – Read).
HTTPS Peer copy (Optional)	Encryption - Microsoft Cryptographic Provider – 256 Bit Symmetric Key Cipher Data Encryption – AES256 Algorithm with 256 key length
Nomad Hash Check Process	Content Hashing Algorithm – SHA 256
ConfigMgr Hash Check Process	Content Hashing Algorithm – SHA 256
Nomad Peer Backup Assistant - PBA Poll and ind	Microsoft Cryptographic Provider – 256 Bit Symmetric Key Cipher Data Encryption – AES256 Algorithm with 256 key length
HTTPS Nomad PBA user data copy to and from PBA host	Encryption - Microsoft Cryptographic Provider – 256 Bit Symmetric Key Cipher Data Encryption – AES256 Algorithm with 256 key length

Component	Detail
Nomad PBA USMT user data encryption	In Replace scenarios where a native Configuration Manager (CM) Computer Association (CA) is used, user data is encrypted using AES 256 with the randomly generated key securely stored in the CM database. This occurs before the data gets copied to the target PBA Host For Refresh or Replace scenarios not using the native CA, AES 256 is used to encrypt user data, with the key being generated by Nomad, the key gets generated when the task sequence runs and is never stored remotely.

9.3.7.3 How Nomad manages content and secures user data

In this section, we'll separate out the way Nomad manages content and the methods behind securing user data when using Nomad Peer Backup Assistant - PBA. These two approaches to securing data are the same in principle, but contain essential differences, that we'll highlight in the following sections.

9.3.7.3.1 Securing captured user data

In this section, we'll describe how Nomad incorporates encryption into the remote storage of captured user data. When using Nomad PBA, it can be important that captured user data is stored encrypted prior to it being restored on to a target device and deleted from the former storage hosts. The following sections explain how this is implemented.

9.3.7.3.1.1 Configuration Manager computer associations

Configuration Manager (CM) supports encryption of captured user data, with the encryption key stored in the CM database. The key is retrieved using the management point server during capture and restore operations within a task sequence. To acquire the key, the requesting host must be authenticated using the CM client certificate. Nomad PBA supports use of this key, and when the task sequence runs, the downloaded key is stored in the task sequence environment.

When running under a full OS, the task sequence environment is secured by applying the Windows file system, share and logon security typically applied using Group Policy. When running in WinPE, the security environment is different.

9.3.7.3.1.2 Task sequence environment and WinPE

During the WinPE phase of the running task sequence, the local host is not a member of the domain, and an interactive logon is not possible. The only way a user can interact with a host is through a Windows command shell. For this to be possible, command shell access must be explicitly enabled during boot image creation in the Configuration Manager console.

Typically, command shell access is only enabled during task sequence development to facilitate troubleshooting. In a production environment, command shell access is usually turned off. Windows share access is not possible in WinPE.

9.3.7.3.1.3 When encryption is not required

In User State Migration Tool (USMT), encryption of captured user data must be enabled on the command line of the USMT scanstate.exe application. In some circumstances you may prefer not to encrypt captured data, and instead maximize ready access to the stored data when performing the restore. In this case the unencrypted data is secured only through the NTFS and share permissions implemented in Nomad PBA.

For some instances of OS deployment, securing captured user data is not even required. In an OS Refresh, USMT makes use of Windows file-system hard-links. In this scenario, user data is never stored off the local disk and Nomad PBA or an SMP is not required.

9.3.7.3.2 Transferring content and user data between peers

This section discusses how you can implement to help content and user data transfer between peers.

9.3.7.3.2.1 Nomad election and PBA traffic

Nomad election and PBA traffic is communicated over port 1779 by default (You can configure this if needed). It is also encrypted with the Microsoft Base Cryptographic Provider using the AES 256 encryption algorithm with a 256-bit key length.

9.3.7.3.2.2 Transferring content using SMSNomadP2P&

You can transfer content between peers using either the local computer account or the local account, SMSNomadP2P&. The Nomad agent is responsible for managing the password when using the SMSNomadP2P& local account, with the password synchronized between peers. To ensure a secure password, a new password gets regenerated on every Nomad agent service startup, when your computer reboots, Nomad resets the password.

The SMSNomadP2P& account password is complex and set to 14 characters long, and the account denied “Log on locally” security rights. This behavior cannot be changed as it's hard coded into the product. This feature is more secure than using Active Directory accounts because no one can know the password used, this password is different for each local SMSNomadP2P& account.

The 14 character password for SMSNomadP2P& is calculated based on a public hash shared by the master during election and a private (secret) hash. At start-up, Nomad generates a new private hash and password. The private hash gets communicated using encrypted communications during an election, and peers work out the password by applying the same algorithm. If that password gets altered, no other device could connect to the NomadSHR or Cache folder without a way of communicating that password out to every system that would need to use it.

> **Note**
>
> Please refer to The Nomad share for more details about Nomad share security, for more details about:

Enhanced Nomad share security

Nomad Branch service and the Nomad share

Custom share permissions.

9.3.7.3.2.3 Transferring user data

For Nomad PBA, we have an additional, unique local account created by Nomad that's used to transfer user data between source and target devices; user data gets stored in the NMDS share on the participating Nomad PBA host. A unique account gets generated each time user data gets stored on a remote host and takes the format **NMDSUser<number>** for example, NMDSUser0001. The local computer account cannot be used when transferring user data.

The password for the local account gets synchronized in the same way as the SMSNomadP2P& account. The PBA local account gets assigned full permissions and rights to the NMDS share and NTFS folder on the PBA host. No other accounts get assigned permissions. Nomad also creates the NMDSUsers local group, to which it adds the NMDS account(s).

9.3.7.3.2.4 Active Directory considerations

Both HTTP/HTTPS and Windows File and Print sharing requires authentication to ensure secure access to cache content or user data that's shared or accessed. In an Active Directory Domain, Group Policy refers to this as network login rights. The Local Computer Security Policy must be modified, assigning the local account SMSNomadP2P& to the setting Computer Configuration→Policies→Windows Settings→Security Settings→Local Policies→User Rights Assignment→Access this computer from the network. For Nomad PBA, customers must assign the above rights to the **NMDS_Users** local group.

If Active Directory Group Policy enforcement is in place, ensure that the SMSNomadP2P& local computer account has access granted to the **Access this computer from the network** settings at the Active Directory Group Policy level.

The File and Print Server service is not available in WinPE and therefore the Nomad share will not exist. For this reason, the Nomad agent in WinPE will only be capable to copy content from a Nomad master running in the full OS and is not able to act as a master itself. The process of accessing and copying content from the remote cache is the same in WinPE as in the full OS and is done using a local SMSNomadP2P& account. Using the local computer account to connect to the remote share is not supported.

Note

Nomad PBA does not support off-line (WinPE) user data capture and restore.

9.3.7.4 Changing the default behaviors of the Nomad security model

So far, we have described the default behavior of Nomad. Organizations that have more strict security policies may wish to adjust the default behavior of Nomad. These options can be configured in the Windows Registry.

You can find these values in the following registry location:

For 32-bit systems - HKLM\Software\1E\NomadBranch

For 64-bit systems - HKLM\Software\Wow6432Node\1E\NomadBranch.

9.3.7.4.1 Using HTTP and HTTPS

Nomad 6.2 introduced Peer copy over HTTP or HTTPS. Configuring Nomad to use HTTP/HTTPS means that Nomad Peer BackUp Assistant (PBA) uses the transport to transfer USMT capture data between the capture/restore and PBA hosts.

By default, Nomad uses the SMB transport. Implementing HTTP/HTTPS requires additional Windows Installer properties need to be specified when installing or upgrading the NomadBranch agent. For existing installations of the agent, the registry will need to be updated, in order for Nomad to use HTTP or HTTPS.

The principal registry setting used to configure Nomad is P2PEnabled. By configuring this setting, the agent can be configured to use either SMB, HTTP or HTTPS and, if required, fall back to using a different transport. The values for selecting the transports are:

Registry setting	Explanation
P2PEnabled = 0x0001	P2P enabled. This option is set by default and enables Nomad P2P using SMB. When set, the Nomad agent will create the NomadSHR file share started, unless the CustomShare option has been enabled in SpecialNetShare. When P2PEnabled is set in addition to Bit 5 (use HTTP) or Bit 6 (use HTTPS), Nomad will attempt to use HTTPS/HTTP and will fall back to SMB if HTTPS/HTTP is unavailable on other peers. To disable SMB P2P, set this bit to 0.
P2PEnabled = 0x0020	Use the HTTP protocol to share its own cache and access other caches.
P2PEnabled = 0x0040	Use the HTTPS protocol to share its own cache and access other caches.

Other registry values are used to set the HTTP/HTTPS ports and configure the use of HTTPS and PKI, for example:

P2PHTTPPort

P2PHTTPSPort

CertIssuer

CertSubject

P2PSSLSettings.

> **Note**
>
> P2PSSLSettings indicates that Nomad should use a PKI or self-signed certificate. If using a PKI certificate, then you must specify Certissuer and CertSubject.

Using file and print sharing

You can use the SpecialNetShare registry value to configure security options. SpecialNetShare can be a combination of multiple options by combining the bit values. You can find a complete list of options for this registry key in SpecialNetShare. If you change the default settings, ensure you apply the same setting consistently on all Nomad Clients.

9.3.7.4.2 What if Windows file and print sharing and HTTP/HTTPS are disabled?

If the File and Print sharing is unavailable, we recommended you configure Nomad to use HTTP or HTTPS, which are also supported when you use Nomad in WinPE.

If Windows File and Print Sharing and HTTP/HTTPS is not allowed on the local host due to security restrictions, then the Nomad is still able to copy content using the SMB protocol from a peer who happens to have Windows File and Print Sharing enabled. However, the local host will not be able to act as a master and serve content to other peers. This is the case in WinPE, where Windows File and Print Sharing is unavailable. Nomad clients running in WinPE are still able to access remote peer cached running under the full OS using SMB.

In any set ConfigMgr task sequence, to use Nomad in Windows PE, in the**Install Nomad** task sequence step configure P2PEnabled=0x0007. This is the combined value of having P2P enabled and allowing the device to act as a P2P server and client if you wish the WinPE Nomad agent to act as a master.

> **Note**
>
> Normally, you would not want a WinPE Nomad client to act as a master as this state tends to be transitory with several reboots occurring.

9.3.7.5 Configuration table

The following table summarizes the configurations discussed on this page.

Device state	Default Configuration	HTTPS	Device account Security (Not applicable to Nomad PBA)	Connection-less (UDP) (Not applicable to Nomad PBA)
Full-OS	Account: <COMPUTERNAME>\SMSNomadP2P& Account: <COMPUTERNAME>\NMDSUser<nnnn> Group: <COMPUTERNAME>\NMDSUsers Password:	**Client (Peer) Authentication:** Account: <COMPUTERNAME>\SMSNomadP2P& Account: <COMPUTERNAME>\NMDSUser<nnnn> Group:	Account: <DOMAIN>\<COMPUTERNAME>$ Password: Unknown; auto-generated; managed by AD Nomad Share permissions: Uses defaults, for example	P2PEnabled = 0x0007 0x0001 (P2P enabled) 0x0002 (P2P server) 0x0004 (P2P client)

Device state	Default Configuration	HTTPS	Device account Security (Not applicable to Nomad PBA)	Connection-less (UDP) (Not applicable to Nomad PBA)
	Unknown; auto-generated by Nomad during service restart. For PBA automatically generated during PBA. Nomad Share permissions: Uses defaults, for example Authenticated Users, SMSNomadP2P& NMDS share and folder permissions NMDS_User<nnnn> Full access	<COMPUTERNAME>\NMDS_Users Password: Unknown; auto-generated by Nomad during service restart. For PBA automatically generated during PBA. **Server (Master) Authentication:** Certification based authentication, either PKI or Nomad Self-signed certificate used.	Authenticated Users Group Policy: Add Domain Computers	
Windows PE (Not applicable to Nomad PBA)	Account: <DOMAIN>\SMSNomadP2P& Password: Manually created and managed by ConfigMgr admins	Account: <COMPUTERNAME>\SMSNomadP2P&> Password: Manually created and managed by ConfigMgr admins	P2PEnabled = 0x0005 0x0001 (P2P enabled) 0x0004 (P2P client)	

9.4 Nomad features

Many Nomad (Nomad) features are available with minimal configuration of the Nomad client. However, some features require additional configuration of the client on Configuration Manager Distribution Points.

Nomad features maximize download efficiency in branch network deployment scenarios, and reduces the number of Configuration Manager Distribution Points. Nomad integrates closely with Configuration Manager, assists with WAN link usage efficiency during downloads, copes with different network protocols.

9.4.1 Nomad features and concepts

With Nomad, you get all the benefits you would expect from Nomad with the additional benefits of the Tachyon platform, included in the license fee:

Increased patch compliance by ensuring clients are functioning, and you are able to deploy updates to them at all times.

Total control over downloads in your environment with the ability to stop them in their tracks if needed.

Centrally managed content in the Nomad cache on clients, with the ability to remove content from any client in real time.

9.4.1.1 New features in Nomad

Many Nomad features are available with minimal configuration of the 1E Client. However, some features require additional configuration of the 1E Client on Configuration Manager Distribution Points.

9.4.1.1.1 Platform

Works with Tachyon 8.1

Insights on how Nomad enhances user experience - with the rapid shift to a Work From Anywhere (WFA) workforce and an increased focus on the Digital End-User eXperience, Nomad on Tachyon Platform now provides insights into how it helps to ensure a great user eXperience. With the introduction of Nomad's Bandwidth Protection Reporting, you can now see how Nomad is preventing end-user disruption due to software and update deployments. Bandwidth Protection Reporting will allow you to see the positive impact Nomad is having across the organization, to individual sites, subnets, all the way down to a single client.

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, there is an increased reliance on Cloud Distribution Points for distributing content.

Feature improvements - as Configuration Manager evolves and new features are released, Nomad on Tachyon Platform is being continuously maintained to ensure it works seamlessly with new releases.

9.4.1.1.2 Client

NomadBranch 8.1 client is the Nomad module in 1E Client 8.1

Support for Cloud-based content in Task Sequences - cloud-based services to support Work From Anywhere (WFA) users are becoming more critical to the way enterprises work, and there is an increased reliance on Cloud Distribution Points for distributing content.

Enhancements:

Improvements to the Certificate Selection criteria to authenticate with a DP (or any download source)

Download reporting now includes back-off data, for Bandwdith Protection Reporting.

9.4.1.1.3 Tools

Nomad AdminUI Console Extensions now require .NET Framework 4.8

Cloud infrastructure support

Enhancements:

Provide a way for SCCM Console users to use alternate credentials to authenticate with ContentDistribution/Platform, for details refer to Using Nomad pre-caching.

PlatformUrl validation is improved, by logging a warning during installation. In UI mode users have the option of continuing with the installation, for details refer to Installing Nomad Branch Tools.

9.4.1.2 Modern management

Nomad provides a way of managing legacy and modern applications in a unified way by providing enhanced oversight, security, and awareness to IT departments, with a particular focus on Delivery Optimization (DO). The following table describes the Nomad capabilities:

Nomad capability	Nomad feature	Uses Platform features
Content Distribution	**Bandwidth management and peer sharing** Protect the WAN when downloading from DP and share content with local peers. Refer to Nomad fundamentals: Full control over WAN link usage.	✓
Single Site Download Share content across subnets in the same location. Refer to Single Site Download.	✓	
Pre-caching Get content distributed ahead of important deployments. Refer to Nomad Pre-caching.	✓	
Cache management Periodically delete unused content from the cache. Refer to Cache management.	✓	

Nomad capability	Nomad feature	Uses Platform features
Cloud-attached CM support Download content from Cloud DP / Content enabled CMG. Refer to Cloud Support.	✓	
OS Deployment	**Peer Backup Assistant** Use available storage on peers instead of servers to temporarily store user state during OS deployment. Refer to Peer Backup Assistant - PBA.	✓
PXE Everywhere Dynamic peer-based PXE eliminates the need for PXE servers. Refer to Using Nomad with PXE Everywhere.		
Nomad OSD Tools Nomad support for Configuration Manager OS Deployment. Refer to Nomad OS Deployment task sequence actions.		
Nomad Management	**Nomad app** Real-time visibility of what content is downloading or available in each location, subnet, and client. See how much WAN traffic is being saved overall and each day. Refer to the Nomad app.	✓
Delivery Optimization (DO) Visibility		

Nomad capability	Nomad feature	Uses Platform features
Real-time visibility of Delivery Optimization downloads and content availability in each location, subnet, and device.		
Nomad Download Pause Immediately stop Nomad downloads across your network or on specific CM Collections. Refer to Nomad Download Pause.		
Client Health	**Nomad Client Health** Real-time monitoring to ensure Nomad is running, can communicate through the firewall, is correctly registered with the CM client, its cache share is accessible. Refer to Nomad Client Health Policy.	✓
MEMCM Client Health Real-time monitoring to ensure the CM client is installed, running and assigned to the correct site, it is communicating with the MP, supporting services are running and WMI is healthy, with real-time remediation for many client issues. Refer to MEMCM Client Health Policy.	✓	
Windows Client Health Check for application crashes, free disk space and WMI repository health. Refer to Windows Client Health Policy.	✓	

9.4.2 Content Distribution

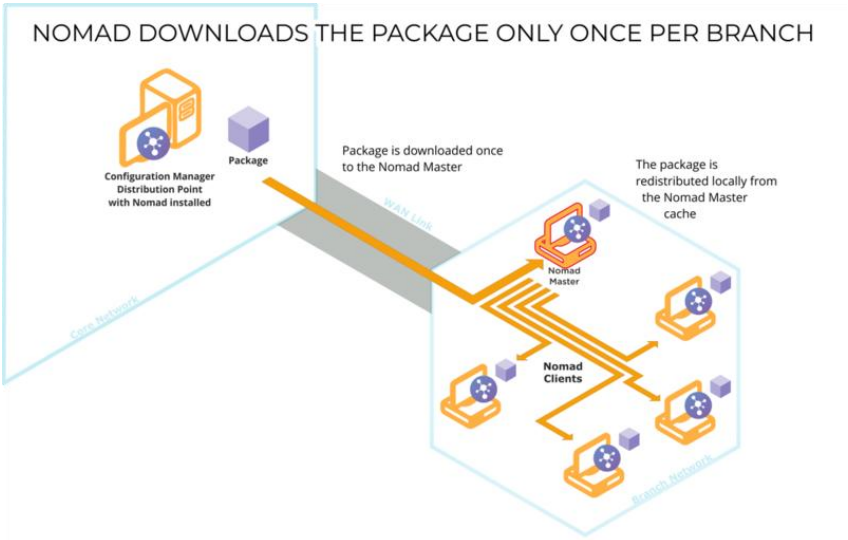
1E Content Distribution is a Tachyon Consumer providing control and visibility on content deployments and delivery in an organization.

9.4.2.1 Download once to branch

Nomad ensures that software packages are only ever copied once per branch over the WAN, utilizing local computers as temporary file caches to distribute the software locally. This reduces the bandwidth required for delivering software updates and means that small offices or sites connected by poor network links can receive software updates more reliably.

The Nomad clients with local copies of the package can themselves act as the master if the need arises. This significantly reduces the number of Configuration Manager servers required to manage a Configuration Manager hierarchy, thereby reducing initial and ongoing maintenance costs.

Refer to Deploying software with Configuration Manager for example scenarios about deploying Applications and Packages where Nomad is integrated with Configuration Manager and how you can monitor those deployments using the Nomad app.

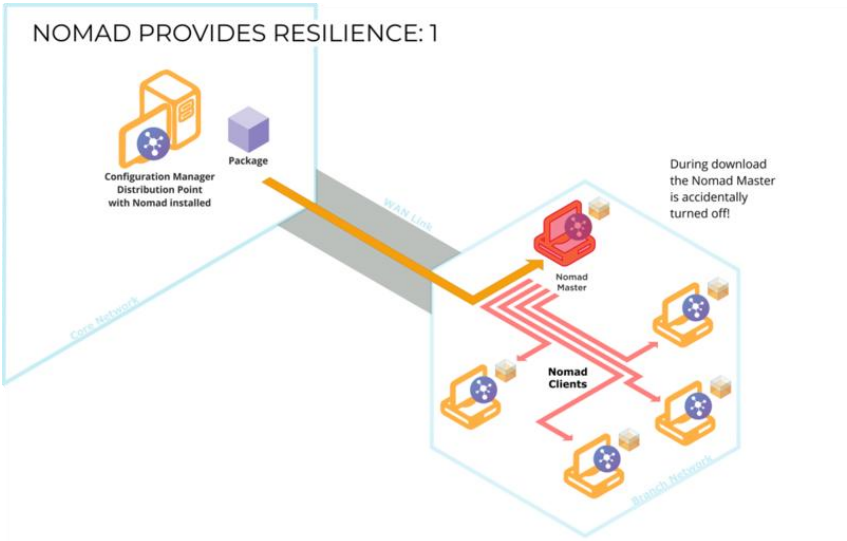


9.4.2.1.1 Nomad Master Elections

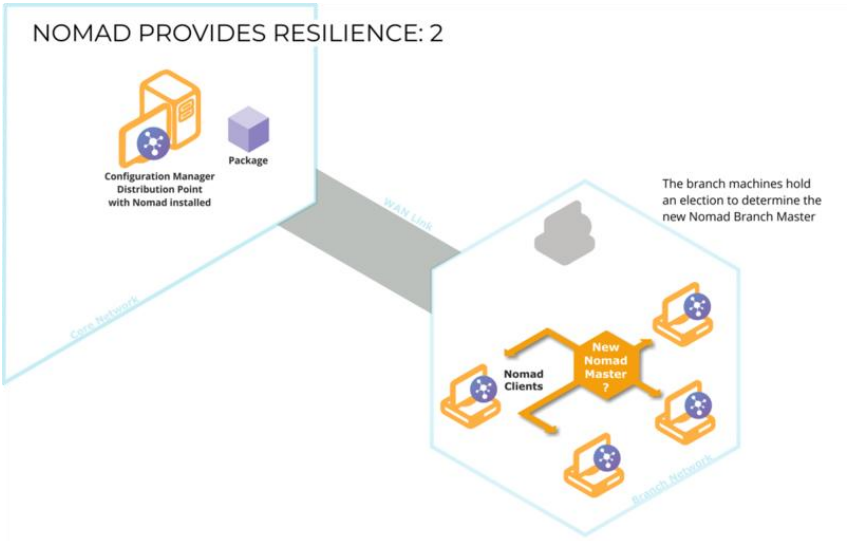
When a software package is deployed to the Nomad clients, an election is held per subnet in the branch to find an appropriate Nomad master, this Nomad master then downloads the software. The software is stored in the Nomad share which is then accessed by the other Nomad clients on the same subnet that require the software package.

Nomad is installed on each computer in the branch and on the distribution point. The computers on the branch network elect a local master. This acts as the single contact point for downloading packages from the distribution point and handles the local redistribution.

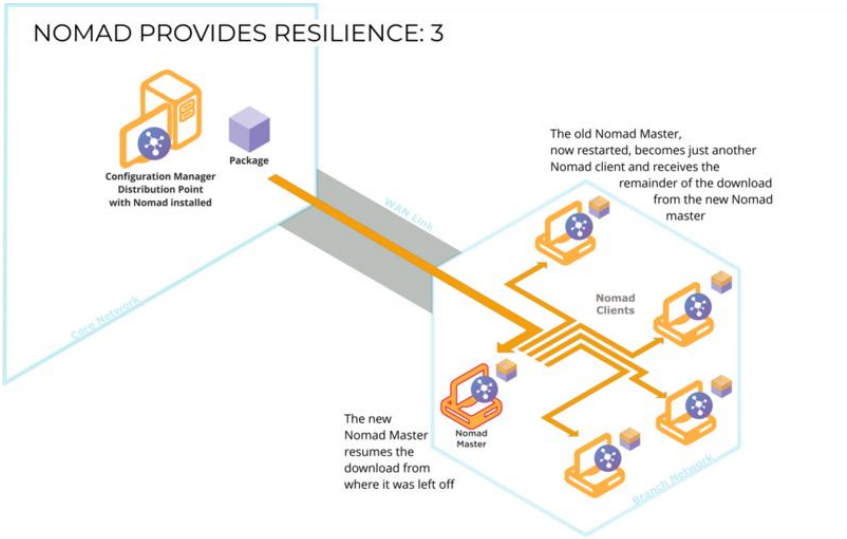
It is possible that a particular Nomad master may be affected in some way during the download. It could be turned off or disconnected from the network for example. If this is the case Nomad ensures that the download continues.



During download, elections continue to be held periodically to determine if the current Nomad master is still the most suitable candidate. If the local Nomad master is affected some way, for example if it is turned off during a download, the other Nomad clients on the branch network interact to elect a new master. The elections are weighted towards the most suitable candidate using a combination of rules.



Once a new master is elected, the download continues to this new master starting from the point at which the download is currently at in that client's cache. The other treat this new master in exactly the same way as the previous master. In fact, if the previous master is turned back on, it may receive the rest of its interrupted download from the new master instead.



See Election rules and master elections for more details about the election process.

9.4.2.1.2 Nomad cache

An overview of the Nomad cache including different methods used by Nomad peers to access the cache on the elected master. The Nomad cache is essential to Nomad's download once to branch feature. The cache enables Nomad to hold its downloaded content so that it can be distributed locally to other Nomad peers. The Nomad cache contains downloaded content (such as packages, applications, and software updates) which can vary in size from relative small patches to rather large OS image files.

As outlined above, Nomad combines the use of elections and cached storage to ensure that content is only downloaded once per subnet over the WAN. Further efficiencies can be made by implementing the Single Site Download advanced feature to ensure that downloads over the WAN only occur once per site.

Note

Refer to Nomad cache for more details, including peer access methods, switching between wireless and wired network connections and multi-forest environments.

9.4.2.1.3 Election rules and master elections

When you install Nomad on computers within a remote branch, part of the installation includes a service called *NomadBranch.exe*. This service runs continuously on the Nomad clients and manages the process of electing masters and transfers the download between peers.

As a package is deployed to computers within a remote branch, one branch Configuration Manager client is elected as the Nomad master. This client downloads the package to its local cache and the other clients on the remote branch IP subnet uses this local master as an alternative distribution point. The other clients can either connect to the local master over HTTP[S] or they connect to its cache folder over Microsoft Server Message Block (SMB) protocol and download the package to their own cache.

Note

Standard Configuration Manager behavior remains unchanged when using Nomad. Nomad clients will not start to download the package until they have received the Configuration Manager deployment, subject to the usual polling cycle.

However, if this elected master became unavailable, the Nomad clients hold an election to nominate another master. The election process starts when the master is discovered to be unavailable.

A master is elected based on election rules including percentage of the package already downloaded and election weighting. Any one of the remote Nomad clients can be elected as a master, even when they are halfway through downloading a package. In this way, software is downloaded once over the WAN and distributed locally.

Cached packages are kept on the local computer. If disk space becomes restricted, a separate automatic cache cleaning process is initiated which deletes packages cached by the peer-to-peer process.

9.4.2.1.3.1 Election rules

Elections for a master occur on a per package basis and are called for the following reasons:

Whenever any Configuration Manager deployment with Nomad enabled in the package properties starts

When a computer which is copying content from a master notices that the master is no longer available – this may happen if the master is switched off or disconnected from the network

Every 5 minutes while a master is actively downloading to ensure a more suitable master (one with more content than the currently elected master) has not been introduced to the network since the last election.

The outcome of an election is decided using the following criteria in order of precedence:

Percentage of content already cached (it is only ever deemed to be 100% once it has been verified)

Election weighting (the higher weighting value wins)

Current master

Time since cache was last verified by Nomad

System uptime (amount of time the computer has been up and running)

Computer initiating the election

Computer name (alphanumeric).

9.4.2.1.3.2 Election weighting

Nomad performs automatic weighting depending on its situation, according to the criteria listed below, and stores the value in memory (not registry). The higher the value, the greater the probability of winning the election.

61 – the agent is running on a server OS and it is not a domain controller (DC)

40 – the agent is running on a laptop

30 – the agent is running on a wireless network

10 – the agent is running on WinPE

50 – default

If necessary, you can use the P2PElectionWeight registry setting to increase or decrease a Nomad client's probability of being elected a master. The range for this registry value must be between 0 and 99 inclusive. If not set, Nomad uses the values listed above.

The registry key is located at: *HKLM\software\1e\NomadBranch\P2PElectionWeight*

To take effect after setting the registry value, the client sevice must be restarted.

This method is not recommended because Nomad is already quite efficient in the way it elects a master and needs very little intervention in this process. However, you may want to reduce the chance of computers with low processing power, or prevent critical servers, becoming a master.

You should also consider the following points before you influence the weighting:

Use this technique in exceptional circumstances and only after testing has shown that you need to make a particular computer more or less likely to be elected as a master for specific operational reasons.

Choose the simplest weighting strategy possible - for example, set servers at 90, laptops at 10 and workstations at 50.

The weighting does not guarantee that the more heavily weighted computers will win the election – they may be turned off or another local peer may have already cached more of the requested content.

The final weighting value used by the computer during an election may differ from the registry value as Nomad will automatically adjust it depending on the chassis and the network connection used.

In the event you no longer need the values to be set, you should remove it and restart the service to resume dynamic election weighting.

Setting to 0 is a special case called Sensitive server weighting designed for use on critical servers. The 0 value prevents Nomad from acting as master, and devices with this value will not respond to election requests.

9.4.2.1.3.3 Sensitive server weighting

You can exclude computers from the election process by updating the P2PElectionWeight registry value to 0 (zero) and restarting the service – if you do not restart the service, the update will not take effect and the computers are still available for election. Computers with this registry value will not respond to election requests and are never considered candidates for elections. We also recommend you set the *SSDEnabled* registry value to 1 if you are using the single site download feature as this will enable the device to consume content from an SSD peer but not be a provider.

When using the default Nomad configuration, Nomad will not respond to elections on a DC and cannot be elected as a master. This is because it is not possible to create the local SMSNomadP2P& account on a DC and allow it to become a Nomad master. To prevent Nomad from becoming a master, set its weighting to 0. The topic on Nomad scenarios illustrate how elections are carried out and how it ties in with downloading installation packages, refer to Basic Nomad behavior in a simple environment.

9.4.2.1.3.4 Inhibiting sites and subnets

You can also define subnets and AD sites where computers will download but not participate in Nomad election, refer to Design Considerations: Inhibiting subnets and sites. This feature is useful for sites that have a local DP or a VPN without isolation.

Typically, VPN solutions isolate each client using single-node subnets (i.e. each client is in its own subnet with a 32-bit subnet mask). This is to prevent broadcast traffic between VPN clients that are typically geographically dispersed and not on the same local network. If the VPN solution is not configured in this manner and clients get an IP address with a subnet mask less than 32 bits, broadcasts can be exchanged between the VPN clients allowing Nomad to elect a master that is not on the same local network.

9.4.2.1.4 Distributing software with Nomad and Configuration Manager

Nomad integrates with the Configuration Manager (CM) client content download process. When Nomad is installed, it registers with the Configuration Manager client as an Alternate Content Provider (ACP), which means the CM client will use Nomad as an alternative to BITS when it requires content if Nomad is enabled for the requested content object. Nomad can be enabled on individual packages (including Driver Packages, Operating System Images, Operating System Upgrade Packages and Boot Images) and Task Sequences.

For Applications and Software Updates, Nomad is enabled on each client for all Applications and Software Updates through Default Client Settings. When the CM client requires Nomad-enabled content, it passes a request to Nomad, which in turn downloads the content, places it in the CM client cache and passes back to the CM client for execution. The 1E Client (with Nomad client module enabled) must be installed on all CM client machines and on all Distribution Points (DP).As well as enabling Nomad on the CM content objects as described above, additional options can be configured in the same manner. For example, you can set the priority for package downloads, interrupting less urgent downloads and then carrying on from where they left off. You can also configure Nomad to send status messages to CM that show the progress for package download.

Refer to Deploying software with Configuration Manager for example scenarios about deploying Applications and Packages where Nomad is integrated with Configuration Manager and how you can monitor those deployments using the Nomad app.

9.4.2.1.4.1 Supported Configuration Manager content sources

Nomad is able to download content deployed through Configuration Manager (CM) from the following sources:

Distribution Points - using either HTTP (default) or HTTPS (requires Nomad client configuration)

Cloud Distribution Points - using HTTPS (requires client configuration)

Cloud Management Gateway (CMG) - configured to function as a Cloud DP

Microsoft Update - where the Software Update deployment has been configured to download from Microsoft Update when the content is not available on a DP.

When the CM client instructs Nomad to download content, it provides a list of sources from which the requested content is available. The list of sources is prioritized as follows:

On-premises DP - based on Boundary Group configuration.

Microsoft Update - exclusively for Software Updates when this option is enabled in the Software Update Deployment.

Internet-facing DP.

Cloud DP or **CMG** - configured to function as a Cloud DP.

The Nomad elected master attempts to connect to each content source in the prioritized list in turn and will download the content from the first available source in this list. The elected master then shares this content with other peers on the network as described in the Download once to branch feature.

9.4.2.1.4.2 Nomad and Configuration Manager

Nomad can be set as a content provider for individual instances of the following types of Configuration Manager (CM) content. In the Configuration Manager Console, navigate to **Software Library → Overview** and then to one of the following:

CM Console node	Sub-node	Action
Application Management	**Packages**	Select a package.
Operating Systems	**Driver Packages**	Select a driver package.
Operating System Images	Select an operating system image.	
Operating System Upgrade Packages	Select an operating system upgrade package.	
Boot Images	Select a boot image.	
Task Sequences	Select a task sequence.	

Right-click and select **Properties**or click on**Create** to start a **New Wizard**. Nomad properties is then accessible on the **Nomad** tab.

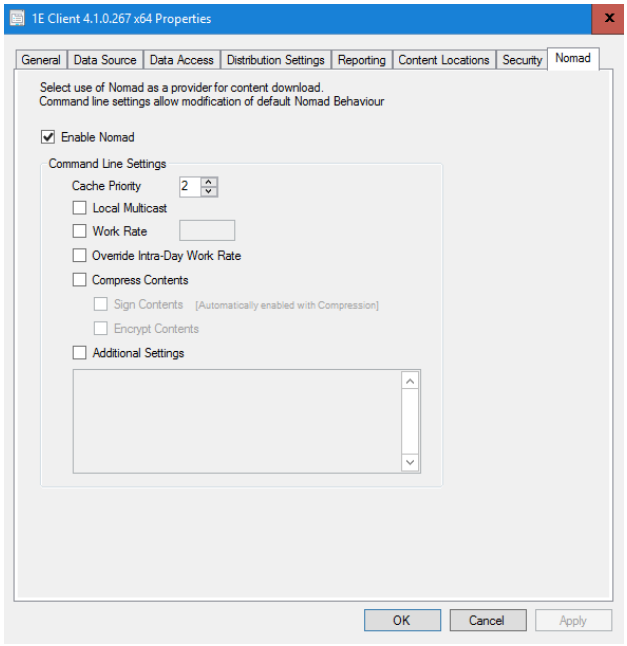
> **Note**
>
> Nomad can be set as a content provider for **Applications** and **Software Updates**. You must configure settings for *all* **Applications** and *all* **Software Updates** using **Client settings**, as described below Configuration Manager client settings, and not individual instances.

> **Note**
>
> Nomad includes a number of custom task sequence steps that can be used to integrate with OS deployments, refer to OS deployment task sequences: Custom task sequence actions for details.

9.4.2.1.4.2.1 Nomad tab

You can set the following options on the **Nomad** tab:

Option	Description
Enable Nomad	Enables Nomad to be used as a data transfer service for the selected package. The other controls on this page are only active if this is enabled. **Note** On the **Nomad** tab for a task sequence, this option is labelled **Enable Nomad – Modifies currently associated reference packages**. This is to emphasize the fact that, for task sequences, enabling Nomad at the task sequence level modifies the Nomad settings for all the packages referenced by that task sequence.
Cache Priority	defines the priority of this specific content in the Nomad cache to manage purging when new content requires cache space. Values are from 1-9; the lower the value, the more likely the content will be purged by other content that requires the space. Refer to Cache management for details.
Local Multicast	Enables local distribution multicast for the package after it is downloaded. **Warning** The Multicast feature is not supported in the Tachyon 5.2 release. This feature is under consideration for re-design and may be available in future versions of Nomad.
Work Rate	Work Rate (%) – determines the percentage of available bandwidth to use for the download. The default value is 80%. If you have set intra-work rates, (the lower of these two values is used unless you enable the Override Intra-Day Work Rate option. Please refer to MaxWorkRates for details about intra-day work rates.
Override Intra-Day Work Rate	Overrides the intra-day work rate for the duration of the download. If Intra-day work rates have been defined on the client and this option is selected, the value defined in the Work Rate property will take precedence over the Intra-day work rate for the current day and time.
Additional Settings	Enables you to define arguments for the download command-line. The arguments are listed in the Additional Settings table.



9.4.2.1.4.2.2 Additional Settings

Arguments	Default value	Range	Description
++pr	Configuration Manager defines the following default values: For Packages and Task Sequences the default is 3 For Applications the default is 0 For Software Updates the default is 1 Nomad will use the default values defined by CM unless the ++pr argument is specified. **Note** As these defaults are defined by Microsoft,	0 – Foreground (the highest priority) 1 – High 2 – Normal 3 – Low 4 – Background (the lowest priority)	Sets the priority for the package download. Packages with a higher priority will be downloaded before lower priority packages. **Note** Be careful not to confuse package priority *(++pr)* a setting related to Configuration Manager package downloads with cache priority, a setting on the Nomad properties page related to the Nomad cache. If a content download request with a higher priority comes along while content with a lower priority is downloading, the current download will be suspended and the higher priority content will be downloaded. When the higher priority content has finished downloading the

Arguments	Default value	Range	Description
	they may change in the future.		previously suspended download will be continued from where it left off. This caters to the situation where a large image package is being downloaded and a critical patch needs to be sent. Setting the critical patch to have a higher priority will enable it to download first and then allow the image package to continue downloading. **Note** If you modify the priority values for packages associated with a task sequence, you must set all the priorities for all the packages to the same value.
++sm		1 to 99	Sets the frequency of the Nomad download status message. These messages are useful for monitoring the status of large package downloads taking place over a long period of time. The messages appear in Configuration Manager under the downloading package's status. The messages are also logged locally in the Nomad log file on the client machine. The value for this argument sets the percentage of the download at which a status message is sent. So, *++sm=10* sets Nomad to send a message each time ten percent of the download has been transferred. The messages sent are subject to an overall default limit of one message per hour per client. This is to prevent

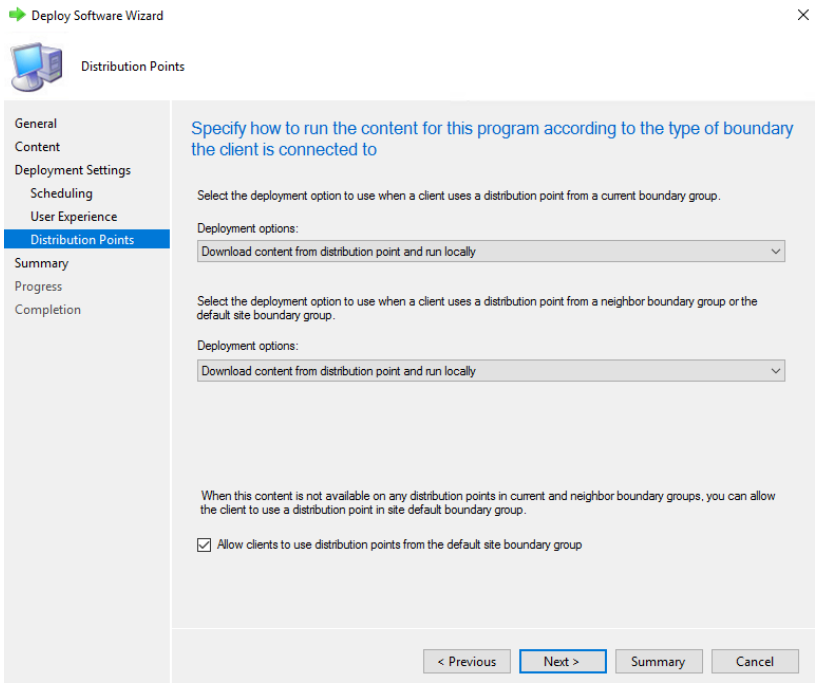
Arguments	Default value	Range	Description
			Configuration Manager from being overwhelmed by a status message coming from many thousands of clients.
--debug	9	1 – minimal logging 9 – default and recommended logging level 25 – detailed logging. If you use this, we recommend you increase the size of your log file to more than 1MB.	Sets the level for debug logging. Changing this value will result in a persistent change on the client.

9.4.2.1.4.2.3 Configuring deployments with Nomad

Packages and task sequences make use of deployments for distribution.

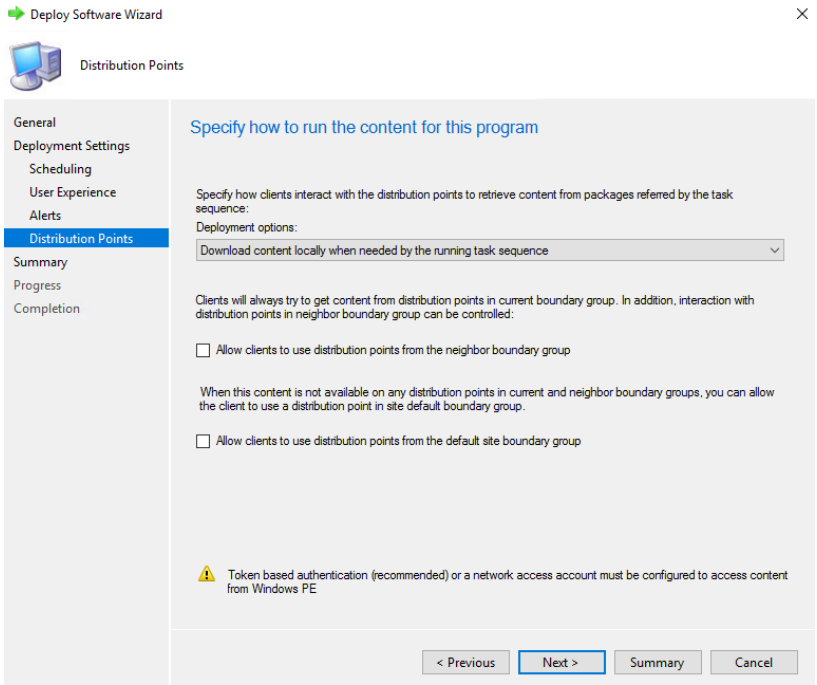
Package deployments intended for use with Nomad must be set to **Download content from distribution point and run locally** for clients using a distribution point from both a current boundary group and from a neighbor boundary group or the default site boundary group.

Using Nomad, you can also safely **allow clients to use distribution points from the default site boundary group**.



For task sequence deployments, select the **Download content locally when needed by the running task sequence** option on the **Distribution Points** screen in the **Deploy Software Wizard**.

Using Nomad You can safely **allow clients to use distribution points from the neighbor boundary group** and **allow clients to use distribution points from the default site boundary group** if this is appropriate based on your Boundary Group configuration.



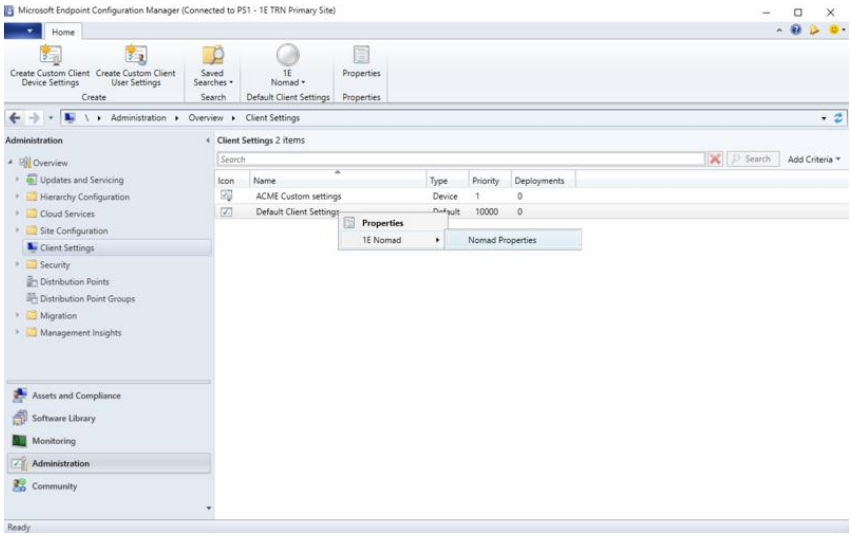
9.4.2.1.4.3 Enabling Nomad for Applications and Software Updates

Set Nomad as a download provider for applications and software updates in Configuration Manager **Client Settings**.

To do this:

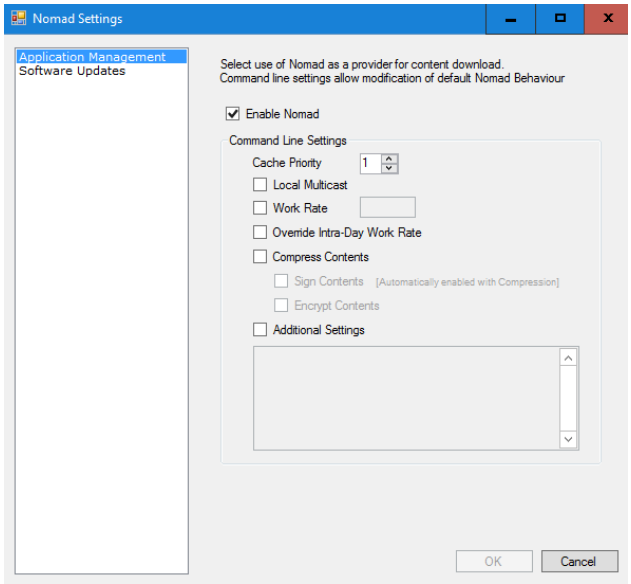
Open the Configuration Manager console.

Under **Administration**, choose **Client Settings**.



On **Default Client Settings**, choose **Nomad Properties** from the context menu.

In the **Nomad Settings** dialog, unique settings can be stored for both **Application Management** and **Software Updates**.



9.4.2.1.4.3.1 Custom device settings

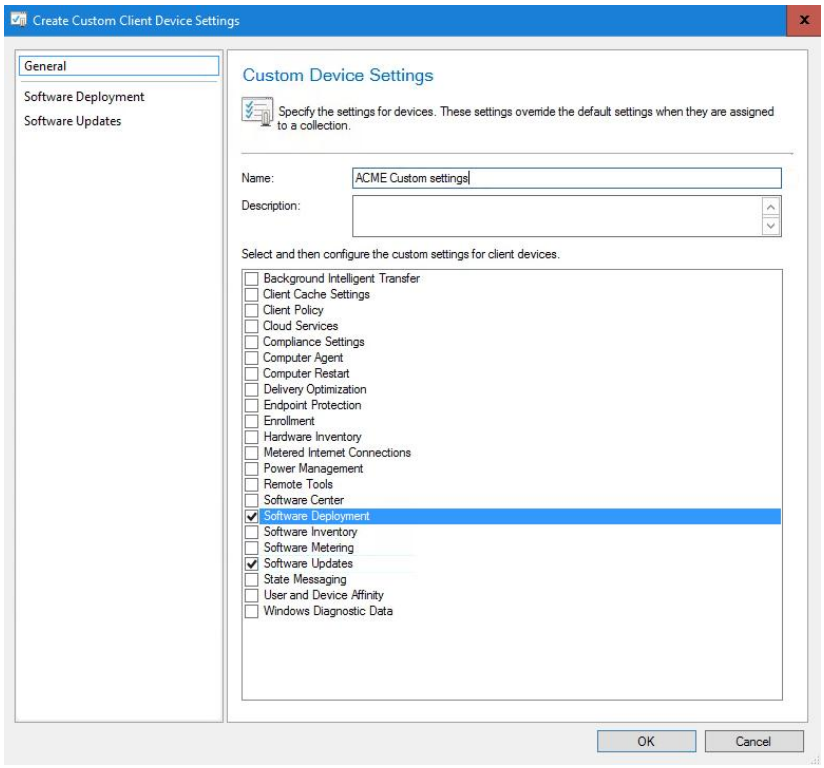
In addition to configuring the **Default Client Settings**, you can also enable Nomad for Applications and Software Updates in within a custom client settings group.

> **Note**
>
> You must configure **Default Client Settings** so that clients have default settings to fall back to if they move out of scope of the custom settings.

When creating new or modifying existing **Custom Device Settings** to enable Nomad, ensure the **Software Deployment** custom setting is selected (to enable Nomad for Applications) and **Software Updates** custom setting is selected to enable Nomad for Software Updates.

When the Custom Settings have been created or modified to include these options, right-click the custom client settings (by Name) in the **Client Settings** list in the console, select **1E Nomad** → **Nomad Properties** and enable and configure Nomad for Application Management and Software Updates as indicated in the screenshot above.

> **Note**
>
> When using Nomad in an OS Deployment Task Sequence that includes Applications or Software Updates, it is necessary for Nomad to be enabled (for Application Management and Software Updates respectively) in the Default Client Settings.
>
> When a Task Sequence is executing and the ConfigMgr client is initially installed, it uses only settings from the Default Client Settings and will not apply any custom settings.



9.4.2.1.5 Download resumption and consistency checking

To minimize repeated downloads of the same content from the Distribution Point, Nomad supports download resumption and consistency checking.

Refer to Deploying software with Configuration Manager for example scenarios about deploying Applications and Packages where Nomad is integrated with Configuration Manager and how you can monitor those deployments using the Nomad app.

9.4.2.1.5.1 Download resumption

Nomad downloads include checkpoint recovery, so if the connection to the distribution point is disrupted during a download, it is resumed when the connection is next available. Download resumption starts from the point it had reached when the connection was lost. This means that no previous time spent downloading the package is wasted.

9.4.2.1.5.1.1

9.4.2.1.5.2 Consistency checking

Nomad must be installed on all the Configuration Manager DPs. This not only lets central multicast work, but also enables package file checksums to be calculated centrally allowing efficient recovery from file transfer issues if one exists. The central creation of the checksums also minimizes the computational overhead.

Nomad uses manifest files to describe the download contents of Configuration Manager applications and packages. This enables it to provide file-level transfer and, when integrated with Configuration Manager remote differential compression (RDC), file delta downloads. The Nomad client automatically generates a manifest for each version of each package. The generation request occurs as the first Nomad client attempts to download the newest version of a package.

9.4.2.1.5.2.1

9.4.2.1.5.3 Manifest files

The manifest, a *LSZ* file, is stored in the root of the Nomad cache. This lists each file, its time stamp, a CRC checksum and the Configuration Manager hash value for the content. Nomad uses this manifest to ensure that the correct files have been downloaded for each package and to enable the rapid detection of changes between versions of packages.

9.4.2.1.5.3.1 Hash checks for Windows 10 service updates

Nomad now gets the hash from the *LSZ* file and validates the calculated hash with it. Since the *LSZ* file can contain SHA2 or SHA1 hashes, along with cyclic redundancy checks (CRC) for individual files, the precedence of the validation is:

Use HashV4 (which is SHA2) if it exists, for the validation.

Use Hash (which is SHA1) if it exists, for the validation.

Otherwise, only perform CRCs on all the files that have that value in the *LSZ* file.

This enables standalone downloads to get the hash check on the server side (from the *.ini* file) as well as on the client side (from the *LSZ* file).

9.4.2.1.5.4 Distribution point resilience

If a DP becomes unavailable during a download, Nomad will failover to the next DP on the list ensuring download resilience efficient content delivery.Configuration Manager provides a list of DPs from which the content for packages can be downloaded. Under certain circumstances, DPs may become unavailable. Using a list supports failover by selecting a new DP to continue the download.

Earlier versions of Nomad would only attempt to download once from each DP in the list. If a DP was not available, Nomad would abort the download. However since v4, Nomad now cycles through the list of DPs until a connection is established. If no DP is accessible, it will wait for a time before trying the list again until a timeout is reached.

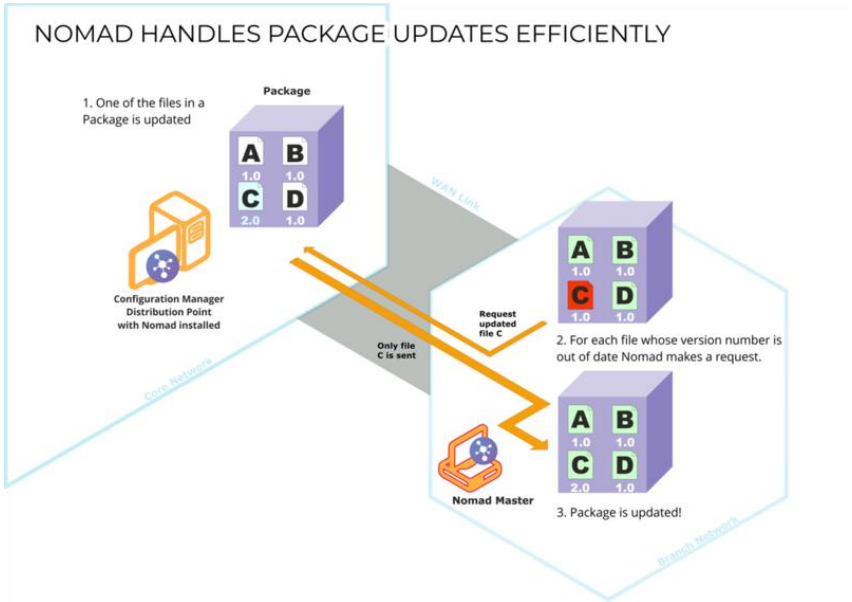
The delay before retrying the DP list is configured in the RecycleDPDelay registry value

The maximum download timeout is configured in the DownloadTimeout registry value.

9.4.2.1.5.5 File-level delta downloads

Nomad is able to perform package updates efficiently not only by downloading just the files whose versions have changed, but also by downloading just the portions of the changed files that are different. In a similar way to file consistency checking, Nomad can also efficiently deal with package updates.

In this example, if a package that has been previously downloaded has one of its files updated, Nomad compares each of the file versions for its cached package with the file versions for the incoming updated package. If a file has an older version, it is requested for download. if that is the only file that has been updated the transfer is complete and the package is updated.



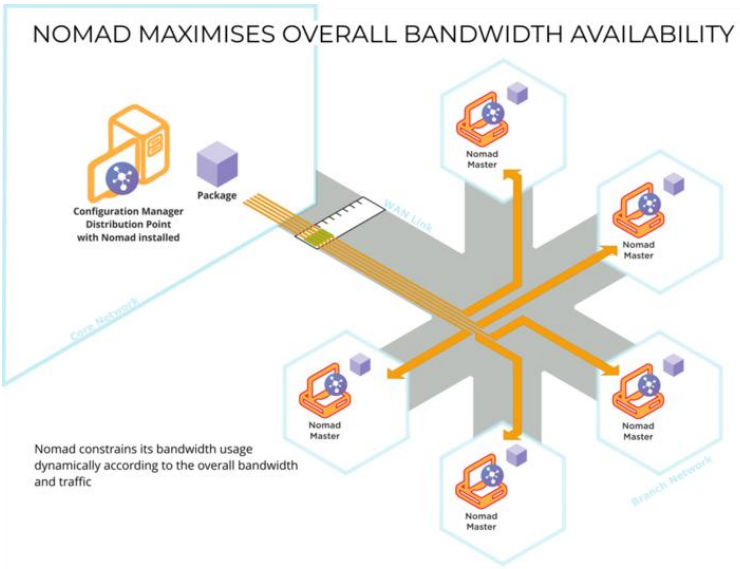
9.4.2.1.6 Bandwidth Protection

Nomad dynamically analyzes the overall WAN traffic to ensure that it only uses a percentage of the total. It is also aware of mobile devices and knows the difference between wireless and wired connections and is able to select the most efficient available connection to use.

9.4.2.1.6.1 Full control over WAN link usage

Nomad respects business data on the network – it detects the true end-to-end available bandwidth and monitors this throughout the duration of the download. This is calculated using a sophisticated algorithm that looks beyond the receiving capabilities of each device's network card. If bandwidth is available, the transfer speeds up; if it becomes restricted, the transfer slows down. As a result, overall WAN availability is maximized and the impact on the critical link between the branch networks and the central network is minimized.

To avoid placing a burden on office wireless bandwidth and to use the most efficient transfer system possible, Nomad can be configured to switch from a wireless to a wired network connection automatically when one becomes available. (Please refer to Design Considerations - Managing stable LAN connections).



9.4.2.1.6.2 Bandwidth Protection Reporting

With Bandwidth Protection Reporting, so you can now see how Nomad is preventing end-user disruption due to software and update deployments. Bandwidth Protection Reporting will allow you to see the positive impact Nomad is having across the organization, to individual sites, subnets, all the way down to a single client.

Using the Nomad app, you can view bandwidth protection metrics on the following pages:

Overview page

Devices page

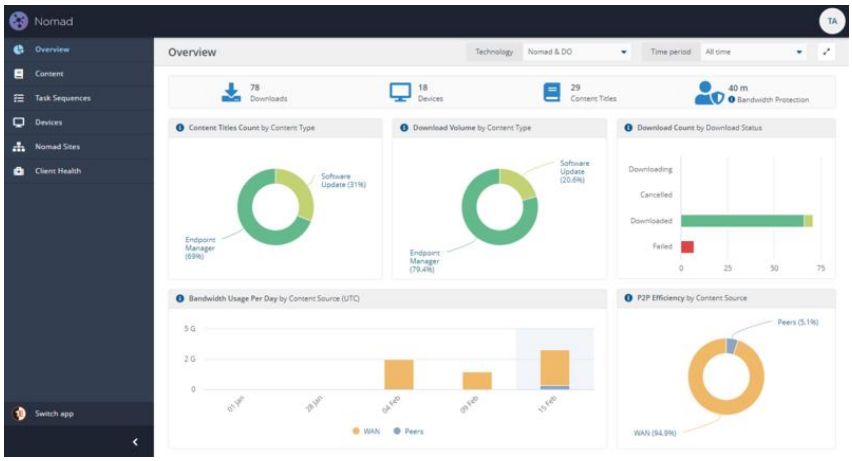
Nomad Sites page.

The following new metrics are available in the Nomad app to help demonstrate how Nomad benefits your organization:

Metric	Description
Bandwidth Protection	Displays the total time that Nomad backed off when downloading content to protect end-user bandwidth. This is the result of the **Bandwidth Protection Time** column dived by the **Active Download Duration** and multiplied by 100.
Bandwidth Protection %	Bandwidth Protection shown as a percentage of downloads.
Bandwidth Protection Time	Duration the client backed off from downloading to save download bandwidth.

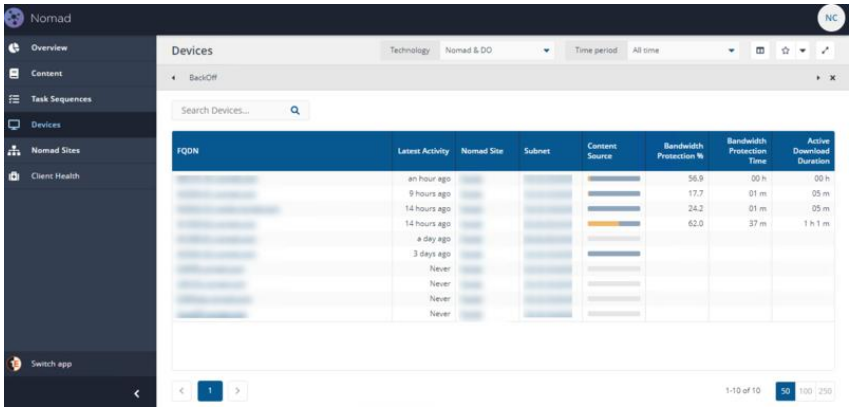
9.4.2.1.6.2.1 Overview page

The Overview page gives a high level view of the current status of content throughout the entire network, including **Bandwidth Protection**.



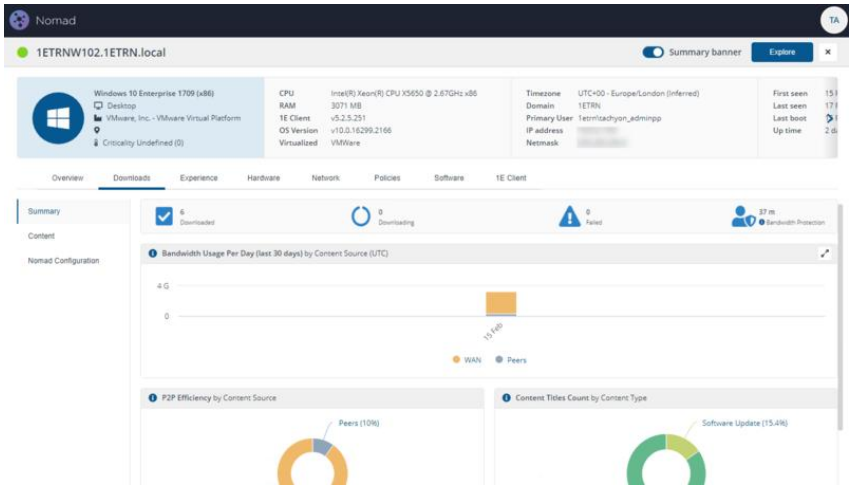
9.4.2.1.6.2.2 Devices page

The Devices page lists all Devices that have sent Nomad device registration events and have sent download events within a selected time period, and includes **Bandwidth Protection %** and **Bandwidth Protection Time**.



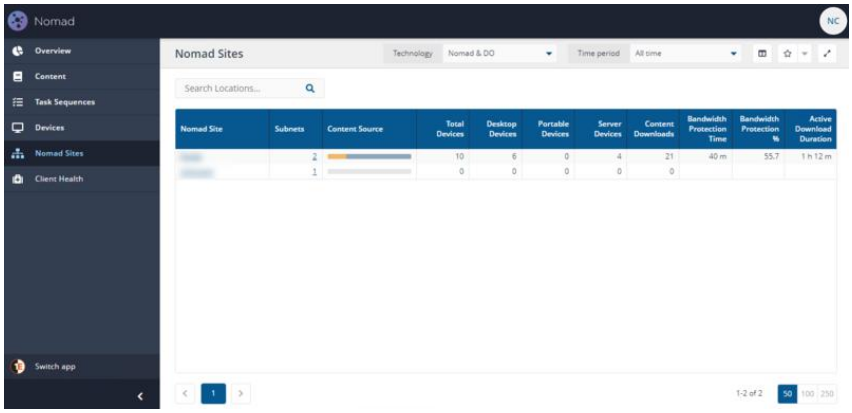
9.4.2.1.6.2.2.1 Devices page details view

The status bar along the top shows high-level download statistics for a particular device, including **Bandwidth Protection**.



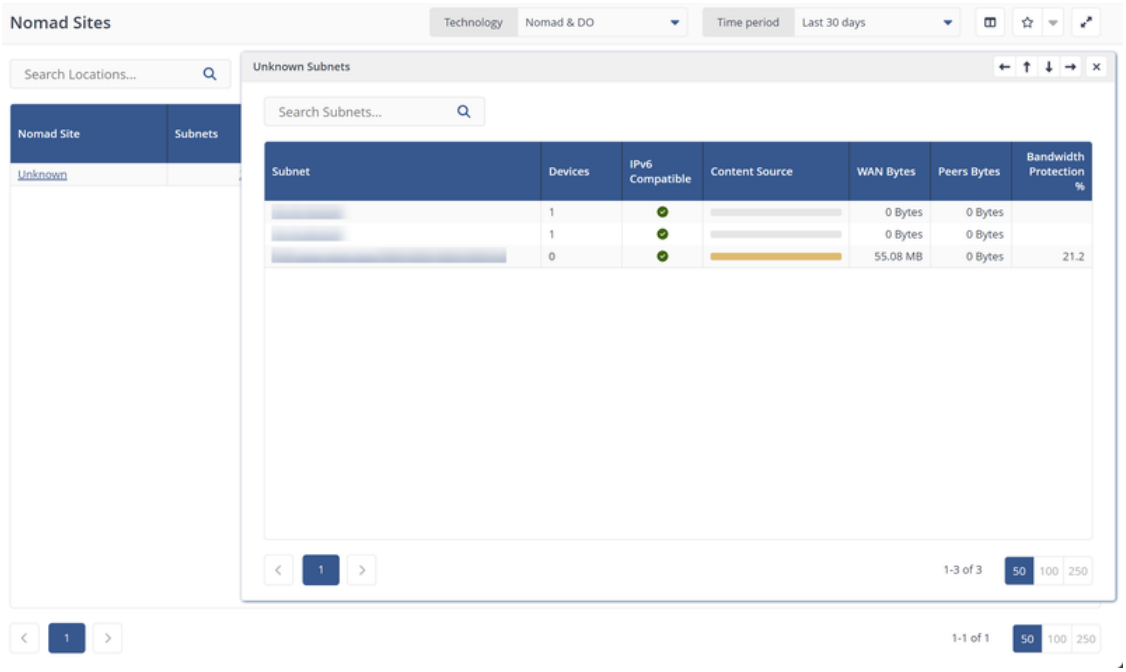
9.4.2.1.6.2.3 Nomad Sites

The Nomad Sites page shows how the network is being used for content distribution in different locations, including **Bandwidth Protection**.



9.4.2.1.6.2.3.1 Nomad sites subnet drawer

A drawer that opens up when you click on **Subnets**, **Content Source**, **WAN Bytes** etc. except **Network Location**. It shows a list of all Subnets falling under that location, including **Bandwidth Protection %**.



9.4.2.1.7 Nomad FanOut

Windows imposes a limit on the number of concurrent connections on the Nomad share. The FanOut feature compensates for this limitation by enabling any peer that has more content than the requester to respond to the FanOut request. It is not limited to peers that have an active connection to the master.

9.4.2.1.7.1 How FanOut works

To use FanOut, the Nomad *SpecialNetShare* registry value must be updated to include bit 6 (*0x40*or 64 decimal) on all devices hosting Nomad.

By default, the Nomad cache share *(NomadSHR)* is limited to six concurrent connections by Windows. This means that up to six Nomad peers (devices that request the download) can obtain content from the master at any given time (the device that wins the election on the subnet and becomes the central source for the download). Under normal circumstances, if a Nomad client tries to connect to the master and all six connections are in use, the Nomad client retries later.

The FanOut feature compensates for this limitation by enabling the Nomad client to ask for an alternative peer on the same subnet that has the content it needs, any other peer on the subnet can respond to this request but will only do so if it meets certain criteria, it must:

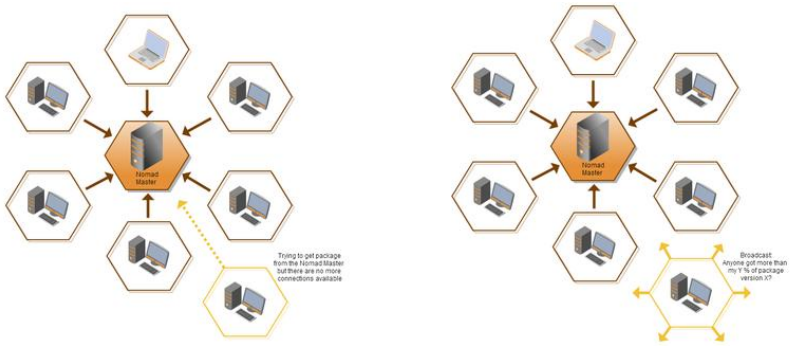
Have more content than the Nomad client requesting it

Have available connections on its own *NomanSHR*

Not already be connected to a FanOut peer (a device connected to the master share that responds to FanOut requests and allows other devices to connect to it).

Refer to Deploying software in large networks - Using FanOut for large subnets for an example scenario about deploying software in a large network and how you can monitor those deployments using the Nomad app.The following illustrations demonstrate how FanOut works.

If a Nomad peer gets a Maximum connections limit when trying to connect to a master, it broadcasts a request for who has more than a certain percentage of a package with a certain ID.



A device responds to a FanOut request if the following conditions apply:

If it is currently active and downloading, or it is idle and has downloaded part or all of the package from the master

It has a larger percentage of the package than the device broadcasting the request

If the broadcast request has not been received over a wireless link

Its version of the package is greater than or equal to the package version held by the device broadcasting the request

It has free connections to its Nomad share

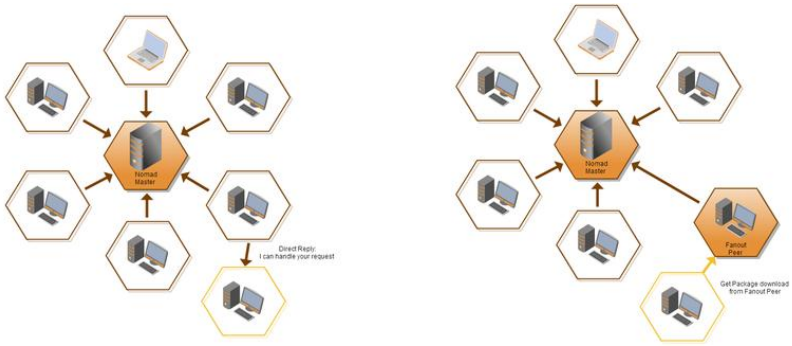
Its election weighting is greater than zero – i.e. it is not set as a sensitive server

It is not a domain controller

It is not part of any inhibited subnets and sites - please refer to Design Considerations: Inhibiting subnets and sites

Its NomadSHR exists and P2PEnabled is turned on, it is not set to 0.

The Nomad peer will attempt to connect to the first FanOut peer that responds to its request. In this way, rather than limiting the distribution to six Nomad peers, many more devices can be accessing the download from the master, exponentially speeding up content deployment on large subnets.



9.4.2.1.7.2 Checking to see if FanOut is working

To observe FanOut on Nomad client when the connection to NomadSHR is reached on the elected master:

Open *NomadBranch.Log* on a Nomad client. This client must not be the master.

Notice that the client has failed to connect to the master.

It then polls for a FanOut peer.

It receives a response and starts the download.

Date/Time	Log Text
12/8/2014 1:41:29 PM	AttemptConnection "1ETRNW81"
12/8/2014 1:41:29 PM	Standard P2P connecting to master \\1ETRNW81\NomadSHR as "1ETRNW81\SMSNomadP2P&"
12/8/2014 1:41:31 PM	Failed to connect to "\\1ETRNW81\NomadSHR" - No more connections can be made to this remote comp (0x00000047)
12/8/2014 1:41:31 PM	FanOutPeer Poll
12/8/2014 1:41:31 PM	FanOutPeer candidate 1ETRNW71 40.817%

12/8/2014 1:41:34 PM	SMB Connected OK
12/8/2014 1:41:34 PM	CopyLstFromPeer:: - \\1ETRNW71\NomadSHR\PS100015_1.LsZ
12/8/2014 1:41:34 PM	P2P 0100007F 2000 "PS100015_1.LsZ" blk=0 (blk/s=0) 0(0)

9.4.2.1.7.3 Limitations

Nomad FanOut cannot currently be used with the following features:

Nomad is installed in WinPE is not capable of becoming a FanOut peer (i.e. a provider of package content) because file sharing is not supported. However, Nomad is capable of requesting content from and connecting to FanOut peers on the local subnet.

Nomad FanOut is not compatible with Nomad multicast, if multicast is enabled for a particular package, Nomad FanOut is not used, regardless of the value in *SpecialNetShare*

Nomad FanOut will not be used when Nomad is run in standalone mode

Nomad FanOut is disabled for computers using wireless connectivity.

9.4.2.1.8 Content Distribution overview

1E Content Distribution is a Tachyon Consumer, providing control and visibility on content deployments and delivery in an organization.

9.4.2.1.8.1 Content Distribution features

Content Distribution offers visibility for the following using the Nomad app:

The status of all deployments, including both delivery and execution of content

The effectiveness of Peer to Peer technologies like Delivery Optimization (DO), Nomad and BranchCache

Historical trends like Peer to Peer effectiveness

Where content is located or cached by a Peer to Peer technology.

In addition, to the reporting use-cases mentioned above, Content Distribution supports other content distribution uses-cases like:

Single Site Download (SSD)

Nomad Pre-caching

Nomad Download Pause.

> **Note**
>
> The above features were previously provided by ActiveEfficiency Server, which has been replaced by Content Distribution on Tachyon Platform 5.2.

9.4.2.1.8.2 Content Distribution components

Content Distribution consists of four main components, the Nomad app is the front end of Content Distribution and the other components form the back end.

Component	Description
Nomad app	Shows content distribution stats and provides a UI to manage content distribution.
Content Distribution Consumer	REST API collects content distribution data from endpoints and provides it to the Nomad app for rendering.
ContentDistribution database	A database that backs the REST API and stores its data.
1E Client	A component running locally on the endpoint captures content distribution data and posts it to the REST API.

9.4.2.1.8.3 Nomad app

Content Distribution features are exposed to the user in the Nomad app. Each page in the Nomad app offers different tiles displaying various Peer to Peer metrics.

The **Overview** page gives a high level view of the current status of content throughout the entire network. By default, the view will show activity and status for both Nomad and Delivery Optimization. These defaults can be modified using the **Technology** filter (to show Nomad or DO activity only) and the **Time period** filter.

The **Overview** page gives a brief snapshot of download activity. The page has multiple tiles showing:

Content Titles by Content type

Download Volume by Content Type

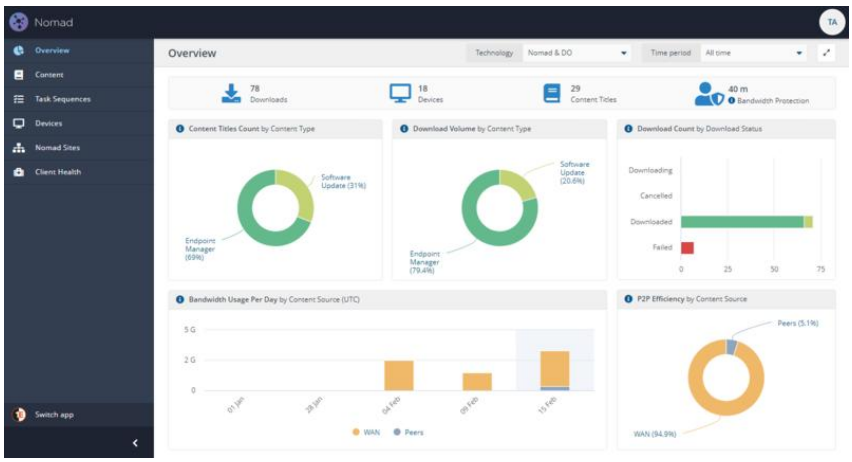
Download Count by Download Status

Bandwidth Usage Per Day by Content Source (UTC)

P2P Efficiency by Content Source (Peer to Peer - P2P).

The results can further be narrowed down by using the **Technology** and **Time period** filters on the page.

Please refer to the Nomad app reference for more details.



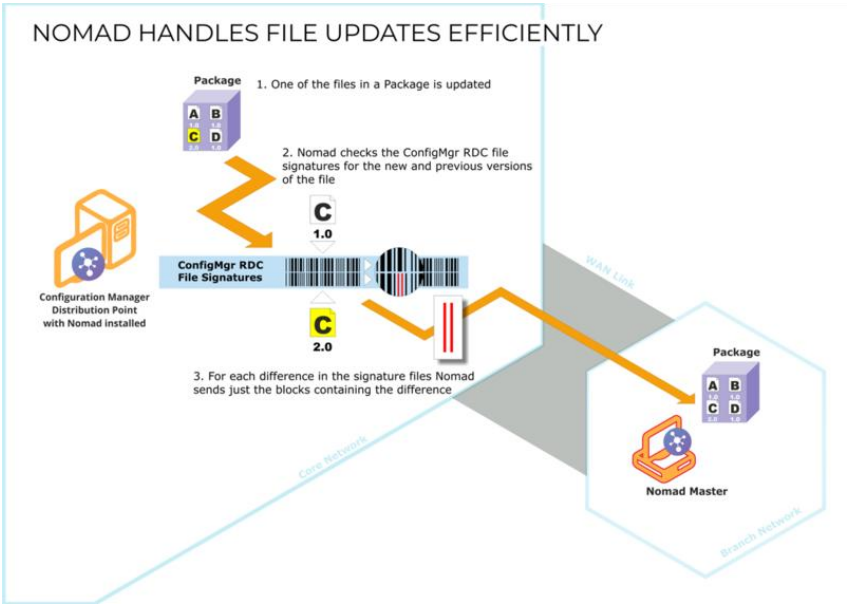
9.4.2.1.9 Remote differential compression (RDC) integration

Not only is Nomad aware of the file level differences between different versions of a package so that only changed files are downloaded, it is also aware of the differences within individual files.

This is sometimes known as binary differential replication or binary deltas but is more commonly known as remote differential compression (RDC) integration, for details refer to https://docs.microsoft.com/en-us/previous-versions/windows/desktop/rdc/about-remote-differential-compression.

Refer to Deploying software in large networks - Using FanOut for large subnets for an example scenario about deploying software in a large network and how you can monitor those deployments using the Nomad app.

In our example, a package that has been previously downloaded has one of its files updated. Nomad compares the Configuration Manager RDC signature file (where each block in the file is given a number that identifies it according to its contents) for the new version of the file and the one before it. By identifying the changes, Nomad is able to download just the file blocks containing the differences.



In combination with other Nomad features such as bandwidth protectionanddynamic elections, remote differential compression (RDC), when used with Configuration Manager (CM), results in an even more efficient and reliable mechanism for transferring content across the WAN. The Nomad client automatically generates a manifest file for each version of a package when the first client attempts to download the newest version of a package. If RDC is enabled, file delta downloads becomes a feature of the manifest file and the client will download just the differences from either the DP or the local peer.

RDC integration occurs on:

Configuration Manager distribution point (DP)

Nomad client master

Nomad client peers.

The only configuration required for RDC is:

Enable Configuration Manager RDC on the DP

Install Nomad using the SIGSFOLDER property on any DPs (or update the Nomad SigsFolder registry value).

> **Note**
>
> On Configuration Manager, RDC is not used for applications. This is because an application's content version always remains at 1, only the content revision gets updated with a new content ID, so RDC for applications will not occur. This is not a limitation of Nomad, but simply the way the application model is implemented.

9.4.2.1.9.1 RDC on distribution points

RDC signature files must be generated and copied to the default signature folder (*C:\SMSSIG$*) by Configuration Manager. If you use a different location for the signature files, you must update its location in the in SigsFolderregistry value. Signature files are generated for every package, including OSD images.

9.4.2.1.9.2 RDC on the elected client

The RDC file copy feature only works between the DP and the elected master. The package download process remains almost the same as in earlier versions of Nomad, except for files that have an RDC value specified for them in the manifest file.

The Nomad master checks for the package version *(n-1)* on the subnet. If the version *(n-1)* is cached locally or available on another client on the same subnet, it uses RDC to copy delta blocks from the DP. Once the elected master starts to download the newest version of a package, it first fetches the manifest file and RDC data generated by the *NomadBranch* service for that package on the DP. The RDC data contains the needs list (*.needs.bin*) for all the files in the package that have changed between versions *n-1* to *n*. These *.needs.bin* files are used to create the target files by copying blocks from the files cached locally and from the DP.

If the master becomes unavailable during this process, a re-election takes place and the new master re-downloads the needs list from the DP.

> **Note**
>
> The *NomadBranch* service skips RDC calculations while generating the *LSZ* of a package where the *LSZ* of version *n-1* has not been generated earlier or if the *LSZgen* request is for the first version of the package.

9.4.2.1.9.3 RDC on the peer

RDC file copy is done between the DP and the elected master only in a subnet. The remaining devices or peers in the subnet copies all the blocks of files modified in the package using normal P2P.

9.4.2.1.9.3.1 Alternate source copy

Alternate source copy, often referred to as alt-copy, takes place when the elected master does not have the previous version of the package, but another device on the subnet has it. The elected master can still do RDC file copy by copying the required blocks using RDC_alt copy from the other device on the subnet.

> **Note**
>
> If a version *n* of a package is not available from Nomad peers but version *n*-1 is, Nomad fetches *n*-1 on the assumption that at least some files are unchanged between versions, then it will download just the remaining, different, files in version *n* from the DP.
>
> This mechanism relies on the name of the content remaining the same between versions with just a change in the version number, and so it only works for packages. A new version of an application or software update has a completely new name, and version numbers are not meaningful. There is no configuration option for this, Nomad does it automatically.

On Windows Server DPs without a primary or secondary site server, RDC must be installed manually using Windows Server Manager.

> **Note**

Alternate source copy will only work when clients download from the same DP.

9.4.2.1.10 Downloading content for CM Software Updates from Microsoft Update

This feature enables Nomad to download content from Windows Update / Microsoft Update (WUMU). Starting in CB version 1806, software updates can be deployed to devices without first downloading and distributing content to Distribution Points, instead clients download updates directly from the cloud.

Refer to Deploying software updates using Configuration Manager for an example scenario about deploying software updates using CM and how you can monitor those deployments using the Nomad app.

9.4.2.1.10.1 Configuration

Downloading the following type of updates is enabled by default in the Nomad client (1E Client 4.1 and later). Downloading from Microsoft Update is also enabled by default.

The settings are defined in CompatibilityFlags and you will need to ensure the relevant bits remain set if you are using that registry value to configure other options, as follows:

Type	Enable Nomad to download	Enable Nomad to download from Microsoft Update
Software Updates (including Windows 10 feature updates)	Always enabled	Set bit 27 (0x08000000, 134217728 in decimal)
Office 365 updates	Always enabled	Set bit 28 (0x10000000, 268435456 in decimal)
Windows 10 Express Installation Files and Delta Content for Updates	Set bit 26 (0x04000000, 67108864 in decimal)	Set bit 28 (0x10000000, 268435456 in decimal)

To enable all the above, then AND bits 26, 27 and 28 with whatever you have already set in CompatibilityFlags.

Please refer toDistributing software with Nomad and Configuration Manager: Enabling Nomad for Applications and Software Updatesfor how to configure client settings to set Nomad as a download provider for applications and software updates.

Note

Please note, there is no configuration is required on Distribution Points.

9.4.2.1.10.2 How it works

9.4.2.1.10.2.1 Configuration Manager and Microsoft Updates

Configuration Manager supports Windows Update / Microsoft Update (WUMU) cloud service as a content location for Software Update deployments.

When creating a deployment of a software update, on the **Download Settings** page you can configure the setting

If software updates are not available on distribution point in current, neighbor or site boundary groups, download content from Microsoft Updates. Enabling this setting means *intranet-connected* clients will download software updates from Microsoft Update if updates aren't available on Distribution Points. *Internet-based* clients always go to Microsoft Update for software updates content. This setting is beneficial when dealing with extremely large update content and if you want clients to always get content from the Windows Update / Microsoft Update (WUMU) cloud service. This feature supports any update type supported by Configuration Manager software updates management, including Windows and Office updates.

9.4.2.1.10.2.2 Nomad and Microsoft Updates

Before the introduction of this feature in Nomad 7.0, if Configuration Manager client Content Transfer Manager (CTM) asked Nomad to get a download job from WUMU, it used to fail the job with error code ERROR_UNKNOWN_TRANSPORT 0x2059, which notifies E_FAIL to CTM. Nomad does this because it expects CTM to take over the download using BITS. With the introduction of this new feature in Nomad 7.0, Nomad client can now manage the content download from WUMU, and use Nomad's P2P feature to download content from peers that already have the necessary content.

At the time of writing CB 1902, and therefore Nomad, does not support Windows Update for Business.

9.4.2.1.10.2.3 Compatibility with Distribution Points

WUMU is treated as just another Distribution Point and features like DP resilience would work as expected. If Nomad was for example, downloading an update from a DP and encountered an issue in reaching the server, then it would continue the download from WUMU (if configured) from wherever it was interrupted.

9.4.2.1.10.2.4 Hash validation

When downloading from a Distribution Point, Nomad client retrieves the LSZ file and does a full hash validation of the update as well, because Nomad on a DP can retrieve it and keep it in LSZ file. Individual files are validated against HASH fetched from URL's, but the whole update is not validated together as the full Hash of the update isn't available anywhere in WMI.

9.4.2.1.11 Windows 10 Express Installation Files and Delta Content for Updates

As Windows 10 cumulative updates get very big, very quickly (often in excess of 1GB a few months after any given Feature Upgrade), Microsoft started publishing express installation files for these updates in addition to the traditional full update files. Configuration Manager introduced support for Windows 10 Express Installation File updates in Current Branch 1802 hotfix KB4163547.

Express installation files are a much larger payload on the Distribution Point compared to traditional software update files, but the feature enables clients to download delta byte-ranges from these files, so each month the amount of data a client has to download is typically much smaller. Configuration Manager Current Branch can be configured to support express installation files (refer to https://docs.microsoft.com/en-us/configmgr/sum/deploy-use/manage-express-installation-files-for-windows-10-updates for more details).

With the release of Windows 10 1809, Microsoft replaced express update files with a new way of managing deltas within software updates. In Configuration Manager 1902 the **Enable installation of Express installation files on clients** option in Software Update Client Settings was replaced with **Allow clients to download delta content when available**.

Note

Nomad supports the download of Express installation files and delta content for updates.

Refer to Deploying software updates using Configuration Manager for an example scenario about deploying software updates using CM and how you can monitor those deployments using the Nomad app.

9.4.2.1.11.1 Updates, Nomad and Delivery Optimization

The Microsoft implementation of byte-range downloads in Configuration Manager integrates with Delivery Optimization (DO) on Windows 10 clients. When the CM client has been configured to use express installation files or delta content for software updates, Delivery Optimization will attempt to get the content from other DO peers. In normal circumstances, if DO is unable to fulfil a request from DO peers it will revert to the HTTP source on the Internet. However, in this scenario, when the software update is managed by CM, DO reverts to the CM client to get the content from the DP and in turn Nomad will be used to download the content. It is therefore possible that when using express updates or delta content for updates, some byte ranges may be downloaded by Nomad and some by DO.

Any byte ranges downloaded by Nomad in this scenario will be available to Nomad and DO peers, whereas byte ranges downloaded by DO will only be available to DO peers. As DO is typically more aggressive than Nomad at clearing its cache, it is likely that Nomad will fulfil more byte-range requests than Delivery Optimization if the update deployment is phased over a number of days, whereas DO could be expected to fulfil more requests when the same update is deployed to all clients at the same time. It is therefore important when enabling express installation files or delta content for software updates in Configuration Manager to ensure you have Delivery Optimization configured appropriately for your environment, even though you are using Nomad.

9.4.2.1.11.1.1 Download mode

The download mode option is important as this determines which devices DO considers as peers it can share content with and may result in content being downloaded over the WAN, for details about download mode refer to https://docs.microsoft.com/en-gb/windows/deployment/update/waas-delivery-optimization-reference#download-mode.

Setting	Description
Download Mode is set to 1	On Windows 10 Enterprise and Education, Download Mode is set to 1 (LAN) by default. This will allow peers within the same network (including all clients sharing a public Internet address through NAT) to share content. The default value for other editions is 3 (Internet) allowing clients to get content from other peers on the Internet.
Download Mode is set to 2 (Group)	Setting Download Mode to 2 (Group) will by default enable peers within the same AD site (or if not in a defined AS Site, the same AD Domain) to share content. You can use other methods

Setting	Description
	to define the group, including DHCP Scope Option, DNS suffix or Azure AAD Tenant ID, refer to https://docs.microsoft.com/en-gb/windows/deployment/update/waas-delivery-optimization-reference#select-the-source-of-group-ids for details. If you enable the Configuration Manager Client setting **Use Configuration Manager Boundary Groups for Delivery Optimization Group ID**, Download Mode will be set to 2 (Group) and peers within the same CM Boundary Group can share content. In this scenario the CM client sets the Group ID on each client using a unique identifier for the CM Boundary Group that the client is in.
Download Mode to 0 (HTTP only)	You can turn off Delivery Optimization peer-to-peer content distribution by setting Download Mode to 0 (HTTP only). This will result in Nomad downloading all byte ranges, but will prevent DO from sharing other content. (e.g. Microsoft Store, Microsoft Updates outside of CM or Intune Win32 apps) with peers. We do not recommend turning off DO peer-to-peer if you are using or planning to use these Microsoft features.
Download Mode = 99 (bypass)	**Note** Do not use Download Mode = 99 (bypass). This option is only relevant on clients if you use WSUS (outside of CM) and prefer to use BranchCache rather than DO. If you are using CM and Nomad for software updates then this option is not needed and can prevent updates from successfully downloading.

9.4.2.1.11.1.2 Windows 10 express installation files

Nomad can download byte ranges from Windows 10 express installation files requested by the Configuration Manager client from either an on-premises DP, Microsoft Update or a Nomad peer.

> **Note**
>
> For details on how Configuration Manager Current Branch uses express updates, refer to https://docs.microsoft.com/en-us/sccm/sum/deploy-use/optimize-windows-10-update-delivery. This also details some native Configuration Manager caveats when using Express updates (notably the increased disk space required on Distribution points and source servers within Configuration Manager).

Using Express installation file or delta content for updates in Configuration Manager (with or without Nomad) has the following additional limitations:

Limitation	Description
Express installation file support.	Express installation files are supported on Configuration Manager Current Branch 1802 (with hotfix KB4163547) and CB 1806 or later, and Windows 10 versions 1703, 1709 and 1803 or later. Delta content for updates is supported in CM CB 1910 onward.
Nomad does not send status messages for downloads of express installation file or delta content for updates.	Nomad does not send status messages

Limitation	Description
	for downloads of express installation file or delta content for updates as there is no way for Nomad to determine if all the required byte ranges have been downloaded for a given update. Nomad is simply obtaining byte ranges as they are requested and notifies the CM Content Transfer Manager as it completes each

Limitation	Description
	download.
Deploying updates using express installation files typically takes longer to install.	Deploying updates using express installation files typically takes a lot longer to install compared to traditional full updates as a lot of processing is required on the client to calculate what byte ranges are required. As an example, a typical Windows 10 Express CU may take over 1 hour to download over even

Limitation	Description
	a fast 1GBs Network connection, where a copy of the same full update would typically take only a couple of minutes.
The Install Software Updates step in an OS Deployment Task Sequence may become unresponsive.	The Install Software Updates step in an OS Deployment Task Sequence may become unresponsive for several hours. As examples, a Windows 10 "Wipe and load" Task Sequence might fall back to

Limitation	Description
	using full versions of the software updates after several retries and an in-place upgrade, fail to initialize the Delta download startup task and hang at a "install Software Updates" step, meaning OS Deployment task sequences, may take some additional hours than normal to complete.

9.4.2.1.11.2 Enabling express installation file and delta content for updates in Nomad.

Once you have configured CM for express installation files or delta content for updates and are comfortable that your Delivery Optimization configuration is appropriate for your network, you

can enable the feature in Nomad through the CompatibilityFlags registry value on the client, setting bit 26 (0x4000000, or 67108864 in decimal).

Downloading the following type of updates is enabled by default in the Nomad client (1E Client 4.1 and later). Downloading from Microsoft Update is also enabled by default.

The settings are defined in CompatibilityFlags and you will need to ensure the relevant bits remain set if you are using that registry value to configure other options, as follows:

Type	Enable Nomad to download	Enable Nomad to download from Microsoft Update
Software Updates (including Windows 10 feature updates)	Always enabled	Set bit 27 (0x08000000, 134217728 in decimal)
Office 365 updates	Always enabled	Set bit 28 (0x10000000, 268435456 in decimal)
Windows 10 Express Installation Files and Delta Content for Updates	Set bit 26 (0x04000000, 67108864 in decimal)	Set bit 28 (0x10000000, 268435456 in decimal)

To enable all the above, then AND bits 26, 27 and 28 with whatever you have already set in CompatibilityFlags.

Please refer to Distributing software with Nomad and Configuration Manager: Enabling Nomad for Applications and Software Updates for how to configure client settings to set Nomad as a download provider for applications and software updates.

Note

Please note, there is no configuration is required on Distribution Points.

9.4.2.2 Single Site Download (SSD)

Nomad's Single Site Download (SSD) feature ensures a download across the WAN only happens once per site. It does this by maintaining information about which subnets are neighbors of each other (accessible on LAN rather than WAN), so that when an elected master considers a download from a DP rather than a peer in its subnet, it can discover which other local subnets already has the package. These subnets are typically at a single customer site, specifically a single geographical location.

Nomad SSD uses Content Distribution. When a Nomad client downloads a package, it registers this information with Content Distribution, enabling a profile to be created on which Nomad clients hold particular packages.

Refer to Deploying software in large networks for scenarios for deploying software in large networks, utilizing Single-Site Download (SSD), and how you can monitor those deployments using the Nomad app.

Without SSD, an elected master for each subnet always accesses a Distribution Point (DP), often over a slow or congested WAN, even if a neighboring subnet in the LAN had the requested package. In practice, this had no major impact on WAN traffic as Nomad only uses a proportion of the current *free* network capacity rather than the total rated capacity, but efficiency can be improved by enabling access to Nomad caches on other subnets.

When a Nomad client requires a particular package, it attempts to find a copy on the local subnet. If it is unable to find one, it queries Content Distribution to see if there are Nomad clients on adjacent subnets that hold a copy. If it finds one, it will download the package from it; if it doesn't, it will download the package from the DP over the WAN as a last resort.

> **Note**
>
> Nomad reacts dynamically to network adapter changes, and if its IP address changes it will automatically update its subnet information in Content Distribution. So, for example, closing the lid of a laptop and moving it to another subnet and resuming work there is handled by Nomad.

How SSD interacts with other CD features

SSD works seamlessly with FanOut – FanOut applies to peers and SSD applies to subnet masters

SSD will use IP addresses if P2PEnabled registry value is set to use net literal names

Work rates only apply to downloads from a DP not to P2P transfers, therefore they do not affect downloads from peers when using SSD

When packages are purged from the cache, the corresponding entries are deleted from Content Distribution. If you delete content directly from the cache, Nomad will not be aware that it has been removed and the corresponding Content Distribution record will not be deleted. If that host subsequently becomes a site master, it will inform requesting Nomad clients that it does not have the package, forcing them to request the package from the next master in the list.

Refer to Enabling SSD in WinPE to make use of Nomad SSD in OS Deployment.

Restrictions

The mechanism does not support alternate source copy downloads, such as downloading an older version of a package from a LAN neighbor then filling in the changes

Only the initial 0% downloaded of a package and the final percentage (which can be < 100% if the entire package cannot be downloaded) are registered with Content Distribution. There are no "10% so far" etc. intermediate records

Even if a computer has multiple NICs, only details of one NIC and its subnet are used for SSD. If that NIC is unavailable, SSD will not work properly (although Nomad itself may be working correctly, using the DP rather than another site)

Remote differential compression (RDC) integration is not supported over SSD, it will not be used when a subnet master is copying from a site master

IPv6 is not supported.

9.4.2.2.1 Site and Local SSD

The local SSD feature was introduced to supplement site SSD for clients on networks such as wireless where broadcasts are disabled, to prevent each client becoming its own master and downloading direct from the DP. In a SSD enabled environment, a master queries Content Distribution to get a list of devices on other subnets within the site that have content. With local SSD enabled, the master also queries for devices having content within local subnet. If any local

peers with content are available, then the master downloads from them, otherwise it attempts to download from Site peers (other subnets in the site), and if the master still cannot find any peers, it downloads the content direct from the DP.

In version 7.0 and later, a master skips using local SSD if it sees broadcast messages from peers. This means clients in mixed network environments can be configured with the same SSDEnabled setting (with Local SSD enabled) and clients can move seamlessly between networks. When on a wireless network (where broadcasts are typically disabled) local SSD can be used. On LAN networks (where broadcasts are typically allowed) local SSD would be skipped because a master is elected and sees broadcast activity from peers.

9.4.2.2.2 Configuration

Before enabling clients to use SSD, you need to ensure the following:

1E platform 5.2 or later is installed and running successfully.

The Content Distribution database is populated with information about sites and their associated subnets.

9.4.2.2.2.1 How to enable SSD

The following information applies to both new and existing installations of Nomad:

Make sure that 1E platform is installed in your environment and is used as a content location metadata repository, for more information refer to Introducing Tachyon

Within Content Distribution, populate the SSD sites and subnet information. A sample PowerShell script called **PostADSitesandSubnets.ps1** is included in the Nomad installation files, which reads sites and subnets from AD

Nomad captures a list of background channels from the 1E Client in the BackgroundChannelUrl and uses the first working URL as the PlatformURL by appending /Proxy/ContentDistribution/ if this PlatformURL is unreachable it attempts to connect to the next BackgroundChannelUrl, for details about BackgroundChannelUrl refer to Tachyon Architecture

Enable SSD on all Nomad agents, by modifying **HKLM\Software\1E\NomadBranch\SSDEnabled** to 3, this enables SSD for both "Provide" and "Consume" modes, specifically Nomad will provide content to other peers and consume content from other peers

If you already have Nomad installed and are only now enabling SSD, then ensure **HKLM\Software\1E\NomadBranch\Platform\ContentRegistration** is set to 1, in other words Nomad will register downloaded content with Content Distribution, this is automatically enabled for new installations of Nomad, and SSD.

> **Tip**
>
> If you have clients on networks where broadcasts are disabled (for example wireless) then enable local SSD by setting SSDEnabled=7. Also set ContentProviderOnWifi=1.

9.4.2.2.2.2 Building a subnet profile in Content Distribution

For Content Distribution to build a subnet profile for SSD and the peer backup assistant feature, Nomad must communicate with its web service. When the Nomad service starts, it connects and registers the hosting device by name with Content Distribution, which returns a device ID in the form of a GUID that enables it to uniquely identify the Nomad client and its default subnet. If it is

unable to communicate with Content Distribution, it retries every 5 minutes until it succeeds (as long as SSD is enabled). An attempt to communicate with Content Distribution is also made prior to a package download to register its status.

Please refer to Enabling SSD in WinPE to make use of Nomad SSD in OS Deployment.

The following points should be noted:

On a multi-NIC host, only one NIC gets registered, and a wired interface takes precedence over a wireless interface during registration

If Nomad fails initially to register an adapter, it retries every 5 minutes (for as long as SSD is enabled) until it succeeds

Wireless adapters can be configured to act as SSD content providers and consumers. Use the ContentProviderOnWiFi registry setting to do this

If the initial device registration was successful when the Nomad service started, but Content Distribution later becomes unavailable, when Nomad subsequently downloads and caches a package it will not be able to register the package with Content Distribution (see below for details). Nomad does not re-attempt package registration, so Content Distribution will not know that this particular Nomad host has the package.

9.4.2.2.2.3 Example PowerShell scripts

You can get information about sites and subnets from AD, or by other means. Example PowerShell scripts can be used for retrieving information about sites and their associated subnets from the AD and updating the Content Distribution database.

Refer to Nomad Branch Tools for details.

9.4.2.2.2.4 Viewing Nomad sites and subnets in the Nomad app

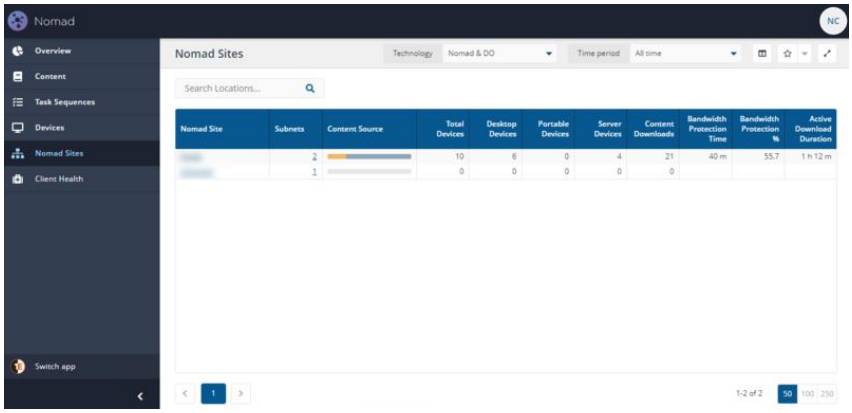
The sites and subnets stored in Content Distribution are visible in the Nomad Sites page of the Nomad app.

The Nomad Sites page is primarily designed to show how the network is being used for content distribution in different locations. It focuses on the volume of content downloaded from peers vs over the WAN, rather than the status of specific Content Titles in a given site. You can see what content is available in a given site by looking at the Content tab for that site.

> **Note**
>
> A Nomad Site corresponds to Nomad Single Site Download (SSD) site. Customers that have implemented SSD and upgrade ActiveEfficiency to the Nomad app and Content Distribution will see their defined SSD locations displayed as **Nomad Sites** in the app.
>
> Any subnets that are not included in a Nomad SSD Site definition will be represented in a site named **Unknown**. If no SSD sites have been defined, all subnets will be included in the 'Unknown' site.

> **Note**
>
> The Nomad app provides visibility of content distribution activity and cache status for content distributed by both Nomad and Delivery Optimization. This includes

Configuration Manager content distributed with Nomad and Software Updates content distributed with either Nomad or Delivery Optimization.



9.4.2.2.2.5 *Uninstallation, reinstallation and reactivation*

When you uninstall a Nomad client, all its registry values are deleted. However, if you subsequently reinstall it, the device ID returned when Nomad next registers with Content Distribution is one that is recycled from the database – this is because that is the device registered for the named computer, so it recognizes that the same computer is involved and restores the previous values to the registry.

> **Note**
>
> If you change the host name or domain, Nomad and Content Distribution will regard this as a new computer and generate a new device ID for it.

If a cached package is reactivated, such as after an OSD upgrade or cloning, Nomad will register the package with Content Distribution. (If this is a re-registration, the Content Distribution record is effectively unchanged).

9.4.2.2.2.6 *Improved resilience of content registration*

The **Content Registration Sync Cycle** is available in Nomad 7.0 or later (1E Client 4.1 or later) which registers pending and failed content registrations with Content Distribution.

Registrations can fail when Content Distribution or the SQL Server hosting the ContentDistribution database is busy, overloaded or down for maintenance, resulting in content registration mismatch between the clients and Content Distribution.

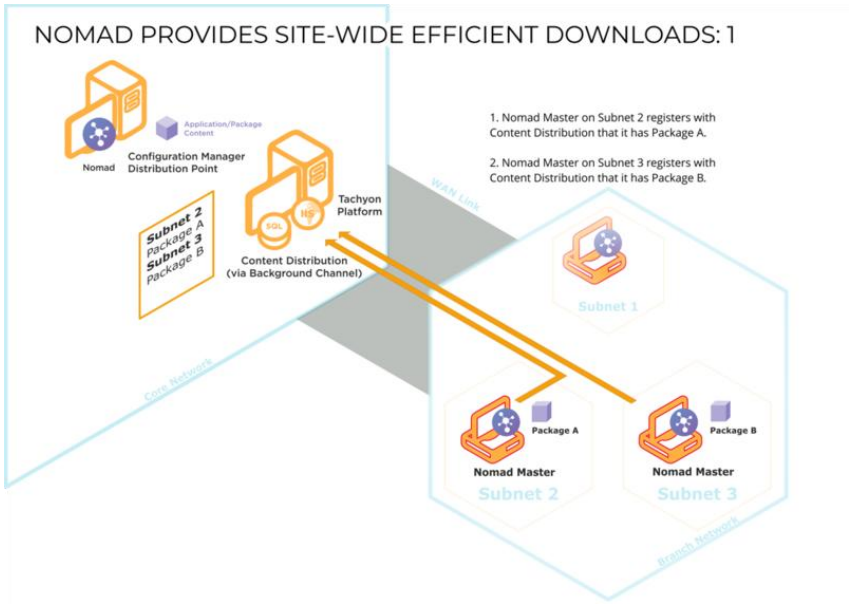
The following registry setting is used by the **Content Registration Sync Cycle** feature.

Registry value	Type	Default	Notes	Installer property
CacheStateSyncIntervalMinutes	REG_DWORD	1440 (1day)	Range: from 60 to	MODULE.NOMAD.CACHESTATESYNCINTERVALMINUTES

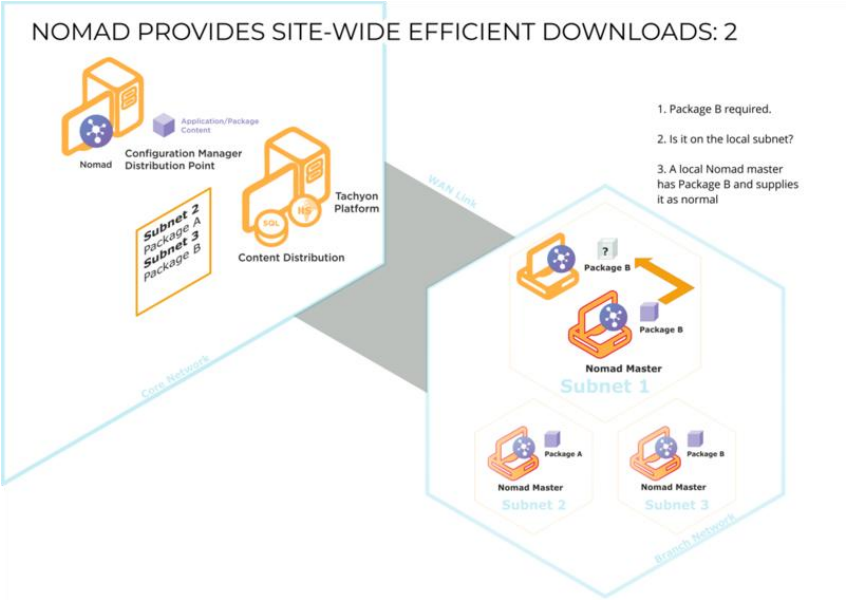
Registry value	Type	Default	Notes	Installer property
			525600 (1Year).	

9.4.2.2.3 How it works

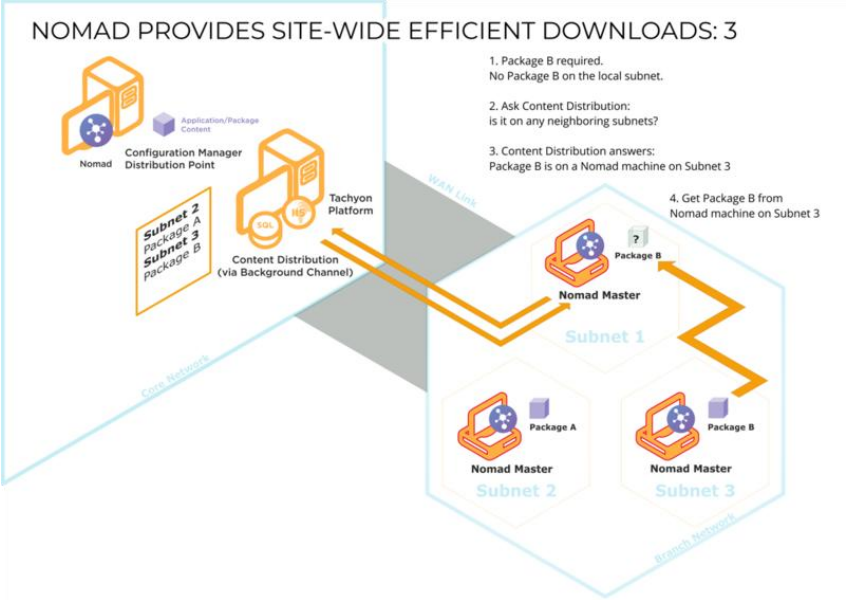
The information about sites and their associated subnets are stored and maintained in Content Distribution. When a Nomad client downloads a package, it registers this information with Content Distribution, enabling it to build a profile of which Nomad client holds particular packages and on which subnet.



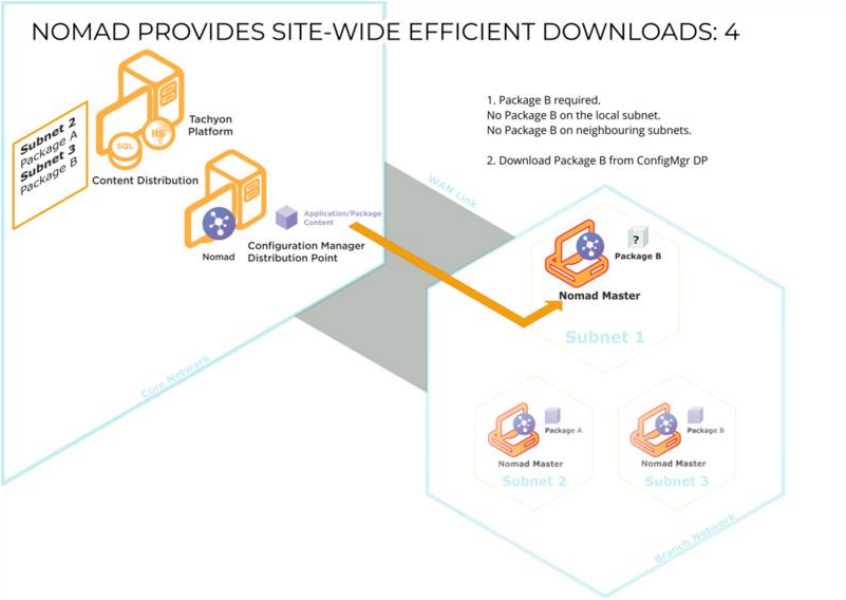
When a Nomad client on a subnet requires a particular package, it first tries to find a copy on the local subnet using the standard method for retrieving cached Nomad files.



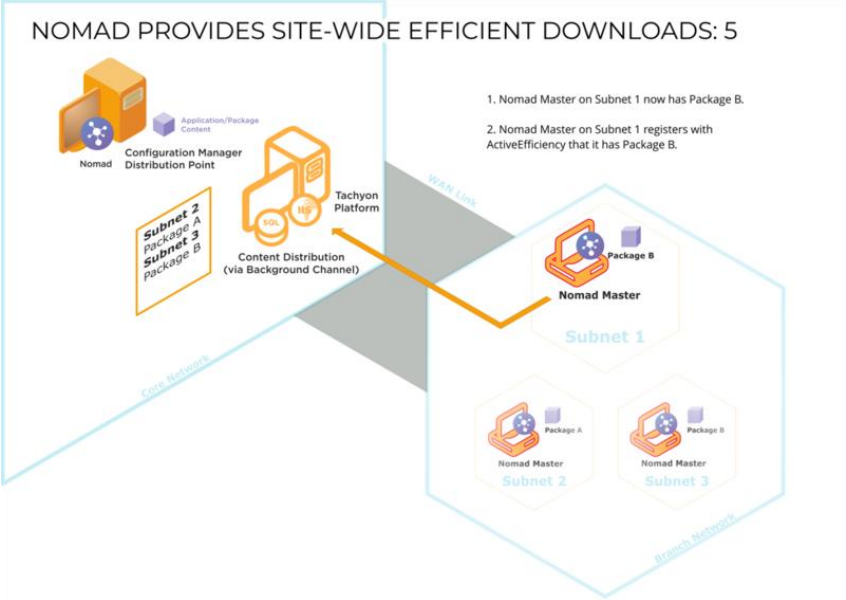
If no local copy of the package is found it then tries Content Distribution database to see if any Nomad clients on other subnets at the same site hold a copy.



Only when all other avenues have failed will Nomad resort to downloading the package from the DP over the WAN.



When the master has a portion of the package it, registers itself with Content Distribution to say that it can provide this package to other subnets if required.



9.4.2.2.3.1 Fetching content

When Nomad receives a request to download content, an election takes place for a master. The master queries Content Distribution about neighboring subnets (accessible on LAN rather than WAN) so that it can download content from a peer in an adjacent subnet (within the same location) if that content is not available on a peer in its own local subnet. For each subnet, the top 10 Nomad clients (in terms of percentage cached by the Nomad client) are listed – the subnet containing the master is excluded from the list if no peer has the content. During this process, the percentage specified by the requesting client is ignored. Although neighboring Nomad clients may have a lower percentage than the requesting Nomad client, they may in fact have gained more

since they last communicated with Content Distribution, so they are potentially useful sources for the package, hence the top 10 rule.

The master (now a subnet master) iterates through the list (which is sorted by percentage) and sends a package status request to each Nomad client. If it receives a response, the master attempts an SMB peer-to-peer download from that Nomad client (the current site master). If the attempt fails (it is not contactable or the limit on the number of concurrent connections is exceeded), it tries the next one in the list. If it fails to get the package from any of them, it downloads from the DP. If the list is empty, the master downloads from the DP. Nomad clients with a lower percentage of the package than the Nomad client requesting it will not respond.

> **Note**
>
> Nomad peers never deal with SSD; they only copy packages from their subnet's master. The subnet master may have the package completely cached or it may be actively downloading from another site or from a DP – the source makes no difference to the peer

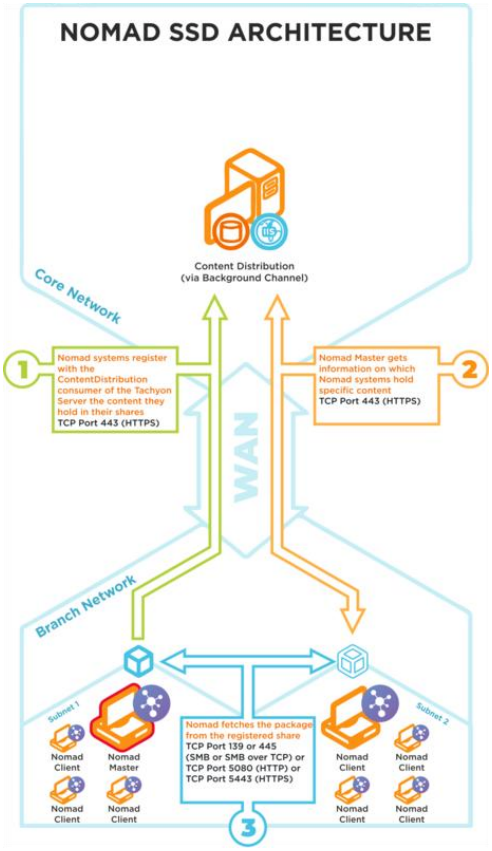
If a download is interrupted part way through (i.e. the source becomes unavailable), Nomad iterates through the remainder of the list and if it fails to get the package from any of them, it downloads from the DP.

When a download starts, Nomad registers the progress with Content Distribution (0% of the content has been downloaded) and when it finishes, the final percentage is also recorded. As long as the content downloaded is greater than 0%, the host becomes a candidate for another client until the package is deleted from its cache. Records with status of 0% downloaded are purged from Content Distribution.

> **Note**
>
> All Nomad clients that have SSD enabled will register content download with Content Distribution, not just the subnet master.

> **Note**
>
> If the Nomad client is running as a guest on VMware, it registers itself as *DeviceType=0* in the Content Distribution Consumer. Content Distribution excludes these devices from SSD query results as they are deemed ineligible to provide content.

9.4.2.2.4 Architecture and ports



Nomad SSD uses the following ports in its communications:

Ports	Notes
TCP 80 (HTTP)	**Step 1**
TCP 443 (HTTPS)	Nomad systems on the branch site register in Content Distribution the content they hold in their shares
TCP 80 (HTTP)	**Step 2**
TCP 443 (HTTPS)	Nomad Masters get information on which Nomad systems hold specific content
TCP 80 (HTTP)	**Step 3**
TCP 443 (HTTPS) TCP 139 (SMB)	Nomad Master fetches a package from the registered Nomad share on a neighboring subnet

Ports	Notes
TCP 445 (SMB over TCP)	

We recommend that the latest version of Tachyon Platform is installed to support this feature, please refer to Requirements for more details.

9.4.2.2.5 Enabling SSD in WinPE

To enable SSD in WinPE:

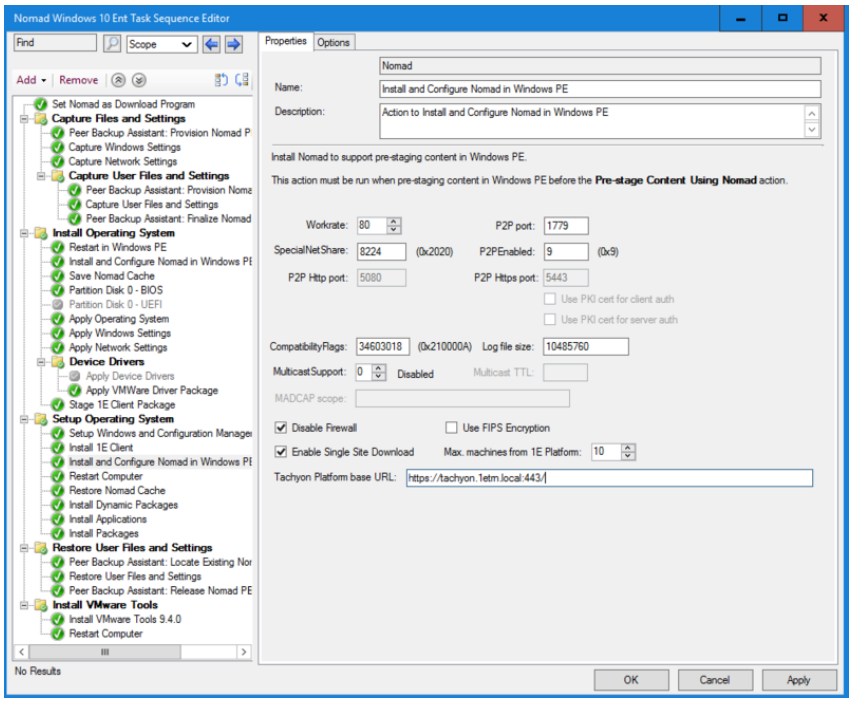
Edit the task sequence for which you want to use SSD.

Enable **Single Site Download**.

In **Tachyon Platform base URL:** enter for example, *https://<server_FQDN:port/* or *http://<server_FQDN:port/* depending on the protocol you are using, where **<server_FQDN>** is the FQDN of the Tachyon server or its DNS alias.

Click **OK**.

> **Note**
>
> After you upgrade to Nomad 8.1 you will need to update any pre-existing task sequences using this step to reflect the move from ActiveEfficiency to the Tachyon Platform.



9.4.2.2.6 Example Active Directory Single Site script

Sample script that scans the Active Directory (AD) environment for all sites and subnets and stores the information in the Content Distribution locations table. This information can then be retrieved

by Nomad at a later stage when implementing the Single Site Download (SSD) or Single Site PBA features.You can view Nomad Sites in the Nomad Sites page.

The Nomad Sites page is primarily designed to show how the network is being used for content distribution in different locations. It focuses on the volume of content downloaded from peers vs over the WAN, rather than the status of specific Content Titles in a given site. You can see what content is available in a given site by looking at the Content tab for that site.

Note

A Nomad Site corresponds to Nomad Single Site Download (SSD) site. Customers that have implemented SSD and upgrade ActiveEfficiency to the Nomad app and Content Distribution will see their defined SSD locations displayed as **Nomad Sites** in the app.

Any subnets that are not included in a Nomad SSD Site definition will be represented in a site named **Unknown**. If no SSD sites have been defined, all subnets will be included in the 'Unknown' site.

9.4.2.2.6.1 Prerequisites

Note

You can download the 1E Content Distribution Tools from the **Releases** page for your platform version at https://support.1e.com/.

The script requires:

Content Distribution version 8.0 or above.

Use PowerShell version 5.0 or above.

Run the script on a device joined to the AD domain where the required information resides and have permissions to read device attributes from AD.

9.4.2.2.6.2 Using the example PostADSitesandSubnets script

The sample script:

Clears all current sites and subnet information stored in the ContentDistribution database.

Connects to LDAP://RootDSE and enumerates the subnets for each Site and adds them to the ContentDistribution database.

Note

The example script does not support supernets.

You can modify the script to include filters and logic to ignore or add specific Sites or subnets.

Note

If you prefer to maintain your own list of Sites and subnets then you should consider using Example Single Site script, or Example Location Discovery script, instead.

9.4.2.2.6.2.1 Parameters

The script uses the following parameters:

PlatformUrl as a mandatory parameter - you must provide the platform base URL

Tls12 as an optional switch parameter - include this switch if TLS 1.2 is required to connect to your platform server.

For example, to run the script on a PowerShell command-line:

Example

```
.\PostADSitesandSubnets.ps1 -PlatformUrl https://tachyon.1etrn.local:443 -Tls12
```

9.4.2.2.6.2.2 How it works

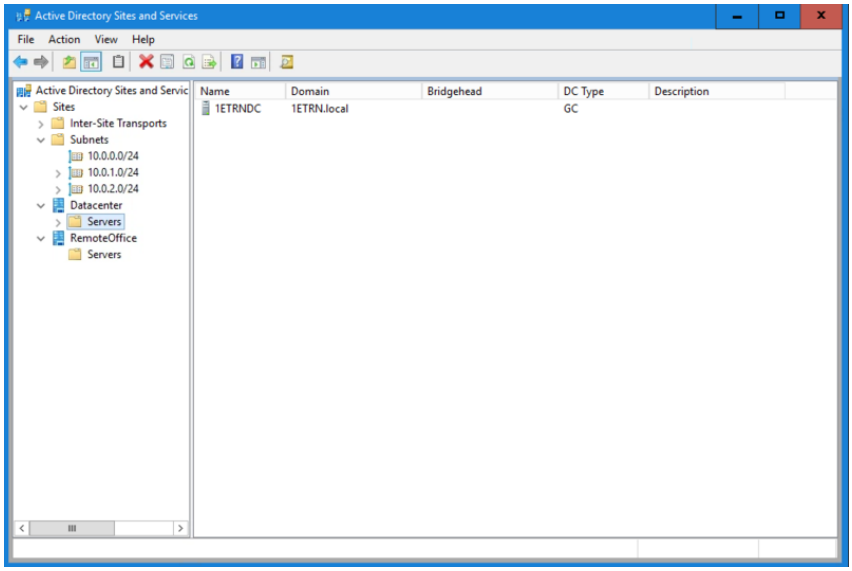
The script clears all current sites and subnet information stored in the ContentDistribution database, it then scans the Active Directory for stored sites and subnets and stores these in ContentDistribution. The AD environment scanned, is for the domain containing the device where you run the script.

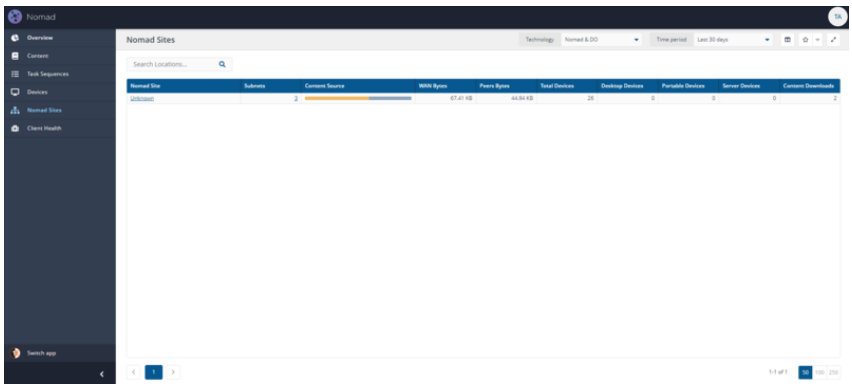
In our example, we have two distinct locations (a datacenter and a remote office), with the servers all located in the datacenter and the workstations all located in the remote office. It just so happens that the remote office has two subnets. Active Directory Sites have already been defined to reflect this configuration.

Before running **PostADSitesandSubnets.ps1** we only have an unknown Nomad site as you can see in the accompanying picture showing the Nomad Sites page.

The Nomad Sites page is primarily designed to show how the network is being used for content distribution in different locations. It focuses on the volume of content downloaded from peers vs over the WAN, rather than the status of specific Content Titles in a given site. You can see what content is available in a given site by looking at the Content tab for that site.

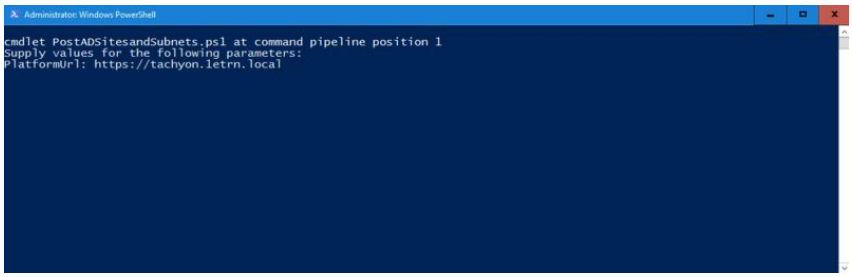
> **Note**
>
> A Nomad Site corresponds to Nomad Single Site Download (SSD) site. Customers that have implemented SSD and upgrade ActiveEfficiency to the Nomad app and Content Distribution will see their defined SSD locations displayed as **Nomad Sites** in the app.
>
> Any subnets that are not included in a Nomad SSD Site definition will be represented in a site named **Unknown**. If no SSD sites have been defined, all subnets will be included in the 'Unknown' site.



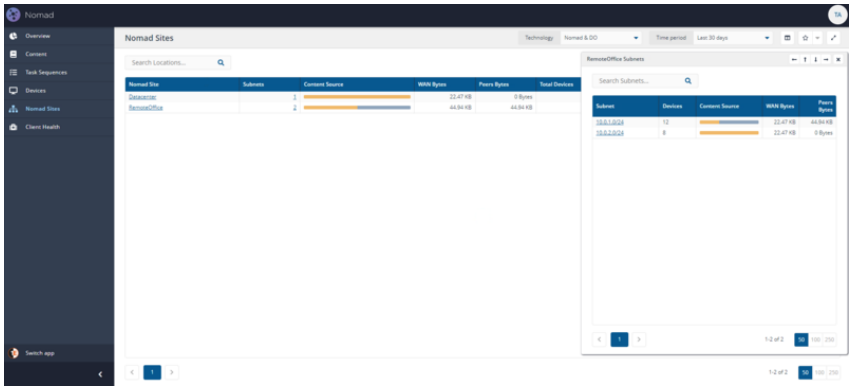


In our example we downloaded the script to **C:\Temp\nomadbranch.v8.0.4.265\scripts** folder, we right-click on **PostADSitesandSubnets.ps1** and select **Edit** to open the file in Windows PowerShell ISE.

We enter *https://tachyon.1etrn.local/* as the platform url for our environment and hit return.



Once the script completes we can return to the Nomad app and refresh the page, now we can see our environment's sites and subnets defined on the Nomad sites page.



9.4.2.2.7 Example Single Site script

Sample script that provides two functions to update sites and subnets in the Content Distribution locations table: DeleteAllLocations and AddLocation(). This information can then be retrieved by Nomad at a later stage when implementing the Single Site Download and Single Site PBA features. You can view Nomad Sites in the Nomad Sites page.

The Nomad Sites page is primarily designed to show how the network is being used for content distribution in different locations. It focuses on the volume of content downloaded from peers vs over the WAN, rather than the status of specific Content Titles in a given site. You can see what content is available in a given site by looking at the Content tab for that site.

> **Note**
>
> A Nomad Site corresponds to Nomad Single Site Download (SSD) site. Customers that have implemented SSD and upgrade ActiveEfficiency to the Nomad app and Content Distribution will see their defined SSD locations displayed as **Nomad Sites** in the app.
>
> Any subnets that are not included in a Nomad SSD Site definition will be represented in a site named **Unknown**. If no SSD sites have been defined, all subnets will be included in the 'Unknown' site.

9.4.2.2.7.1 Prerequisites

The **ExampleSitesAndSubnets.ps1** script is available from the **Scripts** folder in the 1E Content Distribution Tools download zip.

> **Note**
>
> You can download the 1E Content Distribution Tools from the **Releases** page for your platform version at https://support.1e.com/.

Content Distribution 8.0 or above.

PowerShell version 5.0 or above.

9.4.2.2.7.2 Using the example Single Site script

The sample script includes an example of how the script can be used:

Clears all current sites and subnet information stored in the ContentDistribution database.

Adds the following 3 sites and subnets in the ContentDistribution database.

"HOMER.SIMPSON.Springfield" "192.148.226.0/24"

"HOMER.SIMPSON.Springfield" "192.148.228.0/24"

"MARGE.SIMPSON.Springfield" "192.168.227.0/24"

Before using it in your environment, you must edit the script to replace the example "HOMER" site and subnets with your own list. Over time, you will manually modify the script to reflect your environment.

Note

The example script does not support supernets.

Note

If you prefer to automatically add Sites and subnets by querying AD, then you should consider using Example Active Directory Single Site script instead.

Parameters

The script uses the following parameters:

PlatformUrl as a mandatory parameter - you must provide the Tachyon Platform base URL.

Tls12 as an optional switch parameter - include this switch if TLS 1.2 is required to connect to the Tachyon Platform server.

For example, to run the script on a PowerShell command-line:

```
.\ExampleSitesandSubnets.ps1 -PlatformUrl https://tachyon.acme.local:443 -Tls12
```

9.4.2.2.7.2.1 How it works

The sample script provides the following two functions:

Script functions

```
function DeleteAllLocations()
Description: Deletes all rows from the ContentDistribution locations table
Params: none
Return: $result(empty)

function AddLocation()
Description: Adds a new entry into the ContentDistribution locations table
Params: site  - [string] containing the site name
             subnet - [string] containing the ipv4subnet in CIDR notation
Return: $result - newly created location object of the form #     {"Id":"efa192
26-266f-4bd0-8a9d-94fa5ac1b773","Site":"HOMER.SIMPSON.Springfield","Subnet":"19
2.148.226.0/24"}
```

You must edit this section with your own list of sites and subnets:

```
# optional will delete all existing entries
DeleteAllLocations

# sample adding 3 locations using the AddLocation function
# duplicate entires will report an error: (409) conflict
AddLocation "HOMER.SIMPSON.Springfield" "192.148.226.0/24"
AddLocation "HOMER.SIMPSON.Springfield" "192.148.228.0/24"
AddLocation "MARGE.SIMPSON.Springfield" "192.168.227.0/24"
```

9.4.2.2.8 Example Location Discovery script

Sample script to enable and disable the location discovery feature, along with the option to run it and load site, subnet and information in Content Distribution. This information can then be retrieved by Nomad at a later stage when implementing the Single Site Download (SSD) or Single Site PBA features.You can view Nomad Sites in the Nomad Sites page.

The Nomad Sites page is primarily designed to show how the network is being used for content distribution in different locations. It focuses on the volume of content downloaded from peers vs over the WAN, rather than the status of specific Content Titles in a given site. You can see what content is available in a given site by looking at the Content tab for that site.

> **Note**
>
> A Nomad Site corresponds to Nomad Single Site Download (SSD) site. Customers that have implemented SSD and upgrade ActiveEfficiency to the Nomad app and Content Distribution will see their defined SSD locations displayed as **Nomad Sites** in the app.
>
> Any subnets that are not included in a Nomad SSD Site definition will be represented in a site named **Unknown**. If no SSD sites have been defined, all subnets will be included in the 'Unknown' site.
>
> **Note**
>
> You can download the 1E Content Distribution Tools from the **Releases** page for your platform version at https://support.1e.com/.

The **1E Nomad** product pack is included in the platform zip. The platform zip file can be downloaded from https://support.1e.com/. Additional Product Packs are available from 1E Exchange.

The sample script requires:

ContentDistribution version 8.0 or above is installed.

1E platform with the Nomad consumer provisioned.

The**1E-Nomad-LocationDiscovery**instruction is uploaded and permissioned appropriately. The typical configuration is:

The **1E Nomad** product pack is uploaded into an Instruction set called **1E Nomad**.

The **Nomad Administrator** role is configured with **Actioner** permissions on the **1E Nomad** instruction set, and the **All Devices** management group.

The account used to run the script must be a platform user with the **Nomad Administrator** role assigned.

CSV file – described below.

9.4.2.2.8.1 CSV file

The **LocationDiscovery.ps1** script uses a CSV file as input, and accepts several parameters.

The input file should be made up of four columns, without column headers:

Site name

CIDR notation subnet associated with that site

Latitude of the site

Longitude of the site

An example of the file contents for a site named LAB with four subnets would be:

LAB,10.1.1.0/24,-89.2345,120.5674

LAB,192.168.1.0/24,-81.2345,180.5674

LAB,192.168.2.0/24,20.2345,-160.5674

LAB,192.168.2.0/24,59.2345,20.5674

	A	B	C	D	E	F	G
6	LAB	10.1.1.0/24	-89.2345	120.5674			
7	LAB	192.168.1.0/24	-81.2345	180.5674			
8	LAB	192.168.2.0/24	20.2345	-160.5674			
9	LAB	192.168.2.0/24	59.2345	20.5674			
10							
11							
12							
13							

9.4.2.2.8.2 Using the example Location Discovery script

9.4.2.2.8.2.1 Parameters

The **LocationDiscovery.ps1** has the following configurable parameters:

Parameter	Description
TLS12	TLS12 is an optional switch type parameter. Include this switch if TLS 1.2 is required to connect to the CD server.

Parameter	Description
GetSettings	GetSettings is used to fetch the existing configured settings of the location discovery feature.
Enable	Enable is a switch to turn-on the location discovery feature. If this feature is enabled, a user needs to use the "execute" switch to download the automatic grouping of sites and subnets.
Disable	Disable is a switch to turn off the location discovery feature. If this feature is disabled, grouping of locations and subnets has to be provisioned by scripting in the ContentDistribution LocationsV2 table.
Execute	Execute is a switch to trigger automatic location discovery instruction and automates download of the Excel file containing sites and subnet grouping. This step takes at least 45 minutes, and depends on your devices and network topology.
OutPath	OutPath is a mandatory parameter in case of Execute switch is present. It indicates where the result file should be downloaded. The path should already exist.
InterSiteDistance	InterSiteDistance is a mandatory parameter to be configured if the location discovery feature is enabled. By default, its value is 500 meters.
Upload	Upload is a parameter used for uploading the Excel file containing site, subnet, latitude, longitude fields in the ContentDistribution LocationsV2 table. This step will take a backup of the existing LocationsV2 table, truncates it and loads new data from an input Excel file. If Excel is not loaded successfully, then the previous LocationsV2 table entries will be loaded again.
CDServer	CDServer is a mandatory parameter. You must provide the name of the ContentDistribution web server using this parameter.
Protocol	Protocol is a mandatory parameter. You must indicate if the ContentDistribution web server is configured for HTTP or HTTPS connections.

9.4.2.2.8.2.2 Example PowerShell command lines

The example **LocationDiscovery .ps1** script can be run on a PowerShell command line as shown in the following examples, where 1Etrnap.1etrn.local is the ContentDistribution server in our sample environment:

Get location discovery feature settings:

```
.\LocationDiscovery.ps1 -Disable -CDServer 1Etrnap.1etrn.local -Protocol http
```

Configure inter-site distance for location discovery feature:

```
.\LocationDiscovery.ps1 -InterSiteDistance 50 -CDServer 1Etrnap.1etrn.local -Pr
otocol http
```

Execute location discovery feature:

```
.\LocationDiscovery.ps1 -Execute -CDServer 1Etrnap.1etrn.local -Protocol http -
OutPath C:\Temp\
```

Import Site and Subnet information from C:\Temp\network.csv using HTTP after clearing the Locations table:

```
.\LocationDiscovery.ps1 -Upload C:\Temp\network.csv -CDServer 1Etrnap.1etrn.loc
al -Protocol http
```

9.4.2.2.9 Content Distribution purge configuration script

Sample script to view or update Purge Configuration in the Content Distribution Service defined in the ContentDistribution PurgeSettings table if it is configured.

9.4.2.2.9.1 Prerequisites

> **Note**
>
> You can download the 1E Content Distribution Tools from the **Releases** page for your platform version at https://support.1e.com/.

To script requires:

ContentDistribution version 8.0 or above is installed.

Use PowerShell version 5.0 or above.

1E platform has the Nomad consumer provisioned.

The account used to run the script must be a platform user with the **Nomad Administrator** role assigned.

9.4.2.2.9.2 Using the example Content Distribution purge configuration script

Parameters

The script uses the following parameters:

Parameter	Required	Description
CDServer	Mandatory	The hostname or FQDN of the CD server, as needed in your environment.

Parameter	Required	Description
Get	Optional	Include this switch to view the existing purge configuration. One of the switch from "-Get" and "-Update" should be specified.
Update	Optional	Include this switch to update the existing purge configuration. If this switch is enabled, the other 2 switches should also be enabled - **PurgeSchedule_HoursIn24HrFormat** and - **PurgeSchedule_Minutes**.
PurgeSchedule_HoursIn24HrFormat	Mandatory in case of -Update switch else optional.	It can take the value between 0-23 (inclusive).
PurgeSchedule_Minutes	Mandatory in case of -Update switch else optional.	It can take the value between 0-59 (inclusive).
Tls12	Optional	Include this switch if TLS 1.2 is enabled.
Protocol	Optional	The protocol for connecting to the server, either HTTP or HTTPS. By default, it is HTTPs.

9.4.2.2.9.2.1 Example PowerShell command lines

The **CDPurgeSettings.ps1** script can be run on a PowerShell command line as shown in the following examples, where *tachyon.1etrn.local* is the PlatformURL for our sample environment:

View the existing Purge configuration with HTTPS protocol and **Get** switch:

```
.\CDPurgeSettings.ps1 -Get -Protocol https -CDServer tachyon.1etrn.local:443
```

Update the existing purge configuration with HTTP protocol with confirmation:

```
.\CDPurgeSettings.ps1 -Update -PurgeSchedule_HoursIn24HrFormat 20 -PurgeSchedul
e_Minutes 10 -Protocol http -CDServer tachyon.1etrn.local:80
```

Update the existing purge configuration with HTTPS protocol with confirmation:

```
.\CDPurgeSettings.ps1 -Update -PurgeSchedule_HoursIn24HrFormat 20 -PurgeSchedul
e_Minutes 10 -Protocol https -CDServer tachyon.1etrn.local:443
```

Update the existing purge configuration with HTTP protocol and **tls12** support:

```
.\CDPurgeSettings.ps1 -Update -PurgeSchedule_HoursIn24HrFormat 20 -PurgeSchedul
e_Minutes 10 -Protocol http -Tls12 -CDServer tachyon.1etrn.local:80
```

9.4.2.3 Nomad Pre-caching

Pre-caching lets you preload the Nomad caches of particular machines directly from the Configuration Manager console. This enables downloads to be available on the branch prior to a deployment taking place, which can be very useful in large-scale deployment scenarios.

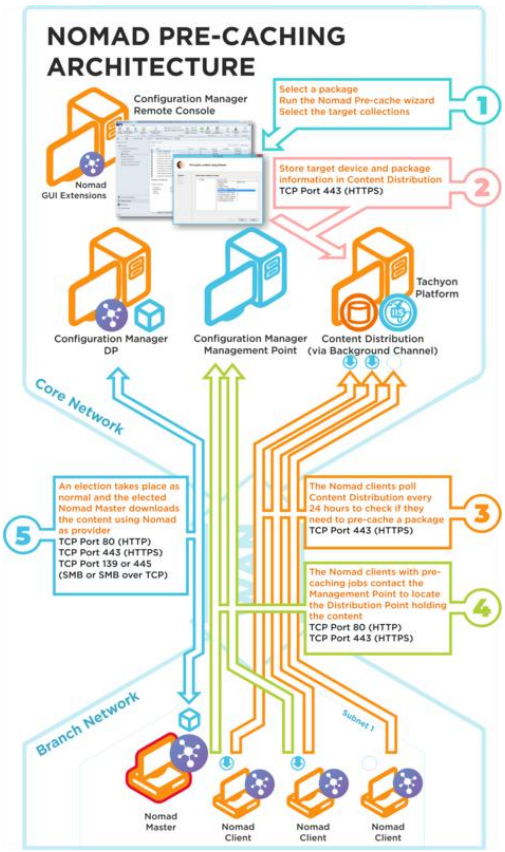
Before you start, ensure the following prerequisites are met:

Tachyon Platform 5.2 or later is accessible, with Nomad features enabled

Nomad Configuration Manager console extensions must be installed.

Refer to Using Nomad with Operating System Deployment OSD for example scenarios about how to use Nomad to maximize the efficiency of distributing large OS content across the network and how you can monitor those deployments using the Nomad app.

9.4.2.3.1 Architecture and ports



The Nomad pre-caching uses the following ports in its communications. If a site server is configured to use custom ports, pre-caching will use those ports to communicate with a management or distribution points. To ensure high-availability, pre-caching falls back to next available site server if it fails to communicate with a management or distribution point.

Ports	Description
N/A	**Step 1** Choose a package and run the Nomad pre-caching wizard, selecting the target device collection. This step does not require any port configuration but the Nomad Configuration Manager console extensions must be installed in the Configuration Manager Console.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 2** The Nomad pre-caching wizard stores the target device and package information in Tachyon.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 3** The Nomad clients, where the pre-cache feature has been enabled, poll Tachyon every 24 hours to see if they need to pre-cache some content. This takes the form of pre-caching notifications that tell the Nomad clients they need to process a download job to fetch the specified content.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 4** The Nomad clients, with pre-caching notifications, contact the Management Point to locate the Distribution Point that holds the content. This may use HTTP or HTTPS depending on how the Management Point is configured.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 5** A Nomad Master election takes place and the elected master processes the job by downloading the pre-cache content using Nomad as provider. This is then distributed locally to the Nomad peers that also require the pre-cached content. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB

Ports	Description
	SMB over TCP For Configuration Manager the default setting is either HTTP or HTTPS.

9.4.2.3.2 Enabling Nomad pre-caching

When you consider how to install the Nomad Branch Tools (refer to Installing Nomad Branch Tools), you can also install them in unattended mode by using the MODULE.NOMAD.PLATFORMURL installer property or by setting the PlatformURL registry value on the machine where the extensions are installed post-installation.

> **Note**
>
> If you have an existing Nomad 7.0.200 installation, and you upgrade to Tachyon Platform 8.1 you should also upgrade your Nomad Configuration Manager console extensions to the current version, doing this ensures you can view your pre-existing Nomad pre-cache jobs. When you upgrade from earlier versions of Nomad to Tachyon Platform, ActiveEfficiency is upgraded to Content Distribution. As a result, if you have an earlier version of the Nomad Configuration Manager console extensions, you may not be able to view your existing Nomad pre-cache jobs until you upgrade.

Nomad clients must also be configured to support pre-caching. This is done during installation in the Nomad screen of the 1E Client installer, for more details refer to Installing the 1E Client for Nomad.

Setting	Description
Enable Nomad	Check this box to enable Nomad. Nomad is used to support efficient content download for Configuration Manager and Tachyon. For Tachyon, its Nomad content download feature is enabled by default but only used if Nomad is enabled. **Note** If Nomad is enabled, when the 1E Client starts it will upgrade any previous installation of the NomadBranch client.
Enable 1E Platform features	Check this box to let you configure the Single-Site Download (SSD) options and WakeUp integration.

Setting	Description	
	Options	Enabled
	Content Registration only	This configures Nomad to use **Single Site Download** to *provide* content to peers by registering the content it has in its cache in Content Distribution on the Tachyon Platform. In the registry SSDEnabled is set to 2 and ContentRegistration is set to 1. This also allows content to be reported in Nomad app dashboards and Device View. Typically, content registration should be enabled, unless there is a specific reason for a computer not to be a master. Content Registration is automatically disabled in WinPE.
	Single-Site Download (SSD) only	This configures Nomad to use **Single Site Download** and *consume* content which has been registered in Content Distribution on the Tachyon Platform. SSD is used as a fallback if the client is unable to find content on the local subnet. In the registry SSDEnabled is set to 1 and ContentRegistration is set to 1. Nomad queries Content Distribution on the Tachyon Platform asking for peers that have registered content.
	Both enabled	This configures Nomad to use **Single Site Download** so that it can both *consume and provide* content, as well as reporting in the

Setting	Description
	Nomad app and Device View. In the registry SSDEnabled is set to 3 and ContentRegistration is set to 1. This is the recommended configuration unless there is a specific reason for a computer not to be a master. Content Registration is automatically disabled in WinPE.
Neither enabled	The client does not participate in **Single Site Download** activities, and does not report content details to Content Distribution. In the registry SSDEnabled is set to 0 and ContentRegistration is set to 0. **Enable 1E Platform features** has no effect, and is ignored.

If you need to enable reporting but prevent the Nomad client acting as an SSD provider, then use installer properties or mst transform files to configure MODULE.NOMAD.SSDENABLED and MODULE.NOMAD.CONTENTREGISTRATION.

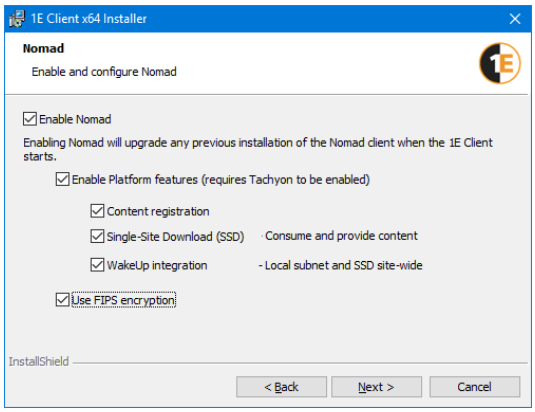
For more information about SSD, please refer to Single Site Download.

Options	Enabled
WakeUp integration	If you check **WakeUp integration** but not **Single Site Download (SSD)**, any attempt to wake-up peers with particular content will only be on the local subnet. If **Single Site Download (SSD)** is also checked, Nomad will try to wake peers with particular content in neighboring subnets on the site if peers on the local subnet do not wake.

Setting	Description
	Note The Platform settings are only available if you have enabled Tachyon. **Note** These settings do not affect other Platform features such as Pre-caching.
Use FIPS encryption	Checking **Use FIPS Encryption** configures the Nomad module to use FIPS encrypted communications. You must ensure that Nomad is configured with the same **FIPS encryption** setting on all your 1E Clients.

Note

Although the **Single-Site Download** option must be enabled in the installer, you can use the Nomad pre-caching feature without using SSD by not configuring the Single Site Download feature. If you are already using the SSD feature in your environment, no further Nomad client configuration will be required to enable Nomad pre-caching.



9.4.2.3.3 Using Nomad pre-caching

Nomad pre-caching is directly integrated with the Configuration Manager Console, is fully compliant and works with Role Based Access in Configuration Manager, refer to Nomad pre-caching RBAC support for details.

To start the pre-cache wizard, right-click any of the following types of content in the Configuration Manger console and from the context menu, choose Pre-cache content using Nomad.

Applications

Packages

Driver packages

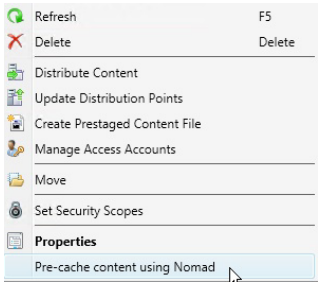
Operating system images

Operating system upgrade packages

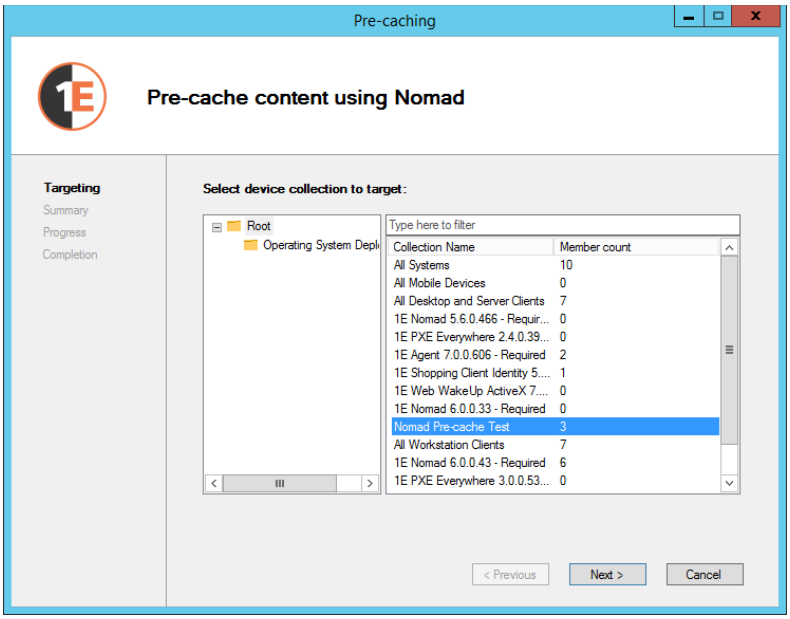
Boot images

Task sequences.

For task sequences, please refer to the note in the table under Dynamic pre-caching below:



On the **Targeting** screen, choose the device collection you want to pre-cache.



On the **Summary** screen, verify your selection.

Click **Apply** if it is correct

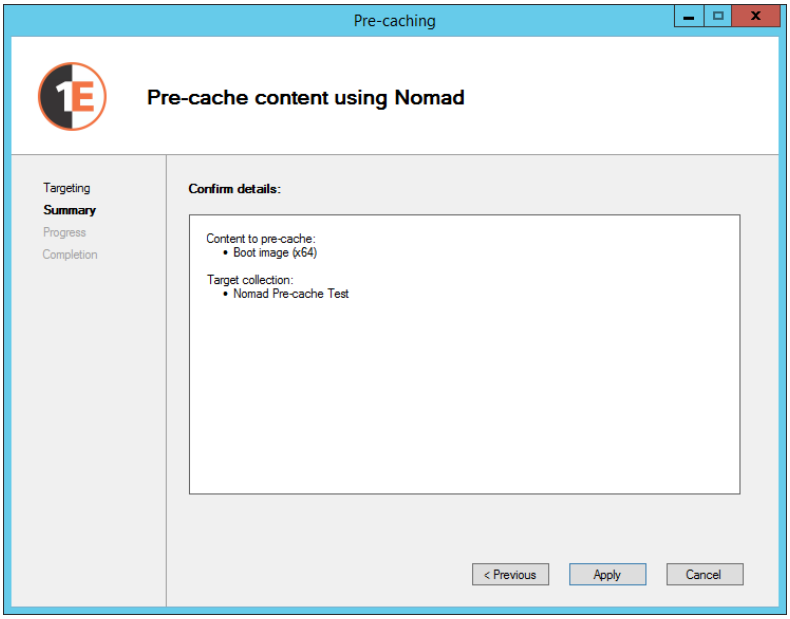
If it is incorrect, click **Previous** to start again.

The **Progress** screen displays the status while the wizard sets up the pre-cache notification in ContentDistribution.

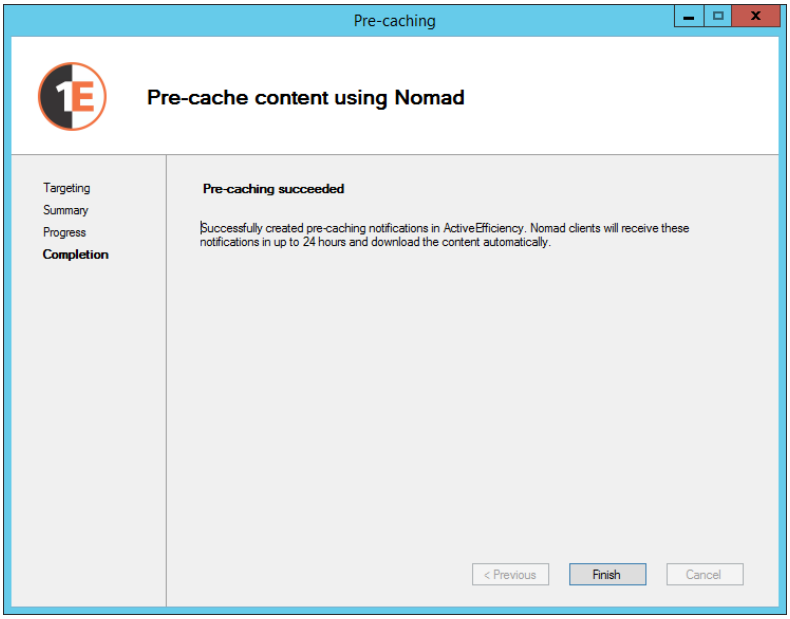
Note

From Nomad 8.1 there is support for providing alternate credentials to authenticate with the Tachyon Platform. If your Tachyon Platform instance resides in another

domain or the cloud, you will be prompted to enter alternate credentials for that location, which get stored in the credential store for any future requests.



On the **Completion** screen, click **Finish** to close the wizard.



9.4.2.3.3.1 Viewing pre-cached jobs

If you are not a full administrator, you can only view pre-cached jobs provided you have Read permissions on the collection as well as the content.

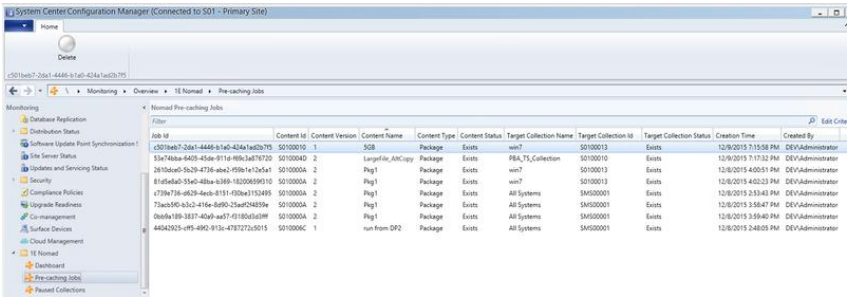
To view pre-cached jobs:

In Configuration Manager, choose **Monitoring**.

Expand the **1E Nomad** node and select **Pre-caching Jobs**.

The attributes for the job are displayed in the right-hand pane as follows:

Column title	Attribute definition
Job Id	The ContentDistribution identifier of the job.
Content Id	Configuration Manager identifier for the content referenced by the job.
Content Name	Name of the content referenced by the job.
Content Version	Version of the content referenced by the job.
Content Type	Type of the content referenced by the job (i.e. application, task sequence).
Target Collection Id	Device collection identifier targeted by the job.
Target Collection Name	Device collection name targeted by the jobs.
Creation Time	The time the job was created.
Created By	The person who created the job.
Content Status	(Visible only to those with full administrator rights) – displays the status of the content, i.e whether it exists or is deleted.
Target Collection Status	(Visible only to those with full administrator rights) – status of the device collection, i.e. whether it exists or is deleted.



9.4.2.3.3.2 Deleting pre-cached jobs

You can only delete pre-cached jobs if you have permissions for a particular content type. If you are not a full administrator, you will need:

Read permissions on collections (through a security role)

Access to the pre-cached job (i.e. content and the device collection)

To delete a pre-cached job:

In Configuration Manager, choose Monitoring.

Expand the Overview tree and choose Nomad Pre-cache jobs.

In the Nomad Pre-caching jobs list, right-click the pre-cached you want and from the context menu, choose Delete.

9.4.2.3.3.3 Managing pre-cached jobs with Powershell cmdlets

You can also manage pre-cached jobs by using PowerShell cmdlets.

To get all pre-cached jobs from ContentDistribution, run:

Get-PreCachingJobs [-PlatformURL <String>] [<CommonParameters>]

To remove pre-cached jobs from ContentDistribution run:

Remove-PreCachingJobs [-Id] <String> [-PlatformURL <String>] [-Confirm [<SwitchParameter>]] [<CommonParameters>]

Remove-PreCachingJobs -Before <String> [-PlatformURL <String>] [-Confirm [<SwitchParameter>]] [<CommonParameters>]

Remove-PreCachingJobs -AgeInDays <UInt32> [-PlatformURL <String>] [-Confirm [<SwitchParameter>]] [<CommonParameters>]

Remove-PreCachingJobs -All [<SwitchParameter>] [-PlatformURL <String>] [-Confirm [<SwitchParameter>]] [<CommonParameters>]

The parameters are:

Parameter	Optionality	Notes
-Id	Mandatory	ID for the job to delete.
-PlatformURL <string>	Optional	Location of ContentDistribution. If not provided, it is retrieved from the *NomadAdminUI* registry value.
-Confirm	Optional	Suppresses the confirmation prompt for the deletion.
-Before	Mandatory	Delete jobs before a particular date and time where the notation is *yyyyMMddHHmmss*.
-AgeInDays	Mandatory	Delete jobs older than a particular number of days.
-All	Mandatory	Delete all jobs. Exercise caution if you use this.

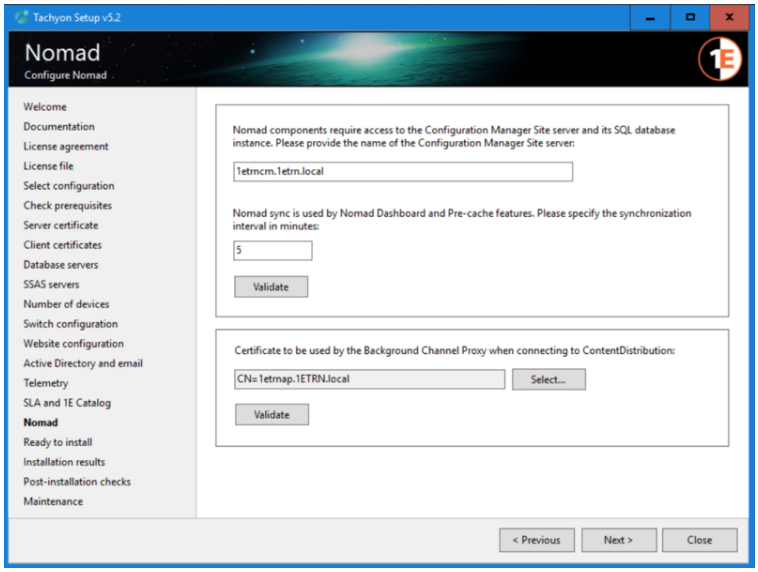
Parameter	Optionality	Notes
<CommonParameters>		Values are: Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable and OutVariable

There is more information about *CommonParameters* at http://go.microsoft.com/fwlink/?LinkID=113216

9.4.2.3.3.4 Dynamic pre-caching

If the content or membership of a targeted collection changes after a pre-cached job is created, Nomad is updated to keep in sync with Configuration Manager. It does this by polling the Configuration Manager database at regular intervals to fetch updated content.

These intervals (you would have defined the intervals when you installed Tachyon Platform) have the following characteristics:



The range for the interval is between 5 minutes and 1440 minutes (1 day). By default, Nomad synchronizes with the Configuration Database every 30 minutes. If the values are outside the range, for example if the interval is less than 5, it will default to the minimum which is 5 minutes. Similarly, if the interval is greater than 1440, it defaults to the maximum which is 1440 minutes.

If a synchronization fails, it is rescheduled to run again in 15 minutes

Each synchronization task fetches the following:

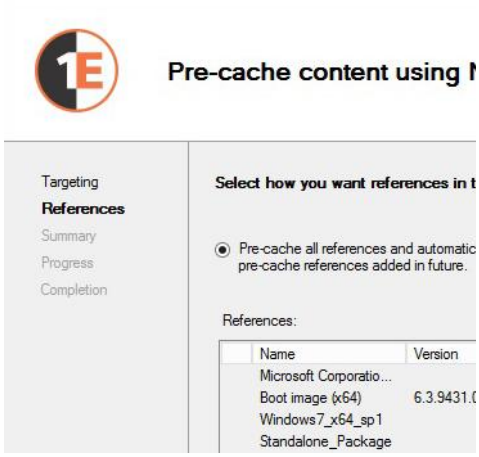
Pre-caching data (device collections and contents)

Dashboard data (status messages).

Pre-cached jobs are affected when these events take place in Configuration Manager, and on the next synchronization with Nomad:

Configuration Manager events	Next Nomad synchronization cycle	
Device collections	Where there is a change in membership for a device collection Where a device collection is deleted.	Nomad collection is updated to reflect the change in membership for that device Nomad pre-cached jobs for that device collection is deleted.
Packages	Where a package is updated Where a package is deleted.	Nomad is updated with the packages Nomad pre-cached jobs for that package as well as any pre-cached jobs referenced in a task sequence is deleted.
Applications	where deployment types are added or removed where an application is deleted.	Nomad deployment types for that application is updated Nomad pre-cached jobs for that package as well as any pre-cached job referenced in a task sequence is deleted.
Task sequences	If you chose to automatically pre-cache references (as well as those added later)	Nomad is updated: when references are added or removed when referenced content is updated or deleted when a reference is deleted

Configuration Manager events	Next Nomad synchronization cycle	



Note

Applications and packages that will be installed using a **dynamic variable list** will not be automatically pre-cached.

Also be aware that any other dynamic content will not be pre-cached, for example drivers deployed using Modern Driver Management (http://www.scconfigmgr.com/modern-driver-management/).

Dynamic content needs to be pre-cached independently as

Configuration Manager events	Next Nomad synchronization cycle
	separate jobs.
If you chose to selectively pre-cache references:	Nomad is not updated when references are added or removed
	Nomad is updated when referenced content is updated or deleted Nomad is not updated when a reference is deleted.

9.4.2.3.3.5 Manually forcing a synchronization between Content Distribution and Configuration Manager

You can force a synchronization to occur outside its normal cycle to assist in troubleshooting or just to speed up the sync process.

Navigate to https://<Platform_URL>/contentdistribution/v1.0/commands/cmsync

You should then see the response: *Initiated Cm Sync*

Check C:\ProgramData\1E\ContentDistribution\ContentDistribution.log for details.

> **Note**
>
> By default, all synchronization activities are logged in the ContentDistribution service log C:\ProgramData\1E\ContentDistribution\ContentDistribution.log.

9.4.2.3.3.6 Disabling synchronization

There may be instances, such as carrying out maintenance on the Configuration Manager server or the SQL Server instance, where you have to disable synchronization. To do this:

Open appsettings.json located in the service installation folder, typically in C:\Program Files\1E\ContentDistribution\Web\WebService

Set *Enabled* to *false* under the *CmSync* element, for example:

```
"CmSync": {
     "Enabled": false,
     "IntervalMinutes": "30",
```

```
        "TimeoutMinutes": 10,
        "CmServer": "1etrncm.1etrn.local"
    }
```

9.4.2.3.4 Hash validation

Hash validation is used when content is downloaded for pre-cached jobs and for LSZgen requests for these jobs. When a pre-cached job is created:

For task sequences, hashes for all referenced packages and applications are posted to Content Distribution

For applications, hashes for all its child deployment types are posted to Content Distribution.

On the client side:

Where a job is queued, the client queries the management point for content locations. The management point returns a hash for application content types only. If it does not return a hash, the client retrieves it from Content Distribution. Hashes from management points take priority over Content Distribution.

For the Tachyon server hosting Content Distribution, the client fetches the hash during the pre-cache cycle for that particular content.

9.4.2.3.5 Nomad clients polling the ContentDistribution database

9.4.2.3.6

After running the wizard, Nomad clients that are registered with the ContentDistribution database, and that were included in the selected device collection, will get a pre-cache notification within 24 hours. This notification tells Nomad that it has to process a download job on the content to be cached. The default number of notifications a client processes in one pre-cache poll cycle is 20, but you can modify this by updating the PrecachePollBatchSize registry value.

9.4.2.3.6.1 When is polling disabled?

Nomad clients normally start their polling cycle when the service starts, with a random delay to minimize the possibility of multiple simultaneous polls from different clients. However, polling will not start if any of the following is true:

The Tachyon Platform URL is not set in the Nomad registry.

Nomad is running on a machine using the Win PE operating system.

The Configuration Manager client is not installed on the machine – in order to download pre-cached content, the Nomad service needs to contact the management point and this is only possible if the client is installed locally.

To explicitly turn polling off for a Nomad client set the PrecachePollMinutes registry value to 0.

9.4.2.3.7 Nomad pre-caching RBAC support

Nomad pre-caching is tightly integrated into Configuration Manager and honors the permissions and restrictions enforced by role-based access control (RBAC). The following rules are used to

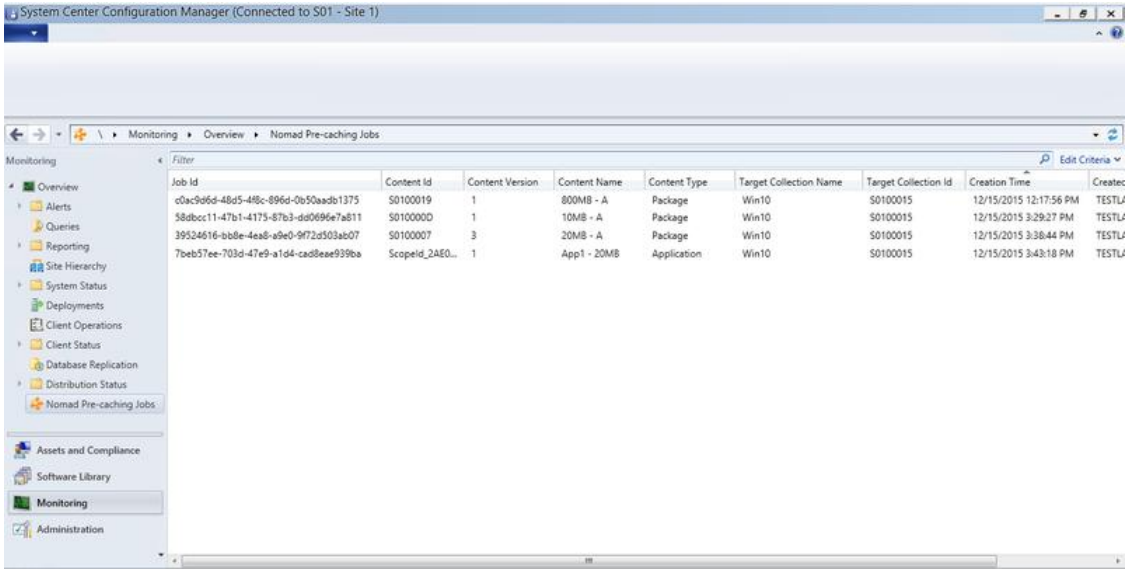
determine whether a particular user is allowed to pre-cache a particular content on a particular collection or not:

A user is only allowed to pre-cache a content item if they have the RBAC permissions to deploy it via Configuration Manager.

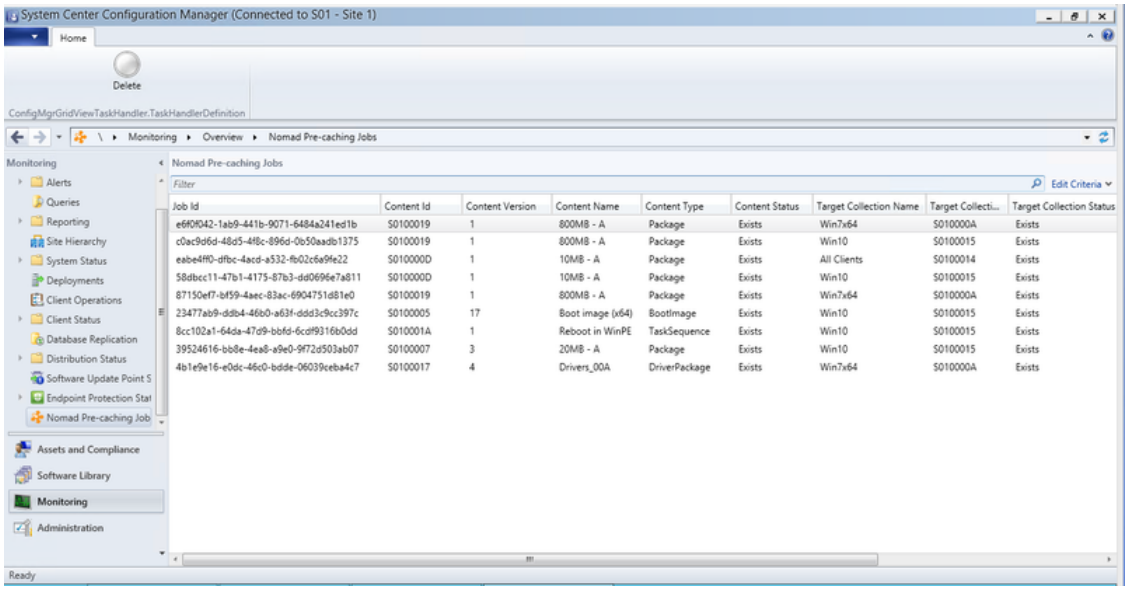
A user is only allowed to pre-cache to a device collection if they have the RBAC permissions to access that collection.

> **Note**
>
> Configuration Manager (CM) administrators will need to be a member of the Nomad Administrators group, so they can manage Configuration Manager collections, for example create, view and delete pre-cache and paused collections. Refer to Installing the Nomad app and 1E Content Distribution - Nomad roles and permissions for details.

If an administrator does not have the necessary RBAC permissions, they will not be able to see or access any of the Nomad pre-cache features in the Configuration Manager Admin console. Similarly, if they do not have the right permissions to a device collection, that collection will not be available to them in the Targeting screen of the pre-cache wizard.



However, full administrators will see:



The following table provides an overview of the availability of Nomad pre-caching for the built-in Configuration Manager security roles:

Nomad pre-caching support based on the Configuration Manager security role					
Built-in Configuration Manager Security Roles	**SOFTWARE LIBRARY**				
APPLICATION MANAGEMENT	**Operating System**				
Applications	**Packages**	**Driver Packages**	**Operating System Images**	**Boot Images**	**Task Sequences**
Nomad pre-caching Wizard					
Application Administrator	Pre-caching available (Access to Collection required)	Not available			

Application Author	Pre-caching Not available (Access to Application Management only)	Not available
Application Deployment Manager	Pre-caching available (Access to Collection required)	Not available
Asset Manager	No access to Software Library	
Company Resource Access Manager		
Compliance Settings Manager	Pre-caching Not Applicable for Software Updates (No Access to Application Management & Operating System, Only	

	Software Updates under Software Library available)	
Endpoint Protection Manager	No Access to Software Library	
Full Administrator	Pre-caching available (Access to Collection required)	
Infrastructure Administrator	Pre-caching not available (Access only to Windows Sideloading Keys in Application Management under Software Library)	
Operating System Deployment Manager	Pre-caching not available	Pre-caching available (access to Collection required)

Note

		If Package/ Application is part of a task sequence, pre-caching does not happen
Operations Administrator	Pre-caching available (Access to Collection required)	
Read-only Analyst	Pre-caching not available (Configuration Manager console is in Read-Only mode)	
Remote Tools Operator	No access to	

	Software Library
Security Administrator	
Software Update Manager	Pre-caching not applicable for Software Updates (No access to Application Management & Operating System, Only Software Updates under Software Library available)

9.4.2.3.7.1 Limitations

The following limitations are part of the current implementation of the Nomad pre-caching feature:

Software Updates are not supported by Nomad Pre-caching. Instead, make use of the available and mandatory advertisement dates.

Disabling Nomad Content Registration with the ContentDistribution database prevents Nomad clients from fetching further pre-caching notifications after the first batch of 20.

The Nomad Pre-caching Wizard allows packages that do not have content to be selected for pre-caching.

Delays may be seen when processing Pre-caching notifications for devices with many notifications. By default, Nomad clients will poll the ContentDistribution database once a day. Each time a client polls it will fetch a batch of 20 notifications to process, so for a client with 100 outstanding pre-caching notifications, it will take 5 days for all the notifications to be processed. The time between polls depends on the PrecachePollMinutes setting which can be reduced if there are many pre-caching jobs, though the 24-hour default is recommended.

Pre-caching jobs do not support Nomad *additional settings* (such as those configurable in the Nomad tab in the Package or Task Sequence properties).

Nomad won't re-download a pre-caching job with updated data format (that is compressed/encrypted), if the content has previously downloaded to the cache. The conversion will happen when ACP triggers the same content.

Nomad synchronization may cause issues if there is any replication issues between the central administration site and primary site.

Workgroup member clients may not be able to use the Nomad Pre-Caching feature, as it requires ContentDistribution registration using their FQDN.

9.4.2.3.8 Using network access accounts

Prior to this release, when a download is initiated, Nomad only used the credentials from the first Configuration Manager network access account it found to authenticate, and if that failed, the download stopped. From this release, Nomad cycles through all native Configuration Manager network access accounts to authenticate, thereby reducing the risk of failure.

> **Note**
>
> Nomad won't use network access accounts for SMB downloads from Distribution share. It uses the **SYSTEM$**account to connect to the package share location.

9.4.2.4 Nomad cache

An overview of the Nomad cache including different methods used by Nomad peers to access the cache on the elected master. The Nomad cache is essential to Nomad's download once to branch feature. The cache enables Nomad to hold its downloaded content so that it can be distributed locally to other Nomad peers. The Nomad cache contains downloaded content (such as packages, applications, and software updates) which can vary in size from relative small patches to rather large OS image files.

Nomad cache is used in a number of deployment scenarios, for example scenarios and how you can monitor those deployments using the Nomad app refer to:

Deploying software with Configuration Manager

Deploying software in large networks

Deploying updates for Office 365

Using Nomad with Operating System Deployment OSD.

9.4.2.4.1 Hard links

Nomad uses file system hard links between the Nomad and Configuration Manager client caches, ensuring that only a single copy of the content is retained. The use of hard links can be disabled using the NoHardlink setting.

Hard links are used for all content types except

Office 365 Updates, as this type of content is retained in the **Office 365 Click To Run** agent installation folder rather than the CCM cache folder

Content downloaded from Cloud Distribution Points

A hard link is the file system representation of a file by which more than one path references a single file in the same volume. Nomad uses this technique when making files in its cache available to the Configuration Manager cache if both of them are on the same volume and hard linking is not disabled. Both caches will hold the files but only uses one footprint on the physical volume. The Nomad cache is defined in the LocalCachePath registry value which is set during installation using the CACHEPATH installer property. If these caches are on different volumes, or hard linking is disabled, then Nomad copies content to the Configuration Manager cache.

Irrespective of whether hard linking is used or not, the following applies:

The Configuration Manager client and Nomad Branch each independently manages the content in their respective cache folders

When Nomad removes content from its cache as part of cache management, it also removes the same content from the Configuration Manager cache

When Configuration Manager removes content from its cache, content in the Nomad cache is not purged

Content downloaded directly by the Configuration Manager client (outside of Nomad) is not hard linked or copied to the Nomad cache

If the Configuration Manager client does not have sufficient space in its cache, it will not request a Nomad download.

9.4.2.4.2 Peer access methods

Nomad uses peer-to-peer connections to enable Nomad peers to access the Nomad master's cache. Nomad can share content with peers either through a file share (using Windows File and Printer Sharing Services) over SMB, or through an HTTP web service implemented in the Nomad client. Nomad also supports a 'connectionless' option for sharing content over UDP, but this should only be used as a last resort if SMB or HTTP/S are not viable in your environment.

Due to the complexity of network environments, Nomad provides some low-level control over the way the P2P communications are handled to help overcome certain scenarios that may arise. Specifically Nomad has a number of peer-to-peer connection related enhancements that enable it to work where:

File and Print Sharing Services are disabled

The connections may switch between wired and wireless communications

A multi-forest environment where peer computers from different forests may co-exist in the same subnet and are unable to access the Nomad master share using its hostname alone

Large files are being transferred.

9.4.2.4.2.1 HTTP/S

Nomad can be configured to use HTTP or HTTPS for all P2P sharing – thereby eliminating Nomad's dependency on SMB and **File and Printer Sharing Services**. Nomad also supports certificate-based client authentication, which eliminates the local SMSNomadP2P& account previously required for clients to authenticate with the elected master.

This is the recommended method of peer sharing content.

Note

For more detail please refer to Peer copy over HTTP or HTTPS.

9.4.2.4.2.2 SMB and File and Printer Sharing Services

This is the original and default method for Nomad peer sharing, which uses SMB and requires **File and Printer Sharing Services**.

Note

For more detail please refer to The Nomad share.

9.4.2.4.2.3 Connectionless P2P

Nomad can be configured to bypass these services and use the connectionless transfer protocol over the **User Datagram Protocol (UDP)** instead. Connectionless P2P does not use authentication and is approximately five times slower than SMB. This transfer method is only recommended for environments where other methods are not available.

To enable Connectionless P2P update the Nomad P2Penabled registry value on all Nomad clients to:

0x0000 – P2P disabled

0x0002 – Enable connectionless P2P server

0x0004 – Enable connectionless P2P client.

In most cases both **P2P server** and **P2P client** should be enabled, by setting 0x0006 (decimal 6), as shown below:

9.4.2.4.3 Switching between wireless and wired network connections

When network connections are switched between wireless and wired, Nomad may encounter problems accessing the share. Problems are likely to occur if DHCP uses a short lease time and the DNS does not reflect these changes quick enough. To mitigate these issues, Nomad has support for net literal names (IP addresses) for identifying its shares. Nomad clients normally use the elected master's hostname to connect to the NomadSHR in order to download the LSZ, LST and package files.

To configure Nomad to use net literal names (IP addresses) when connecting to peer shares, update the P2Penabled registry value to include:

0x0001 – P2P enabled

0x0008 – Enable use of net literal names (IP addresses).

For example, P2P enabled (0x1) plus enable use of net literal names (0x8), by setting 0x0009 (decimal 9), as shown below:

9.4.2.4.4 Multi-forest environments

By default, Nomad clients use the master's hostname to connect to the master in order to retrieve the package and signature files.

In a multi-forest environment computers from different forests may be present in the same subnet as the peers and are not able to connect to the master using just the hostname. In this scenario, Nomad should be configured to use FQDN for peer-to-peer connections. For this to work, it is necessary that the reverse lookup for IP addresses is correctly configured and running. If this is not available, Nomad reverts to using the IP address for its connection to P2P shares.

To configure Nomad to use FQDN when connecting to peer shares, update the P2PEnabled registry value to include:

0x0001 – P2P enabled

0x0010 – Enable use of FQDN name.

For example P2P enabled (0x1) plus enable use of FQDN (0x10), by setting 0x0011 (decimal 17), as shown below:

9.4.2.4.5 Cache management

The downloaded content in the Nomad cache consume disk space, therefore management of the cache is critical. Because files may be re-used and distributed to other devices on the same subnet or site, the simple solution of deleting the files as soon as they have finished downloading and executing is not sufficient. Instead, Nomad has a cache cleaner utility that automatically but intelligently maintains control over the cache's disk usage.

Nomad cache is used in a number of deployment scenarios, for example scenarios and how you can monitor those deployments using the Nomad app refer to:

Deploying software with Configuration Manager

Deploying software in large networks

Deploying updates for Office 365

Using Nomad with Operating System Deployment OSD.

9.4.2.4.5.1 Cache clean cycle versus CacheCleaner

There are two ways to clean the cache:

The cache clean cycle - which runs automatically on a cycle and clears the unused content from the cache as a preference (default off).

The CacheCleaner and its cache cleaner rules - which is either run by Nomad during an active download or manually from the command-line.

CacheCleaner can be run when required in addition to the automated cache clean cycle, for example when reserving space for new contents to be downloaded by manually running it from the command-line. CacheCleaner deletes content based on its priority and doesn't check its last usage date. So it is possible that content which is lower in priority but has been recently used, or is used regularly (like WIM files), may also get deleted when CacheCleaner runs. This mechanism therefore acts more as an emergency option to free up disk space but may result in the deletion of content that is likely to be used (which must then be downloaded again when needed). The cache clean cycle helps to maintain the low profile of the Nomad cache by removing content that is less likely to be used.

Both cache clean cycle and CacheCleaner methods are described in detail in:

Cleaning the cache using the cache clean cycle

Cleaning the cache using CacheCleaner.

9.4.2.4.5.2 Cleaning the cache using the cache clean cycle

The automated cache clean cycle runs automatically on a regular configurable interval. Nomad was designed to cache content that Configuration Manager has requested or that has been pre-cached using Content Distribution. Because of this the content accumulated in the Nomad Cache can become quite extensive, with a large degree of it no longer relevant or useful. For example, a Windows software update which has been superseded by a newer update is no longer relevant or useful and can be safely removed. The cache clean cycle helps to manage the Nomad cache, remove aged and irrelevant content and minimize its impact on the host machine.

The cache clean cycle is turned off by default, so the registry entries must be set before it will start to regularly clean the cache.

9.4.2.4.5.2.1 Configuration options

This option is configured by setting the following registry values or installer properties:

Registry Value	Default Value	Installer Property	Description
CacheCleanCycleHrs	0 (turned off)	CACHECLEANCYCLEHRS	The first automatic cache clean runs randomly between 10 to 60 mins of service start up. Subsequent

Registry Value	Default Value	Installer Property	Description
			cache clean cycles run after the number of hours specified. 0 means feature turned off. No cache cleaning cycle would run. Changing this registry entry performs an internal restart. The minimum value is 4. The maximum value is 168 (Once a week)
CacheCleanSubnetLookup	1 (turned on)	CACHECLEANSUBNETLOOKUP	Before deleting content, Nomad checks if it is on any other client in the same subnet, and will only delete local content if the same is present on at least one other client on the same subnet. To disable subnet lookup, set the value to 0. Its value can be 0 or 1. The default value is 1, subnet lookup is enabled. New setting introduced in 8.0.
MaxCacheDays	0 (turned off)	MAXCACHEDAYS	Set to delete application or package content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only application or package

Registry Value	Default Value	Installer Property	Description
			content that have triggered elections recently will be kept in the cache. 0 means that application and package content will not be deleted automatically when the cache cleaner runs.
MaxCacheDaysThreshold	0 (turned off)	MAXCACHEDAYSTHRESHOLD	This is the maximum number of days content is present on a client. If it's not zero, then content will be deleted without any other checks once it reaches the threshold. If the threshold has a value greater than zero and less than 30, Nomad uses the threshold of 30 days and creates an associated log. Default value is 0. New setting introduced in 8.0.
MaxPreCacheDays	0 (turned off)	MAXPRECACHEDAYS	Set to delete pre-cached content that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only pre-cached content that has triggered elections recently will be kept in the cache. 0 means that pre-cached content will not be deleted

Registry Value	Default Value	Installer Property	Description
			automatically when the cache cleaner runs.
MaxSUCacheDays	0 (turned off)	MAXSUCACHEDAYS	Set to delete software updates that last triggered Nomad elections before the specified number of days from the date the cache cleaner runs. This ensures that only software updates that have triggered elections recently will be kept in the cache. 0 means that software updates will not be deleted automatically when the cache cleaner runs.
DpCacheCleanupEnabled	0 (turned off)	DPCACHECLEANUPENABLED	Deletes all LSZ files in a Distribution Point (DP) cache whose content is no longer distributed, that is not present in ContentLib. To enable DP Cache Cleaner, set the value of registry to 1 (any value except for 0 enables this feature).

9.4.2.4.5.2.2 Cache clean cycle delete conditions

When the cache clean cycle runs, it will check the type of each content and the last election date associated with it. There are four main types of content, and these will be marked for deletion if the following delete conditions are true:

Content type	Delete condition
Pre-cached	last election date + MaxPreCacheDays > cache clean cycle run date
Application or package	last election date + MaxCacheDays > cache clean cycle run date
Office 365 update byte-range	last election date + MaxSUCacheDays > cache clean cycle run date
Software updates related to SMSTSNomad jobs	

The cache clean cycle will then also check the following, for all content other than Office 365 update byte-ranges:

The content should be present on at least one of the Nomad subnet peers with an equal or a higher percentage of content

The network has broadcasts enabled

If both of these conditions are also true, the content will be deleted.

9.4.2.4.5.2.3 Caveats

The following points describe various caveats related to the way that the cache clean cycle works:

If pre-cache content is deleted by the cache clean cycle, but the corresponding pre-caching job still exists, Content Distribution will send the download notification again to the client

> **Note**
>
> If your Nomad policy is to not delete pre-caching jobs, you should turn off deletion of pre-cached content by setting the MaxPreCacheDays registry value to 0.

Application upgrades and uninstallation via Software Center require content to be present on the machines (the current version is required for uninstallation and the previous version is required for upgrade scenarios). If the content has been deleted by the cache clean cycle, the content would be downloaded again at uninstall or upgrade time. Because of the way that the cache clean cycle delete conditions are applied Nomad retains one copy of the content per subnet, so even if such a download request comes the content would be downloaded from a Nomad peer and not a DP

ByteRange content is not checked to be present on subnet peers

Cache optimization does not work for content that is to be activated later on

Cache optimization does work on Sensitive Servers.

9.4.2.4.5.3 Cleaning the cache using CacheCleaner

To maintain the cache Nomad uses a set of basic rules that lets you decide the cache's effect on overall disk usage and performs automatic cleaning when necessary. When a job is advertised, automatic cache cleaning could occur under the following circumstances:

If the percentage of available disk space is less than the PercentAvailableDisk setting after downloading an incoming package, according to its download package size, automatic cache cleaning is initiated before the download takes place

Nomad then assesses how much space could be cleared by deleting cache folders that are eligible for deletion. A cache folder is deemed eligible for deletion if its cache priority value is lower than or equal to the cache priority value of the incoming package. The cache priority value is set on the Nomad command-line using the pc argument, or set in the Nomad properties page when using Configuration Manager. By default, if no value is specified, packages have a cache priority of 1

If the assessment determines there would still not be sufficient space available: no deletion will take place, the download is aborted and an error logged, which may be one of:

Insufficient disk or cache space available to download the Program...

Insufficient cache space available to achieve a Max Cache Size of X

If the assessment determines there would be sufficient space available in the cache: the folders are deleted in order according to their cache priority until the required disk space is available.

9.4.2.4.5.3.1 Cache cleaner and Configuration Manager

When Nomad is used with Configuration Manager the cache cleaner will also:

Purge linked contents from the Configuration Manager cache

Purge older versions from the Configuration Manager cache before downloading the content for a newer version.

The cache cleaner mechanism also works with the priority job control to ensure that suspended lower priority job caches are not cleaned to make way for the higher priority job unless absolutely necessary.

9.4.2.4.5.3.2 Command-line switches

CacheCleaner is an executable that can be used to explicitly purge the Nomad cache. By default, the Nomad cache is not purged unless there is an active download. In most cases, available disk space is not really an issue, but there may be circumstances where you may want to manage the cache to keep the disk usage overhead to a minimum. Please refer to Cache management for further information about managing the cache.

It is installed as part of Nomad and the format of the command-line is:

```
CacheCleaner.exe -switch
```

For a complete reference of Nomad command-line switches refer to Command-line switches.

Note

If the Nomad cache is deleted while another client is accessing it, the other client will recover by downloading directly from the DP. This is by design and ensures recovery occurs in order to complete a successful download.

9.4.2.4.5.3.3 CacheCleaner examples

In the following examples, there is no requirement to specify the path to CacheCleaner.exe because the path to Nomad executables is set in the PATH environment variable:

Example	Description
Set the cache cleaner to run as a Configuration Manager program.	You can set the cache cleaner to run as a Configuration Manager program and advertise it to all Nomad systems in a single operation. You can also schedule this as a regular housekeeping job, ensuring that the cache is kept under control automatically. To purge the cache when the total free disk space is at 20% run: `CacheCleaner.exe –PercentAvailableDisk=20`
Ensure that content in the cache is not kept for more than 30 day.	To ensure that content in the cache is not kept for more than 30 days, run: `CacheCleaner.exe –MaxCacheAge=30`
Delete a particular package and version.	To delete a particular package and version, run: `CacheCleaner.exe –DeletePkg=L0A00001 –PkgVer=1`
Purge the contents of a cache with a priority of 3 or lower.	To purge the contents of a cache with a priority of 3 or lower, run: `CacheCleaner.exe –DeleteAll -Force=3`
Purge the contents of a cache with a particular priority and size.	To purge the contents of a cache with a particular priority and size, run: `CacheCleaner.exe –PkgSize=10485760 –CachePriority=6`

9.4.2.4.6 Peer copy over HTTP or HTTPS

Nomad peer-to-peer content transfer uses SMB by default, which requires File and Print services to be enabled in order for it to share the content. For better security Nomad can be configured to use HTTP or HTTPS for peer-to-peer content transfer, removing the requirement for file shares. When Nomad is configured to use HTTP/S, if Peer Backup Assistant is enabled it will also use HTTP/S.

For some example deployment scenarios and how you can monitor those deployments using the Nomad app refer to:

Deploying software with Configuration Manager

Deploying software in large networks

Deploying updates for Office 365.

9.4.2.4.6.1 Enabling HTTP/HTTPS

Enabling HTTP/S for peer-to peer content transfer (including Peer Backup Assistant) is done by modifying the relevant bits of theP2PEnabled registry value as shown in the following table:

Bit	Hex	Decimal	P2P Protocol used
0	0x01	1	SMB
5	0x20	32	HTTP
6	0x40	64	HTTPS

Note

P2PEnabled is a numeric value where, when represented in binary, each bit represents a configurable option, The table above only shows the bits that are relevant to P2P protocol selection. These values can be combined with other P2P settings, refer to P2PEnabled for full details.

It is important to ensure all clients are configured to use the same protocol, as a mismatch in protocol will prevent Nomad peers copying content from the elected master. You can enable multiple protocols on a client - for example P2PEnabled = 0x61 enables the peer to connect to the elected master using either HTTPS, HTTP or SMB. In this scenario, the peer will attempt the most secure protocol (HTTPS) first, followed by HTTP and finally falling back to SMB if it is unable to connect using HTTPS or HTTP.

9.4.2.4.6.1.1 HTTP and HTTPS Ports

When you enable HTTP and/or HTTPS, by default Nomad will use port 5080 for HTTP and 5443 for HTTPS, If these ports are already in use in your environment, you can define custom port numbers using the following registry values,

Registry value	Default value	Notes
P2PHttpPort	5080	Default HTTP port to use for peer copy. If you are using a custom port, ensure that all Nomad clients use the same custom port.

Registry value	Default value	Notes
P2PHttpsPort	5443	Default HTTPS port to use for peer copy. If you are using a custom port, ensure that all Nomad clients use the same custom port.

9.4.2.4.6.2 Client authentication

Client authentication is required when Nomad peers connect to the elected master. Nomad supports two client authentication methods,Windows authentication and certificate-based authentication.

9.4.2.4.6.2.1 Windows authentication

By default, Nomad peers use the local SMSNomadP2P& account, which is created by Nomad on each client, to authenticate with the elected master (when the master is elected, it shares a key that enables them to determine the credentials for this local account on the master). This requires each client to allow their local SMSNomadP2P& account to access the computer from the network. Alternatively, Nomad peers can be configured to use their Computer Account to authenticate with the elected master using the SpecialNetShare setting. If the Computer Account is used, the Domain Computers group at a minimum must be configured to access the computer from the network on all clients.

By default, the elected Nomad master will allow connections from its own SMSNomadP2P& account and all authenticated Users (Authenticated users is required when using the peer's Computer Account to authenticate). You can restrict this further to just the SMSNomadP2P& account using the AuthenticatedUsers setting.

9.4.2.4.6.2.2 Certificate-based authentication

When Nomad is configured to use HTTPS for peer-to-peer content transfer, peers can use a PKI Client authentication certificate to authenticate with the elected master. This is more secure than Windows authentication as it does not require any local accounts to be granted 'Access this computer from the network' permissions. To enable certificate-based client authentication:

Configure clients to use HTTPS for peer-to-peer content transfer through the P2PEnabled client setting.

Ensure clients have enrolled a client authentication certificate from a PKI in the Local Computer Personal certificate store. (Self-signed certificates cannot be used for client authentication). If you are using Configuration Manager with HTTPS site systems, you should already have a suitable PKI client authentication certificate enrolled on all CM clients that Nomad can use for P2P client authentication.

Optionally (but recommended) configure CertIssuer client setting to assist Nomad in selecting the correct client authentication certificate if there are several in the Local Computer Personal certificate store

Configure P2PSslSettings to enable certificate-based client authentication. When this option is enabled, Nomad does not create the local SMSNomadP2P& account.

Warning

If you enable certificate-based authentication for peer-to-peer content transfer, you must ensure that a valid client authentication certificate is available at all times. If the certificate expires, Nomad will return ERROR_CLIENT_CERT_MISSING (0X209A). This error code has been added to the Nomad SuccessCodes default setting, which means that Nomad will fail the download job and CM will not fall back to BITS to download the content from the DP. Nomad will not be able to download any content until a valid certificate becomes available on the client.

If you have configured Nomad to use a PKI certificate for server or client authentication, when Nomad starts it will look for an appropriate certificate in the Local Computer Personal certificate store. In most cases Nomad will be able to select an appropriate certificate without any additional configuration. In some cases you may need to specifyCertIssuerand possiblyCertSubject.

9.4.2.4.6.2.2.1 Client authentication certificate selection

Nomad will select a client authentication certificate for peer-to-peer authenticationfrom the Local Computer Personal certificate store using the following criteria if:

If the first certificate is issued by one of the issuers specified in CertIssuer but the next certificate is not, then the first will be selected. If both match or do not match the CertIssuer, then the next step is evaluated.

If the first certificate has a subject specified in CertSubject but the next is not, then the first will be selected, otherwise the next step is evaluated.

If the first certificate has a subject specified as an FQDN and the second does not, the first will be selected, otherwise the next step is evaluated.

The certificate with the latest expiry will be chosen.

Nomad will select the first certificate that matches the above criteria. CertIssuer should only be required if the CM client is using a self-signed certificate for client authentication with CM site systems and there are certificates from multiple Certificate Authorities. When CertIssuer is defined, Nomad will select the first certificate issued by that CA that matches the other criteria.

Note

Nomad also requires a client authentication certificate for authenticating with CM HTTPS Site Systems. In most cases, it will use the same certificate for authentication with peers and CM site systems, which will typically be the PKI-issued CM client authentication certificate.

If for any reason a different certificate should be used for authentication with CM site systems, you can additionally specify CertSubject.

9.4.2.4.6.2.2.2 Caching of certificates

Once a certificate is selected using the above criteria, it is cached and is provided for any subsequent client certificate requests until the certificate is expired or no longer present in store. Once the certificate is expired or no longer present, another certificate is chosen by using the above selection criteria.

9.4.2.4.6.2.2.3 Exception

If the registry value "thumbprint" is specified under HKLM\Software\1E\NomadBranch\Platform then the certificate with this thumbprint will be chosen (if it is valid, if not then the above selection criteria is used) if the download URL is a background channel URL or if both registry values CertIssuer and CertSubject are not specified.

9.4.2.4.6.2.2.4 Missing or invalid client authentication certificate

If Nomad is unable to select a valid client authentication certificate for any reason (for example if no certificate present, or is expired, or the certificate is not from the specified issuer), then Nomad returns ERROR_CLIENT_CERT_MISSING(0x209A) for the download job. This error code is included in the default SuccessCodes, so if it occurs, Configuration Manager will not revert to downloading using BITS, thereby protecting the network from potential congestion.

In Windows PE, Nomad fails the job immediately.

In the full OS, Nomad retries every 10 minutes until a valid client certificate is available in the Local Computer Personal certificate store or timeout (defined by P2PClientCertWaitPeriodMins, 24 hours by default) occurs.

If a client certificate becomes available before timeout occurs, a new election is initiated and Nomad tries downloading the content again.

If no certificate becomes available within the timeout period, Nomad will fail the job.

During the timeout period, if the Nomad service is reset, the download job is paused or the system goes to sleep, Nomad will continue to wait for the timeout period to expire. Any other interruption (the for example, if Nomad service is stopped, or the download job is cancelled or expires) will cause the download job to fail with the appropriate error condition.

While the download job is waiting for a valid client certificate, Nomad will not process any other download jobs.

9.4.2.4.6.3 Server authentication

Server authentication is required when Nomad is configured to use HTTPS for peer-to-peer content transfer. In this scenario, Nomad binds a server authentication certificate to the HTTPS endpoint to secure the communication between the elected master and peers. This certificate can be generated either by Nomad (self-signed) or through a Public Key Infrastructure (PKI). Use the P2PSslSettings to configure Nomad to use either self-signed (default) or PKI certificate.

9.4.2.4.6.3.1 Server authentication certificate selection

Nomad will select a server authentication certificate in the Local Computer Personal certificate store using the following criteria

Store = MY (the default certificate store)

Usage = Server Authentication

Subject/DNS = Host name or FQDN

Valid (NotBefore is in the past) and not expired (NotAfter is in the future)

Issuer = CertIssuer (Optional).

In most cases, the built-in criteria are sufficient to determine a single applicable certificate. If multiple certificates are likely to match these criteria, you can optionally specify CertIssuer to limit the certificates that Nomad will consider to those issued by one or more specific Certificate Authorities. Note that CertIssuer also affects the selection of the Client Authentication certificate. If the server and client authentication certificates are issued by different Certificate Authorities, you can specify multiple CAs with CertIssuer, either using a sub-string that is common to the desired CA names, or a comma-separated list of CA names.

If multiple certificates match the criteria above, Nomad uses the following order of precedence when matching the Subject Name:

Hostname and FQDN

Hostname

FQDN

If a single certificate matching the criteria still cannot be resolved, the matching certificate with the longest validity is used.

Note

When using Net literal names (3rd bit in P2PEnabled is set), clients ignore mismatch in host names during the SSL handshake – this is because IP addresses are generally not included in certificates

When using self-signed certificates for server authentication, clients do not validate the certificate issuer since it is issued by *NomadBranch* and it is not a valid CA

Due to the nature of how proxy servers can be implemented, some of which can be quite complex, you may need to consult your networking specialist to see if exceptions need to be added to enable Nomad's peer-copy over HTTP or HTTPS.

9.4.2.4.6.4 Firewall exceptions

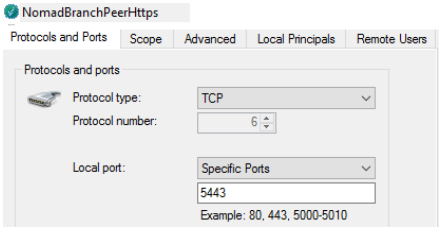
Depending on your preferences (protocols, ports) during installation, the installer will add the exceptions to Windows firewall.

Note

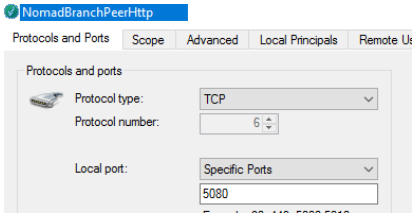
If for some reason these exceptions are removed post-installation, Nomad service will automatically re-add them. You'll just have to restart the service. Nomad service checks and fixes required firewall exceptions whenever it starts.

You can verify these in its Inbound Rules:

For HTTPS (port 5443)



For HTTP (port 5080)



Note

Firewall exceptions are added against the program "system" not NomadBranch.exe. This is because Nomad uses Windows HTTP Server API (https://docs.microsoft.com/en-us/windows/win32/http/http-api-start-page?redirectedfrom=MSDN)to create the HTTP server and under this API all requests are handled by Windows kernel's "system" program not by Nomad directly. In some third-party firewalls you may have to use the program name "ntoskrnl.exe", since "system" is actually an alias for ntoskrnl.exe.

9.4.2.4.6.5 Windows PE support

When running in Windows PE, Nomad can download content from peers over HTTP/S, but is not able to serve content to others (a Windows PE client will not be elected as a master). However, Nomad still needs to be configured correctly (port usage and certificate type) or it will not be able to connect peers.

9.4.2.4.6.5.1 Certificate-based P2P Client Authentication in Windows PE

When Nomad is configured to use certificate-based client authentication for peer-to-peer content transfer, to support running in Windows PE you will need to update the Windows PE boot image(s) to include a client authentication certificate in the Windows PE boot image (as Windows PE will not be able to enrol a Client Authentication certificate, typically done through Active Directory). If you are using 1E PXE Everywhere and have prepared boot images using UpdateBootImage with a PKI-issued client authentication certificate, no further action is required. If you are not using PXE Everywhere, or have prepared boot images using a CM self-signed certificate you will need to update your boot images to use a PKI-issued Client Authentication certificate.

If CM is using PKI-issued certificates for Client Authentication, you can use (export) the certificate that CM will have already prepared for use with boot images. If CM is using self-signed certificates, you will need to export a suitable PKI-issued Client Authentication certificate. In either case, you will need to export the appropriate certificate and provide the path to the exported certificate in the UpdateBootImage UI / command line. Even if you are not using PXE Everywhere, you can use the UpdateBootImage tool by installing just the PXE Everywhere Admin Tools on a device that has the CM console and Windows 10 ADK (version corresponding to the version of

Windows PE you are using for your boot images). You can download PXE Everywhere from the 1E Support Portal.

9.4.2.4.6.5.1.1 Certificate-based P2P Client Authentication in the full OS

When a Task Sequence reboots from WinPE into the full OS, Nomad will usually fail to find a certificate in the Microsoft certificate store. This is not an issue. Default logging level logs this fact, but does not show that Nomad successfully gets the BootImage certificate which the Task Sequence had previously stored in its variables list while in WinPE. Nomad uses this BootImage cert to authenticate with peers, and also with the Background Channel proxy to read data from Content Distribution if SSD is enabled and required. The log goes on to show the "Peer Connected OK" and gets the content.

Whilst Nomad Branch and 1E Client are separate services, Nomad depends on 1E Client to post events via the Tachyon Switch. However, the Client connection to the Switch depends on finding a certificate in the Microsoft certificate store, which does not exist, and 1E Client logs this error (not in the Nomad log). The 1E Client is unable to use the BootImage cert that Nomad uses. Inability to post events while the Task Sequence is running is not an issue, and any errors logged should not be of any concern. When the Task Sequence completes, your normal process of certificate enrollment will complete and the 1E Client will connect to the Switch and the backlog of Nomad events will be posted.

Whilst unnecessary, if you want Nomad events to be posted sooner in full OS, you can modify your Task Sequence to enrol a certificate into the Microsoft certificate store earlier. One method is to add a step to enable AutoEnrollment after 1E Client (and Nomad) is installed. For example, a Run command-line:

```
reg add HKEY_LOCAL_MACHINE\Software\Policies\Microsoft\Cryptography\AutoEnrollment /v AEPolicy /d 7 /t REG_DWORD /f /reg:64
```

9.4.2.4.6.5.2 Configuring Nomad to use HTTP/S in Windows PE

Nomad uses a custom Install and Configure Nomad in WinPE Task Sequence step to install Nomad after the Task Sequence has booted into Windows PE. The settings highlighted below are related to configuration for HTTP/S.

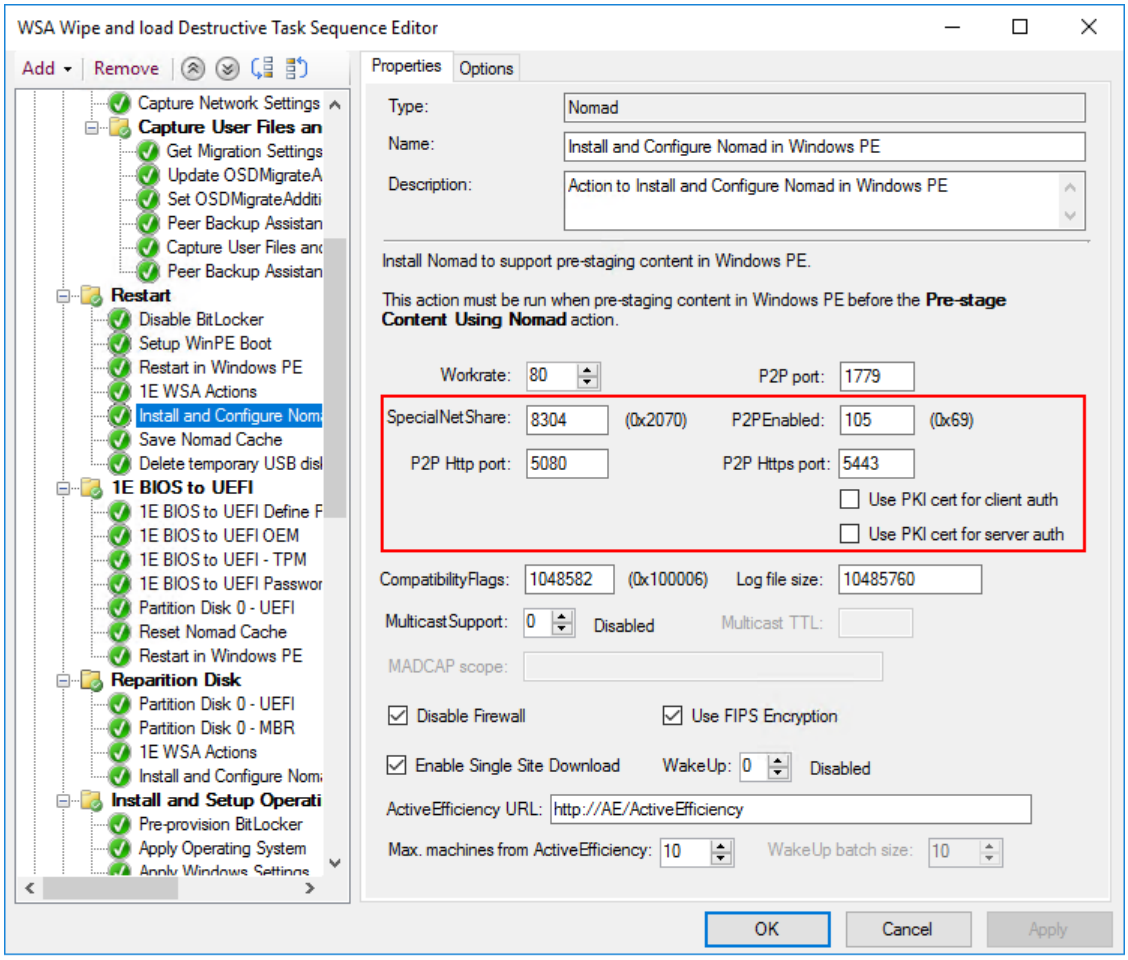
P2PEnabled must be set to include HTTP or HTTPS. By default, this is set to 0x9, which disables HTTP/S

P2PHttpPort is disabled unless HTTP is enabled (bit 0x20 set in P2PEnabled). It defines the port that is used for Nomad P2P communication over HTTP (default 5080)

P2PHttpsPort is disabled unless HTTPS is enabled (bit 0x40 set in P2PEnabled). It defines the port that is used for Nomad P2P communication over HTTPS (default 5443)

Use PKI cert for client auth enables certificate-based client authentication, which requires a PKI-issued certificate. Selecting this option sets bit 0x2 of P2PSslSettings

Use PKI cert for server auth configures Nomad to use a PKI certificate for server authentication when HTTPS P2P is enabled (bit 0x40 set in P2PEnabled). If this option is not checked and bit 0x40 in P2PEnabled is set, Nomad will use a self-signed certificate for server authentication.



9.4.2.4.6.6 Configuring use of PKI-issued certificates post-installation

If Nomad was originally installed to use HTTPS with self-signed certificates for server authentication and you want to switch to using PKI-issued certificates, do the following:

Deploy the certificate to all Nomad clients. Ensure that the certificate's usage is Server Authentication and the certificate Subject is the client's host name or FQDN.

Enable HTTPS (Bit 6 - 0x0040) in P2PEnabled.

Update CertIssuer with the name of the certificate authority.

P2PSslSettings set to 1 to enable PKI certificate for server authentication.

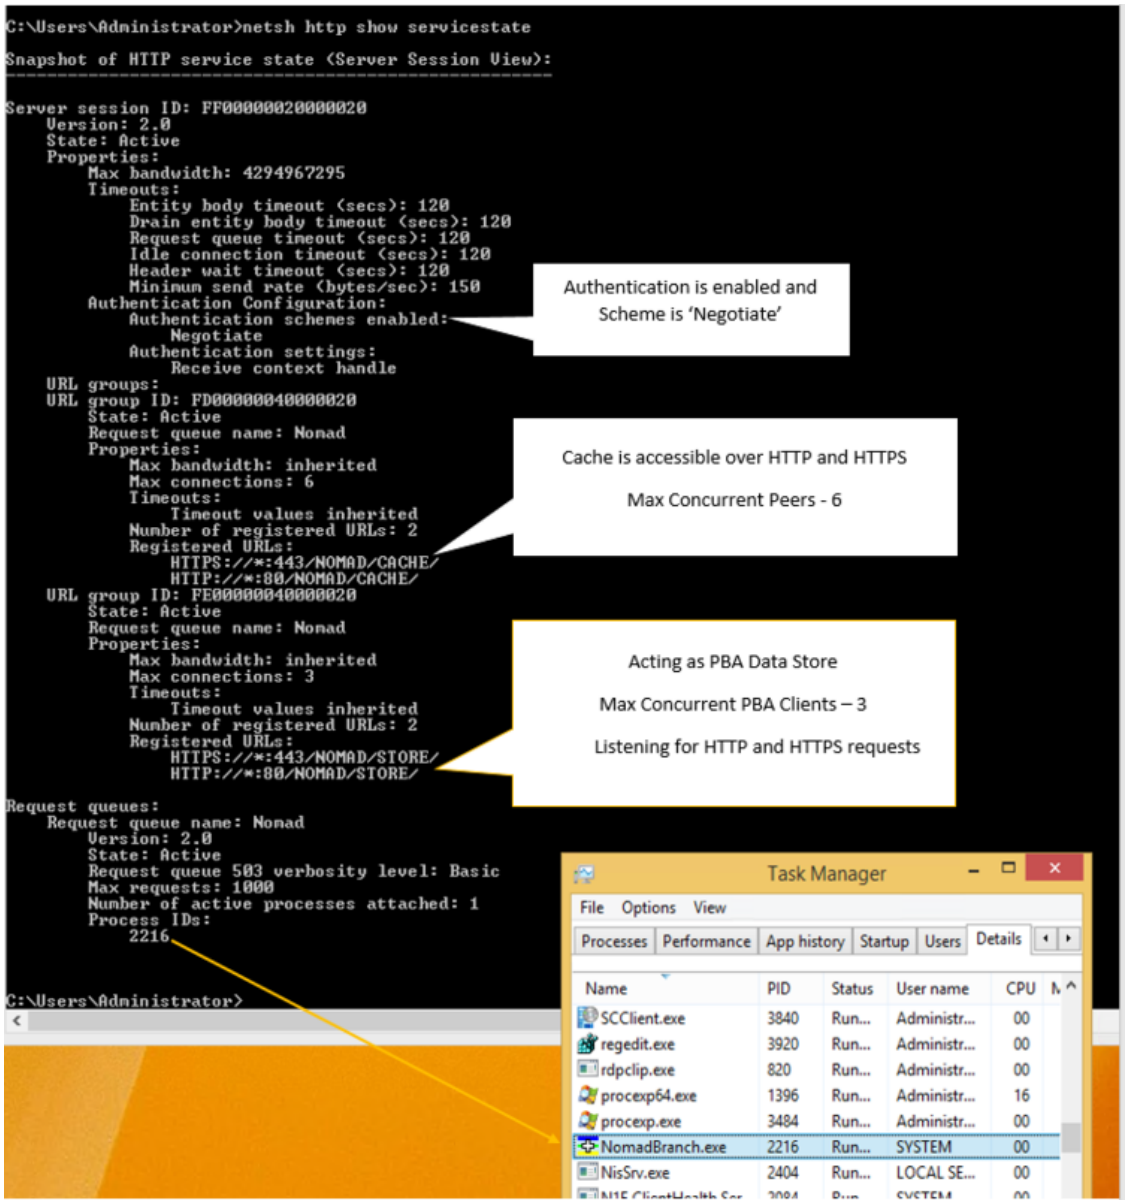
Restart the Nomad service.

9.4.2.4.6.7 Checking the status of your Nomad P2P HTTP server

To check the status of the P2P HTTP server, open the NomadBranch log. When the Nomad service starts, it logs a list of URLs it listens to, as shown in the example opposite.

1/25/2017 7:45:05 PM	Starting Http(P2P) Server
1/25/2017 7:45:05 PM	Http Initialized
1/25/2017 7:45:05 PM	Http Create Request Queue: 'Nomad'
1/25/2017 7:45:05 PM	listening for http requests on 'Http://*:5080/Nomad/Cache'
1/25/2017 7:45:05 PM	listening for http requests on 'Https://*:5443/Nomad/Cache'
1/25/2017 7:45:05 PM	listening for http requests on 'Http://*:5080/Nomad/Store'
1/25/2017 7:45:05 PM	listening for http requests on 'Https://*:5443/Nomad/Store'

Alternatively, run *NETSH* to check the status of the P2P HTTP server, as shown in the example opposite.

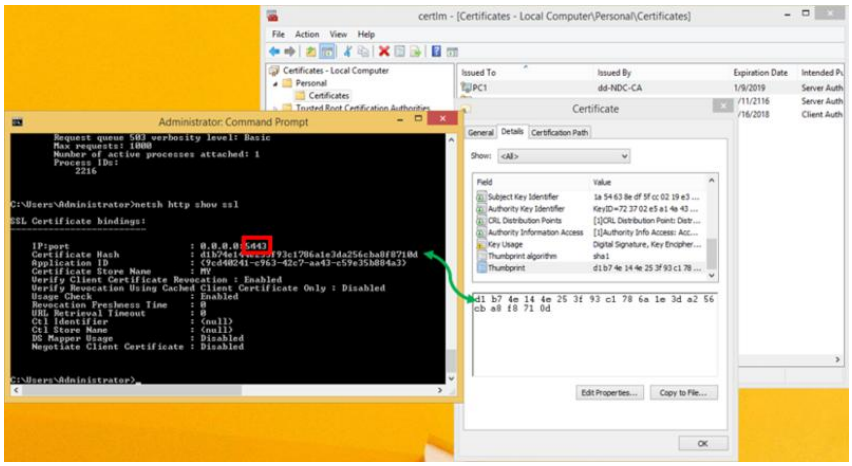


9.4.2.4.6.8 Checking SSL certificate bindings

To check the bindings of your SSL certificates, open the Nomad log. When the Nomad service starts, it logs the name of the certificate and its issuer, as shown in the example opposite.

```
1/27/2017 1:17:13 PM    Http Initialized
1/27/2017 1:17:13 PM    Http Create Request Queue: 'Nomad'
1/27/2017 1:17:13 PM    listening for http requests on 'Http://*:5080/Nomad/Cache'
1/27/2017 1:17:13 PM    listening for http requests on 'Https://*:5443/Nomad/Cache'
1/27/2017 1:17:13 PM    listening for http requests on 'Http://*:5080/Nomad/Store'
1/27/2017 1:17:13 PM    listening for http requests on 'Https://*:5443/Nomad/Store'
1/27/2017 1:17:13 PM    Software\1E\NomadBranch\P2PSslBindingId=""
1/27/2017 1:17:13 PM    Using Certificate (Issuer) NomadBranch "NomadBranch Authentication Certificate"
1/27/2017 1:17:13 PM    Set Software\1E\NomadBranch\P2PSslBindingId="36599882-0096-4e03-a4ff-fe7a5890196d"
1/27/2017 1:17:13 PM    Precache polling disabled. PlatformURL not set.
1/27/2017 1:17:13 PM    Nomad Http(P2P) Listener started
```

Alternatively, run *NETSH* to check the bindings for the certificates. In our example, the bindings for port 5443 are shown in the example opposite.

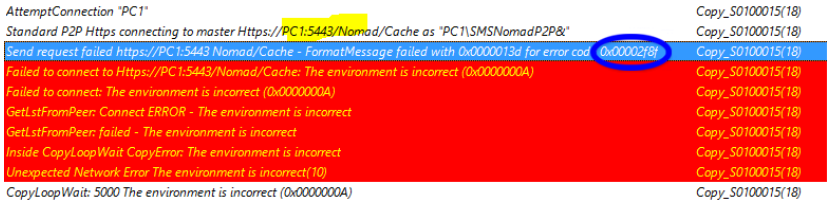


9.4.2.4.6.9 Troubleshooting failures during HTTP/HTTPS downloads

The most likely causes of HTTP/HTTPS download failures occur during a connection to a master. The most common errors are detailed below:

Error codes	Reason
0x00002efd 0x00004CF	HTTP/HTTPS is not enabled on the master or HTTP/HTTPS server on the master is listening on different port. In our example, the log illustrates that HTTPS had not been enabled on the PC1 master. *AttemptConnection "PC1"* — *Copy_S0100015(18)* *Standard P2P Https connecting to master Https://PC1:5443/Nomad/Cache as "PC1\SMSNomadP2P&"* — *Copy_S0100015(18)* *Send request failed https://PC1:5443 Nomad/Cache - FormatMessage failed with 0x0000013d for error cod 0x00002efd* — *Copy_S0100015(18)* *Failed to connect to Https://PC1:5443/Nomad/Cache: The network location cannot be reached (0x000004CF)* — *Copy_S0100015(18)* *Failed to connect: The network location cannot be reached (0x000004CF)* — *Copy_S0100015(18)* *GetLstFromPeer: Connect ERROR - The network location cannot be reached* — *Copy_S0100015(18)* *GetLstFromPeer: failed - The network location cannot be reached* — *Copy_S0100015(18)* *Inside CopyLoopWait CopyError: The network location cannot be reached* — *Copy_S0100015(18)* *Unexpected Network Error The network location cannot be reached(1231)* — *Copy_S0100015(18)* Possible solution: Double-check the values of P2PEnabled on both the client and remote peer - they should be the same.

Error codes	Reason
0x00002f8f	Invalid Certificate on master.
0x000000A	In our example, issues with certificates causes the download to fail with 0x00002f8f (security error) and the logging does not identify the cause of the failure.



Where errors like this occurs, check the following on master:

Expiry date

Subjects – should contain hostname or its FQDN

Issuer must be trusted via the trust chain on the peer machine

SSL Binding – ensure it exists for the HTTPS port.

9.4.2.4.7 The Nomad share

The Nomad cache is configured as a share that enables peer-to-peer distribution of downloaded content. Nomad provides control over the accounts that have access to the share and also provides an advanced Nomad FanOut mechanism that can overcome the connection limit to shares on workstations to ensure that content is distributed efficiently and securely.

> **Note**
>
> If Nomad is configured to use exclusively HTTP/HTTPS for peer copy, then the Nomad share is not created by the NomadBranch service.

For some example deployment scenarios and how you can monitor those deployments using the Nomad app refer to:

Deploying software with Configuration Manager

Deploying software in large networks

Deploying updates for Office 365.

9.4.2.4.7.1 Enhanced Nomad share security

Nomad leverages native Windows security to define which accounts have access to the Nomad share. In Nomad's default configuration, a Nomad share is created when the Nomad service is

started and removed when it is stopped. The default Nomad settings also grants both Authenticated Users and the *SMSNomadP2P&* Nomad share account read-only access to the share.

In early versions of Nomad, further restricted access to the Nomad share could only be done using custom share permissions. The major disadvantage to this approach was that the Nomad service no longer managed the Nomad share, and it had to be created and managed through other methods. So, if you wanted to exclude Authenticated Users from the Nomad Share permissions, you must take over the management of the share.

In Nomad, a cache access security option has been implemented that is controlled using the AuthenticatedUsers registry value. This optionally restricts access to the Nomad share to just the *SMSNomadP2P&* Nomad share account, thereby excluding Authenticated Users from the Nomad share permissions but still leaves Nomad in control of the creation, management and removal of its share.

9.4.2.4.7.2 Nomad Branch service and the Nomad share

The Nomad share is created each time the Nomad Branch service starts and removed when it stops. When the Nomad Branch service starts:

A share called *NomadSHR* for the Nomad cache folder is created. The share is removed when the Nomad Branch service stops. If this share is created on a workstation, only 6 concurrent users can access it. If the share is created on a server, there is no limitation.

A local user account called *SMSNomadP2P&* is created with its password attribute set to Password Never Expires. This account is not removed when the Nomad Branch service stops. The password for this account is changed each time the Nomad service restarts and is made up of 14 characters using a combination of upper and lower case alpha-numeric characters. This account is not a domain user and does not have the logon locally privilege. Account details are requested by peer clients during the master election process.

If the AuthenticatedUsers registry value is configured to use the built-in security principal Authenticated Users, the NTFS permissions on the Nomad cache folder are updated so that Authenticated Users is granted Read and Execute, List folder contents and Read permissions for the folder, its subfolder and files. These NTFS permissions are not removed when the Nomad Branch service stops.

Share Permissions for *NomadSHR* is configured as Read-only for the local *SMSNomadP2P&* user account and optionally a built-in security principal as specified by the AuthenticatedUsers registry value. The default is:

local user account *SMSNomadP2P&*

built-in security principal Authenticated Users.

The default location for the Nomad cache is `C:\ProgramData\1E\NomadBranch`. The MODULE.NOMAD.CACHEPATH installer property is also used to configure the location of the Nomad Cache, which is stored in the registry value LocalCachePath.

You can use the MODULE.NOMAD.SPECIALNETSHARE installer property or update the SpecialNetShare registry value so that Nomad hides the Nomad share. If you do this, the share will be renamed *NomadSHR$* and you will need to update all Nomad installations to use the hidden share.

Nomad can also be configured to use the machine account for peer connections instead of the local SMSNomadP2P& account by using the MODULE.NOMAD.SPECIALNETSHARE installer property or by updating the SpecialNetShare registry value. If the machine account is used, the local *SMSNomadP2P&* account is not

created. *Machine$* accounts in trusted domains are considered as Authenticated Users – the AuthenticatedUsers registry value must include Authenticated Users. Peer clients must be in trusted domains.

Use the MODULE.NOMAD.AUTHENTICATEDUSERS installer property or update the AuthenticatedUsers registry value to configure read-only access to the Nomad share for Authenticated Users (default), Everyone or neither in addition to the Nomad Share Account (SMSNomadP2P&). If Authenticated Users is selected, additional NTFS permissions are also configured for Authenticated Users on the Nomad cache folder.

The difference between Authenticated Users and Everyone depends on the OS version but in general Everyone includes Authenticated Users plus Guest.

Note

Domain controllers

When Nomad is installed on a domain controller (DC), it does not create the *SMSNomadP2P&* account and does not create the Nomad share. This is because it is not possible to create a local account on a DC. Nomad will not respond to elections and cannot be elected as a master.

If software is targeted at a DC, Nomad downloads the content from the distribution point (DP)

If the DC is also a DP, Nomad continues to process LsZ files and respond to Nomad clients as normal.

9.4.2.4.7.3 Custom share permissions

The SpecialNetShare registry values enables administrators to create their own share called *NomadSHR*, set the user limit and permissions. The Nomad cache is shared as *NomadSHR*, giving read access to the local Nomad share account and authenticated users. This enables new peer connections to be established and also allows access to the cache for computers with existing connections.

Share permissions can be configured on the share and requires the minimum read-only permission for

the local user account *SMSNomadP2P&* if not using the machine account

Built-in security principal Authenticated Users if using the machine account

NTFS security can also be set on the Nomad cache folder and requires these minimum permissions:

Built-in security principal SYSTEM requires Full control permission (because the Nomad Branch service uses the local system account)

Local group Users requires Read & execute, List folder contents and Read permissions

Local group Administrators requires Full control permission.

In addition, if using the built-in security principal Authenticated Users, as required when using the machine account, it requires NTFS security permissions Read & execute, List folder contents and Read.

9.4.2.5 Cloud Support

Nomad supports the following Configuration Manager (CM) on Azure scenarios:

Infrastructure as a Service (Iaas) - your host CM infrastructure servers are in Azure virtual machines

Cloud based Distribution Points - CM distribution points are hosted in Microsoft Azure as a cloud service

Cloud Management Gateway (CMG) - CM management points are hosted in the cloud, including support for CMG VM scale sets.

9.4.2.5.1 Infrastructure as a Service (IaaS)

Nomad 6.3 and later supports integration with Configuration Manager (CM) and Active Directory (AD) infrastructure servers in Azure virtual machines (Infrastructure as a Service). This is where CM and AD are being run in Azure, managing local clients network on organization's premises and this local network is connected to Azure using Microsoft Azure Site-to-Site Connectivity. Tachyon Platform may be hosted on a virtual machine hosted in the Azure cloud or locally on the on-premises network, with Nomad as usual installed on all client devices.

9.4.2.5.2 Cloud based Distribution Points

Configuration Manager (CM) now supports Distribution Points (DP) that are hosted in Microsoft Azure. The DP Site system role hosted on Windows Azure is referred to as a site system cloud service. The site system cloud service contrasts to a site system server, which refers to an on-premises computer that is managed in the local network environment. Nomad also support Cloud Management Gateway (CMG) for management point roles to manage CM clients on the Internet.

When a CM Client (ContentTransferManager) requests Nomad to download the content from a cloud based Distribution Point, Nomad performs the following tasks:

Downloads the encrypted content.

Decrypts the content before copying it to its own cache.

When the download is complete, Nomad encrypts the content and copies it to the CM cache.

Nomad peers looking for the original content in the subnet, perform an election for the decrypted content and then copy it from an elected master.

When the peer copy is complete, the peer Nomad encrypts the content and copies it to the CM cache.

> **Note**
>
> Unlike other content, for content downloaded from a cloud based Distribution Point, Nomad does not create hard links between the Nomad cache content and the CM cache, but the Nomad cache cleaner is able to delete the content from both the Nomad cache and the CM cache.

> **Note**
>
> Support is not yet available for Delta downloads, like Office 365 or Windows 10 software updates in Nomad. Microsoft does not recommend using distributing software update

content on Cloud Distribution Points, for more information refer to docs.microsoft.com/en-us/mem/configmgr/core/clients/manage/cmg/plan-cloud-management-gateway#content-storage.

9.4.2.5.2.1 Cloud based DP content and LSZ/LST file generation

Nomad content distribution relies on having access to an LSZ file that provides metadata regarding the download content. With on-premises Distribution Points, the LSZ file is normally generated by a local Nomad service. That option is not available for cloud based DP as they run as a service in Azure, and a Nomad service cannot be installed. Instead, the LSZ file is generated locally by mimicking the process used by CM agent, which queries the content's metadata from the DP directly.

Note

Be aware that:

Cloud based Distribution Points are not currently supported for Office 365 updates

RDC is not supported on cloud-based Distribution Points

If content is marked to be delivered as 1 (Compressed) or 2 (Encrypted) under Nomad SECure and needs to be downloaded to the client from a cloud based distribution point, these settings are ignored and content is downloaded in the original format. For the same reason, Ahead Of Time (AOT) LSZ generation is also not supported for cloud-based distribution points.

9.4.2.5.3 Cloud Management Gateway (CMG)

From Configuration Manager (CM) version 1610 and above, the cloud management gateway provides a simple way to manage CM clients on the Internet. The Cloud Management Gateway (CMG) service is deployed to Microsoft Azure and requires an Azure subscription. It connects to your on-premises CM infrastructure using a new role called the Cloud Management Gateway connector point. Once deployed and configured, clients will be able to access on-premises CM site system roles regardless of whether they're on the internal private network or on the Internet. Currently, CMG only supports management point and software update point roles, and Nomad has only been tested with management points.

When a client is on the Internet, the CM Client requests Nomad to download the content from a cloud based distribution point. Nomad gets the management point list (including cloud management gateway enabled Internet management points) from WMI and uses those to determine the appropriate distribution points. The rest works as usual.

9.4.2.5.4 Configuration Manager Enhanced HTTP Support

Enhanced HTTP is a feature implemented in Configuration Manager (CM) to enable administrators to secure client communication with site systems without the need for PKI server authentication certificates. Primarily this feature is used to support a Cloud Management Gateway (CMG) or to support Azure AD joined devices, both of which scenarios would otherwise require Management Points to be configured to use HTTPS with a PKI Server Authentication certificate.

Enhanced HTTP also allows clients to download content from a Distribution Point without the need for a Network Access Account, PKI client authentication certificates or Windows authentication as it establishes a new endpoint on the Distribution Point (CCMTOKENAUTH) that uses token-based access.

Refer to the Microsoft documentation for a full explanation of Enhanced HTTP and how to configure site systems to use it - https://docs.microsoft.com/en-us/mem/configmgr/core/plan-design/hierarchy/enhanced-http

9.4.2.5.4.1 Supported scenarios

Nomad supports downloading content from Distribution Points configured to use Enhanced HTTP without the need for a Network Access Account in the following scenarios.

> **Note**
>
> These scenarios assume the Management Point is configured to use HTTP (not HTTPS) as required for Enhanced HTTP.

9.4.2.5.4.1.1 Clients and site systems on the corporate network

Scenario	Clients supported	Notes
Configuration Manager Package, Application, Software Update and Task Sequence Deployments	Workgroup AD Domain-joined Azure AD-joined Hybrid-joined	When content is deployed through CM, Nomad needs to obtain the access token for the Enhanced HTTP DP endpoint from the Management Point, which it is able to do using HTTP. For Task Sequences, the access token is available in the _SMSTSDPAuthToken Task Sequence variable, so Nomad does not need to obtain it from the MP.
Nomad Pre-caching	Workgroup AD Domain-joined Azure AD-joined Hybrid-joined	Pre-caching requires Nomad to access the Management Point to locate the content and DP access token, which it is able to do using HTTP.

These scenarios are also supported if the client on the corporate network gets a Cloud DP as a source.

9.4.2.5.4.1.2 Internet clients with CMG / Cloud DP

For the purpose of this discussion, Cloud DP refers to either a classic Cloud DP or a content-enabled CMG.

Scenario	Clients supported	Notes
Configuration Manager Package, Application, Software Update and Task Sequence Deployments	Workgroup AD Domain-joined Azure AD-joined Hybrid-joined	When content is deployed through CM, Nomad is able to obtain the access token for Cloud DP from the CM client [(1)]. If there are multiple Cloud DPs, the client will be able to download content from the Cloud DP for which the CM client queued the download job using the Cloud DP access token provided by the CM client. If that DP becomes unavailable, Nomad will attempt to connect to the other Cloud DPs in the list and will query the CMG for the new Cloud DP access token. If Nomad is unable to authenticate with the CMG[(1)] it will continue to retry the available DPs returned by the CM client until it is able to connect to the original DP.
Nomad Pre-caching	Workgroup AD Domain-joined Hybrid-joined	Pre-caching requires Nomad to access the CMG to locate the content and obtain the Cloud DP access token[(1)].

[(1)] If the CM client is not using a PKI client authentication certificate to authenticate with the CMG, Nomad will not be able to request content location or obtain the Cloud DP access token from the CMG. Note that CM requires Workgroup and AD Domain-joined clients to have a PKI client authentication certificate (refer to https://docs.microsoft.com/en-us/mem/configmgr/core/clients/manage/cmg/certificates-for-cloud-management-gateway#bkmk_mphttps), so this will only affect Azure AD Joined / Hybrid devices that use Azure AD or token-based authentication with the CMG.

9.4.2.6 App-V support

Nomad supports application virtualization (App-V) applications which are deployed as streamed content by Configuration Manager.

> **Note**
>
> Nomad only handles App-V applications that use Configuration Manager as the App-V server. It does not integrate with the standalone App-V server.

App-V streaming is a way of providing centrally managed applications to many enterprise users. The majority of the application's content is not downloaded until a user actually invokes the application for the first time, thus not wasting network bandwidth or the user's time until they

need the content. The icons etc. for the application appear on the user's desktop, but the executable part of the application is held back until it is required.

> **Note**
>
> The executable part of the application is downloaded by the App-V client when required, it is not downloaded by Configuration Manager. This means that Nomad is not involved and the App-V client fetches it directly from the DP.

Nomad respects the Configuration Manager settings for fast and slow networks. For example, an App-V application's deployment type may specify streaming on a fast network but a full download on a slow network.

9.4.2.6.1 App-V supported versions

These versions of App-V are supported:

4.6 SP2

5.0 RTM, 5.0 SP1, 5.0 SP2

In fact Nomad is not even aware of App-V as such, just that certain files should be excluded from the application's content.

9.4.2.6.2 Partial content and Nomad elections

When Nomad downloads the non-executable part of a streamed application, it recognizes that it only has part of the entire content even when it has downloaded everything it has been told to. For App-V streamed applications, this initial download amount is reflected in the final job statistic as less than 100%. Typically, the non-executable part of a streamed application is less than 1% of the entire application. This percentage is accurately reflected when Nomad clients hold an election, including where Single Site Download is involved.

For example, if client A has a complete streamed download but then client B wants the entire download for some reason, B will fetch the partial download from A and then the rest (the executable part of the content) from the DP (if no other client has more content). In keeping with standard Nomad behavior, a client which has previously downloaded all the content will always win an election over clients that have downloaded partial content, even if the requesting client only requires the partial content.

Nomad FanOut mode is also supported for streamed applications.

9.4.2.6.3 Forcing a full download

App-V streaming support is enabled by default. If it needs to be disabled, update the CompatibilityFlags registry value. This will cause the entire content to be downloaded by rather than just the XML configuration files.

9.4.2.6.4 Restrictions

Multicast is not supported for streamed App-V applications

Space reserved in the Nomad cache will be for the entire package content size, not just the streamed content size

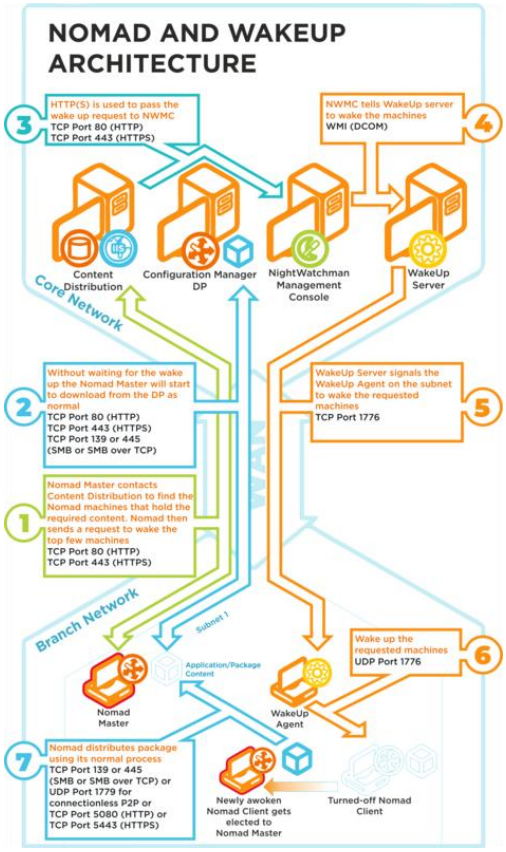
Full elections will take place if the partial content is re-requested for download by the Configuration Manager client even if that partial content has already been downloaded.

9.4.2.7 Integrating Nomad with WakeUp

Nomad integration with WakeUp enables Nomad to share content from its devices that are holding particular content, even if those devices are offline. One reason why peers in the local subnet may not respond to the request even though they have content in their caches is that they are offline (shutdown, in hibernate or sleep mode). However, if WakeUp is integrated, the Nomad client would know which offline device has the content and can wake it up when it queried Content Distribution.

The wake up list is maintained by Content Distribution and is the same list that Single Site Download (SSD) uses. Separate lists of peers are returned for subnet and site. This feature requires Nomad SSD to be enabled, Content Distribution and a NightWatchman infrastructure. The feature is enabled during installation of NightWatchman Management Center. Please refer to Nomad Preparation for requirements.

9.4.2.7.1 Nomad and WakeUp architecture and ports



Ports	Description
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 1**

Ports	Description
	Nomad Master contacts Content Distribution and gets a list of Nomad devices that hold the content it requires. Nomad sends a request to wake the top 5 devices on the list. Refer to WakeUpBatchSize for details about how you can set the maximum number of machines to wake up in a single call.
TCP 80 (HTTP) TCP 443 (HTTPS) TCP 139 (SMB) TCP 445 (SMB over TCP)	**Step 2** Without waiting for any devices to be awoken, the Nomad master starts to download content from the DP. This communication depends on how the DP is configured. It may be one of the following: HTTP HTTPS SMB SMB over TCP For Configuration Manager, the default setting is HTTP or HTTPS.
TCP 80 (HTTP) TCP 443 (HTTPS)	**Step 3** Content Distribution posts the wake message from Nomad to the NightWatchman Management Center Web API.
WMI (DCOM)	**Step 4** NightWatchman Management Center tells the WakeUp server to wake the requested devices.
TCP 1776	**Step 5** WakeUp Server signals the WakeUp Agent on the appropriate subnet to wake the requested devices.
UDP 1776	**Step 6** The WakeUp agent on the subnet sends a wakeup request to the requested devices.
TCP 139 (SMB)	**Step 7**

Ports	Description
TCP 445 (SMB over TCP) UDP 1779 (connectionless P2P)	As part of its standard behavior, Nomad holds regular elections (every 5 minutes) to determine the most appropriate master. If a device is found (i.e. one that has been recently awoken) that holds more of the required content, it stops downloading from the DP and fetches the content from the new device's cache. This may be via SMB or via connectionless P2P, depending on the configuration of Nomad.

9.4.2.7.2 How it works

When a Nomad client wants to download content it broadcasts a request for peers in the local subnet, if no peers respond then:

If Single Site Download (SSD) is enabled, it queries Content Distribution for peers on other subnets for the content.

If SSD is not enabled, it downloads from the DP.

WakeUp integration can be for peers on the local subnet, in the site (i.e. neighboring subnets not the local subnet), or on the local subnet and in the site.

These lists are sorted in descending order by:

Highest percentage of content.

Server, followed by desktop, then laptop. (for Nomad's purposes, whether a device is a server or a desktop depends on the operating system, not the hardware.)

Most recent timestamp on the content (because recent information is more likely to be correct than older data).

Nomad sends a wake up request to Content Distribution, which relays it through NightWatchman Management Center to WakeUp servers and ultimately the 1E agents to wake these devices up.

> **Note**
>
> Nomad does not wait for devices to wake at this point. It carries on immediately after sending the wake up requests and starts downloading from the DP. Nomad also uses a fire and forget policy: it does not keep track of which devices do and do not get woken.

Meanwhile, periodic elections occur and when a master is elected, the download from the DP is interrupted and the download process begins again. The difference this time is that Nomad will not query Content Distribution again, as some subnet and/or site devices will have woken up and is able to provide the content.

> **Note**
>
> In addition, Content Distribution will not return devices that do not match the following criteria:

The network adapter registered for the device matches the criteria for local subnet or site wakeups

Device must be enabled as a content provider

Device is not an unknown device.

Reasons for not being a content provider are:

Running under WinPE

A domain controller

Content not to be registered with Content Distribution (ContentRegistration = 0)

Peer-to-peer communication disabled (P2PEnabled = 0)

Sensitive server (P2PElectionWeight = 0)

SSDEnabled = consumer-only

Using wireless adapter (so cannot be woken)

Inhibited subnet being used

Inhibited AD site being used.

9.4.2.7.2.1 Batching WakeUp requests and other configuration

WakeUp can be enabled for just the local subnet, the site (of neighboring subnets), or both. This is configured by the WakeUpEnabled setting. Note that if site wake up is required, then SSD consumer mode must also be enabled (SSDEnabled is 1 or 3).

If WakeUp integration is enabled, the number of devices in each list (subnet and site, separately) is specified by MaxDevicesFromAE.

Not all devices need be woken at once. After all, it is desirable to awaken as few devices as necessary because they were shut down in the first place for a good reason – to save power. They can be collected into batches (separately for subnet and site wake ups), controlled by the WakeUpBatchSize setting.

By default, this is the same as MaxDevicesFromAE so there is usually just one wakeup iteration. But if *WakeUpBatchSize* is less than *MaxDevicesFromAE* (obviously it cannot be greater), then some devices will be left over after the first batch of wake ups has been sent (assuming that at least *MaxDevicesFromAE* devices were actually found in Content Distribution), and these remainders will be woken if Nomad falls back to the DP on its second and subsequent periodic elections.

Note

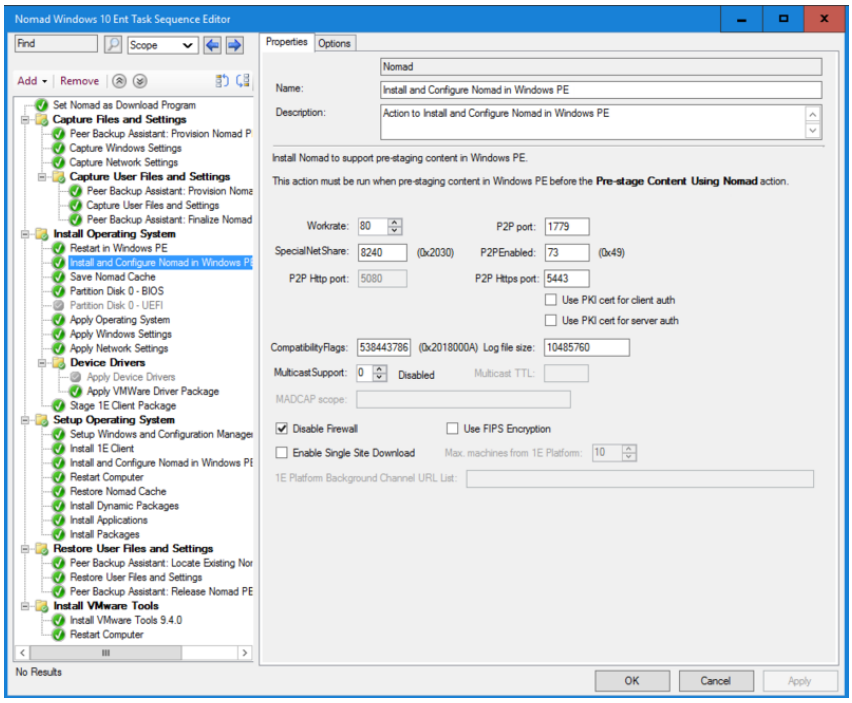
MaxDevicesFromAE and *WakeUpBatchSize* are applied to the subnet and site lists separately, but different values for site and subnet cannot be specified – the same are used for both. For example, if *MaxDevicesFromAE* is 10 then up to 20 devices will be fetched (if there are sufficient registered in Content Distribution with the content), 10 for the subnet plus another 10 for the site.

Finally, if the content is small then there might not be time for a periodic election to occur, because Nomad gets everything from the DP in the first iteration. In this situation, there is no

point waking up devices because they will not be ready in time. For this reason the WakeUpMinPackageSizeMB setting controls the lower cutoff size limit at which wake ups occur.

9.4.2.7.3 Support for Nomad running under WinPE

WakeUp integration, like SSD, can be used when running under WinPE to download the full operating system. WakeUp is particularly useful in this case because OS *.wim* files tend to be large. WakeUp integration is not enabled by default. This example shows a task sequence action where it has been enabled.



9.4.2.7.4 Restrictions

Please note the following restrictions.

Restriction	Explanation
Nomad running under WinPE cannot use wake up if Windows authentication is enabled in Content Distribution.	This is because a WinPE device is not in a domain.
The WakeUpMinPackageSizeMB setting is effectively always 0 in WinPE and for standalone Nomad downloads, so WakeUp will be invoked even for small packages.	This is because the size of the content cannot be easily determined (under normal conditions the size can be found from Configuration Manager policy. And in the situations where *WakeUpMinPackageSizeMB* is used, even if enough of a package has already been

Restriction	Explanation
	downloaded to take it under the limit, wake up requests are still sent.
Even if just local wake up is used (i.e. within the local subnet but not the site), the *Locations* table in the Content Distribution database must be populated.	The *Locations* table must always be configured for Nomad WakeUp integration to work.
If, when a periodic election occurs, a different master host is elected, the whole WakeUp process starts again.	The new host queries for devices with the content and the batched wake up requests start from the beginning. However, in practice, if a given host gets elected as master, it is very likely to be re-elected when a periodic election occurs. Also, if a master is shut down while a transfer is running, when it is restarted it will start the WakeUp process again.
The mechanism does not support alternate source copy downloads.	i.e. downloading an older version of a package from a LAN neighbor then filling in the changes.
IPv6 is not supported.	n\a

9.4.2.8 Deploying Office 365 updates

Configuration Manager introduced support for Office 365 agents in Current Branch 1602, and Nomad introduced support in version 6.1.100. This section describes how Office 365 deployments differ in terms of ACP requirements and goes on to describe how Nomad behaves during the download.

Refer to Deploying updates for Office 365 for an example scenario about deploying Office 365 updates and how you can monitor those deployments using the Nomad app.

9.4.2.8.1

9.4.2.8.1.1 Configuration

Downloading the following type of updates is enabled by default in the Nomad client (1E Client 4.1 and later). Downloading from Microsoft Update is also enabled by default.

The settings are defined in CompatibilityFlags and you will need to ensure the relevant bits remain set if you are using that registry value to configure other options, as follows:

Type	Enable Nomad to download	Enable Nomad to download from Microsoft Update
Software Updates (including Windows 10 feature updates)	Always enabled	Set bit 27 (0x08000000, 134217728 in decimal)
Office 365 updates	Always enabled	Set bit 28 (0x10000000, 268435456 in decimal)
Windows 10 Express Installation Files and Delta Content for Updates	Set bit 26 (0x04000000, 67108864 in decimal)	Set bit 28 (0x10000000, 268435456 in decimal)

To enable all the above, then AND bits 26, 27 and 28 with whatever you have already set in CompatibilityFlags.

Please refer toDistributing software with Nomad and Configuration Manager: Enabling Nomad for Applications and Software Updatesfor how to configure client settings to set Nomad as a download provider for applications and software updates.

Note

Please note, there is no configuration is required on Distribution Points.

9.4.2.8.2 How it works

The Office 365 Click to Run agent (CTR) will process the update metadata obtained from the Configuration Manager Software Update Point and pass a request for content to the Configuration Manager agent. As with non-Office download requests, the same Alternate Content Provider API is used by the Configuration Manager agent; with the Configuration Manager agent Content Transfer Manager (CTM) thread invoking Nomad to download the requested content. When Nomad receives a download job with a manifest file from the CTM it will:

Parse the manifest to retrieve the content description.

Download the content described in the manifest either from a DP or peer cache.

Copy the downloaded data to the destination folder described in manifest.

Notify Configuration Manager that the download job is complete.

Wait for the next job.

For Office 365 updates the CTM passes different information to Nomad, when compared with other types of content download. The other types typically provide a content identifier i.e. Package ID and version. For Office 365 updates, a manifest file is also passed with the request. It is the manifest file that contains details of the content to be downloaded and its destination path (typically C:\ProgramData\Microsoft\ClickToRun\...). A single update may require multiple download jobs, resulting in multiple manifests being passed to Nomad while it is obtaining the content. Once the content has been downloaded, it is copied into the destination specified in the manifest file. Nomad does not configure hardlinks for Office 365 updates.

9.4.2.8.2.1 Hash checking and communication with the CTR agent

Another difference is that Office 365 updates do not have a Configuration Manager-generated hash associated with the content. For other types of content, Nomad performs an AES256 hash check prior to, and immediately after, download and compares this with the Configuration Manager hash in order to establish the content's validity. For Office 365 updates, there is no comparison hash made available to Nomad. Nomad therefore depends on the CTR for the validity status of the Office 365 update installation (the CTR performs its own hash check). Nomad also listens to the status API exposed by the CTR agent to check if the installation succeeded. If the installation fails, Nomad deletes the update from its cache and retries the download. As soon as Nomad receives a download success status, it sends a status message and stops listening to the CTR agent.

9.4.2.8.2.2 Byte-ranges

In order to make the download process more efficient, Microsoft has implemented a process of byte-range requests rather than (or sometimes in addition to) requesting entire files. Nomad treats byte-range requests in just the same way as files and will initiate a local election for each to minimize the impact of any download across the WAN.

To process and download these byte-ranges, Nomad divides each Office 365 package file into pages of 128MB, for example a 300MB file has 3 logical pages. If we think of a file as a book, then each page of the book is 128MB with each line of a page being 32KB. The byte-ranges described in the manifest indicates the start and end position within our lines of the page. Nomad normalizes these byte-ranges to 32KB blocks, adjusting the start and end positions so that the byte-range contains complete lines and no line is truncated.

9.4.2.8.2.3 Nomad elections

Elections may occur when a Nomad client requires content that is not resident in its cache. An election is not always necessary, with Nomad storing active download broadcast notifications in memory and then connecting direct to these hosts if itself requires the byte-range or file at some later time. All responses peers receive are stored in its Query Result Store (QRS). Before initiating an election, a Nomad client will first verify its QRS to see if relevant peers are available for content downloads. If relevant peer(s) are found in the query store, an election does not occur.

When elections do occur and Nomad clients respond, the receiving Nomad client sorts the list of responders top-down based upon the following criteria:

Longest byte-range on disk starting from requested offset

Longest relevant active downloader

Election weighting

NomadBranch service start-up time

Machine name.

Under certain circumstances, a Nomad client will not reply to an election request, even if it has the data in its cache. This happens when:

Request comes from an inhibited network

P2P SMB is disabled [Connectionless mode is not supported for Office 365 update deployments]

The Nomad Account (*SMSNomadP2P&*) is locked out

The Nomad Account (*SMSNomadP2P&*) is not active

The machine is a domain controller and *SPECIALNETSHARE_MACHINEACCOUNT* is not set in *SpecialNetShare*

The *P2PElectionWeight* registry value is set to zero

The Nomad share not available.

9.4.2.8.3 Which other Nomad features are supported by the Nomad Office 365 feature?

The following Nomad features are supported:

Nomad feature	Definition
Peer copy over HTTP or HTTPS	Nomad can be used to enable the Office 365 update byte-range request content to be shared amongst Nomad peers.
Single Site Download (SSD)	SSD can be used to locate byte-range request content across different subnets on the local branch.
Peer-to-peer SMB	Peers can download data from other peers using the SMB protocol.
Work rates and cache priority	Work rates determine the amount of bandwidth Nomad utilizes for the download and cache priority determines when the cache is purged.
Download timeout	The timeout in seconds after which a job will be cancelled if the download has not been successful.
Save and restore Nomad cache	Custom task sequence action to Save Nomad Cache either in WinPE or a full Microsoft Windows operating system and a custom task sequence action to Restore the Nomad cache in the new Operating System during provisioning after Nomad has been installed.
Status messages for download events	Status messaging for specific download events.
Inhibiting subnets and sites	Defining subnets and AD sites where machines download from the DP and not participate in Nomad elections (status messages are not relayed).
SpecialNetShare	Options for the Nomad share.

Nomad feature	Definition
Custom ports	Enables the use of custom ports for data transfer and communications.
Cache cleaning	Enables cache management.

The following are not supported by the Office 365 feature:

Cloud-based DP

Connectionless P2P

Nomad FanOut

SMB downloads from the DP

Remote differential compression (RDC)

Nomad Pre-caching

Hash or CRC validation

LSZ or metadata creation or download

Failover to BITS (SuccessCodes includes 0x9999).

> **Note**
>
> Download from Microsoft Updates is only supported if Downloading content for CM Software Updates from Microsoft Update is enabled (default). Set bit 28 (0x10000000, 268435456 in decimal) in CompatibilityFlags.

9.4.3 OS Deployment

Nomad support for Configuration Manager OS Deployment.

9.4.3.1 OS deployment task sequences

Nomad can integrate with OSD strategies to maximize the efficiency of distributing large OS content across the network. It does this by providing a number of Task Sequence steps that can be integrated directly into your OSD Task Sequences.

Refer to Using Nomad with Operating System Deployment OSD for an example scenario about how Nomad can integrate with Operating System Deployment (OSD) strategies to maximize the efficiency of distributing large OS content across the network and how you can monitor those deployments using the Nomad app.

> **Tip**
>
> Big Bang have integrated Nomad into their Universal Imaging Utility (UIU) product to search for driver content on peers. Check out the 1E blog Taking the worries out of managing drivers during Windows 10 upgradesfor a quick overview, take a look at

https://www.bigbangllc.com/The-UIU or reach out to https://www.bigbangllc.com/Support for further information.

9.4.3.1.1 Nomad and OS deployments

The three areas where Nomad integrates with OSD are:

WinPE support – to provide Nomad functionality when imaging a machine

Custom task sequence actions – enables Nomad functionality to be integrated directly into OSD task sequences

Configuring PBA hosts – enables Nomad functionality to be used during OSD to back up user files and settings (USMT data)

> **Note**
>
> When Nomad AdminUI Extensions are upgraded from an older version to a newer version, you must ensure that the Nomad task sequence actions have correct values set including modified as well as default values.

9.4.3.1.1.1 OSD Enhancements

Nomad includes OSD enhancements that increase Nomad's integration with OSD task sequence. These enhancements drastically simplify the task sequence engineering process and the steps that are required to integrate Nomad with OSD.

These enhancements are:

Enhancement	Description
SMSTSNomad.exe	An executable that's part of the OSD tool-set, allowing Nomad to leverage the Configuration Manager **SMSTSDownloadProgram**option and act as Alternate Content Provider during OSD.
Preserving Nomad logs	The **Save Nomad Cache**and**Restore Nomad Cache**task sequence actions ensure that Nomad logs are preserved across all OSD phases.
Nomad cache handling	The functionality of the **Save Nomad Cache** and **Restore Nomad Cache** task sequence actions reduces the risk of the copy/move content behavior leading to task sequence failures.

9.4.3.1.1.2 SMSTSNomad.exe

SMSTSNomad.exe supports the use of Configuration Manager's **OSDDownloadContent.exe** directly from a Run Command Line step in a Task Sequence, as well as the previously supported **Download Package Content Native** Configuration Manager Task Sequence Step. No additional configuration is required to make this work. NomadBranch.exe supports SMSTSNomad.exe.

Nomad leverages the Configuration Manager SMSTSDownloadProgram task sequence variable. When this variable is set to the path to an executable, the task sequence engine calls the executable whenever it has to download some content. For this to work effectively, Nomad uses SMSTSNomad.exe.

To avoid the overhead of having to manually set the SMSTSDownloadProgram variable to SMSTSNomad.exe in your task sequence, use the custom task sequence action Set Nomad as Download Program. The following are the content types that are supported by SMSTSNomad.exe:

Packages

OS Images

Boot Images

Applications

Driver packages

Drivers (via Auto apply drivers TS action).

9.4.3.1.1.3 Preserving Nomad logs

Save Nomad Cache preserves the Nomad log files long with the contents of the Nomad cache. They are restored again after the OS has been deployed when **Restore Nomad Cache** runs. **Save Nomad Cache** also appends a time stamp to the name of the Nomad log files to prevent any possibility of name conflicts during the subsequent **Restore Nomad Cache** step.

For more detail about these Task Sequence steps, please refer to Save Nomad Cache and Restore Nomad Cache.

9.4.3.1.1.4 WinPE support

Nomad can be used in an OSD task sequence to find OSD packages required by WinPE that are located on pre-cached Nomad peers on the local subnet rather than downloading them from the nearest DP. Using Nomad in WinPE as part of an OSD bare metal task sequence has a number of distinct advantages:

Multiple connections are supported by Nomad caches maximizing the number of machines that can be built concurrently

Multiple pre-cached locations can be supported (we recommended at least 2 per subnet to increase the number of simultaneous imaging jobs are supported)

Nomad in WinPE supports all the Nomad features, so elections, failover, and bandwidth efficiency are all on hand to maximize the resilience and performance of the imaging process.

These advantages become important when you plan a rapid OS refresh over a relatively short time. Nomad must be installed as part of a task sequence in order to support the use of pre-staged content from within WinPE and managed through custom task sequence actions,

9.4.3.1.1.5 Pre-caching content

Pre-caching packages used during OSD is important because:

Image packages, especially for Windows, tend to be several gigabytes in size and downloading these across the WAN as part of an OSD is undesirable and slow

Bandwidth Protection is enforced if Nomad senses that the WAN link is getting congested with other network traffic, this ensures that any impact on the WAN during pre-caching is kept to a minimum.

Nomad in WinPE automatically locates local pre-cached content and uses these to avoid WAN traffic to ensurer that once the image package is on the branch there is no impact on the WAN and the time taken to retrieve the image is minimized because everything is local.

> **Note**
>
> If there is no pre-cached content on the local branch and multicast is not enabled, we recommend you configure Nomad to use connectionless P2P using the P2PEnabled value. This is because WinPE does not have File and Print Sharing services, so Nomad machines cannot use their default P2P communications. Enabling connectionless P2P ensures that multiple WinPE Nomad machines only download their content once and then share it locally.

Nomad pre-caching is directly integrated with the Configuration Manager Console, is fully compliant and works with Role Based Access in Configuration Manager.

To start the pre-cache wizard, right-click any of the following types of content in the Configuration Manger console and from the context menu, choose Pre-cache content using Nomad.

Applications

Packages

Driver packages

Operating system images

Operating system upgrade packages

Boot images

Task sequences.

Refer to Nomad Pre-caching for more information about using the Nomad pre-cache wizard.

> **Note**
>
> Performing this step will update the Nomad settings for the OS image properties as well. This will affect the use of Nomad in every location this image is referenced.

9.4.3.1.1.6 Adding binaries to an existing boot image

The *NBCacheActions.exe*, *NomadPackageLocator.exe*, *TSEnv2.exe*, *NomadBranch.exe*, *SMSNomad.exe* and *SnoItfPS.dll* files are placed in the Microsoft Configuration Manager installation folder by **NomadBranchTools.msi** , they copy the 32-bit tools to *OSD\bin\i386* and the 64-bit tools to *OSD\bin\x64* and then modify the *osdinjection.xml* file to include these in the WinPE boot images when DPs are updated.

On Configuration Manager, the *NomadBranchTools.msi* installer must be used.

9.4.3.1.2 Custom task sequence steps

Nomad has a number of custom task sequence steps that can be integrated with Configuration Manager Task Sequences. These custom task sequences are located in the Task Sequence editor.

> **Note**
>
> When Nomad AdminUI Extensions are upgraded from an older version to a newer version, you must ensure that the Nomad task sequence actions have correct values set including modified as well as default values.

To add a Nomad custom task sequence step:

Navigate to **Software Library** → **Overview** → **Operating Systems** → **Task Sequences**

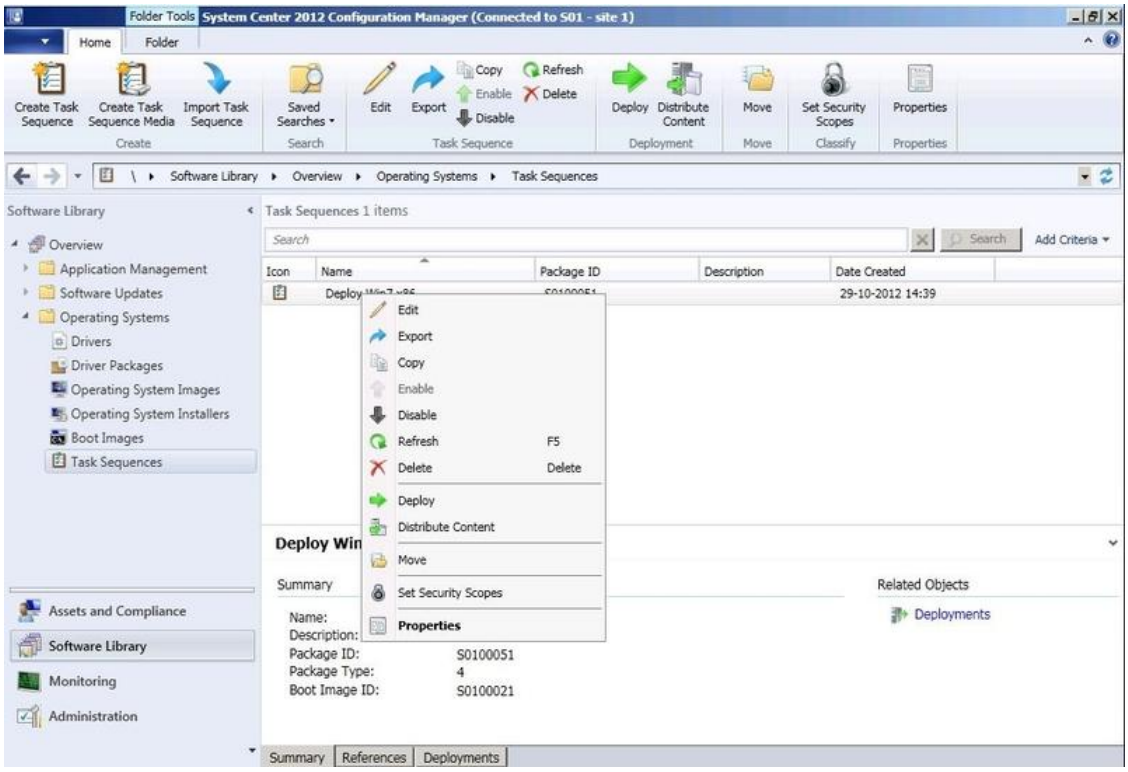
You can create a new Task Sequence or edit an existing one, which opens the **Task Sequence Editor**

For an existing Task Sequence, click on an existing step, to create a group or step above it

In the Task Sequence editor menu, click **Add**

This opens a menu showing a range of different Task Sequence sets

Click on one of the sets and select a Nomad Task Sequence step - the names of sets and steps are listed opposite.



9.4.3.1.2.1 1E Nomad task sequence actions

Set Nomad as Download Program — Sets SMSTSNomad.exe as the download program during a task sequence. This is accomplished by setting the SMSTSDownloadProgram task sequence variable to SMSTSNomad.exe.

Create Nomad Application Policy — Creates a Nomad application policy and is used in a task sequence during the provisioning phase prior to any applications being installed. It uses the NomadPackageLocator.exe command-line switches tool to enable Nomad to be used as an Alternative Download Provider during provisioning. When the application policy is no longer required it can be removed using the Delete Nomad Application Policy action.

Delete Nomad Application Policy — Deletes a Nomad application policy previously created using the Create Nomad Application Policy action. It uses the NomadPackageLocator.exe command-line switches tool to remove the previously created Nomad application policy.

Install and Configure Nomad in WinPE — Installs and configures Nomad in WinPE. Typically, to support the use of pre-staged content.

Save Nomad Cache — Saves the Nomad cache either in WinPE or a full Microsoft Windows operating system. It copies, links or moves previously downloaded content to the protected task sequence runtime folder so that it is not deleted by the standard Apply Operating System task sequence action.

Restore Nomad Cache — Restores the Nomad cache in the new Operating System during provisioning after the 1E Client has been installed with the Nomad module enabled. This action only needs to be included in the task sequence if Save Nomad Cache is run prior to applying the new Operating System.

Get Migration Settings — Provides support for optional encryption in Nomad PBA, and Provides computer association details in 1E Application Migration. Used in computer Replace and Refresh (Wipe and Load destructive and non-destructive) scenarios, it is configured to run under either the capture phase or the restore phase, depending on the scenario.

Stage 1E Client Package — Downloads the 1E Client package ready for installation by the Install 1E Client Task Sequence step. It's typically executed in Windows PE and must be included before the Install 1E Client step in the task sequence.

Install 1E Client — Installs the 1E Client. The Stage 1E Client Package step must be to be included before this step in the Task Sequence. The 1E Client installer and any Transform or Patch that should be applied during installation must be included in the 1E Client Package referenced in the Stage 1E Client Package step.

9.4.3.1.2.2 1E Nomad PBA task sequence actions

Peer Backup Assistant: Provision Nomad PBA Data Store — Provisions a PBA data store prior to saving user state using USMT. It is the first step of the Peer backup assistance sequence (USMT Capture User State follows).

Peer Backup Assistant: Finalize Nomad PBA Data Store — Closes the connection to the PBA data store after user state is saved with USMT Capture User State.

Peer Backup Assistant: Locate Existing Nomad PBA Data Store — Finds saved user data, prior to restoring user state using the USMT Restore User State action.

Peer Backup Assistant: Release Nomad PBA Data Store — Releases saved user data in the Nomad cache, after restoring user state with USMT Restore User State.

Peer Backup Assistant: Close Nomad PBA Data Store (deprecated) — This step has been replaced by Peer Backup Assistant: Finalize Nomad PBA Data Store. Existing deployments will still work, but you cannot modify them. Going forward, we recommend using its replacement.

Peer Backup Assistant: High Availability (deprecated) — This step is deprecated, and you should use the Peer Backup Assistant: Finalize Nomad PBA Data Store instead. Existing deployments will still work, but you cannot modify them. Going forward, we recommend using its replacement.

9.4.3.1.2.3 1E OSD task sequence actions

1E WSA Actions — The 1E WSA Actions action is an essential component of the WSA deployment task sequence. Its position and configuration within the task sequence is critical to ensuring the task sequence completes successfully. The action performs one or more of the following functions depending on the selection made when configuring the step:

9.4.3.1.3 Using Nomad for an OSD refresh

An operating system deployment (OSD) refresh typically uses two Configuration Manager site systems – a distribution point (DP) and a state migration point (SMP). A standard OSD refresh uses task sequences as follows:

The user state is captured and either stored locally or on a SMP.

The Configuration Manager client downloads the Windows Preinstallation Environment (WinPE) boot image to the local workstation while the Configuration Manager client is still running.

If the task sequence is deployed as Download all content before starting, all content is downloaded into the Configuration Manager cache (not suitable for dynamic packages).

The boot record is updated to enable the computer to reboot to WinPE.

If the task sequence is deployed as Access content from DP as required or Download content as required, the content is obtained from the DP.

The new OS is applied.

The saved user state is reapplied to the new OS and the process completes.

9.4.4 Nomad Management

Real-time visibility of what content is downloading or available in each location, subnet and client. Real-time visibility of Delivery Optimization downloads and content availability in each location, subnet and device.

9.4.4.1 Nomad app overview

The app provides visibility of activity and cache status for content distributed by both the Nomad and Delivery Optimization.

9.4.4.1.1 Explaining content versions

In Configuration Manager (CM), the content associated with a Package or Application Deployment Type may be updated by an administrator. In the case of Packages, CM increases the Package

Version property, and for Application Deployment Types, CM generates a new Content ID for the Deployment Type.

The Nomad Overview page displays summarized distribution data for a selected period. The displayed data shows all downloads and download activity for all versions of content for that period. For example, if a device downloaded Package A version 1 a month ago and later downloaded version 2 of the same Package, the Overview page would reflect both downloads.

In this version it has not been possible to reflect previous versions in the **Content Titles** summary in the top status bar, or in the **Content Titles Count by Content Type** and **Download Volume by Content Type** tiles. These will only represent download activity for the latest version of content. This may result in apparent 'loss' of data (e.g. a reduction in the number of content titles or download volume) when content for an existing Package or Application is updated in CM, as these metrics will only include download activity for the latest version. This will be addressed in a later version of Nomad.

> **Note**
>
> Other pages in the app, such as the Content page, only show the latest version of any given **Content Title**. Those pages concern the current state of things (e.g. where content is available) because only the latest version is usable by CM deployments. As a result, showing older versions would be misleading for users.

The **Overview** page gives a brief snapshot of download activity. The page has multiple tiles showing:

Content Titles by Content type

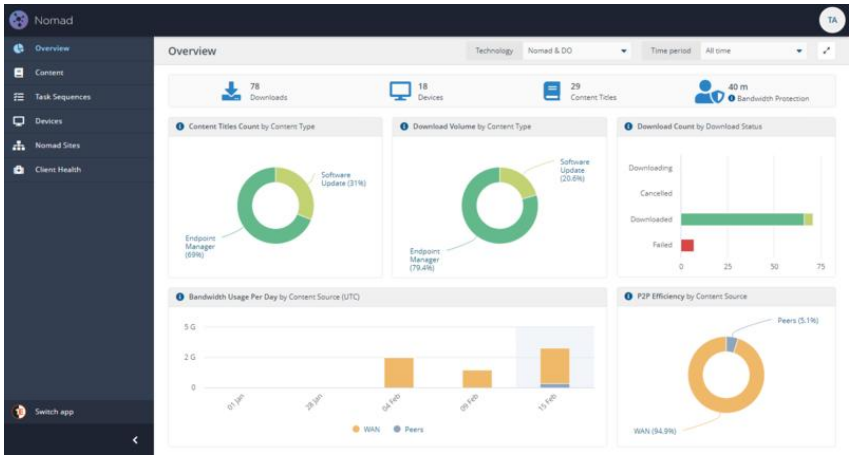
Download Volume by Content Type

Download Count by Download Status

Bandwidth Usage Per Day by Content Source (UTC)

P2P Efficiency by Content Source (Peer to Peer - P2P).

The results can further be narrowed down by using the **Technology** and **Time period** filters on the page.



9.4.4.1.2 Navigation and Filtering

By default, the view shows activity and status for all time and will show activity and status for both Nomad and Delivery Optimization. These defaults can be modified using the **Technology** filter and the **Time period** filter.

> **Note**
>
> Each content tile can be expanded using the **Expand** button on the top right-hand corner of each tile.

9.4.4.1.2.1 Time period filter

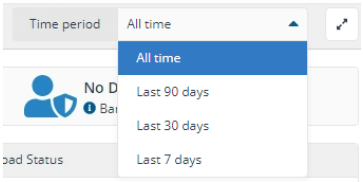
Using the **Time period**filter at the top of the page, you can narrow down the results by date. You can choose from the following options:

Last 90 days

Last 30 days (Default)

Last 7 days.

> **Note**
>
> If these filters are applied to any app page, it is reflected on all other pages in the Nomad App.



9.4.4.1.2.2 Technology filter

You can use the **Technology** filter to differentiate between downloads through Nomad or Delivery Optimization (DO).

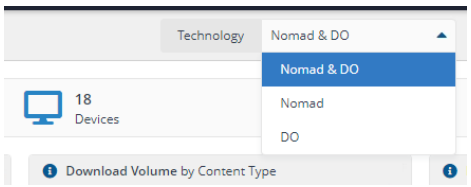
The following options are available:

Nomad & DO (Default)

Nomad

DO.

> **Note**
>
> If this filter is applied to any app page, it is reflected on all other pages in the Nomad App.



9.4.4.1.3 Top status bar

The status bar along the top of the page shows high-level statistics for the currently selected **Technology** (Nomad or DO) and **Time period**. The bar is shown on the Overview page and includes four icons, **Downloads**, **Devices**, **Content Titles** and **Bandwidth Protection**.

Item	Description	Icon
Downloads	Downloads reflect the total number of content downloads. This includes both Delivery Optimization (DO) and Nomad downloads. The results can be filtered on the **Time period** and **Technology** filters and display the total number of downloads of any version of content that occurred in the selected period. A download counts as any download activity for a given Content Title on a given device. For example, if there are 10 content titles downloaded by 50 devices, the total count of download instances would be 500. For CM Applications, each Application Deployment Type counts as a separate Content Title. Clicking on this icon navigates to the **Content** page filtered to show **Content Titles** reporting download activity within the selected **Time period**.	
Devices	Displays the total number of devices that have reported download activity for any content version in the selected **Time period**, including: Packages Applications Updates from Configuration Manager. Clicking this icon navigates to the **Devices** view, filtered to show devices where download activity was reported within the selected **Time period**.	

Item	Description	Icon
Content Titles	Displays the total number of unique **Content Titles** where download activity of the latest version of the content titleis reportedin the selected**Time period.** For CM content, a**Content Title**is a single Application or Package. Clicking on this icon navigates to the Content view filtered to show the **Content Titles** that have reported download activity within the selected**Time period.** **Note** Applications in CM may have many Deployment Types. This summary counts an Application as a single Content Title.When viewing the Content view, Content Titles for CM Applications are further identified with the Deployment Type thatwas downloaded. So, the total number of Content Titles identified on the top status bar may be lower than the corresponding list of Content Titles on the Content page. This is because the Content page reports download activity for individual Deployment Types of CM Applications.	
Bandwidth Protection	Displays the total time that Nomad backed off when downloading content to protect end-user bandwidth. **Bandwidth Protection** allows Nomad to adjust the speed of ongoing downloads to save bandwidth for other business use. Bandwidth Protection ensures Nomad doesn't consume excess bandwidth and hinder other business activity.It does that by tracking the download time of data packets. If the time increases, it slows itself down (backing off) by sleeping for a few moments before downloading another packet.	

9.4.4.1.4 Content tiles

Content tiles display statistics for content download activity in the following panes:

Content Titles Count by Content Type

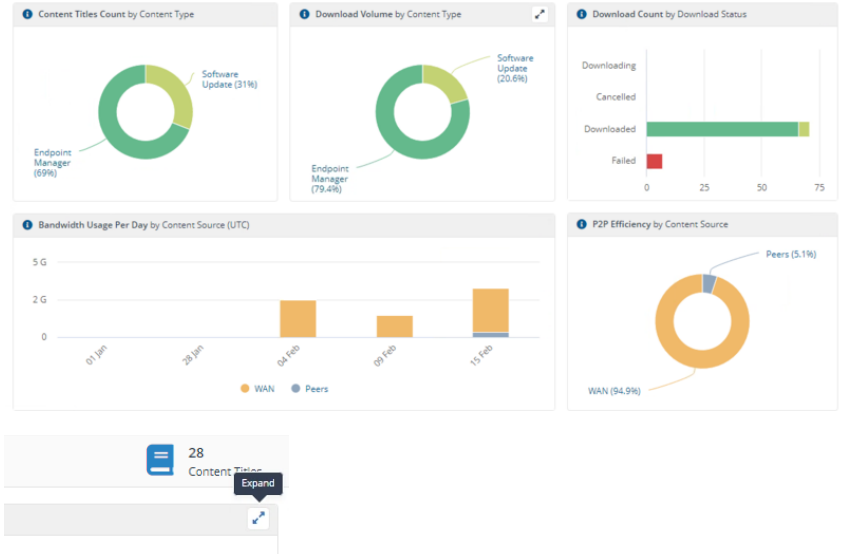
Download Volume by Content Type

Download Count by Download Status

P2P Efficiency by Content Source

Bandwidth Usage Per Day by Content Source UTC.

> **Note**
>
> Each content tile can be expanded using the **Expand** button on the top right-hand corner of each tile.



9.4.4.1.4.1 Content Titles Count by Content Type

The **Content Title Count by Content Type** tile shows the total number of unique **Content Titles** for where there is download activity reported for the latest version of the content within the selected **Time period**.

The data is grouped by **Content Type** and displayed as a donut chart. The app currently reports on two **Content Types**:

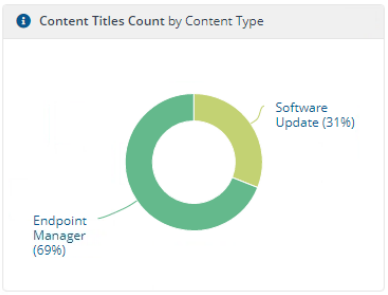
Endpoint Manager - CM applications and packages that are not delivered by DO

Software Update - includes any Microsoft Software Updates deployed through CM or Windows Update.

> **Note**
>
> Applications in CM may have multiple **Deployment Types**. This tile counts an Application as a single **Content Title**. When viewing the **Content view**, **Content Titles** for CM Applications are further identified with the **Deployment Type** that was downloaded.
>
> As a result, the total number of **Content Titles** identified on the top status bar may be lower than the corresponding list of Content Titles on the Content page (which reports download activity for individual **Deployment Types** of CM Applications).

Hovering over a **Content Type** segment of the chart displays the count of **Content Titles** of that type, also represented as a percentage of all **Content Titles**.

Clicking on a **Content Type** segment of the chart will navigate to the **Content** view, filtered to show related **Content Titles**.



9.4.4.1.4.2 Download Volume by Content Type

The **Download Volume by Content Type** tile shows the cumulative volume of content of the latest version of content downloaded by all devices within the selected **Time period**. The data is grouped by **Content Type** and displayed as a donut chart.

The chart enables you to see the effect that different types of content have on your network, in terms of the volume of data associated with them. It shows the percentage of packages and software updates by volume for:

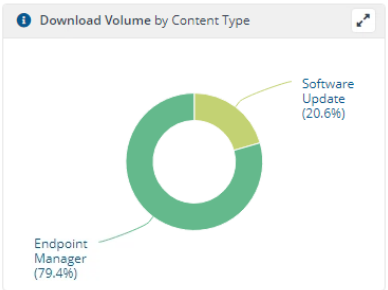
Endpoint Manager - CM applications and packages that are not delivered by DO

Software Update - content that can be delivered by Nomad, or DO if you're using Windows Update directly.

For example, if a single content title is 100MB and it is downloaded by 100 devices, the cumulative **Download Volume** reported for that particular **Content Title** would be 10,000MB. The chart shows the cumulative volume for all **Content Titles** on all devices, grouped by **Content Type**.

Hovering over a **Content Type** segment of the chart displays the total volume of downloaded content of that type. This is also shown as a percentage of total volume of downloaded content.

Clicking on a **Content Type** segment of the chart navigates to the **Content** view, filtered to show **Content Titles** of the selected segment.



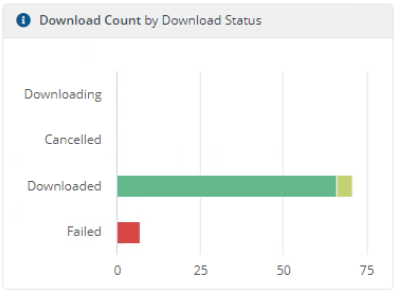
9.4.4.1.4.3 Download Count by Download Status

The **Download Count by Download Status** tile shows the status of download activity within the selected **Time period**, displayed as a bar chart by:

Status	Description
Downloading	Number of downloads currently in progress, where a download has been reported as started but has not yet reported complete, failed or cancelled.
Cancelled	Number of downloads whose last reported status was **Cancelled**, downloads may be cancelled by the user, or by the system, for example if the system is shut down or higher priority downloads are queued.
Downloaded	Number of successful downloads, if the downloaded content is still cached on a given device, it's represented by the dark green part of the Downloaded bar labelled **(Downloaded (Cached)** when you hover over it. If the downloaded content was subsequently deleted from the cache on a given device, it's represented in the light green part of the **Downloaded** bar labelled **(Downloaded (Deleted)** when you hover over it.
Failed	Number of downloads whose last reported status was **Failed**.

Hovering over any of the bars displays the number of downloads in the selected download state.

Clicking on any of the bars navigates to the **Content** view, filtered to include **Content Titles** where one or more devices is in the selected download state.



9.4.4.1.4.4 Bandwidth Usage Per Day by Content Source (UTC)

The **Bandwidth Usage Per Day by Content Source (UTC)** tile represents daily download activity throughout the entire network during the selected **Time period**.

A column is displayed for each day when there was download activity. Each column indicates the volume of content downloaded over the WAN (in orange) or from peers (in grey). Hovering over a segment of the column will display the volume of content downloaded on that day.

This view demonstrates the value that Nomad and Delivery Optimization are providing through reduced WAN traffic. If the majority of content is being downloaded over the WAN, it could indicate that peers are simply not available (e.g. users working from home) or it could be an indication that Nomad or Delivery Optimization are not correctly configured to optimize content from peers.

The columns on this chart are not clickable, they are for data visualization only and do not navigate to another view of the data.

Tip

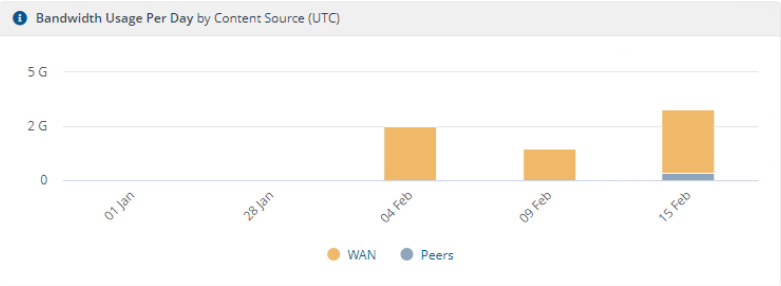
On the Overview page, when you select the **All Time** filter, the **Bandwidth Usage Per Day by Content Source (UTC)** graph displays a maximum 365 days of data.

Note

This chart only displays content that was downloaded over the network either from a peer or from the source (e.g. a CM Distribution Point), if a device:

Requests content that is already in its cache, it will not be represented in this chart

Only has some content in its cache and downloads the remainder of the content from peers or the source, the content that was downloaded will be shown.



9.4.4.1.4.5 P2P Efficiency by Content Source

The **P2P Efficiency by Content Source** tile represents the overall peer-to-peer efficiency across the entire network during the selected **Time period**.

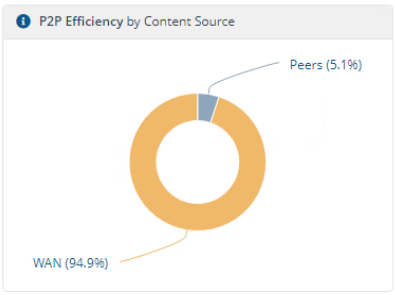
The data is grouped by source (Peers and WAN) and displayed as a donut chart showing the volume of content downloaded from peers (in grey) and from the source over the WAN (in orange). This gives an indication of the overall value of Nomad and Delivery Optimization across your organization.

Ideally, more content will be downloaded from peers than from the source over the WAN, which saves network bandwidth. Where this is not the case, it could be due to many users working remotely without any local peers, or it could be due to configuration settings on the client that are not optimized for peer-to-peer caching and availability.

This chart is not clickable, it is summary data visualization only and does not navigate to another view of the data.

Note

In this chart, the volume of content downloaded from peers includes any content requested by a device during the selected **Time period** and was already in the cache at the time (i.e. 'already cached' is represented as content obtained from a peer). If the content was downloaded from a peer or over the WAN during the selected **Time period**, it will be represented accordingly.



9.4.4.2 Nomad Download Pause

Nomad integrates with Tachyon to enable pausing or resuming Nomad downloads throughout the estate. This feature provides a safety measure for situations when a faulty or harmful deployment is made by mistake. In such situations, pausing Nomad downloads on all targeted devices can prevent or limit the potential damage.

It can also be used to facilitate troubleshooting, making it possible to pause all Nomad downloads across the network and enable IT teams to eliminate content distribution from their assessment of network bandwidth usage.

> **Note**
>
> Support for this feature was originally introduced in Tachyon 3.3 and requires the Tachyon client (Tachyon Agent or 1E Client) deployed to all the devices where you want the pause feature enabled.
>
> The latest version requires Tachyon Platform 8.x and a valid Tachyon license.

The Nomad Download Pause feature lets you immediately pause or resume current and future Nomad downloads at the press of a button. It is integrated directly into the Configuration Manager console and lets you select the collections you want to control. The feature works by pausing Nomad's job queue and effectively pauses all downloads on that agent and those added later, until the queue is resumed. Tachyon is used as the medium to send the pause and resume actions to the devices in the selected collection in real-time.

The feature is designed with a fail-safe in mind such that when a pause is triggered it is only active *for the next 24 hours*. After 24 hours, Nomad service automatically resumes the queue. This prevents the situation where a device receives a pause command but then fails to receive a corresponding resume command for an extended period due to network problems or because it is switched off.

> **Note**
>
> Refer to Using Nomad for example scenarios about how systems administrators use Nomad to deploy software, software updates and operating system upgrades, and how you can monitor those deployments using the Nomad app.

9.4.4.2.1 Installing Nomad Download Pause

To use the Nomad Download Pause feature, you will need to use the Nomad Branch Tools installer (**NomadBranchTools.msi**). For more details, refer to Installing Nomad Branch Tools.

9.4.4.2.1.1 Before you start

All users require the following permissions to install and use the Nomad Configuration Manager console extensions:

Local administrator rights on the computer – to install the console extensions

Configuration Manager console installed on the computer – to install and use the console extensions

Configuration Manager user with **Full Administrator** rights – to be able to use the Download Pause feature

Tachyon (or later) installed and working – you must know and enter the full URL for the Tachyon website in the installer.

The feature requires:

Tachyon Platform 8.x installed

Uploaded Tachyon instructions

Permissions allowing Configuration Manager (CM) administrators to execute the uploaded instructions.

These steps should be completed by a user that has Global Admin role in Tachyon, refer to Installing the Nomad app and 1E Content Distribution for details about Tachyon Platform setup, **Nomad Administrator** role and the 1E Nomad product pack.

Upgrading

If you are upgrading Nomad or Tachyon and you have previously installed **Nomad Download Pause** then you can continue using your existing setup, you do not need to do anything further, and you can ignore the information and steps below.

However, you are recommended to rename the old instruction set from**Nomad Core Instructions**to**1E Nomad**to match the name used in the steps below for new installations. The renamed set will retain the permissions you previously configured.

Prior to Nomad 7.0.200, you were advised *not* to change the name of the instruction set. This was because the **NomadBranchAdminUIExt.msi** installer uploaded the instructions into an instruction set named **Nomad Core Instructions**. From version 7.0.200 onwards, this restriction no longer applies, because the instructions are no longer in the installer, and instead are only available in the **1E-Nomad** product pack.

The installation steps below use the Settings app to create the **1E Nomad** instruction set and upload instructions for a new installation. However, if you instead use the **Tachyon Product Pack Deployment Tool** to upload the **1E Nomad** product pack, the tool will create an instruction set called **1E Nomad** and place *new* instructions there. If the instruction set **Nomad Core Instructions** has not been renamed, any *existing* instructions in it will remain or be updated if they are new versions. You may end up with two instruction sets. You can keep both sets, or you can do the following, which will retain the permissions you previously configured:

move the new instructions from **1E Nomad** to **Nomad Core Instructions**

delete the now empty instruction set **1E Nomad**

rename the old instruction set from **Nomad Core Instructions** to **1E Nomad**

The **1E-Nomad** product pack is provided in the Tachyon Platform download zip, and includes new versions of the same instructions. A list of these instructions is provided below under the heading 1E-Nomad product pack, which include the two instructions required by Nomad Download Pause.

9.4.4.2.1.2 Installing Nomad Branch Tools

The following steps describe how to run the Nomad Branch Tools installer interactively, for more details and how to install from the command line, refer to Installing Nomad Branch Tools.

9.4.4.2.1.3 Installing interactively

Note

You can download the 1E Content Distribution Tools from the **Releases** page for your platform version at https://support.1e.com/.

Install Nomad Branch Tools on the same device as the Configuration Manager Console, you can do this is done by running **NomadBranchTools.msi** from an elevated command prompt.

Note

The Configuration Manager Console must not be running when you run **NomadBranchTools.msi**

To install, start a Command Prompt with elevated rights, navigate to the location where you extracted **NomadBranchTools.msi** and run it with the following command-line:

```
> msiexec /i NomadBranchTools.msi /l*v NomadBranchInstall.log REBOOT=REALLYSUPPRESS
```

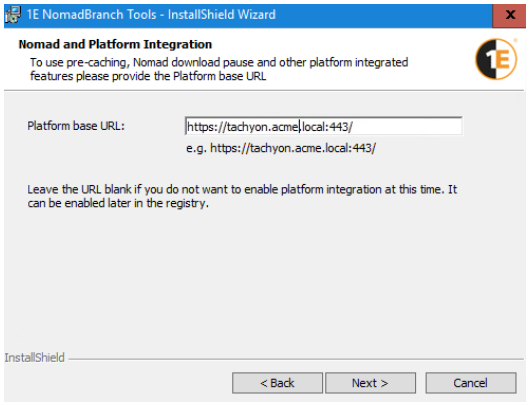
9.4.4.2.1.3.1 Nomad and Platform Integration

Note

Before installing this feature, please refer to Nomad Download Pause, for steps on configuring the prerequisites.

You need to supply the root URL to the Tachyon API. Which will be in the form: **https://<Tachyon DNS Alias FQDN>** using the Tachyon DNS Alias FQDN defined when you installed Tachyon.

For example if you installed Tachyon using **tachyon.acme.local** as the DNS Alias FQDN then the Tachyon API Root URL should be set to:



`https://tachyon.acme.local`

Note

The Tachyon API is Tachyon's Consumer API. You can learn more about Tachyon in Introducing Tachyon.

Note

From Nomad 8.1 there is support for providing alternate credentials to authenticate with the Tachyon Platform. If your Tachyon Platform instance resides in another domain or the cloud, you will be prompted to enter alternate credentials for that location, which get stored in the credential store for any future requests.

Click **Next** to continue.

9.4.4.2.2 Confirming Nomad Download Pause installation

It is good practice to confirm the installation of the **Nomad Download Pause** components in both Tachyon and Configuration Manager (CM).

9.4.4.2.2.1 Confirm the installation in Tachyon

Logon to Tachyon Platform as a user with at least **Consumer Administrators, Instruction Set Administrators** and **Permissions Administrators** roles and click the **Settings** app from the Tachyon Portal

On the **Consumers** page check the following:

A consumer with the name **Nomad** is already listed.

Note

This consumer name will have been registered already by one of the following methods:

installation of the **Nomad Configuration Manager console extensions,** if the installation account had the correct Tachyon user permissions

a previous installation of **Nomad Configuration Manager console extensions**

installation of the **Nomad app** and **Content Distribution** by Tachyon Setup

On the **Instruction→Instructions sets** page check the following:

A **1E Nomad** instruction set exists, and contains the following two instructions:

Pause the Nomad job queue for <PauseDurationMinutes> minutes

Resume the paused Nomad job queue.

On the **Permissions** page check the following:

On the **Roles** tab check that the **Nomad Administrators** role has been created with **Actioner** permissions on the **1E Nomad** set.

Click on the **Nomad Administrators**→**Management Groups** tab, and click on the **Add** button. Select **All Devices** in the **Add management group** popup, and then click **Add**.

> **Note**
>
> If other management groups are selected instead, then members of this role can only use the instructions on devices belonging to those management groups.

On the **Permissions**→**Users** tab check that all Configuration Manager users and groups that have the **"Full Administrator"** role have been added to Tachyon as users.

> **Note**
>
